September 4 Recess	
October 2	
November 6	

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

SUMMARY OF RULES AND PROCEDURES

AGENDA ITEMS: The Commission may reschedule items on the agenda. The Commission will generally hear uncontested matters first, followed by discussions of contested matters, and staff announcements in that order. Anyone who wishes to address the Commission should obtain a form from either the Commission Clerk or from the table located near the entrance of the hearing chamber.

CONDUCT OF HEARINGS: A contested matter is usually heard as follows: (1) discussion of the staff report and the environmental document; (2) testimony of proponent; (3) testimony of opponent; (4) Public Testimony (5) rebuttal by proponent; (6) provision of additional clarification by staff as required; (7) close of the public hearing; (8) Commission discussion and Commission vote.

ADDRESSING THE COMMISSION: Any person who wishes to address the Commission should submit a speaker's request form at the beginning of the meeting; move to the front of the chambers when an item is called; and, when recognized by the chair, state their name, address and affiliation. Please attempt to make your statements concise and to the point. It is most helpful if you can cite facts to support your contentions. Groups of people with similar viewpoints should appoint a spokesperson to represent their views to the Commission. The Commission appreciates your cooperation in this matter.

PUBLIC COMMENT TIME LIMITS: The Sacramento Local Agency Formation Commission welcomes and encourages participation in its meetings. Rules of the Commission provide for the following limitations of discussion: The Commission will hear public comment prior to the consideration of any item. (1) a principal proponent will be allowed a 5-minute statement; (2) other proponents will be allowed a 3-minute statement; (3) opponents are allowed 3-minute statements with the exception of spokespersons for any group who shall be permitted 5-minutes; (4) the principal proponent shall have a 3-minute rebuttal; (5) staff will provide clarification, as required.

VOTING: A quorum consists of four members of the Commission, including any alternate. No action or recommendation of the Commission is valid unless a majority (4 votes) of the entire membership of the Commission concurs therein.

OFF AGENDA ITEMS: Matters under the jurisdiction of the Commission, and not on the posted agenda, may be addressed by the general public under "Public Comment From the Floor" on the Agenda. The Commission limits testimony on matters not on the agenda to three minutes per person and not more than fifteen minutes for a particular subject. The Commission cannot take action on any unscheduled items.

SPECIAL NEEDS: Meeting facilities are accessible to persons with disabilities. Requests for assistive listening devices or other considerations should be made 48 hours in advance through the Commission Clerk at (916)874-6458.

AB 745 DISCLOSURES: The Political Reform Act requires all interested parties to disclose contributions and expenditures for "political purposes" related to proposals for changes of organization or reorganization (annexations, incorporations, etc.,) as well as contributions and expenditures in connection with Conducting Authority protest proceedings. Such contributions and expenditures must be reported to LAFCo's Executive Officer to the same extent, and subject to the same requirements, as local initiative measures under the Political Reform Act. Additional information regarding these requirements can be found on LAFCo's website at: <http://www.saclafco.org/Forms/index.htm>.

STAFF REPORTS: Staff Reports are available on line at www.SacLAFCo.org or upon request to Diane Thorpe, Commission Clerk at (916)874-6458.

VIDEO BROADCASTS: The meeting is video taped in its entirety and will be cablecast live on Metro Cable channel 14, the government affairs channel on the Comcast, and SureWest Cable Systems and is closed captioned for our hearing impaired viewers. The meeting is webcast live at <http://www.saccounty.net> . The current meeting is broadcast live and will be rebroadcast; check the Metro Cable schedule for dates and times.

***MINUTES FOR THE MEETING OF
Wednesday June 5, 2013***

TO: Sacramento Local Agency Formation Commission
FROM: Peter Brundage, Executive Officer *PB*
RE: Monthly Budget and Accounting Reports

RECOMMENDATION:

Receive and File Accounting Period Reports 11 and 12 for FY 2012-13 as of July 8, 2013.

DISCUSSION:

The attached budget and accounting reports are for Accounting Period 11 and 12 for FY 2012-13. These reports summarize monthly expenditures and revenues as well as the Trial Balance for this reporting period.

There are no significant variances to report at this time.

Year End Fund Balance and Period 13 Accounting Report will be provided at the next Commission meeting. In addition, the FY 2012-13 Financial Audit is scheduled to commence on August 23, 2013.

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION
1112 I Street #100
Sacramento, California 95814
(916) 874-7458

August 7, 2013

TO: Sacramento Local Agency Formation Commission

FROM: Peter Brundage, Executive Officer

RE: Legislative Update

CONTACT: Don Lockhart, AICP, Assistant Executive Officer (916) 874-2937

RECOMMENDATION

Information only, no action is recommended.

BACKGROUND

This memo is part of the ongoing effort to keep your Commission informed regarding various legislative matters.

More than 2,200 Senate and Assembly bills were introduced for consideration in the 2013-14 session. May 24 was the final day for a Bill to advance. This winnowed down the Bill tracking effort considerably.

An ad-hoc committee appointed by the CALAFCO Board of Directors will consider and adopt positions on several bills, which staff will report back on.

SUMMARY

There continue to be several pieces of proposed legislation that may be of interest to your Commission.

AB 453 (Mullin D) Sustainable communities

Introduced: 2/19/2013

Status: 5/30/2013-Action From THIRD READING: Read third time. Passed Assembly to SENATE.

Location: 5/30/2013-S. SENATE

Calendar: 5/30/2013 #50 ASSEMBLY ASSEMBLY THIRD READING FILE
8/12/2013 10 a.m. - John L. Burton Hearing Room (4203) SENATE
APPROPRIATIONS, DE León, Chair

Summary:

The Strategic Growth Council is required to manage and award grants and loans to a council of governments, metropolitan planning organization, regional transportation planning agency, city, county, or joint powers authority for the purpose of developing, adopting, and implementing a regional plan or other planning instrument to support the planning and development of sustainable communities. This bill would make a local agency formation commission eligible for the award of financial assistance for those planning purposes.

Position: Sponsor

CALAFCO Comments: This would allow LAFCOs to apply directly for grants that support the preparation of sustainable community strategies and other planning efforts.

AB 743 (Logue R) The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000.

Introduced: 2/21/2013

Last Amend: 4/3/2013

Status: 5/9/2013-Referred to Com. on GOV. & F.

Location: 5/9/2013-S. G. & F.

Calendar: 6/5/2013 9:30 a.m. - Room 112 SENATE GOVERNANCE AND FINANCE, WOLK, Chair

Status: 7/8/2013-Read third time. Passed. Ordered to the Assembly. (Ayes 33. Noes 0.)

Summary:

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 authorizes a local agency formation commission to approve, after notice and hearing, a petition for a change of organization or reorganization of a city, if the petition was initiated on or after January 1, 2010, and before January 1, 2014, and waive protest proceedings entirely if certain requirements are met. This provision applies only to territory that does not exceed 150 acres. This Bill would delete the January 1, 2014, date and make conforming changes. This bill contains other related provisions and other existing laws.

Position: Support

Subject: Annexation Proceedings, CKH General Procedures

CALAFCO Comments: As amended, this bill removes the sunset date provision to waive protest proceedings for certain island annexations. The size of the island areas for the purposes of annexation under this provision has been amended back to 150 acres.

Unincorporated islands are more costly and inefficient for counties to administer as opposed to the local municipality. A sunset date was initially established on this ability to encourage the use of the provision and was extended to allow cities and LAFCOs additional time to implement island annexation programs. The unforeseen economic downturn over the past five years has significantly hampered the initial progress, and with the sunset ready to expire at the beginning of next year, cities and LAFCOs have yet to complete the work that the law intended them to do. Over the twelve year period since the law was established, hundreds of islands have been annexed, yet hundreds more remain.

Additionally, the bill was amended to reset the effective island creation date from January 1, 2000 to January 1, 2014 thus allowing smaller islands of less than 150 acres created after 2000 to be annexed under these provisions. Many of these current islands remained as remnants of larger substantially surrounded island areas that had irregular boundaries or were affected by the annexation of territory for newer development.

AB 1427 (Committee on Local Government) Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000.

Introduced: 4/1/2013

Status: 6/24/2013-In Assembly. Ordered to Engrossing and Enrolling..

Summary:

Current law, the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (act), provides the sole and exclusive authority and procedure for the initiation, conduct, and completion of changes of organization and reorganization for cities and districts. This bill would specify that the definition excludes any independent special district having a legislative body consisting, in whole or in part, of ex officio members who are officers of a county or another local agency or who are appointees of those officers other than those who are appointed to fixed terms. This bill contains other related provisions and other existing laws.

Position: Sponsor

Subject: CKH General Procedures

CALAFCO Comments: Cortese-Knox-Hertzberg Omnibus bill.

SB 56 (Roth D) Local government finance: vehicle license fee adjustments.

Introduced: 1/7/2013

Last Amended: 4/23/2013

Status: 4/23/2013-From committee with author's amendments. Read second time and amended. Re-referred to Com. on GOV. & F.

Calendar:

5/8/2013 9:30 a.m. - Room 112 SENATE GOVERNANCE AND FINANCE, WOLK, Chair Status: 6/19/2013-From committee: Do pass and re-refer to Com. on APPR. (Ayes 7. Noes 0.) (June 19). Re-referred to Com. on APPR

Summary:

Would, for the 2013-14 fiscal year, provide for a new vehicle license fee adjustment

amount, as specified. This bill would also, for the 2013-14 fiscal year and for each fiscal year thereafter, provide for a vehicle license fee adjustment amount for certain cities incorporating after a specified date, as provided. This bill contains other related provisions and other existing laws.

Attachments:

CALAFCO Letter of support April 10, 2013

Position: Support

Subject: Financial Viability of Agencies, Tax Allocation

CALAFCO Comments: This bill reinstates revenues through ERAF (backfilled by the state general Fund) for cities incorporating after 2005 and annexations of inhabited territories.

SB 772 (Emmerson R) Drinking water.

Introduced: 2/22/2013

Status: **Dead -Bill failed to advance.**

Would require the State Department of Public Health or the local health agency, where applicable, annually to provide the address and telephone number for each public water system and state small water system to the Public Utilities Commission and, as prescribed, to a local agency formation commission. This bill contains other related provisions and other existing laws.

Attachments:

CALAFCO Letter of Opposition April 10, 2013

Position: Oppose

Subject: LAFCo Administration, Service Reviews/Spheres

CALAFCO Comments: Requires LAFCos as part of a MSR, to request information from identified public or private entities that provide wholesale or retail supply of drinking water, including the identification of any retail water suppliers within or contiguous to the responding entity. Further requires LAFCos to provide a copy of the SOI review for retail private and public water suppliers to the Public Utilities Commission and the state department of Public Health.

SB 731 (Steinberg D) Environment: California Environmental Quality Act and sustainable communities strategy.

Introduced: 2/22/2013

Last Amended: 4/23/2013

Status:

Status: 5/29/2013-Read third time. Passed. (Ayes 39. Noes 0.) Ordered to the Assembly. 7/1/2013-Do pass as amended and be re-referred to the Committee on Local Government.

Summary:

Would provide that aesthetic impacts of a residential, mixed-use residential, or employment center project, as defined, within a transit priority area, as defined, shall not be considered significant impacts on the environment. The bill would require the Office of Planning and Research to prepare and propose, and the Secretary of the Natural Resources Agency to certify and adopt, revisions to the guidelines for the implementation

of CEQA establishing thresholds of significance for noise, and for the transportation and parking impacts of residential, mixed-use residential, or employment center projects within transit priority areas. The bill would require the lead agency, in making specified findings, to make those findings available to the public at least 15 days prior to the approval of the proposed project and to provide specified notice of the availability of the findings for public review. Because the bill would require the lead agency to make the draft finding available for public review and to provide specified notices to the public, this bill would impose a state-mandated local program. This bill contains other related provisions and other existing laws.

Position: Watch

Subject: CEQA

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

***1112 I Street, Suite #100
Sacramento, California 95814
(916) 874-6458***

August 7, 2013

TO: Sacramento Local Agency Formation Commission

FROM: Peter Brundage, Executive Officer

RE: **Rio Linda/Elverta Community Water District – Draft
Municipal Service Review – Report Back (LAFC 07-10)**

RECOMMENDATION

1. Receive and file status report.
2. Direct the Executive Officer to continue to monitor the status of Rio Linda Elverta Community Water District on a monthly basis and to report back to the Commission as necessary if there are any significant changes related to the District's operational and financial condition.

Overall the District continues to provide adequate water service to the community and progress is being made to address the water supply and water quality issues. The overall financial condition is improving. Currently, the District has a balanced budget and is current with accounts payable. The District has obtained coverage for employment practices from the Association of California Water Agencies. The coverage will commence in October, 2013 during the annual renewal period.

DISCUSSION

This report summarizes the actions, developments, and events related to the Rio Linda Elverta Community Water District that have occurred since June 5, 2013.

I. Board of Directors

The Board is developing a Strategic Plan to prioritize deferred maintenance, capital improvement projects and district financing. The Board has established several sub-committees to review and recommend policies for the consideration by the Board.

The Board approved the collection of the Inactive Service fee that was recently suspended.

The new Board is taking positive actions to improve Board meetings and develop a long term operational, financing and capital improvement strategies for the District, and also control its legal costs.

II. Proposed Reservoir Tank and Booster Station

CDPH has agreed to amend the Scope of Work to add a Reservoir Tank and Booster Station in lieu of constructing another well. However, the District needs to develop plans and complete an environmental review of the project before CHDP will approve a change to the Funding Agreement. The District has authorized the General Manager to enter into contracts for environmental and construction design for the proposed reservoir tank.

The following steps summarize the major components of this project:

Complete:	RFP issued for design
Complete:	Select Consulting Engineer
95% Complete:	Develop Plans and Specifications
In Progress:	Amend Funding Agreement with CDPH
In Progress:	Issue RFP for Construction Contract
In Progress:	Approve Construction Bid
In Progress:	Commence Construction

It is anticipated that the design and engineering plans will be 95 percent complete by the end of July, 2013. Currently environmental review is under way. It is possible construction could commence in the Fall of 2013.

Completion of the Reservoir Tank and Booster Pump should allow the District to satisfy the outstanding Compliance Order issued by CHDP.

Overall Operations

Generally, the District appears to have stabilized and is moving in a very positive direction. There are no significant issues to report.

Status of CDPH Compliance Orders

The water quality and quantity continue to be satisfactory. Water pressure is subject to variation because of leaks and equipment failures. However, generally, water pressures remain adequate and comply with CDPH standards.

Completion of the Reservoir Tank and Booster Station should satisfy the outstanding Compliance Order related to adequate water supply.

The District has completed the required Federal/State audit related to the State revolving loan. No audit exceptions were noted in the report. The District is in compliance with the terms and conditions of the loan and has accurately reported required financial information.

III. Status of District Operations

District Financial Condition

The District has adopted a balanced budget for FY 2013-14. The budget includes approximately \$300,000 for capital improvements and it projects that it will have a fund balance of approximately \$100,000 at the end of this fiscal year.

Staffing and Employee Relations

The Board authorized the General Manager to hire three employees. Therefore, staffing levels should be adequate.

Liability Insurance

The Association of California Water Agencies (ACWA) has extended the District's liability coverage for a 6 month period until October, 2013: ACWA has agreed to provide coverage for employment practices when the insurance policy is renewed in October.

District Operations

The General Manager's report for June 11, 2013 to July 9, 2013 is attached highlighting the status of various district activities.

Elverta Specific Plan Development Project

Currently, the CDPH has imposed a building moratorium until the District has complied with the outstanding Compliance Order. The developer for the unfranchised areas of the Elverta Specific Plan Area has contacted the District about annexing the remaining portion of the Elverta Specific Plan Area into the District boundaries.

The District is in the process of preparing the Master Plan Update. This plan should be complete by December, 2013. Once the Master Plan is complete and approved, the District will prepare a financial plan and rate study to determine the appropriate rates for the new development and current rate payers.

The Board of Directors have approved the agreement with the developer group to fund the engineering work for District's Master Plan update and efforts to comply with PF8.

Pending Litigation as of January 14, 2013

Currently, there is no pending litigation.

IV. Summary of Issues

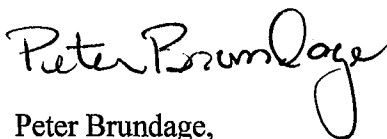

Overall the District is providing adequate water service to the community and progress is being made to address the water supply capacity issue. The District has obtained insurance coverage for employment practices effective October 2013. The District's overall financial is improving and accounts payable are current. It appears that the District continues to move in a very positive direction.

V. Next Steps

LAFCo staff will continue to work with CDPH and the District to monitor the situation. The Executive Officer will continue to monitor the District on a monthly basis and report back to the Commission if there are significant changes to the District's operational and financial condition.

Respectfully Submitted;

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

Peter Brundage,
Executive Officer

Managers Report

June 11, 2013 to July 9, 2013

On June 12, 2013 I went to a water caucus meeting where all managers from area water districts discussed matters of importance to all of us. These included the Bay Delta Plan, Best Management Practice (BMP) 1.4 regarding the structure of water rates and the meetings that are coming up to review this BMP, current legislation and a flow standard the RWA is still modeling for the regional plan required by the State.

On June 13, 2013 I went to Sacramento Groundwater Authority (SGA) bimonthly meeting. We received an update on the model treatment of chromium 6 project being done in Davis. They also approved the annual budget transferring some items to the current year from the past year that had not been completed to date. There was also a legislative update and a groundwater management update. The audit for fiscal year 2012/13 was also approved.

On June 17, 2013 Jim Carson, Jim Crowley and I met with the City of Sacramento to discuss possible surface water purchases for the Elverta Specific Plan and other developments in the area. There was a positive response from the city. They are gathering information and will be in contact with our engineers.

On June 18, 2013 Jim Carson, Jim Crowley and I met with Carmichael Water District to discuss the potential of buying water credits from their agency as an interim measure to meet PF8 requirements. The discussion was positive and this information will be added to the information staff is gathering for potential sources of surface water. Afterward Mr. Carson and Crowley and I had a meeting discussing our progress so far in contacting all agencies in the area and next steps to take with the project.

On June 19, 2013 I went to an all day meeting with the California Urban Water Conservation Council (CUWCC) and discussed Best Management Practice (BMP) 1.4 rate setting in great detail with the group. The CUWCC is trying to determine if the current methods available for water conservation rate structure are appropriate and if they should be reviewed and revised. There was an overwhelming response from the water community that the current method of 70 % volumetric and 30% fixed expense rate structure was not workable for many Districts and there should be more methods available to comply with this BMP. This information was taken to the Plenary meeting the next day.

On June 20, 2013 I went to the Plenary meeting where they discussed BMP 1.4 options 1 and 2, future demand forecasting, avoiding costs of water energy projects and allowed networking between the three groups of the CUWCC.

On June 26, 2013 the ACWA/JPIA boiler and machinery inspection services consultant came out to inspect our hydropneumatic tanks. They were informed that the District has already done preliminary testing on our tanks and has budgeted for removal of 2 tanks per year until all are replaced or circumvented.

On June 27, 2013 we had a meeting with the SEMS people and informed them of our status in providing them with the information needed to implement their program. Later that day the Air Quality Management District inspected and was happy with our operations. No corrective actions are needed.

On June 28, 2013 The Board President and I met with Mr. Miller regarding his inactive service fee. Mr. Miller feels that the District should ask the County for additional tax money for our fixed costs instead of asking the customers who are not currently using their service to pay a fee. This was discussed during the Finance and Administrative meeting on the 8th of July. Later that day Jim Crowley and I met with the Manager of El Dorado County Water District and discussed their action to acquire water rights in the area. It was determined that the two agencies would keep each other up to date on our plans to acquire surface water.

On July 2, 2013 I met with SMUD's energy efficiency staff. They will be providing us with more energy efficient lighting and our peak factor rate will be adjusted because of this energy audit. This should drop the energy bill in the office for at least the next 12 months.

On July 3, 2013 the Planning committee met. The L St. design is 95% complete. The proposal to do environmental work on the pipeline to well 5 was presented. An update was provided on the Elverta Specific plan. A water supply matrix is forthcoming on this project. A Capital Budget item was presented for recommendation to the full Board. New bins for building materials need to be constructed at well 2A before the L St. project starts as the old bins will have to be destroyed. The Hyce property easement agreement was discussed. Based on the information presented the committee felt that Mr. Hyce should be allowed to transfer his service to someone else if he wishes to do so.

On July 8, 2013 the Finance/Administration committee met. The District expenditure and financial reports were discussed. The job descriptions of Water Utility Superintendent and Administrative Assistant were discussed along with compensation and benefits. The 2013-14 final budgets were reviewed and discussed. The inactive service fee was discussed at length in an effort to determine what the best course of action would be regarding this charge. Mr. Ridilla was asked to provide the staff with options/choices for amending the fee. His ideas were received and incorporate in the inactive service fee staff report.

RIO LINDA / ELVERTA COMMUNITY WATER DISTRICT REGULAR MEETING OF THE BOARD OF DIRECTORS

1

Monday, July 15, 2013 (6:30 p.m.)

Visitor's / Depot Center
6730 Front Street
Rio Linda, CA 95673
(916) 991-1000

AGENDA

The Board may discuss and take action on any item listed on this agenda including items listed as information items. The Board may also listen to the other items that do not appear on this agenda, but the Board will not discuss or take action on those items, except for items determined by the Board pursuant to state law to be of an emergency or urgent nature requiring immediate action. The Board may address any item(s) in any order as approved by the Board.

The public will be given the opportunity to directly address the Board on each listed item during the Board's consideration of that item. Public comment on items within the jurisdiction of the Board is welcomed, subject to reasonable time limitations for each speaker. Public documents relating to any open session item listed on this agenda that are distributed to all or any majority of the members of the Board of Directors less than 72 hours before the meeting are available for public inspection at the District office at 730 L Street, Rio Linda, CA 95673. In compliance with the Americans with Disabilities Act, if you have a disability and need a disability-related modification or accommodation to participate in this meeting, please contact the District office at (916) 991-1000. Request must be made as early as possible, and at least one full business day before the start of the meeting.

1. CALL TO ORDER, ROLL CALL and PLEDGE OF ALLEGIANCE

2. PUBLIC COMMENT

Members of the public are invited to speak to the Board regarding items within the subject matter jurisdiction of the District that are not on the agenda or items on the consent agenda. Each speaker may address the Board once under Public Comment for a limit of 2 minutes. (Policy Manual § 2.01.160).

3. CONSENT CALENDAR

Action items: Approve Consent Calendar Items

a. Minutes:

June 17, 2013 Regular Meeting

b. Expenditures

c. Financial Reports

4. REGULAR CALENDAR

ITEMS FOR DISCUSSION AND ACTION

4.1 Ron Hyce, Property Easement Agreement.

Board to consider whether to permit Mr. Hyce to transfer his 1" water service. *Recommendation by the Planning Committee is that Mr. Hyce be given ability to transfer his 1 " water service pursuant to*

his December 18, 1991 agreement with the District to another party. Meter not to be installed until after the State moratorium is lifted.

2

4.2 Inactive Service Fee

The Board to consider approval of the recommendations of the Finance and Administrative committee . *The Committee recommends that the inactive service fee be reduced to \$27.68 which is the amount required from each customer to pay debt service. They also recommend that all inactive customers be given the opportunity to have their service disconnected with the understanding that if their service is capped they will be required to pay capacity fees again in order to get the service turned on. Customers who have paid the higher rate will receive a credit to their account for the difference which will then be applied to future billings. Accounts that do not pay the fee will be subject to the District's collection proceedings including disconnection and lien of the property.*

4.3 2013-14 Final Budgets

The Board to consider approval of the 2013-14 final budgets. *Recommendation of the Finance / Administrative Committee is to approve the 2013-14 final budgets.*

4.4 Change Lead Operator title to Water Utility Supervisor

The Board to consider changing the title of the lead operator to water utility supervisor. The Board to also consider and approve the new job description for Water Utility Supervisor with one additional week of vacation. *Finance / Administrative Committee recommend approval of the above.*

4.5 Change Secretary / Receptionist title to Administrative Assistant

The Board to consider changing the title of Secretary/ Receptionist to Administrative Assistant with a \$1.00 hour increase in pay for the current Secretary/Receptionist. *Recommendation of the Finance / Administrative Committee is to change the title of Secretary / Receptionist to that of Administrative Assistant.*

5. PUBLIC COMMENT

Public comment for closed session items only: The public is invited to comment on any item listed on the closed session agenda. Each speaker is limited to 2 minutes.

6. CLOSED SESSION - The Board of Directors will convene to Closed Session to discuss the following items.

6.1 CONFERENCE WITH LABOR NEGOTIATOR

The Board will meet in closed session pursuant to Government Code § 54957.6 - Discussion and possible modification to the Memorandum of Understanding (MOU) with a Letter of Understanding (LOU).

7. The Board will reconvene to Open Session

8. Announcements from Closed Session

The Board President will report on any actions taken in closed session.

4.6 Letter of Understanding

The Board will discuss the Letter of Understanding (LOU) modifying the Employees Memorandum of Understanding (MOU) and take possible action.

Action Item: It is recommended by the Finance / Administrative Committee that the Board approves the LOU modifying the Employees MOU.

9. INFORMATION ITEMS

1. DISTRICT ACTIVITY REPORT

- a. General Manager's Report
- b. Water Production Report
- c. District Engineers Report

2. BOARD REPORTS

**-DRAFT-
MINUTES OF THE
June 17, 2013
REGULAR MEETING OF THE BOARD OF DIRECTORS
THE RIO LINDA/ELVERTA
COMMUNITY WATER DISTRICT**

1. CALL TO ORDER, ROLL CALL and PLEDGE OF ALLEGIANCE

The June 17, 2013 Regular Meeting of the Board of Directors of the Rio Linda/Elverta Community Water District was called to order at 6:31 p.m. at the Depot/Visitor Center located at 6730 Front Street, Rio Linda, Ca. General Manager, Mary Henrici took roll call of the Board of Directors. President Brent Dills, Director Frank Caron, Director Duane Anderson, Director Matt Longo and Director Paul R. Green, Jr. were present.

2. PUBLIC COMMENT

The Board received public comment from Chris Miller regarding a bill received for charges on an inactive water meter.

3. CONSENT CALENDAR

Action items: Approve Consent Calendar Items

a. Minutes:

May 20, 2013 Regular Board Meeting and Public Hearing

- a. Expenditures**
- b. Financial Reports**
- c. Single Audit, Richardson & Company**
- d. Conservation Coordinator job description**

President Dills stated that the Single Audit by Richardson & Company is a regulatory requirement that the District had to meet. He also commented that the Board had a strategic planning meeting in March or April and the position for a Conservation Coordinator was discussed and at the last meeting, the Board tentatively approved a budget for the next fiscal year which included funding for this position.

Director Green inquired about items on the expenditure list and Conservation Coordinator job description.

Director Longo inquired about an item on the expenditure list and a possible credit for training.

It was moved by Director Anderson and seconded by Director Caron to approve the Consent Calendar. The motion carried with a unanimous vote of 5-0-0.

4. REGULAR CALENDAR

4.1 New Well Drilling in designated area adjoining the McClellan Park

Mary Hall, Civil Engineering Group and Public Affairs Officer for McClellan Park introduced Steve Mayor who provided an overview of the status of the groundwater cleanup project at the former McClellan Air Force Base.

Susan Williams, Sacramento County Environmental Management Department provided a brief history of her background and responsibilities. Ms. Williams described the boundary lines of the prohibition area of the former McClellan AFB. She also provided the variances from the requirements of the well ordinance prohibiting the installation of new supply wells. McClellan Prohibition Area is the only area in Sacramento County where the construction of new supply wells is prohibited.

Public Member, Mary Harris asked if RLECWD or Sacramento Groundwater Authority was consulted before the data provided was made public. She also requested testing results.

Susan Williams stated that nothing has changed, every ordinance and revision they have done since 1991 has had the Groundwater Authorities involvement along with public participation.

President Dills recommended that Ms. Harris be given a contact name and phone number so that she might obtain the information requested.

4.2 Well 12 Rehabilitation

Jim Carson explained that Well 12 does not produce the volume of water that it should due to the original construction techniques. It was recommended by the Planning Committee that the Board approve task 1 of Wood Rogers proposal to rehabilitate Well 12.

It was moved by Director Green and seconded by Director Anderson to approve Task 1 of the Wood Rogers proposal. The motion carried with a unanimous vote of 5-0-0.

4.3 ESA Cultural Services Contract

Jim Carson explained that the L Street elevated tank is over 50 years old and therefore it needs to be evaluated which is part of the CEQA requirements.

The Planning Committee recommended the ESA contract be approved. Director Longo stated that this item has to be done and the District does not have any choice as it is a CEQA mandate.

It was moved by President Dills and seconded by Director Longo to approve the contract with ESA for Cultural Services in the amount of \$4,222. The motion carried with a unanimous vote of 5-0-0.

4.4 Form of Action section of the Policy Manual

The Board discussed and received clarification on required actions in order to approve policy manual changes.

It was moved by Director Anderson and seconded by Director Green to approve this change in the Form of Action. The motion carried with a unanimous vote of 5-0-0.

Director Longo left the meeting at 7:40 pm.

7

4.5 Resolution 2013-08 Inactive Service Resolution

Director Caron stated that the purpose of this Resolution was for vacant properties, which could be rentals that are vacant or properties that are owned by the bank.

President Dills asked the intent of the word vacant. Did it mean uninhabited homes or did it mean properties. General Counsel, Ravi Mehta stated that it means land, vacant, unimproved properties / parcels meaning bare dirt, with no improvements such as a residence or orchards.

Director Caron recommended that the word "and" and the "/" be removed from the resolution so that it reads "vacant unimproved properties/parcels".

It was moved by Director Green and seconded by Director Anderson to approve Resolution 2013-08 as amended. The motion carried with a unanimous vote of 4-0-0. Director Longo was absent.

4.6 Policy Manual Amendment on new PERS requirements

President Dills stated that this is a requirement for any new hires after January 1, 2013.

Director Green asked how this item will be offset in the budget. G.M. Henrici stated that the District will be paying less for new employees. The employees will still pay 3-1/2 % of their PERS per the Memorandum of Understanding.

It was moved by Director Anderson and seconded by Director Green to approve. The motion carried with a unanimous vote of 4-0-0. Director Longo was absent.

General Counsel, Ravi Mehta stated that the closed session item 6.3 for discussing an Letter of Understanding could not be addressed this evening because it is listed incorrectly. It should read "Conference with Labor Negotiator" not General Manager. Therefore it will be placed on the agenda for July 15, 2013 Closed Session. Along with that agenda item #4.7 will also being placed on the next agenda.

5. PUBLIC COMMENT

Public comment for closed session items only: The public is invited to comment on any item listed on the closed session agenda. Each speaker is limited to 2 minutes.

6. CLOSED SESSION - The Board of Directors convened to Closed Session to discuss the following items.

6.1 CONFERENCE WITH LEGAL COUNSEL

The Board of Directors will meet in closed session pursuant to Government Code § 54957(b)(1) – to consider the appointment, employment, evaluation of performance, discipline, or dismissal of public employee, Legal Counsel, Ravi Mehta

6.2 CONFERENCE WITH BOARD OF DIRECTORS

The Board of Directors will meet in closed session pursuant to Government Code § 54957(b)(1) – to consider the appointment, employment, evaluation of performance, discipline, or dismissal of public employee, General Manager, Mary Henrici.

6.3 This item was tabled to the next meeting of the Board

7. Announcements from Closed Session

President Dills stated that the District will continue their relationships with the General Manager and Counsel.

4.7 This item was tabled to the next meeting of the Board

8. INFORMATION ITEMS

1. DISTRICT ACTIVITY REPORT

- a. General Manager's Report
- b. Water Production Report
- c. District Engineers Report

2. BOARD REPORTS

- a. Regional Water Authority – Dills, Henrici
- b. Sacramento Groundwater Authority – Green, Henrici
- c. LAFCo – Caron
- d. Planning Committee – Longo, Green
- e. Finance / Administrative Committee – Dills, Anderson
- f. Other Reports

9. DIRECTORS' AND GENERAL MANAGER COMMENTS

President Dills

10. ADJOURNMENT

President Dills adjourned the meeting at 8:40 pm.

Respectfully submitted,

Mary Henrici, Secretary

Brent Dills, President

RIO LINDA

ELVERTA

**Item for Discussion and Action
Agenda Item: 3.b**

Date: July 15, 2013

Subject: Expenditures

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The Finance / Administrative Committee recommend approval of the Expenditures for the month of June 2013.

Current Background and Justification:

These expenditures have been done since the last regular meeting of the Board.

Conclusion:

These expenditures need to be reviewed and approved by the Board of Directors.

Board Action / Motion

Motioned by: Director _____ Seconded by Director _____

Dills: _____ Green: _____ Caron: _____ Anderson: _____ Longo: _____.

ELVERTA

Item for Discussion and Action Agenda Item: 4.1

Date: July 15, 2013

Subject: Ron Hyce Property Easement Agreement

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The Planning Committee recommends allowing Mr. Hyce to transfer his 1" connection to whomever he chooses with the requirement that it cannot be used until the Building Moratorium has been lifted.

Current Background and Justification:

On August 13, 2012 Mr. Hyce had requested monetary compensation for the 1" water service that he was given to be constructed anywhere in the District in exchange for an easement across his property. The proposed value of the water service in 1991 was \$1,460.00. The Board at that time denied his request. Mr. Hyce again approached the Board in April of this year and requested that our agency find out if the California Department of Public Health would allow connection of his service at this time as it was already approved before the moratorium was imposed. Mr. Hyce would like to sell this connection to another land owner as he no longer owns land in the District. I have contacted the State several times since then and have received no response. Due to this lack of response I will have to believe they will not make an exception for this connection.

Conclusion:

Mr. Hyce was given a 1" water service as payment for an easement that he provided the District. His agreement does not mention that it is not transferable. The agreement does not include connection fees. So a service would be installed by staff but the connection fees would still need to be paid.

Item for Discussion and Action

Agenda Item: 4.2

Date: July 15, 2013

Subject: Inactive Service Fee

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The committee recommends that the service fee be reduced to \$27.68 / bi-monthly which is the amount of debt service required from each customer to pay our loans. They also recommend that all inactive customers be given the opportunity to have their service disconnected with the understanding that if their service is capped they will be required to pay capacity fees again in order to get the service turned on. Customers who have paid the higher rate will receive a credit to their account for the difference which will then be applied to future billings. Accounts that do not pay the fee will be subject to the District's collection proceedings including disconnection and lien of the property.

Current Background and Justification:

The original standby fee was enacted in September 2012 during a meeting where the staff also requested the Board approve implementing the rest of the rate increase approved in 2011. The Board denied increasing the rates to active customers but approved charging a fee for all inactive customers based on meter size to pay debt service and fixed costs. The inactive service fee has been discussed at just about every Board meeting since the new Board has been seated. It has been politically unpopular with the public since the fee has been established. Since the fee's inception the Board has reduced the fee to a flat fee from the previous fee based on meter size. The Board has made exclusion for properties with two meters in the Mc Clellan cleanup area. They have also allowed properties that are vacant and unimproved to be excluded from the fee provided they pay capacity fees again once the service is activated.

The District billed out \$6,269 in the month of May and has received \$3,871 as of June 30, 2013 for these charges.

Estimated annual revenue based on May bills is \$37,614.00.

Annual total income is \$2,440,000/\$37,614 inactive service fee charges = 1.5% of total income.

\$37,614 is equivalent to 123 hrs of legal work.

District has already spent at least 41.25 hrs or \$12,581.25 for legal work on this issue as of May 30, 2013.

If the fee was abolished the estimated amount of debt service that would need to be paid through current customers for inactive accounts would be \$20,760 based on 125 inactive accounts @ \$27.68 each.

Conclusion:

The Finance/Administration Committee has reviewed the options of repealing the fee, reducing the fee and giving the public an option to opt out of the fee.

With all things considered the Finance committee felt it would be best to reduce the fee to the amount required to pay debt service which is \$27.68 bimonthly. The committee also recommended that all inactive customers be allowed to have the option to opt out of paying the fee with the understanding that they would be required to pay capacity fees again when their service is reconnected.

Subject: Final Budget

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The Finance / Administrative Committee recommend approval of the Final Budget for Fiscal Year 2013/14. The budgets are attached for the Board's review.

Current Background and Justification:

The preliminary budget was approved after the public hearing held at the May meeting of the Board of Directors. Staff has reviewed and revised the numbers in the final budgets with the year end amounts currently available.

Conclusion:

The Finance/Administrative committee has reviewed the final Operating and Capital budgets and made their recommendations to staff. With these revisions the committee recommends the Board approve the final budget as presented.

4416 services X \$19.00 X 6 billings										

38

The Following budget assumptions are proposed:

External Factors:

Property tax assessed values contain an inflation factor for each County combined with growth or decline factors; overall expect a moderate increase.

Interest rates on investments will be at current market rates, approximately 0.5%.

Surcharge Fund Activities:

The Surcharge Fund is a Restricted Fund only to be used for the construction of our well project. The Surcharge Fund is a reserve that is only in place until the Department of Health Services loan is paid off. During the course of our audits of the prior years it has been determined that there is a substantial sum of money that was being used to operate the District instead of being put into the Surcharge Fund. There were also a few expenses that should have not been paid out of this Fund. The figures are noted below:

Fiscal Year 2009/10	\$ 16,130.00	Income not put into the Fund
Fiscal Year 2010/11	\$ 17,729.00	Income not put into the Fund
Fiscal Year 2011/12	\$105,856.00	Bills that should not have been paid by the Fund.
Fiscal Year 2011/12	\$26,000.00	revenue not recorded.
		\$165,714.00 Total Due to the Surcharge from Operating Fund.

The previous Board determined a methodology to repay the Surcharge Fund these amounts over a period of time. In 2012-13 the District paid the fund \$29,212. \$34,125 will be paid by the end of Fiscal Year (FY) 2013/14 with another \$34,125 proposed to be paid in FY 2014/15.

Operating Fund Revenues:

The Operating Fund revenue has increased due to the implementation of the full 2011 rate increase Ordinance. Estimated revenue increase is \$195,500 per year. An inactive service fee has also been implemented which will increase District revenues by \$47,500 based on 125 inactive properties. The District has 4616 connections but only 4458 were on during the last billing cycle. Our State Revolving Fund loan is based on all properties putting money into the Surcharge Fund. If monies are not received from all accounts the Operating Fund must somehow backfill the Surcharge fund in order to pay off the

loan. This is also happening with our current bonds we are paying off in the amount of \$240,263.00 each year.

40

Due to the need for a constant revenue stream to pay off the District's debt service accounts and fixed operating costs the Board implemented an inactive service fee in the amount of \$63.33 per inactive account for each billing cycle. This insures that our loan payments and fixed costs would be paid without putting further hardship on our customers that are currently connected to the system.

Tower leases have increase \$8,000.00.

Service App/New Location Fees were increased to \$10,000.00 based on current year revenue there was no initial budget for this year on this item.

Late Payment Fees were decreased by \$2,000 in the final budget based on yearend figures.

Salaries and Benefits District-wide:

1. Staffing

The District has been below appropriate staffing level for the past year. One of the staff had abandoned his job before the current management took over and the Board has not approved hiring a replacement to date. There is also a need for a Conservation Coordinator/Receptionist. The District currently only has one Grade 3 Operator. Another operator has recently taken his Grade 3 test but the results are not in to date. A minimum of two Grade 3 Operators is required for coverage should one of the Operators become ill or be away from the District. In the State mandated staffing survey that was complete last year it was determined that the District needed an additional 2 and a half field staff. This budget includes hiring 2 laborers at \$11.64 per hour and 1 Conservation Coordinator/Receptionist at \$15.00 per hour. The District's current Secretary/Receptionist job title and duties would change to Secretary/Administrative Assistant to assist the General Manager with the additional duties required by the new Board Directors. \$108,895 was added to salaries for the 3 additional staff, step increases and COLA.

2. Salaries

- Estimated Cost of Living allowance of 3% will be implemented on December 1, 2014 per the District's Memorandum of Understanding with the Teamsters Union. This 3% COLA will also apply to the nonunion staff.
- Salary reclassification. There is one Staff member who will be eligible for a Salary reclassification if he passes his Grade 3 Water Distribution test. This has been considered in the preliminary Budget.
- Step increase. There are 3 staff step increases included in the budget. There were none given last year.
- Overtime and standby pay are estimated from prior year expenses.

3. Payroll taxes and Benefits

- Employer Social Security is calculated at 6.2% of the salary up to \$110,100.
- Employer Medicare (FICA) is calculated at 1.45% of salary.

- State Unemployment Insurance is calculated at 5.7% of salary up to \$7,000.
- Workers Compensation insurance is calculated at the following rates per \$100.00 of wages:
 - 7520 - Waterworks Employees \$5.14
 - 8742 - Outside Employees \$1.16
 - 8810 - Clerical \$0.52
 - The rates noted above are then multiplied by 200% EMOD to take into account the District's injury rate over the past several years. This is down 60% from last year's EMOD rate.
- Health, Dental and Vision insurance is calculated at \$1,070.00 per employee per month. New employees are budgeted for 6 months of coverage per the MOU.
- Cal PERS Employer Contribution rate has increased from 16.273% to 17.11 for current staff. This new rate and the addition of the 3 new staff members at the rate of 9.75% will increase the budget for this item by \$15,111.

4. Operations and Maintenance Costs

Operation and Maintenance cost categories are reviewed individually to determine the most reasonably precise budget estimate. Where it is impractical to use this method, an inflation factor of 3% will be applied.

The significant changes in the budget from last year are noted below:

-\$115,000 as deleted from **General Counsel Fees** due to the lack of litigation.

\$3,300 was added the **Auditor Fees** as a Single Audit is required by the Federal Government in addition to the regular audit that is performed annually.

-\$11,000 was deleted from **Auditor Forensic Fees** as this item has been completed.

\$3,000 was added to **Director Fees** due to the additional meetings for Finance/Administration and Planning Committee meetings.

-\$41,500 was deleted from **Extra Contract Help** due to the funding of full time positions.

\$900 was added to **Cell Phones** for air card needed to communicate between scada system and field computer.

-\$12,400 deleted from **Insister Lease** as this equipment was purchased during FY 2012-13.

-\$10,500 deleted from **Physical and Chemical Tests** as there is less monitoring required by the State this year. This item varies from year to year.

\$20,000 was added for **Cross Connection Testing** outsourcing.

\$5,000 has been added to **Pumping Electricity** due to power rate increase estimates.

-\$10,000 has been deleted from **Service Connection Repairs** due to prior year figures.

-\$6,000 has been deleted from **Meter Maintenance** due to meter replacement being done which is a Capital Expenditure instead of repair for older units.

-\$5,000 has been deleted from **Contract Repairs** based on prior year figures.

\$5,139 has been added to **Conservation** to provide supplies and funding for the California Urban Water Conservation Counsel.

-\$11,500 has been deleted from **Insurance** based on current insurance premium information.

-\$2,700 has been deleted from **SGA** based on last year's membership cost.

-\$8,245 has been deleted from **Elections** as there is no election this year.

SUMMARY OF FINAL BUDGET RECOMMENDATIONS

\$34,125.00 should be paid to the Surcharge Fund to refund operating expenses paid out of the Surcharge Fund for the next 4 years.

2 additional staff to be hired per the staffing survey provided to California Department of Public Health and 1 additional staff to fill Conservation Coordinator/Receptionist position.

Total Budgeted Income \$2,443,162 is up \$264,206

Total Budgeted Expenditures \$1,914,325 is up \$29,530

\$319,000 to be put into Capital Improvement Fund to fund Capital Projects. This figure is not included in the expenditures noted above.

TECHNICAL MEMORANDUM

To: Mary Henrici, General Manager
From: Jim Carson, District Engineer
Subject: 2013/14 Capital Budget Descriptions
Date: June 27, 2013

This Technical Memorandum (TM) provides the budget descriptions for the proposed 2013/14 Rio Linda / Elverta Water District's (District) Capital Budget. The following are a list of the budget items along with their descriptions:

Water Supply

A-1 Plant Paving/Slurry – Various Plant Sites – \$10,000

This budget item is to replace sections of deteriorated paving and slurry seal the existing paving at various plant sites. The existing plant paving has deteriorated and needs this work in order to extend the life of the existing paving.

A-2 Well 9 – Electrical Panel Replacement and Tank Removal – \$40,000

This budget item is to replace the existing electrical panel that is at the end of its economic life with a new electrical panel. The new panel will be Arc Flash compliant and have a soft start that will minimize pressure surges from starts and stops of the well pump. The new soft start will enable the District to remove the hydropneumatic tank that cannot be certified.

A-3 Well 10 – Electrical Panel Replacement and Tank Removal – \$40,000

This budget item is to replace the existing electrical panel that is at the end of its economic life with a new electrical panel. The new panel will be Arc Flash compliant and have a soft start that will minimize pressure surges from starts and stops of the well pump. The new soft start will enable the District to remove the hydropneumatic tank that cannot be certified.

A-4 Well 3 – Upgrade Perimeter Fencing – \$6,000

This budget item is to upgrade the existing Well 3 perimeter fencing by adding barbed wire for better security and replacing/repairing the gate for better access.

A-5 Well 2A – Construction Spoils Bins - \$20,000

This budget item is to relocate the construction spoils bins from the District Office to Well 2A. The bins at the District Office are in conflict with the new L Street Reservoir and Pump Station.

A-6 Miscellaneous Pump Replacement – \$20,000

This budget item is for the replacement or upgrade of any well pump and/or motor that has failed throughout the budgeted year.

State Revolving Fund Project

SRF – 1 “L” Street Reservoir and Pump Station

This budget item is for the construction of a new reservoir and pump station located adjacent to the District Office. The project is to be funded by a State Revolving Fund loan.

Water Distribution

B-1 Paving Replacements – \$5,000

This budget item is to pave sections of streets where the existing street paving has been cut into due to water service repairs or replacements.

B-2 System Valve Replacements – \$5,000

This budget item is to replace broken water system valves. These broken valves are being identified from the District’s valve exercising program.

New Business

**NB-1 Elverta Specific Plan – Water Supply and Planning– \$250,000
(Funding by Others)**

This budget item is for the water supply and master planning for the existing system and the future expansion of the Elverta Specific Plan Development. This budget item will be funded by the Elverta Specific Plan Development per a funding agreement between the District and the landowners.

Miscellaneous

M-1 Service Replacements – \$15,000

This budget item is for the replacement of leaking water services that cannot be repaired.

M-2 Small Meter Replacements – \$60,000

This budget item is to replace customer meters that are no longer working or cannot maintain accuracy.

M-3 New Automated Meters for Route 20 - \$54,000

This budget item is to replace the Route 20’s manual read meters with automated meters.

M-4 ½ Ton Truck Replacement – \$25,000

This budget item is to replace field truck number 4 with a new ½ ton truck. The existing mileage on the truck is 121,383 and has exceeded its economic life.

Contingency

C-1 Contingency (Non SRF) – \$27,000

This budget item accounts for cost of unbudgeted projects that are not planned for in the capital budget. The budgeted cost is based on 10% of the total Capital Budget less projects funded by others (New Business) and the contingency associated with the SRF funded project.

C-2 Contingency (SRF Project) - \$156,000

This budget item is for the contingency associated with the remaining SRF project funding that is currently associated with the "L" Street Reservoir and Booster Station.

**Rio Linda Elverta Community Water District
2013-14 Capital Budget**

46

Budget Item	Budget Description	Budgeted Cost (\$)
Water Supply		
A-1	Plant Paving/Slurry - Various Plant Sites	10,000
A-2	Well 9 - Electrical Panel Replacement and Tank Removal	40,000
A-3	Well 10 - Electrical Panel Replacement and Tank Removal	40,000
A-4	Well 3 - Upgrade Fencing	6,000
A-5	Well 2A - Construction Spoil Bins (Relocation from District Office)	20,000
A-6	Miscellaneous Pump Replacements	20,000
Total Water Supply		136,000
State Revolving Fund Project		
SRF-1	"L" Street Reservoir and Pump Station	3,862,673
Total Water Supply		3,862,673
Water Distribution		
B-1	Street Paving Replacements	5,000
B-2	System Valve Replacements	5,000
Total Distribution		10,000
New Business		
NB-1	Elverta Specific Plan - Water Supply and Planning - Funded by Others	250,000
Total New Business		250,000
Miscellaneous		
M-1	Service Replacements	15,000
M-2	Small Meter Replacements	50,000
M-3	New Automated Meters for Route 20	54,000
M-4	1/2 Ton Truck Replacement (Vehicle Number 4)	25,000
Total Miscellaneous		144,000
Contingency		
C-1	Contingency (10 Percent of District Funded Projects less New Business)	29,000
C-2	SRF Contingency	156,000
Total Contingency		185,000
Total Capital Budget		4,587,673
Total Funded by District w/o SRF		319,000
Total Funded by District w/ SRF		4,337,673

RIO LINDA

ELVERTA

Item for Discussion and Action

Agenda Item: 4.4

Date: July 15, 2013

Subject: Change of Lead Operator title to Water Utility Supervisor

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The Finance / Administrative Committee recommend approval of the attached job description which would change the Lead Operators position to Water Utility Supervisor. This position would continue to be nonexempt. The position would also be provided 1 additional week of vacation. If the Board approves this position title this would then go to the union and with staff and union approval and LOU would be created to include this position in the MOU document. The proposed job description is attached for the Boards review

Current Background and Justification:

President Dills requested that this item be taken up in the Finance and Administrative Committee. He felt that the Lead Operator is performing the duties of a Supervisor. Because he is performing the duties of a Supervisor he should be called a Supervisor. The current Lead Operator is performing the job duties and description of a Water Utility Supervisor. The District water system operates under the current State Certificates of the Lead Operator. He also has increased job responsibilities, including direction of field personnel, monthly, quarterly and annual State reporting. He is also the District's cross connection control specialist and safety officer. The Lead Operator has 15 years experience at the District and is the responsible party in the absence of the General Manager. Traditionally the Supervisor position has received 1 additional week of vacation per year. It was asked that staff investigate what other utilities do in the area for this position. This information was provided to the Finance and Administrative committee. Exempt employees are not paid overtime and do not have pager duties. Currently with our limited staff the Lead Operator must take pager duties.

Conclusion:

Based on the recommendation of the Board President and the many duties that the Lead Operator performs it is recommended by the committee that the position title be changed from Lead Operator to Water Utility Supervisor. This change in position would not increase the pay rate but would include 1 additional week of vacation.

Water Utility Supervisor

GENERAL STATEMENT OF DUTIES:

Performs a variety of supervisory, construction, technical, operations, and maintenance work in the operation, repair, maintenance, replacement and construction of the District water system.

SUPERVISION RECEIVED:

Works under the general direction of the General Manager who reviews work for effectiveness in conformance to established policy.

SUPERVISION EXERCISED:

Exercises direct supervision over Water Utility Operators, Water Utility Workers and Laborers. Makes operational decisions when the General Manager is away.

ESSENTIAL DUTIES AND RESPONSIBILITIES:

Plans, schedules, implements and oversees construction, maintenance, and operation activities in order to assure quality water service for District customers; standardizes department policies and procedures to improve efficiency and effectiveness of operations.

Reviews project and development plans of others for compliance with District regulations and standards and inspects work for compliance with approved plans.

Assures the operation of the water quality sampling program and the proper reporting related thereto in order to conform county, state, and federal regulations; maintains operations records and prepares reports based on those records to be submitted to state and federal regulatory agencies.

Interacts with representatives of the State Department of Health Services regarding compliance issues involving the water system and permits related thereto.

Supervises, instructs and assists assigned crews in installing and relocating water lines, valves, fire hydrants and meters, and maintaining the existing water supply system.

Responds to or assures the proper response to complaints regarding water quality, leaks, pressure loss or no water; explains findings to property owners if necessary.

Trains, supervises and disciplines subordinate employees performing the duties of maintenance, construction and operation of the District water system.

Supervises the use of and assumes responsibility for all materials, supplies and equipment used in the maintenance, construction and operation of the District water system; requisitions such materials, supplies and equipment as needed and budgeted; insures that all necessary materials, supplies and equipment are available by maintaining an inventory of parts and materials and obtaining necessary parts, tools and supplies from the store room.

Analyzes annual operating costs and makes recommendations for department budget.

Oversees the safety of Utility Operators and Workers by instructing individuals in proper safety procedures and monitoring work in progress and performs the duties of District Safety Officer.

Assists in development and maintains a procedure manual for all departmental operations.

Performs duties of Laborer, Water Utility Worker and Water Utility Operator as needed

PERIPHERAL DUTIES:

Operates a variety of power construction and maintenance equipment used in the water industry.

Assists the General Manager with the development of a capital improvement and replacement program for the District and the development of short term and long range plans.

Serves on various employee, regional association, or other committees as assigned.

DESIRED MINIMUM QUALIFICATIONS

Education and Experience:

Seven years experience in the operation and maintenance of a water utility at a responsible level; possession of a current California Department of Health Water Treatment Operator Grade II certificate and a California Department of Health Water Distribution Operator certificate Grade III; possession of a valid Class C California driver's license or the ability to obtain one within one (1) month of employment; graduation from high school; or any equivalent combination of experience, training and certification.

Necessary Knowledge, Skills and Abilities:

Thorough knowledge of equipment, facilities, materials, regulations, methods and procedures used in the construction and maintenance of public water systems; ability to guide, direct and motivate employees; ability to operate and maintain various equipment used in water maintenance and repair such as backhoe, dump trucks, etc.; ability to organize and supervise the activities of various crews performing construction and maintenance work; ability to communicate effectively, verbally and in writing; ability to make decisions independently in accordance with generally accepted construction practices and established policy and to use initiative and judgment in carrying out tasks and responsibilities with only general instruction and guidance; ability to use tact and judgment when dealing with the public; ability to lift heavy objects and perform sustained manual work.

SPECIAL REQUIREMENTS :

Must be bondable.

Must possess a valid driver's license.

Must pass a drug screening test.

TOOLS AND EQUIPMENT USED:

Motorized vehicles and equipment, including dump truck, pickup truck, utility truck, backhoe, tamper, saws, pumps, compressors, sanders, generators, common hand and power tools, shovels, wrenches, detection devices, mobile radio, phone, hand-held computer, personal computer (including word processing, spreadsheet, database and other software), copy and fax machine.

PHYSICAL DEMANDS:

The physical demands described here are representative of those that must be met by an employee to successfully perform the essential functions of this job. Reasonable accommodations may be made to enable individuals with disabilities to perform the essential functions.

While performing the duties of this job, the employee is regularly required to use hands to finger, handle, feel or operate objects, tools, or controls and reach with hands and arms. The employee frequently is required to stand, talk and hear. The employee is occasionally required to walk; sit; climb or balance; stoop, kneel, crouch, or crawl; and smell.

The employee must frequently lift and/or move up to 25 pounds and occasionally lift and/or move up to 100 pounds. Specific vision abilities required by this job include close vision, distance vision, color vision, peripheral vision, depth perception, and the ability to adjust focus.

WORK ENVIRONMENT:

The work environment characteristics described here are representative of those an employee encounters while performing the essential functions of this job. Reasonable accommodations may be made to enable individuals with disabilities to perform the essential functions.

While performing the duties of this job, the employee regularly works in outside weather conditions. The employee frequently works near moving mechanical parts and is frequently exposed to wet and/or humid conditions and vibration. The employee occasionally works in high, precarious places and is occasionally exposed to fumes or airborne particles, toxic or caustic chemicals, and risk of electrical shock. The noise level in the work environment is usually loud.

SELECTION GUIDELINES:

Formal application, rating of education and experience; oral interview and reference check; job related tests may be required; driving records will be evaluated; drug screening is mandatory, as is a physical to determine capability to meet the physical demands of the job.

GENERAL

The duties listed above are intended only as illustrations of the various types of work that may be performed. The omission of specific statements of duties does not exclude them from the position if the work is similar, related or a logical assignment to the position.

The job description does not constitute an employment agreement between the employer and employee and is subject to change by the employer as the needs of the employer and requirements of the job change.

RIO LINDA

ELVERTA

Item for Discussion and Action

Agenda Item: 4.5

Date: July 15, 2013

Subject: Change of Secretary/Receptionist title to Administrative Assistant

Staff Contact: Mary Henrici, General Manager

Recommended Committee Action:

The Finance / Administrative Committee recommend approval of the position change from Secretary/Receptionist to Administrative Assistant with a \$1.00 per hour raise for the position above the current rates for Secretary/Receptionist. If the Board approves this position title this would then go to the union and with staff and union approval and LOU would be created to include this position in the MOU document. The proposed job description is attached for the Boards review.

Current Background and Justification:

The Board of Directors has requested that the Manager acquire additional staff to assist her with completed staff work. The position would also prepare agendas, minutes and board packets for various meetings. Other duties would include typing correspondence and scheduling the Managers appointments in addition to assisting the Manager with the day to day duties as needed. The new Conservation Coordinator will be taking over the duties of Receptionist when that position is filled. The District would have to put together another LOU to change the position title and duties of this position.

Conclusion:

The General Manager needs additional staff to provide the Board of Directors with all of the information needed for meetings. With the addition of the Conservation Coordinator /Receptionist the Administrative Assistants duties can be tailored to better assist the General Manager with Administrative work.

Administrative Assistant

GENERAL STATEMENT OF DUTIES:

Performs a variety of routine and complex clerical, secretarial, data processing, and administrative work associated with the operation of the District Office.

SUPERVISION RECEIVED:

Works under the supervision of the General Manager.

SUPERVISION EXERCISED:

Supervision ordinarily is not a responsibility of this class; may supervise part-time or temporary staff as assigned.

ESSENTIAL DUTIES AND RESPONSIBILITIES:

Receives telephone calls and citizen visits; handles questions and matters of a more technical nature; responds to citizen complaints.

Prepares periodic utility, financial, statistical or operational reports as assigned.

Provides assistance to the General Manager in meeting management; copies, assembles and distributes Board agenda packets and background materials; prepares draft minutes of meetings from video recordings.

Maintains District filing system and filing indices and District library; maintains agenda packet binders, minute books, ordinance books and resolution books; updates policy and procedure books as directed.

Develops and maintains office forms and procedures.

Answers central telephone system and mobile phone system.

Maintains District website ensuring that it is current and up to date.

Composes, inputs, and edits a variety of correspondence, reports, memoranda, and other material requiring judgment as to content, accuracy, and completeness.

Provides completed staff work to the General Manager and Board of Directors.

Assists in the development of notices, flyers, brochures, newsletters, media releases, news articles, and other informational materials about programs and services.

PERIPHERAL DUTIES:

Provides clerical support to other staff as required.

Receives the public and answers questions; responds to inquiries from employees, customers and others and refers, when necessary, to appropriate persons.

Receives and stamps incoming mail, and distributes as directed; processes outgoing mail

Processes outgoing mail.

Prepares and maintains office supply inventory.

Serves on or provides support for various employees, regional association, or other committees as assigned.

DESIRED MINIMUM QUALIFICATIONS

Education and Experience:

Graduation from an high school with specialized course work in general office practices such as typing, accounting, data processing (completion of community college or business school bookkeeping or data processing training may be substituted for one year of experience); or any equivalent combination of education and experience. Three years of experience in a responsible secretarial position with exposure to legal or governmental documents.

Necessary Knowledge, Skills and Abilities:

Working knowledge of computers and electronic data processing; working knowledge of modern office practices and procedures and computers and data processing; skill in to operating listed tools and equipment, ability to establish successful working relationships; ability to work under pressure and/or frequent interruptions. Knowledge of standard office practices and of business English, spelling, composition, and math; excellent typing skills; computer experience with word processing and spreadsheets; ability to make decision independently in accordance with established policy; ability to use tact and judgment in dealing with the public.

SPECIAL REQUIREMENTS :

Must be bondable.

Must have drivers license

Must pass a drug screening test.

TOOLS AND EQUIPMENT USED:

Personal computer, including accounting, billing, word processing and spreadsheet software; typewriter, 10-key calculator, phone, copy machine, fax machine and mail processing equipment. Must be able to operate a District vehicle.

PHYSICAL DEMANDS:

The physical demands described here are representative of those that must be met by an employee to successfully perform the essential functions of this job. A physical examination by a licensed physician selected by the District will be required prior to employment to determine if the applicant can meet the physical demands of the position. Reasonable accommodations may be made to enable individuals with disabilities to perform the essential functions.

While performing the duties of this job, the employee is frequently required to sit and talk or hear. The employee is occasionally required to walk; use hands to operate, finger, handle, or feel objects, tools, or controls; and reach with hands, wrists, and arms.

The employee must occasionally lift and/or move up to 25 pounds. Specific vision abilities required by this job include close vision and the ability to adjust focus.

WORK ENVIRONMENT:

The work environment characteristics described here are representative of those an employee encounters while performing the essential functions of this job. Reasonable accommodations may be made to enable individuals with disabilities to perform the essential functions.

The noise level in the work environment is usually moderately noisy.

SELECTION GUIDELINES:

Formal application, rating of education and experience; oral interview and reference check; job related tests may be required; driving records will be evaluated; drug screening is mandatory, as is a physical to determine capability to meet the physical demands of the job.

GENERAL

The duties listed above are intended only as illustrations of the various types of work that may be performed. The omission of specific statements of duties does not exclude them from the position if the work is similar, related or a logical assignment to the position.

The job description does not constitute an employment agreement between the employer and employee and is subject to change by the employer as the needs of the employer and requirements of the job change.

Managers Report

June 11, 2013 to July 9, 2013

On June 12, 2013 I went to a water caucus meeting where all managers from area water districts discussed matters of importance to all of us. These included the Bay Delta Plan, Best Management Practice (BMP) 1.4 regarding the structure of water rates and the meetings that are coming up to review this BMP, current legislation and a flow standard the RWA is still modeling for the regional plan required by the State.

On June 13, 2013 I went to Sacramento Groundwater Authority (SGA) bimonthly meeting. We received an update on the model treatment of chromium 6 project being done in Davis. They also approved the annual budget transferring some items to the current year from the past year that had not been completed to date. There was also a legislative update and a groundwater management update. The audit for fiscal year 2012/13 was also approved.

On June 17, 2013 Jim Carson, Jim Crowley and I met with the City of Sacramento to discuss possible surface water purchases for the Elverta Specific Plan and other developments in the area. There was a positive response from the city. They are gathering information and will be in contact with our engineers.

On June 18, 2013 Jim Carson, Jim Crowley and I met with Carmichael Water District to discuss the potential of buying water credits from their agency as an interim measure to meet PF8 requirements. The discussion was positive and this information will be added to the information staff is gathering for potential sources of surface water. Afterward Mr. Carson and Crowley and I had a meeting discussing our progress so far in contacting all agencies in the area and next steps to take with the project.

On June 19, 2013 I went to an all day meeting with the California Urban Water Conservation Council (CUWCC) and discussed Best Management Practice (BMP) 1.4 rate setting in great detail with the group. The CUWCC is trying to determine if the current methods available for water conservation rate structure are appropriate and if they should be reviewed and revised. There was an overwhelming response from the water community that the current method of 70 % volumetric and 30% fixed expense rate structure was not workable for many Districts and there should be more methods available to comply with this BMP. This information was taken to the Plenary meeting the next day.

On June 20, 2013 I went to the Plenary meeting where they discussed BMP 1.4 options 1 and 2, future demand forecasting, avoiding costs of water energy projects and allowed networking between the three groups of the CUWCC.

On June 26, 2013 the ACWA/JPIA boiler and machinery inspection services consultant came out to inspect our hydropneumatic tanks. They were informed that the District has already done preliminary testing on our tanks and has budgeted for removal of 2 tanks per year until all are replaced or circumvented.

On June 27, 2013 we had a meeting with the SEMS people and informed them of our status in providing them with the information needed to implement their program. Later that day the Air Quality Management District inspected and was happy with our operations. No corrective actions are needed.

On June 28, 2013 The Board President and I met with Mr. Miller regarding his inactive service fee. Mr. Miller feels that the District should ask the County for additional tax money for our fixed costs instead of asking the customers who are not currently using their service to pay a fee. This was discussed during the Finance and Administrative meeting on the 8th of July. Later that day Jim Crowley and I met with the Manager of El Dorado County Water District and discussed their action to acquire water rights in the area. It was determined that the two agencies would keep each other up to date on our plans to acquire surface water.

On July 2, 2013 I met with SMUD's energy efficiency staff. They will be providing us with more energy efficient lighting and our peak factor rate will be adjusted because of this energy audit. This should drop the energy bill in the office for at least the next 12 months.

On July 3, 2013 the Planning committee met. The L St. design is 95% complete. The proposal to do environmental work on the pipeline to well 5 was presented. An update was provided on the Elverta Specific plan. A water supply matrix is forthcoming on this project. A Capital Budget item was presented for recommendation to the full Board. New bins for building materials need to be constructed at well 2A before the L St. project starts as the old bins will have to be destroyed. The Hyce property easement agreement was discussed. Based on the information presented the committee felt that Mr. Hyce should be allowed to transfer his service to someone else if he wishes to do so.

On July 8, 2013 the Finance/Administration committee met. The District expenditure and financial reports were discussed. The job descriptions of Water Utility Superintendent and Administrative Assistant were discussed along with compensation and benefits. The 2013-14 final budgets were reviewed and discussed. The inactive service fee was discussed at length in an effort to determine what the best course of action would be regarding this charge. Mr. Ridilla was asked to provide the staff with options/choices for amending the fee. His ideas were received and incorporate in the inactive service fee staff report.

TECHNICAL MEMORANDUM

To: Mary Henrici – General Manager
From: Jim Carson, District Engineer (Affinity Engineering)
Subject: District Engineering Staff Report – July 2013
Date: July 7, 2013

This Technical Memorandum (TM) updates the Board of Directors on the engineering projects since last month's engineering report.

1. Planning Committee

The planning committee met on June 3, 2013 and discussed several planning projects as described in the committee's minutes. The planning committee is scheduled to meet the first Tuesday of each month. The next scheduled meeting is August 6, 2013.

2. State Revolving Fund Project – "L" Street Reservoir and Booster Station

- a. Engineering Design: The project is currently under design. The 95% submittal is currently planned for the middle of July.
- b. Well 12 Rehabilitation: The contract was sent to the consultant for them to sign. Recommended changes were made by the consultant to the contract and forwarded to the Attorney for his review and consideration.
- c. Construction Bin Relocations: A layout was reviewed and approved by the District for the replacement location of the construction bins. The existing construction bins are being demolished to make room for the new reservoir and pump station. An addition to the 2013/14 Capital Budget is being requested to pay for the relocation of these construction bins.
- d. Environmental Consultant: The CEQA document is nearing completion. It is planned to be completed next week. The consultant will be providing a compliance checklist to make sure that the document complies with the public review requirements.

3. Preliminary Environmental Review- Elverta Pipeline:

A proposal to complete a preliminary environmental review was obtain from EN2 Consulting. The review is recommended by staff to determine if installing a new pipeline up to the Elverta Booster Station from Elverta Road would be feasible in the old railroad ROW that is owned by the County. A determination of no significant environmental impact would result in a significant savings to the District. If a significant environmental issue is associated with this pipeline route, the pipeline will be routed in the street paralleling existing water mains at a higher cost to the District.

4. Master Plan/Elverta Specific Plan (ESP)

Meetings have been held with City of Sacramento and Carmichael Water District to identify potential water supply options for ESP as well as to meet the District's infill requirements. A water supply matrix is being developed to document the District's water supply options. Follow up meetings are being held with some of the water district to further discuss the District's best short and long term water supply options.

Our regional voice continues to strengthen. We have engaged on a number of fronts to protect our water supplies and minimize the negative impacts of actions in the Delta on our region. We launched a regional Public Relations Program to convey the important successes in being good stewards of our regional water resources that are often overlooked. We held high profile workshops and leveraged the media to inform stakeholders in our region about the potential impacts of a Delta solution.

In regional planning, we are concluding a comprehensive update of the American River Basin Integrated Regional Water Management Plan (ARB IRWMP), supported in part by a \$400,000 planning grant the California Department of Water Resources (DWR). We expect the ARB IRWMP to position the region to pursue implementation grant funding in 2014. During the year, we began management of the \$16 million grant award from DWR to help fund 17 priority projects in the ARB IRWMP.

We also commenced a project, partially funded by a grant from the California Water Foundation, to evaluate regional data, information, and analytical tools needs. At the request of a member agency, we explored a subscription program to solicit bids for water and wastewater treatment chemicals. We ran a pilot solicitation for two chemicals, and participating members will save more than \$700,000 in fiscal year 2014.

In water efficiency, we continued implementation of the award winning Blue Thumb campaign. This year's campaign focused on efficient sprinkler systems and featured our signature "Sprinkler Dance" on all distributed PSAs and media outreach. Additionally, we provided significant assistance to members in implementing and reporting the Prop 50 Drought Assistance Grant measures, which has resulted in \$1,300,000 paid to participants in this fiscal year.

The RWA Board of Directors, at its May 16, 2013 meeting, approved the fiscal year 2013-2014 budget and dues schedule. Attached is your agency's invoice for the year.

Please call me at (916) 967-7692 if you have any questions.

Sincerely,

John Woodling
Executive Director

Rio Linda, CA 95673

Dear Ms. Henrici:

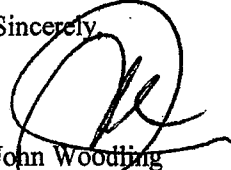

The Regional Water Authority (RWA) is pleased to invite Rio Linda/Elverta Community Water District to continue its participation in the Water Efficiency Program (WEP) for fiscal year (FY) 2014. Enclosed is the FY 2014 invoice and Business Plan adopted by the WEP Advisory Committee on May 14, 2013. This year's invoice reflects a 5 percent dues increase to cover the rising costs of maintaining this valuable Program. Please note that participant dues have not been increased since FY 2005.

The WEP provides a cost-effective approach to help achieve water savings targets and BMP requirements through economies of scale. With the passage of Senate Bill x7-7, the need for a coordinated regional effort is greater than ever as water savings requirements have increased. In addition to assisting with water saving programs, the FY 2014 WEP services and products satisfy several BMP requirements of the Water Forum, the Bureau of Reclamation Central Valley Project Improvement Act, and the California Urban Water Conservation Council (CUWCC) MOU.

Throughout FY2013, the WEP was successful in assisting participants with meeting Best Management Practice (BMP) commitments, securing and managing grants, and developing important regional messaging through the award winning Blue Thumb campaign. The WEP Program serves as a regional forum for discussing and responding to issues, such as the CUWCC's BMP 1.4, legislation, and dry-year messaging to customers.

As we enter into FY2014, the Program will focus on strategic planning to identify the region's water efficiency and conservation priorities. To support this effort, RWA will be developing a comprehensive regional data collection framework to consolidate understanding of our region's water supply systems and track progress toward meeting SB x7-7 targets. We will explore whether regional compliance with the SBx7-7 requirements is beneficial to RWA members. RWA will also continue to manage the current Proposition 50 and Proposition 84 grants projects and will seek out new grant opportunities to continue to support your agency's water efficiency efforts.

Sincerely,

John Woodling
Executive Director

Ms. Mary Henrici
Rio Linda/Elverta Community Water District
730 L Street
Rio Linda, CA 95673-3496

Dear Ms. Henrici:

Thank you for your continued support of the Sacramento Groundwater Authority (SGA).

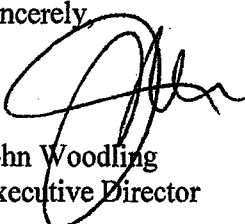

Through your support and participation in SGA, we are able to fully satisfy the Groundwater Management Element of the Water Forum Agreement in northern Sacramento County, allowing us to expand our water supply reliability while protecting the lower American River. Our strong groundwater management program has also enabled the region to receive tens of millions of dollars in grant funding to construct regional water supply facilities. SGA has implemented a monitoring program and data management system that will help to ensure effective management and local control of groundwater resources.

Among the highlights of the previous year, we completed monitoring to satisfy California Statewide Groundwater Elevation Monitoring (CASGEM) program requirements; began work on the fourth update to the SGA Basin Management Report (BMR); began a comprehensive update of the SGA Groundwater Management Plan (GMP); began tracking of the SGA Water Accounting Framework; and received a grant from the Local Groundwater Assistance (LGA) Program to evaluate an emerging regional groundwater contamination problem in northern Sacramento County. In the upcoming year, SGA will complete the BMR and GMP updates; commence the LGA-funded contaminant study; evaluate regional data, information, and analytical tools needs; and continue CASGEM monitoring.

The SGA Board, at its June 13, 2013 meeting, approved the fiscal year 2013-2014 budget and fee structure. Attached is your agency's invoice for the year.

Please feel free to call me at (916) 967-7692 if you have any questions.

Sincerely,

John Woodling

**SACRAMENTO GROUNDWATER AUTHORITY
REGULAR MEETING OF THE BOARD OF DIRECTORS**

Thursday, June 13, 2013; 9:00 a.m.

5620 Birdcage Street, Suite 110

Citrus Heights, CA 95610

(916) 967-7692

The Board will discuss all items on this agenda, and may take action on any of those items, including information items and continued items. The Board may also discuss other items that do not appear on this agenda, but will not act on those items unless action is urgent, and a resolution is passed by a two-thirds (2/3) vote declaring that the need for action arose after posting of this agenda.

The public shall have the opportunity to directly address the Board on any item of interest before or during the Board's consideration of that item. Public comment on items within the jurisdiction of the Board is welcomed, subject to reasonable time limitations for each speaker. Public documents relating to any open session item listed on this agenda that are distributed to all or a majority of the members of the Board of Directors less than 72 hours before the meeting are available for public inspection in the customer service area of the Authority's Administrative Office at the address listed above. In compliance with the Americans with Disabilities Act, if you have a disability and need a disability-related modification or accommodation to participate in this meeting, please contact the Executive Director of the Authority at (916) 967-7692. Requests must be made as early as possible, and at least one full business day before the start of the meeting.

1. **CALL TO ORDER AND ROLL CALL**
2. **PUBLIC COMMENT:** Members of the public who wish to address the Board may do so at this time. Please keep your comments to less than three minutes.
3. **CONSENT CALENDAR**
 - a) Minutes of April 11, 2013 regular board meeting.
 - b) Minutes of April 11, 2013 special board meeting

Action: Approve Consent Calendar items.
4. **FISCAL YEAR 2013-2014 BUDGET**

Information: Staff discussion of proposed FY 2013-2014 budget and fees.

Action: Adopt Resolution No. 2013-04 to fund the administrative and program budgets for FY 2013-2014, and providing for the collection of said funds.

Action: Approve payment of SGA's portion of the side fund in fiscal year 2013, estimated at \$26,900
5. **CONTRACT FOR PROFESSIONAL AUDITING SERVICES**

Action: Authorize the Executive Director to contract with Richardson and Company to provide for professional auditing services for SGA's fiscal year 2013 audit. The contract shall not exceed \$17,400 for the FY 2013 audit.
6. **SGA GROUNDWATER MANAGEMENT PROGRAM UPDATE**

Information Update: Rob Swartz, Principal Project Manager.

Action: Designate up to \$18,400 budgeted in FY13 for the Groundwater Management Plan Report for potential use in FY14.

Action: Designate up to \$26,000 budgeted in FY13 for Groundwater Modeling for potential use in FY14

7. **CHROMIUM 6 STUDY UPDATE**
Information Presentation: Tim Williams and Sarah Laybourne,
Kennedy/Jenks Consultants.
8. **EXECUTIVE DIRECTOR'S REPORT**
 - a) Government Affairs Update
9. **DIRECTORS' COMMENTS**

ADJOURNMENT

Next SGA Board of Director's Meeting – August 8, 2013, 9:00 a.m., RWA/SGA office, 5620 Birdcage Street, Ste. 110, Citrus Heights.

JUNE 13, 2013

TO: SACRAMENTO GROUNDWATER AUTHORITY BOARD

FROM: JOHN WOODLING

RE: EXECUTIVE DIRECTOR'S REPORT

- a) **Government Affairs Update** – SGA staff are tracking a number of water-related bills in the State Legislature. The updated tracking information is available at www.sgah2o.org. Of note is AB 426 (Salas), which would promote conjunctive use by streamlining the process for a water rights holder to transfer surface water during above average water years to offset groundwater pumping. Staff are working with the author's office on clarifying amendments that would be beneficial to our region.

Minutes, July 3rd, 2013 Planning Committee Meeting

Attendees: Jim Carson District Engineer, Mary Henrici District General Manager, Paul Green Director and Matthew Longo Director.

Meeting called to order at 3:20 pm

An update and informative meeting by the District Engineer to the Directors with regard to those present and future projects.

Public Comment: There was no public comment as there was no public in attendance.

Agenda items:

1. State revolving funds Project Status Update:
 - a. Status of design. The design stage is at about 95% complete and will be submitted to CDPH and the District O/A July 20th. The engineer is working with Tesco relative to the equipment in the L St. building as Tesco is our sole source for our SCADA system and PLC due to approval by CDPH. Tesco is also the current supplier for all other SCADA systems in the Dist. All other gear and equipment for the project will go out to bid. Wood Rodgers is finalizing structural plans. Engineer is working with SMUD to get meter main installed prior to the building, to get ahead of the SMUD elec. hook up. Engineering is planning drainage for the L St site to accommodate 2000GPM in the event of a very remote possibility of reservoir over flow. The county drainage immediately adjacent to site has a capacity of 1000GPM with the street being able to absorb the difference.

There is no action recommended by the planning committee at this time as this is a point of information.

- b. Current Layout of Facilities. All is working and fitting well. A few adjustments have been made for greater efficiency. Engineering is recommending, moving our construction and spoils bins to well site 2a for more room at the L St. site.

There is no action recommended by the planning committee at this time as this is a point of information.

- c. Elverta Pipeline Environmental Evaluation. There are 2 possibilities for the Elverta pipeline to former well site 5.
 1. To parallel the existing pipe in the street.
 2. To go in direct along the bike path.

The route direct along the bike path is believed to be the best for our district however it is going to be up to an environmental evaluation. It is recommended that the Dist. have EN2 take a look at the environmental issues relative to the direct route along the bike trail. If the environmental issues can be mitigated the route along the bike path is the most cost effective.

The Planning Committee recommends that we spend the necessary \$4200.00 for EN2 environmental review on the path of the pipeline as it has potential savings if the route can be made along the bike trail.

- d. EN2 project CEQA Document. Affinity has been supplying EN2 with all needed information so that EN2 can complete CEQA doc. It is hoped that EN2 will have document finish by 7/9/13 to present to board as a point of info and to set public hearing period.

2. Elverta Specific Plan

- a. A precursor to all future plans and the ESP is the county ruling that does not allow further ground water pumping. AS a result both the manager and the Engineer have been in meetings with all of the water purveyors around us including but not limited to Natomas, San Juan, Carmichael and Sac Suburban. At this time getting additional river water from Natomas Mutual is most compatible.
- b. The Water Supply Matrix is forth coming.

There is no action recommended by the planning committee at this time as this is a point of information.

- 3. A revision to the Capital Budget to relocate construction and spoils bins to well 2a was discussed at length as to procedure for adding items to the budget. It was recommended that the Engineer and General Manager inform the board and public with regard to the change in a manner that is consistent with previous policy and transparency.

The planning Committee discussed the importance and relevance of moving the bins to the well 2a site and therefore recommends adding it to our fiscal budget.

- 4. Service Fee Waiver for Vacant Lands. 4 properties. This item is still under Legal review.
- 5. Hyce Property Easement. Mr. Hyce has asked if he may sell his water service right that he was given in exchange for a previous easement to the district.

Based on the information presented to the planning committee we can see no reason that Mr. Hyce could not sell his water service provided he and the buyer were aware that no connections are allowed until the moratorium is lifted.

Meeting Adjourned at 5:00 pm

Rio Linda Elverta Community Water District
Finance and Administration Committee Meeting

July 8, 2013

78

Committee Chairman Anderson began meeting at 5:30 p.m.

Attendees:

District- Directors Duane Anderson and Brent Dills and G.M. Mary Henrici

Public-John Ridilla, Mary Harris

Public Comment: No comments

Agenda item #1 District Expenses:

A question about Quick Books was asked by Director Dills. Service vs. employee payroll confusion was addressed. The Quick Books issue can be resolved by calling the payroll item "employee payroll" instead of service. It is not a service. It is payroll. Director Anderson also asked about a check made out to Sentinel Inc. Both questions were clarified by Director Henrici.

Agenda item #2 Review District Financial Reports:

G. M. Henrici said the District has paid all held checks this month. Director Anderson had some questions about debt service and G.M. Henrici explained it was related to interest payments.

Agenda item #3 Change Title of Lead Operator to Water Utility Supervisor:

After a lengthy discussion with public input, Committee recommends approval to full board with some reservations by Director Anderson and public member Harris. Those reservation will be shared with full board.

Agenda item #4 Approval of Final FY 13/14 District Budget:

Committee had a few questions that were answered by G. M. No changes were made and the committee recommends approval by full board.

Agenda item #5 Revise Job Description of Secretary/Administrative Assistant and increase salary \$1 per hour:

Committee Agreed to recommend approval of revision of duty statement and salary increase for position previously discussed and approved by full Board.

Agenda item #6 Inactive Service Fee:

Public member Ridilla agreed to provide some verbiage for some more options/chooses to be included in the Inactive Service Fee Ordinance clarification language and Committee will incorporate that what Legal Counsel is doing and for a discussion by the full Board.

Meeting was adjourned by Finance and Administrative Committee Chairman Anderson at 7:10 p.m.

RIO LINDA

Date: July 15, 2013

Subject: Directors' and General Manager Comments

Staff Contact: Mary Henrici, General Manager

Directors' and General Manager Comments

COMPLETED AND PENDING ITEMS FROM PAST MEETINGS

80

1. Preliminary Budget Fiscal Year 2013-14 completed final budget approval in July.
2. Well 12 Rehabilitation. Contract has been created and reviewed by legal awaiting approval from Wood Rodgers.
3. ESA cultural service contract. Contract has been signed **COMPLETED**.
4. Form of Action revision was approved at last meeting. Policy manual has been updated. **COMPLETED**.
5. Inactive service charges Resolution 2013-08 was approved at the last meeting of the Board. Legal is preparing an application for variance and a recordable document for properties if a variance is approved by the Board. Legal has been asked to stop work on this item until the Board further discusses this item at the meeting of July 15, 2013.
6. Policy manual amendment on new PERS requirements. Amendment was approved at the last meeting of the Board. Policy manual has been updated, **COMPLETED**.
7. Legal Performance Review has been **COMPLETED**.
8. Backflow Prevention Device Testing Program request for bids has gone out. Bids will be opened on July 19, 2013.
9. Owner / Tenant Billing Agreement Letter has gone out to all property owners with known renters. New fee will be on July billing. **COMPLETED**
10. Resolution 2013-07 Duplicate Billing Fee was approved. Ordinance 2008-02 needs to be revised to include this fee. This has gone to the Admin/Finance committee went to legal 6-11-13.
11. Hyce water service agreement. I have not heard from the State to date regarding this issue. Planning committee has recommended Mr. Hyce be allowed to transfer his 1" water service to another person. This will be revisited at the July 15, 2013 meeting.
12. Hydropneumatic tank pressure relief valves. The remainder of the valves should be installed by 7/12/13.
13. Review of cost for staff to take vehicles home when on call will take place at August meeting.

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

***1112 I Street, Suite #100
Sacramento, California 95814
(916) 874-6458***

August 7, 2013

TO: Sacramento Local Agency Formation Commission

FROM: Peter Brundage, Executive Officer

RE: **Appointment of Voting Delegate for the CALAFCO 50th Anniversary Conference at Squaw Creek and CALAFCO Board of Directors Nomination**

RECOMMENDATION:

1. Delegate the Executive Officer to vote for the CALAFCO Board of Directors for the Central Region at the Regional Caucuses immediately preceding the business meeting to be held at the annual conference in Squaw Creek on Thursday, August 29, 2013.
2. Your Commission may nominate any Regular or Alternate Commissioner to run for their respective seat (City, County, Special District and Public Member). Commissioner Singleton has expressed interest in the City Office.

DISCUSSION:

Voting Delegate

The CALAFCO Bylaws require each member LAFCo to designate a Voting Delegate to vote on behalf of their Commission. The voting delegate may be a commissioner, alternate commissioner, or executive officer attending the conference. I recommend that the Commission designate the Executive Officer to vote on behalf of Sacramento LAFCo, unless a Commissioner attending the annual conference wishes to do so.

Nomination

As your Commission may recall, on July 9, 2010, the CALAFCO membership approved the creation of Board of Director representation by regions for the CALAFCO Board of Directors (51 LAFCo's supported, 2 opposed, and 4 abstained). As a result of the election, four regions were created (North, South, Central and Coastal.) There are a total of four representatives from each region. Each region is be represented by a city, county, special district and public member. The CALAFCO Board has a total of 16 directors.

Sacramento LAFCo is within the Central Region. The Central Region City Member office is now open for the Fall Board election. The close of the formal nomination period was July 29, 2013, which fell during your Commission Summer Recess. Nominations may still be made from the floor during the Central Region Caucus election process.

Commissioner Singleton has expressed interest in the City Office. His Candidate Resume Form, as well as a letter of endorsement from Supervisor Yee, Commission Chair are attached. Adoption of a Resolution of support by your Commission may bolster his candidacy, should he be nominated from the floor.

The nominations announcement and regions map for the CALAFCO Board of Directors are also attached.

Respectfully,

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

Peter Brundage
Executive Officer

Dear Mr. Gladbach,

Kindly accept this letter of endorsement for board nomination of Mike Singleton for the City member vacancy of the Central Region for CALAFCO. Mike is currently the Vice Chair of the Sacramento Local Agency Formation Commission (LAFCo).

As Chair of the Commission, during the time we have served together, I have found Mike to consistently perform the duties of his office with diligence and fair consideration of all matters before the Commission. I am confident he would make like contributions to the CALAFCO Board.

In light of Sacramento LAFCo's summer recess schedule and the CALAFCO nomination submittal deadline of July 29, I am providing this short letter of endorsement. Sacramento LAFCo will discuss the nomination at our regular meeting of August 7, 2013. We will apprise you of the outcome of that meeting.

Sincerely,

A handwritten signature in black ink that reads "Jimmie R. Yee".

JIMMIE R. YEE
Supervisor, District 2

RE: Nominations for 2014 CALAFCO Board of Directors

Nominations are now open for the fall elections of the Board of Directors. Serving on the CALAFCO Board is a unique opportunity to work with other commissioners throughout the state on legislative, fiscal and operational issues that affect us all. The Board meets four times each year at alternate sites around the state. Any LAFCo commissioner or alternate commissioner is eligible to run for a Board seat.

The following offices on the CALAFCO Board of Directors are open for nominations.

<u>Northern Region</u>	<u>Central Region</u>	<u>Coastal Region</u>	<u>Southern Region</u>
County Member	City Member	City Member	County Member
District Member	Public Member	Public Member	District Member

The election will be conducted during regional caucuses at the CALAFCO annual conference prior to the Annual Membership Meeting on Thursday, August 29th, 2013 at the Resort at Squaw Creek in North Lake Tahoe, CA.

Please inform your Commission that the CALAFCO Recruitment Committee is accepting nominations for the above-cited offices until Monday, July 29th, 2013. Incumbents are eligible to run for another term. Nominations received by July 29th will be included in the Recruitment Committee's Report, copies of which will be available at the Annual Conference. Nominations received after this date will be returned; however, nominations will be permitted from the floor during the Regional Caucuses or during at-large elections, if required, at the Annual Membership Meeting.

For those member LAFCos who cannot send a representative to the Annual Meeting an electronic ballot will be made available if requested in advance.

Should your Commission nominate a candidate, the Chair of your Commission must complete the attached Nomination Form and the Candidate's Resume Form, or provide the specified information in another format other than a resume. Commissions may also include a letter of recommendation or resolution in support of their nominee. **The nomination forms and materials must be received by the CALAFCO Executive Director no later than Monday, July 29th, 2013.**

15 K Street, Suite 1650
Sacramento, CA 95814

Voice 916-442-6536
Fax 916-442-6535

Please forward nominations to:

CALAFCO Recruitment Committee c/o Executive Director
California Association of Local Agency Formation Commissions
1215 K Street, Suite 1650
Sacramento, California 95814
FAX: 916-442-6535

Electronic filing of nomination forms and materials is encouraged to facilitate the recruitment process. Please send e-mails with forms and materials to info@calafco.org. Alternatively, nomination forms and materials can be mailed or faxed to the above address.

Attached please find a copy of the CALAFCO Board of Directors Nomination and Election Procedures. Members of the 2014 CALAFCO Recruitment Committee are:

Chair - Jerry Gladbach, Los Angeles LAFCo (Southern Region)
jgladbach@calafco.org 626-204-6500

Robert Bergman, Nevada LAFCo (Northern Region)
rbergman@calafco.org 530-265-7180

mmcgill@calafco.org 925-335-1094

Elliot Mulberg, Associate Member and former CALAFCO Board Member
Mulberg@gmail.com 916-217-8393

Former CALAFCO Board Member and Associate Member Elliot Mulberg has agreed to once again assist CALAFCO with the election process. We appreciate and value his expertise. Questions about the election process can be directed to him at elliott@mulberg.com or 916-217-8393.

Please consider joining us!

Enclosures

Director within 15 days of the certification of the election.

8. FILLING BOARD VACANCIES

Vacancies on the Board of Directors may be filled by appointment by the Board for the balance of the unexpired term. Appointees must be from the same category as the vacancy, and should be from the same region.

These policies and procedures were adopted by the CALAFCO Board of Directors on 12 January 2007 and amended on 9 November 2007, 8 February 2008, 13 February 2009, 12 February 2010, 18 February 2011, and 29 April 2011. They supersede all previous versions of the policies.

RE: **DRAFT RIO LINDA ELVERTA RECREATION & PARK DISTRICT**
MUNICIPAL SERVICE REVIEW AND SPHERE OF INFLUENCE
UPDATE (LAFC #05-12) [CEQA Exempt]

RECOMMENDATION

Attached is the Draft Municipal Service Review (MSR) for the Rio Linda Elverta Recreation and Park District. It is being circulated for public review and comment for 30 days. The Final Municipal Service Review will be brought before your Commission for consideration after this period. No change to the existing, coterminous Sphere of Influence is proposed.

The Draft is the result of collaboration with Rio Linda Elverta Recreation and Park District management and staff. Your staff would like to recognize the Rio Linda Elverta Recreation and Park District for their ongoing assistance, and timely responsiveness.

BACKGROUND

The Administrative Draft makes the following preliminary determinations:

The Rio Linda Elverta Recreation and Park District effectively meets the recreational needs of the Rio Linda Elverta community. The potential for future growth in the Elverta and possibly other areas will have a significant, positive financial impact on its ability to expand services. The District will continue to strive to satisfy the recreational needs of residents by providing a wide range of recreation programs, park facilities, and other opportunities to enrich the quality of life. The cost of addressing future capital project needs as well as to maintain current facility infrastructure without identifying new revenue source is the current largest challenge.

Management

The District has an adequate management structure, staff, and facility sharing arrangements to ensure efficient management and provide parks and recreation services to the community at a reasonable cost. The District is efficiently structured and organized. The District provides the

public with adequate information and opportunity for input and involvement in District Activities.

District Services

The District is able to appropriately gauge the demand and provide parkland, recreational facilities and programming to meet the needs of the community. The District provides adequate levels of service for parks and recreational facilities. The District effectively meets the needs of existing and future populations of the service area.

Infrastructure

The District provides adequate levels of service and park maintenance. Through financial planning and capital improvement projects, the District is able to replace, improve and renovate amenities in the park and provide safe and enjoyable facilities for residents. The acquisition and development program has not required long term indebtedness.

Finance

The District's financial position is adequate and planned opportunities in the future will enhance the District's fiscal position. Though there are revenue constraints, the District is able to continue to serve residents. The District also takes advantage of various grants and private donations to improve infrastructure and services provided. All of the Rio Linda Elverta Recreation and Park District's annual independent audits have resulted in an unqualified report.

Respectfully submitted,

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

Peter Brundage
Executive Officer

Primary Revenue Source: Ad Valorem Property Tax

INTRODUCTION

The Rio Linda Elverta Recreation and Park District is an independent special district in Northwestern Sacramento County

Mission

The mission reflects the overarching principles of District operations and is consistent in its efforts to create a great community for residents of all ages and abilities. Nine key functions make up our Mission:

- Provide Recreational Experiences
- Foster Human Development
- Promote Health and Wellness
- Increase Cultural Experiences
- Facilitate Community Problem-solving
- Protect Natural Resources
- Strengthen Safety and Security
- Strengthen Community Image and Sense of Place
- Support Economic Development

Boundary

The District is bounded on the north by the Sacramento, Placer, and Sutter County lines and on the east by Watt Avenue, a jog westerly on Elverta Road and south on 28th Street to Elkhorn Boulevard to the topmost portion of McClellan Business Park, and continues in a southwestern direction along McClellan Business Park's boundary. The southern boundary is generally Ascot Avenue, Hwy 80, and Elkhorn Road. The western boundary runs south along Hwy 99/El Centro Road, Elkhorn Boulevard, Sacramento City limit by, and Gateway Park Boulevard. (Exhibit B)

Area

The District occupies approximately 30 square miles or 19,200 acres of land.

Population

Rio Linda Elverta Recreation and Park District population is approximately 25,000.

History

The Rio Linda Recreation and Park District was formed as County Service Area #3 by the Sacramento County Board of Supervisors and established under the Sacramento County Department of Parks and Recreation in fiscal year 1961-1962 to provide park and recreation services to the residents of the Rio Linda area. The community of Elverta was included in a

1985 annexation. In 1990, the Rio Linda Elverta Recreation and Park District was created as a dependent park district and became an independent district in 1993.

MANAGEMENT

Management Structure

Rio Linda Elverta Recreation and Park District is an independent special district governed by a five-member elected board of directors. The Board of Directors holds regular meetings on the third Wednesday of each month at 6:30 pm, at the Sacramento Northern Welcome/Visitors Center (Depot), 6730 Front Street, Rio Linda, California. Meeting notices are posted at the Rio Linda Elverta Community Center, the Depot, the Rio Linda Elverta Community Water District Office, and the District website (www.RLEparks.org). Board members receive a stipend of \$100 per meeting.

The Board of Directors appoints the District Administrator, who serves at-will and is responsible for policy implementation and the day-to-day operation of the district including the recruitment and supervision of district staff. Senior management employees include the Administrative Analyst, Park Supervisor and Recreation Supervisor.

Outreach

The Board of Directors encourages the public's involvement at all meetings. Besides posting the board meeting agendas, copies are sent to all residents who have requested notification, other local government officials, and area newspapers of general circulation.

Other services are marketed through a seasonal activity guide, a street side marquee, banners, flyers distributed at schools, a website (www.RLEParks.org), social media (Facebook), mass email notices, and local newspapers.

SERVICES

Services Provided

Rio Linda Elverta Recreation and Park District provides recreation programs, improved parks, and open space services to meet the recreational needs of community residents.

The District follows the National Recreation and Park Association recommended standard of five to ten acres of park for every 1,000 population. Five park categories recognized in the District's 2006 Recreation Facilities Master Plan:

- Mini Parks. Generally less than two acres in size serving a concentrated or limited population.
- Neighborhood Parks. Small park areas of approximately five to fifteen acres serving a population of 2,000-5,000 within ¼ to ½ mile radius.
- Community Parks. Designed to accommodate a wider variety and higher intensity of recreational uses than a neighborhood park often including specialized facilities such as a community center or aquatic center. Intended to serve multiple neighborhoods reaching a population of 20,000 people in a one to two mile radius.
- School-Park Sites. Could provide neighborhood or community park services combining the design and use of recreational amenities jointly with a school site thereby increasing service potential for both the park and school system.
- Special Use Facilities or Areas. Usually do not fit into other park categories, often varying in character and use from traditional park sites. Special Use Facilities or Areas can provide unique recreational opportunities or preserve valuable environmental, cultural and/or historical resources.

Recreation programs

A variety of recreational, educational, and social-service activities are offered to serve all ages, interests, needs, and abilities. Programs include sports, camps, special interest classes, aquatics, senior citizen activities, and special events. Programs are offered throughout the year and often in cooperation or partnership with other organizations including the Chamber of Commerce, churches, service clubs, nonprofit organizations, local businesses, school districts, and other government agencies.

Parks and Facilities

The district provides seven improved parks totaling 47.32 acres. An additional 33.5 acres of unimproved park land is available for development. (Table No. 1). Amenities include sports fields, a dog park, play equipment, group picnic shelters, horse arena, community center, skate park, basketball, and tennis courts. A bicycle motocross track and quarter midget race track are offered through concession management. Gymnasiums, multipurpose rooms, class rooms, as well as a swimming pool are used for District recreation activities through joint use and rental agreements.

Besides sharing school facilities, the district operates two community centers to provide a variety of classes and special events as well as an opportunity to hold meetings and rental activities.

Future growth is approved for the Elverta Specific Plan Area in the northeast quadrant of the District. The land use plan of 1,744 acres is intended to provide a village-scaled community with an eventual build-out of up to 4,950 new homes. This will include a 15 acre community center, 38 acre sports-park, and more than 20 acres of planned neighborhood and community parks. Additionally, street landscape and 118 acres of open

space are contemplated. The District's 2006 Park Master Plan addresses the standards required for future park and facility development.

Park Descriptions
Table No. 1

	PARK	AC	AMENITIES	NOTES
1	Babe Best Park	8.16	Baseball fields (4), playground, parking lot (2), restroom/snack bar.	Possible mini dog park in future; expand N/ parking lot.
2	Central Park Horse Arena Park	12.29	Horse arena, improved and unimproved parking; BMX track.	Access to bike trail; bridge access to Hayer Park.
3	Community Center Park	6.09	Community Center; district office; playground, horseshoe pits; basketball ct.; tennis court.; two playgrounds; parking lot; butterfly gardens; shuffleboard court; picnic shelter; trail access.	2006 Master Plan, Page VII-25 says Community Center Park is 12.5 acres (not 8.5 ac).
	Depot Park	4.1	Depot Center; gazebo; horse and pedestrian/bike trail.	
4	Harvey House Corporation Yard	1.25	Maintenance offices; garage; outdoor storage.	
5	Hayer Park	6.9	Parking lot; quarter midget race track; restroom/snack bar; picnic tables.	Adjacent to Rio Linda Preparatory Academy (TRUSD) sports fields and track.
6	Linda Creek Park	3.5	Open Space	In flood plain.
7	Northbrook Park	2.5	Play equipment; basketball court; fitness trail. [APN: 215-0140-014 & 016]	
8	Ponderosa Farm Park	30.0	Unimproved park [APN: 202-0030-034 (portion)]	Part of 80 acre tract of land; zoned AG-80 F. (Flood Zone: AE; A99; X.FEMA Map No. 0602620055D, dated 11/15/89)
9	Westside Park	7.28	Lighted softball field; volleyball ct.; dog park; restroom; parking lot. [APN: 214-0200-040 & 041]	Includes apx. 3.5 acres turf area with backstop and play equipment at Westside School (TRUSD).
10	Un-named Parcel	.09	Posts for hanging District banners are the only site improvement.	
TOTAL IMPROVED PROPERTY		46.56		
TOTAL UNIMPROVED PROPERTY		35.6		

INFRASTRUCTURE

Infrastructure needs are determined by the District's Board of Directors with input from staff, members of the public, youth athletic groups, community organizations, park neighbors, and surveys. In 2005 the District approved a master plan for future park facilities. The Park and Recreation Master Plan is reviewed annually and was formally updated in 2006. Through a memorandum of understanding, the District partners with the Twin Rivers Unified School District for use of gymnasiums, a swimming pool, and other facilities. Program services are also provided on school facilities through a partnership with the Elverta Joint Elementary School District.

Capital Improvement Projects

The need to provide new capital improvements is based on policies developed in the District's 2006 Park and Recreation Master Plan and public demand. Priorities for new projects consider:

- Ability to meet broad public need
- Availability of outside revenue resources
- Financial ability to provide ongoing maintenance and operation
- Socio-economic and quality of life impact
- Ability to coordinate with other projects to minimize environmental impacts and maximize use of resources.

The District utilizes facilities or other organizations to expand its ability to provide services and avoid project duplication. These can include schools, churches, and commercial properties. The Rio Linda Elverta Community Center (7,272 sf) is recognized as an Emergency Preparedness Center by Sacramento County.

Deferred Maintenance

In 2011, the District contracted with an independent engineering firm to conduct a review of all facilities and park amenities resulting in a thirty year analysis of infrastructure conditions, life expectancy, and repair or replacement projection costs. The report provides a year-to year recommendation of maintaining a replacement reserve fund for all capital facilities and equipment. The District annually adds and/or withdraws from the deferred maintenance reserves based on current and projected needs.

The study evaluated all fixed assets including building and park structures, landscaping, parking lots, etc. Interior and exterior improvements such as paint, plumbing, roofing were considered along with prior and anticipated wear.

FINANCES

Revenue Sources

The District's primary revenue source is the ad valorem property tax. In FY 2013, the Appropriations (Gann) Limit was \$982,995 while the Secured Property Tax Income was \$660,772, well within the established limit. Budgeted tax revenues in all categories were \$718,752. Other principle sources of revenue include Facility Rentals (\$22,960), Recreation Fees (\$124,659), and maintenance services to the Sacramento Area Flood Control Agency (\$23,500). Total budgeted revenues in FY 2013 of \$1,221,549 included one-time sources such as grants and transfers from reserve accounts. Total budgeted expenses in FY 2013 were \$959,376.

Revenue Constraints and Opportunities

With the passage of Proposition 1A in 2004, property tax revenues stabilized after several years of transfers by the State Legislature to the Educational Revenue Augmentation Fund (ERAF). This was followed by the decline in property tax assessed valuations starting in 2006. Recently assessed values appear to have stabilized and moderate growth in property tax income is expected in the next several years. The District receives only about 4% of the 1% assessed value of the annual property tax collected which severely limits its ability to maintain existing facilities and provide adequate administrative support and recreation services. Faced with declining tax revenues, the District recently initiated salary and wage freezes, work furloughs, a reduction in force by not filling vacant positions, downgraded management positions, and postponed deferred maintenance projects.

The pending development of the Elverta Village Specific Plan area will provide not only new facilities to meet the needs of future residents but increased property tax revenues which, through a broad economy of scale, will help sustain District operations. The District now receives a park impact fee (\$6,567 for Single Family Residential) for new development. The Elverta Village Specific Plan is conditioned to provide an ongoing park maintenance revenue source which will likely be either a Community Facilities District (Mello-Roos) or Benefit Assessment District.

Reserve Funds

The District maintains several reserve funds to assure adequate funds for future costs. The ongoing funds include (a) contingency reserves for unanticipated expenses, (b) compensated absences to fund employee leave banks, (c) Park Impact and In Lieu (Quimby) fees, and (d) deferred maintenance. The reserves help insure that expenditure impacts on annual operational monies is minimal.

DETERMINATIONS d

The Rio Linda Elverta Recreation and Park District effectively meets the recreational needs of the Rio Linda Elverta community. The potential for future growth in the Elverta and possibly other areas will have a significant, positive financial impact on its ability to expand services. The District will continue to strive to satisfy the recreational needs of residents by providing a wide range of recreation programs, park facilities, and other opportunities to enrich the quality of life. The cost of addressing future capital project needs as well as to maintain current facility infrastructure without identifying new revenue source is the current largest challenge.

Management

The District has an adequate management structure, staff, and facility sharing arrangements to ensure efficient management and provide parks and recreation services to the community at a reasonable cost. The District is efficiently structured and organized. The District provides the public with adequate information and opportunity for input and involvement in District Activities.

District Services

The District is able to appropriately gauge the demand and provide parkland, recreational facilities and programming to meet the needs of the community. The District provides adequate levels of service for parks and recreational facilities. The District effectively meets the needs of existing and future populations of the service area.

Infrastructure

The District provides adequate levels of service and park maintenance. Through financial planning and capital improvement projects, the District is able to replace, improve and renovate amenities in the park and provide safe and enjoyable facilities for residents. The acquisition and development program has not required long term indebtedness.

Finance

The District's financial position is adequate and planned opportunities in the future will enhance the District's fiscal position. Though there are revenue constraints, the District is able to continue to serve residents. The District also takes advantage of various grants and private donations to improve infrastructure and services provided. All of the Rio Linda Elverta Recreation and Park District's annual independent audits have resulted in an unqualified report.

I. Introduction

A. *The Master Plan*

Open space, parks, and recreation facilities have in recent years come to be recognized as essential to a healthy environment. The necessity to preserve open space and to provide parks and recreation facilities comes as a response to the increasing degree of urbanization throughout the nation, including Sacramento County. Increasing population density, scarcity of open space and natural areas, concern with the quality of our environment, and the increasing amount of leisure time available to many in our society has made the quality of park, recreation and open space a critical issue to most in urban areas.

The Rio Linda/Elverta community is an example of an area which has preserved its rural characteristics for many decades, but is currently facing proposals for intensive residential development which will result in tremendous increase in population and greater demands for more parks and recreational services. Although the Rio Linda & Elverta Recreation and Park District (District / RLRPD) has no direct role in determining population density or the land uses in the community, it is partially responsible for providing a healthy, enjoyable environment for the present and future residents of the District.

During the next ten years, the District faces the challenge of providing adequate park and recreation opportunities for an increasing population in a time of growing fiscal limitations. Increased recreational demand will continue to be stimulated by public interest in the environment, parks and open space, preservation of natural areas, health and fitness, and an increasing amount of time for pursuit of recreational activity. This anticipation of a continued population increase and accelerating recreational demand must be balanced with fiscal ability of the District and its property owners. The District must focus on the needs of the community and the interests of the District in continuing with an aggressive approach to providing a sound park and recreation program.

Over the last twenty years the District has experienced sporadic development of residential and commercial projects within its boundaries. In recent years some major road improvements have been completed by the County and there is currently in process the Elverta Specific Plan, proposing to build over 4,500 dwelling units, schools, parks and associated commercial projects in the north-eastern portion of the District. This is the first major development project to occur in the District, but it will not be the last. With the incorporation of the cities of Elk Grove and Rancho Cordova, the Rio Linda area is one of the last potential growth areas available in the County of Sacramento. Negotiations have already begun between the City of Sacramento and the County of Sacramento concerning the development of a large tract of land north of "the Natomas Development" along interstate-5. This area, east of HWY 99, is within the jurisdiction of the Rio Linda & Elverta Recreation and Park District. If these proposed projects are approved for development, new parks and recreational facilities will need to be funded as well as other public services and facilities as part of the project Capital Improvement Program.

Though the District has no authority related to land use decisions, the District Board is using this master planning process to re-examine the future course of action it should be taking in regards to future District funding, parkland acquisition, development, recreation programming, and the management of the District. The purpose of this master plan, therefore, is to provide the District with a comprehensive view of its park and recreation resources, develop suggested ways to improve the existing parks and facilities, to develop additional new parks and recreation facilities, and a practical program to finance, acquire, develop, and operate a sound park and recreation system for the next decade and beyond.

B. Mission of Rio Linda & Elverta Recreation and Park District

The following are the Mission Goals of the District Board:

- To acquire, develop and maintain an adequate number of neighborhood and community park facilities for the leisure time enjoyment of Rio Linda and Elverta residents.
- To provide a balanced variety of quality recreational programming for a rapidly expanding and diverse population.
- To develop an efficient park maintenance operation equipped to provide an acceptable level of maintenance and safe usage by park users.
- To provide park security patrol for the protection and safety of park users and public properties.
- To maintain effective citizen and organizational resources that encourages volunteerism and participation by individual and community organizations.

C. Recommendations

The following are the recommendations to help implement this master plan:

1) Adopt Standards and Guidelines

The District should request that the Sacramento County adopt the Rio Linda Elverta Recreation and Park District's Park and Recreation Standards and Guidelines as described herein.

2) Acquisition / Development Priority

Acquire and develop sufficient park lands, recreation facilities, and open space areas for the benefit of the community. Place high priority on acquiring additional parklands, and developing parks and facilities in areas of the District that are underserved. If acquisition of additional parklands in a Planning Area is infeasible due to lack of suitable land or affordable land, make alternative arrangements to address the park and recreational facility need.

3) Parity in Park and Facilities

Provide parity in park and recreation improvements throughout the District. Improvements to parks and recreation facilities in established, older neighborhoods shall be given equal importance as the development of parks and facilities in the newer neighborhoods.

4) Funding Mechanisms

Develop additional funding mechanisms to support the District's effort to acquire and develop needed parks and recreational facilities; continue to apply for grants for acquisition, development, and renovation of parks and facilities; upgrade existing parks and facilities as needed; and enhance the recreation programs and services.

5) Work closely with the County and Land Developers

Work closely with County of Sacramento regarding negotiations with developers on projects, conditions of approval, park and recreation standards, plan processing fees, and other ways to enhance the quality of park and recreation, open space, and environmental quality for the present and future residents of the community. Insure that the required parks and recreation facilities are developed on a timely schedule and in keeping with the District's development standards.

6) Work Cooperatively with Other Entities

Work cooperatively with other entities such as the City and County of Sacramento, the Community Planning Council, adjacent park districts, and other public and private entities to develop and operate park and recreation facilities to the benefit of District residents.

7) Actively Support Related Parks and Recreation Facilities

Actively support the planning, development, and management of park and recreation facilities managed by others such as the development of the Dry Creek Parkway, Dry Creek Greenway, Ueda Parkway, improvements to Gibson Ranch and Cherry Island Soccer Complex, the Cherry Island Golf Course, and the establishment of a countywide trail system.

8) Joint Use Agreement with School Districts

Pursue the adoption of a joint use agreement with the local school districts that would enhance District use of school grounds and facilities, and the opportunity for RLERPD to assist the school districts with school site maintenance work.

9) Recreation Programs

Provide a broad range of recreation programs to meet the needs of all age groups as well as the special needs of the elderly and the disabled, and be inclusive of different interest groups.

10) Open Space Preserves and Public Access

While the District recognizes and supports the need to preserve important open space areas for habitat preservation, protection of endangered species, and value these areas as valuable community resource, the District also encourages the preservation of open space areas that also accommodates controlled public access.

D. Strategy to Upgrade Existing Parks and Facilities

Upgrade and enhance existing parks and facilities to boost public use and enjoyment, expand programs, and improve the surrounding community in the following order:

First priority should be to remove health and safety hazards, comply with ADA requirements, and create an enjoyable/attractive park.

Second priority should be to provide adequate park and recreational facilities and programs to meet the needs of the District residents.

Third priority should be to implement the other park and facility improvements described in this master plan to enhance the service to the District residents.

II. The District

A. *Background*

Rio Linda & Elverta Recreation and Park District (District or RLRPD) was formed as Community Services Area #3 by the Sacramento County Department of Parks and Recreation during the 1961-1962 fiscal years to provide parks and recreation services to the residents of the Rio Linda area. The town of Elverta was included in a later annexation to this growing area. The former County Service Areas were originally created by a mandate to provide areas that previously were not autonomous, with a governing power to implement their parks and recreation services. The goal was to convert these areas to a dependent District, and ultimately to an independent District. Consequently, in 1990 the RLRPD was created as a dependent park District, and became an independent District in 1993.

The functions of the District are to develop and monitor the budget, carry out the policies of the Board, and oversee the daily operations of the District. Except for some support services provided by Sacramento County, such as accounting and tax collection, the RLRPD is an independent District.

B. *Location*

RLRPD is located in the northern portion of Sacramento County directly north of the City of Sacramento.

Figure 1 — Regional Context Map

C. Boundaries

The District is bounded on the north by the Sacramento, Placer, and Sutter County lines and on the east by Watt Avenue, a jog westerly on Elverta Road, and south on 28th Street to Elkhorn Boulevard to the topmost portion of McClellan Business Park, and continues in a southwestern direction along McClellan Business Park's boundary. The southern boundary is generally Ascot Avenue, HWY 80, and Elkhorn Rd. The western boundary runs south along HWY 99/El Centro Rd., Elkhorn Blvd., Sacramento City limit, and Gateway Park Blvd. The District occupies approximately 30 square miles of land. (See the following Figure 2 – District Boundary Map).

In addition to Planning Area 1-A, referred to as the Natomas Area, which is further described in Chapter IV and involves potential annexation proceeding by the City of Sacramento, Planning Area 1-B, the Panhandle, has over the years also been the subject of annexation proposal at the Sacramento City Hall. This area located south of Elkhorn Blvd. to Interstate 80, bounded by East Levee Road on the east, and Sacramento City limits to the west includes some 1,425 acres. Composed of rural residential, industrial, and vacant land use, this area is currently being targeted for residential development. Many residents in the area are opposed to these developments since they want to retain the rural character of the area.

The original boundaries of the District included exclusively the township of Rio Linda. In October 1985, annexation procedures that included Elverta and other adjoining, un-serviced areas more than doubled the size of the original District. Thereafter, a portion of the District south of 1-80 was annexed to the City of Sacramento in the Raney Reorganization.

D. Geography

The District is comprised of relatively flat terrain. The natural vegetation is predominantly oak grasslands with oak and cottonwood groves occurring in an east-west direction in association with the Dry Creek and Rio Linda Creek streambeds.

The communities of Rio Linda and Elverta have had a long history of periodic flooding along the various stream channels and drainage courses in the area. Portions of the District lie within designated floodways, which include the stream channel and portions of the adjoining floodplain that provide for the passage of the "100 year flood" flow. The major areas of flooding are generally along the three major drainage systems; Dry Creek, Rio Linda Creek and Steelhead Creek (formerly known as Natomas East

Main Drainage Canal). For further information regarding the floodplain, see Appendix C, Rio Linda-Elverta Community Area Major Drainage System map.

Climatically, the area is noted for hot, dry summers and mild, moist winters. Annual temperatures average 62 degrees Fahrenheit, but range from below freezing in the winter to over 100 degrees Fahrenheit during some summer days. Average annual rainfall is 19 inches.

Figure 2 — District Boundary Map (not to scale)

E. Cultural Resources

1) Prehistoric Resources

Many archaeological sites have been identified along major drainage ways in the County of Sacramento, especially sites located on high ground near permanent water sources, and along the smaller creeks such as Dry Creek. Sites that have been identified and are still preserved along these drainages are often highly significant. Also, numerous unidentified sites are probably extant; however, alluvium has been deposited over a long period of time, burying many such archaeological sites.

2) Cultural Setting

The Sacramento area has a long prehistoric association. Indigenous people populated the Sacramento Valley region for thousands of years prior to the influx of Euro-American settlers in the mid-1800s. Archaeological evidence confirms that the initial occupation of California occurred prior to 8,000 years ago (Moratto 1984). The earliest inhabitants were apparently transient hunters and gatherers who exploited the various ecological zones on a seasonal basis. As time progressed, more permanent settlements were established and food collecting became intensive.

Ethnographic records (from missions and other documents) show that the groups that inhabited the Rio Linda / Elverta area were the Nisenan, or Southern Maidu. Nisenan sites included villages, seasonal camps, quarries, ceremonial grounds, trading sites, fishing stations, cemeteries, and river crossings (Wilson and Towne 1978:389). Principal villages included a large, semi-subterranean assembly house and substantial residences that were partly excavated into the ground. These types of houses were constructed of a frame covered with brush or tules. Acorns were the staple among many California native groups. Villages ranged in size from small extended families of 15 to 20 individuals to large groups of 500 or more.

In the middle to late 1800s, with the arrival of trappers, settlers, and miners, the Southern Maidu were displaced from their land, killed, or fell victim to various epidemics. This greatly reduced the population, and resulted in the near destruction of their languages and cultures (Wilson and Towne 1978).

3) Historic Resources

Historic period structures, buildings, and archaeological sites are found predominately where early settlements are located and along transportation routes connecting these settlements. For example, much of the Rio Linda and Elverta area surrounding Dry Creek was settled in the decade between 1910 and 1920. Prior to that, the area was subject to floods and development was restricted. By 1911, the first Reclamation District (No. 1000) was formed and levee building begun. Some agricultural settlement existed prior to reclamation on the higher grounds; however, most homes, farms, and rural development of the surrounding area post-date 1911.

4) History

Though not a gold-bearing area of California, the Gold Rush greatly shaped the history and development of the Rio Linda-Elverta area. Transportation and agriculture were two primary contributions. Portions of the Rio Linda-Elverta locality were incorporated into an early land grant, Rancho Del Paso, 44,000-acre estate.

Once the area was secured from flooding, rapid agricultural development and additional settlement followed. The town of Elverta was established in 1908 adjacent to the line of the Sacramento Northern Electric Railway, which was extended southward from Marysville through the Rio Linda/Elverta area to the City of Sacramento in 1907. The Sacramento Valley Colonization Company, a subsidiary of the United States Farm Land Company of Chicago, Illinois, purchased the lands of Rancho del Paso in 1910. The company announced plans to establish two towns along the railway line, one near the station at Walerga on the Southern Pacific line and the other near the station at Dry Creek on the Sacramento Northern line. This latter site was renamed Rio Linda, a community founded in 1913. Divided into 10-acre parcels, Rio Linda was widely marketed in the 1920s as an ideal location for orchard homes and poultry farms.

Archeological information pertaining to RLERPD is contained within the December 1985 Cherry Island Golf Course Draft Environmental Impact Report. A total of two hundred acres in the Dry Creek/Cherry Island area was surveyed, and no significant cultural resources were found. Essentially, the entire Dry Creek/Cherry Island area was surveyed to assist the proposed Sacramento County golf course and for processing the Cherry Island Soccer Complex project. It should be noted that these results are "surface" survey findings only. The report recommended that if any artifacts are found below the surface during the golf course and soccer complex development, work in the area should be stopped until further archeological surveys and environmental reviews are done. There were no other archeological records pertaining to other park sites in the area. Further archeological information is contained in the Natomas Basin Study conducted by the City of Sacramento in 1997 and 2001; Dry Creek Parkway Master Plan EIR in 2003; and the Rio Linda Elverta Community Plan EIR.

Historical resources at RLERPD's park sites previously included an antique fire truck on view in the museum building at the Rio Linda Depot Park. More recently, the museum building was demolished and the antique fire truck relocated for safe keeping by the Sacramento Metro Fire District. The small stone and wood depot building originally at the park site was moved and turned into a home, now located near 6th Avenue. A new replica of the Old Depot was re-built on its original site in 2003, and is now referred to as the Visitor Center / Meeting Hall.

Approaching the business District of Rio Linda from the west, one is greeted by the distinctive street arch at Rio Linda Boulevard and "M" Street. This landmark was offered to Rio Linda by the City of Marysville in 1925, and it was moved the following year to its present location. An entrance sign originally hung from the center, but was replaced later by the flashing red light. (Source: History of Rio Linda/Elverta, 1977, Donald Walker, Ed.)

THIS PAGE IS INTENTIONALLY LEFT BLANK

III. Recreation and Park Resources

The District currently administers seven parks, one horse arena, one community center, an undeveloped 30 acre Ponderosa Farms Community Park site, and the 3.5 acre undeveloped Linda Creek Park site. These parks total approximately 82.66 acres. Some of these parks were, in part, developed with the assistance of the Community Development Block Grant (CDBG) through the Sacramento Housing and Redevelopment Agency, including the Community Center building, the Depot bandstand/gazebo, the replica of the original Sacramento Northern Railroad Depot, landscaping in the Community Center and Depot Park, Community Center parking lot, Central Park restrooms, fencing, bridge, parking facilities, and the Westside Park frontage improvements and parking lot. The township of Elverta, which was annexed to the District in 1985, presently does not have a developed park site or a recreation facility.

The various parks and recreation facilities managed by the District are further described in the following pages with information regarding the type of facility, acreage, investment to date, and development status (see Table 1 — RLERPDP Park Inventory). Maps of each park with recommended improvements are found in Chapter VII.

A. Existing Parks and Facilities

Babe Best Park is a partially developed neighborhood park of 8.5 acres located on the south west quadrant of 10th and “U” Streets within Planning Area 2. The park was named for a Rio Linda Fire Chief, Babe Best. Except for the 10th Street frontage and Q Street easement used as unpaved parking area, the remaining sides of the park abut residences and a church. The property was acquired in 1964 to serve the neighborhood, and is primarily used for ball field activities.

Since the last master plan, new playground equipment has been installed, the parking lot has been repaved, ADA access provided to playground and concession area, and two additional ball fields were added.

Central Park Horse Arena is a partially developed special purpose park of 12.5 acres which was acquired in 1967 by the former Service Area. The park is located in Planning Area 3, just south of Elkhorn Blvd. and Cherry Lane. The sole vehicular access to the site is off of Elkhorn Blvd. with pedestrian and bicycle access provided from Elkhorn Boulevard and the adjacent Sacramento Northern Railroad Bikeway on the west side of the park. Previously, pedestrian access to Central Park Horse Arena was provided by means of a pedestrian bridge across Hayer Pond. For safety and security reasons, this bridge was removed almost a decade ago. While the north side of the park is bounded by residences, the west side is open to the Sacramento Northern Railroad Bikeway, and the south tributary of Dry Creek flows along the east side. As the name implies, the Horse Arena and its related equestrian activities has been a major focus at this site. However, the use of the Horse Arena has declined dramatically in the last few years. The BMX track continues as a concession operation with casual use of the BMX track on the week-days, and active competition on week-ends and some week-day nights.

The park is equipped with full-size lighted arena, bleachers, and an announcing booth. Historically, rodeos, horse shows, and other livestock activities were conducted periodically from April through October.

Some of the improvements and changes that have taken place in the last decade include parking lot repaving and ADA access, new entrance sign, planting of

additional shade trees with irrigation, BMX track with lights, and oak tree mitigation planting along Dry Creek. New panels were also installed around the arena, and improvements made to the announcer's booth.

Community Center Park is an 8.5 acre site consisting of two shuffleboard courts, eight competition horseshoe pits, shade structure, tot lot, a multi-purpose basketball and/or volleyball court, and a tennis court. The Sacramento Northern Railroad Bikeway passes along the western edge of the park, and the Dry Creek Parkway lies contiguous to the south. During the last decade the old playground equipment was replaced, the parking lot repaved, ADA accommodations provided, cement pad provided for refuse area, and bike racks were installed. Except for the adjoining, undeveloped corporation yard site and the southern natural area, this site is nearly fully developed.

The Community Center includes a patio, kitchen, meeting rooms to accommodate 142 people seated and 305 standing, and a sizable adjacent parking lot. Beyond recreation programs conducted at the facility, the center is available for parties, wedding

receptions, meetings, and other community and private events. The District's administrative offices are located here, as well as all recreation program registration.

An adjacent 2 acre parcel was donated to the District by the Harvey Family to enlarge the park. The District plans to convert the site for its future Corporation Yard. The former Harvey House, located on the site, has the potential when renovated to serve as an office or meeting facility for the District or other community groups.

Depot Park - The Rio Linda Station Depot, after which this park is named, started as part of the Northern Electric Railway constructed in 1905. The December 18, 1910

railroad timetable shows a station at Elverta and Dry Creek (the town site of Rio Linda). In 1917 the Rio Linda Station Depot was completed on land donated by the Sacramento Suburban Fruit Lands Company. The last day of the passenger trains serving this station was June 21, 1936, but the Depot continued to be used for freight service for some time thereafter.

The 3 acre site was acquired in 1988 and has served as a greenbelt park ever since. This is the location of the bandstand / gazebo, and the new Visitor Center. "Old Betsy," the antique community fire truck was previously located at this park. The Sacramento Northern Railroad Bikeway passes longitudinally through this park.

Some of the recent improvements made to the park include the relocation of the bandstand / gazebo further south onto a new foundation, and the construction of a replica of the original Sacramento Northern Railroad Depot which is now used as a Visitor Center / Meeting Hall.

Elkhorn Equestrian Staging Area is located on the east side of East Main Drain Canal and south side of Elkhorn Boulevard, part of what is now referred to as the Ueda Parkway. Though not owned by the District, the District nonetheless maintains the staging area for public use. This staging area accommodates horse trailers and is one of the equestrian access points to a riding trail that parallels Ueda Parkway. This parkway and trail will eventually allow trail

connection to the American River Parkway to the south and the Dry Creek Parkway to the north east.

Linda Creek is an undeveloped 3.5 acre parcel located, south of E. Street between Dry Creek Road and 16th Street, adjacent to Linda Creek. This is one of the newer District park site's becoming part of RLERPD in 1996.

Northbrook Park is a 2.5 acre neighborhood park, located on the east side of Dry Creek, across Dry Creek from Gibson Ranch. This site was acquired from Sacramento County in 1994 and was improved the following year. The existing park improvements include concrete path, turf, shade trees, play ground, basketball court, par course, picnic areas, and a perimeter of drought tolerant plantings. Excepting for maintenance and emergency vehicles, access is presently limited to

pedestrian and bicyclists via Tourmaline Way. In the future, this park will also serve as a rest stop along this segment of the Dry Creek Parkway's multi-use trail.

Ponderosa Farms Community Park Site is a 30 acre undeveloped site located west of Rio Linda Blvd. and north of Elverta Road. This site was purchased by the District in 1991 for a future community park. Prior to proceeding with any park master plan or development, carefully examine the site to identify seasonal wetlands, flood prone areas, and other sensitive environmental issues that may impact the future use of the site.

Roy E. Hayer Park is a 2.6 acre site, located across Dry Creek from the Central Horse Arena, and is contiguous with the Dry Creek Parkway. Central Park, the former name, was changed to Roy E. Hayer Park to honor the family that donated the park site to the District. Presently, the park improvements include turf, shade trees, horseshoe pits, concession stand, picnic areas, paved parking, and access to Dry Creek

and Hayer Pond. In order to accommodate fish migration, Hayer Dam was removed and cross vanes installed to maintain the water level at the Hayer Pond while also allowing fish to pass. Future plans for this site includes the construction of a new bridge to reconnect Hayer Park to Central Park Horse Arena, and the construction of an infiltration gallery to enable water diversion from the Hayer Dam to serve Bell Aqua Lakes.

Westside Park is a partially developed 7.5 acre park located on the west side of W. 2nd Street, south of M. Street, and adjacent to Westside Elementary School. The park improvements include one lighted softball field, bleachers, and a 70 car parking lot. During the last ten years, the improvements made to this park have included upgrading the perimeter fence from 4' to 6' high, relocating the outfield fence from 275' to 300', installing new lights and

new scoreboard. The name of the ball field was also changed to Wayne H. Paulson Field for the former Recreation Superintendent of the District. Some of the improvements made since the last master plan include two sand volleyball pits, installation of a permanent restroom; repaving of the parking lot; replacement of the old playground equipment; and addition of a fenced Dog Park.

B. Recreation Programs

The District continues to offer a variety of recreation programs and activities. Currently, some of the programs offered by the District include youth classes, special interest classes and activities, senior programs, and family sports programs in basketball and soccer. Special programs such as an annual crafts fair, carnival, a Halloween extravaganza, and Easter Egg Hunt are also provided. The Staff continually evaluates the programs in order to upgrade and expand recreation and park services.

Illustrated below in Table 2 is the program participation summary for the years 1997 through 2001. As illustrated, the more popular programs have sustained themselves for a number of years while the less popular programs have been dropped or are barely able to continue. The table is only illustrative of the programs where participation data was available from the District. In many other youth and adult sports programs that the District provides, participation data was not available for inclusion in this chart.

Table 2 — Recreation Program Participation

Program Description	1997-98	1998-99	1999-00	2000-01

* Annual program attendance days

Based on Table 2, 1997-2001 recreation program participation, it is difficult to evaluate the success of the District's overall program activities since attendance figures for significant numbers of programs are not available. It is safe to say that some programs, specifically aerobics, dance/gym, dog obedience, draw/paint, hunter safety, piano, and martial arts classes have shown steady growth or are maintaining a steady public support.

As in the past, a majority of the programs and activities offered by the District are held within the township of Rio Linda. Rio Linda contains the largest concentration of the District's population and all of the District facilities. Although Elverta area has the second largest population, presently the lack of recreation facilities in the Elverta area limits programming opportunities in the area. Two programs that are offered in the Elverta Area include after school programs at Elverta School, and at the Sacramento Metropolitan Fire Department facility.

C. Additional Recreation Resources

In addition to existing parks, natural streams, trails and bikeways in the District, a number of private businesses offer additional recreation opportunity to the residents of the District. Some of these include the Rio Linda Airport, Antelope Greens Golf Course, Water Ski Lake, and local horse owners who provide training and riding opportunities to the public. The availability of these additional public and private recreational facilities, however, does not lessen the need for local park facilities and recreation programs provided by the District.

1) 1/4 Midget Track

With the creation of the Dry Creek Parkway, the contract that the 1/4 Midget Track had with Sacramento County for the use of the land for a race track ended. As part of this termination arrangement, RLERPD agreed to assist the 1/4 Midget Track group to locate another site for their track. The minimal requirement for the 1/4 midget track is 2 acres plus parking area. Although the District has not located a suitable site to relocate this track, it continues to be one of the park features that the District will be considering for future park sites.

2) Bikeway and Trails

As part of the Sacramento County's Trails System, RLERPD has several bikeways within its borders (See Figure 4 and the graphic Master Plan). A paved bikeway runs north through the District along the old roadbed of the Sacramento Northern Railroad, a designated multi-use trail corridor. This bikeway connects Hayer Park, Central Park Horse Arena, Rio Linda Depot and the Rio Linda/Elverta Community Center and Park. In addition, the Elverta Villages Specific Plan includes trail systems within and connecting to adjacent trail system.

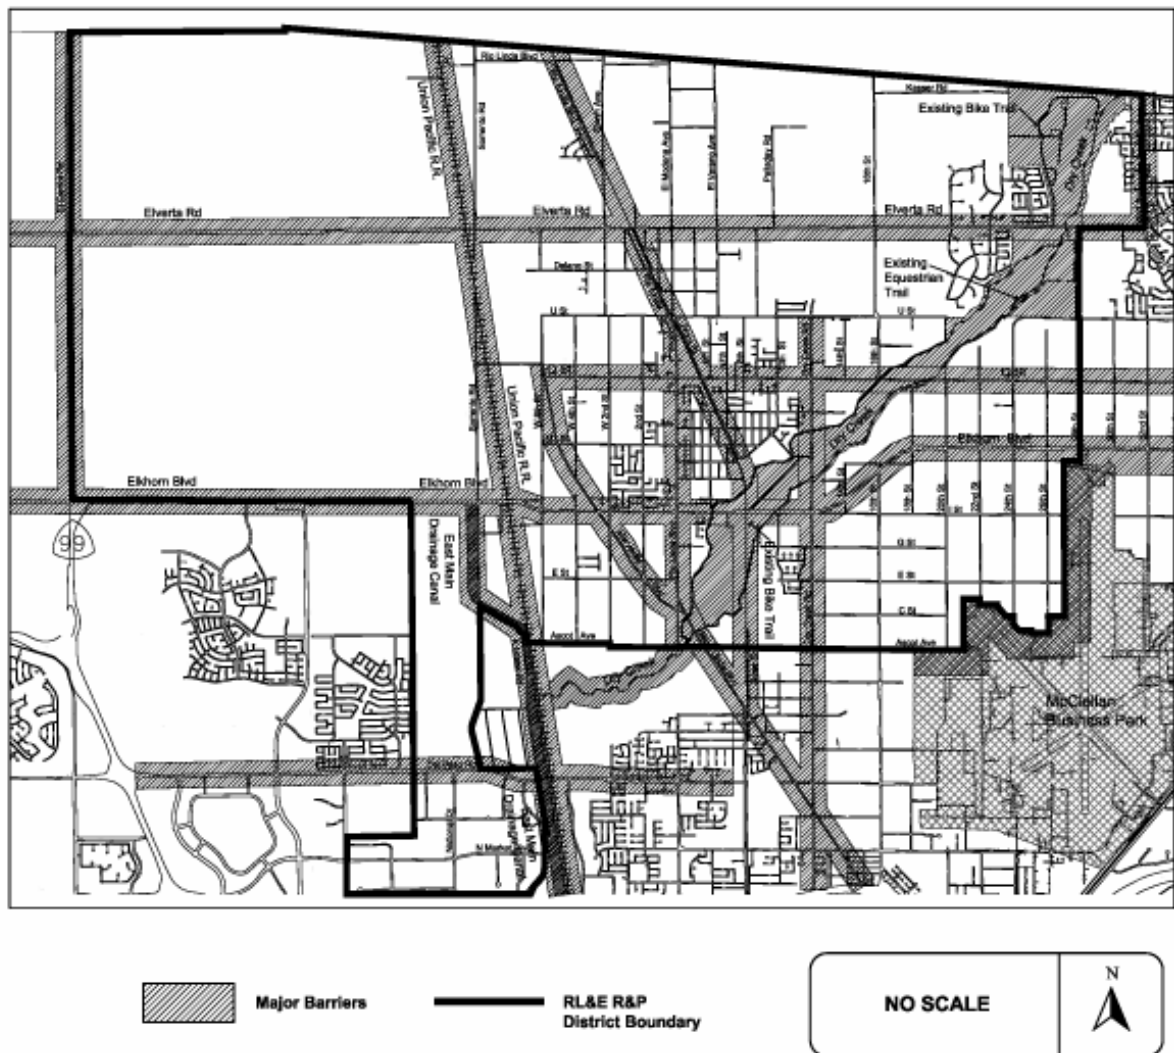

Figure 3 — Major Barriers and Traffic Routes Map

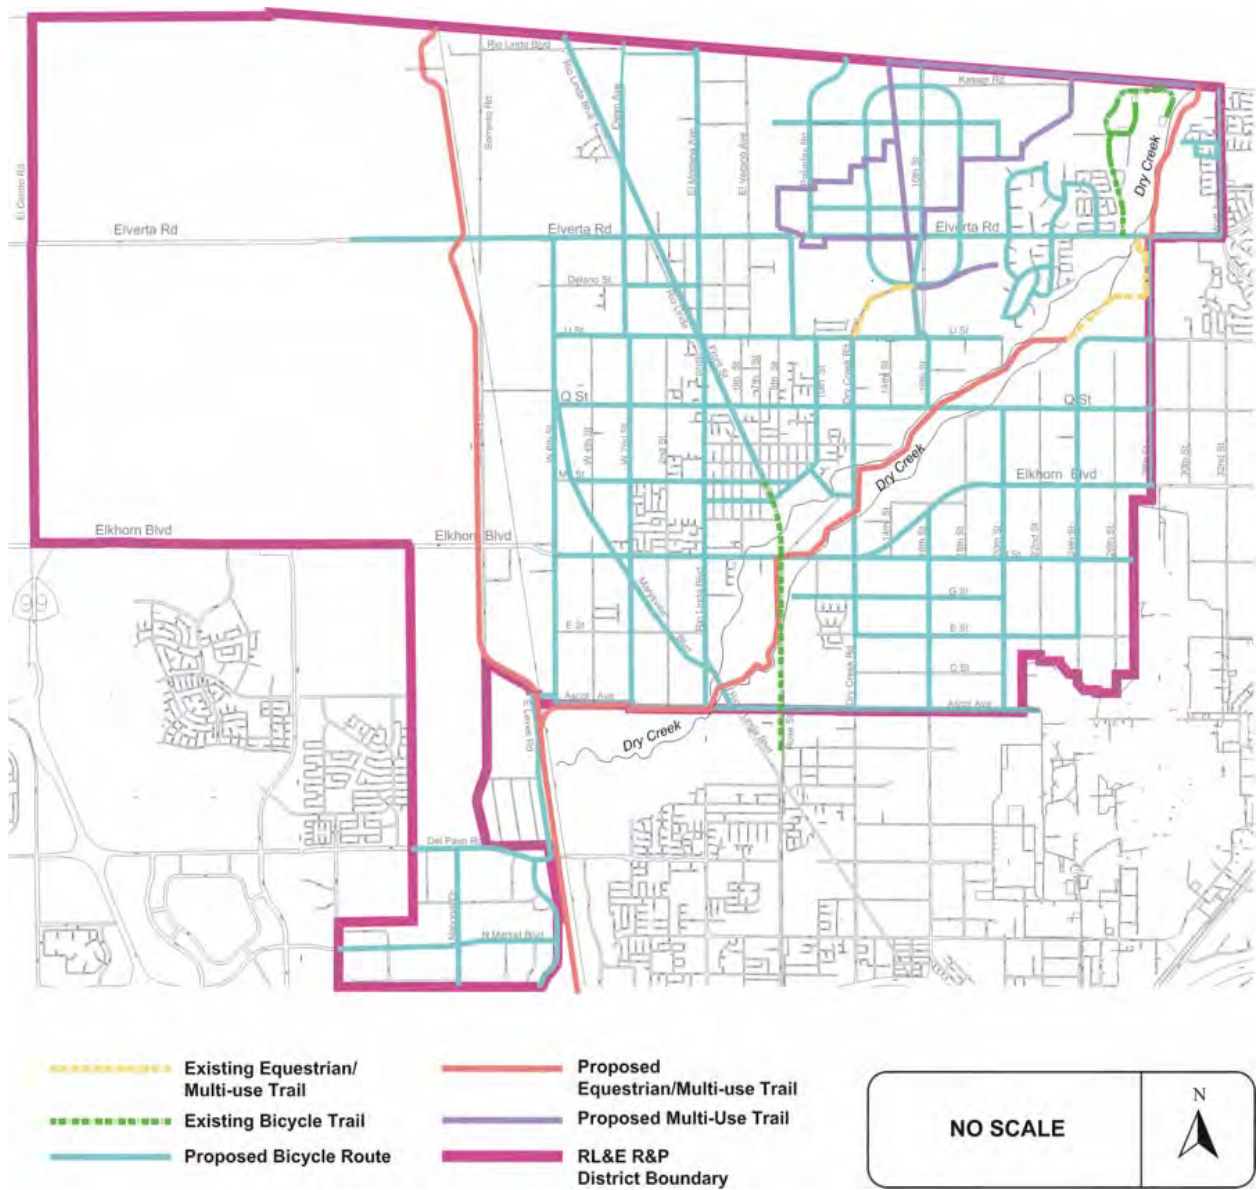

Figure 4 — Bicycle Route and Trail Plan Map

Bikeways are designated as Class I, II, and III and are defined as follows:

- **Class I Bikeway (Bike Path or Trail)** — A completely separated, paved, right of way for the exclusive use of bicycles and pedestrians with cross-flow minimized.
- **Class II Bikeway (Bike Lane)** — A striped lane for one-way bike travel on a street or highway.
- **Class III Bikeway (Bike Route)** — Provides for shared use of a road with pedestrian or motor vehicles. Signs are required to be placed along the road designating the road as a Bike Route.

3) Natural Streams

There are four natural streams, Dry Creek, Rio Linda Creek, Goat Creek, and Robla Creek within the District. As more of the open space / farm lands are developed for various urban uses within Rio Linda and Elverta Area, and even more so in Roseville and Placer County (which is part of the Dry Creek watershed) the creeks and drainage ways in Rio Linda and Elverta Area will receive greater surface runoff. Recognizing this increasing problem, Sacramento County and SAFCA has been systematically acquiring flood prone properties within this portion of the Dry Creek Floodplain from willing sellers. The objectives of this program are to remove residences from flood prone areas and to return the land back to open space and agricultural uses that would be compatible with periodic flooding.

Dry Creek Parkway

Sacramento County Department of Parks, Recreation and Open Space has also been utilizing various grant funds to gradually assemble the linear Dry Creek Parkway from Placer County line to Sacramento City limit. While the Department has been successful in

assembling the various Dry Creek Parkway properties up to Dry Creek Road, the acquisition of the remaining properties between Dry Creek Road and Ascot Way will require greater reliance on Sacramento County Water Resources and

*RIO LINDA—ELVERTA RECREATION & PARK DISTRICT
DISTRICT MASTER PLAN*

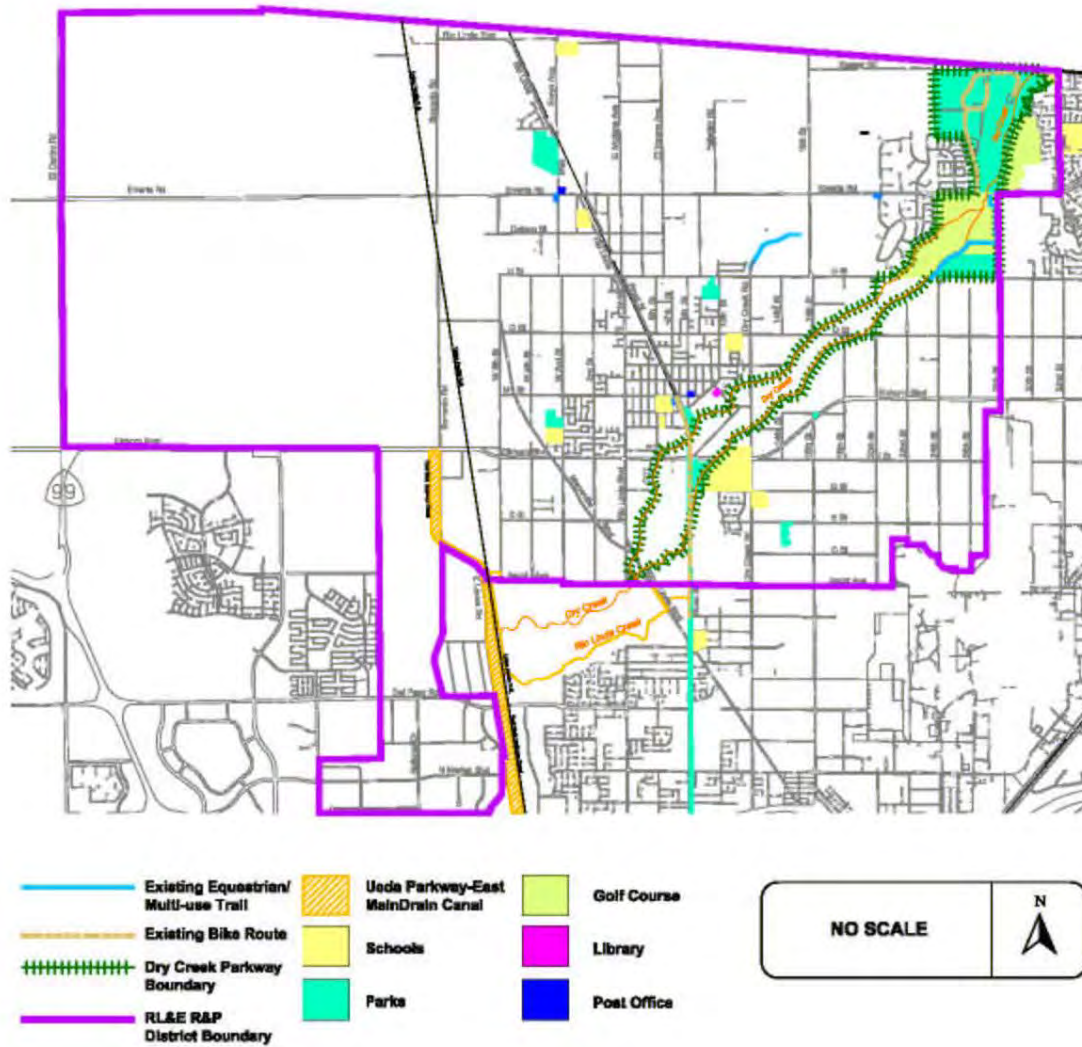

Figure 5 — Existing Features Map

*RIO LINDA—ELVERTA RECREATION & PARK DISTRICT
DISTRICT MASTER PLAN*

Figure 6 — Dry Creek Parkway

SAFCA to complete the acquisition of the remaining portions of the Dry Creek Parkway. Fortunately, the acquisition of the properties in the Dry Creek floodplain has been a high priority for both Sacramento County and SAFCA. Both agencies have been working closely with County Parks to acquire properties in the Dry Creek floodplain, clearing the properties of structures and unwanted vegetation, and turning the property over as open space to County Parks for inclusion in the Dry Creek Parkway. With the adoption of the Dry Creek Parkway Master Plan in April 2002, this linear parkway became a reality.

The Dry Creek Parkway is intended to be a natural, riparian parkway with a multi-use trail system to accommodate pedestrian, equestrian, and bicycle use with the bulk of the parkway retained in open space or compatible agricultural use. Other appropriate parts of the parkway are designated for public access, linkages to adjacent trails and neighborhoods, and limited areas are intended for active recreational use. The Parkway will link many of the developed regional recreational features in the area such as the Gibson Ranch, Cherry Island Soccer Complex, Cherry Island Golf Course, and the Dry Creek Historic Ranch.

D. Regional Recreation Facilities

Residents of RLERPD can additionally avail themselves of a number of other public regional recreation resources such as Gibson Ranch, Sacramento River, the American River Parkways, Folsom State Recreation Area, Sacramento Softball Complex, and many municipal and private golf courses in the area.

Located in the northeast corner of the District are Gibson Ranch County Park, the Cherry Island Golf Course, and the Cherry Island Soccer Complex.

- Gibson Ranch – Gibson Ranch covers 345 acres and includes residence camp, picnic areas, a lake, many picnic areas, huge turf areas to accommodate a variety of activities, and equestrian trails. A day camp area is available for groups. Group picnic areas have picnic shelters and an 8.8 acre lake, which is popular for fishing, is located in the middle of the park. Gibson Ranch also has facilities for boarding 100 horses, pastures for rent, and daily/hourly horse rentals are available to the public.
- Cherry Island Golf Course – Cherry Island Golf Course is an 18-hole, 200-acre, championship golf course, which includes a driving range, pro shop, restaurant, and a club house.
- Cherry Island Soccer Complex – Cherry Island Soccer Complex is a 37 acre site located south of Cherry Island Golf Course. The soccer complex was opened to the public in 1986 and has 10 soccer fields, a concession building, restrooms, a group picnic area, and a 250 vehicles paved parking lot. This complex is used year-round as the venue for youth soccer games and tournaments that attract teams and supporters from greater Northern California and beyond.
- Antelope Greens Golf Course – Antelope Greens Golf Course is a privately owned, public 18-hole, golf course located on Elverta Road, just east of Cherry Island Golf Course.

- Hansen Dairy – The City of Sacramento acquired the 200-acre Hansen Dairy property site for a proposed golf course. Unfortunately, due to the presence of abundant seasonal wetlands with endangered species, this site remains undeveloped and has been acquired by SAFCA as a future preserve and mitigation site.
- Dry Creek Parkway – The Dry Creek Parkway is comprised of approximately six miles of open space and riparian corridor starting at the Sacramento/Placer County line and extending southwesterly along the two forks of Dry Creek to the Sacramento City limits at Ascot Lane. The boundary of the parkway encompasses an area 75' beyond the normal top of the creek bank, as well as Cherry Island Soccer Complex, Cherry Island Golf Course, Gibson Ranch, Northbrook Park, and the Rio Linda – Elverta Community Center Park. The Dry Creek corridor provides migration route, habitat, and forage for a wide variety of aquatic and terrestrial wildlife, including rare, threatened, and endangered species. The Dry Creek Parkway will also provide a combination of passive and active recreational opportunities for the surrounding neighborhoods and will become a significant addition to the linear trail corridor extension that currently includes the American River Parkway, the Ueda Parkway and the Sacramento Northern Bikeway in this area. Ultimately, it is anticipated that the Dry Creek Greenway (the name for that portion of the parkway in Placer County) will continue easterly through Placer County and the City of Roseville to the City of Folsom and link up with the eastern end of the American River Parkway. When these critical parkway segments are completed, a 70 mile greenway loop will be created for the residents and visitors to enjoy in the Sacramento/Placer County area. This regional greenway is planned to have multi-use trails for pedestrians, bicyclists and equestrians.
- Folsom State Recreation Area – The 18,000-acre lake and recreation area offers opportunities for hiking, biking, running, camping, picnicking, horseback riding, water-skiing and boating. Fishing for trout, catfish, big and small mouth bass, and perch are part of the popular activities at the lake. Visitors can also see the Folsom Powerhouse (once called "the greatest operative electrical plant on the American continent"), which from 1885 to 1952 produced 11,000 volts of electricity for Sacramento residents. The park also includes Lake Natoma, downstream from Folsom Lake, which is popular for crew races, sailing, kayaking and other aquatic sports.
- American River Parkway (ARP) – More than 5 million visitors each year are drawn to ARP with its unique wildlife and recreation areas, known as the "Jewel of Sacramento". The 23-mile Parkway runs from Hazel Avenue and the Nimbus Fish Hatchery, west to the confluence of the American and Sacramento Rivers. From historic Gold Rush and Maidu Indian sites to lush riverine forests and oak woodlands, ARP offers a multitude of passive recreational opportunities including: walking and hiking, bicycling, fishing, rafting, picnicking, and nature appreciation.
- Ueda Parkway – In 1988, the Sacramento County Open Space Task Force recommended that a bikeway and hiking/equestrian trail be developed along the East Main Drain Canal. In 1998, the East Main Drain Canal was renamed the Ueda Parkway to recognize Walter Ueda, a landscape architect and park administrator who had worked for both the City and County Parks Departments. Currently, plans are being finalized to install pedestrian and bike trails along the Ueda Parkway, and

future considerations for equestrian trails along the length of the parkway from Discovery Park to Elkhorn Blvd. Through community efforts, the creek running through the Ueda Parkway was later renamed Steelhead Creek to recognize it as a historic habitat for Steelhead and other riparian wildlife that inhabit the creek corridor. Ueda Parkway also links the Dry Creek Parkway to the American River Parkway at Discovery Park East.

E. School Resources

RLERPD encompasses four different school Districts:

- Grant Union High School District
- Center Joint Unified School District
- Rio Linda Union Elementary School District
- Elverta Joint Union School District

There are a total of seven public schools in RLERPD: one high school, one middle school, and five elementary schools¹. (See Existing Features Map on page III-13)

School sites, in many cases, play an important role in accommodating the neighborhood's recreational need. Typically, 40% to 50% of a school site is developed for recreation/open space areas. Elementary schools have an average of about 4 acres for recreational use, junior high schools approximately 7 acres, and high schools 18 acres. The degree to which these recreation/open space facilities are available to the community and the RLERPD is dependent upon the policies of the School Districts and the relationships that are developed between the School and Park Districts.

It should be noted that School Districts are experiencing substantial funding reduction which has resulted in fees being charged for after-school sports programs. In addition, the Civic Center Act, (California State Assembly Bill No. 2634, effective January 1983), grants authority to school Districts to charge certain organizations for use of their facilities. Prior to this, schools did not have this authority, although some historically charged fees anyway. Public agencies (including park Districts) may be charged an amount equal to the school Districts' costs incurred by providing use of their facility. It is thought that this law will not affect existing joint use agreements. However, when these agreements are renewed, school boards may vote to cover their costs by charging groups for use of their facilities.

¹ Though the Robla School District does not have any schools within the RL&ERPD boundaries, it is within the RL&ERPD boundary, and consequently is included with the other Districts. (See Appendix H, Sacramento County School Districts Map.)

THIS PAGE IS INTENTIONALLY LEFT BLANK

IV. Park District Demographic Characteristics

A. *Planning Areas*

For park and recreation planning purposes, the District was divided into five planning areas (See Figure 7 — Planning Area Boundary Map below). The five planning areas are based on land use patterns, population densities within the District, and census and demographic boundaries. The five planning areas with some minor exceptions coincide with the planning area boundaries as established in the 1990 Master Plan. Planning Area 1 was further divided into 1A and 1B since these two areas are so distinctly different. A slight modifications to the other planning area boundaries were also made to reflect the year 2000 census tract boundaries (Figure 9 — 2000 Census Tracts Map).

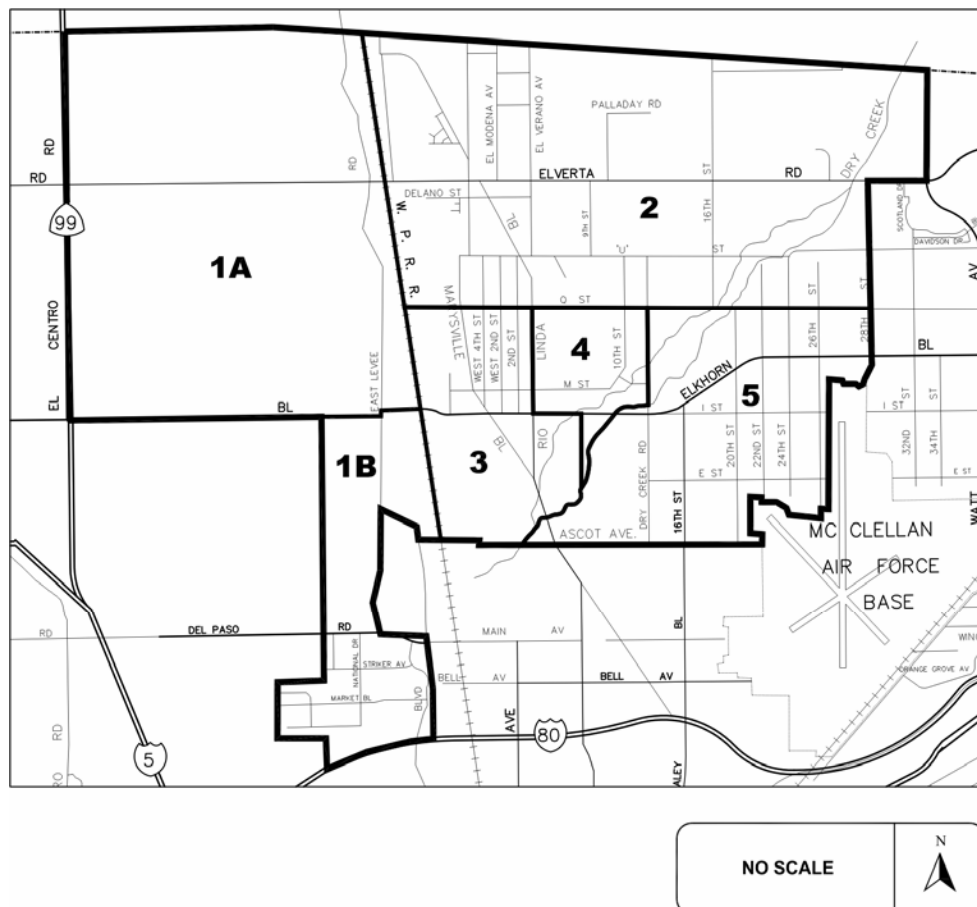

Figure 7 — Planning Area Boundary Map

Planning Area #1A

Planning area #1A is bounded on the north by the Sacramento/Sutter County line, on the east by the Western Pacific Railroad to Elkhorn Blvd., then westerly along Elkhorn Blvd. to Highway 99, and north along Highway 99 to the Sacramento/Sutter County line.

Planning Area #1B

Planning area #1B is bounded on the north by Elkhorn Blvd., south along the Western Pacific Rail Road to Ascot, then westerly to East Levee Road, and southerly along East Levee Road, south along the Sacramento City/County line (generally Sorrento Road, Del Paso Road, and East Levee Road) to Interstate 80. The boundary continues west along Interstate 80 (which is also the Sacramento City/County line) and then north along the Sacramento City/County line, with a large jog to the west towards the East Drainage Canal, up to Elkhorn Blvd.

Planning Area #2

The northern boundary of Planning Area #2 is the Sacramento/Placer County line. The east boundary of this planning area runs south down Watt Avenue, west along Elverta Road to 28th Avenue and south to U Street. The southern boundary is U Street between 28th Street and the Western Pacific Railroad. The Western Pacific Railroad right-of way between the Sacramento/Placer County line and Q Street forms the western boundary.

Planning Area #3

Planning Area # 3 is bounded on the north by Q Street between Rio Linda Boulevard and the Western Pacific Railroad. The Sacramento Northern Railroad right-of-way serves as the western boundary. The eastern boundary is formed by Rio Linda Boulevard to the north and Rio Linda Central Park and Dry Creek in the southern portion of this planning area. Ascot Avenue between Dry Creek and the Western Pacific Railroad forms the southern boundary of this planning area.

Planning Area #4

This Planning Area is roughly square in shape with the exception of the southern boundary. Q Street between Rio Linda Boulevard and Dry Creek Road forms the northern boundary. The western boundary is formed by Rio Linda Boulevard, west along Elkhorn Boulevard and south along the eastern edge of Rio Linda Central Park. The eastern boundary runs south from Q Street along Dry Creek Road and jogs southeast along Dry Creek to Rio Linda Central Park.

Planning Area #5

Q Street forms the north boundary of Planning Area #5. The east boundary is 28th Street down to the west boundary of McClellan Business Park, then generally southbound but with various jogs at the southern portion, until it

reaches Ascot Avenue. Ascot Avenue represents the south boundary. The west boundary follows the former Sacramento Northern Railroad right-of-way up to the southern side of Dry Creek, then northeasterly up Dry Creek to Q Street.

B. Population and Housing Characteristics

1) Population

According to the year 2000 census, the total population of the Rio Linda Elverta Park District was 21,169 (Table 3 — RLERPD Total Population by Planning Area). In comparison, the total population for Sacramento County in the year 2000 was 1,223,499. Therefore, the District's population constitutes approximately 1.7% of the total population of Sacramento County (Table 4 — RLERPD's Population as a Percentage of the Total County Population).

Table 3 — RLERPD Total Population by Planning Area

Year	Area #1A	Area #1B	Area #2	Area #3	Area #4	Area #5	All Areas
2000	0	264	9,575	4,008	3,579	3,743	21,169

**Table 4 — RLERPD's Population as a Percentage of the
Total County Population**

Year	Rio Linda Elverta Park District Population	Sacramento County Population	District's Population as a Percentage of the Total County Population
2000	21,169	1,223,449	1.73 %

The California Department of Finance Demographic unit projects that Sacramento County's population will increase to 1,327,435 in 2005 and 1,436,286 in 2010. For the purposes of projecting the total future population of the District it is assumed that the District's population will increase at the same projected rate as that of Sacramento County for the years from 2000 to 2010 and will continue to grow at the same rate to 2014. Based on these assumptions and discounting any major residential development such as Elverta Village, the projected population of the District will be 22,967 in 2005, 24,850 in 2010, and 26,597 in 2014 (Table 5 — RLERPD's Projected Population Growth 2000-2014).

Table 5 — RLERPD's Projected Population Growth 2000-2014

Year	Rio Linda Elverta Park District Population	Sacramento County Population
2000	21,169	1,223,449
2005	22,967	1,327,435
2010	24,850	1,436,286
2014	26,597	1,537,111

In order to calculate the projected population for the five planning areas, it was assumed, for this planning purpose, that the District's total projected population increase will be proportionally distributed as the population was found during the 2000 census for the planning areas. Based on a proportional distribution of the District's total projected population increase, the District's projected population to 2014 is shown in Table 6. In addition to the normal population increase in the District, Table 6 includes additional population increases specifically in Planning Area 1B due to proposed developments in the area, and Elverta Village and its impact upon Planning Area 2.

Planning Area #1A

Due to the Natomas Joint Vision plans being proposed by the City and County of Sacramento, there is potential for residential development in this area. However, lacking specific land use proposals for this area presently, this plan will continue to treat this area as agricultural land use. In the process of adopting specific land use proposals for this area, the District will need to take an active role in assuring that adequate and appropriate parks and recreational facilities are planned for the area, and that the Public Facility Financing Plan for the area includes adequate funding to acquire, develop and maintain the proposed parks, open space/greenways, and recreational facilities.

Planning Area #1B

There are a number of residential development proposals in this area making it likely that the area's population will grow more rapidly than anticipated for the District in general. As such, Table 6 shows in brackets the additional population growth projected for the Area during the period of 2010 and 2014.

Planning Area #2

Due to the anticipated development of Elverta Village, Table 6 shows in brackets the proposed additional population growth projected for this area in the period 2010 and 2014.

**Table 6 — RLERPD's Projected Population Growth by
Planning Area 2000-2014**

Year	Area #1A	Area #1B	Area #2	Area #3	Area #4	Area #5	Total Population All Areas
2000	0	264	9,575	4,008	3,579	3,743	21,169
2005	0	286	10,388	4,348	3,883	4,061	22,966
2010	0	310 (8,415)**	11,240 (5,000)*	4,705	4,201	4,394	38,265
2014	***	332 (9,013)**	12,030 (10,000)*	5,036	4,496	4,703	45,610

* Additional residents due to Elverta Village.

** Additional residents due to proposed developments in the area.

*** If urbanization of this area is approved, resident population in the area is probable.

2) Housing

According to the 2000 census, there were 7,028 housing units located within the boundary of the Rio Linda Elverta Park District (Table 7— RLERPD Housing Units by Planning Area). Planning Area #2 contains the largest number of housing units while Planning Area #1A is composed of agricultural fields and does not have any housing units while Planning Areas #3, #4 and #5 contain approximately the same number of housing units.

Table 7— RLERPD Housing Units by Planning Area

Year	Area #1A	Area #1B	Area #2	Area #3	Area #4	Area #5	Total All Housing Units
2000	0	104	2,983	1,390	1,243	1,308	7,028

Of the 7,028 housing units located within the District as of the 2000 census, 6,785 housing units were occupied and 243 were vacant (Table 8). The total occupancy rate for the entire District is 96.54% (Table 9). All of the Planning Areas within the District have occupancy rates greater than 90%. While Planning Area #1B has a relatively high vacancy rate (8.65%) when compared to the other planning areas, it has the smallest number of vacant housing units (9). Likewise, Planning Area #2 has the relatively low vacancy rate (2.72%) but has the largest number of vacant housing units (81).

Table 8 — RLERP Housing Occupancy Status by Planning Area

	Area #1A	Area #1B	Area #2	Area #3	Area #4	Area #5	Total All Housing Units
Occupied	0	95	2,902	1,333	1,205	1,250	6,785
Vacant	0	9	81	57	38	58	243

Table 9 — RLERP Housing Occupancy and Vacancy Rates by Planning Area

	Area #1A	Area #1B	Area #2	Area #3	Area #4	Area #5	Total All Housing Units
Occupancy Rate	0	91.35%	97.28%	95.90%	96.94%	95.57%	96.54%

3) Summary of Planning Areas

Planning Area #1A

Planning Area #1A, being composed entirely of agricultural fields and located within a flood plain, does not currently have any resident population. However, due to the Natomas Joint Vision plans being proposed by the City and County of Sacramento, Planning Area #1A may very well come under urbanization in the near future. According to the City/County report and pending Memorandum of Understanding (MOU) between the two entities, this “Joint Vision” will:

- Result in an agreement to collaboratively manage growth and preservation of open space and habitat in the unincorporated area of the Natomas basin within Sacramento County.
- Transfer 10,000 acres of County land to the City “Sphere of influence” with probable future annexation.
- Require, one-acre of permanent open space be preserved for each acre developed.
- Establish an agreement between the City and County to share revenues that result from development of the area.
- Require any future development be in accordance with adopted “Smart Growth Principals” and “Infill Strategy”.

Although the exact impact of this “Joint Vision” proposal to Planning Area #1A is uncertain at this point, this Joint Vision and the MOU does indicate that a significant portion of the Planning Area #1A is ultimately slated for urban development. The District should assume that Planning Area #1A will eventually

urbanize and that appropriate public services such as parks, recreation facilities, open space, and trails will need to be provided for the future residents of this area. Along with the City/County and developers, the District will need to be actively involved in the planning and negotiation process to assure that adequate and appropriate parks and recreational facilities are provided for, and that the Public Facility Financing Plan for the area includes adequate funding to acquire, develop, operate and maintain the proposed parks, open space/greenways, and recreational facilities.

Planning Area #1B

According to the year 2000 census tract figures, Planning Area #1B had a population of 264 people of which 136 were male and 128 were female. Next to Planning Area #1A, Planning Area #1B has the lowest population of the six planning areas. There is a residential/commercial development being proposed that will significantly increase the population of the area. Area 1B is in the City of Sacramento's Sphere of Influence and it is anticipated that an application for annexation for this area is pending. Should an agreement amicable to the District not be reached with the City of Sacramento for the District to continue to provide services in this area following annexation, the District intends to protect its revenue stream from the area.

A total of 104 housing units are located within this planning area of which 95 or 91.35% were occupied as of the 2000 census. Of the 95 occupied homes, 65 are owner occupied and 30 are renter occupied.

The anticipated additional growth of this area is based on the premise that approximately 3,300 units of new housing will be constructed and sold between 2006 through 2014. Based on 2.55 residents per the new dwellings as projected in the North Natomas Community Plan, and assuming normal increase of the area's population, Table 6 illustrates that by the end of year 2010, 8,725 residents will be in the areas, and by end of 2014 this number will increase to 9,345.

Planning Area #2

Of the five planning areas, Planning Area #2 has the largest population. The 2000 census indicates that the population of Planning Area #2 is 9,575 of which 4,762 are male and 4,813 are female. The population of Planning Area #2, if Elverta Village were discounted, is projected to increase to 10,388 in 2005, 11,240 in 2010, and 12,030 by 2014.

However, in anticipation of Elverta Village (4,950 proposed dwelling units) being developed in ten years, and assuming that approximately 500 units of housing will be built and sold each year starting in 2006 with 2.5 occupants per dwelling, as the Elverta Village Specific Plan projects, the consequent additional population increase in this area will amount to 5,000 in 2010 and 10,000 in the year 2014. (See Table 6)

Planning Area #3

For Planning Area #3, the 2000 census specifies a total population of 4,008. Of the 4,008 people within Planning Area, 2,030 are male and 1,978 are female. Planning Area #3 has the second highest population of the five planning areas. The projected population for this planning area is 4,348 for 2005, 4,705 by 2010, and 5,036 by 2014. The total projected increase in the population during the planning horizon for this Master Plan is 1,028 representing an increase of 25.6%.

According to the 2000 census, there are a total of 1,390 housing units within Planning Area #3. Of these, 1,333 are occupied housing, or an occupancy rate of 95.9%.

Planning Area #4

Analysis of the 2000 census tract figures for the District indicates that Planning Area #4 has a total population of 3,579 with approximately the same number of males (1,759) as females (1,820). Generally, Planning Area #4 had the second lowest population of the five, which is most likely, a result of the relatively small size of this planning area. The population is expected to increase to 3,883 by 2005, to 4,201 by 2010, and 4,496 by 2014.

According to the 2000 census, the number of housing units in Planning Area #4 is 1,243. Of these, 1,205 homes are occupied which translates to an occupancy rate of 96.9%.

Planning Area #5

The 2000 census indicates that the total population of Planning Area #5 is 3,743 of which 1,818 are male and 1,925 are female. The population of this planning area is projected to increase to 4,061 by 2005, 4,394 by 2010, and 4,703 by 2014.

The total number of housing units within Planning Area #5 is 1,308 of which 1,250 are occupied, or an occupancy rate of 95.57%.

C. Land Use Characteristics

A large portion of the District is affected by its inclusion in or proximity to flood prone areas. (See Appendix C, Rio Linda-Elverta Community Area Major Drainage System Map).

Most of the District is in the McClellan Business Park area of Influence. Prime concerns related to this condition are safety and noise. Generally, recreational uses are compatible with the over flight zone. However, neighborhood parks, community-wide and regional parks, and indoor recreation and amusements are not compatible in the approach zone. It should be noted that a portion of Gibson Ranch County Park, Cherry Island Soccer Complex, and Cherry Island Golf Course are within this approach zone.

The land use characteristics of the District are related to the relative population sizes of each area (See Table 3, page IV-3). In general, while Planning Areas #3, #4, and #5 are of approximately the same size, #2 has the largest population consistent with its primarily residential zoning (RD-5, RD-10, and RD-20) as well as some commercial zoning. Planning Areas #4 and #5 follow with incrementally decreasing amounts of residences. Planning Area #4 is mostly low density zoning (RD-5) with accompanying commercial zones.

Planning Area #1A

Planning Area #1A is almost entirely agricultural with some industrial zoning, thus, lacking residences. Even though large in size, majority of this planning area is agriculturally zoned (AG) and most of it is in AG-80 (minimum 80 acres).

As discussed earlier in this Chapter, the future needs for schools, parks, trails and open space areas in Planning Area 1A needs to be considered in the Public Facility Financing Plan related to future developments proposed in this area.

DISTRICT MASTER PLAN*

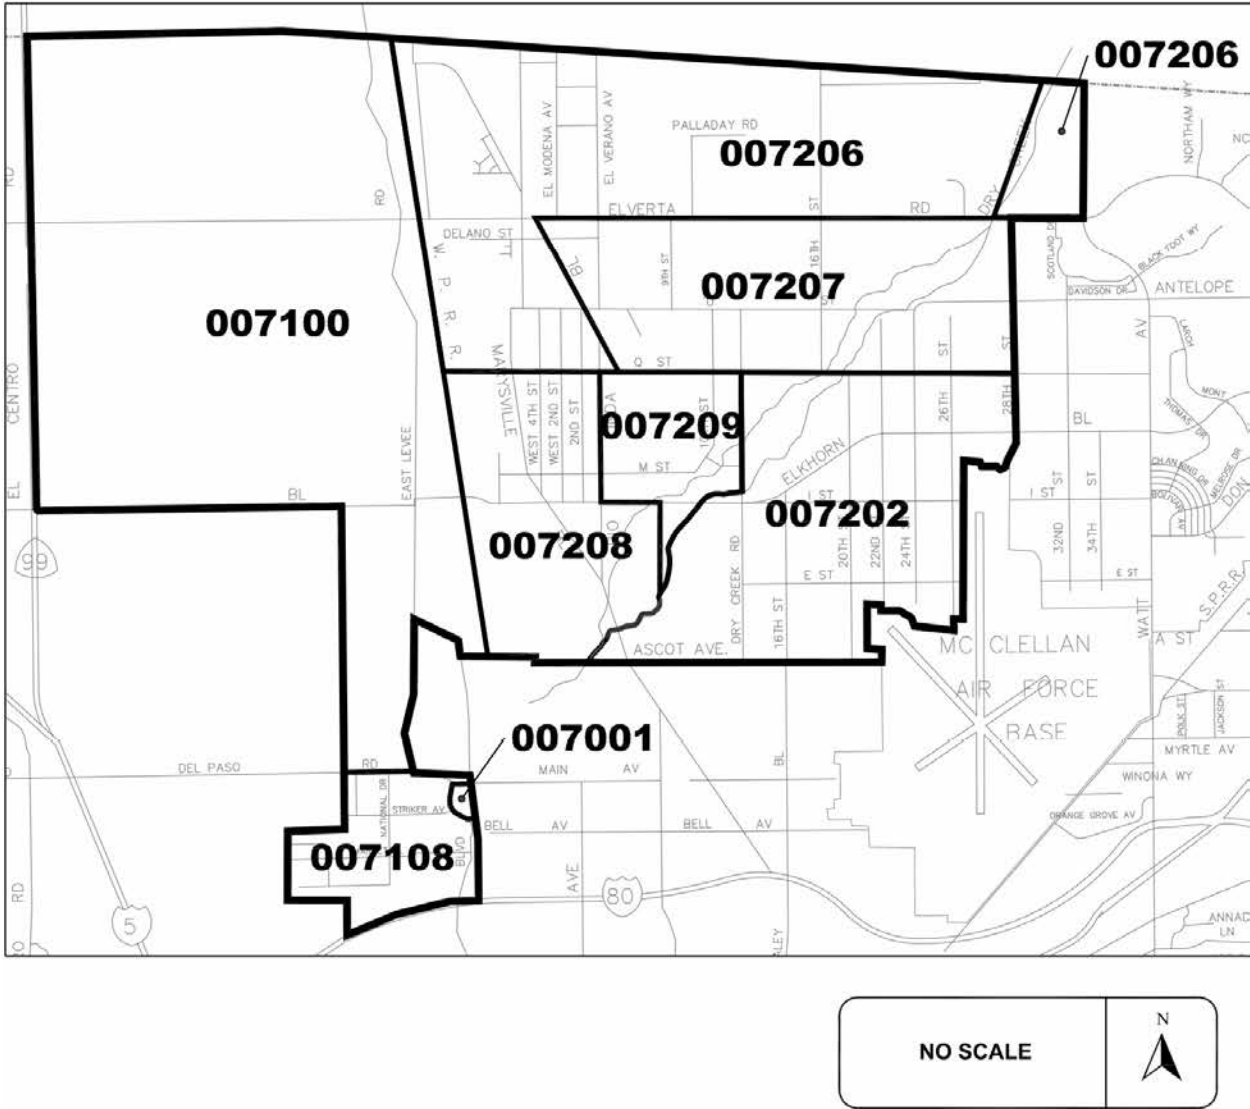

Figure 9 — 2000 Census Tracts Map

*RIO LINDA—ELVERTA RECREATION & PARK DISTRICT
DISTRICT MASTER PLAN*

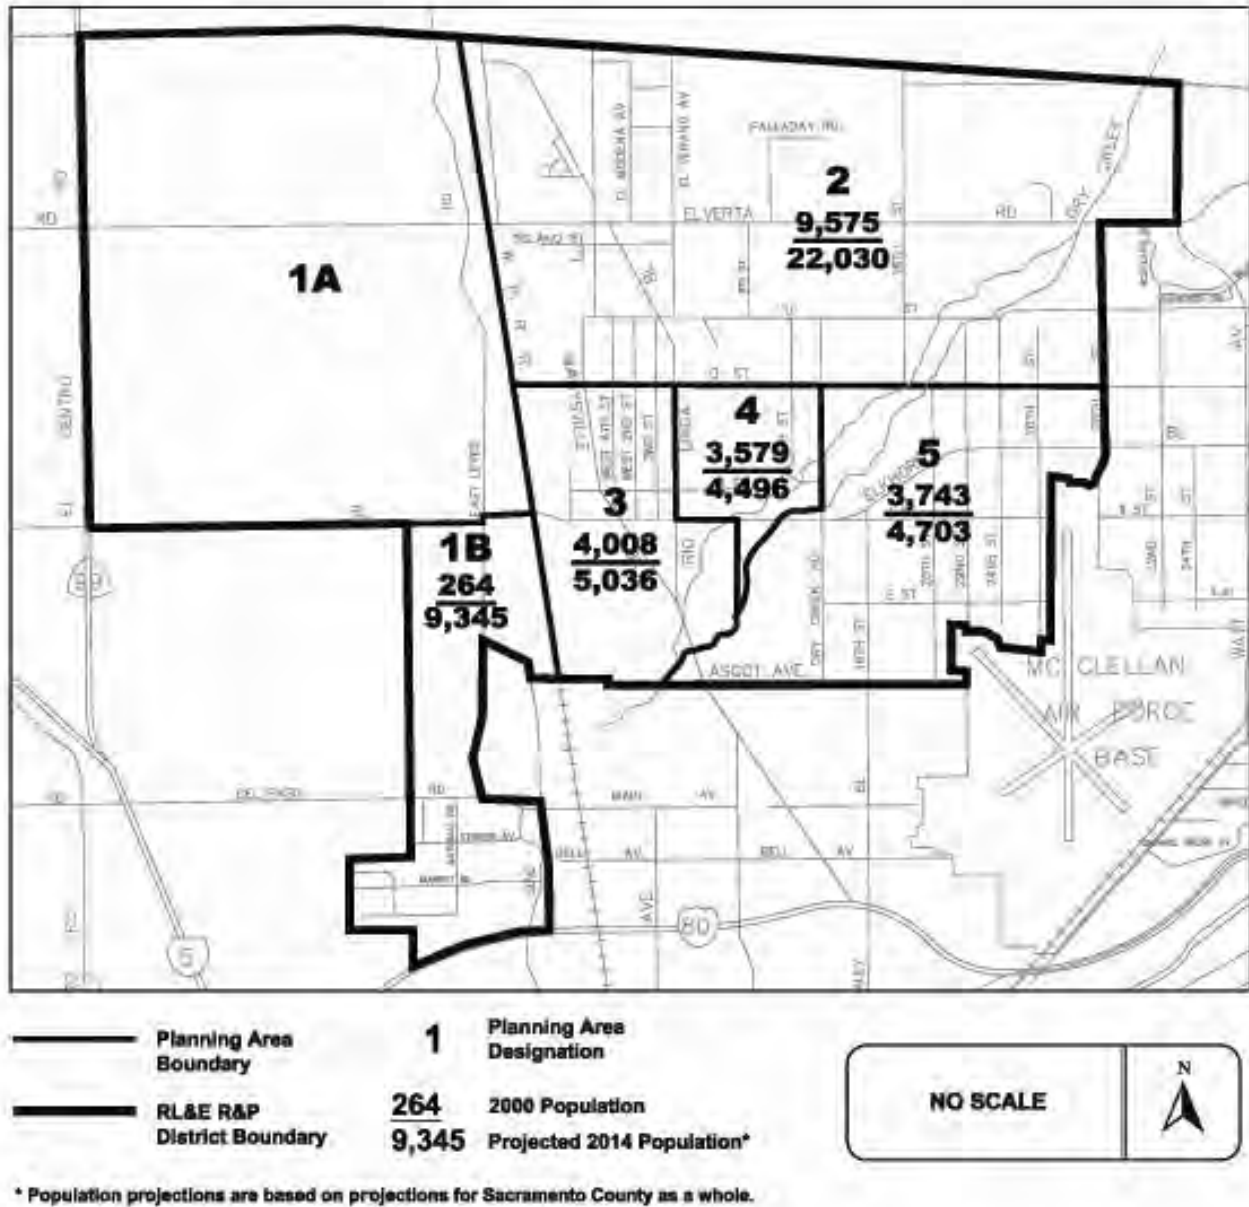

Figure 10 — Population Growth Map

Planning Area #1B

The lower portion of Planning Area #1B is mostly manufacturing-type uses, noted by office and industrial parks, including a Special Sign Corridor and Landscaped Freeway designations. The portion north of Del Paso Road is predominantly AG-Residential with significant areas dedicated to pasture. A portion of the District south of Planning Area 1B once crossed Interstate 80, but was annexed to the City of Sacramento during the Raney Reorganization in June 1982.

The future needs for schools, parks, trails and open space areas in Planning Area 1B needs to be incorporated in the Public Facility Financing Plan for the future developments proposed in this area.

Planning Area #2

Agricultural zoning (both AG and AR) characterizes a large portion of this area. There are some large pockets of industrial and industrial reserve at the southwest portion near the railroad. Also there is a concentration of RD-2 and RD-5 on either side of Rio Linda Blvd, between Elverta Road and U Streets. The highest residential zoning for this area is RD-10, located north of U Street and west of Dry Creek Road. Another area of RD-5, which includes AR-1, is located north and south of Elverta Road and generally west of Dry Creek. West of Watt Avenue to Dry Creek is another concentration of AG and AR zoning. The extreme eastern portion is dominated by the presence of Dry Creek.

A number of elementary schools are located here: Alpha Middle School; Elverta Elementary; and one future Jr. High School site. The Elverta Switchyard, serving the Bureau of Reclamation and SMUD lines is located at the western boundary on the south side of Elverta Road. A Fire Station is located at Rio Linda Boulevard and Elverta Road, and the Post Office is located on Delano Street at Rio Linda Boulevard.

The District's Babe Best Park is located at 10th and U Streets, while the County's Gibson Ranch Regional Park is located in the northeast portion, west of Dry Creek. Cherry Island Golf Course is located south of Gibson Ranch, with Cherry Island Soccer Complex, at the northwest corner of 28th and U Streets.

The proposed Elverta Specific Plan covers 1,734 acres in the eastern half of this Planning Area with a build-out capacity up to 4,950 residential units of housing and potentially 12,375 residents. The improvements proposed in this community includes various features such as Elverta Neighborhoods, Town Center District, Village Center Neighborhoods, Residential Neighborhoods, Parks, Schools, and Open Space Areas to provide character and identity to this proposed community. Located in the Appendix H are further details regarding the proposed parks, trails and open space areas that are included in the Elverta Specific Plan.

Planning Area #3

The north, west, and southern portions of this area are relatively low in population due to their zoning. The northeastern and central portions show a

concentration of RD-5 zoning with areas of RM (mobile home) and other residential densities as high as RD-10 and RD-20. The area towards the west boundary (Western Pacific Railroad) is characterized by industrial reserve and manufacturing zoning (IR and M) with some agriculture residential (AR). The southeast corner is mostly in the floodplain of Dry Creek and is zoned Recreation Reserve (RR-F) and AG-W (F). There are several small areas of commercial: GC (General Commercial) on Rio Linda and Elkhorn Boulevards; LC (Limited Commercial) on Front Streets east of Rio Linda School, and at Rio Linda and E Streets.

The two elementary schools in this area are Westside and Rio Linda. There is also a school site at West 4th and Q Streets. Westside Park is located adjacent to Westside School.

Planning Area #4

This is the smallest of the five planning areas, characterized by RD-5 residential zoning. It has a concentration of commercial and business zoning (LC, GC, BP, and SC), and several small pockets of high density zoning (RD-20). It has the largest area in the floodplain of Dry Creek. The only school is Orchard Elementary. This "downtown" portion of Rio Linda is the location for the Fire Station, Chamber of Commerce, Post Office, and the Library.

Rio Linda Central Park is located at the southern tip; south off of Elkhorn Boulevard and between Dry Creek and the former Sacramento Northern Railroad. The Rio Linda Community Center, which houses the Recreation and Park District's offices, is located south of Oak Lane and north of Dry Creek. Rio Linda Central Park Horse Arena is between Elkhorn Boulevard and north of Dry Creek.

Planning Area #5

The zoning for this planning area is almost entirely AR (Agriculture Residential), with a small amount of industrial (M-1) at the northeast portion and some adjacent to McClellan Business Park. There is a node of commercial at the intersection of E Street and Dry Creek Road. The southwest corner is zoned CO (commercial recreation) and includes the private Rio Linda Airport.

The two elementary schools in this area are Vineland and Dry Creek. Rio Linda High School and Rio Linda Junior High School are located at the southwest corner of Dry Creek Road and Elkhorn Boulevard.

D. Barriers and Trails

1) Traffic Count

Auto traffic is heaviest on Elkhorn, Marysville/Rio Linda, and Northgate Boulevards; Del Paso, Elkhorn, and Elverta Roads; and Main Avenue. Elkhorn has the greatest

traffic, with traffic counts of more than 30,400 cars in a 24-hour period west of Watt Avenue. Rio Linda Boulevard, a portion of Dry Creek Road near Elkhorn, and a short area of 'M Street (west of Rio Linda Boulevard) all have traffic counts of over 7,500 vehicles in 24-hours. The Rio Linda traffic count increases to over 9,400 north of its juncture with Marysville Boulevard. For further indication of traffic in the Rio Linda – Elverta Area, please see Appendix F.

2) Barriers

Any street with high traffic counts acts as a barrier to bicycle and/or pedestrian circulation. Additional barriers are the Western Pacific Railroad and water features such as the East Main Drainage and East Drainage Canals (although the latter is currently in the area of agriculture usage). Dry Creek, Rio Linda Creek and several small unnamed creeks also serve as barriers, especially during the rainy season. Any park development in new locations such as Elverta Villages should consider these barriers.

3) Bikeways

The Sacramento Northern Railroad Bikeway, once the roadbed of the Sacramento Northern Railroad, is heavily used by both bikers and equestrians. It runs north from the Sacramento City/County boundary to Elkhorn Boulevard, and then splits east to the District boundary, and north to the Rio Linda Depot Park. One of the proposed bikeways that will have the greatest impact on the future recreational opportunities in the Rio Linda/Elverta area is the trail system planned for the Dry Creek Parkway. The other is the extensive multi-use trail system planned for the Elverta Villages which includes many trails along drainage canals. The Great Northern Bikeway, the Ueda Parkway, Elkhorn Boulevard, Dry Creek Parkway, and other County-designated trails will be very critical in enabling local residents to travel conveniently to regional destinations. See Bicycle Route and Trails Plan Map on page III-11, showing the Sacramento County's Trails System with some additional trails proposed in the District.

4) Equestrian Trails

Currently, the only officially designated equestrian trail in the Rio Linda/Elverta area is located in Gibson Ranch Recreation Area. It is a 1.2 mile trail along Dry Creek north from Elverta Road, with 2 equestrian staging areas. Given the significant interest in equestrian activities in the community, it is critical that the District support the County in the development of the trails within the Dry Creek Parkway, designate other trails, and provide linkage to other County and regionally-designated equestrian trails. The proposed multi-use trail system planned for the Elverta Villages should also be linked with adjoining trail system. In 1988, the Open Space Task Force proposed an additional 33.3 miles of equestrian trails in the Rio Linda/Elverta area, to join with the 398.6 existing and proposed trails elsewhere in the County. These additional trails should be prioritized and added to the Countywide Trails Plan.

THIS PAGE IS INTENTIONALLY LEFT BLANK

V. Park Planning Criteria and Standards

A. *Park Acreage Standard*

The National Recreation and Park Association (NRPA) recommends that communities have a park system composed of park and open space lands totaling between 5 to 10 acres of developed lands for every 1,000 population. Although the national standard varies from community to community, it is a standard that many communities have used to develop a minimum of 5 acres per 1,000 population for traditional active / passive park acreage, with additional acreage for special use facilities and open space (non-traditional parklands) allocated in another 5 acres, for a total standard of 10 acres per 1,000 population.

A standard of 5 acres per 1,000 population is considered minimally adequate for providing the traditional active/passive recreation acreage and is consistent with the Quimby Parkland Dedication Ordinance.

1) **RLERPD Standard for Parkland Dedication**

In order that RLERPD adequately provide parks and recreation facilities for its present and future residents, and be able to offer the quality of parks and open space amenities that the community deserves, the District needs to increase the present 1.5 acres per 1,000 of developed parklands to the 5 acres per 1,000 standard for the District in conformance to NRPA and Quimby Parkland Dedication requirement.

2) **Traditional Parklands**

Traditional parklands typically provide a variety of active/passive facilities, such as sports fields, multi-use turf, hard court areas, children play areas, and picnic areas. This type of parkland is categorized into a hierarchy of parks types: mini, neighborhood and community parks and is granted full parkland dedication credit towards meeting the 5 acres per 1,000 population standard as required in the Quimby Ordinance.

3) **Non-Traditional Parklands**

Non-traditional parklands refer to open space areas such as natural feature preserves, oak woodlands, riparian areas, detention basins and linear parkways/greenbelts. These non-traditional parklands most often are not granted parkland dedication credit in meeting the 5 acres per 1,000 population Quimby Ordinance requirement because they do not fulfill the needs of active park and recreation activity needs. Although such areas are a desirable community amenity, enhance and provide character to the area, these also do not fulfill the traditional parkland use and program requirements, even if a measure of public accessibility and recreational improvement is provided.

In some cases, if the non-traditional parklands are developed to District standards and with District oversight, public access and park and recreation improvements are provided, and an annual maintenance fund for maintaining the facility is provided, the District Board may consider providing partial credit on a case by case basis.

4) Parkland Approval Process

The location of the parkland should adhere to the parkland location criteria contained herein, be consistent with the District Master Plan, and be approved by the District Board of Directors prior to the approval of a tentative map or parcel map per the County Parkland Dedication Ordinance. Parklands dedicated shall be net useable acres and not encumbered by power line easements, utility facilities (i.e. - well sites, sewer lift stations, electrical sub-stations, etc.), flood plains, drainage channels, riparian buffers, wetlands and other environmental conditions. It is of critical importance that dedicated parkland is of a character, size and shape that will allow for maximum recreational activity and provide for the development of facilities that meets the standards for the park type with the facilities required.

A Conceptual Site Plan at scale acceptable to the District shall be submitted to the District that indicates the size, shape, terrain, natural site features, etc., and that demonstrates the development potential of the site in meeting the facilities needed for the proposed park type and recreation activities. This plan shall be reviewed and approved by the District Board of Directors prior to the acceptance of a tentative map or parcel map by the County.

B. Park Category Description and Recommended Size

The following description of park categories reflects a hierarchy of parks that will compose the RLPRD park system. Classification into park categories is based on use, function, acreage, service area and population served. This system of park organization includes mini parks, neighborhood parks; community parks, special use areas, park/school sites, and a regional park.

1) Mini Parks

Mini parks are generally less than 2 acres in size and are designed to serve a concentrated or limited population. They are developed for a unique or single purpose, such as a recreation facility for a small or isolated neighborhood, to provide access into a linear greenbelt or to preserve an isolated natural feature. They are generally placed in residential neighborhoods in close proximity to small lot residential development and higher density residential development, including apartment and condominium complexes. Mini parks are also beneficial where arterials or other site features such as drainage corridors or railroad tracks bisect neighborhoods. Mini parks are of less value in single-home residential areas where yards are common.

In comparison to neighborhood and community parks, mini parks provide necessary, but limited, recreation benefit to the entire community when examined in light of the cost of construction and long-term maintenance costs. For these reasons, the District discourages the development of additional mini parks.

2) Neighborhood Parks

This type of park functions as the core facility within the park system and should seek a balance between active and passive recreation uses as well as creating a sense of place for the neighborhood. Recreational facilities include sports fields, multi-use turf areas, hard court games, children's play areas, picnic structure and tables, and social gathering

areas. This is the essential core park for residential areas, as they provide the most close-at-hand recreational facilities and should be evenly distributed throughout the District. Neighborhood parks should be easily accessible to the neighborhood population, geographically centered within neighborhood to be served, and within safe walking and/or biking distance. Neighborhood parks are often developed adjacent to an elementary/intermediate school sites.

A neighborhood park typically has a service area that encompasses a 1/4 to 1/2 mile radius and serves a population of 2,000 to 5,000. The desirable site size is 5 to 15 acres. Generally, 5 acres is considered as the minimum size necessary to provide space for the typical facilities desired within a neighborhood park.

3) Community Parks

Community parks are designed to accommodate a wider variety and higher intensity of recreational uses than neighborhood parks, and may have unique amenities such as special use facilities (i.e. community center, aquatic center, etc.) or unique natural feature preserves. Community parks are larger than neighborhood parks and are intended to serve several neighborhoods. Typical amenities/facilities may include large turf areas as open space, large children's play areas, interactive water play feature, group picnic facilities, lighted sports fields for organized sports, tennis courts, community/senior center buildings, library buildings, outdoor concert area or amphitheater, aquatic complex, concession/restroom facilities, and off-street parking. Community parks often include land with outstanding natural features/qualities for activities such as walking, viewing, sitting, and picnicking and/or may be a site with some historic significance in the community. Community parks may be located adjacent to intermediate or high schools. A community park may also function as a neighborhood park for the immediate area.

A community park serves several neighborhoods with a 1 to 2 mile service area radius and an approximate population of 20,000. The desirable size for a community park is 20 to 150 acres or more; its actual size should be based on the land area needed to accommodate the desired facilities and uses, also the need to preserve or protect environmental or historic features of significance.

4) School-Park Sites

In many communities, planning school and park sites adjacent to one another have historically proven to be very beneficial. By combining the resources of two public agencies, the school-park facility allows for expanding the recreation, social, and educational opportunities available to the community in an efficient and cost effective manner. Properly planned, school-park sites can become a valuable community resource and vital part of the park system. The important outcome in the joint-use relationship is that both the school district and the park system benefit from shared use of facilities and land area.

RLERPD will look for opportunities to work with School Districts on joint school-park projects so long as it can be demonstrated that the arrangement will be beneficial to the park agency and does not include extensive use restrictions and limitations.

5) Special Use Facilities/Areas

These areas do not fit into the other park categories because they vary in character and use from more traditional park sites. Special Use Facilities/Areas are defined as facilities such as a community center, senior centers, or sports complex that services a specific recreational need. Lands which are set aside for the preservation of significant environmental, cultural, and/or historical resources are also included in this park category. The existing natural site features or designated use for the land may make providing active recreation facilities infeasible, but the land may have value for interpretation and preservation. Where this occurs, it would be appropriate for adjacent landscape or buffer areas to include interpretive signage indicating the nature of the significant resource, its history, value and condition, preservation requirements, plant and wildlife species, restoration methods and other related information. Where possible within natural special use areas, viewing and sitting areas, walking trails and picnic tables should be incorporated into the site design.

The following table summarizes the hierarchy of parks within the District including the type of park, its dedication requirements, desirable size and service area radius.

Table 10 — Park Type, Size, and Service Area

Type	Desirable Size	Service Area	Dedication Requirement
Mini Park	½ - 2 acres	1/8 – ¼ mile radius	5 acres per 1,000
Neighborhood Park	5-15 acres	¼ - ½ mile radius	
Community Park	20 -150 plus	1-2 mile radius	

C. Recommended Park Location Criteria

A key component in planning and developing a park system is determining the location, distribution and type of park acreage required for providing geographical accessibility and the desired level of service in order to meet recreational needs of the community. It is not enough to provide acreage wholesale, if it is not evenly distributed throughout residential areas and capable of providing parks that meets the community needs. The location of some recreation facilities is important; while many special community facilities may be located anywhere within the planning area, every neighborhood needs immediate access to certain facilities, including children play areas, open turf areas for impromptu play, active and organized play areas, picnic areas and gathering areas for socializing. For this reason, standards have been established for park locations and development.

The locations of each type of park category, neighborhood and community, requires careful planning regarding travel distance and other barriers, including highways, railroads, etc., so residents will have reasonable access to the parks and facilities. Park service areas have been established using national standards based on the population served and reasonable travel distance for each category of park. Mini parks are small in size and are designed to serve a concentrated or limited population and generally are within less than one-quarter mile of the population to be served. Neighborhood parks are designed to serve an approximate population of 2,000 to 5,000. They have limited need for parking, and users generally walk or bike to the park. A reasonable distance to walk or bike to a neighborhood

park is about 1/2 mile. Community parks provide facilities and recreation programs that serve 20,000 or more people, and typically serve residents within a 2-mile service area radius.

The following establishes the recommended guideline and criteria for the location of each park type.

1) General Location Criteria for All Park Types

- Ease of access from throughout the service area, even geographical distribution, connection to interconnecting trail system and relationship to other parklands is key criteria in site location.
- Provide convenient and safe access for pedestrians, bicyclists and autos from throughout the service area.
- Locate with frontage on at least one public street.
- Choose sites that have interesting or special features.
- Locate parks in areas that can be viewed easily for security reasons.
- Locate parks so as to link to existing and planned bikeways, trails, open space network, and other connections.
- Choose sites that avoid possible hazards such as heavy traffic, railroads, industrial sites, or electrical transmission line easements.
- Provide buffers between active use areas and adjacent residential development.
- Choose sites that exhibit the physical characteristics appropriate for its intended use (i.e. size, shape, topography or natural features).
- “Left-over” parcels of land that are undesirable for development are generally undesirable for traditional park development and should be avoided.
- Lands within a flood plain should only be considered if developed facilities and supporting lands can be accommodated above the 100-year flood elevation.

2) Mini Parks

- Locate in the interior of neighborhoods or near high-density development.
- Locate where immediate access to a neighborhood park is limited.
- Locate to address limited, isolated or unique recreational needs.
- Locate near high-density development.
- Locate for accessibility by way of interconnecting trails, sidewalks, or low-volume residential streets.
- Avoid undesirable “left-over” or odd-shaped parcels.
- Consider opportunities for preserving natural features.
- Locate, where required, as access points into linear parkways or greenbelts.

3) Neighborhood Parks

- Neighborhood parks are planned to function as the core of the park system; locate as the recreational and social focus of the neighborhood.
- Locate with frontage on residential low-volume or collector streets.
- Avoid separation of park and residential areas by major arterial or other barriers.
- Limit activities that generate traffic from outside the neighborhood.
- Plan for both active and passive recreation facilities, accommodating a wide variety of age and user groups.
- Provide off-street parking where recreational facilities/uses require.
- Select sites that exhibit the physical characteristics appropriate for both active and passive recreational uses.
- Configuration of the site shall be contiguous usable (nonlinear) land, with sufficient level terrain to accommodate active organized recreation.

4) Community Parks

- Locate to serve the recreation needs of several neighborhoods or larger sections of the community.
- Locate with frontage on residential collector or arterial streets.
- Locate for access by interconnecting trails and public transit.
- Locate adjacent to intermediate or high schools, when possible.
- Configuration of the site shall be contiguous usable (nonlinear) land, with level terrain to accommodate active organized recreation.
- Select sites that exhibit the physical characteristics appropriate for both active and passive recreational uses. Active organized group or sports related activities typically are located in community parks.
- Locate larger, more active facilities away from residential neighborhoods.
- Provide off-street parking.
- Incorporate special or unique features.

5) School-Park Sites

- Develop joint/cooperative use agreements with schools when it is determined to be beneficial to the park agency.
- Seek opportunity to work together on joint planning, land acquisition, development, and operation with schools when it is advantageous to the park agency.

6) Special Use Facilities/Areas

- Special use facilities should be located based on the type of facility, recreation need serviced by the facility, and land availability.
- Special use facilities should be viewed as strategically located community-wide facilities rather than serving well-defined neighborhoods or areas.
- Locate special use facilities within reasonable and equal driving distance from population served.
- Lighted sports complexes should be located adjacent to non-residential land uses.
- Locate for access from collector or arterial streets, public transit, and interconnecting trails.
- Individual sites exhibiting significant environmental, cultural or historical resources set aside for preservation.
- Land that is unsuitable for development but offer natural resources potential such as natural vegetation, drainage ways or detention basins, and other areas that may be acceptable as “non-traditional parklands.”

D. Open Space and Greenbelts

1) Linear Parkways, Greenbelts and Open Space

- Locate consistent with the County General Plan, Land Use, Circulations, Conservation and Open Space Element.
- Locate to provide an interconnecting multi-use trail system between parks, recreation facilities, schools, and open space.
- Provide controlled access to open space areas except those areas sensitive to human presence.
- Locate open space and greenbelts to provide a buffer between conflicting land uses.
- Provide a "buffer" or separation between neighborhoods.
- Provide an interconnecting system of open space corridors that, where feasible, incorporate bikeways, pedestrian paths, and equestrian trails.
- Incorporate special or unique features such as drainage ways and sloughs.

2) Bikeways

- Ensure that needed bicycle lanes/routes and multi-use trails are included in the General Plan, that every effort is made to include these improvements in related public works projects, and are included as requirements in development projects as a condition of approval.
- Secure any available outside funding to support the acquisition, development, and operation of bicycle lane/routes, and multi-use trail facilities.

- Work cooperatively with County of Sacramento to develop more effective mechanisms for enforcing the existing bicycle regulations, and provide bicycle safety education.
- Encourage Regional Transit to increase efforts to promote alternative modes of travel by providing more carry-on options for bicycles on buses.
- Encourage and support a network of pedestrian/bicycle trails in the design of residential neighborhoods.

3) Detention Basins, Utility and Drainage Corridors

Especially in some of the developing portions of the District, wetlands and sensitive habitat areas are being preserved for open space, wildlife habitat, and creek ways preserved to convey flood water. These same areas can be an invaluable community resource for open space and natural scenery, areas to view wildlife, and areas for multi-use trails and other recreational use.

- The District should actively work with the County, and the developers to insure that these sensitive open space areas are preserved, that natural creek ways are protected with adequate buffer, that the open space preserve areas are linked together to create natural corridors for wildlife migration, and that every effort be made to include public access and controlled public use as part of managing these open space areas.
- When it is advantageous for the District, incorporate natural and open space areas that are set aside for drainage ways, detention basins, creeks, wetlands and open space preserves as part of the District park system.
- Plan, engineer and maintain detention basins to serve multiple functions of flood control, improving water quality, providing wildlife habitat, enhancing environmental quality, and also providing recreational opportunity.
- Develop joint use agreements for utility corridors that do not conflict with the primary functions of these corridors; agreements that accommodate desirable, alternative public use; and agreements to convey such corridors or portions thereof to the District if it is found no longer of value to the entity.
- Preserve, protect, and enhance creekways to accommodate necessary surface water runoff. Protect and enhance the values of creekways as a resource for wildlife habitat, wildlife migratory corridors, as a valuable landscape and visual amenity in a neighborhood, and as a potential route for hiking, bicycle, and equestrian trails.
- Support programs that protect and enhance water quality, and encourage the restoration of creekways to support wildlife, habitat, and environmental quality.

E. Open Space Transition Options

Transition areas bordering open space, detention/retention basins, and other restricted use natural areas, will be designated and maintained with a developed and manicured approach as opposed to being left in a natural state. A minimum of fifteen (15) foot developed transition area with turf and trees, or shrub/groundcover and trees, with mow strip and sidewalks or multi-use trails separating the street from the natural area will be provided.

F. Parks and Open Spaces Managed by Others

Major park facilities within and adjoining the District such as the Dry Creek Parkway, Gibson Ranch, Ueda Parkway, Steelhead Creek, Cherry Island Golf Course, Cherry Island Soccer Complex, and others provide invaluable recreation opportunities for the residents of District. To the extent possible, participate in the planning and management of adjoining recreation facilities, and develop ways to cooperatively conduct programs of mutual benefit.

G. Concession Operation

Develop policies to encourage concession operations on District lands that serve public needs and interests, are compatible with the intended uses of the parkland, are compatible with the surrounding neighborhood, and will be beneficial to the District from a park operation and revenue standpoint. Also investigate the opportunities for the private concessionaire to maintain portions of the park/facility that its services impacts.

H. Private Recreation

The District should work with private recreation providers to enhance the recreation programs available to the public. Through cooperative efforts with the private sector, the District could gain additional revenue, the community could be provided expanded and higher level of service, and some of the burden of providing similar services by the District would be diminished.

I. Recreation Facilities Development Standards

The National Standards by NRPA suggest a wide range of recreational facilities many of which may or may not be suited for the District. Therefore, the NRPA development standards were evaluated, and the District Standards were developed based on general practice in the region. Also facilities standards have been established for many new types of recreation activities that are gaining in popularity such as skate parks, roller hockey courts, interactive water play areas, disc golf and dog parks, etc. Table 11 includes recommended space requirements, size, dimensions, orientation, number of facilities per population, and service area radius.

**Table 11 — Rio Linda Recreation and Park District
Park Facility Standards**

Activity/ Facility	Units per / Pop.	Space Req.	Recommended Size & Dimensions	Recommended Orientation	Service Area Radius
Amphitheater	1/50,000	1.0 acre plus	Seating for 500 to 1,000	Seating facing away from sun	
Archery Range	1/50,000	5 – 10 acres	Safety fan of 300 yds with safety embankments or buffer	Target direction 45 degree of north. Locate in turfed field	30" travel time
Ball Field: Baseball Lighted	1/15,000 1/30,000	3.0 – 3.85 acres min.	Center field 400'	Line from home plate through pitcher's mound runs east-north-east	
Ball Field: Little League Lighted	1/5,000 1/30,000	1.2 acres min.	Center field 200 – 250'	Same as baseball	¼ to ½ mile
Ball Field: Softball Lighted	1/25,000	1.5 – 2.0 acres	Center field 250 – 300'	Same as baseball	
Basketball, Indoor	1/8,000				
Basketball, Outdoor	1/5,000	2,400 – 7,280 sf	46' to 50' x 84' 50' x 84'	Long axis north and south	¼ to ½ mile
Campground	1/100,000	10 - 40 acres plus	Varies with site and program objectives 40,000 sf	N/A	30" travel time
Community Center (teens)	1/50,000	3.0 – 5.0 acres site	Varies with community and program objectives	N/A	1 to 2 miles
Community Center (seniors)	1/30,000				
Cultural Gardens	1/50,000				
Dog Park	1/25,000	¼ to 2.0 acres	Varies with site and proposed program	N/A	30" travel time
Field Hockey	1/20,000	1.5 acres min.	180' x 300' with 10' clearance on all sides	Long axis north and south	15" to 30" travel time
Football	1/40,000	1.5 acres min.	160' x 360' with a 10' clearance on all sides	Long axis north and south	15" to 20" travel time
Frisbee Course	1/100,000	5 acres plus	Site with tree obstacles and terrain desirable	N/A	30" travel time

*RIO LINDA—ELVERTA RECREATION & PARK DISTRICT
DISTRICT MASTER PLAN*

Activity/ Facility	Units per / Pop.	Space Req.	Recommended Size & Dimensions	Recommended Orientation	Service Area Radius
Golf: Par 3 9 Hole	1/25,000	50 to 60 acres.	Average length: 600 to 2,700 yards	Majority of holes on a north south axis.	½ to 1 hour travel time
Golf Par 3 18 hole	1/50,000	110acres min.	2,250-6,500 yards	Majority of holes on a north south axis.	to 1 hour travel time
Golf driving range. Min 25 tees	1/50,000	13.5 acres min. 25 tees	900' x 690'. Add 12' width for each additional tee.	Long axis south- west-northeast with golfer driving toward northeast	30"travel time
Gymnasium	1/10,000	Combined with community center or school	Provide space for multi-purpose courts, storage, lockers, restroom / shower facility, office, and parking	N/A	
Handball	1/20,000	800 sf for 4 wall, 1,000 sf for 3 walls	20' to 40' with a min. of 10' to rear of 3 wall court.	Long axis north- south. Front wall at north end.	15" to 30" travel time
Hard Surface Court, multi use	1/10,000	9,840 sf	120' x 80	Long axis of courts with primary use is north-south.	1-2 miles
Horseshoe	NS	1,500 sf	10' x 50' with 10' clearance between pits.	Long axis north – south.	
Model Boating Lake	NS	½ to 2 acres	Varies with site and program objective	N/A	30" travel time
Multi-Use Recreation Center	1/10,000				
Paint Ball Course	NS	Varies	N/A	N/A	One hour travel time
Picnic: Family	1/2,500	N/A	Individual tables or shelters with 4 tables and BBQ	N/A, though shade trees or shelter is desirable.	¼ to ½ mile
Picnic: Group	1/10,000	1.0 – 2.0 acres	Shelter with multiple tables and group BBQ for small and large groups	Near parking lot, recreational amenities, and surrounded by multi-purpose turf.	1 mile
Play Apparatus	1/5,000	¼ to 1 acre	Age appropriate creative play apparatus and facilities often divided into youth and pre- teen areas.	Within convenient distance of parking, picnic facility, and restroom.	¼ to ½ miles travel time.

*RIO LINDA—ELVERTA RECREATION & PARK DISTRICT
DISTRICT MASTER PLAN*

Activity/ Facility	Units per / Pop.	Space Req.	Recommended Size & Dimensions	Recommended Orientation	Service Area Radius
Roller Hockey	NS	0.5 acres	Youth 80'x 60' Adult – 85' x 80'	N/A	½ - 1 miles travel time
Senior Center	1/30,000	Combined with community center	Same as community center	N/A	
Shooting Range	NS	Varies	Varies whether indoor or outdoor.	North – south orientation with the target to the north in outdoor range.	N/A
Shooting: skeet and trap field	1/100,000				
Skeet and Trap Range	1/50,000	50 acres min.	300 yds x 400 yds min.	North to northeast shooting direction	N/A
Skate Park	1/50,000	0.5 to 1 acre	Varies depending on type of facility	N/A	30" travel time
Soccer, youth	1/7,000	0.5 to 1.25 acres	120' x 180' or 180' x 300'	Same as football	¼ to ½ mile
Soccer, Regulation	1/3,000	1.7 to 2.1 acres	195' to 225' x 330' with 10' min clearance all sides	Same as football	1-to 2 miles
Sports Field: Girls Softball	1/5,000				
Sports Field: Girls Soft Lighted	1/20,000				
Sports Field: Soccer Lighted Synthetic	1/25,000				
Sports Field: Multi-use	1/3,000				
Swimming Pool	1/20,000	Varies on size of pool and amenities. Usually 0.5 to 5 acres	Pool size and configuration varies with program objectives	Care should be taken to site lifeguard station in relation to afternoon sun.	15 to 30 minutes travel time
Teen Center	NS	Varies with program objectives.	N/A	N/A	
Tennis	1/4,000	7,200 sf for single court. 2 acres for complex	36' x 78' with 12' clearance on both sides and 21' clearance on ends	Long axis north and south	¼ to ½ miles

Activity/ Facility	Units per / Pop.	Space Req.	Recommended Size & Dimensions	Recommended Orientation	Service Area Radius
Track ¼ mile	1/20,000	4.3 acres	Overall width – 276' Length – 600.02'	Long axis in sector from north to south to north- west-south-east with finish line at northerly end.	15 to 30 minutes travel time
Trail System	1 system/ region	N/A	Well-defined trailhead. Width - 10' to 12'. Grade – 5% not to exceed 15%. Trail capacity: Rural – 40 hikers / day / mile. Urban – 90 hikers / day / mile	N/A	N/A
Turf Area: Multi-Use	1/3,000	2.0 acres plus	200' x 400' or greater depending on program and objectives	Same as football	¼ to ½ miles
Volleyball (sand or indoor)	1/5000	4,000 sf min.	30' x 60' with 6' min. clearance on all sides.	Long axis north and south	¼ to ½ miles
Water Park	1/50,000	¼ to 1 acre or more	Varies with program objectives and amenities.	N/A	15 - 30 minute travel time

J. Park Development Standards

The following summarizes the park development standards, including park facilities, location criteria, and general park amenities.

Table 12 — General Park Standards

Table 13 — Mini Park Standards

Table 14 — Neighborhood Park Standards

Table 15 — Community Park Standards

Table 16 — School-Park Site Standards

Table 17 — Special Use Facility Standards

Table 18 — Linear Parkways, Greenbelt and Open Space Standards

Table 12 — General Park Standards

SIZE AND SERVICE AREAS

- Depends on the park type: mini, neighborhood, community, city-wide park.

SITE CHARACTERISTICS

Location and Access

- Ease of access from throughout the service area, even geographical distribution, connection to interconnecting trail system and relationship to other parklands is key criteria in site location.
- Provide convenient and safe access for pedestrians, bicyclists and autos from throughout the service area.
- Locate with frontage on at least one public street.
- Choose sites that have interesting or special features.
- Locate parks in areas that can be viewed easily for security reasons.
- Locate parks so as to link to existing and planned bikeways, trails, open space network, and other connections.
- Choose sites that avoid possible hazards such as heavy traffic, railroads, industrial sites, or electrical transmission line easements.
- Provide buffers between active use areas and adjacent residential development.
- Choose sites that exhibit the physical characteristics appropriate for its intended use (i.e. size, shape, topography or natural features).
- “Left-over” parcels of land that are undesirable for development are generally undesirable for park development and should be avoided.
- Lands within a flood plain should only be considered if the facilities are constructed above the 100-year flood elevation.
- Provide universal access to all facilities per American with Disabilities Act (ADA) requirements.

Play Areas

- Creative play area for ages 2-5.
- Creative play area for ages 6-12.
- Include play equipment for active, social and imaginative play.
- Provide District approved play surface(s) that meet ADA requirements, and with necessary drainage system.
- Provide adjacent seating areas for adult supervision and other family activity such as picnicking.
- Provide shade trees throughout the park.
- Locate proximate to other desirable activities such as turf fields, spectator areas, group picnic areas, pathways, etc.

- Locate appropriate to other conveniences such as parking, restrooms, etc.
- 0.5-acre minimum.

Park Features and Plans

- Provide irrigated turf, sport fields, and park features as required for the type of park.
- Irrigation system shall be automated controlled system as required by District.
- Landscape planting including trees, shrubs, groundcover, turf, and vines shall meet District standards and requirements.
- Park improvement plans and specifications shall be developed to District standards and requirements, and construction documents will require District approval prior to construction.

Passive Recreation

- Provide benches, pathways, some shade trees and informal turf for impromptu play or natural areas for passive recreation.

Lighting

- Provide lighting at parking lots and pathways for security and safety.
- Sports field lighting as appropriate for park type and neighborhood.
- Design to minimize glare and spillover into adjacent residential areas.

Bicycle Parking

- Lockable bicycle parking at suitable locations.

Fences and Walls

- Provide 6' wrought iron, non climb fence, painted black along the edge of parks abutting open space or natural areas with appropriate pedestrian or maintenance gates as required by the District.
- Provide 6' masonry wall along park edge abutting commercial, and industrial land use.

Pathway System

- Provide a central multi-use paved pathway system, minimum ten-foot wide, for service and emergency access to major facilities within the park.
- Provide secondary multi-use paved pathway system, appropriate width determined by type of use and demand, throughout the park.

Site Furnishings

- Trash receptacles
- Drinking fountain, handicap accessible with a separate dog watering feature
- Benches
- Picnic tables
- Barbecues
- Park signage

Table 13 — Mini Park Standards

DEFINITION

- Small parks within residential neighborhoods that may include unique or single purposes, such as: a recreation facility for an isolated area of a neighborhood, or to preserve an isolated natural resource.

SERVICE AREA

- 1/4-mile service radius.

SIZE

- 0.50 to 2 acres.

SITE CHARACTERISTICS

Location and Access

- Locate in the interior of neighborhoods or near high-density development.
- Locate where immediate access to a neighborhood park is limited.
- Locate to address limited, isolated or unique recreational needs.
- Locate near high-density development.
- Locate for accessibility by way of interconnecting trails, sidewalks, or low-volume residential streets.
- Avoid undesirable “left-over” or odd-shaped parcels.
- Consider opportunities for preserving natural features.
- Locate, where required, as access points into linear parkways or greenbelts.

BASIC REQUIREMENTS

- Benches in shaded areas.
- Play area for children, age appropriate.
- Provide site furnishings per general park standards.
- Provide social gathering space for impromptu use by the community.
- ADA accessible drinking fountain

OPTIONAL ELEMENTS

- Small hard court area
- Small turf area.
- Picnic table (2), shaded, to accommodate 4-8 people.
- Shade structure or arbor.
- Fixed in place trash receptacles.

Table 14 — Neighborhood Park Standards

DEFINITION

- Medium-size park that provides scenic and aesthetic value, passive recreation for all ages and designated active areas for a specific neighborhood.
- May be located adjacent to a school's facilities, generally elementary or intermediate.

SERVICE AREA

- ¼ to ½-mile radius to serve a single neighborhood or population up to 5,000, and not separated from the population by a barrier such as a creek, drainage way, arterial road, freeway, or railroad.

SIZE

- Five to twelve acres.

SITE CHARACTERISTICS

Configuration

- Contiguous, usable (nonlinear) shape, with level terrain to accommodate impromptu play and organized sports activities.

Access/Location

- Neighborhood parks are planned to function as the core of the park system; locate as the recreational and social focus of the neighborhood.
- Locate with frontage on residential low-volume or collector streets.
- Avoid separation of park and residential areas by major arterial or other barriers.
- Limit activities that generate traffic from outside the neighborhood.
- Plan for both active and passive recreation facilities, accommodating a wide variety of age and user groups.
- Provide off-street parking where recreational facilities/uses require.
- Select sites that exhibit the physical characteristics appropriate for both active and passive recreational uses.
- Configuration of the site shall be contiguous usable (nonlinear) land, with level terrain to accommodate active organized recreation.
- Locate adjacent to elementary or intermediate schools, when possible.

Character

- May contain natural features for passive recreation
- Should contain large trees for shade and open turf area for free play, sports fields for organized play, areas for picnicking, some natural areas, and a play area for supervised children's play.

BASIC REQUIREMENTS

Passive Recreation

- Open turf area for non-organized sports, minimum one acre to two acres or more desirable.
- Pathway system for walking/jogging according to general park standard.
- Social gathering space.

Active Recreation

- Multi-use turf areas
- Sports fields for organized youth sports league/practice.
- Skate/BMX street feature(s)

Play Areas

- Provide according to general park standards.
- Children creative play area, age appropriate.
- Skate/BMX street features

Family Picnic Areas

- Provide shade structure: 20-25 person capacity for group reservations.
- Tables for 4-8 people each.
- Provide barbecue facilities.
- Locate proximate to other desirable activities such as turf areas, play areas, pathways, etc.

Informal Picnic

- Provide picnic tables for non-reservation use under shade trees.

Site Furnishings

- Provide per general park standards.

Lighting

- Provide lighting at parking areas and along pathways for security and safety.
- Provide according to general park standards.

Shade

- Provide shade structure where natural shade from trees is insufficient.

Restroom

- Restroom, depending on type of park facilities available

OPTIONAL ELEMENTS

- | | |
|--|--|
| <ul style="list-style-type: none">• Exercise course.• Interactive water play feature. | <ul style="list-style-type: none">• Botanical garden.• Off-street parking |
|--|--|

Table 15 — Community Park Standards

DEFINITION

- Large park that includes passive and active recreation facilities that serve to accommodate a wider variety and higher intensity of recreational uses than neighborhood parks.
- May have unique amenities such as natural features for preservation or special use facilities.
- Includes facilities typically found at neighborhood parks and may function as a neighborhood park for the area in which it is located.
- May be located adjacent to school facilities, generally intermediate or high school.

SERVICE AREA

- One- to two-mile radius, approximately 20,000 residents.

SIZE

- 20 to 150 acres plus.

SITE CHARACTERISTICS

Configuration

- Contiguous usable (nonlinear) shape, with level terrain to accommodate active recreation, including youth and adult organized sports leagues.

Access/Location

- Locate to serve the recreation needs of several neighborhoods or larger sections of the community.
- Locate with frontage on residential collector or arterial streets.
- Locate for access by interconnecting trails and public transit.
- Locate adjacent to intermediate or high schools, when possible.
- Configuration of the site shall be contiguous usable (nonlinear) land, with level terrain to accommodate active organized recreation.
- Select sites that exhibit the physical characteristics appropriate for both active and passive recreational uses. Active organized group or sports related activities typically are located in community parks.
- Locate larger, more active facilities away from residential neighborhoods.
- Provide off-street parking.
- Incorporate special or unique features.

Character

- Have open flat areas for active recreation, and desirable visual and natural attributes for passive recreation areas.

BASIC REQUIREMENTS

Sports Facilities

- Lighted regulation facilities for organized league practice, play, and tournaments for softball, baseball, and/or soccer.
- Bleachers, restrooms, storage, concession stand at league sports facilities and batting cage for softball and hardball.
- Lighted tennis courts, basketball courts, sand volleyball courts, and practice walls.
- Provide 40-60 parking spaces for each sports field.
- Provide four parking spaces for each game court.
- Provide lighting for sports facilities.

Passive Recreation

- Combination walking and jogging pathways and benches.
- Open turf area for casual games and unsupervised free play of minimum two acres.
- Natural areas.

Special Use Facilities

- Include at least one special use facility such as a pool, community center, gymnasium, amphitheater, or sports complex.
- Provide street skate/BMX features.

Family Picnic Areas

- Provide several shade structures: 20-25 person capacity or more.
- Tables for four to eight people each.
- Provide barbecue facilities.
- Locate proximate to other desirable activities such as turf areas, play areas, pathways, etc.
- Locate proximate to other conveniences such as parking, restrooms, etc.
- Provide one parking space for each 2.5 seats.

Group Picnic Area

- Provide large shade structure for group reservations: 80-100 person capacity.
- Provide picnic tables, serving tables, sinks, barbecue facilities, and electrical service.
- Locate proximate to other desirable activities such as turf areas, play areas, pathways, etc.
- Locate proximate to other conveniences such as parking, restrooms, etc.
- Locate away from nearby residential areas.
- Provide one parking space for each 2.5 seats.
- Provide ability to facilitate one to three groups at a time.

- Provide stage or other place for group assembly and focus.

Informal Picnic

- Provide picnic tables for non-reservation use under shade trees throughout the park.

Restrooms

- Locate convenient to use and utilities.
- Provide permanent restrooms buildings.
- Provide restroom facilities with multiple fixtures based on estimated usage.
- Provide lighting.

Lighting

- Provide lighting according to general park standards.
- Sports facilities lighting as required for league and tournament play.

Telephone

- Provide according to general park standards.

Bicycle Parking

- Provide according to general park standards.

Drinking Fountain

- Provide according to general park standards. Quantity as required meeting facilities demand.

Pathway System

- Provide according to general park standards.

Site Furnishings

- Provide according to general park standards.

Dog Run

- Provide dog run or dog park area.

OPTIONAL ELEMENTS

- | | |
|---|---|
| <ul style="list-style-type: none">• Nature interpretive area.• Exercise course.• Specialized facilities for bocce ball, art and culture, etc.• Food concessions building.• Nature features.• Community garden area.• Horticultural garden area. | <ul style="list-style-type: none">• Amphitheater.• Skate Park.• Small building for meeting rooms.• Lake or pond feature for aesthetics, detention requirements, fishing and non-motorized boating.• Synthetic turf fields• Other special use features. |
|---|---|

Table 16 — School-Park Site Standards

DEFINITION

- Facilities that are developed in cooperation with the School District and are located in part or entirely on School District lands.
- Locate children's play areas on park property so that play areas are accessible during the hours of 9:00 a.m. to 3:00 pm., Monday through Friday, in addition to non-school hours.
- The basic intent is to provide neighborhood/community park-type facilities with joint-use capabilities.
- Develop community parks adjacent to intermediate or high school facilities.
- Develop neighborhood parks adjacent to elementary or intermediate school facilities.

SERVICE AREA

- One-half to two-mile radius depending on park type.

SIZE

- Varies, depending on park type.

SITE CHARACTERISTICS

Configuration

- Contiguous, usable (nonlinear) shape, with level terrain. No fencing between school and park lands.

Access/Location

- Location will generally be determined by the school district based on local policy for the distribution of schools.
- Select sites to provide neighborhood/community park-type facilities.
- Locate with frontage on residential collector or arterial streets.
- Provide off-street parking, quantity based on the facilities. Joint use with school parking whenever possible.

Character

- Contain turf fields and ancillary facilities for active recreation.
- Should contain large trees for shade, open turf area for free play, and a play area for supervised children's play.
- Sports facilities and complexes depending on park type and District needs.

BASIC REQUIREMENTS

- Open turf areas, baseball/multipurpose fields, soccer fields, and children's play areas.
- Other features to conform to community/neighborhood park standards.
- Provide according to neighborhood and community park standards.

OPTIONAL ELEMENTS

- Exercise course or cluster.
- Tennis courts, basketball courts, and volleyball courts, or practice wall.
- Restroom/concession building.
- Adventure Club facility.
- Swimming pools.
- Gymnasium.
- Track facility.
- Football/soccer stadium.

Table 17 — Special Use Facility Standards

DEFINITION

- A facility such as a community center, athletic complex, aquatic center, horse arena, or other cultural or athletic facility that services a specific need for a portion of the specific plan area's population.

SERVICE AREA

- The entire Specific Plan Area.

SIZE

- Varies

LOCATION

- May be included within a community park or may be at a separate location.

FACILITY TYPES

- | | |
|---|--|
| <ul style="list-style-type: none">• Community center with auditorium, meeting rooms, classroom space, offices, indoor recreation space, crafts room, exercise space, gymnasium, etc.• Indoor gymnasium.• Indoor pool.• Aquatics complex for recreational and organized team swimming.• Childcare facility.• Community Theater, indoor.• Outdoor theater, amphitheater.• Lighted sports complex for organized youth or adult tournament, practice and league play.• Senior center.• Community Art/Cultural center.• Teen Center.• Public Library. | <ul style="list-style-type: none">• Public golf course and driving range.• Tennis court complex.• Track facility.• Football / Soccer stadium.• Indoor soccer facility.• Skate Park.• BMX track.• Dog Park.• Lake or pond for aesthetics, detention requirements, fishing and non-motorized boating.• Preservation of significant environmental, cultural or historical resource.• Aeronautic Hobby Park. |
|---|--|

Table 18 — Linear Parkways, Greenbelt and Open Space Standards

DEFINITION

- Linear corridors designed for recreational travel and commuting, including hiking, biking, equestrian, and walking.

SERVICE AREA

- Located to serve the entire District as part of the interconnecting pedestrian/bikeway system.

SIZE

- Located to serve the entire District as part of the interconnecting pedestrian / bikeway / equestrian trail system.

SITE CHARACTERISTICS

- Open space corridors developed along creeks, riparian areas, drainage channels, abandon railroad beds, utility easements, or rights-of-way.
- Minimum 35 feet wide.
- Where linear corridors are located adjacent to local residential streets, such as at the ends of cul-de-sacs or along parallel streets, fencing shall be prohibited and public access points provided to the interconnecting trail system.
- A paved dual-purpose trail (bike path and maintenance vehicles) should be provided on either side of drainage channels. Drainage channel slopes should be contoured to avoid an excessively geometric appearance. Channel design criteria calls for wide channel facilities having banks of an average of 4:1 slope and shall vary typically between 3:1 and 5:1.
- Sufficient land should be provided outside of the top of slopes along the channels to allow for the multi-use trail, 4' equestrian path, and landscaping. There should be a minimum of 25 feet on either side of the channel for this purpose.

BASIC AMENITIES

- Paved bicycle/pedestrian path min. 10 feet wide with 2 feet wide shoulders on both sides (Cal Trans Class I standards), heavier trail to be designed to Sacramento County Standards, 12 feet wide with 3 feet wide shoulders.. Incorporate emergency and maintenance vehicle access for dual-purpose use.
- Install identity, use and safety signs as required along the trail system.
- Trailhead areas with benches or picnic tables, water, public telephone, and informational signs.
- Unpaved hiking paths, 6 feet wide, stabilized soil or decomposed granite surface, and 4' wide earthen equestrian path.
- Viewing areas for natural feature preservation areas along the trail system.
- Interpretive signage for significant environmental, cultural or historical features along the trail system.

- Bridges over creeks and drainage channels for equestrians, pedestrians, bikes, emergency and maintenance vehicles.

OPTIONAL AMENITIES

- Rest areas.
- Drinking fountain.
- Jogging trails, separate from bicycle/pedestrian path and equestrian path. .
- Road under crossings for trail system to accommodate pedestrians, bikes, emergency and maintenance vehicles
- Hitching rails.

VI. Park & Recreation Need

A. *Recreation Needs Survey*

During 2002 and 2003 survey questionnaires were distributed to the residents of the District. Survey questions were structured to elicit responses from Rio Linda and Elverta residents relative to their desires for recreation programs and park facilities, and their opinions regarding existing facilities, programs, and services. (See Appendix E summary results of the Recreation Needs Survey.) Conclusions and recommendations of the survey are listed in the following section.

1) **Resident's Desire**

The following are the desires of the community residents who participated in the survey:

- Increase park security, particularly at night.
- Improve restroom maintenance.
- Encourage and work with the school Districts to make school sites available for recreation use during non-use hours.
- Give equal importance to rehabilitating and improving existing recreation facilities as to acquiring and developing new facilities.
- Offer more recreation programs for all age groups, especially those for children and teenagers.
- Increase programming in the areas of sports leagues, special interest classes, and outdoor recreation programs.
- Ban alcohol in parks, and require that renters of the community recreation facility provide liability insurance when alcohol is involved.
- Close parks at dusk except for parks and facilities that offer organized evening activities.
- Require reservations for community facilities with a security deposit from the renter, and user fees for special programs.
- Investigate the development of handicapped recreation program. Even though only 5% of the respondents indicated a need, this could be an important need in the District.
- Provide a multi-use trail/path/lane (system (pedestrian, bicycle, and equestrian) that connects parks, schools, open space areas, community activity centers, and are linked to County wide trails system.

B. Park and Recreation Needs

By examining the parks, school sites, and other recreational facilities located in the District, the relative level of recreation services provided in differing parts of the District is determined. This process also identifies areas within the District that are deficient in park and recreation facilities. Table 19, Recreation Acreage Needs by Year 2014 illustrates how the District and its Planning Areas are currently served and will need to be served in the future based on population projection.

Table 19 shows that, although Planning Area 3 is adequately served in terms of park acreage, all of the other populated areas of the District are presently deficient of park lands. Due to projected population increase, this deficiency will become worse over time in Planning Areas 3, 4, and 5 unless additional park lands are acquired. The Panhandle PUD, planning area 1B, and Elverta Village, planning area 2, will both have land dedicated for parks and open space during the development process. The following section covers each of the Planning Areas: their present and future populations; level of park services presently available and will be needed during the next decade.

1) Park Acreage Needs

The Table 19 illustrates quantitatively how the District is meeting the park and recreation needs of its residents presently and during the next decade. For purposes of park and recreation planning analysis, the District has been divided into five Planning Areas, and depending on the present and projected populations for each Planning Area, park acreage needs have been determined for each area and for the District as a whole.

Table 19 — Recreation Acreage Needs by Year 2014

Planning Areas	PA 1A	PA-1B	PA-2	PA-3	PA-4	PA5	District
2000 Population		264	9,575	4,008	3,579	3,743	21,169
2000 Acreage Need		1.3	47.8	20.0	17.9	18.7	105.7
Projected 2005 Population		286	10,388	4,348	3,883	4,061	22,966
Projected 2005 Acreage Need		1.4	51.9	21.7	19.4	20.3	114.7
Projected 2010 Population		8,725	16,240	4,705	4,201	4,394	38,265
Projected 2010 Acreage Need		43.6	81.2	23.5	21.0	22.0	191.3
Projected 2014 Population		9,345	22,030	5,036	4,496	4,703	45,610
Projected 2014 Acreage Need		46.7	110.15	25.18	22.5	23.5	228.0
Present Developed Park Acres		0	11	20	12.1	2.6	45.7
Present Total Acquired Park Acres		0	41	20	12.1	6.7	79.8
Park Acres to be provided by Development		<u>121.5</u>	75.5				<u>197</u>
2014 Park Acreage Deficiency		<u>74.8</u>	6.35	-5.18	-10.4	-16.8	<u>48.8</u>
Recreation acreage needs are based on NRPA / RLERP Standard of 5 acres per 1,000 population.							

In addition to the park acreages in each Planning Areas, there are school sites in many of the Planning Areas that often provide substitute park opportunities. Although it may be enticing to calculate the school site acreages into the park acreage mix, it must be understood that school sites have significant restrictions and limitations regarding public use. Therefore, though it is a community recreation resource, the total park acreage needs of the District and of the Planning Areas will discount school sites in calculating acres of parklands needed.

Planning Area #1A

This Planning Area presently does not have a resident population since the area is predominantly agricultural. However, if the City County Joint Vision proposal for urbanizing this area becomes a reality, appropriate parks, open space, landscape corridors, trails, and recreation facilities in accordance with the District Park Standards will need to be provided through the Public Facilities Financing Plan for the area.

Planning Area #1B

Data indicates that this Planning Area has a relatively small population with a current recreation acreage need of 1.3 acres. However, the projected population growth for the next decade is significant, increasing from approximately 286 in 2005 to a projected population of 9,345 in 2014. This translates to a need for over 46.7 acres of parkland. Currently, the only park feature located in the area is the 3 acre Elkhorn Equestrian Staging Area, which is not owned by the District. [The Panhandle Planned Unit Development is currently in the approval process. As part of the PUD a total of 121.5 acres will be dedicated as parks and open space \(see Appendix I\). Assuming that this full acreage is developed as parklands, then Planning Area 1B will have almost 75 acres of parkland above the target of 1 acre per 5,000 residents.](#)

Planning Area #2

The 8.5 acre Babe Best Park, the 2.45 acre Northbrook Park and the 30 acre undeveloped Ponderosa Farms Community Park site are located in this area. In addition, seven new parks totaling approximately 75.5 acres, greenways and community center are proposed in the Elverta Villages Specific Plan which is located in this area. Based on current and projected population for this Planning Area, the 2000 population park acreage need is 47.8 acres, and increases to 110.15 acres in 2014. However, with the addition of the proposed 75.5 acres of parkland in the Elverta Specific Plan, the total of the existing and proposed parklands exceeds the standard for this area by 6.35 acres. If all of the proposed parklands are developed, Planning Area 2 will be the rare case in the District in which the Parkland Standard of 5 acres per 1,000 may be exceeded.

Planning Area #3

The 12.5 acre Central Park Horse Arena and the 7.5 acre Westside Park are located in this area. The 2000 census data indicates a need for 20.0 acres and 25.18 acres are needed by the year 2014. As there exists 20 acres of parks in the area, 5.18 acres of additional park land will need to be acquired by 2014.

Planning Area #4

Located here are the 8.5 acre Community Center Park, 3 acre Depot Park, and the 0.6 acre Welcome to Rio Linda Entry Park. There are a total of 12.1 acres of parks in the area, 2.6 acres of which are undeveloped. Population figures indicate 17.9 acres of park land are needed in 2000 growing to 22.5 acres by the year 2014, or a deficit of 10.4 acres.

Planning Area #5

The two parks in this Area are the 2.6 acre Roy E. Hayer Park and the 3.5 acre Linda Creek Park site. The 2000 census data indicates a need for 18.7 acres and 23.5 acres by the year 2014. There is, therefore, a current deficit of 13.6 acres and increasing to 16.8 acres of parkland deficit by year 2014.

Summary of Park Acreage Needs

Based on these computations, disregarding the proposed park acreages that may be provided in Area 1A, as they will basically meet the park acreage needs of those anticipated to populate those areas, in 2005 RER&PD is deficient of 34.9 acres of parkland. If all of the proposed parkland in Planning Areas 1B and 2 is developed, then by 2014 the district will have an excess of 48.8 acres.

Analysis of park and recreational needs based upon acres per 1,000 is only part of determining the ultimate park and recreation needs of the District. Additional factors must also be considered such as population characteristics, population and densities, accessibility to other parks and open space areas in the vicinity, and the perceived needs of the community. The following section continues this analysis.

2) Neighborhood Park Needs

The District in 2000 was in need of 63.39 acres dedicated to neighborhood parks, which will increase to 136.81 acres by the year 2014. With the District presently having 51.2 acres of neighborhood parks, the District is presently 12.19 acres deficient of neighborhood parks and this will grow to 85.61 acres by the year 2014 if no additional neighborhood parklands are acquired. This deficiency, in part, will be off-set by the 36.7 acres of Neighborhood Parks proposed in Elverta Village, assuming that they are developed as proposed, resulting in a net deficiency of 48.91 acres of neighborhood parklands by 2014. The Panhandle PUD will, presumably, have a sufficient acreage of neighborhood parks, removing 18.68 acres from the deficit. However Planning Areas 3, 4, and 5 will still have a need for additional neighborhood park acreage.

Table 20 — Neighborhood and Community Park Needs

Planning Area	PA-1A	PA-1B	PA-2	PA-3	PA-4	PA-5	District
2000 Population		264	9,575	4,008	3,579	3,743	21,169
2000 Neighborhood Park Need		.79	28.7	12.0	10.7	11.2	63.39
2000 Community Park Need		.53	19.15	8.0	7.16	7.5	42.34
Projected 2014 Population		9,345	22,030	5,036	4,496	4,703	45,610
2014 Neighborhood Park Need		28.02	66.09	15.1	13.5	14.1	136.81
2014 Community Park Need		18.68	44.06	10.1	9.0	9.4	91.24

Neighborhood Park need is based on standard of 3 acres per 1,000 population, while the Community Park need is based on a standard of 2 acres per 1,000 population.

3) Community Park Needs

In 2000 there was a need for 42.34 acres of community parks; this will increase to 91.24 acres by 2014 based on the population projection for the District. With the future development of Ponderosa Farms Community Park (30 acres) and the Community Parks in Elverta Village (52.7 acres), this will total 82.7 acres of community park, still leaving a deficit of 8.54 acres.

Beyond the development of Ponderosa Farms Community Park and the community parks proposed in the Elverta Villages development, the District has a unique opportunity to cooperatively create a community park in Areas 4 and 5. This can result by combining the District's Central Park Horse Arena and Hayer Park with the 10.4 acres athletic field (located north-west of the intersection of 10th Street and G Street) owned by the Rio Linda Junior High School to create a 25.5 acre Community Park. For a number of years, the School District has been unable to properly maintain their athletic facility. Since funds are very scarce for both the Park and School Districts, and land of this size is very difficult to secure, RERPD should approach the School District with a proposal to assist the School District to improve and help maintain the site in conjunction with the District's two adjacent park sites. Through this cooperative effort, the Park District could secure the right to use the fields for recreational programs when the fields are not needed by the Junior High School.

This arrangement, if acceptable to both Districts, should be formalized through a Memorandum of Understanding (MOU) that would be executed by both entities spelling out the roles, responsibilities, and rights of the parties. Similar arrangements between park and school agencies have benefited many other communities. This one would help to solve the needs of the Park District for a sizable park with multiple sports fields in the southern portion of the District, help the School District to improve and maintain their athletic fields that they need, but are unable to maintain. Most of all, this arrangement would benefit the residents of the community who desperately need more fields for various sports activities. Beyond the purely recreational value of this complex, this Community Park could also become the center of community activities for Rio Linda / Elverta for multitude of out door events and activities. The improvement of this combined park/school site would also be very attractive project for joint grant applications to the State Dept. of Education and State Parks.

C. Comparison with Similar Park Agencies

Six local park agencies of comparable size, including Rio Linda & Elverta Recreation and Park District, were examined. The table below indicates the comparisons for population served, acres of developed parklands maintained, acres of parks provided per 1,000 residents, staff per 1,000 residents, and the cost to their respective residents to maintain and operate the park system. The data for this comparison came from a survey conducted by CPRS District II, in February 2002:

Table 21 — Comparative Data for Park Agencies

Agency	Population In 1,000	Acres Developed Parks	Acres of Developed Parks Per/1,000	Staff Per/ 1,000	Budget \$ Per Person
Arcade Creek Recreation and Park District	21	49	2.3	.23	\$23.8
El Dorado Hills Community Services District	22	86	3.9	1.04	\$140.5
Fulton El-Camino Recreation and Park District	30	80	2.6	.43	\$46.6
North Highlands Recreation and Park District	35	60	1.7	.22	\$40.0
Orangevale Recreation and Park District	32	128	4.0	.43	\$33.1
Rio Linda & Elverta Recreation and Park District	22	35	1.5	.22	\$26.9

1) Population

The communities compared were between 21,000 to 35,000 population. RLRPD was, consequently, on the smaller end of the range, however, since the comparison was based on per 1,000 residents, the relative size differential was considered unimportant.

2) Acres of Developed Parks Per 1,000

Most telling data in this chart is the Acres of Parklands Per /1000 population. As indicated in Table 21, Rio Linda and North Highlands respectively provide 1.5-1.7 acres of parklands per 1,000 residents, while Arcade Creek and Fulton El-Camino respectively provided 2.3 - 2.6 acres. While it appears that El Dorado Hills and Orangevale have been more successful in providing parklands, not all of their parklands are developed, and these two communities are still below the NRPA standard of 5 acres for Neighborhood and Community Parks. Based on these comparisons, it is evident that RLRPD need to make a concerted effort to acquire

and develop additional parklands in the next decade, particularly as the District's population is anticipated to grow significantly during this time. Part of the need for additional parklands will be provided in the Elverta Villages Development, but these parks will also be developed primarily to offset the population growth that will result in the area.

3) Staffing Per 1,000 Residents

The staffing level for Arcade, North Highlands, and RLERPD appears to be almost identical with .22-.23 of a staff per 1,000 residents. Fulton El-Camino and Orangevale have almost double the staff level of .43 per 1,000 residents. Understandably, the more affluent community of El Dorado Hills has a quadruple level of staffing when compared to the other three at the bottom. Part of the reason for this disparity comes from the differences in the property values, property taxes paid in these areas, the willingness / ability of the property owners to further tax themselves to support a higher level of park and recreation services, and finally the differing levels of recreation program expectations of the residents of different communities.

4) Budget Dollars per Person

The recreation budget per person is quite varied with Arcade Creek and RLERPD at the bottom and El Dorado Hills at the top. The major difference between the communities compared herein is the willingness of the property owners within different communities to tax themselves to achieve a higher level of park and recreation service. If the District Board is not satisfied with a minimal level of park and recreation services, there will have to be a concerted effort to educate the property owners that it is in their long-term best interest to provide a quality park and recreation service to make RLERPD competitive with other similar communities. Part of this education and awakening may occur as the result of the level of park facilities and open space areas that are planned in the Elverta Villages development as compared to the remainder of the District.

5) Facility Needs

Facility needs for RER&PD were determined using the NRPA's (National Recreation and Park Association) standards as a guide. This was supplemented taking into account the District's characteristic, needs expressed by the Recreation Needs Survey, traditions, and the availability of other recreational facilities found within and adjacent to the area. In addition, it is important to note that these NRPA standards represent the minimum standard, certainly not the optimum standards.

The District's most pressing recreation facility needs are a community swimming pool and an additional multi-use recreation center. Currently, swimming facilities are not available. In assessing the need for a future swimming pool, serious consideration should be given to building an indoor or enclosable pool to enable year-around swimming and aquatic activities, especially in joint partnership with the School District or adjoining park agencies. Assuming appropriate location and adequate buffering from adjacent residential areas, future basketball, soccer, softball and tennis complexes should be lighted to accommodate greater use and flexibility of

scheduling. If funding permits, some of the key soccer and softball fields should also be constructed of synthetic fields to reduce maintenance costs, and enable greater use.

High Priority Recreation Facility Needs:

- swimming pool/aquatic complex
- multi-purpose recreation center
- basketball courts, full and half courts
- soccer fields (adult and youth) and complex
- softball complex
- tennis complex
- multi-use trail system (This will be satisfied with the development of the County's Dry Creek Parkway.)

6) Natural Streams and Open Space Areas

There are two prominent streams within the District, Dry Creek and Rio Linda Creek. These drainage corridors, while a natural barrier, also provide an excellent resource for linking park and recreation facilities within the District. These can be for passive recreation use such as hiking, bicycling and equestrian use, and also for wildlife habitat preservation. The District should encourage the County Planning Department to establish and secure a 50' buffer land outward from the top of creek bank to preserve the corridor as habitat, to aid in protecting water quality, create a buffer to adjacent land use, and provide a route for maintaining the fire breaks.

7) Adjacent Recreation Facilities

The District is located within a region that offers a wide range of related outdoor recreational opportunities such as the American River Parkway, Gibson Ranch Regional Park, Ueda Parkway, Cherry Island Golf Course, Cherry Island Soccer Complex, Antelope Green Golf Course, Dry Creek Parkway and the Dry Creek Greenway in Placer County. Park and recreation facilities adjacent to the District provide an extension of the recreational opportunities available to the residents of RLERPD. Although the District's primary focus is on its own facilities and programs, the District should encourage and support the development and operation of other public and private recreation facilities that complement or supplement those offered by the District.

VII. The Park and Recreation Master Plan

This chapter includes recommendations regarding existing and proposed facilities, priorities for making park improvements during the next ten years, and a Ten Year Capital Improvement Program.

A. Park and Facility Recommendations

The graphic master plan on the following page illustrates the existing and proposed recreation facilities recommended for the District. Also included are locations of schools, recreation facilities provided by other agencies, open space areas, biking / hiking / equestrian trails, and the surrounding community. The master plan suggests four community parks. One is referred to as the Rio Linda Center School Park located in Area 5, the second is the proposed Ponderosa Farms Community Park in Elverta, Area 2, the third is the proposed Community Park in Elverta Villages, and the fourth is the Rio Linda Central School Park described below. Except for the existing facilities, the locations of proposed future parks are general and the locations should be considered flexible within the general vicinity indicated. The final locations of future parks will be dictated by developments, land uses at the time, locations of future school sites, available funds, and other related factors.

B. Future Park and Recreation Facilities

1) Rio Linda – Elverta Recreation & Park District’s Capacity to Serve the park and recreational needs of proposed new community in Planning Area 1-A:

RLERPD and its predecessors have forty plus years of history serving the residents of Rio Linda and Elverta Area with park and recreational services. Through the District, there exists an elected Board of Directors, experienced staff and organizational structure with capacity to grow and meet the future needs of Planning Area 1-A. Further, the Board and staff of the RLERPD has historic knowledge and experienced serving the park and recreational needs of the local residents, and are keenly interested in serving the growing needs of the District including the Elverta Village on the east side of the District, and the possible future development of Planning Area 1-A on the west side of the District.

While the City of Sacramento has expressed interest in annexing and administering the public service needs of the future development in Planning Area 1-A, including park and recreational services, the staff and Board of the RLERPD strongly believes that it is in a better position to provide these services. Due partly to proximity to the area, historic knowledge of the area, organizational capacity, ability to provide focused attention to the needs of a new community, and being better able to adjust

to changing needs, assuming that necessary operational and capital funds would be provided whether administered by the City or the District, the District believes that it is much more capable of serving the new community than the City of Sacramento.

In preparation for providing the park and recreational needs of a growing District, the RLERPD will be expanding its staff and services to meet the future needs of 11,250 new residents on the east side of the District called Elverta Village. It is anticipated that Elverta Village will be fully built out in ten years, and consequently will enable the District to grow and transition into a vigorous organization able to serve the current and future needs of a much larger community, including Planning Area 1A.

2) Some of the possible ways to Fund Planning Area I-A:

In addition to the Public Facilities Financing Plan for the capital costs of acquiring, developing, and operating the various public facilities, including parks and recreational facilities that would be put in place for the new developments proposed in Planning Area 1-A, some additional tools available to RLERPD to fund additional parks and recreational services potentially needed in Planning Area 1-A include:

Impact Fees from New Development

The land development process provides local governments with opportunities to guide development and to negotiate with developers to obtain improvements in local quality of life as an outcome of regulatory approval of development proposals. Impact fees, collected as part of this process, can be of value to park and recreation agencies affected by current or potential land development proposals. The District needs to work closely with Sacramento County to determine the connection, or “nexus,” between the demand initiated by the proposed development and the dedications that local officials impose as conditions for approval of the proposal. Sacramento County would collect the impact fee and make it available to the District to fund capital improvements for the needed park and recreation services for the impacted area.

Local Police Powers

Local governments have broad authority to exercise “police power” to regulate public health, safety and welfare. Within this authority, development of private land is regulated by cities and counties. RLERPD needs to develop cooperative agreements with Sacramento County to impose terms and conditions on development proposals that meet the long-term park and recreational needs of the District and the residents who will be residing in the proposed development. As part of the Subdivision Map Act, cities and counties have the authority to control the design and improvement of subdivisions of land within their boundaries. Through the Act, cities and counties may impose requirements, or exactions, on developers as conditions of land use approval. These can be used to mitigate or offset the costs of public services that will be required as a result of the development proposal. They can be in forms such as fee payment, dedication of land, or construction of a public facility. In essence, exactions shift

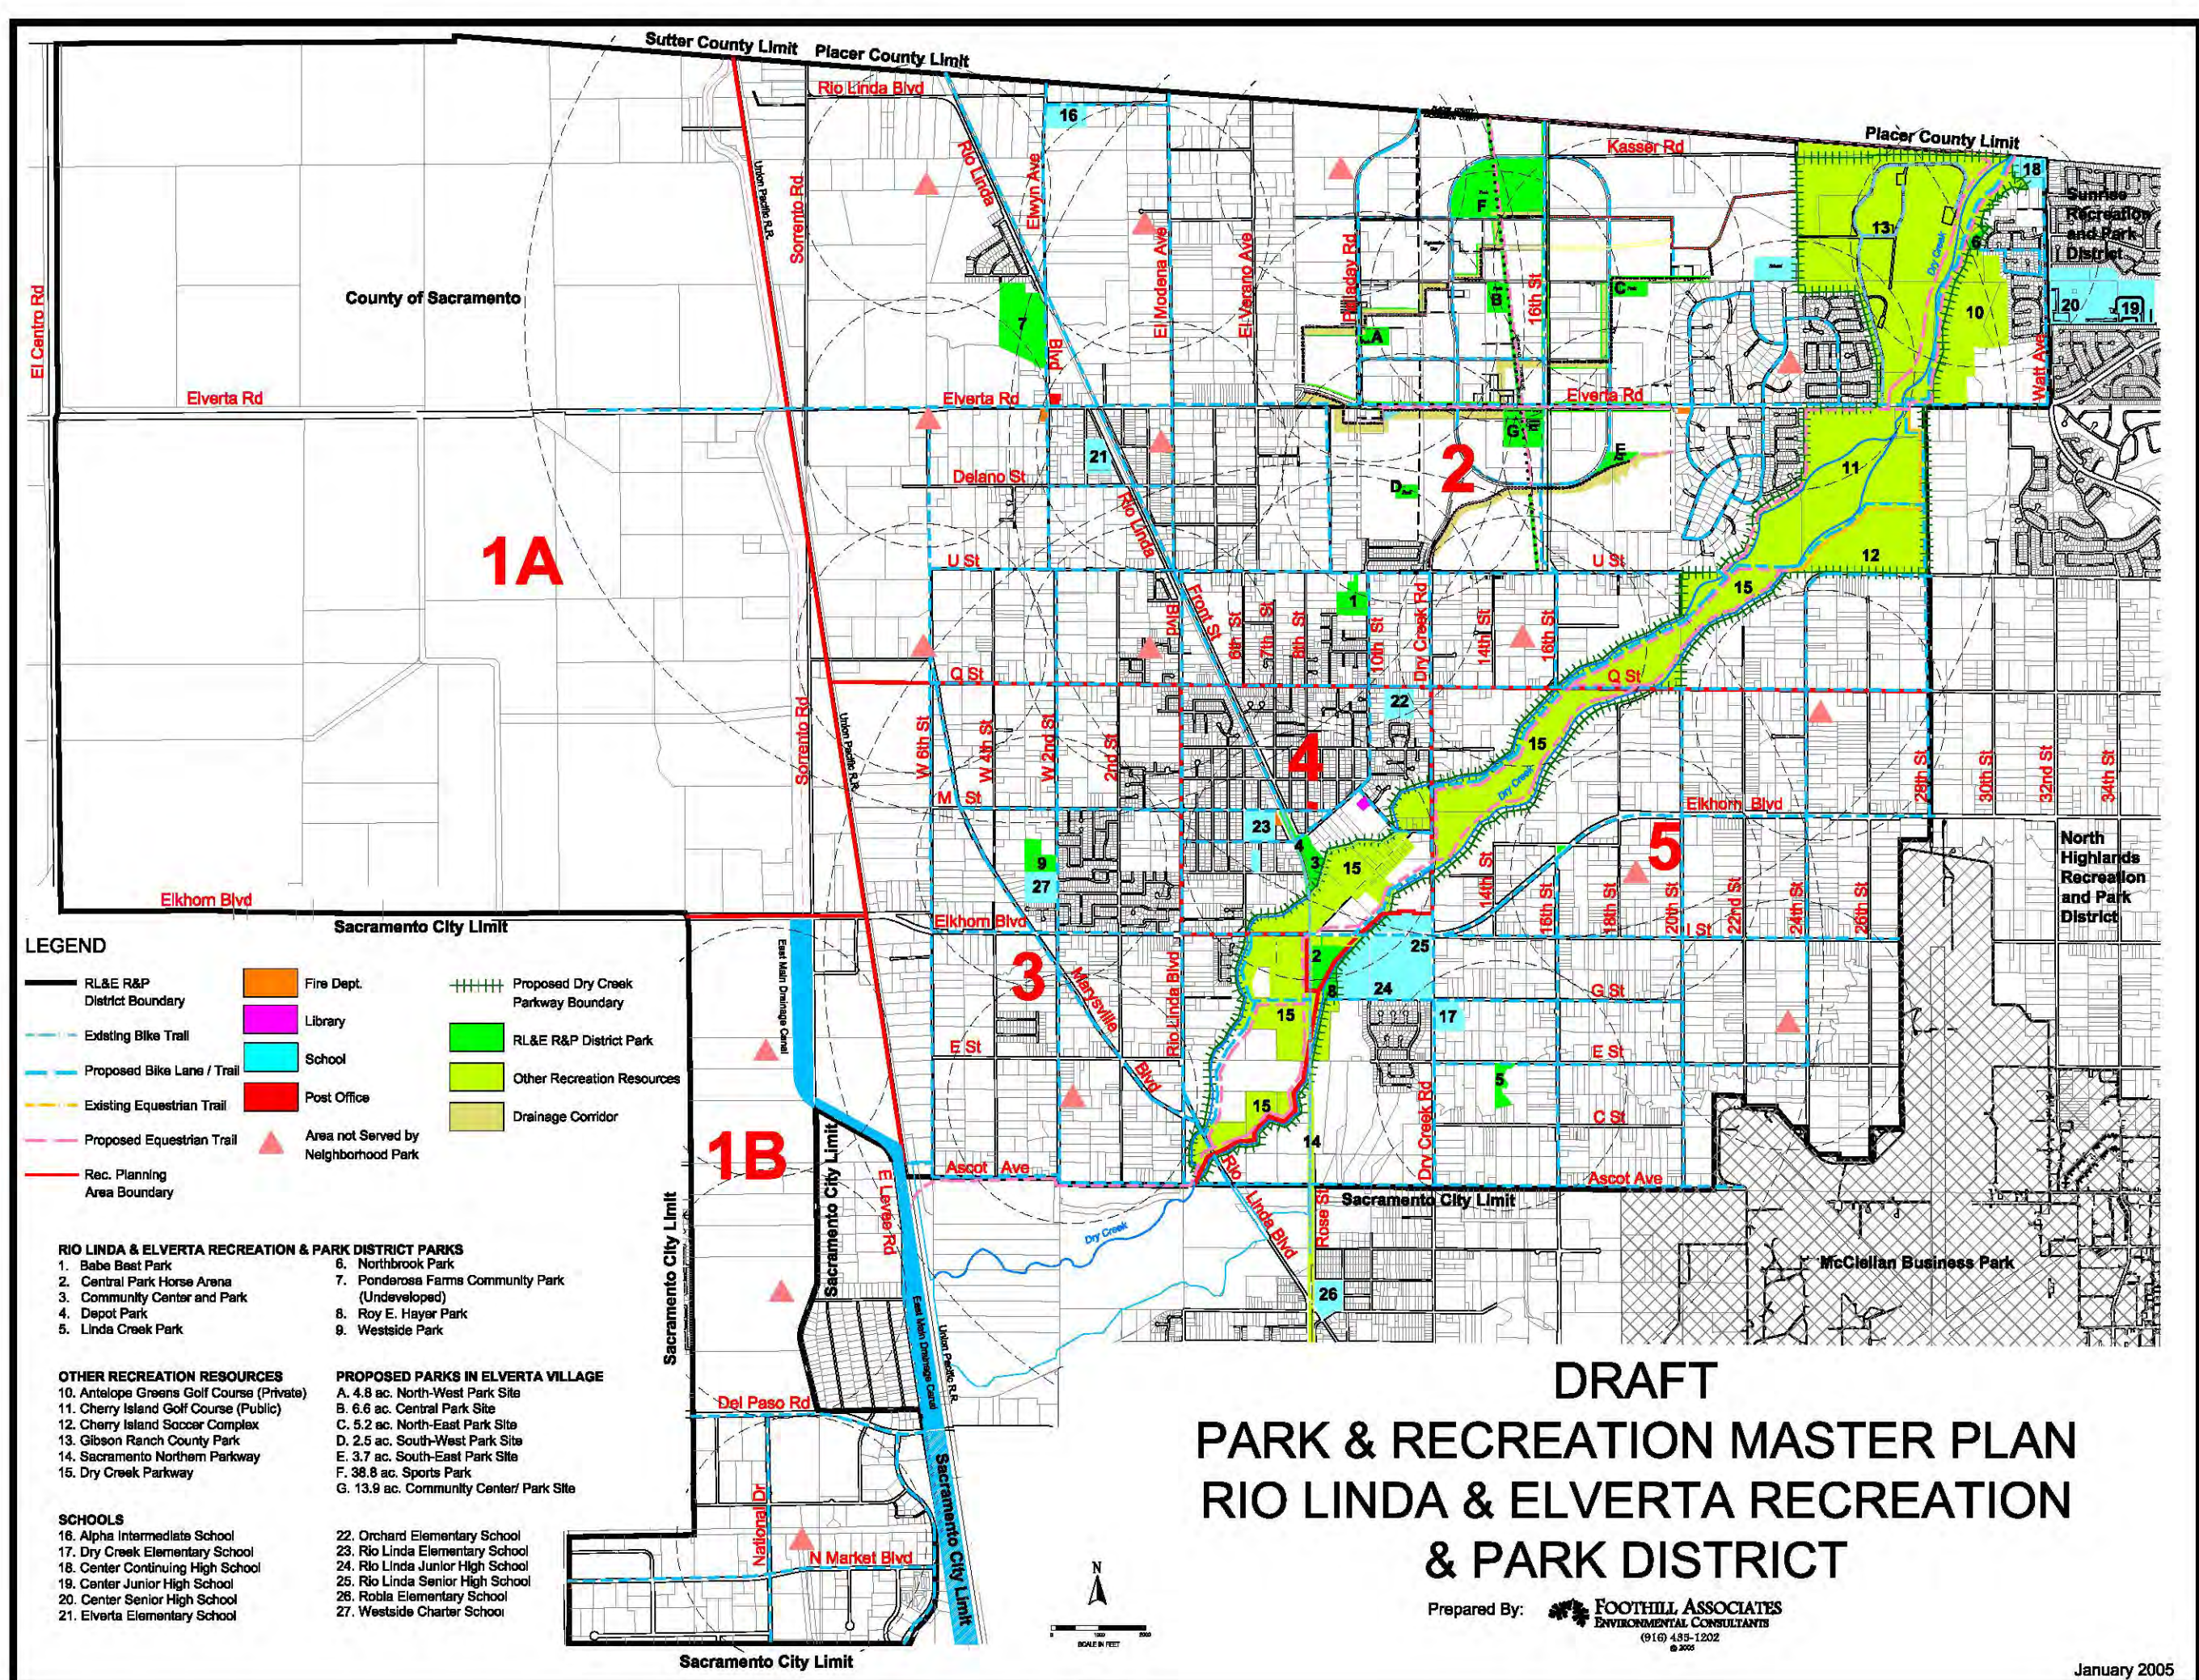

Figure 11

THIS PAGE IS INTENTIONALLY LEFT BLANK

the recovery of service costs forward to new residents of an area, since builders pass along their exaction costs to the buyers of the new developments.

Development Agreements

Cities and Counties have authority to negotiate development agreements with those who wish to obtain approval for their land development projects. The development agreement is an enforceable instrument that enables orderly community development, and it guarantees the developer will be able to build the houses necessary to pay off the public and private construction costs. It provides the approving agency with a means to improve local infrastructure, including parks and recreation components. The District needs to actively participate with Sacramento County in negotiations with developers to insure that the desired parks and recreation amenities are funded, developed, and or included in the Public Facility Financing Plan for the project.

Regulatory Conditions

Cities and Counties can also impose regulatory conditions on development proposals. Authority to do so can be through specific conditions imposed by local ordinance per the Subdivision Map Act, implementation of the California Environmental Quality Act (CEQA), and other conditions that follow from general plan implementation. A community's duly adopted general plan is the blueprint for its growth and development that sets forth the community's intentions in this regard. As such, the general plan (Park and Recreation Master Plan, a component of the general plan) is crucial to the sustainability of requirements placed on development projects.

Financing Mechanisms

State law also provides a variety of specific financing mechanisms that empower cities and counties to work with developers and enable community growth. Among the tools available in this regard are:

Mello-Roos Community Facilities Act of 1982 – The Act allows creation of a Mello-Roos Community Facilities District. Such a district establishes special property taxes beyond the ad valorem Proposition 13 property assessment level. These obligations are placed on homes and other structures built by developers. The concept is to enrich the new neighborhood with public facilities and services that strengthen the desirability of the neighborhood and, ultimately, improve the value of the property. The Mello-Roos Act allows infrastructure to be built with tax-exempt financing. The authorizing local government sells the tax-exempt infrastructure bonds. The bonds are used to underwrite the costs of the improvements. After sale of the properties by the developer, the new owners take on the obligation for the special taxes within the district.

Mitigation Fee Act of 1987 – The Act permits use of the approval process for new developments to generate impact fees for park and recreation purposes. The fees are to be based on a clear nexus between the fees and

the use of the fees. The District can obtain impact fee revenue by working with the county planning departments to get the Board of Supervisors to enact the appropriate ordinances.

Because special districts lack direct land use authority, RLERPDP must work with Sacramento County and request a share of the revenue stream generated by the approval of new developments. It would be helpful for the District to have an arrangement in place with Sacramento County to be the designated provider of recreation and park services in the area to be served by the new development.

Assessments on Existing Property

However valid it may be to obtain infrastructure revenue from new developments, local governments are challenged to find ways to operate and maintain the improvements generated by new developments and to deal with infrastructure costs (capital improvements, rehabilitation, operations and maintenance) in built-out areas. Consequently, local governments have been looking for new revenue sources for these purposes, including the imposition of benefit-based assessments on property. These are levies or charges against real property that are used to pay for specific improvements linked to the affected property. Revenues generated in this manner are then used to underwrite capital improvements and, in some cases, operation and maintenance costs associated with those improvements.

The Landscape and Lighting (L&L) Act of 1972 – This act empowers local governments to levy an assessment for improvements with direct benefit to property if certain procedures were followed. Park and recreation improvements and services were among the uses authorized by the Act.

Following the passage of Proposition 218 in 1996, a local government could impose the tax only after determining there was not a formal, written protest from a majority of owners of property to be assessed. This threshold was lower than the two-thirds voter approval limit of Proposition 13. Also, in the event that not all property owners returned ballots, it was difficult to reach the required protest level.

The assessment district can be formed if a majority of the ballots received by the conclusion of the hearing do not protest creation of the district. If the District is approved, the assessment is established and will be billed on the property tax bills each year. For the local government, chances for success are enhanced if the need for the expenditure is clearly communicated so as to generate understanding and acceptance on the part of those who will pay the new charges.

Grants

Grant funding is another potential area for new revenues. Grant money is available from both public and private sources. On the public side, park and recreation agencies are eligible for millions of dollars of bond act funds approved

by the voters of California in 2000 and 2002 and other state grants. Federal grant programs also provide dollars through a variety of grant funds to local park and recreation agencies. Eligibility, application deadlines and other program requirements differ among the many grant opportunities available. Some grants are competitive. Others are allocated on a per capita basis or are directly specified in legislation. Information on the bond acts, state grants and federal funds for local parks is available in the following chapter.

Collaboration and Public-Private Partnerships

Local park and recreation agencies that partner with like-minded organizations can conceivably acquire new resources they need to attain their goals. Or they can avoid direct program expenses by enabling the demand to be met by the partner. In this way park and recreation agencies can adjust the mix of services and facilities for the people of the community. The collective contributions of several entities can produce a result that is greater than the sum of the parts.

Working with Community Groups

One approach to collaboration depends upon a strong set of community partnerships that encourage and enable agencies and non-profit organizations to work together in meeting the needs of the community. These partnerships provide a framework for engaging key stakeholders—including police chiefs, business and religious leaders, elected officials, universities and representatives of major arts and cultural institutions—in collaborative efforts with community groups to keep parks and recreation programs going.

Working with Schools

Communities have historically viewed school grounds as important open space and recreation assets. In the mind of the public, school grounds are good places to go during after-school hours for soccer games, basketball practice, playing catch, flying a kite, or just taking an evening walk. State law encourages public access to school grounds for recreation purposes. Joint-use is enabled as well by provisions of state law concerning grants for new school construction.

Working with After-School Programs

After-school programs have attracted considerable interest in recent years. There are two important programmatic pathways for after-school activities: criminal justice and education. Neither program is oriented around parks and recreation, but there is ample opportunity within each program for park and recreation agencies to receive funds.

Working with the Private Sector

Collaboration with business and non-profit organizations is another way of achieving mutual benefit. Most park and recreation agencies already have relationships with businesses for things like concession contracts, program

sponsorships, utility installation leases, and even naming rights on ball fields, pools and other facilities.

Ultimately, it really does not matter to the local residents which community organization owns or operates a program. Instead, what counts is that the community gets the services it wants, with the convenience, quality and price features it demands.

3) Rio Linda Central School Park (suggested name):

A community park of 20-40 acres with a variety of recreation facilities to accommodate community-type activities is needed in Planning Area #5. Unfortunately, a property of this size is difficult to find, and would be prohibitively expensive. As previously described in Chapter V, with the cooperation of the Grant Joint Union High School District, the combination of the Central Park Horse Arena and Roy E. Hayer Park with the adjoining Rio Linda Junior High School Athletic Fields could be improved jointly, and used by both the Jr. High and the District. With proper planning, development, and management of these park and school resources, this Community Park could serve as the venue for a variety of recreational and community events.

The residential properties on the north side of Central Horse Arena Park that were acquired by Sacramento County as part of removing flood prone properties from the Dry Creek flood plane should be added to this Community Park. The District should actively request that the Board of Supervisors convey these properties to the District to expand the Central Horse Arena Park.

A conceptual plan for the proposed Rio Linda Central School Park is shown on page VII-14. The present Roy E Hayer Park (with proposed improvements as described later) would continue to serve the typical neighborhood recreational needs. The Rio Linda Central Park Horse Arena, improved as described later could also provide facilities for equestrian, BMX and multi-use open play fields, picnic facilities, and could be a staging area for access to the Dry Creek Parkway. The Rio Linda Junior High School's athletic fields could be improved and continue to serve the athletic needs of the Jr. High while also enabling the Park District to conduct recreation and community activities when the fields are not needed by the School.

This combined facility would require irrigation improvements, re-establishment of the turf fields, development of additional parking areas, construction of group picnic areas, restrooms, the installation of bleachers for the play fields, planting of shade trees, pathway, athletic field improvements, new park furniture and fixtures, and upgrade of existing facilities. With much less cost than it would take to purchase and develop a new community park, this approach would immediately provide the District with a Community Park in this developed area, while also benefiting the School District with improved athletic fields and assistance with maintaining the athletic fields. Public use of the athletic fields could be restricted to non-school hours and consequently would not limit the traditional school use of these facilities. In addition, the combined area would enable the Park District to program numerous community-related activities.

4) Surplus School Sites:

In preparation for any school sites being declared surplus in the District, RLERPD should request of the School Districts, that RLERPD be permitted a first right of refusal to purchase such sites or negotiate means to maintain and operate the facility until the school sites are again needed by the School District.

5) Elverta Village (Parks and Recreation Facilities in the Proposed New Community):

The most recent plans for the proposed Elverta Specific Plan include seven parks totaling approximately 75.5 acres. In addition, recreational trails and drainage ways are provide to serve as open space and wildlife habitat for the new community.

Presently, the improvements proposed at the parks include:

5.2 Acres North-East Park

- | | |
|--------------------------------------|------------------------|
| • 1 Tot Lot | • 1 Basketball Court |
| • 1 Concession and Restroom Facility | • 1 Small Soccer Field |
| • 1 Baseball Field | |

6.6 Acres Central Park

- | | |
|--------------------------------------|-----------------------------|
| • Tot Lot | • 1 Formal Green Open Space |
| • 1 Concession and Restroom Facility | • 2 Baseball Fields |
| • 4 Tennis Courts | |

4.8 Acres North-West Park

- | | |
|----------------------------------|------------------------|
| • 1 Tot Lot | • 1 Basketball Court |
| • 1 Restroom and Shade Structure | • 1 Small Soccer Field |
| • 1 Baseball Field | |

2.5 Acres West Park

- | | |
|----------------------------------|----------------------|
| • 1 Tot Lot | • 1 Basketball Court |
| • 1 Restroom and Shade Structure | |
| • Open Formal Green | |

3.7 Acres South-East Park

- | | |
|--------------|------------------------|
| • 1 Tot Lot | • Shade Structure |
| • 1 Dog park | • 1/2 Basketball Court |

38.8 Acres Sports Park

- | | |
|--|--------------------------------|
| • 2 Tot Lots | • 2 Youth Soccer Fields |
| • 1 Adventure Play Area | • 2 Little League Fields |
| • 1 Full Court Basketball | • 3 Softball Fields |
| • Off Street Parking | • 1 Basketball Court |
| • 2 Concession and Restroom Facilities | • 1 Maintenance Bldg. and Yard |
| • Shade Structure | |
| • 3 Large Soccer Fields | |

13.9 Acres Community Center Park

- | | |
|--|-------------------------|
| • Community / Recreation Center Building | • Amphitheater |
| • 1 Shade Structure | • Open Play Area |
| • Parking lot | • Farmer's Market Space |

The plan also includes multi-use trail system for pedestrian, bicycle, horses, and service / emergency vehicle use. The trails will follow the loop road, the drainage ways, and pass through the neighborhoods to connect to adjacent parks and open space areas.

6) Proposed Community Park in Planning Area #2:

The need for a community park in Planning Area #2 will be addressed by the proposed development of parks in the Elverta Village. The Elverta Village plan calls for a 13.9 acre Community Park in the southern portion of the Village, and 38.8 acres Sports Park in the northern portion. Properly planned and developed with the required recreation facilities, these park sites will meet the Community Park and recreational needs of the north eastern part of the District. These sites are proposed to include a community center/multi-purpose building, community swimming pool, and major outdoor recreation facilities such as a softball complex, soccer fields, a tennis complex, and more.

7) Additional Neighborhood Parks:

Acquisition of neighborhood parks in Planning Areas #1B, #4 and #5 totaling some 21.4 acres should be completed within the next ten years. Where possible, parks should be acquired and developed jointly with the school sites, thereby reducing duplication of facilities, helping to maximize use of public funds, and aiding in mutual support of each other's programs. In addition, when specific sites for parks are considered, a number of site selection factors as described in Chapter V should be taken into consideration.

8) Swimming Pool:

Although public swimming at one time occurred at Rio Linda High School pool, this joint use of the high school pool was discontinued several years ago. Recently, it was learned that the Rio Linda High School was in the process of building a new swimming pool which is slated to be finished by September of 2005. The School has also expressed an interest in having the RERPD operate this pool during the summers for public swimming.

Since the District is unable to fund the development of a swimming pool on its own, this new joint use of the High School Pool is an excellent short-term solution to meet the District's need. However, in the long-term, the District must develop a plan to singularly or jointly develop an aquatic complex possibly with the Rio Linda High School or with the North Highland Recreation and Park District. Further in assessing its future need for a swimming facility, the District should seriously consider building an indoor or enclosable pool to enable year-around swimming and aquatic activities that would take advantage of new technologies to conserve energy and reduce operating costs.

9) Trails:

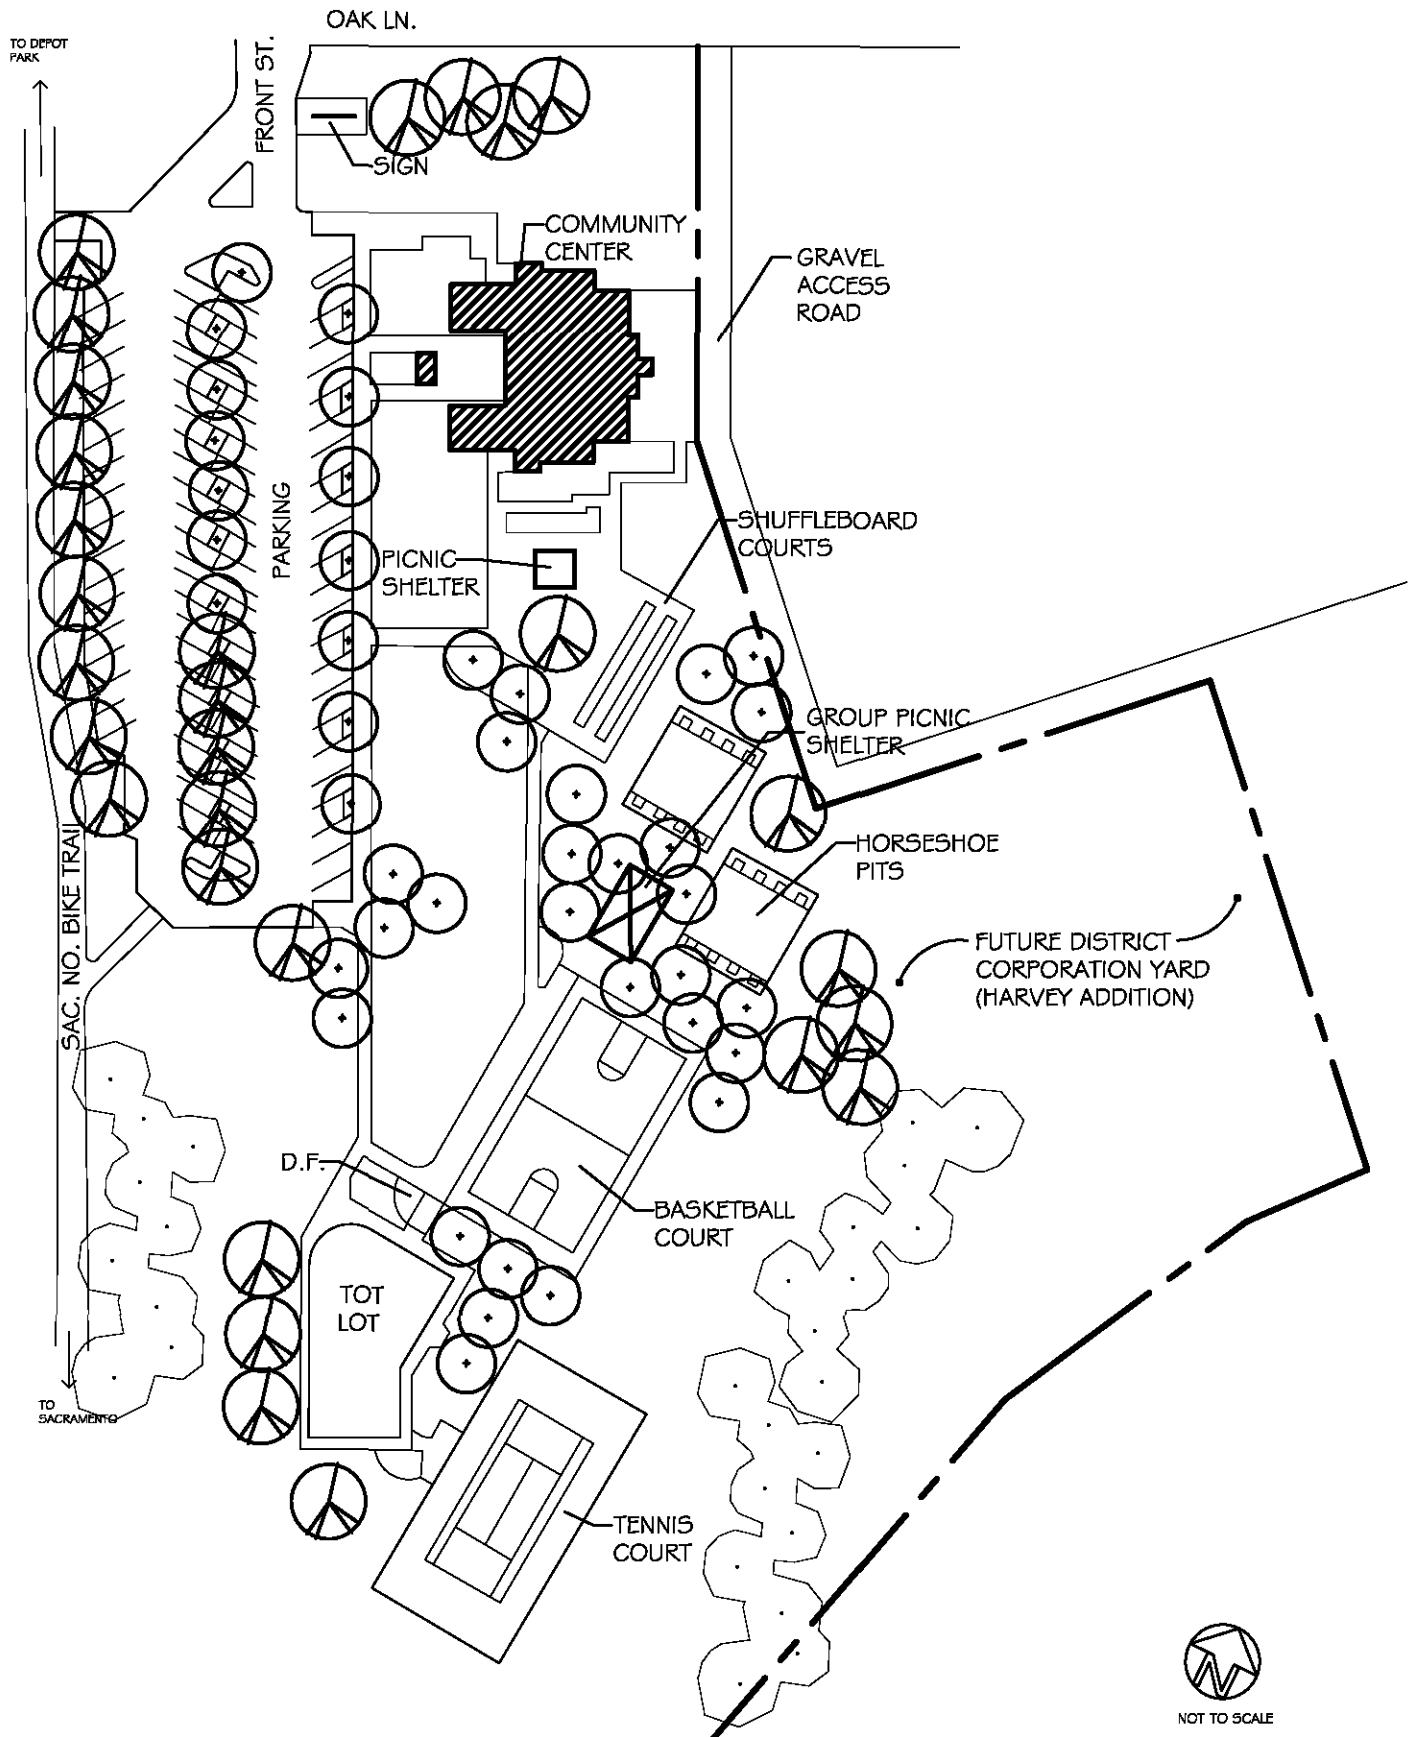

Presently, a short segment of an equestrian trail in Gibson Ranch and a bicycle trail along the abandoned Sacramento Northern Railroad right-of-way exists. Elverta Road and Elkhorn Boulevard are good natural bikeways and should be incorporated into the bikeway plan. This plan also recommends that the District support the efforts of Sacramento County, City of Sacramento and State agencies to develop the multi-use trails along the Dry Creek and Ueda Parkway, and the future extension of the trail system into and through Placer County and Roseville to form the Dry Creek Greenway that will link to the American River Parkway in Folsom.

C. Existing Park and Facility Recommendations

1) Rio Linda/Elverta Community Center Park:

This park consists of the 8.5 acre park with the new 2 acre addition, with a variety of neighborhood park amenities and a natural area on the south end of the park, as well as the Rio Linda/Elverta Community Center (see map, following page). Even though the park is nearly developed, excepting for the Corporation Yard addition, a number of improvements are still needed:

- Enlarge the Community Center Building to accommodate larger groups and more varied activities. Until the other proposed community recreation center in Planning Area #2 is built, this facility will continue to be the primary location for senior, arts and crafts programs.
- Develop the adjoining, 2 acres Harvey addition into the District's Corporation Yard with parking lot, shop buildings, indoor and outdoor storage, and renovate the 1,800 sq. ft. Harvey Residence to serve the office and meeting needs of the District and the community, and further improve the adjoining yard for a community garden and outdoor patio use.
- Improve the southern undeveloped area into a nature study area by recreating natural habitat, planting communities of native vegetation and wild flowers, installing interpretive signs and a nature trail, creating small group study areas, and installing seating/rest areas for nature appreciation.
- Plant additional shade trees around the tot lot, horseshoe area, and the parking lot.
- Provide picnic tables near the tot lot and tennis court area.
- Plant groundcover on the western bank between the bicycle trail and parking lot for erosion-control.
- Majority of the younger shade trees in the park are stunted and are in need of periodic deep watering during the summer months.

Figure 12

- Install an AC trail on the south end of the parking lot to connect the parking lot to the existing trail.
- Resurface the parking lot and improve drainage.

2) Roy E. Hayer Park:

The name of this is 2.6 acre park, located across Dry Creek from the Central Horse Arena, was changed from Central Park to Roy E. Hayer Park to honor the Hayer family that originally donated the park site to the District.

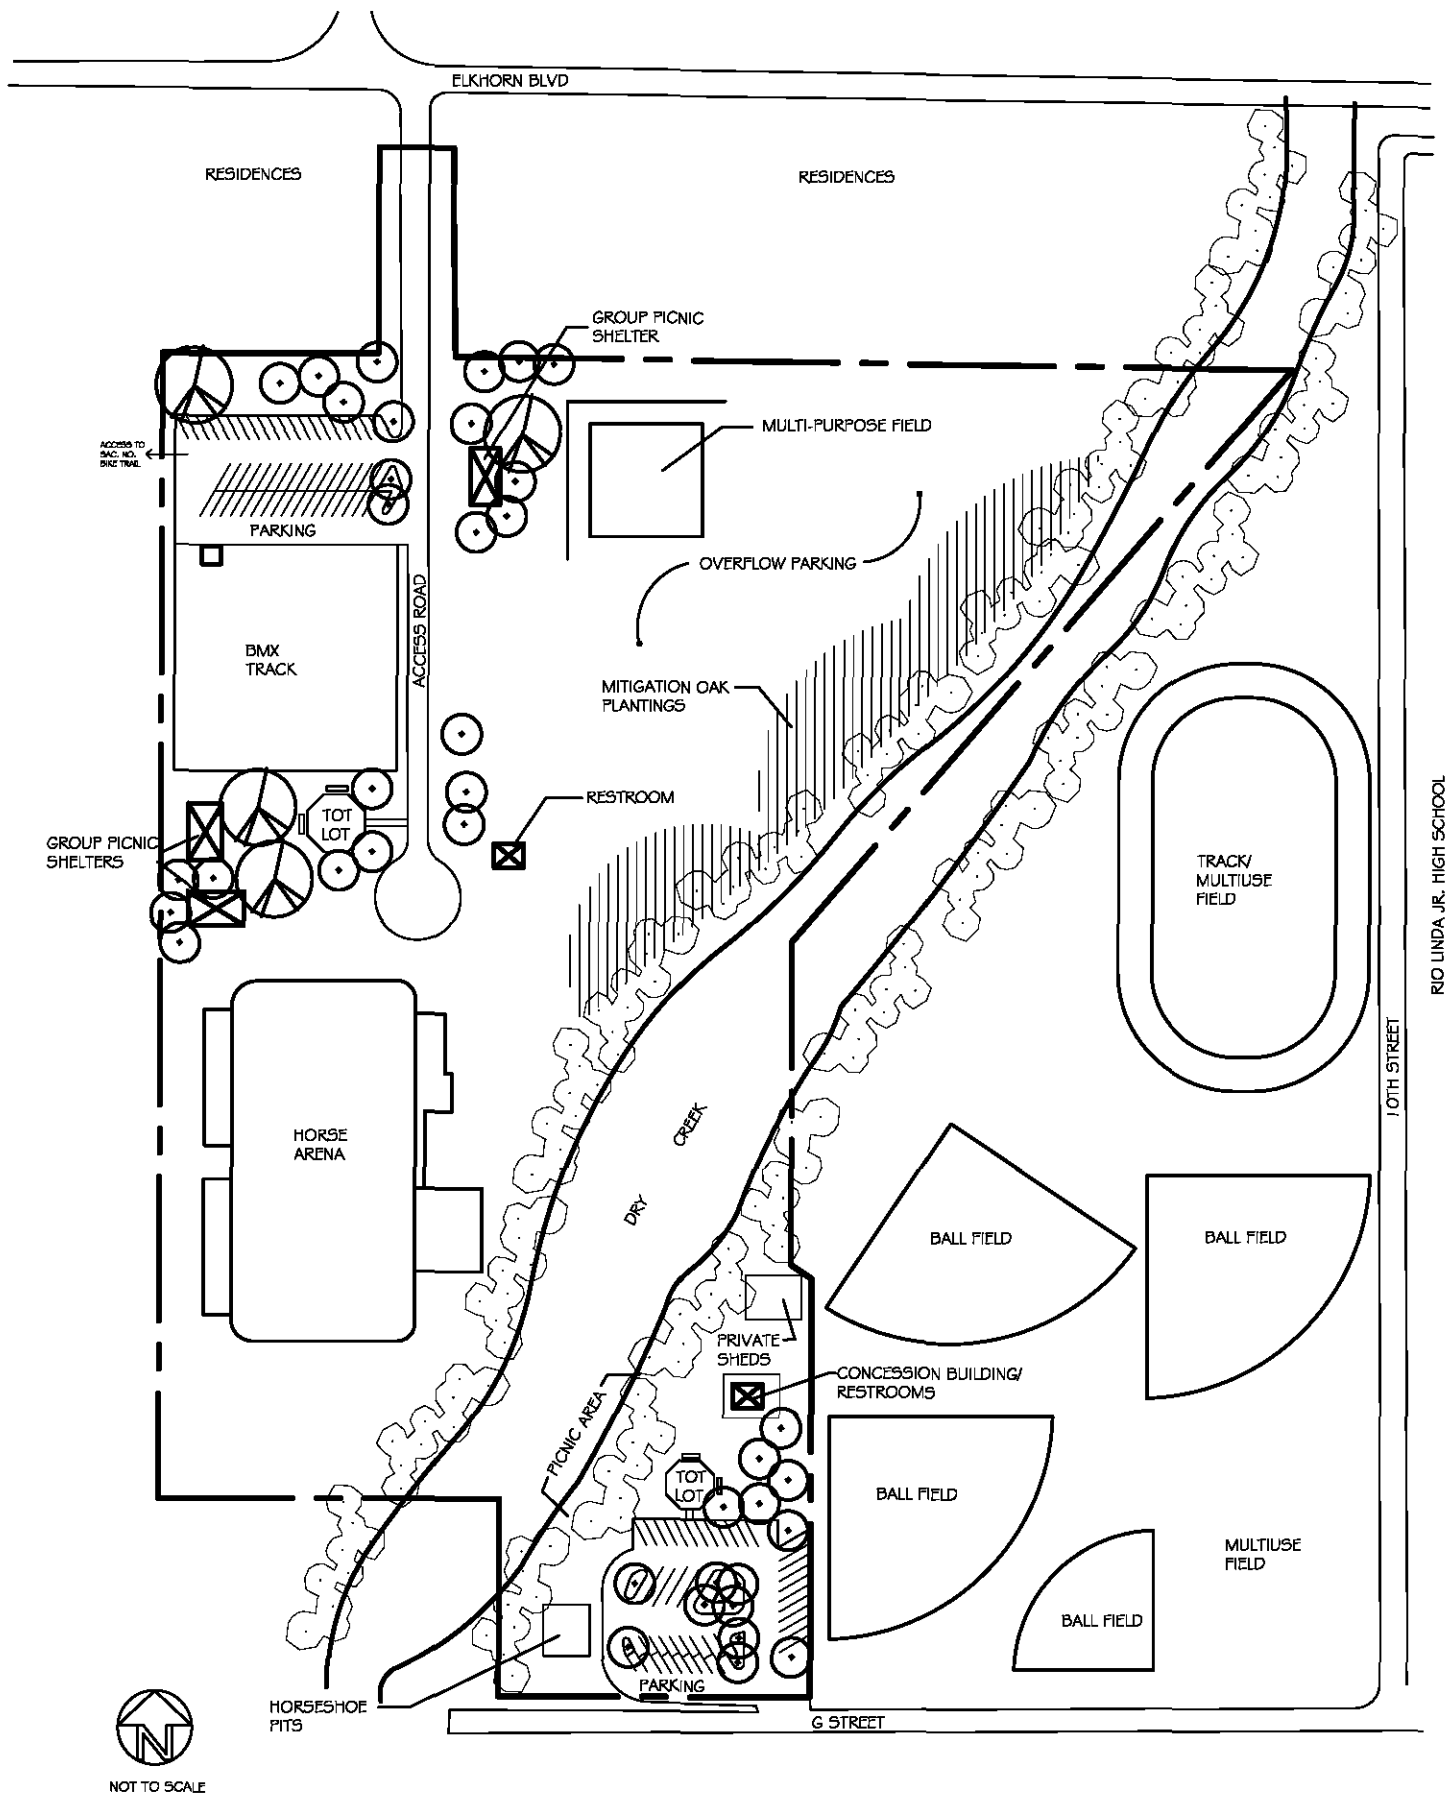

This park is in need of extensive renovation and landscape improvements including:

- Additional shade trees and improvements to the irrigation system.
- Rebuild the group barbecue and picnic shelter.
- Screen the chain link structure in the parking island with vines.
- Provide park signs at the corner of 10th and G Streets and at the immediate entrance to the parking lot.
- Control weed growth along the edge of Dry Creek to improve safety and security.
- Have the trees in the park and those along the creek examined for safety hazards, and institute necessary pruning, maintenance and clean-up work as recommended.
- Involve the students at the adjoining junior high and high schools to improve Rio Linda Central Park, the Horse Arena, and their athletic fields, thereby helping to develop greater pride and sense of ownership of their athletic fields and park.
- Install a playground in the turf area north of the parking lot.

3) Rio Linda Central Park Horse Arena:

The nine acre horse arena area encompasses a large site that is relatively undeveloped and under-used. The horse arena, BMX and the parking lot occupy approximately 1/3 of the site with the remainder being open field, used periodically for overflow parking during equestrian events. As illustrated in Figure 12 (map of the site), the remainder of the site could be developed to serve multi-purpose recreational use as an integral part of the Rio Linda Central School Park. Some of the suggested improvements for this site include:

- Extend the access road to the horse arena area with a turnaround and unloading area for trailers.
- Designate large, unpaved areas for over-flow parking during equestrian and other large events.

RIO LINDA CENTRAL PARK HORSE ARENA AND ROY E. HAYER PARK

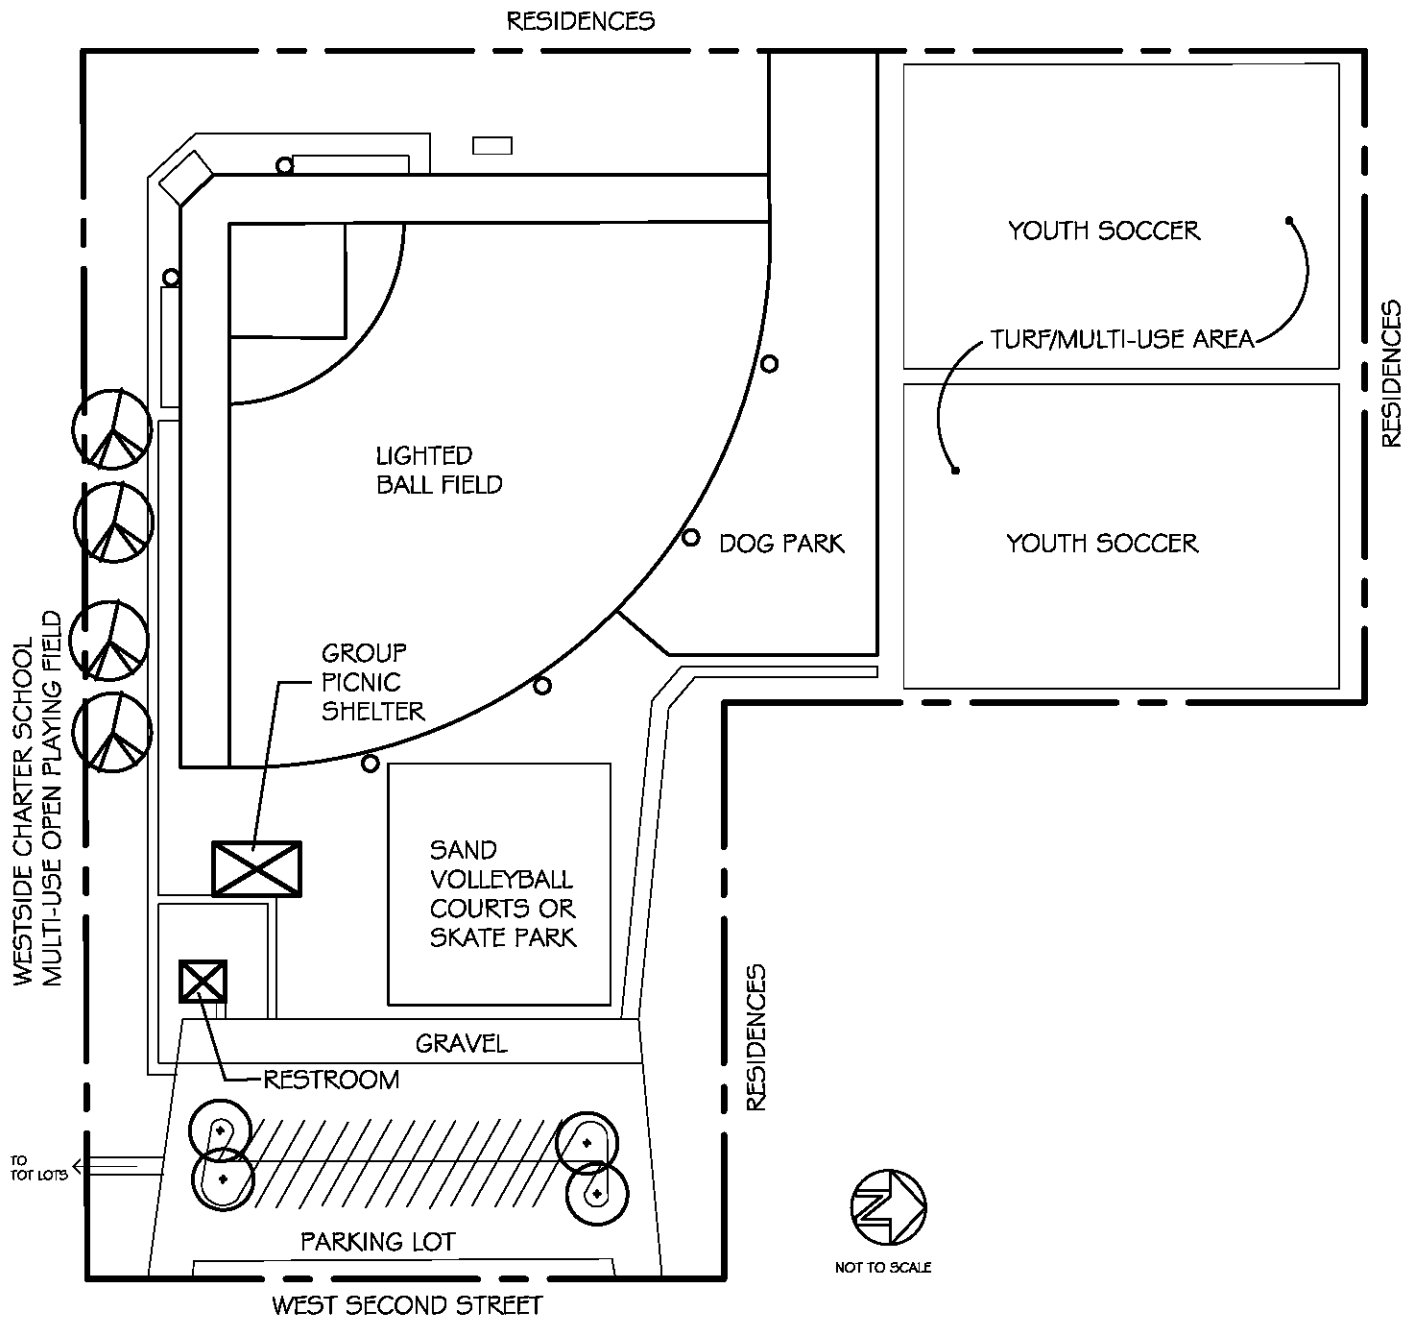

Figure 13

- Remove the existing fencing along the bike trail from the horse arena to the northern boundary.
- Develop the park area east of the access road into Bermuda turf, multi-purpose field for recreational use and for overflow parking during large events. The Bermuda turf, and the irrigation system for this area should be designed to withstand not only annual flooding, but and occasional overflow parking of vehicles and trailers.
- Secure the horse arena from the remainder of the park by installing chain link fencing around the arena. Provide gates at appropriate locations to facilitate equestrian use and activities. Lock and secure the horse arena area during non-use hours, and include the installation of security lights.
- The Gymkhana Club that has taken over the horse arena plans to continue with many of the present activities including the BMX course and miscellaneous park uses. The District should also encourage and support the Gymkhana Club to expand the equestrian activities at this site to include rodeo school, rodeo events, renaissance horse events, and others.
- Improve the site by installing automated sprinkler irrigation system, turf, shade trees, and restroom facilities.
- Reduce weed and brush growth along Dry Creek edge to improve safety and security.
- Install additional park improvements including park fixtures, furniture, trails, security lights, drinking fountains, picnic tables, bike racks, cover over the arena, more bleachers, and restroom.
- Improve signage all over the park.
- Work with Sacramento County to acquire the properties on the north side of the park for park expansion. The addition of the five residential parcels will enable the District to provide greater recreational opportunities, eliminate future land use conflicts, and improve visibility and park security. Once these additional properties are secured, prepare a new master plan of the entire site including the school athletic fields to the east if an agreement for joint use can be reached.
- Provide access to future Dry Creek Parkway trails.

4) Westside Park:

Westside Park is approximately two-thirds developed. Possible additional improvements include:

- Pave the gravel parking area, plant shade trees and other landscape, and improve irrigation system.
- Plant additional shade trees along the perimeter of the park and within the park.
- Install park sign at the entrance.

WESTSIDE PARK

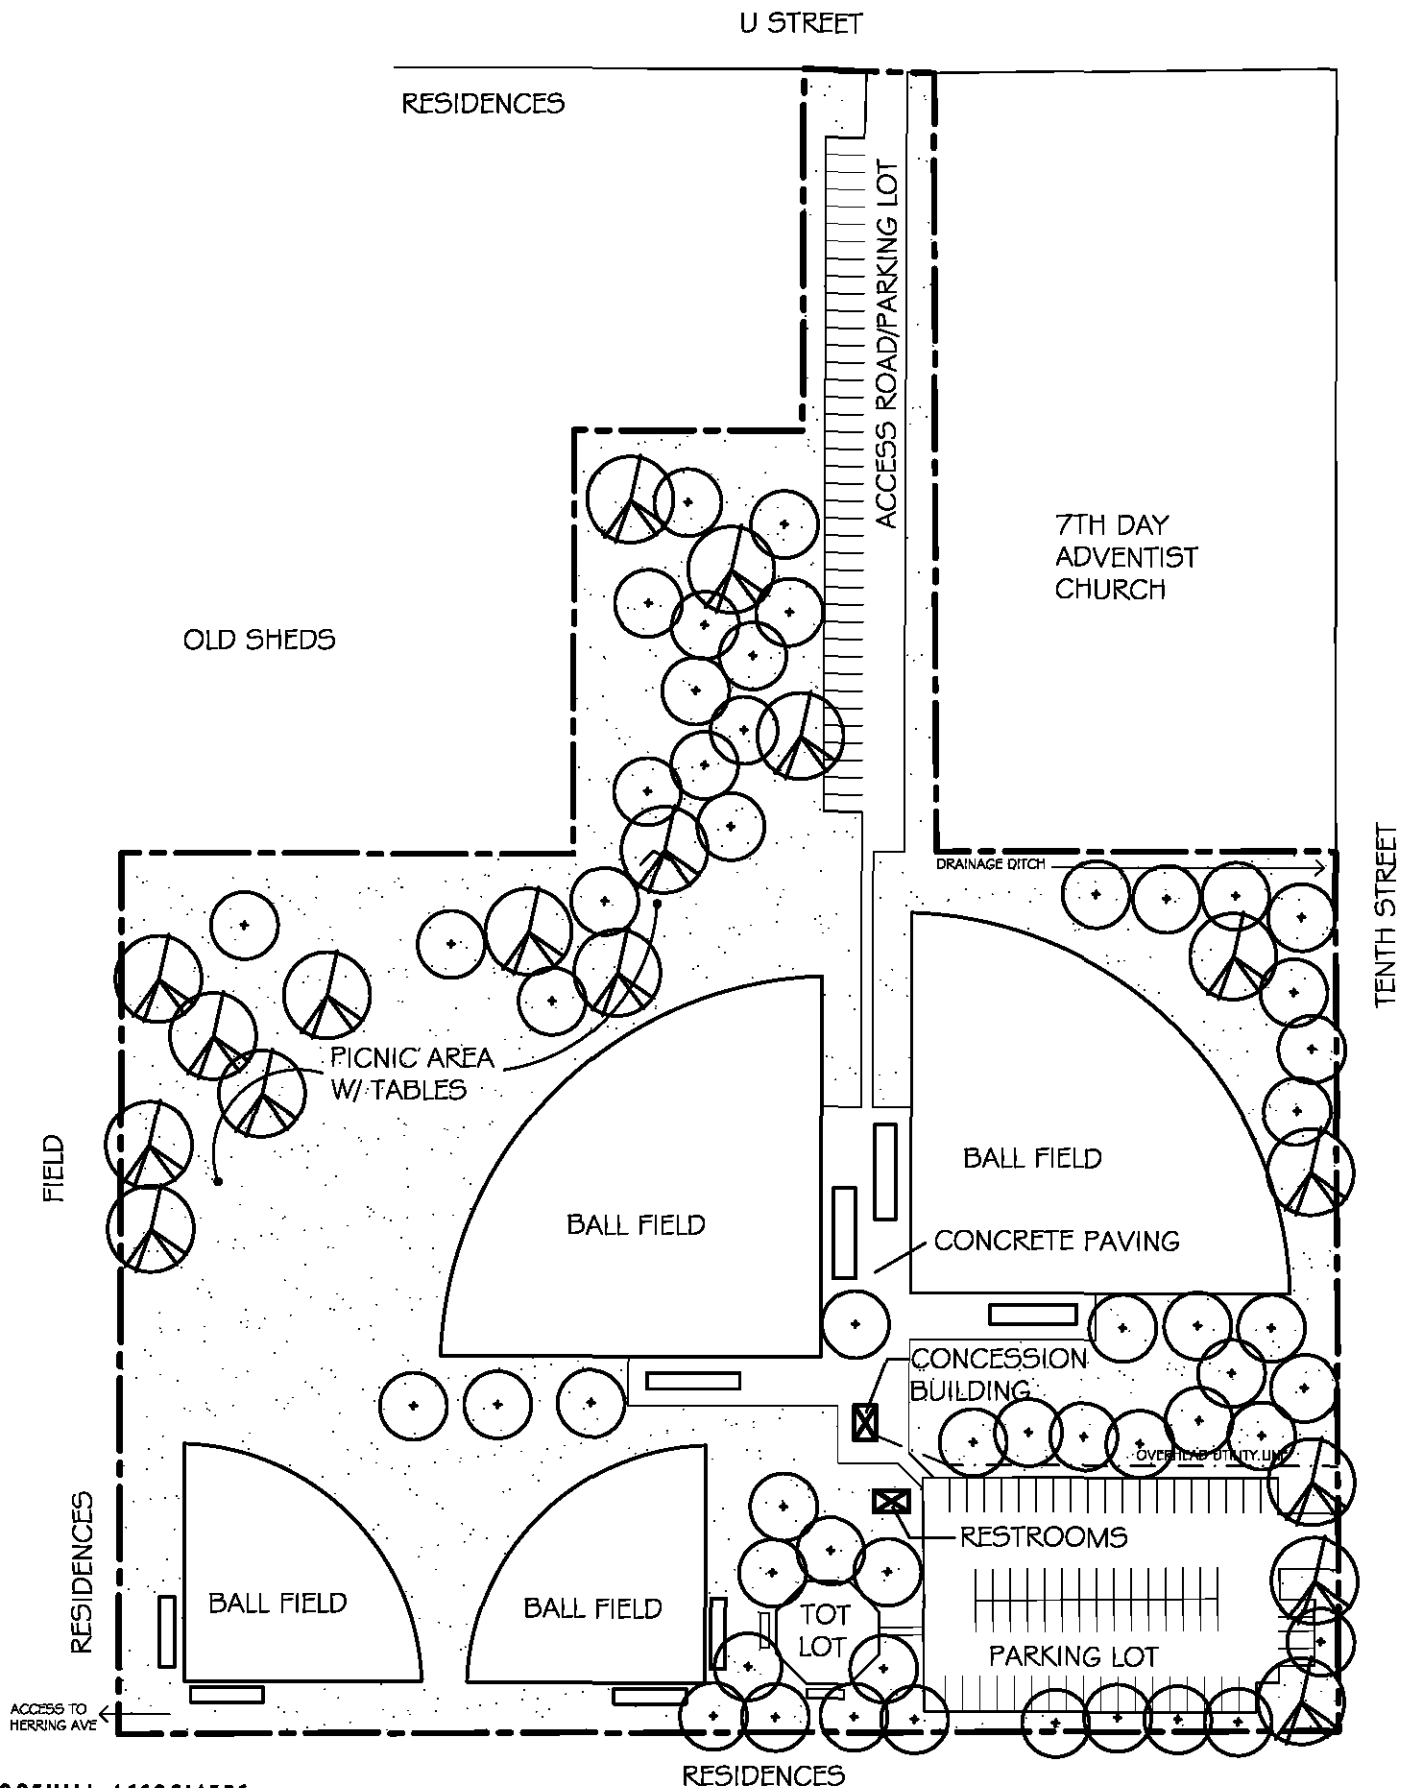

Figure 14

- Provide paved walkway from the parking lot to the ball field spectator area, and spectator seating behind the backstop.
- Create an attractive, shaded area with picnic tables adjacent to the neighboring school tot lot.
- Create areas for picnicking and seating along the proposed walkway to the ball field or in a turf area between the ball field and the parking lot.
- Consider improving the park area north of the dog park as possible area for soccer / multi purpose field. This would require that the easterly side of the Dog Park be moved westward by some 12' to 15' to create a trail corridor to link the area to the remainder of the park.
- As the sand volleyball court does not appear to be actively used, consider converting the area to a Group Picnic Area with a shelter and number of picnic tables, or as a location for a future Skate Park.

5) Babe Best Park:

The improvements recommended for this 8.5 acre park include:

- Provide a driveway and pedestrian path from U Street into the park and create a parking lot.
- Create an attractive, shaded seating area, with turf adjacent to the tot lot for parents and others to supervise children.
- Place a concrete apron/walkway around the concession building. Pave a walkway from the parking area to the ball fields, and a concrete pad between the two ball fields and below the spectator seating area.
- Plant shade trees and shrubs at the park entrance, around the edge of the parking lot, and along 10th Street.
- Plant trees and shrubs along the perimeter of the park to screen and buffer the park from the neighborhood.
- Install a permanent restroom.
- Improve site drainage by installing an underground drainage system and filling the drainage swell.
- Improve the irrigation around the tot lot and remainder of the park.

- Install a park sign at the 10th Street entrance.
- Install more picnic tables around the park.

6) Rio Linda Depot Park:

Recommendations for improving this 3 acre site include:

- Plant more shade trees and attractive landscape around the gazebo to create a focus to the park and improve the appearance of the park.
- Install additional trash receptacles during events and activities.
- Install a new irrigation system, re-grade the site and eliminate the low spots.
- Provide additional benches and picnic tables in shaded areas.
- Relocate the existing post and cable barrier to the back of sidewalk to create more usable park space.
- Provide prominent park signs at the corner of M and Front Streets.
- Provide places for bicyclists to stop, rest, and lock their bikes, and possibly hitching posts for equestrian use.
- Designate an equestrian path.

7) Northbrook Park:

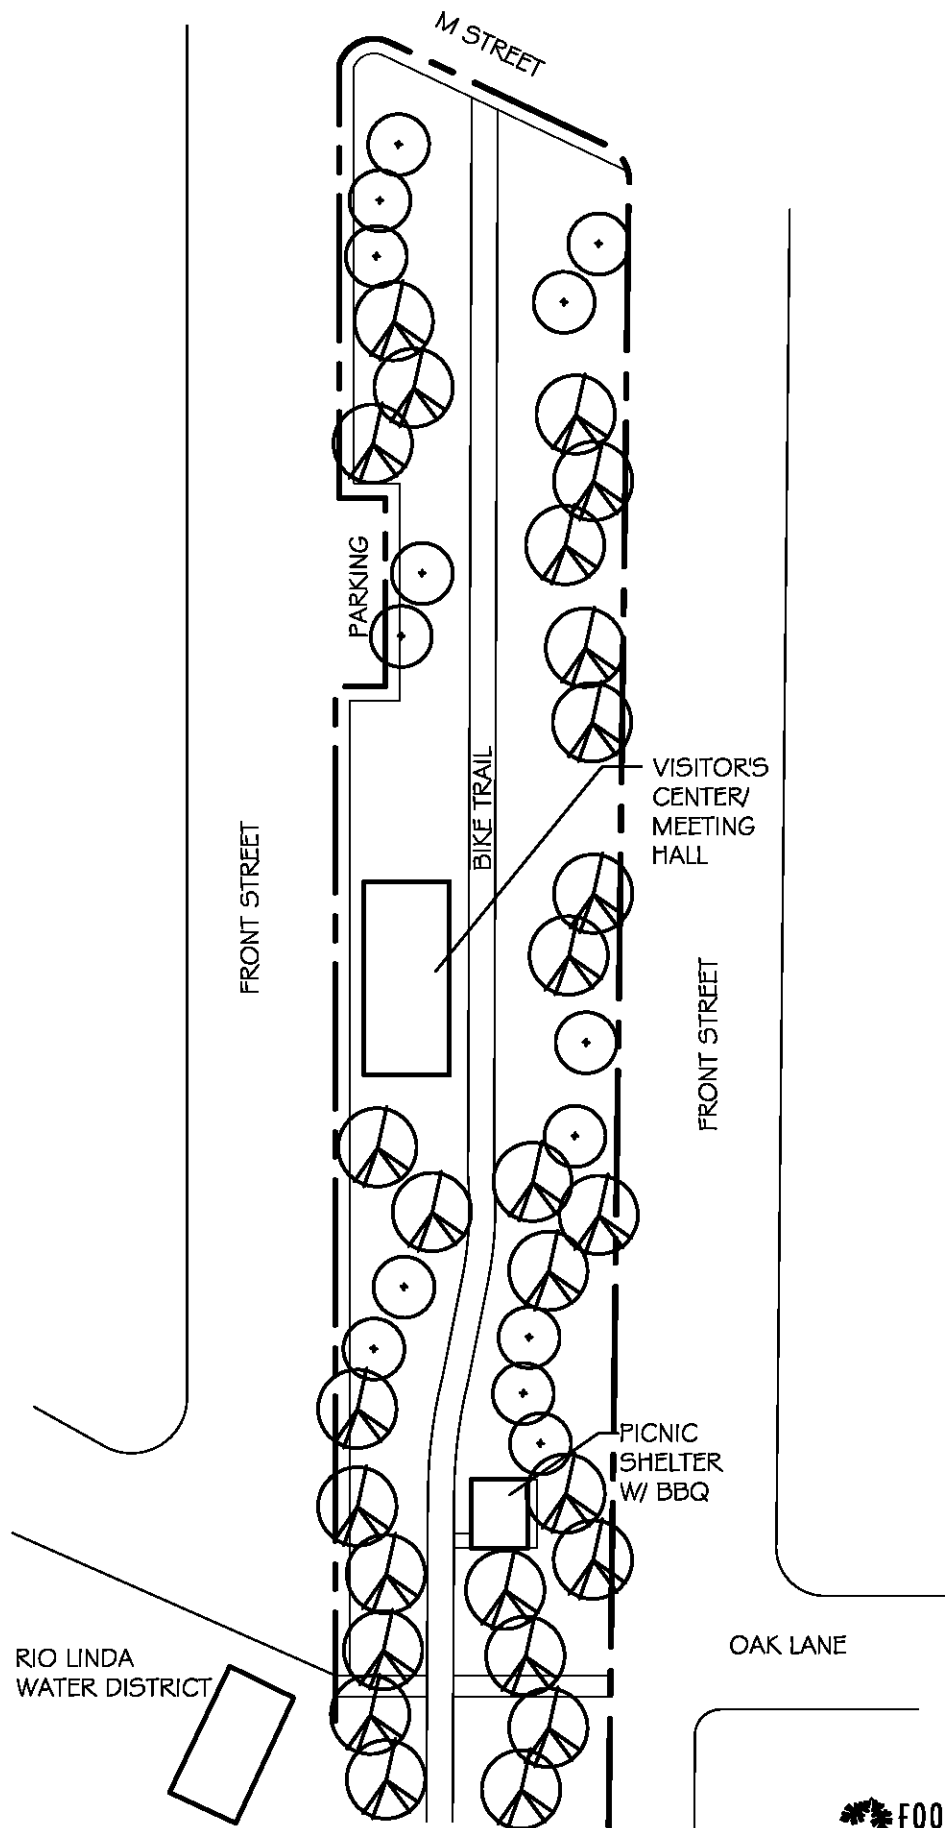

Recommendations for improving this 2.5 acre park:

- Secure the undeveloped lot at the entrance to the park and develop some parking spaces.
- Provide trail access to Dry Creek Parkway.
- Install a shade shelter for the park users with few picnic tables.

8) Linda Creek:

Recommendations for improving this 3.5 acre park:

- Conduct site assessment and develop a master plan to protect, preserve, and improve public access. Based on the master plan, develop a long-term improvement program to develop the area. Some of the improvements that may be appropriate for this site include:
 - Trail staging area and parking lot
 - Equestrian and multi-use trailhead
 - Habitat mitigation/restoration/preservation areas
 - Picnic area
- Interpretive signs

Figure 17

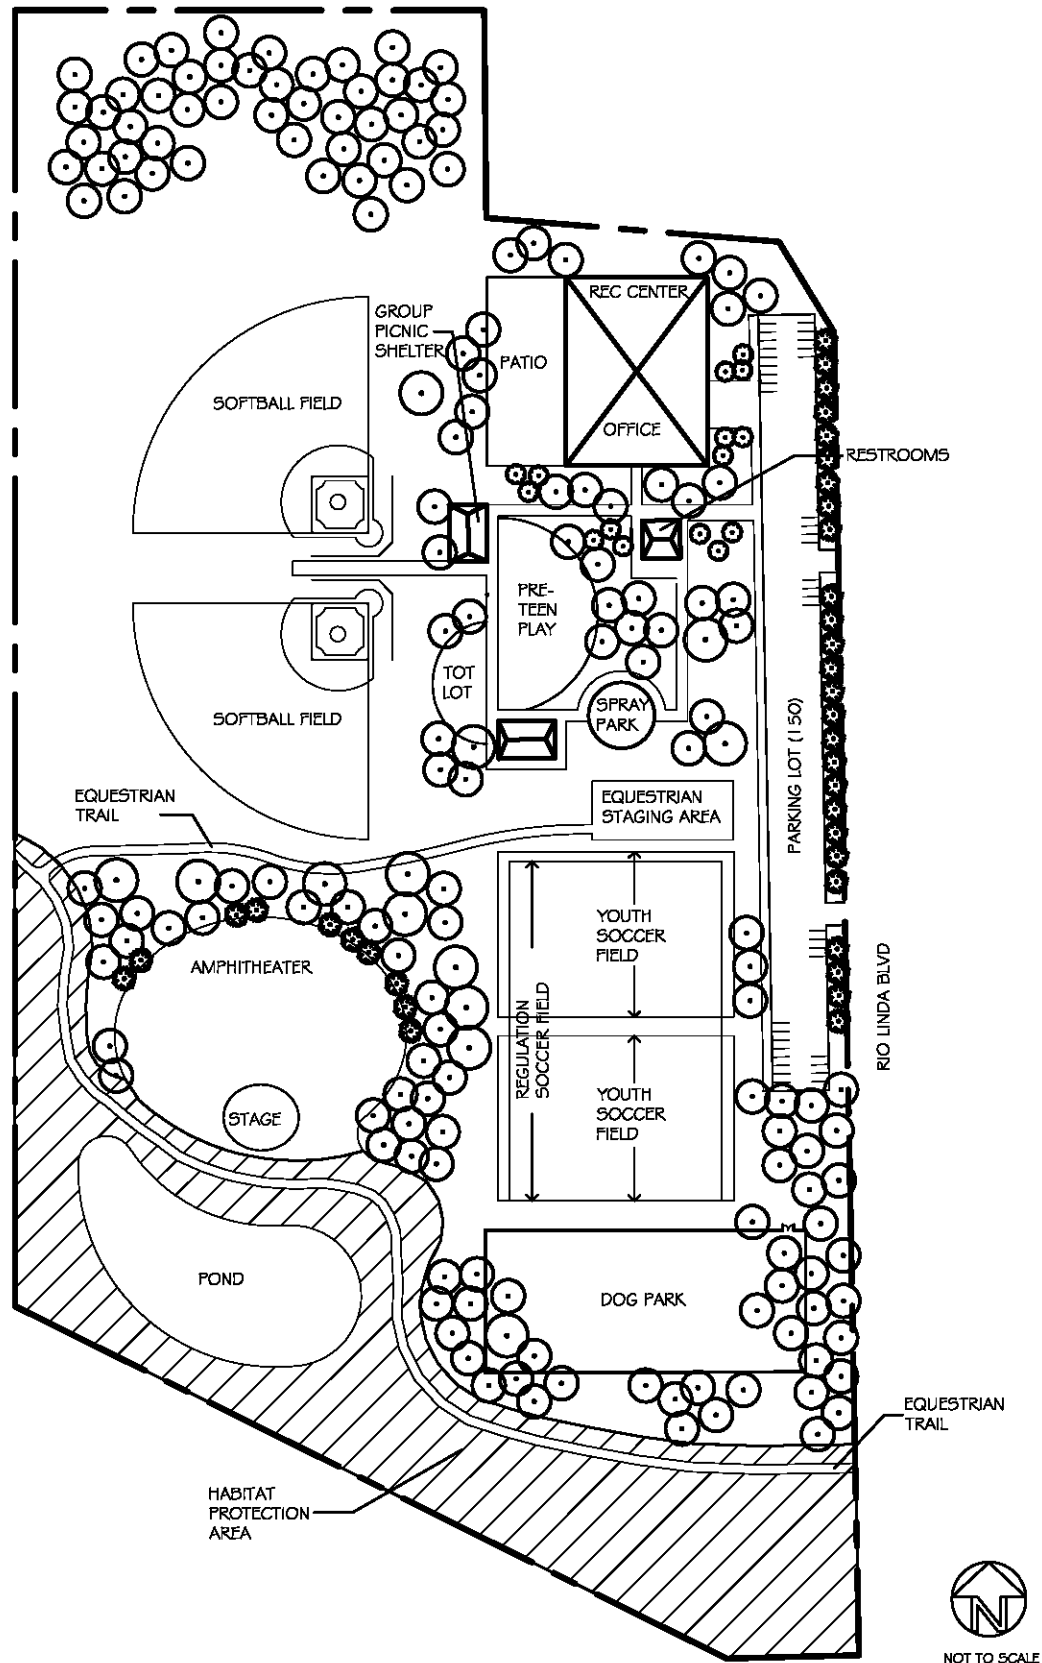

9) Ponderosa Farms Community Park:

Recommendations for improving this 30 acre park site include:

Conduct a site assessment and develop a master plan for the park by determining the ability of the site to accommodate active and passive recreational use, identify the park and recreational needs of the District, and hold a public hearing to obtain comments from District residents regarding the proposed improvements to the site. The site examination needs to carefully consider issues such as flooding, wetlands and sensitive habitat that may be present on the site. Based on the adopted master plan, develop a long-term program to fund and develop the Park. Though not included in the Ponderosa Farms Community Park concept plan, Figure 18, should it be possible to acquire additional adjacent lands, consider the inclusion of a Quarter Midget Track as part of this Community Park.

Illustrated on the following page is a concept plan showing how this site could possibly be developed with the following improvements:

- Softball/Multi-purpose fields
- A fishing pond
- Equestrian staging area and multi-use trails
- Habitat protection area
- Outdoor amphitheater
- Group picnic facilities
- Recreation center/ office
- Restrooms, access road, parking lots, security lighting, etc.
- Tot and Pre-teen Play Ground
- Dog park
- Water spray park

Figure 18

D. Park Development Priorities

Within each park the highest priority for improvements should be placed on removing safety hazards and accommodating the recreational needs of the residents. Safety hazards include any unsafe features, any facilities in disrepair, or any potentially dangerous situations to park users. The second priority is to provide adequate park and recreational facilities and programs to meet the needs of District residents. The third priority is to carry out the improvements recommended for the parks and facilities as outlined in this master plan.

Based on discussions with Staff and review of the park resources, the priorities for park improvements should generally be in the following order:

1. Rio Linda Central Park and Corporation Yard
2. Babe Best Park
3. Rio Linda Depot Park
4. Westside Park
5. Rio Linda/Elverta Community Center Park
6. Ponderosa Farms Community Park
7. Acquire additionally needed park lands as funds permit.

By prioritizing the parks and the work to be done within each park, the District is guided in the most efficient, effective, and flexible manner to implement this 10-year master plan. The District can undertake the improvements at a pace suitable for its financial and staff capabilities.

Finally, should additional outside funds be made available during this ten year planning period, the various improvements and acquisition programs can be accelerated in keeping with this Master Plan.

E. Capital Improvement Program

The ten-year Capital Improvement Program (CIP) (Table 22 on the following page) was developed with District staff to undertake required improvements to District parks. This CIP assumes a level of improvements that are within the projected funding capacity of the District. For the sake of preparing a minimal CIP, this program discounts the use of outside funding opportunities, such as a bond issue or a mechanism such as the Landscape and Lighting Assessment District. Should the District decide to pursue these means or others to obtain additional funds, the anticipated improvements, and especially some of the acquisition program could be advanced. The level of Parkland Dedication or In-Lieu Fees and Development Impact Fees collected will also help to advance park improvements and the parkland acquisition program.

Table 22 — RLERPD Park Facility-Capital Improvement Program

Park and Improvements	High Priority 1-2 years	Moderate Priority 3-5 years	Low Priority 6-10 years	Budget
Babe Best Park (8.5 acres)				
• Irrigation system replacement	\$30,000			\$30,000
• Add restroom	\$100,000			\$100,000
• Demolition and parking lot construction		\$60,000		\$60,000
• Pipe drainage on north side of park		X		
• Slurry seal parking lot		\$3,000		\$3,000
Central Park Horse Arena (12.5 acres)				
• Add irrigation and landscaping	\$5,000			\$5,000
• Investigate permanent restroom	\$2,000			\$2,000
• Build equipment storage		\$5,000		\$5,000
• Cover arena			\$100,000	
Community Center				
• Install new H/AC			\$100,000	\$100,000
• Retrofit lighting for energy efficiency		X		
• Study ADA compliance and remodeling		\$5,000		\$5,000
Community Center Park (8.5 acres)				
• Build maintenance shop	\$38,000			\$38,000
• Re-landscape for water conservation		\$5,000		\$5,000
• Improve irrigation system		\$10,000		\$10,000
• Parking lot repair & slurry seal		\$5,000		\$5,000
• Basketball courts resurfacing		\$2,000		\$2,000
• Tennis courts resurfacing			\$8,000	\$8,000
• Investigate drainage improvements between basketball and tennis courts			\$10,000	\$10,000
Depot Park (3 acres)				
• Build replica of Depot & Freight Shed	\$40,000			\$40,000
• Upgrade landscaping	\$3,000			\$3,000
• Improve irrigation system	\$5,000			\$5,000
Linda Creek (3.5 acres)				
• Assess site for neighborhood park and interpretive area			Use Volunteers	

Northbrook Park (2.45 acres)				
Ponderosa Farms (30 acres)				
• Assessment property for park use	\$10,000			\$10,000
• Develop park master plan			\$20,000	\$20,000
Roy E. Hayer Park (2.59 acres)				
• Renovate irrigation and landscape	\$3,000			\$3,000
• Investigate building a bridge across creek			\$5,000	\$5,000
• Investigate JPA to improve and maintain adjoining school fields			\$2,500	\$2,500
Westside Park (7.5 acres)				
• Investigate JPA with school to install well for irrigation system		\$20,000		\$20,000
• Develop Dog Park addition				
• Improve irrigation for Dog Park and parking lot	\$10,000			\$10,000
• Install landscaping around Dog Park and parking lot	\$6,000			\$6,000
• Make ADA compliant access from parking lot to other park areas	\$3,000			\$3,000
Acquisition of Parklands:				
• Planning Area #1B – 46.7 acres*			\$5,837,500**	\$5,837,500
• Planning Area # 3 – 5.18 acres*			\$647,500**	\$647,500
• Planning Area # 4 – 10.4 acres*			\$1,300,000**	\$1,300,00
• Planning Area # 5 – 16.8 acres*			\$2,100,000**	\$2,100,000
TOTAL PARK IMPROVEMENT COSTS:	\$255,000	\$115,000	\$245,500	\$615,500
LAND ACQUISITION COSTS			\$9,885,000*	\$9,885,500

* Acquire Parklands as funds permit or opportunity arises in conjunction with land development projects.

** These acquisition estimates are based on \$125,000 per acre for Agricultural / Residential property.

As the ten-year CIP is implemented, the first two years would be devoted to High Priority Projects to bring some of the existing parks up to current standards and provide basic park improvements. The Moderate Priority Projects would be undertaken in years three through five to upgrade existing parks. The Low Priority Projects would be undertaken in the year's six to ten. And acquisition of needed additional park lands would occur as funds permit.

Implementation of the District Master Plan will require considerable funding for parkland acquisition, planning and design, and capital improvement. A wide variety of potential

funding sources and in-kind services will need to be pursued to support the implementation of this Master Plan. Grants, sponsorships, endowments, donations, and other forms of outside funding will also become more attainable with the adoption of this updated Master Plan. Located in Appendix A are some of the funding sources that the District should pursue to assist in the implementation of the Rio Linda Elverta Recreation and Park District Master Plan.

F. Park and Recreation Operation

1) Administration:

District needs to maintain a level of experienced staffing to adequately administer the District, maintain the park system, and supervise the recreation programs.

2) Park Operation:

The District should initially concentrate on maintaining and upgrading the existing park facilities. As funding, staff, and equipment allows, additional park improvements should be made. As an alternative to increasing park operation staff, District should consider contract services for basic park maintenance service to keep up with future park system growth.

3) Park Security:

The District, as with many other park agencies, experiences vandalism and security problems in its parks. Since 2001, the District has contracted with Grant School District's Security Guards to patrol its parks on a limited basis. With this patrol, increasing park use, a Park Watch Program, increasing collaboration between RLERPD and the School Districts, and greater public education program, it is anticipated that vandalism and security problems in parks can be lessened.

Park security is in part related to proper planning and development of its parks and facilities, neighborhood awareness, and public awareness of park use regulations. However, past experiences at the District have shown that these factors alone will not

deter vandalism in the parks. There is a continuing need to have a patrol to provide security for the parks so long as vandalism continues and the patrol service is economically viable.

The District has a number of ways to help reduce vandalism and other anti-social activities in its parks including:

- Inform and educate the public regarding the proper use of the parks and facilities, and post park regulations in visible locations in the parks.
- Apprehend and prosecute vandals.
- Provide the public with ways to report crime or vandalism.
- Work with the Sheriff's office to establish Park Watch Programs in park neighborhoods.
- Post notices that limit park use to dawn to dusk unless organized evening activities are conducted. Lock parking lots when the park is closed.
- Plan and design parks and facilities to discourage vandalism and lessen security concerns.
- Design the parks to enable drive-by visibility of majority of the park by police, security guards, and the general public.
- Provide sufficient park security lights to aid in surveillance and discourage vandalism.

4) Recreation Programs:

Provide a variety of recreation programs to meet the expressed needs of the community. The recreation programs should address the needs of all ages and special interest groups to the extent that is possible. To maximize effort and minimize cost, cooperative or joint sponsorship of programs with school Districts and adjacent park agencies should be considered. To offset preschool and youth programs that may not be self-supporting, adult programs should be revenue-generating. Refer to Chapter VI Recreation Needs Survey conclusions and recommendations, regarding future needs in programming. The District also needs to document more accurately the participation in various recreational programs to effectively evaluate programs annually.

G. Additional Considerations to Implementing the Master Plan

1) Other Recreation Providers:

District should encourage, support, and work with other public and private recreation organizations that provide recreation facilities and services that complement the programs offered by the District. District should also investigate opportunities for private concessionaires to lease and operate facilities and programs on District parks or facilities to benefit the District residents. Through cooperative efforts with other recreation providers, the community could be provided with an expanded and higher level of service, and some of the burden of providing similar services by the District could be lessened. Also, properly contracted, the private recreation concessionaires could also help to reduce maintenance burden and possibly help to reduce vandalism.

2) Schools:

As described in other sections of this master plan, school sites and facilities constitute a significant recreation resource for the community. It would behoove both the Park and the School Districts to work cooperatively for mutual benefit since the facilities and services provided by both are very complementary. From planning and land acquisition to development, operation, and management, the District should work closely with the School Districts, especially in regard to sites offering joint use opportunities.

3) Other Agencies:

The efforts by Sacramento County Department of Water Resources and SAFCA to acquire flood prone residential properties in the Dry Creek flood plain using FEMA and State funds should be strongly endorsed by the District. Beyond the fact that

this process is aiding in assembling the Dry Creek Parkway and eventually benefiting the residents of the District, there may also be opportunity for the District to be the direct beneficiary of such properties particularly associated with the residential properties abutting the Central Horse Arena. The District should petition the Board of Supervisor to provide the District the first right of refusal to take management responsibility for such flood prone properties that are acquired adjoining District park sites. In the case of the Central Horse Arena site, the adjoining residential properties that have been acquired to remove residences from flood prone areas, after the site is cleared of structures, should be transferred to the District to enlarge the Central Park Horse Arena and provide badly needed additional recreational facilities.

Appendix A — Funding

The following are some of the funding sources that should be pursued for implementation of the Rio Linda Elverta Recreation and Park District Master Plan.

Grants

Federal:

1. Department of Transportation Intermodal Surface Transportation Efficiency Act (ISTEA)

The Act allows a portion of the transportation funds to be used to build bicycle paths along federal-aid highways, roads, trails or parkways.

2. Watershed Assistance Grants Program (WAG)

The Clean Water Action Plan calls for the creation of a dedicated source of funding to build the capacity of existing or new watershed partnerships to protect and restore their watershed. These partnerships would serve as national models of how to bring together diverse interests to achieve watershed protection and restoration and of how to ensure diversity in watershed partnerships. The WAG program will make grants to local watershed partnerships to support their organizational development and long-term effectiveness.

3. Cooperative Endangered Species Conservation Fund

Granted by the U.S. Fish and Wildlife Service to a State agency with a cooperative agreement with the Secretary of the Interior to assist in the development of programs for the conservation of endangered and threatened species – including habitat protection, restoration, management and acquisition; and public education. Up to 75% of program costs may be received.

4. Wildlife Conservation Fund (Partnership For Wildlife)

Granted by the U.S. Fish and Wildlife Service, available for actions to conserve fish and wildlife species and their habitats; and to provide opportunities for the public to use and enjoy fish and wildlife through non-consumptive activities. Eligible for any fish and wildlife agency in partnership with State agencies and private organizations and individuals. Up to 33% of program costs may be received and private funding match required.

5. Water Banks Program

Granted by the Department of Agriculture's Natural Resources Conservation Service, landowners are eligible for funds to conserve surface waters; preserve and improve wetlands and preserve important nesting, breeding and feeding areas of migratory waterfowl. Annual payments for 10 years will be made for \$7 to \$75 per acre.

6. Wetlands Grants

Granted by the EPA's Office of Water, funds are available to States, local government and not-for-profit organizations to develop the capacity to protect, manage and restore wetlands and riparian resources. Minimum match of 25% of total project cost is required.

7. North American Wetlands Conservation Fund

Granted by the U.S. Fish and Wildlife Service, funds are available for wetlands conservation projects to be matched one on one by U.S. non-federal dollars. Special consideration is given for migratory bird habitat and other key wildlife habitat. Beneficiary eligibility is available to any organization or individual.

8. Urban Park and Recreation Recovery Program

Funded by the National Park Service, funds are available for the rehabilitation of recreation areas and facilities, demonstration of innovative approaches to improving recreation opportunities, and development of improved recreation planning. These grants are matching grants (50% Federal – 50% local).

9. Recreational Trails Program

Granted by the Department of Transportation's Federal Highway Administration, this grant is available to develop and maintain recreational trails and trail-related facilities for both non-motorized and motorized recreational trail uses. A State agency must be designated by the Governor to receive the funds.

10. Outdoor Recreation Acquisition, Development and Planning (Land and Water Conservation Fund Grants)

Grants provided by the National Park Service to acquire and develop outdoor recreation areas and facilities for the general public, to meet current and future needs. Not more than 50% of the project cost may be federally financed.

11. Environmental Education Grants (EEG)

For grants provided by the EPA's Office of Environmental Education, funds are available to support projects to design, demonstrate, or disseminate practices, methods, or techniques related to environmental education and training. Federal funds will not exceed 75% of the project cost.

State:

1. California's Department of Conservation Resource Conservation District (RCD) Assistance Program/Grants

This grant annually provides \$120,000 to support conservation education and on-the-ground projects promoting conservation with landowners and communities within watersheds. Land restoration, fish and wildlife habitat enhancement, water quality conservation, and public outreach and education are all eligible actions supported with this grant. A 25% local match is required.

2. State Lands Commission

Can acquire land through Land Bank funds and/or exchange.

3. Department of Transportation

Proposition 116 - Bicycle trails funding.

4. Resources Agency

State Environmental License Plate Funds – Grants are offered to state agencies, city or county agencies, or private non-profit organizations to support a variety of projects that help to preserve or protect environment. Eligible projects include acquisition, restoration or enhancement of resource lands and endangered species, and development of interpretive facilities. Projects are funded in one-year increments and each must be a separate, distinct project with a clearly defined benefit.

Environmental Enhancement and Mitigation Program (EEMP) – Grants offered to local, state or federal agencies or non-profit entities to provide enhancement or additional mitigation related to eligible transportation facilities. Eligible projects include highway landscaping and urban forestry, acquisition restoration or enhancement of resource lands, and acquisition and/or development of roadside recreation opportunities. The program, established in 1989 (Section 164.56 of the Streets and Highways Code) provides funding from fuel taxes and weight fees.

5. Department of Fish and Game

Inland Fisheries Division Grant Project provides funds for fishery restoration work.

The Cigarette and Tobacco Tax Benefit Fund (Proposition 99) provides funds to restore fish habitat. The Commercial Salmon Stamp account provides funds for projects directed at restoring salmon populations through habitat enhancement or fish rearing, and for projects designed to educate the public on the importance and the ecology of salmon. Anyone may apply. Action projects are preferred to studies, evaluations or monitoring. Funding levels are recommended by the

Commercial Salmon Trollers Advisory Committee or the California Advisory Committee on Salmon and Steelhead Trout.

6. Wildlife Conservation Board (Generally administers the Federal Land and Water Conservation Fund)

Proposition 19 (1984 Fish and Wildlife Enhancement Bond Act) provides funds to correct the more severe deficiencies in fish and wildlife habitat. Funds may be used only by public agencies to enhance, develop or restore flowing waterways for the management of fish outside the coastal zone. Proposition 70 funds are available for endangered species and for native trout habitat restoration.

7. Department of Water Resources

Urban Streams Restoration Program offers grants for local street restoration projects for prevention of property damage by floods and bank erosion and to restore the natural value of streams. Under the Proposition 13 - Safe Drinking Water, Clean Water, Watershed Protection and Flood Protection Act, the grants can fund simple projects such as organizing volunteer help to monitor and clean up streams or can fund complex stream restoration work. Cities, counties, Districts and nonprofit organizations may apply for grants. Small unincorporated community organizations or consulting firms may apply but must find a non-profit organization or a local government to sponsor this proposal. This grant program stresses community participation. Therefore, any proposal submitted by a government agency must be cosponsored by a logical local group with an interest in the problems or streams to be addressed by the proposal. Likewise, projects submitted by nonprofit organizations must be co-sponsored by an appropriate local agency.

8. Department of Forestry and Fire Protection

The Urban Forestry Grant Program (Proposition 12 Tree Planting Grant) was created by the Watershed, Wildlife, and Parks Improvement Bond Act. Cities, counties, Districts and nonprofit organizations may apply for grants. Eligible projects include planting trees along streets, in dedicated open space areas, and in public parking lots and school yards.

Forest Stewardship Program – Funded by Federal dollars and administered by the State for private land owners only. Grants are provided to protect, restore and improve wetlands and riparian areas to maintain water quality and enhance habitat. Eligibility for private landowners as well as public jurisdictions.

9. State Water Resources Control Board

The Non-point Source Pollution Control Program – Non-point sources (NPS) are the major cause of water pollution in California. As the state agency charged with protecting water quality in the State of California, the State Water Resources Control Board (State Board) is committed to promoting implementation projects that reduce NPS pollution in water bodies of the State. The February 1987 amendments to the federal Clean Water Act (CWA) include Section 319, which establishes the framework for non-point sources (NPS) activities on the State

level. The CWA provides funding for the states' NPS programs, including grants for NPS implementation projects. Implementation projects to reduce NPS loading from various sources are eligible for grant funding. NPS implementation activities include demonstration projects, technology transfer, training, public education technical assistance, ordinance development, and other similar activities associated with control of NPS pollution.

Water Quality Planning – The State Water Resources Control Board provides water quality management planning grants to state, local, and regional agencies to address a wide variety of surface and ground water quality problems. These funds are provided by the federal government under Sections 205 and 604(b) of the Clean Water Act. These grants require a 25% non-federal match. The funding emphasis is on projects that focus directly on corrective or preventive actions for water bodies identified as "impacted" in the State's Water Quality Assessment. However, projects that focus on other water quality problems will also be considered.

EPA's State Wetland Program Development – Under the Clean Water Act (CWA) Section 104 (b)(3), grants are given to various wetland projects include "multi-objective river corridor management" projects that address multiple use of rivers and adjacent areas, such as recreation habitat protection, water quality and open space. Funds are available to assist states and local government in implementing new programs relating to wetlands preservation and enhancement.

10. Department of Parks and Recreation

Land and Water Conservation Fund – This program has funds available for the acquisition or development of neighborhood, community or regional parks or facilities supporting outdoor recreation activities. Eligible applicants include counties, cities, recreation and park Districts, special Districts with public park and recreation areas. This is a 50/50 matching program. The applicant is expected to finance the entire project and will be reimbursed 50% of the costs, up to the amount of the grant. The amount of funds available varies from year to year.

Riparian and Riverine Habitat Grant Program – To provide funds on a competitive basis to increase public recreational access, awareness, understanding, enjoyment, protection, and restoration of California's irreplaceable rivers and streams. Includes the acquisition, development, or improvement of recreation areas, open space, parks, and trails in close proximity to rivers and streams. All projects must include a Riparian or Riverine habitat enhancement element and also provide for public access.

Habitat Conservation Fund – This program provides funds for a variety of habitat conservation projects. Eligible applicants include counties, cities, cities and counties, or Districts as defined in Subdivision (b) of the Public Resources Code. Eligible projects include: deer and lion habitat, including oak woodlands; habitat for rare and endangered, threatened and fully protected species; wildlife corridors and urban trails; wetlands; aquatic habitat for spawning and rearing of anadromous salmonids and trout species; and riparian habitat. This is a 50/50 matching program. The match must come from a non-State source.

Non-Motorized Trails Grant Program – Eligible applicants include cities, counties, eligible Districts, and eligible local agencies formed for park purposes, and federally recognized California Indian tribes. This competitive grant program funds the development, improvement, rehabilitation, restoration, and enhancement of non-motorized trails and associated interpretive facilities for the purpose of increasing public access to, and enjoyment of, public areas for increased recreational opportunities.

Private:

1. The Conservation Fund – American Greenways Grant Program

Provides grants in recognition of accomplishments in successful and creative approaches to developing California Greenways, particularly through overcoming obstacles and creative problem-solving.

2. National Fish and Wildlife Foundation's Grants

A private non-profit established by Congress in 1984, the foundation fosters cooperative partnerships to conserve fish, wildlife, plants, and the habitats on which they depend. The Foundation works with its grantees and conservation partners to stimulate private, state, and local funding for conservation through challenge grants. Through a challenge grant, each dollar awarded by the Foundation must be matched with one non-federal dollar. Projects that benefit multiple species, achieve a variety of resource management objectives, and/or lead to revised management practices that reduce the causes of habitat degradation. A special emphasis is placed on larger projects that demonstrate a landscape-level approach and produce lasting, broad-based results on the ground. Numerous grants would apply to the Dry Creek Parkway including "Bring Back the Natives", "Native Plant Conservation Initiative", and habitat conservation plans focusing on migratory bird populations.

Low Cost Services

Federal:

1. U. S. Department of Agriculture, Soil Conservation Service, Resource Conservation District

This program focuses on preserving site-specific plants through collection and propagation of native seeds if project approved by local Resource Conservation District.

State:

1. Conservation Corps

The Conservation Corps provides low cost services for brush clearance and trail building. Sponsor must provide materials, but Corps provides supervision and some tools, and crews often work alongside volunteers.

Other Services/Materials

Federal:

1. National Parks Service

Rivers and Trails Conservation Assistance Program – Under the National Center for Recreation and Conservation. This program provides technical assistance for corridor conservation plans, statewide assessments, conservation workshops, consultation, and information exchange. Rivers & Trails staff work on the grassroots level with local citizens groups and state and local governments to revitalize nearby rivers, preserve valuable open space, and develop trail and greenway networks. All Rivers & Trails projects are locally led and managed, and begin with an invitation from local agencies and/or organizations to help.

State:

1. Department of Forestry

The Department of Forestry sells low-cost native trees. The trees must be purchased in quantities of 10, habitat and erosion control, but not for landscaping. Can also provide discounts if jurisdiction provides own seed. Ordering requires advance planning for availability during proper season.

2. Conservation Corps

The Conservation Corps provides plant materials to any public agency at cost. They prefer 1 to 1-1/2 years lead time for preparation of plant materials. Planting projects do not have to have Corps workers.

Other:

1. Special Tax

The State constitution permits local governments to levy taxes for specific purposes if approved by a two-thirds vote of the electorate. The tax must also be authorized by state law. While cities have a broad choice of taxes which may be used in this manner, counties are much more restricted. A county may, however, use the transient occupancy tax (hotel/motel tax) for general or specific purposes. Some local governments in California earmark this tax or a portion of it for recreation and tourism activities.

2. Benefit Assessment

Traditionally, benefit assessments have been used to fund specific Public Works facilities which directly benefit the property assessed and increase its value. Streets, sidewalks, and street lighting are examples of such facilities. Since Proposition 3 was approved, assessments have been authorized by the Legislature for new facilities on a broader scale. In some cases, voter approvals are required which make the assessment differ little from a special tax. But in other cases, a vote is not required unless a certain percentage of affected property owners file protests. Evolution of the law will determine whether a County-wide benefit assessment to fund Parkway facilities maintenance and development could be implemented.

3. In-Kind and Other Funding Sources

Private contributions of materials or equipment, volunteers and similar types of assistance are "funding" sources which should play a role in future park maintenance, development, and interpretation. Community groups could assist with a variety of activities including Neighborhood Park Watch Program, safety education programs, maintenance, tree planting, vegetation management, and docent tours.

4. Property Tax

Investigate the opportunity to renegotiate the percentage of property tax dedicated to special districts.

Appendix B — Trends Affecting the Future of Park and Recreation

The following is a summary from the “Trend Analysis for Park and Recreation: 2000 and Beyond” which resulted from the VIP (Vision, Insight, Planning) Project conducted by the California Park and Recreation Society’s (CPRS) report “Creating Community in the 21st Century”. In this report, Tapan Munroe, Ph.D., looks at the emerging trends and issues that will be shaping the future and the implications for park and recreation in California. Although some of the trends and recommendations pertain primarily to CPRS and its statewide strategy, the trends and recommendations included herein are pertinent to local communities such as the Rio Linda & Elverta Recreation and Park District.

1. California Economy:

- Park and Recreation is a critical component of California’s growing economy, and communities such as RER&PD needs to take an active role in developing, maintaining and promoting local parks and recreation opportunities.
- Parks and Recreation is a part of the larger Tourism and Hospitality Industry that accounts for over \$30 billion of our annual State economy. RER&PD needs to develop joint marketing campaigns with the local and regional tourism and convention bureaus to receive its share of the economic benefit.

2. Community Economic Vitality and Other Economic Impacts

- Park and Recreation is a Critical Factor in community economic vitality and particularly in competing with other communities for desirable industries. Some of the quality of life factors that most businesses consider in business retention and relocation include physical environment, recreation amenities, cultural amenities, and climate. The quality of parks and recreation opportunities provided by RER&PD is a vital part in attracting and keeping business in the community.

3. Demographic, Social, and Cultural Trends

- Population growth and increased park usage will place greater burdens on the State, regional and local park agencies to maintain existing parks and develop additional parks and recreation facilities to meet the growing demand. This will require additional and new funding means for local agencies to acquire, develop, staff, and maintain the needed park and recreation facilities.
- Growing ethnic diversity of the State and local population will require greater understanding of cultural preferences, sensitivities, needs, and trained staff to cater to the changing cliental. Park facilities will also need to be user-friendly to a diverse population without detracting from the enjoyment of others.
- The increasing population of elderly and retirees will be more active, more financially secure, and will be very politically influential. They will require new and growing level of recreational / educational services, while also being a reservoir of potential volunteers that RER&PD should utilize.
- Income inequality and urban and rural poverty continues to grow even as majority of Californians continues to prosper. This new inequality is based on lack of training, education, and the inflexibility to changing workplace by those

with minimal means. Park and recreation programs need to be sensitive to this trend and create programs to increase access to those with limited means. Recreation programs that also help to build work related skills and job mobility training should be encouraged.

- Meeting the challenge of crime, violence, and concern for personal safety will continue to be a major issue. The traditional response of more police, longer jail terms, and more prisons does not appear to be solving the problem. There is also considerable evidence that crime rate drops when open space and recreation opportunities are expanded and improved. Community leaders need to understand that providing adequate park and recreation programs can be a cost effective way of lowering juvenile crime by engaging young people in creative and healthy activities. RER&PD can play an important role in collaborating with police, community development department, community organizations, and business to enhance community livability.
- Quest for economic sustainability and environmental stewardship becomes a greater and greater issue as Californians become more concerned with the sustainability of their communities and lifestyles. RER&PD needs to become more proactive in educating the public about the long-term socioeconomic and environmental benefits of parks and recreation programs.
- Increased focus on choice and personal autonomy via technology means that the park and recreation field must also learn to customize and personalize services to effectively compete with private business. RER&PD must embrace information and computer technology in the design and delivery of programs and services, customize programs with customer need in mind, and embrace technology that will help to run more cost-effective programs and operations.
- Emerging trends in business particularly in the area of privatization of services offer greater flexibility, help to reduce cost, and improve customer satisfaction. Most Park and Recreation agencies are already utilizing private contractors for program instructors and team officials. Some communities are using contract park maintenance effectively. Privatization of other aspects of park and recreation services will also become more common in the future.
- Communities should take advantage of ways to create park and open space by utilizing programs such as decommissioning of military bases, reuse of unused utility corridors, reuse of unused road right-of-ways, reuse of old landfills and reuse of vacant lots obtained via tax foreclosures, etc.

4. Changing Technology and the Communications Revolution

- Technology is changing how people view where they live and work. For many now, where they live and work is the same place. Also for more senior employees of companies, time spent away from the office working is increasing. RER&PD needs to utilize this flexible schedule by offering programs for teleworkers and by providing 24 hour facilities.
- Technology will also mean that many businesses will no longer need to be in urban centers, employees will be able to function in separated, dispersed locations linked via computers. The consequence of this will be that cities will

change from employment centers to centers of culture and possibly recreation. With the use of technology, park and recreation can be the link that prevents isolation and loneliness of the decentralized workers by providing flexible programs that caters to suburban areas where people will live and work.

- Technology and the changing homes of the future will also provide yet another opportunity for providing services to the residents. Homes of the future will be more than a place to relax, rest, and entertain friends; it will also be a place to obtain a broad range of services via the Internet. RER&PD needs to be positioned to take advantage of this up-coming change.

5. Time Use Patterns

- Speeding up of American Life and increasing concerns about “Leisure Productivity” means that Park and Recreation programs that are short, effective, and highly focused will meet with greater customer satisfaction.
- Time deepening and increasing stress being experienced by majority of Americans means that RER&PD can play an important role in helping to relieve stress by providing a broad range of programs and activities that deal with stress and lifestyle management.
- Recreation as a status symbol means that the separation between work and leisure-related activities is becoming blurred. Many recreational skills are taking on the status of career and job related factors. RER&PD needs to take advantage of this trend by offering programs that provide relaxation and fitness benefits while helping people in their careers.
- RER&PD can play a major role in educating the public about the dangers of the couch potato syndrome. Alternative choices should be available through RER&PD which can have significant benefits on health and the quality of life for the participants.

CERTIFICATE OF COMPLETION

TO: OFFICE OF THE COUNTY RECORDER
P. O. Box 1206
Sacramento, California 95806

I, JOHN S. FARRELL, the Executive Officer of the Local Agency
Formation Commission named herein, hereby certify that the District has completed
a change of organization pursuant to the District Reorganization Act of 1965,
and specifically, Section 56451 of the Government Code, as follows:

The Name of the ~~District~~ ^{City} is: THE CITY OF SACRAMENTO

The Name of the County or Counties in which the entire District is located is (are):
THE COUNTY OF SACRAMENTO

The kind of change of organization completed is:

 An Annexation A Detachment XXX A Reorganization

The short title, if any, of the annexation, detachment or reorganization proceeding is:

RANEY REORGANIZATION (6-82)

The legal description of the territory annexed or detached is set forth in the
attached Exhibit A.

The terms and conditions, if any, of the change of organization as set forth in the
resolution ordering the change of organization are contained in the attached Exhibit B.

The change of organization was:

XXXX Ordered without an election and the resolution ordering the change of
organization was adopted by the Governing Board of the District on
June 1, 1982.

 Confirmed by the voters and the resolution confirming the change of
organization after confirmation by the voters was adopted by the
Governing Board of the District on .

RESOLUTION NO. 82-365

ADOPTED BY THE SACRAMENTO CITY COUNCIL ON DATE OF

JUN 1 1982

RESOLUTION ORDERING REORGANIZATION OF THE RANEY
PROPERTY PURSUANT TO THE DISTRICT REORGANIZATION
ACT OF 1965 (UNINHABITED) (P-8702)

WHEREAS, a reorganization pursuant to the District Reorganization Act of
1965 (Government Code Section 5600 et seq.) proposing annexation of territory
to the City of Sacramento has been commenced by petition of a landowner of
such territory; and

WHEREAS, the proposal is for annexation of 111.1+ acres of territory to
the City of Sacramento and detachment from the Natoma5 Fire Protection District,
said territory generally being located south of I-880, west of Rosin Court, and
more particularly described as set forth in Exhibit "A" attached hereto and
incorporated by this reference; and

WHEREAS, the Sacramento County Local Agency Formation Commission has
approved the reorganization of the territory, and the City Council of the City
of Sacramento has rezoned the territory to the R-1A and A zones; and

WHEREAS, the proposed reorganization is consistent with the Sacramento City
General Plan and the 1978 South Natomas Community Plan; the property is contiguous
to the City of Sacramento; the property is planned for residential and highway
commercial development requiring urban services; and the City of Sacramento is
the only agency capable of providing such urban services; and

WHEREAS, the proposed reorganization will implement these plans and will
benefit, and is in the interest of, the City of Sacramento and the future inhabi-
tants of the territory; and

WHEREAS, all the property owners within the annexation territory have submitted
approval of the proposed reorganization; and

WHEREAS, the Sacramento County Local Agency Formation Commission has determined
the City Council may order the reorganization without notice and hearing, or an
election, pursuant to Government Code Section 56261 and 56439.5.

NOW, THEREFORE, BE IT RESOLVED by the Council of the City of Sacramento:

1. That pursuant to Government Code Sections 56261 and 56439.5 the reorganization
for the Raney Property, which is described in Exhibit "A" attached hereto and
incorporated by this reference, is hereby approved and ordered without notice
and hearing or an election.

Appendix E — Rio Linda & Elverta Recreation and Park District Recreation Needs Survey – Summary Results

The following is a summary of the results from the Recreation Needs Survey taken by residents of the District.

Please rate the Rio Linda & Elverta Recreation and Park District's performance in caring for its parks and facilities:

	Total Responses	A Excellent	B Good	C Fair	D Poor	E No Opinion
1. Maintaining park turf and planting areas.	45	10 (22%)	22 (48%)	11 (24%)	1 (2%)	1 (2%)
2. Keeping parks clean of papers and trash.	45	12 (26%)	21 (46%)	10 (22%)	1 (2%)	1 (2%)
3. Maintaining athletic fields and play equipment.	46	9 (20%)	18 (39%)	6 (13%)	2 (4%)	11 (24%)
4. Keeping parks safe to visit at night.	38	6 (16%)	7 (18%)	3 (8%)	8 (26%)	14 (37%)
5. Keeping parks safe to visit during the daytime.	45	11 (24%)	19 (42%)	9 (20%)	1 (2%)	5 (11%)
6. Maintaining clean restrooms in the park.	43	6 (14%)	9 (21%)	9 (21%)	6 (14%)	13 (30%)

7. What do you like most about our District parks and facilities?

Summary Responses

Playground Equipment	5
Easy Access	4
Clean and Friendly	4

8. What do you like least about our District parks and facilities?

Summary Responses

Lack of maintenance/upkeep	3
Trash or litter in parks	3
Not enough activities/dissatisfaction with current activities	3
Lack of shade/trees	2

9. What additional park and recreational facilities would you like to see developed in our District?

Summary Responses

Pool that is open year round	10
Gym	6
Playground equipment	2
CPHA	2
Skate Park	2

10. If additional recreation facilities such as gyms, swimming pools or additional community centers are needed, how should they be provided? (**91 total responses**)

Number of Responses

A. Use school facilities during unused hours	24 (26%)
B. Develop new facilities on park land	20 (22%)
C. Expand existing facilities	18 (20%)
D. Rent or lease an existing facility	9 (10%)
E. Other	6 (7%)
F. Combination of A, B, C, D or E	14 (15%)

11. Where should the Rio Linda & Elverta Recreation and Park District place its emphasis for park development in the future years? (**74 total responses**)

Number of Responses

A. Maintain, redesign or rehabilitate existing facilities	24 (32%)
B. Provide additional or different recreational facilities	21 (28%)
C. Purchase new park lands for construction of new facilities	10 (14%)
D. Other	4 (5%)
E. Combination of A, B, C, or D	15 (20%)

12. What types of parks and natural areas do you think are most needed in the community?

	Total Responses	A High	B Moderate	C Low	D No Opinion
Mini Parks (less than an acre) at many locations in the District.	40	6 (15%)	9 (23%)	20 (50%)	5 (12%)
Neighborhood Parks (5-10 acres) within easy bicycle ride of homes.	41	21 (51%)	14 (34%)	4 (10%)	2 (5%)
Community Parks (25-75 acres) in several areas of the District with organized recreational facilities.	44	15 (34%)	12 (27%)	12 (27%)	5 (11%)
Natural open space areas for passive recreation (trails, nature study, bird watching, etc.) and for wildlife protection.	41	17 (41%)	15 (37%)	6 (15%)	3 (7%)

13. Please rate the importance of providing future recreational programs for the differing age groups in the District:

	Total Responses	A High	B Moderate	C Low	D No Opinion
Preschool, Age 1-4	42	13 (31%)	18 (43%)	7 (17%)	4 (10%)
Children, Age 5-12	41	23 (56%)	16 (39%)	0	2 (5%)
Teenagers, Age 13-18	41	27 (66%)	13 (32%)	0	1 (2%)
Adults	40	17 (42%)	15 (38%)	6 (15%)	2 (5%)
Senior Citizens	39	17 (44%)	14 (36%)	6 (15%)	2 (5%)

14. Which of the following recreation program areas should the Rio Linda & Elverta Recreation and Park District emphasize? (Please check all that apply). **(132 total responses)**.

	Number of Responses
A. Special Events (Halloween Carnival, Easter Egg Hunts, etc.)	28 (21%)
B. Trips and Excursions (Marine World, Wine Country Trips, etc)	15 (11%)
C. Sports, Athletics and Leagues (Softball, Basketball, etc.)	29 (22%)
D. Special Interest Classes (Crafts, Aerobics, etc.)	34 (26%)
E. Outdoor Oriented Programs (Nature Study, Day Camps, etc.)	26 (20%)
F. Other	Folk dance, educational classes, developmental learning for toddlers

15. If you or your family currently participate in any of the District programs, please check all the programs that apply: **(50 total responses)**

	Number of Responses
A. Classes (i.e.: dances, after school programs, aerobics, etc.)	21 (35%)
B. Youth Sports Activities	11 (18%)
C. Adult Sports	7 (12%)
D. Senior Programs	2 (3%)
E. Special Events	19 (32%)

16. Please indicate your level of agreement or disagreement with the following five policy questions relating to the Rio Linda & Elverta Recreation and Park District:

	Total Responses	A Strongly Agree	B Agree	C Disagree	D Strongly Disagree	E No Opinion
Use of alcoholic beverages should be prohibited in certain parks.	43	25 (58%)	14 (33%)	1 (2%)	3 (7%)	0
Parks should only be open for public use from dawn to dusk, except for parks with lighted facilities.	44	28 (64%)	9 (20%)	3 (7%)	3 (7%)	1 (2%)
Special programs and activities should be supported by user fees.	41	17 (41%)	20 (49%)	2 (5%)	2 (5%)	0

RECREATION PREFERENCES:

17. Please list your family's five most popular recreation activities:

	Number of Responses		Number of Responses
Golf	2	Gardening	4
Dance	4	Fishing	5
Easter	2	Tennis	3
Horseback Riding	6	After School	2
Basketball	6	Walking/Hiking	8
Horses	3	Piano	2
Swimming	8	Biking	11
Arts and crafts	4	Dogs	2
Camping	7	Baseball	3
Adult Softball	6	Picnic/BBQ	5
Halloween	2	Roller Blading	2

18. What community/local, City, County or Regional Park does your family visit most frequently and why?

	Number of Responses
Westside Park	3
RLCC	14
Gibson Ranch	8
Discovery Park	5
CPHA	2

NOW WE WOULD LIKE TO ASK YOU SOME QUESTIONS ABOUT YOUR HOUSEHOLD THAT WILL ASSIST US IN PLANNING FOR YOUR FUTURE RECREATION AND PARK SERVICES. PLEASE BE ASSURED THAT ALL RESPONSES ARE CONFIDENTIAL AND FOR STATISTICAL PURPOSE ONLY.

19. What is your gender? **(43 total responses)**

A. Male	7 (16%)
B. Female	36 (84%)

20. What are the age groups of persons living in your household? (Please check all that apply)
(74 total responses)

- | | |
|--------------------------|----------|
| A. Under 12 years of age | 14 (19%) |
| B. 13 – 18 years of age | 5 (7%) |
| C. 19 – 40 years of age | 23 (31%) |
| D. 41 – 55 years of age | 24 (32%) |
| E. 56 years or over | 8 (11%) |

21. How long have you resided in the Rio Linda & Elverta Area? (43 total responses)

- | | |
|-----------------------|----------|
| A. Less than one year | 1 (2%) |
| B. 1 – 5 years | 9 (21%) |
| C. 6 – 10 years | 4 (9%) |
| D. 11 – 20 years | 15 (35%) |
| E. Over 20 year | 14 (32%) |

22. Please refer to the attached District Map and check the Planning Area that you reside in.

- | | |
|--------------------|--------------------------------|
| A. Planning Area 1 | Data omitted from the District |
| B. Planning Area 2 | |
| C. Planning Area 3 | |
| D. Planning Area 4 | |
| E. Planning Area 5 | |

23. Does any person in your household require special recreation programs for the disabled?
(41 total responses)

- | | |
|--------|----------|
| A. Yes | 1 (2%) |
| B. No | 40 (98%) |

24. Taking all members of your household into account, what income group did your household fall into in year 2000? (39 total responses)

- | | |
|----------------------------------|----------|
| A. Below \$25,350 | 3 (8%) |
| B. Between \$25,351 and \$40,550 | 5 (13%) |
| C. Between \$40,551 and \$50,650 | 2 (5%) |
| D. Between \$50,651 and \$60,800 | 12 (31%) |
| E. Greater than \$60,800 | 17 (44%) |

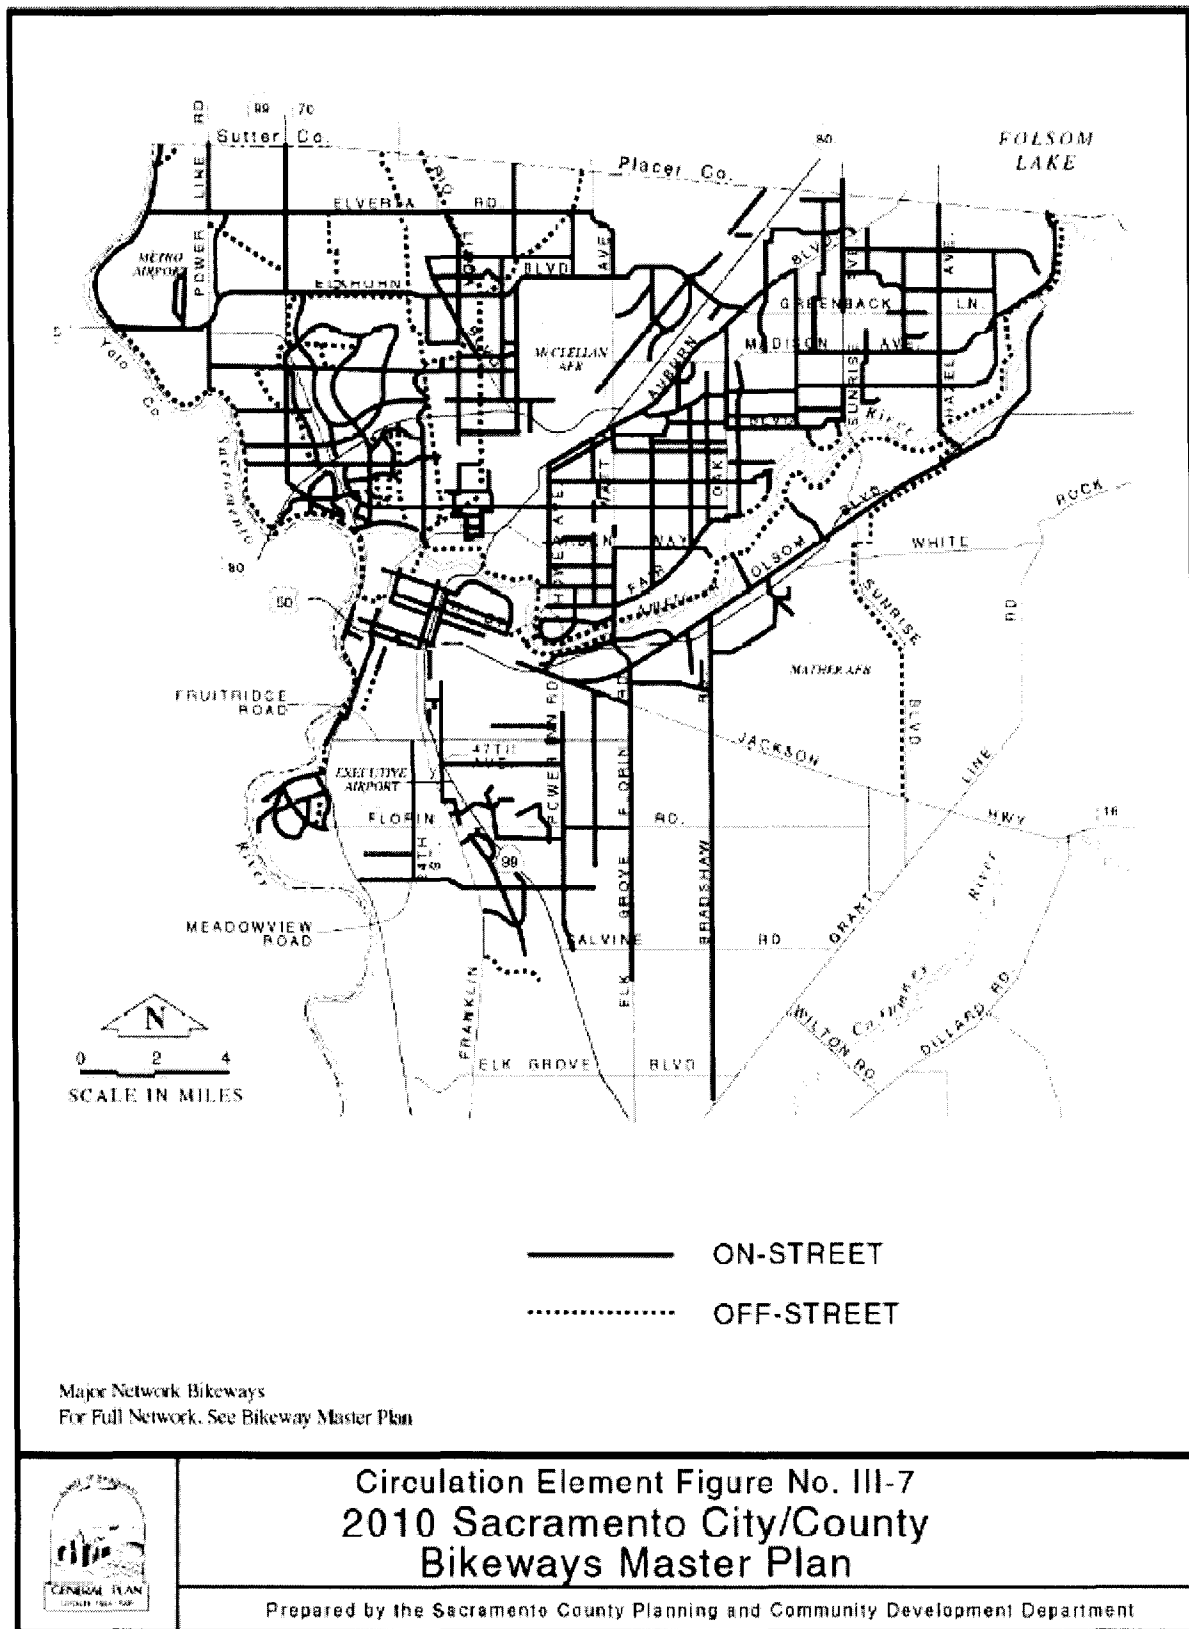

25. Please indicate the number of people in your household. (**43 total responses**)

A. One	4 (9%)
B. Two	15 (35%)
C. Three	9 (21%)
D. Four	10 (23%)
E. Five or more	5 (12%)

2306 Garfield Avenue
Carmichael, CA 95608
(916) 979-4800

Property Owners: See Section 3, Table 1 for list of owners.

2.0 INTRODUCTION

The proposed Panhandle project (Project) is a residential mixed-use community proposed within the North Natomas Community Plan (NNCP) area. The Project area includes approximately 595 acres between Elkhorn Boulevard and Del Paso Road in unincorporated Sacramento County. The Project is surrounded on the south, east and west by existing development within the City of Sacramento. The property location and its configuration create an infill opportunity within the NNCP.

Panhandle is proposed to assist in meeting the region's future needs for residential opportunities in a way that implements the best of traditional and historical urban planning principles. The Project is designed to implement the intent of the NNCP, the "smart growth" principles advocated by the Sacramento Area Council of Governments (SACOG) and the Panhandle Working Group Principles (2005).

3.0 PROPERTIES WITHIN PROJECT AREA

Project Site

The developers of the Panhandle Project are Dunmore Homes and Vaquero Land Holdings, LLC. Dunmore Homes controls approximately 348.9 acres of the site, consisting of APNs (201-0320-020, 225-0050-020, 225-0050-021, 225-0050-003, 225-0050-022 and 225-0050-021). Vaquero Land Holdings, LLC controls approximately 136.74 acres consisting of the Krumenacher Ranch (APN 201-0320-021).

Grant Joint Union School District controls 68.9 acres (APN 201-0320-018 and 201-0320-019).

The Project site area is 594.5 acres and consists of the participating properties controlled by Dunmore Homes, Vaquero Land Holdings, LLC and Grant Joint Union School District.

Annexation Area

The area north of Del Paso Road and south of Elkhorn Boulevard proposed for annexation consists of 594.7 acres and includes the Panhandle Project area APN 225-0050-016 owned by Ernest Brothers (40.3 acres). Although not a part of the Project, the parcel owned by Ernest Brothers is located in the annexation area.

An inventory of properties within the Project area is shown on Table 1.

4.0 PROJECT LOCATION

The Project site encompasses 554.7 acres (gross) of land located south of Elkhorn Boulevard and north of Del Paso Road in unincorporated Sacramento County. The Project site is located immediately west of the Natomas East Main Drainage, Sorento Road and E. Levee Road and immediately east of the Natomas Park subdivisions. The Project site is located in unincorporated Sacramento County, in the City's sphere of influence. The site is bound on the east and west by lands that are within the City's limits.

5.0 PROJECT SETTING

The Project is covered with grasses and is undeveloped. There are a few existing home sites, along with barns and outbuildings on the site. Existing residential uses served by domestic wells and private septic systems. Historically, the site was used for agricultural uses including wheat, hay and barley. There are no farming operations on the site today.

On the eastern portion of the property, high-voltage power lines traverse in a north-south direction. Two sets of steel lattice towers are constructed in the corridor that support double-circuit 230 kV lines owned by the Western Area Power Administration and a 115 kV line owned by Sacramento Municipal Utility District (SMUD). Radio towers are mounted on top of the steel towers that support the electric lines.

Elkhorn Boulevard is the northern boundary of the Project area. Lands north of Elkhorn Boulevard are within unincorporated Sacramento County and are zoned AG-80. An existing residential unit is located at the northwest corner of Elkhorn Boulevard and E. Levee Road and the area west of the home site is being used for rock material stockpiling. E. Levee Road and the Natomas East Main Drain Canal (NEMDC) are located along the eastern edge of the site. East of the NEMDC, are the Elkhorn Asphalt Plant operated by Granite and other light industrial uses. Farther south and east of Sorento Road are ranchette home sites in the Valley View Acres neighborhood.

Del Paso Road forms the southern boundary of the Project area and light industrial office buildings are located south of Del Paso Road. The area west of the Project site is completely developed within the North Natomas Community Plan with residential uses in the Regency Park and Natomas Park communities. Natomas Charter School is located immediately west of the Project site, on Del Paso Road.

6.0 ENTITLEMENT REQUEST

The Project includes the following entitlement requests:

1. **General Plan Amendments** from Low Density Residential, Medium Density Residential, Parks-Recreation-Open Space, Public/Quasi-Public to Low Density Residential, Medium Density Residential, Parks-Recreation-Open Space, Public/Quasi-Public, Community Commercial;
2. **Community Plan Amendments** from Low Density Residential, Medium Density Residential, High Density Residential, Parks-Open Space to Low Density Residential, Medium Density Residential, High Density Residential, Parks-Open Space, General Public Facilities (schools) and Village Commercial;
3. **Pre-Zoning** of the site from AG-80 (Sacramento County Zoning Designation) to R-1 PUD, R-1 PUD (School), R-1A, R-2A PUD, C-1 PUD, and A-OS (PUD);
4. **Establishment of the Panhandle Planned Unit Development;**
5. **Inclusionary Housing Plan** - Krumenacher Ranch (Vaquero Land Holdings, LLC) for a portion of the Panhandle Project.
6. **Inclusionary Housing Plan** - Dunmore Homes for a portion of the Panhandle Project;
7. **Development Agreement** between the City of Sacramento and Dunmore Land Company, LLC for a portion of the Panhandle Project; and
8. **Development Agreement** between the City of Sacramento and Vaquero Land Holdings, LLC (Krumenacher Ranch) for a portion of the Panhandle Project.

The following entitlements are necessary for implementation of the Project and will be requested in separate applications that will complement the application for plan amendments:

1. Master Tentative Parcel (Large Lot) Map to create large lot parcels for the purpose of creating legal parcels corresponding to villages within Panhandle.

2. Small Lot Tentative Subdivision Maps for the Project to subdivide the property into small lots for single-family residential home sites and other uses.

In addition to the above City approvals and entitlements, implementation of Panhandle will/may require approval of the following permits from federal, state and local agencies prior to construction. This list is not inclusive; additional permits may be identified during preparation of the EIR.

- Sacramento Local Area Formation Commission (LAFCO) approval of Municipal Services Review, annexation of territory to the City of Sacramento and detachment from Sacramento County Water Maintenance District, County Service Area #1, Rio Linda/Elverta Parks and Recreation District, Natomas Fire District, and Sylvan Cemetery District;
- U.S. Army Corps of Engineers section 404 permit to fill wetland areas;
- Department of Fish and Game Streambed Alteration Agreement for work in any water courses;
- State General Construction Activity Stormwater Permit, issued by the Regional Water Quality Control Board; and
- Regional Water Quality Control Board permits related to the control of nonpoint source runoff pursuant to the National Pollution Discharge Elimination System (NPDES) permit requirements, and approval for the recycled water deliveries for non-potable use.

7.0 REGULATORY FRAMEWORK

General Plan Amendments

The Project site is designated in the City's General Plan with the following land uses: The existing and proposed General Plan designations for the site are shown below:

General Plan Designation	Existing Acreage	Proposed Acreage
Low Density Residential (4-15 du/ac)	335.8	271.3
Medium Density Residential (16-29 du/ac)	72.4	95.0
Parks, Recreation, Open Space	176.5	121.5
Public/Quasi-Public – Misc	10.0	76.1
Community Commercial		30.8
	594.7	594.7

Community Plan Amendments

The Project site is located within the North Natomas Community Plan (NNCP) (1994). The 1994 NNCP designates the Project site for Low Density Residential, Medium Density Residential, High Density Residential and Parks-Open Space. The existing and proposed NNCP designations for the site are shown below:

Community Plan Designation	Existing Acreage	Proposed Acreage
Low Density Residential (3-10 du/ac)	339.7	271.3
Medium Density Residential (7-21 du/ac)	20.9	45.9
High Density Residential (11-29 du/ac)	51.4	49.1
Parks – Open Space	176.5	121.5
General Public Facilities (Schools)	6.2	76.1
Village Commercial		30.8
	594.7	594.7

Prezone/Rezone

The site is located in unincorporated Sacramento County is zoned Agriculture-80 (AG-80). A Planned Unit Development (PUD) will be established for the site, known as the Panhandle Planned Unit Development. The existing zoning and proposed zoning within the PUD are shown below:

Zone	Existing Acreage	Proposed Acreage
AG-80 (Sacramento County)	594.7	0
R-1 PUD	0	303.0
R-1 PUD (School)		66.1
R-1A PUD	0	47.8
R-2A PUD	0	49.1
C-1 PUD	0	30.8
A-OS PUD	0	97.9
	594.7	594.7

Inclusionary Housing Plans

Upon annexation, the Project site will be located in a new growth area and will be subject to the City's Mixed Income Housing Policy. The Mixed Income Housing Policy adopted in the City's Housing Element and required by the City's Mixed Income Housing Ordinance, City of Sacramento City Code Chapter 17.190 requires that ten percent (10%) of the total units in a Residential Project be affordable to very low income households and five percent (5%) for low income households (Inclusionary Requirement). The affordable housing plans ensure that affordable units are developed concurrent with market rate units.

The Project consists of 2,977 dwelling units. Based on the current Project proposal, the Inclusionary Requirement for the Project is 298 units for Very Low Income (10%) and 149 units for Low Income (5%) for a total of 447 inclusionary units. All Inclusionary Units will be constructed on-site within the Panhandle Project area.

The Project includes two draft Inclusionary Housing Plans prepared for Vaquero-controlled parcels (Krumenacher) and Dunmore-controlled parcels.

Development Agreements

Two development agreements are proposed for the Project. One agreement will be between the City of Sacramento and Dunmore Homes, et al for a portion of the Panhandle Project and the other will be between the City of Sacramento and Vaquero Land Holdings, LLC. The agreements are based on the North Natomas Development Agreement model.

Annexation

The Project site is located within the City's Sphere of Influence and within the Frying Panhandle Annexation (Reorganization) (M00-066) for which the City initiated annexation of the territory to the City of Sacramento in December 2000 (Resolution 2000-734). The Frying Panhandle Annexation (Reorganization) consists of the following:

- Annexation of territory to the City of Sacramento
- Detachment of territory from Sacramento County Water Maintenance District, County Service Area #1, Rio Linda/Elverta Parks and Recreation District, Natomas Fire District, and Sylvan Cemetery District;

The Frying Panhandle Annexation consists of approximately 1,430 acres, of which the Project is approximately 555 acres and the Ernest Brothers property (APN 225-0050-016) is approximately 40 acres. Most of the annexation area outside of the Project consists of light industrial and office park uses south of Del Paso Road.

In initiating the reorganization, the City Council found the following:

- The affected territory is within the Sphere of Influence of the City;
- The affected territory is within the North Natomas Community Plan area;
- The affected territory is within the Urban Service Boundary of the County General Plan;

- The annexation represents a logical and reasonable extension of the City boundaries because it is surrounded on three sides by the existing City limits;
- The annexation would facilitate the more efficient provision of municipal services, including compliance with the uniform City planning and development standards throughout the North Natomas Community Plan area.
- The annexation would constitute a fiscally sound addition to the City because the revenue generated by the non-residential land uses would likely exceed the costs of providing municipal services;
- The annexation area can be served by existing or planned infrastructure and municipal services, consistent with the City Master Services Element;

8.0 OVERVIEW OF LAND USES

The proposed Project is a residential mixed-use community proposed within the North Natomas Community Plan area. The goal of Panhandle is to create a variety of residential neighborhoods with a nearby open space parkway nearby. Panhandle is designed to adhere to the NNCP's goal of encouraging pedestrian-friendly neighborhood circulation and convenient access to open space and recreation uses.

Panhandle consists of residential, commercial mixed use, open space, parks and school sites on 595 acres. The Project proposes 2,977 dwelling units in a mix of residential unit types, lot sizes and densities. Table 2 summarizes proposed land uses.

Table 2
Land Use Summary

Use	Acreage (gross)	Units	Density (gross)
Residential			
<u>Low Density Residential</u>			
40 x 60' Alley	38.5	243

40	Open Space	Detention		9.6	
41	Open Space Parkway			51.2	
Total			2,977	594.7	

Residential

In the Panhandle Plan, 2,957 residential units are proposed on approximately 366.3 acres. Densities of residential uses range from 4.5 to 20 units per acre. The density among residential uses is 8.1 units per acre and the average density over the Project site is 5.0 units per acre. The pattern of residential land uses is generally in a radiating form with a mix of dwelling types centered by some form of park or recreation facility. The mix of lot sizes and densities will supply housing stock for a variety of lifestyles and price ranges. Higher density residential areas have been dispersed.

Commercial Mixed Use

The Panhandle project will be anchored by a thematic mixed-use commercial center. The center consists of two sites at the southern end of the Project, north of Del Paso Road, on each side of National Drive. The commercial sites are located at the southern entry to the Project at National Drive and will provide community-serving commercial uses. Twenty residential units are proposed within the commercial site.

Schools

Grant Joint Union School District proposes a middle school and high school site within the Project, west of the proposed alignment of National Drive. An elementary school is proposed in the southern portion of the Project area. The elementary school is located within the Rio Linda Union School District.

Parks and Open Space

Panhandle includes approximately 121.5 acres of parks and open space uses. The land use concept for Panhandle includes a variety of park sizes rather than three or four traditional eight to ten-acre parks. Nearly 50 acres of parks are proposed in several pocket park and neighborhood park locations. This approach to park planning ensures that open space and recreation uses are generally available within 600 to 800 feet of each residential unit.

A highly amenitized bicycle and pedestrian trail system is proposed from Del Paso Road north to Elkhorn Boulevard within the open space parkway beneath the power lines. The open space area that would include the trail system would be approximately 200 feet in width and would link to the remainder of the plan area through east-west connections. The trail system will increase connectivity to other areas of Natomas and to existing trails to the south that connect to the American River Trail System.

Access/Circulation

Primary access to the Project site is available from Elkhorn Boulevard and Del Paso Road. The Project proposes to extend National Drive north from its existing terminus at Del Paso Road to Elkhorn Boulevard. National Drive will be

the primary arterial through Panhandle with an alignment that bends west through the site.

Reserve Study Transmittal Letter

Date: October 13, 2011
To: Wayne Lowery, Rio Linda Elverta Rec Prk Dist
From: Browning Reserve Group (BRG)

Re: Rio Linda Elverta Recreation and Park District

Attached, please find the reserve study for the association. To assist in your understanding of the study, and to highlight key information you may need quickly, we have listed below some of the important information contained in the study. At BRG our goal is to bring clarity from complexity, so should you have any questions, please do not hesitate to contact us anytime.

1. Where do I find the recommended reserve contribution for next year's budget?

This is found in *Section III, "30 Year Reserve Funding Plan, Cash Flow Method."* **\$90,000** is the annual amount. Directly under the annual amount is the amount per ownership interest, per month, or other period, as applicable. **\$7,500.00 /Unit/month @ 1.** For any other funding related issues, if any, see *Section III, "30 Year Reserve Funding Plan, Cash Flow Method."*

2. Where do I find the status of the reserve fund, based on the Percent Funded calculation?

This is found for the 30-year term of the study in *Section IV, "30 Year Reserve Funding Plan, Including Fully Funded Balance and % Funded."* For the year for which the study was prepared, 2012/2013, the association is **23.0%** funded.

Based on the 30 year cash flow projection, the Project's reserves appear adequately funded as the reserve fund ending balances remain positive throughout the replacement of all major components during the next 30 years.

California statute imposes no reserve funding level requirements nor does it address funding level adequacy, and although one or more of the reserve fund percentages expressed in this report may be less than one hundred percent, those percentages do not necessarily indicate that the Project's reserves are inadequately funded.

3. Where do I find the assumptions for interest and inflation factors?

While this information is in various places in the study, it can always be found in *Section III, "30 Year Reserve Funding Plan, Cash Flow Method."* For this study the assumption is **2.5%** for the interest rate and **2.5%** for the inflation factor. Please be advised these rates estimate the values that will stand the test of time over the 30-year term of the study, not simply only next year.

Please read the two helpful sections entitled "Glossary" and "Notes to the Auditor." The glossary explains common reserve study terms as well as BRG specific terminology. The Notes to the Auditor while intended to assist the auditor, has useful information for the casual reader on how year zero, (2011/2012) the current fiscal year is dealt with in the study.

Thank you for the opportunity to work with the Rio Linda Elverta Recreation and Park District on this study.

Reserve Study

Full Study

Prepared for the 2012/2013 Fiscal Year

Rio Linda Elverta Recreation and Park District

Reserve Study Summary

A Reserve Study was conducted of Rio Linda Elverta Recreation and Park District (the "**Project**"). A **Full Study** includes an on-site review upon where the following tasks are performed:

- development of a reserve component inventory;
- condition assessment based upon on-site visual observation;
- life and valuation estimates;
- fund status;
- and a funding plan.

Physical Inspection

Browning Reserve Group ("**BRG**") conducted a physical inspection of the Project. The inspection encompassed those major components that the Project is required to maintain. For this study components are determined to be major components if:

1. As of the date of the study, they have a remaining useful life of less than 30 years, and a value greater than \$1,000.
2. Such additional components, if any, determined by the Project Manager.

During the inspection, BRG utilized the services of our own construction cost estimator. In addition, independent contractors were retained to render opinions on selected components as indicated in **Section VI, Included Component Listing.**

Supplemental information to the physical inspection may have been obtained from the following sources:

1. Project plans where available.
2. Maintenance records of the reserve components where available.
3. Association board members, management and staff.

Summary of Reserves

For the first year of the Reserve Study, the reserve contribution is based upon the existing budget unless otherwise noted in "**Section III, Reserve Funding Plan.**" In addition BRG relied on the Project to provide an accurate Beginning Reserve Balance.

The status of the Project's reserves, as reflected in the following Reserve Study, is as follows:

- 1. The Expenditure Forecast of the following Reserve Study identifies the major components which the Project is obligated to repair, replace, restore or maintain, as determined in accordance with the criteria specified above, and specifies for each such component:**
 - a. Its current estimated replacement cost;**
 - b. Its estimated useful life; and**
 - c. Its estimated remaining useful life.**
- 2. It is estimated that the total cash reserves necessary to repair, replace, restore or maintain such major components (in the aggregate) during and at the end of their first remaining useful life is \$613,256.**
 - [For purposes of this calculation, "necessary" is defined as the Fully Funded Balance (FFB) (Component Current Cost X Effective Age / Useful Life, including a provision for interest and inflation in future years.)]**
- 3. The current amount of accumulated cash reserves actually set aside to repair, replace, restore, or maintain such major components as of the fiscal year ending June 30, 2013 is estimated to be \$140,861, constituting 23.0% of the total expenditures anticipated for all such major components through their first end of useful life replacement.**
- 4. Based upon the schedule of annual reserve contributions necessary to defray the cost of repairing, replacing, restoring or maintaining such major components in the years such expenditures are estimated to be required, it is estimated that annual reserve contributions in the initial amount of \$90,000 [*\$7,500.00 per Unit per month (average)*] for the fiscal year ending June 30, 2013 (the first full fiscal year following first distribution of this report) will be necessary in order to meet all such reserve expenditures when they are projected to come due.**

Funding Assessment

Based on the 30 year cash flow projection, the Project's reserves appear adequately funded as the reserve fund ending balances remain positive throughout the replacement of all major components during the next 30 years.

California statute imposes no reserve funding level requirements nor does it address funding level adequacy, and although one or more of the reserve fund percentages expressed in this report may be less than one hundred percent, those percentages do not necessarily indicate that the Project's reserves are inadequately funded.

Percent Funded Status

Based on paragraphs 1 - 3 above, the Project is 23.0% funded. The following scale can be used as a measure to determine the association's financial picture whereas the lower the percentage, the higher the likelihood of the Project requiring a special assessment, or other large increases to the reserve contribution in the future.

Methodology

The above recommended reserve contribution for the next fiscal year (and future fiscal years as outlined in *Section III, Reserve Fund Balance Forecast*) was developed using the cash flow method. This is a method of developing a reserve funding plan where the contributions to the reserve fund are designed to offset the variable annual expenditures from the reserve fund. Different reserve funding plans are tested against the anticipated schedule of reserve expenses until the desired funding goal is achieved.

Funding Goals

The funding goal employed for Rio Linda Elverta Recreation and Park District is

Threshold Funding: Establishing a Reserve funding goal of keeping the Reserve balance above a specified dollar or Percent Funded amount. Depending on the threshold, this may be more or less conservative than "Fully Funding."

Limitations

The intention of the Reserve Study is to forecast the Project's ability to repair or replace major components as they wear out in future years. The Reserve Study is not an engineering report, and no destructive testing was performed. The costs outlined in the study are for budgetary and planning purposes only, and actual bid costs would depend upon the defined scope of work at the time repairs are made. Also, any latent defects are excluded from this report.

Compliance

The Reserve Study was conducted pursuant with standards set forth by the Community Associations Institute (CAI) and the Association of Professional Reserve Analysts (APRA).

Supplemental Disclosures

General:

BRG has no other involvement(s) with the Project which could result in actual or perceived conflicts of interest.

Personnel Credentials:

BRG is a licensed general building contractor in California and the owner, Robert W. Browning, holds the Reserve Specialist designation from the Community Associations Institute.

Completeness:

BRG has found no material issues which, if not disclosed, would cause a distortion of the Project's situation.

Reliance on Client Data:

Information provided by the official representative of the Project regarding financial, physical, quantity, or historical issues will be deemed reliable by BRG.

Scope:

This Reserve Study is a reflection of information provided to BRG and assembled for the Project's use, not for the purpose of performing an audit, quality/forensic analysis, health and safety inspection, or background checks of historical records.

Reserve Balance:

The actual beginning reserve fund balance in this Reserve Study is based upon information provided and was not audited.

Reserve Projects:

Information provided about reserve projects will be considered reliable. Any on-site inspection should not be considered a project audit, quality inspection, or health and safety review.

Component Listing Included Components

Prepared for the 2012/2013 Fiscal Year

Babe Best Park

01000 - Paving

100 - Asphalt: Sealing	Useful Life 5	Remaining Life 2
25,370 Sq. Ft. Paved Parking Lot	Quantity 25,370	Unit of Measure Square Feet
	Cost /SqFt \$0.123	
	% Included 100.00%	Total Cost/Study \$3,121
Summary	Replacement Year 2013/2014	Future Cost \$3,278

This is to prepare the surface and apply a single coat asphalt emulsion product. If a second coat is desired the cost is generally 10% to 20% higher.

200 - Asphalt: Ongoing Repairs	Useful Life 5	Remaining Life 2
25,370 Sq. Ft. Paved Parking Lot (2%)	Quantity 25,370	Unit of Measure Square Feet
	Cost /SqFt \$3.33	Qty * \$/SqFt \$84,514
	% Included 2.00%	Total Cost/Study \$1,690
Summary	Replacement Year 2013/2014	Future Cost \$1,776

This is for miscellaneous repairs including crackfill, skin patching and minor dig out & fill.

Component Listing

Included Components

Third Draft
Prepared for the 2012/2013 Fiscal Year

Babe Best Park

01000 - Paving

300 - Asphalt: Petromat Overlay	Useful Life 25	Remaining Life 12
25,370 Sq. Ft. Paved Parking Lot	Quantity 25,370	Unit of Measure Square Feet
	Cost /SqFt \$1.64	
	% Included 100.00%	Total Cost/Study \$41,607
Summary	Replacement Year 2023/2024	Future Cost \$55,957

This is to apply a Petromat overlay on top of the existing asphalt surface along with 1-1/2" of new hot asphalt. Generally this includes edge grinding and utility box extensions.

800 - Striping	Useful Life 5	Remaining Life 2
Paved Parking Lot	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$512	
	% Included 100.00%	Total Cost/Study \$512
Summary	Replacement Year 2013/2014	Future Cost \$538

This is to re-stripe asphalt to match existing plan.

Babe Best Park

02000 - Concrete

220 - Walkways	Useful Life 10	Remaining Life 7
1,590 Sq. Ft. Concrete Walkways (2%)	Quantity 1,590	Unit of Measure Square Feet
	Cost /SqFt \$16.40	Qty * \$/SqFt \$26,076
	% Included 2.00%	Total Cost/Study \$522
Summary	Replacement Year 2018/2019	Future Cost \$620

This is to repair, replace or grind failed concrete flatwork to remove abrupt elevation changes and maintain functionality. Since the concrete useful life exceeds the scope of this study, this component provides for repair only and not full replacement. This component provides for the concrete beneath the shade structure. Dugout slabs are provided for in another component.

380 - Pad	Useful Life 3	Remaining Life 1
1,320 Sq. Ft. Dugout Slabs (2%)	Quantity 1,320	Unit of Measure Square Feet
	Cost /SqFt \$16.40	Qty * \$/SqFt \$21,648
	% Included 2.00%	Total Cost/Study \$433
Summary	Replacement Year 2012/2013	Future Cost \$444

This is to maintain and repair the concrete dugout slabs.

03000 - Painting: Exterior

120 - Surface Restoration	Useful Life 10	Remaining Life 7
1,040 Sq. Ft. Snack Bar/Restroom Building	Quantity 1,040	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$1,066
Summary	Replacement Year 2018/2019	Future Cost \$1,267

This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint.

Babe Best Park

03000 - Painting: Exterior

122 - Surface Restoration	Useful Life 5	Remaining Life 2
750 Sq. Ft. Backstop Wood	Quantity 750	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$769
Summary	Replacement Year 2013/2014	Future Cost \$808

This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint. Includes the backstop wood and the scorers booth.

04000 - Structural Repairs

910 - Building Maintenance	Useful Life 20	Remaining Life 17
1,040 Sq. Ft. Restroom/Snack Bar	Quantity 1,040	Unit of Measure Square Feet
	Cost /SqFt \$5.12	
	% Included 100.00%	Total Cost/Study \$5,330
Summary	Replacement Year 2028/2029	Future Cost \$8,110

This is for general building repairs to external surface area of the masonry walls of the restroom/snack bar building..

950 - Dry-rot repairs- ongoing	Useful Life 5	Remaining Life 1
750 Sq. Ft. Backstop Wood (16.7%)	Quantity 750	Unit of Measure Square Feet
	Cost /SqFt \$10.25	Qty * \$/SqFt \$7,687
	% Included 16.67%	Total Cost/Study \$1,281
Summary	Replacement Year 2012/2013	Future Cost \$1,313

This is for general repairs and on-going replacement of the wood at the backstops.

Babe Best Park

04000 - Structural Repairs

990 - Miscellaneous	Useful Life 5	Remaining Life 5
391 Sq. Ft. Shade Structure Repairs	Quantity 391	Unit of Measure Square Feet
	Cost /SqFt \$2.62	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2016/2017	Future Cost \$1,160
This is for miscellaneous on-going repairs to the shade structure. Roofing is provided for in another component.		

05000 - Roofing

440 - Pitched: Dimensional Composition	Useful Life 25	Remaining Life 25
4 Squares- Shade Structure	Quantity 4	Unit of Measure Squares
	Cost /Sqrs \$512	
	% Included 100.00%	Total Cost/Study \$2,050
Summary	Replacement Year 2036/2037	Future Cost \$3,801
This is to reroof with a dimensional composition roofing product. Composition roofs should be regularly inspected and repaired as indicated to ensure maximum life.		

Babe Best Park

05000 - Roofing

650 - Pitched: Fibrous Cement	Useful Life 30	Remaining Life 19
7 Squares- Restroom/Snack Bar	Quantity 7	Unit of Measure Squares
	Cost /Sqrs \$615	
	% Included 100.00%	Total Cost/Study \$4,305
Summary	Replacement Year 2030/2031	Future Cost \$6,882

This is to replace the cement tile roofing system. Tile roofs should be regularly inspected and repaired as indicated to ensure maximum life.

08000 - Rehab

100 - General	Useful Life 5	Remaining Life 2
24 Lin. Ft. Metal Gates	Quantity 24	Unit of Measure Linear Feet
	Cost /l.f. \$21.35	
	% Included 100.00%	Total Cost/Study \$512
Summary	Replacement Year 2013/2014	Future Cost \$538

This is for a general rehab of the yellow metal gates. Includes minor repairs and painting.

Component Listing

Included Components

Third Draft
Prepared for the 2012/2013 Fiscal Year

Babe Best Park

08000 - Rehab

220 - Restrooms	Useful Life 10	Remaining Life 7
2 Restrooms	Quantity 2	Unit of Measure Items
	Cost /Itm \$2,050	
	% Included 100.00%	Total Cost/Study \$4,100
Summary	Replacement Year 2018/2019	Future Cost \$4,874

This is to rehab and redecorate the restrooms. Includes items such as partitions, fixtures, lighting, tile, etc. This item can be further defined with association input.

18000 - Landscaping

100 - Irrigation: Misc.	Useful Life 3	Remaining Life 1
Common Area	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$1,025	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2012/2013	Future Cost \$1,051

This is for major irrigation system repair in excess of the operating budget.

420 - General Repairs/Upgrades	Useful Life 3	Remaining Life 1
Common Area	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$1,537	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2012/2013	Future Cost \$1,576

This is to have funds in excess of the operating budget for miscellaneous plantings, removals and other work as directed by the association.

	% Included 100.00%	Total Cost/Study \$2,899
Summary	Replacement Year 2027/2028	Future Cost \$4,303
This is to replace the 8' chain link fencing.		

130 - Chain Link: 10'	Useful Life 30	Remaining Life 17
440 Lin. Ft. Backstops & Dugouts	Quantity 440	Unit of Measure Linear Feet
	Cost /l.f. \$18.45	
	% Included 100.00%	Total Cost/Study \$8,118
Summary	Replacement Year 2028/2029	Future Cost \$12,352
This is to replace the 10' chain link fencing.		

510 - Post & Cable	Useful Life 25	Remaining Life 9
1,086 Lin. Ft. Perimeter	Quantity 1,086	Unit of Measure Linear Feet
	Cost /l.f. \$20.50	
	% Included 100.00%	Total Cost/Study \$22,263
Summary	Replacement Year 2020/2021	Future Cost \$27,803
This is to repair and replace the post and cable fence.		

Babe Best Park

21000 - Signage

790 - Monument	Useful Life 10	Remaining Life 4
Park Entrance	Quantity 1	Unit of Measure Items
	Cost /Itm \$1,537	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2015/2016	Future Cost \$1,697

This is to repair and repaint the custom identity monument sign. Approximately 108 square feet of surface area.

26000 - Outdoor Equipment

100 - Tot Lot: Play Equipment	Useful Life 20	Remaining Life 10
Tot Lot	Quantity 1	Unit of Measure Items
	Cost /Itm \$10,250	
	% Included 100.00%	Total Cost/Study \$10,250
Summary	Replacement Year 2021/2022	Future Cost \$13,121

This is to replace the tot lot play equipment.

Babe Best Park

26000 - Outdoor Equipment

140 - Tot Lot: Safety Surface	Useful Life 3	Remaining Life 1
Tot Lot	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$512	
	% Included 100.00%	Total Cost/Study \$512
Summary	Replacement Year 2012/2013	Future Cost \$525
This is to replenish the play area impact absorbing wood safety surface.		

280 - Picnic Tables	Useful Life 20	Remaining Life 11
7 Picnic Area	Quantity 7	Unit of Measure Items
	Cost /ltm \$615	
	% Included 100.00%	Total Cost/Study \$4,305
Summary	Replacement Year 2022/2023	Future Cost \$5,649
This is to replace the picnic tables.		

Babe Best Park

26000 - Outdoor Equipment

302 - Benches	Useful Life 20	Remaining Life 15
8 Dugout Benches	Quantity 8	Unit of Measure Items
	Cost /Itm \$615	
	% Included 100.00%	Total Cost/Study \$4,920
Summary	Replacement Year 2026/2027	Future Cost \$7,126

This is to replace the metal dugout benches.

- 4 - 21 linear foot benches
- 4 - 18 linear foot benches

316 - Benches	Useful Life 12	Remaining Life 5
2 Tot Lot	Quantity 2	Unit of Measure Items
	Cost /Itm \$512	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2016/2017	Future Cost \$1,160

This is to replace the tot lot benches.

Babe Best Park

26000 - Outdoor Equipment

430 - Bleachers	Useful Life 20	Remaining Life 9
4 Wood Bleachers	Quantity 4	Unit of Measure Items
	Cost /Itm \$1,537	
	% Included 100.00%	Total Cost/Study \$6,150
Summary	Replacement Year 2020/2021	Future Cost \$7,681
This is to replace the 10' x 18' wood bleachers.		

440 - Bleachers: Aluminum	Useful Life 20	Remaining Life 16
4 Aluminum Bleachers	Quantity 4	Unit of Measure Items
	Cost /Itm \$2,050	
	% Included 100.00%	Total Cost/Study \$8,200
Summary	Replacement Year 2027/2028	Future Cost \$12,173
This is to replace the 10' x 25' aluminum bleachers.		

Babe Best Park

26000 - Outdoor Equipment

480 - Drinking Fountain	Useful Life 20	Remaining Life 14
4 Ballfields & Restrooms	Quantity 4	Unit of Measure Items
	Cost /Itm \$2,460	
	% Included 100.00%	Total Cost/Study \$9,840
Summary	Replacement Year 2025/2026	Future Cost \$13,904

This is to replace the drinking fountains. The fountains should be inspected, cleaned and sanitized frequently. Handle assemblies should be lubricated every six months.

900 - Miscellaneous	Useful Life 20	Remaining Life 14
Electronic Scoreboard	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$7,687	
	% Included 100.00%	Total Cost/Study \$7,687
Summary	Replacement Year 2025/2026	Future Cost \$10,862

This is to replace the ball field electronic scoreboard.

Central Park Horse Arena/BMX Track

01000 - Paving

102 - Asphalt: Sealing	Useful Life 5	Remaining Life 1
29,154 Sq. Ft. Access Road & Parking	Quantity 29,154	Unit of Measure Square Feet
	Cost /SqFt \$0.123	
	% Included 100.00%	Total Cost/Study \$3,586
Summary	Replacement Year 2012/2013	Future Cost \$3,676

This is to prepare the surface and apply a single coat asphalt emulsion product. If a second coat is desired the cost is generally 10% to 20% higher.

202 - Asphalt: Ongoing Repairs	Useful Life 5	Remaining Life 1
29,154 Sq. Ft. Access Road & Parking (2%)	Quantity 29,154	Unit of Measure Square Feet
	Cost /SqFt \$3.33	Qty * \$/SqFt \$97,119
	% Included 2.00%	Total Cost/Study \$1,942
Summary	Replacement Year 2012/2013	Future Cost \$1,991

This is for miscellaneous repairs including crackfill, skin patching and minor dig out & fill.

Central Park Horse Arena/BMX Track

01000 - Paving

302 - Asphalt: Petromat Overlay	Useful Life 25	Remaining Life 16
29,154 Sq. Ft. Access Road & Parking	Quantity 29,154	Unit of Measure Square Feet
	Cost /SqFt \$1.64	
	% Included 100.00%	Total Cost/Study \$47,813
Summary	Replacement Year 2027/2028	Future Cost \$70,978

This is to apply a Petromat overlay on top of the existing asphalt surface along with 1-1/2" of new hot asphalt. Generally this includes edge grinding and utility box extensions.

462 - Gravel	Useful Life 5	Remaining Life 1
41,350 Sq. Ft. Access Road & Parking (5%)	Quantity 41,350	Unit of Measure Square Feet
	Cost /SqFt \$1.02	Qty * \$/SqFt \$42,384
	% Included 5.00%	Total Cost/Study \$2,119
Summary	Replacement Year 2012/2013	Future Cost \$2,172

This is to replenish the gravel rock throughout the unpaved access road and unpaved parking areas.

Central Park Horse Arena/BMX Track

01000 - Paving

502 - Curbs: Concrete	Useful Life 10	Remaining Life 6
150 Lin. Ft. Parking Lot	Quantity 150	Unit of Measure Linear Feet
	Cost /l.f. \$8.20	
	% Included 100.00%	Total Cost/Study \$1,230
Summary	Replacement Year 2017/2018	Future Cost \$1,426
This is to replace the concrete curbing.		

802 - Striping	Useful Life 5	Remaining Life 1
Parking Lot	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$512	
	% Included 100.00%	Total Cost/Study \$512
Summary	Replacement Year 2012/2013	Future Cost \$525
This is to re-stripe asphalt to match existing plan.		

Central Park Horse Arena/BMX Track

03000 - Painting: Exterior

126 - Surface Restoration	Useful Life 5	Remaining Life 2
1,762 Sq. Ft. Wood Booths	Quantity 1,762	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$1,806
Summary	Replacement Year 2013/2014	Future Cost \$1,897

This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint. This component provides for the Announcer's booth at the horse arena as well as the booths at the BMX track.

130 - Surface Restoration	Useful Life 5	Remaining Life 2
1,424 Sq. Ft. Wood Bleachers	Quantity 1,424	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$1,460
Summary	Replacement Year 2013/2014	Future Cost \$1,533

This is to prepare and paint the wooden bleachers at both the horse arena and the BMX track.

Horse Arena - 1,168 square feet of paintable surface.
BMX Track - 256 square feet of paintable surface.

Central Park Horse Arena/BMX Track

03000 - Painting: Exterior

132 - Surface Restoration	Useful Life 5	Remaining Life 2
6 Wood Benches in Pens	Quantity 6	Unit of Measure Items
	Cost /ltn \$205	
	% Included 100.00%	Total Cost/Study \$1,230
Summary	Replacement Year 2013/2014	Future Cost \$1,292
This is to prepare and paint the wood benches.		

400 - Wrought Iron	Useful Life 5	Remaining Life 2
1,928 Lin. Ft. Tubular Steel Fencing	Quantity 1,928	Unit of Measure Linear Feet
	Cost /l.f. \$6.15	
	% Included 100.00%	Total Cost/Study \$11,857
Summary	Replacement Year 2013/2014	Future Cost \$12,457
This is to prepare and paint the 3, 5 & 6' tubular steel fencing.		

Central Park Horse Arena/BMX Track

04000 - Structural Repairs

954 - Dry-rot repairs- ongoing	Useful Life 5	Remaining Life 2
1,762 Sq. Ft. Wood Booths (16.7%)	Quantity 1,762	Unit of Measure Square Feet
	Cost /SqFt \$10.25	Qty * \$/SqFt \$18,060
	% Included 16.74%	Total Cost/Study \$3,024
Summary	Replacement Year 2013/2014	Future Cost \$3,177

This is for repair and replacement of the wooden announcer's/spectators booths at both the horse arena and the BMX track.

18000 - Landscaping

460 - General Repairs/Upgrades	Useful Life 1	Remaining Life 1
Open Area	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$1,537	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2012/2013	Future Cost \$1,576

This is to maintain the open area and keep vegetation overgrowth to a minimum.

Central Park Horse Arena/BMX Track

19000 - Fencing

110 - Chain Link: 6'	Useful Life 30	Remaining Life 19
24 Lin. Ft. Entrance Gates	Quantity 24	Unit of Measure Linear Feet
	Cost /l.f. \$15.37	
	% Included 100.00%	Total Cost/Study \$369
Summary	Replacement Year 2030/2031	Future Cost \$590
This is to replace the 6' chain link manually operated entrance gates.		

210 - Wrought Iron: 3'	Useful Life 30	Remaining Life 19
72 Lin. Ft. Tubular Steel Hitching Posts [6]	Quantity 72	Unit of Measure Linear Feet
	Cost /l.f. \$25.62	
	% Included 100.00%	Total Cost/Study \$1,845
Summary	Replacement Year 2030/2031	Future Cost \$2,950

This is to replace the six 3' tubular steel hitching posts. With aggressive paint maintenance, this component's life may be extended. Painting is provided for within another component.

Central Park Horse Arena/BMX Track

19000 - Fencing

224 - Wrought Iron: 5'	Useful Life 30	Remaining Life 19
956 Lin. Ft. 5' Tubular Steel Fencing	Quantity 956	Unit of Measure Linear Feet
	Cost /l.f. \$34.85	
	% Included 100.00%	Total Cost/Study \$33,317
Summary	Replacement Year 2030/2031	Future Cost \$53,262
This is to replace the 5' tubular steel fencing forming the horse pens.		

230 - Wrought Iron: 6'	Useful Life 30	Remaining Life 19
900 Lin. Ft. 6' Tubular Steel Fencing	Quantity 900	Unit of Measure Linear Feet
	Cost /l.f. \$36.90	
	% Included 100.00%	Total Cost/Study \$33,210
Summary	Replacement Year 2030/2031	Future Cost \$53,091
This is to replace the 6' tubular steel fencing bordering the horse arena.		

Central Park Horse Arena/BMX Track

19000 - Fencing

512 - Post & Cable	Useful Life 25	Remaining Life 12
728 Lin. Ft. Perimeter Paved Parking	Quantity 728	Unit of Measure Linear Feet
	Cost /l.f. \$20.50	
	% Included 100.00%	Total Cost/Study \$14,924
Summary	Replacement Year 2023/2024	Future Cost \$20,071
This is to repair and replace the 3' post and cable fence.		

780 - Gates	Useful Life 20	Remaining Life 9
14 Lin. Ft. Access Road Gate	Quantity 14	Unit of Measure Linear Feet
	Cost /l.f. \$51.25	
	% Included 100.00%	Total Cost/Study \$717
Summary	Replacement Year 2020/2021	Future Cost \$896
This is to maintain, repair and replace the gates and gate hardware.		

Central Park Horse Arena/BMX Track

20000 - Lighting

100 - Exterior: Misc. Fixtures	Useful Life 5	Remaining Life 9
8 Athletic Field Lighting (13%)	Quantity 8	Unit of Measure Items
	Cost /Itm \$2,562	Qty * \$/Itm \$20,500
	% Included 12.50%	Total Cost/Study \$2,562
Summary	Replacement Year 2020/2021	Future Cost \$3,200

This is on-going replacement of the Athletic Field Lighting.

21000 - Signage

710 - Entry Signs	Useful Life 15	Remaining Life 7
Main Entrance Sign	Quantity 1	Unit of Measure Items
	Cost /Itm \$1,025	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2018/2019	Future Cost \$1,218

This is to replace the "Elkhorn BMX" entry sign.

Central Park Horse Arena/BMX Track

24500 - Audio / Visual

300 - PA System	Useful Life 10	Remaining Life 6
6 Speakers	Quantity 6	Unit of Measure Items
	Cost /Itm \$256	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2017/2018	Future Cost \$1,783
This is to replace the public address system speakers.		

26000 - Outdoor Equipment

282 - Picnic Tables	Useful Life 20	Remaining Life 9
5 Common Area	Quantity 5	Unit of Measure Items
	Cost /Itm \$512	
	% Included 100.00%	Total Cost/Study \$2,562
Summary	Replacement Year 2020/2021	Future Cost \$3,200
This is to replace the picnic tables.		

Central Park Horse Arena/BMX Track

26000 - Outdoor Equipment

304 - Benches	Useful Life 12	Remaining Life 7
2 Common Area	Quantity 2	Unit of Measure Items
	Cost /Itm \$512	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2018/2019	Future Cost \$1,218
This is to replace the benches.		

306 - Benches	Useful Life 12	Remaining Life 7
6 Wood Benches in Pens	Quantity 6	Unit of Measure Items
	Cost /Itm \$615	
	% Included 100.00%	Total Cost/Study \$3,690
Summary	Replacement Year 2018/2019	Future Cost \$4,386
This is to replace the wood benches.		

380 - Garbage Receptacles	Useful Life 20	Remaining Life 10
15 Trash Cans	Quantity 15	Unit of Measure Items
	Cost /Itm \$102	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2021/2022	Future Cost \$1,968
This is to replace the garbage containers.		

Central Park Horse Arena/BMX Track

26000 - Outdoor Equipment

432 - Bleachers	Useful Life 20	Remaining Life 11
2 Wood Bleachers	Quantity 2	Unit of Measure Items
	Cost /Itm \$3,075	
	% Included 100.00%	Total Cost/Study \$6,150
Summary	Replacement Year 2022/2023	Future Cost \$8,069

This is to replace the 2 sets of 15' x 73' (8 rows each) wood bleachers.

442 - Bleachers: Aluminum	Useful Life 20	Remaining Life 13
2 Aluminum Bleachers	Quantity 2	Unit of Measure Items
	Cost /Itm \$4,100	
	% Included 100.00%	Total Cost/Study \$8,200
Summary	Replacement Year 2024/2025	Future Cost \$11,304

This is to replace the 2 sets of 19' x 26' (10 rows each) aluminum bleachers.

450 - Bleachers	Useful Life 20	Remaining Life 12
2 BMX Bleachers	Quantity 2	Unit of Measure Items
	Cost /Itm \$2,050	
	% Included 100.00%	Total Cost/Study \$4,100
Summary	Replacement Year 2023/2024	Future Cost \$5,514

This is to replace the wood bleachers at the BMX track.

1 - 6' x 16' , 3 rows
1 - 9' x 16' , 5 rows

Community Center Park

01000 - Paving

104 - Asphalt: Sealing	Useful Life 5	Remaining Life 2
35,650 Sq. Ft. Parking Lot	Quantity 35,650	Unit of Measure Square Feet
	Cost /SqFt \$0.154	
	% Included 100.00%	Total Cost/Study \$5,481
Summary	Replacement Year 2013/2014	Future Cost \$5,759

This is to prepare the surface and apply a single coat asphalt emulsion product. If a second coat is desired the cost is generally 10% to 20% higher.

204 - Asphalt: Ongoing Repairs	Useful Life 5	Remaining Life 2
35,650 Sq. Ft. Parking Lot (2%)	Quantity 35,650	Unit of Measure Square Feet
	Cost /SqFt \$3.33	Qty * \$/SqFt \$118,759
	% Included 2.00%	Total Cost/Study \$2,375
Summary	Replacement Year 2013/2014	Future Cost \$2,495

This is for miscellaneous repairs including crackfill, skin patching and minor dig out & fill.

304 - Asphalt: Petromat Overlay	Useful Life 25	Remaining Life 12
35,650 Sq. Ft. Parking Lot	Quantity 35,650	Unit of Measure Square Feet
	Cost /SqFt \$1.64	
	% Included 100.00%	Total Cost/Study \$58,466
Summary	Replacement Year 2023/2024	Future Cost \$78,630

This is to apply a Petromat overlay on top of the existing asphalt surface along with 1-1/2" of new hot asphalt. Generally this includes edge grinding and utility box extensions.

Community Center Park

01000 - Paving

464 - Gravel	Useful Life 10	Remaining Life 5
18,200 Sq. Ft. Harvey House Yard	Quantity 18,200	Unit of Measure Square Feet
	Cost /SqFt \$0.256	
	% Included 100.00%	Total Cost/Study \$4,664
Summary	Replacement Year 2016/2017	Future Cost \$5,277
This is to replenish the gravel rock at the Harvey House yard.		

02000 - Concrete

900 - Miscellaneous	Useful Life 5	Remaining Life 1
18,209 Sq. Ft. All Concrete Flatwork (2%)	Quantity 18,209	Unit of Measure Square Feet
	Cost /SqFt \$16.40	Qty * \$/SqFt \$298,628
	% Included 2.00%	Total Cost/Study \$5,973
Summary	Replacement Year 2012/2013	Future Cost \$6,122
This is for miscellaneous concrete repair. This component provides for vertical curb, mowing strips, walkways, slabs, concrete courtyards, horseshoe pit concrete, and the shuffleboard courts. This is for on-going repairs not full replacement.		

Community Center Park

03000 - Painting: Exterior

134 - Surface Restoration	Useful Life 5	Remaining Life 3
5,400 Sq. Ft. Building Surface	Quantity 5,400	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$5,535
Summary	Replacement Year 2014/2015	Future Cost \$5,961
This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint.		

136 - Surface Restoration	Useful Life 5	Remaining Life 1
483 Sq. Ft. Wood Trellis	Quantity 483	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$495
Summary	Replacement Year 2012/2013	Future Cost \$507
This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint.		

Community Center Park

03000 - Painting: Exterior

138 - Surface Restoration	Useful Life 10	Remaining Life 6
3,108 Sq. Ft. Harvey House	Quantity 3,108	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$3,186
Summary	Replacement Year 2017/2018	Future Cost \$3,694
This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint.		

402 - Wrought Iron	Useful Life 4	Remaining Life 1
160 Lin. Ft. 4' Wrought Iron Fencing	Quantity 160	Unit of Measure Linear Feet
	Cost /l.f. \$9.22	
	% Included 100.00%	Total Cost/Study \$1,476
Summary	Replacement Year 2012/2013	Future Cost \$1,513
This is to prepare, power wash, sand, scrape, spot prime and paint the wrought iron.		

Community Center Park

03000 - Painting: Exterior

410 - Wrought Iron Gates	Useful Life 4	Remaining Life 1
12 Building Perimeter	Quantity 12	Unit of Measure Items
	Cost /Itm \$615	
	% Included 100.00%	Total Cost/Study \$7,380
Summary	Replacement Year 2012/2013	Future Cost \$7,565
This is to prepare, power wash, sand, scrape, spot prime and paint the wrought iron gates.		

450 - Wood Fencing	Useful Life 5	Remaining Life 3
1,200 Sq. Ft. Perimeter	Quantity 1,200	Unit of Measure Square Feet
	Cost /SqFt \$0.512	
	% Included 100.00%	Total Cost/Study \$615
Summary	Replacement Year 2014/2015	Future Cost \$662
This is to prepare and paint the wood fencing.		

Community Center Park

03500 - Painting: Interior

100 - Building	Useful Life 10	Remaining Life 4
7,138 Sq. Ft. All Interior Spaces	Quantity 7,138	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$7,316
Summary	Replacement Year 2015/2016	Future Cost \$8,076

This is to prepare and paint all building interior spaces. In 2011, the paint appeared in fair to good condition.

Paintable Surfaces:

- Entry - 600 square feet
- Halls - 736 square feet
- Restrooms - 480 square feet
- Kitchen - 1,322 square feet
- Main Room - 1,600 square feet
- 4 Offices - 2,400 square feet

04000 - Structural Repairs

290 - Ceilings	Useful Life 30	Remaining Life 14
3,500 Sq. Ft. Acoustic Ceilings	Quantity 3,500	Unit of Measure Square Feet
	Cost /SqFt \$1.43	
	% Included 100.00%	Total Cost/Study \$5,022
Summary	Replacement Year 2025/2026	Future Cost \$7,097

This is to replace the acoustic ceiling.

- Entry - 600 square feet
- Halls - 160 square feet
- Main Room - 1,940 square feet
- 4 Offices - 800 square feet

360 Lin. Ft. Tennis Court Perimeter	Quantity 360	Unit of Measure Linear Feet
	Cost /l.f. \$18.45	
	% Included 100.00%	Total Cost/Study \$6,642
Summary	Replacement Year 2030/2031	Future Cost \$10,618
This is to replace the tennis court 10' chain link fencing. Includes the 2 pedestrian gates.		

190 - Chain Link: Slats	Useful Life 30	Remaining Life 12
136 Lin. Ft. Utility Enclosure	Quantity 136	Unit of Measure Linear Feet
	Cost /l.f. \$10.25	
	% Included 100.00%	Total Cost/Study \$1,394
Summary	Replacement Year 2023/2024	Future Cost \$1,875
This is to replace the chain link privacy slats.		

Community Center Park

19000 - Fencing

220 - Wrought Iron: 4'	Useful Life 30	Remaining Life 19
160 Lin. Ft. Building Perimeter	Quantity 160	Unit of Measure Linear Feet
	Cost /l.f. \$30.75	
	% Included 100.00%	Total Cost/Study \$4,920
Summary	Replacement Year 2030/2031	Future Cost \$7,865

This is to replace the 4' wrought iron fencing. With aggressive paint maintenance, this component's life may be extended. Painting is provided for within another component.

310 - Wood: 3'	Useful Life 15	Remaining Life 9
198 Lin. Ft. Wood Rail Fence	Quantity 198	Unit of Measure Linear Feet
	Cost /l.f. \$15.37	
	% Included 100.00%	Total Cost/Study \$3,044
Summary	Replacement Year 2020/2021	Future Cost \$3,802

This is to replace the 3' wood hitching post type fencing including discarded fence material removal and disposal.

Community Center Park

19000 - Fencing

320 - Wood: 4'	Useful Life 15	Remaining Life 11
145 Lin. Ft. Harvey House Perimeter	Quantity 145	Unit of Measure Linear Feet
	Cost /l.f. \$18.45	
	% Included 100.00%	Total Cost/Study \$2,675
Summary	Replacement Year 2022/2023	Future Cost \$3,510
This is to replace the 4' wood fencing including discarded fence material removal and disposal.		

340 - Wood: 6'	Useful Life 15	Remaining Life 10
200 Lin. Ft. Perimeter	Quantity 200	Unit of Measure Linear Feet
	Cost /l.f. \$25.62	
	% Included 100.00%	Total Cost/Study \$5,125
Summary	Replacement Year 2021/2022	Future Cost \$6,560
This is to replace the 6' wood fencing including discarded fence material removal and disposal.		

Community Center Park

19000 - Fencing

420 - Masonry Wall: On-going Maint.
180 Building Exterior

Useful Life 5 Remaining Life 3
Quantity 180 Unit of Measure Lump Sum
Cost /LS \$5.12
% Included 100.00% Total Cost/Study \$922

Summary

Replacement Year 2014/2015 Future Cost \$993

This is for ongoing masonry wall maintenance. Since the core masonry wall useful life exceeds the scope of this thirty year study, this component provides for repair only and not full replacement. Maintenance may include paint touchup, graffiti removal, and minor structural repairs.

514 - Post & Cable
650 Lin. Ft. Perimeter

Useful Life 25 Remaining Life 12
Quantity 650 Unit of Measure Linear Feet
Cost /l.f. \$20.50
% Included 100.00% Total Cost/Study \$13,325

Summary

Replacement Year 2023/2024 Future Cost \$17,921

This is to repair and replace the post and cable fence.

Community Center Park

19500 - Retaining Wall

990 - Miscellaneous	Useful Life 20	Remaining Life 16
185 Lin. Ft. Keystone Retaining Wall	Quantity 185	Unit of Measure Linear Feet
	Cost /l.f. \$10.25	
	% Included 100.00%	Total Cost/Study \$1,896
Summary	Replacement Year 2027/2028	Future Cost \$2,815
This is to replace the keystone retaining wall at the building exterior. 3' nominal height.		

20000 - Lighting

540 - Parking Lot	Useful Life 25	Remaining Life 19
3 Parking Lot	Quantity 3	Unit of Measure Items
	Cost /itm \$2,255	
	% Included 100.00%	Total Cost/Study \$6,765
Summary	Replacement Year 2030/2031	Future Cost \$10,815
This is to replace the parking lot lights.		

Community Center Park

21000 - Signage

792 - Monument	Useful Life 10	Remaining Life 4
Oak Lane Frontage	Quantity 1	Unit of Measure Items
	Cost /Itm \$1,537	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2015/2016	Future Cost \$1,697

This is to repair and repaint the custom identity monument sign. Approximately 108 square feet of surface area.

22000 - Office Equipment

200 - Computers, Misc.	Useful Life 8	Remaining Life 3
4 Offices	Quantity 4	Unit of Measure Items
	Cost /Itm \$2,562	
	% Included 100.00%	Total Cost/Study \$10,250
Summary	Replacement Year 2014/2015	Future Cost \$11,038

This is to replace computers, printers, scanners and networking equipment as needed.

Community Center Park
23000 - Mechanical Equipment

200 - HVAC	Useful Life 15	Remaining Life 9
3 Building Units	Quantity 3	Unit of Measure Items
	Cost /Itm \$5,125	
	% Included 100.00%	Total Cost/Study \$15,375
Summary	Replacement Year 2020/2021	Future Cost \$19,201

This is to replace 3 units in the HVAC system. It is possible that sub-components of this system can be replaced or re-built to extend its life. Two newer units are provided for in another component.

202 - HVAC	Useful Life 15	Remaining Life 15
2 Building Units	Quantity 2	Unit of Measure Items
	Cost /Itm \$5,125	
	% Included 100.00%	Total Cost/Study \$10,250
Summary	Replacement Year 2026/2027	Future Cost \$14,845

This is to replace the two newer units in the HVAC system. It is possible that sub-components of this system can be replaced or re-built to extend its life. Three older units are provided for in another component.

Community Center Park

24000 - Furnishings

Replacement Year 2017/2018 Future Cost \$1,160

Summary

This is to replace the Hobart dishwasher.

Depot Park

01000 - Paving

106 - Asphalt: Sealing	Useful Life 5	Remaining Life 1
1,428 Sq. Ft. Parking Area	Quantity 1,428	Unit of Measure Square Feet
	Cost /SqFt \$0.154	
	% Included 100.00%	Total Cost/Study \$220
Summary	Replacement Year 2012/2013	Future Cost \$225

This is to prepare the surface and apply a single coat asphalt emulsion product. If a second coat is desired the cost is generally 10% to 20% higher. This component also provides for re-stripping.

206 - Asphalt: Ongoing Repairs	Useful Life 5	Remaining Life 1
1,428 Sq. Ft. Parking Area (5%)	Quantity 1,428	Unit of Measure Square Feet
	Cost /SqFt \$3.33	Qty * \$/SqFt \$4,757
	% Included 5.00%	Total Cost/Study \$238
Summary	Replacement Year 2012/2013	Future Cost \$244

This is for miscellaneous repairs including crackfill, skin patching and minor dig out & fill, as well as maintaining the parking blocks. In 2011, the asphalt is cracked and in poor condition.

Depot Park

01000 - Paving

306 - Asphalt: Petromat Overlay	Useful Life 25	Remaining Life 10
1,428 Sq. Ft. Parking Area	Quantity 1,428	Unit of Measure Square Feet
	Cost /SqFt \$1.64	
	% Included 100.00%	Total Cost/Study \$2,342
Summary	Replacement Year 2021/2022	Future Cost \$2,998

This is to apply a Petromat overlay on top of the existing asphalt surface along with 1-1/2" of new hot asphalt. Generally this includes edge grinding and utility box extensions.

02000 - Concrete

200 - Sidewalks, Curbs & Gutters	Useful Life 3	Remaining Life 1
2,933 Sq. Ft. All Concrete (3%)	Quantity 2,933	Unit of Measure Square Feet
	Cost /SqFt \$16.40	Qty * \$/SqFt \$48,101
	% Included 2.50%	Total Cost/Study \$1,203
Summary	Replacement Year 2012/2013	Future Cost \$1,233

This is to repair, replace or grind failed concrete sidewalks, curbs and gutters to remove abrupt elevation changes and maintain functionality. Since the concrete useful life exceeds the scope of this study, this component provides for repair only and not full replacement. In 2011, the concrete appears in good condition.

Depot Park

03000 - Painting: Exterior

140 - Surface Restoration	Useful Life 6	Remaining Life 3
3,270 Sq. Ft. Depot Building	Quantity 3,270	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$3,352
Summary	Replacement Year 2014/2015	Future Cost \$3,609

This is to prepare, power wash, sand, scrape, caulk and paint with a 100% premium acrylic paint. In 2011, the paint appeared in good condition.

404 - Wrought Iron	Useful Life 6	Remaining Life 1
100 Lin. Ft. Gazebo	Quantity 100	Unit of Measure Linear Feet
	Cost /l.f. \$9.22	
	% Included 100.00%	Total Cost/Study \$922
Summary	Replacement Year 2012/2013	Future Cost \$946

This is to prepare, power wash, sand, scrape, spot prime and paint the gazebo's 4' wrought iron fencing.

Depot Park

04000 - Structural Repairs

200 - Wood: Siding & Trim	Useful Life 12	Remaining Life 9
3,270 Depot Building (5%)	Quantity 3,270	Unit of Measure Items
	Cost /Itm \$5.12	Qty * \$/Itm \$16,759
	% Included 5.00%	Total Cost/Study \$838
Summary	Replacement Year 2020/2021	Future Cost \$1,046

This is to replace siding and wood trim. The actual scope of the work will depend on what is found after the existing siding is removed. Includes primer and paint on all new wood surfaces. In conjunction with every other paint cycle.

04500 - Decking/Balconies

520 - Railing: Wood	Useful Life 15	Remaining Life 9
104 Lin. Ft. Depot Building	Quantity 104	Unit of Measure Linear Feet
	Cost /l.f. \$23.57	
	% Included 100.00%	Total Cost/Study \$2,452
Summary	Replacement Year 2020/2021	Future Cost \$3,062

This is to replace the 4' wood safety rail at the concrete slab edge.

Depot Park
05000 - Roofing

10 Picnic Area	Quantity 10	Unit of Measure Items
	Cost /Itm \$615	
	% Included 100.00%	Total Cost/Study \$6,150
Summary	Replacement Year 2020/2021	Future Cost \$7,681
This is to replace the picnic tables.		

312 - Benches	Useful Life 15	Remaining Life 9
3 Picnic Area	Quantity 3	Unit of Measure Items
	Cost /Itm \$615	
	% Included 100.00%	Total Cost/Study \$1,845
Summary	Replacement Year 2020/2021	Future Cost \$2,304
This is to replace the benches.		

484 - Drinking Fountain	Useful Life 20	Remaining Life 6
Restroom Building	Quantity 1	Unit of Measure Items
	Cost /Itm \$2,460	
	% Included 100.00%	Total Cost/Study \$2,460
Summary	Replacement Year 2017/2018	Future Cost \$2,853
This is to replace the drinking fountain. The fountain(s) should be inspected, cleaned and sanitized frequently.		

Roy E Hayer Park

26000 - Outdoor Equipment

910 - Miscellaneous	Useful Life 10	Remaining Life 4
7 Miscellaneous Outdoor Items	Quantity 7	Unit of Measure Items
	Cost /Itm \$205	
	% Included 100.00%	Total Cost/Study \$1,435
Summary	Replacement Year 2015/2016	Future Cost \$1,584

This is to replace miscellaneous outdoor equipment. This component provides for the message board structure, the 4 trash cans, and the 2 pet stations.

Westside Park

01000 - Paving

112 - Asphalt: Sealing	Useful Life 5	Remaining Life 2
23,170 Sq. Ft. Paved Parking	Quantity 23,170	Unit of Measure Square Feet
	Cost /SqFt \$0.154	
	% Included 100.00%	Total Cost/Study \$3,562
Summary	Replacement Year 2013/2014	Future Cost \$3,743

This is to prepare the surface and apply a single coat asphalt emulsion product. If a second coat is desired the cost is generally 10% to 20% higher. Includes striping.

212 - Asphalt: Ongoing Repairs	Useful Life 5	Remaining Life 2
23,170 Sq. Ft. Paved Parking (2%)	Quantity 23,170	Unit of Measure Square Feet
	Cost /SqFt \$3.33	Qty * \$/SqFt \$77,185
	% Included 2.00%	Total Cost/Study \$1,544
Summary	Replacement Year 2013/2014	Future Cost \$1,622

This is for miscellaneous repairs including crackfill, skin patching and minor dig out & fill.

312 - Asphalt: Petromat Overlay	Useful Life 25	Remaining Life 12
23,170 Sq. Ft. Paved Parking	Quantity 23,170	Unit of Measure Square Feet
	Cost /SqFt \$1.64	
	% Included 100.00%	Total Cost/Study \$37,999
Summary	Replacement Year 2023/2024	Future Cost \$51,104

This is to apply a Petromat overlay on top of the existing asphalt surface along with 1-1/2" of new hot asphalt. Generally this includes edge grinding and utility box extensions.

Included Components

Third Draft
Prepared for the 2012/2013 Fiscal Year

Westside Park

01000 - Paving

460 - Gravel	Useful Life 5	Remaining Life 2
16,920 Sq. Ft. Unpaved Parking & Access Roads	Quantity 16,920	Unit of Measure Square Feet
	Cost /SqFt \$0.102	
	% Included 100.00%	Total Cost/Study \$1,734
Summary	Replacement Year 2013/2014	Future Cost \$1,822
This is to replenish the gravel rock throughout the unpaved vehicular areas.		

02000 - Concrete

902 - Miscellaneous	Useful Life 3	Remaining Life 1
8,257 Sq. Ft. Slabs & Walkways (2%)	Quantity 8,257	Unit of Measure Square Feet
	Cost /SqFt \$16.40	Qty * \$/SqFt \$135,415
	% Included 2.00%	Total Cost/Study \$2,708
Summary	Replacement Year 2012/2013	Future Cost \$2,776
This is to repair, replace or grind failed concrete flatwork to remove abrupt elevation changes and maintain functionality. Since the concrete useful life exceeds the scope of this study, this component provides for repair only and not full replacement. Includes the border curbing around the volley ball court.		

03000 - Painting: Exterior

148 - Surface Restoration	Useful Life 4	Remaining Life 1
468 Sq. Ft. Backstop Wood & Score Table	Quantity 468	Unit of Measure Square Feet
	Cost /SqFt \$1.02	
	% Included 100.00%	Total Cost/Study \$480
Summary	Replacement Year 2012/2013	Future Cost \$492
This is to prepare and paint the backstop wood and the scorekeeper's table.		

Westside Park

04000 - Structural Repairs

914 - Building Maintenance	Useful Life 20	Remaining Life 14
Restroom Building	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$3,075	
	% Included 100.00%	Total Cost/Study \$3,075
Summary	Replacement Year 2025/2026	Future Cost \$4,345
This is for general restroom building repairs.		

958 - Dry-rot repairs- ongoing	Useful Life 8	Remaining Life 5
468 Sq. Ft. Backstop Wood	Quantity 468	Unit of Measure Square Feet
	Cost /SqFt \$5.12	
	% Included 100.00%	Total Cost/Study \$2,398
Summary	Replacement Year 2016/2017	Future Cost \$2,714
This is for repair and replacement of the backstop wood and the scorekeeper's table. Painting is provided for in another component.		

Westside Park

08000 - Rehab

228 - Restrooms	Useful Life 20	Remaining Life 9
Restroom Building	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$3,075	
	% Included 100.00%	Total Cost/Study \$3,075
Summary	Replacement Year 2020/2021	Future Cost \$3,840

This is to rehab and redecorate the restroom. Includes fixtures, lighting, & paint. This item can be further defined with association input. The restroom has a concrete floor and approximately 400 square feet of paintable interior surface.

11000 - Gate Equipment

912 - Vehicle Gate Replacement	Useful Life 30	Remaining Life 23
3 Driveways & Access Road	Quantity 3	Unit of Measure Items
	Cost /ltm \$1,537	
	% Included 100.00%	Total Cost/Study \$4,612
Summary	Replacement Year 2034/2035	Future Cost \$8,139

This is to replace the 3 existing manually operated vehicle gates.

18000 - Landscaping

110 - Irrigation: Misc.	Useful Life 3	Remaining Life 1
Irrigation Items	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$1,025	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2012/2013	Future Cost \$1,051

This is for major irrigation system repair in excess of the operating budget.

Component Listing

Included Components

Third Draft
Prepared for the 2012/2013 Fiscal Year

Westside Park

18000 - Landscaping

430 - General Repairs/Upgrades	Useful Life 3	Remaining Life 1
Landscaped Areas	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$1,025	
	% Included 100.00%	Total Cost/Study \$1,025
Summary	Replacement Year 2012/2013	Future Cost \$1,051
This is to have funds in excess of the operating budget for miscellaneous plantings, removals and other work.		

19000 - Fencing

052 - Chain Link	Useful Life 30	Remaining Life 19
61 Lin. Ft. 20' Backstop Fencing	Quantity 61	Unit of Measure Linear Feet
	Cost /l.f. \$36.90	
	% Included 100.00%	Total Cost/Study \$2,251
Summary	Replacement Year 2030/2031	Future Cost \$3,598
This is to replace the chain link fencing.		

Westside Park

19000 - Fencing

102 - Chain Link: 4'	Useful Life 30	Remaining Life 28
1,354 Lin. Ft. Dog Park Fencing	Quantity 1,354	Unit of Measure Linear Feet
	Cost /l.f. \$11.27	
	% Included 100.00%	Total Cost/Study \$15,266
Summary	Replacement Year 2039/2040	Future Cost \$30,479

This is to replace the 4' chain link fencing at the dog park. In 2011, the dog park fencing is newer looking and in excellent condition. Includes the two 3' pedestrian gates and the two 10' maintenance gates.

104 - Chain Link: 4'	Useful Life 30	Remaining Life 19
60 Lin. Ft. Ballfield	Quantity 60	Unit of Measure Linear Feet
	Cost /l.f. \$11.27	
	% Included 100.00%	Total Cost/Study \$676
Summary	Replacement Year 2030/2031	Future Cost \$1,081

This is to replace the 4' chain link fencing.

126 - Chain Link: 8'	Useful Life 30	Remaining Life 19
976 Lin. Ft. Ballfield	Quantity 976	Unit of Measure Linear Feet
	Cost /l.f. \$14.35	
	% Included 100.00%	Total Cost/Study \$14,006
Summary	Replacement Year 2030/2031	Future Cost \$22,390

This is to replace the 8' chain link fencing.

	Cost /l.f. \$18.45	
	% Included 100.00%	Total Cost/Study \$4,059
Summary	Replacement Year 2030/2031	Future Cost \$6,489
This is to replace the 10' chain link fencing.		

520 - Post & Cable	Useful Life 25	Remaining Life 13
749 Lin. Ft. Perimeter	Quantity 749	Unit of Measure Linear Feet
	Cost /l.f. \$20.50	
	% Included 100.00%	Total Cost/Study \$15,354
Summary	Replacement Year 2024/2025	Future Cost \$21,166
This is to repair and replace the post and cable fence.		

20000 - Lighting

108 - Exterior: Misc. Fixtures	Useful Life 5	Remaining Life 9
6 Light Poles (8%)	Quantity 6	Unit of Measure Items
	Cost /lrm \$2,562	Qty * \$/lrm \$15,375
	% Included 8.33%	Total Cost/Study \$1,281
Summary	Replacement Year 2020/2021	Future Cost \$1,600
This is to replace the six athletic field light poles.		

Westside Park

21000 - Signage

796 - Monument	Useful Life 10	Remaining Life 4
W 2nd St. Frontage	Quantity 1	Unit of Measure Items
	Cost /Itm \$1,537	
	% Included 100.00%	Total Cost/Study \$1,537
Summary	Replacement Year 2015/2016	Future Cost \$1,697

This is to repair and repaint the custom identity monument sign. Approximately 108 square feet of surface area.

26000 - Outdoor Equipment

106 - Tot Lot: Play Equipment	Useful Life 20	Remaining Life 16
Tot Lot Play Area	Quantity 1	Unit of Measure Lump Sum
	Cost /LS \$15,375	
	% Included 100.00%	Total Cost/Study \$15,375
Summary	Replacement Year 2027/2028	Future Cost \$22,824

This is to replace the tot lot play equipment. Includes the large multi-station and the swing set.

Rio Linda Elverta Recreation and Park District

Section X

Notes to the Auditor

Third Draft

Prepared for the 2012/2013 Fiscal Year

This report is intended to assist the auditor while preparing the audit, review or compilation of Rio Linda Elverta Recreation and Park District's (the "Project") financial documents.

Browning Reserve Group ("BRG") prepared a reserve study for the Project during the 2011/2012 fiscal year. This was done to help determine the Project's reserve contribution for the next fiscal year (2012/2013) and future fiscal years. In addition, BRG prepared reserve fund disclosures for distribution to the Project members.

This Reserve Study is a Full Study. A **Full Study** includes an on-site review upon where the following tasks are performed:

- development of a reserve component inventory;
- condition assessment based upon on-site visual observation;
- life and valuation estimates;
- fund status;
- and a funding plan. Please note, in order to complete these study tasks, one or more visits were conducted by BRG to Rio Linda Elverta Recreation and Park District.

For BRG reserve studies, the year in which the study is being conducted, is the first year of the study. For example, this study is being prepared during 2011/2012 and is the Project's first year in the study. This enables BRG to use a starting point which ties to the last audited financial statement, June 30, 2011. You will notice in Section III, Reserve Fund Balance Forecast, a Beginning Reserve Balance of \$100,000 is being used which ties to the last completed audit or review of the Project's financial statements. BRG then re-builds the first year of the study, in this case 2011/2012, and estimates an ending reserve fund balance. Again, see Section III and the 2011/2012 ending reserve balance estimate of \$98,349.

"Re-building" the first year of the study as mentioned above simply means using the 2011/2012 adopted budget for the 2011/2012 reserve contribution. Finally, the 2011/2012 reserve expenses both actual and projected are estimated.

We find by using the above method a more accurate reserve study is possible because the beginning reserve fund balance ties directly to the Project's audited financial statement or, in the absence of an audit or review, the year end balance sheet. There is no need to rely on others for determining mid year reserve balances or estimating current year ending reserve balances. This approach forces all involved, to look at the current year's reserve fund activities so a more accurate ending reserve fund balance can be estimated.

With respect to the reserve component information on the next page/s, here are the calculations:

$$\text{FFB} = \text{Current Cost} \times \text{Effective Age} / \text{Useful Life}$$

$$\% \text{ Funded} = \text{First Year Estimated Ending Reserve Balance} / \text{FFB}$$

Please see Section V - Reserve Fund Balance Forecast.

Terms & Definitions

CASH FLOW METHOD: A method of developing a Reserve Funding Plan where contributions to the Reserve fund are designed to offset the variable annual expenditures from the Reserve fund. Different Reserve Funding Plans are tested against the anticipated schedule of Reserve expenses until the desired Funding Goal is achieved.

COMPONENT INVENTORY: The task of selecting and quantifying Reserve Components. This task can be accomplished through on-site visual observations, review of association design and organizational documents, a review of established association precedents, and discussion with appropriate representative(s) of the association or cooperative.

COMPONENT METHOD: A method of developing a Reserve Funding Plan where the total **contribution is based on the sum of contributions for individual components.** See "Cash Flow Method."

COMPONENT: The individual line items in the Reserve Study, developed or updated in the Physical Analysis. These elements form the building blocks for the Reserve Study. Components typically are: 1) Association responsibility, 2) with limited Useful Life expectancies, 3) predictable Remaining Useful Life expectancies, 4) above a minimum threshold cost, and 5) as required by local codes.

CONDITION ASSESSMENT: The task of evaluating the current condition of the component based on observed or reported characteristics.

CURRENT REPLACEMENT COST: See "Replacement Cost."

DEFICIT: An actual (or projected) Reserve Balance less than the Fully Funded Balance. The opposite would be a Surplus.

EFFECTIVE AGE: The difference between Useful Life and Remaining Useful Life. Not always equivalent to chronological age, since some components age irregularly. Used primarily in computations.

FINANCIAL ANALYSIS: The portion of a Reserve Study where current status of the Reserves (measured as cash or Percent Funded) and a recommended Reserve contribution rate (Reserve Funding Plan) are derived, and the projected Reserve income and expense over time is presented. The Financial Analysis is one of the two parts of a Reserve Study.

FULLY FUNDED BALANCE (FFB): Total Accrued Depreciation. An indicator against which Actual (or projected) Reserve balance can be compared. The Reserve balance that is in **direct proportion to the fraction of life "used up" of the current Repair or Replacement cost.** This number is calculated for each component, then summed together for an association **total. Two formulae can be utilized, depending on the provider's sensitivity to interest and inflation effects.** Note: Both yield identical results when interest and inflation are equivalent.

$$\text{FFB} = \text{Current Cost} \times \text{Effective Age} / \text{Useful Life}$$

or

$$\text{FFB} = (\text{Current Cost} \times \text{Effective Age} / \text{Useful Life}) + \\ [(\text{Current Cost} \times \text{Effective Age} / \text{Useful Life}) / (1 + \text{Interest Rate}) ^ \text{Remaining Life}] - \\ [(\text{Current Cost} \times \text{Effective Age} / \text{Useful Life}) / (1 + \text{Inflation Rate}) ^ \text{Remaining Life}]$$

FULLY FUNDED: 100% Funded. When the actual (or projected) Reserve balance is equal to the Fully Funded Balance.

FUND STATUS: The status of the reserve fund as compared to an established benchmark such as percent funding.

FUNDING GOALS: Independent of methodology utilized, the following represent the basic categories of Funding Plan goals:

Baseline Funding: Establishing a Reserve funding goal of keeping the Reserve cash balance above zero.

Full Funding: Setting a Reserve funding goal of attaining and maintaining Reserves at or near 100% funded.

Statutory Funding: Establishing a Reserve funding goal of setting aside the specific minimum amount of Reserves required by local statutes.

Threshold Funding: Establishing a Reserve funding goal of keeping the Reserve balance above a specified dollar or Percent Funded amount. Depending on the threshold, this may be more or less **conservative than "Fully Funding."**

FUNDING PLAN: An association's plan to provide income to a Reserve fund to offset anticipated expenditures from that fund.

FUNDING PRINCIPLES:

- Sufficient Funds When Required
- Stable Contribution Rate over the Years
- Evenly Distributed Contributions over the Years
- Fiscally Responsible

LIFE AND VALUATION ESTIMATES: The task of estimating Useful Life, Remaining Useful Life, and Repair or Replacement Costs for the Reserve components.

PERCENT FUNDED: The ratio, at a particular point of time (typically the beginning of the Fiscal Year), of the **actual (or projected)** Reserve Balance to the **Fully Funded Balance**, expressed as a percentage.

PHYSICAL ANALYSIS: The portion of the Reserve Study where the Component Inventory, Condition Assessment, and Life and Valuation Estimate tasks are performed. This represents one of the two parts of the Reserve Study.

REMAINING USEFUL LIFE (RUL): Also referred to as "Remaining Life" (RL). The estimated time, in years, that a reserve component can be expected to continue to serve its **intended function**. **Projects anticipated to occur in the initial year have "zero" Remaining Useful Life.**

REPLACEMENT COST: The cost of replacing, repairing, or restoring a Reserve Component to its original functional condition. The Current Replacement Cost would be the cost to replace, repair, or restore the component during that particular year.

RESERVE BALANCE: Actual or projected funds as of a particular point in time that the association has identified for use to defray the future repair or replacement of those major components which the association is obligated to maintain. Also known as Reserves, Reserve Accounts and Cash Reserves. Based upon information provided and not audited.

RESERVE PROVIDER: An individual that prepares Reserve Studies.

RESERVE STUDY: A budget planning tool which identifies the current status of the Reserve fund and a stable and equitable Funding Plan to offset the anticipated future major common area expenditures. The Reserve Study consists of two parts: the Physical Analysis and the Financial Analysis.

RESPONSIBLE CHARGE: A reserve specialist in responsible charge of a reserve study shall render regular and effective supervision to those individuals performing services which directly and materially affect the quality and competence rendered by the reserve specialist. A reserve specialist shall maintain such records as are reasonably necessary to establish that the reserve specialist exercised regular and effective supervision of a reserve study of which he was in responsible charge. A reserve specialist engaged in any of the following acts or practices shall be deemed not to have rendered the regular and effective supervision required herein:

1. The regular and continuous absence from principal office premises from which professional services are rendered; expect for performance of field work or presence in a field office maintained exclusively for a specific project;
2. The failure to personally inspect or review the work of subordinates where necessary and appropriate;
3. The rendering of a limited, cursory or perfunctory review of plans or projects in lieu of an appropriate detailed review;
4. The failure to personally be available on a reasonable basis or with adequate advance notice for consultation and inspection where circumstances require personal availability.

SPECIAL ASSESSMENT: An assessment levied on the members of an association in addition to regular assessments. Special Assessments are often regulated by governing documents or local statutes.

SURPLUS: An actual (or projected) Reserve Balance greater than the Fully Funded **Balance**. **See "Deficit."**

USEFUL LIFE (UL): Total Useful Life or Depreciable Life. The estimated time, in years, that a reserve component can be expected to serve its intended function if properly constructed in its present application or installation.

The above terms and definitions are from the Community Associations Institute (CAI) national standards.

INDEPENDENT AUDITOR'S REPORT

Board of Directors
Rio Linda & Elverta Recreation and Park District
Rio Linda, CA

We have audited the accompanying financial statements of the governmental activities and fund information which comprise the basic financial statements of Rio Linda & Elverta Recreation and Park District as of and for the fiscal year ended June 30, 2012, as listed in the table of contents. These financial statements are the responsibility of the District's management. Our responsibility is to express an opinion on these financial statements based on our audit.

We conducted our audit in accordance with auditing standards generally accepted in the United States of America. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement. An audit includes examining, on a test basis, evidence supporting the amounts and disclosures in the financial statements. An audit also includes assessing the accounting principles used and significant estimates made by management, as well as evaluating the overall financial statement presentation. We believe that our audit provides a reasonable basis for our opinion.

In our opinion, the basic financial statements referred to above present fairly, in all material respects, the respective financial position of the governmental activities and fund information of the Rio Linda & Elverta Recreation and Park District as of June 30, 2012, and the changes in financial position, of those activities and funds for the fiscal year then ended in conformity with accounting principles generally accepted in the United States of America.

We have also issued a report dated March 11, 2013 on our consideration of the District's internal control over financial reporting. That report is an integral part of an audit and should be read in conjunction with this report in considering the results of our audit.

The Rio Linda & Elverta Recreation and Park District has not presented the Management Discussion and Analysis that accounting principles generally accepted in the United States have determined is necessary to supplement, although not required to be part of, the basic financial statements.

The required supplementary information other than MD&A, as listed in the table of contents, are not a required part of the basic financial statements but are supplementary information required by the Governmental Accounting Standards Board. We have applied certain limited procedures, which consisted principally of inquiries of management regarding the methods of measurement and presentation of the required supplementary information. However, we did not audit the information and express no opinion on it.

Larry Bain, CPA

**RECONCILIATION OF THE GOVERNMENTAL FUNDS
STATEMENT OF REVENUES, EXPENDITURES, AND CHANGES IN FUND BALANCE
TO THE STATEMENT OF ACTIVITIES
FOR THE FISCAL YEAR ENDED JUNE 30, 2012**

Net Change in Fund Balances - Total Governmental Funds \$ (88,948)

Amounts reported for governmental activities in the Statement of Activities
differs from the amounts reported in the Statement of Revenues, Expenditures
and Changes in Fund Balances because:

Governmental funds report capital outlays as expenditures. However, in the
Statement of Activities. The costs of those assets is allocated over their
estimated useful lives as depreciation expense are allocated to the
appropriate functional expense when the cost is below the capitalization
threshold. This activity is reconciled as follows:

Cost of assets capitalized	143,024
Depreciation expense	(83,060)

Certain revenues recognized in the Statement of Activities that do not provide
current financial resources were not reported as revenues in the funds. -

Compensated absences reported in the statement of activities do not require
the use of current financial resources and, therefore, are not reported in
governmental funds. 293

Change in net assets of governmental activities \$ (28,691)

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS

JUNE 30, 2012

Note 1: Summary of Significant Accounting Policies

The District was established in 1990, as a reorganization consisting of the formation of the District and the dissolution of County Service Area No. 3. It is operated under the advisement of a five member Board of Directors duly elected and empowered by the electorate with sole authority over the District's operations. Although the District is now independent from the Sacramento County's Board of Supervisors, its financial activities are still processed through the Sacramento County Auditor-Controller's Office.

In addition to providing recreational programs and services to the community, the District maintains park sites. The accounting policies of the District conform to accounting principles generally accepted in the United States of America as applicable to governments. The following is a summary of the more significant accounting policies:

A. Reporting Entity

The District has defined its reporting entity in accordance with accounting principles generally accepted in the United States of America, which provide guidance for determining which governmental activities, organizations, and functions should be included in the reporting entity. In evaluating how to define the District for financial reporting purposes, management has considered all potential component units. The primary criterion for including a potential component unit within the reporting entity is the governing body's financial accountability. A primary governmental entity is financially accountable if it appoints a voting majority of a component unit's governing body and it is able to impose its will on the component unit, or if there is a potential for the component unit to provide specific financial benefits to, or impose specific financial burdens on, the primary government. A primary government may also be financially accountable if a component unit is fiscally dependent on the primary governmental entity regardless of whether the component unit has a separately elected governing board, a governing board appointed by a higher level of government, or a jointly appointed board.

Based on the aforementioned oversight criteria, there are no component units in accordance with Governmental Accounting Standards Board Statement No. 14.

B. Basis of Accounting

Government-wide financial statements are reported using the economic resources measurement focus and the accrual basis of accounting. Revenues are recorded when earned or, for property tax revenues, in the period for which levied. Expenses are recorded when a liability is incurred, regardless of the timing of related cash flows.

Governmental funds are reported using the current financial resources measurement focus and the modified accrual basis of accounting. Revenues are recognized when both measurable and available. Measurable means the amount of the transaction can be determined and available means collectible in the current period or soon enough thereafter to be used to pay liabilities of the current period. Resources not available to finance expenditures and commitments of the current period are recognized as deferred revenue or as a reservation of fund balance. The District considers property taxes available if they are collected within sixty-days after year-end. Expenditures are recorded when the related fund liability is incurred. Principal and interest on general long-term debt, as well as compensated absences and claims and judgments are recorded only when payment is due. General capital acquisitions are reported as expenditures in governmental funds. Proceeds of general long-term debt and capital leases are reported as other financing sources.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS

JUNE 30, 2012

Note 1: Summary of Significant Accounting Policies (Continued)

C. Non-Current Governmental Assets/Liabilities

GASB Statement 34 eliminates the presentation of account groups, but provides for these records to be maintained and incorporates the information into the Governmental Activities column in the government-wide statement of net assets.

D. Basis of Presentation

The accounts of the District are organized and operated on the basis of funds. A fund is an independent fiscal and accounting entity with a self-balancing set of accounts established for the purpose of carrying on specific activities or attaining certain objectives in accordance with special regulations, restrictions or limitations. The District's resources are accounted for in these individual funds based on the purposes for which they are to be spent and the means by which spending activity is controlled. For financial reporting, these funds have been grouped into the fund types discussed below.

Governmental Fund Types

Governmental funds are used to account for the District's expendable financial resources and related liabilities (except those accounted for in proprietary and similar trust funds). The measurement focus is based upon determination of changes in financial position. Following are the District's governmental funds:

General Fund - This fund accounts for all the financial resources not required to be accounted for in another fund. This fund consists primarily of general government type activities.

Special Revenue Fund - This funds account for the activity of the developer in lieu fees that are legally restricted to expenditures for specific purposes.

E. Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires management to make estimates and assumptions that affect the reported amounts of assets and liabilities and disclosure of contingent assets and liabilities at the date of the financial statements and the reported amounts of revenues and expenditures/expenses during the reporting period. Actual results could differ from those estimates.

F. Restricted Assets

Restricted assets are financial resources generated for a specific purpose such as construction of improvements and financing of debt obligations. These amounts are restricted, as their use is limited by applicable bond covenants or other external requirements.

G. Fund Equity

Reservations of fund balances of governmental funds are established to either (1) satisfy legal covenants that require a portion of fund balance to be segregated or (2) identify the portion of the fund balance that is not appropriable for future expenditures.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS JUNE 30, 2012

Note 1: Summary of Significant Accounting Policies (Continued)

H. Compensated Absences

Compensated absences represent the vested portion of accumulated vacation. In accordance with GASB 16, the liability for accumulated leave includes all salary - related payments that are directly and incrementally connected with leave payments to employees, such as retirement pay. A current liability has been recorded in the governmental fund type to account for these vested leave accruals, which are expected to be used within the next fiscal year. At June 30, 2012, a long-term liability of \$19,021 for unpaid vacation and sick leave has been recorded in the government-wide, statement of net assets.

I. Property Taxes

The District receives property taxes from the County of Sacramento, which has been assigned the responsibility for assessment, collections, and apportionment of property taxes for all taxing jurisdictions within the County. Secured property taxes are levied on January 1 for the following fiscal year and on which date it becomes a lien on real property. Secured property taxes are due in two installments on November 1 and February 1 and are delinquent after December 10 and April 10, respectively, for the secured roll. Based on a policy by the County called the Teeter Plan, 100% of the allocated taxes are transmitted by the County to the District, eliminating the need for an allowance for uncollectible. The County, in return, receives all penalties and interest. Property taxes on the unsecured roll are due on the January 1 lien date and become delinquent if unpaid by August 31. Property tax revenues are recognized in the fiscal year they are received.

J. Capital Assets

Capital assets, recorded at historical cost or estimated historical cost if actual historical cost is not available, are reported in governmental activities column of the government-wide financial statements. Contributed fixed assets are valued at their estimated fair market value. Capital assets include land, buildings and building improvements and equipment. Capital assets are defined by the District as assets with an initial, individual cost of more than \$5,000.

The costs of normal maintenance and repairs that do not add to the value of the asset or materially extend assets lives are not capitalized. Major outlays for capital assets and improvements are capitalized as projects are constructed. Depreciation is recorded in the government-wide financial statements on the straight-line basis over the useful life of the assets as follows:

<u>Assets</u>	<u>Useful Life</u>
Buildings	50 years
Building improvements	10-20 years
Site improvements	10-20 years
Equipment and machinery	5 to 20 years

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS JUNE 30, 2012

Note 2: Cash and Investments

Cash and investments at June 30, 2012, consisted of the following:

Checking account	\$ 8,413
Imprest cash	300
Cash and investments with County Treasurer	<u>263,651</u>
Total cash and investments	<u><u>\$ 272,364</u></u>

A. Investments Authorized by the California Government Code and the Entity's Investment Policy

The table below identifies the **investment types** that are authorized for the Rio Linda Recreation and Park District by the California Government Code (or the District's investment policy, where more restrictive). The table also identifies certain provisions of the California Government Code (or the District's investment policy, where more restrictive) that address **interest rate risk**, **credit risk** and **concentration of credit risk**. This table does not address investments of debt proceeds held by bond trustees that are governed by the provisions of debt agreements of the District, rather than the general provisions of the California Government Code or the District investment policy.

Authorized Investment Type	Maximum Maturity	Percentage of Portfolio	Investment in One Issuer
Investment pools authorized under CA			
Statutes governed by Government Code	N/A	None	\$40 million
U.S. Treasury Obligations	5 years	None	None
Bank Savings Accounts	N/A	25%	None
Federal Agencies	5 years	75%	None
Commercial Paper	180 days	20%	None
Negotiable Certificates of Deposit	180 days	20%	None
Re-Purchase Agreements	180 days	20%	None
Corporate Debt	5 years	25%	None

B. Disclosures Relating to Interest Rate Risk

Interest rate risk is the risk that changes in market interest rates will adversely affect the fair value of and investment. Generally, the longer the maturity of an investment the greater the sensitivity of its fair value to changes in market interest rates. Information about the sensitivity of the fair values of the District's investments to market interest rate fluctuations is provided by the following table that shows the distribution of the District's investment maturity:

Investment Type	Totals	Remaining Maturity (in Months)			
		12 Months or Less	13 - 24 Months	25 - 36 Months	37 - 48 Months
Sacramento County*	\$ 263,651	\$ 263,651	\$ -	\$ -	\$ -
Total	<u>\$ 263,651</u>	<u>\$ 263,651</u>	<u>\$ -</u>	<u>\$ -</u>	<u>\$ -</u>

*Not subject to categorization

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS JUNE 30, 2012

Note 2: Cash and Investments (Continued)

C. Concentrations of Credit Risk

The investment policy of the District contains limitations on the amount that can be invested in any one issuer. There are no investments to one issuer exceeding those limits.

D. Custodial Credit Risk

Custodial credit risk for deposits is the risk that, in the event of the failure of a depository financial institution, a government will not be able to recover its deposit or will not be able to recover collateral securities that are in the possession of an outside party. The custodial credit risk for investments is the risk that, in the event of the failure of the counterparty (e.g. broker-dealer) to a transaction, a government will not be able to recover the value of its investment of collateral securities that are in the possession of another party. The California Government Code and the District's investment policy do not contain legal or policy requirements that would limit the exposure to custodial credit risk for deposits or investments, other than the following provision for deposits; The California Government Code requires that a financial institution secured deposits made by state or local governmental units by pledging securities in an undivided collateral pool held by a depository regulated under state law (unless so waived by the government unit). The fair value of the pledged securities in the collateral pool must equal at least 110% of the total amount deposited by the public agencies. California law also allows financial institutions to secure the District's deposits by pledging first deed mortgage notes having a value of 150% of the secured public deposits.

At June 30, 2012, the District's deposits balance was \$8,413 and the carrying amount was \$8,413. Of the bank balance, all was covered by the Federal Depository Insurance and none was covered by collateral held in the pledging bank's trust department in the District's name.

E. Investment in Government Pool

Investments are accounted for in accordance with the provisions of GASB Statement No. 31, which requires governmental entities to report certain investments at fair value in the balance sheet and recognize the corresponding change in fair value of investments in the year in which the change occurred. The District reports its investment in the Sacramento County investment pool at fair value based on quoted market information obtained from fiscal agents or other sources if the change is material to the financial statements.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS JUNE 30, 2012

Note 3: Property, Plant, and Equipment

Activity for general fixed assets capitalized by the District is summarized below:

	Balance July 1, 2011	Additions	Deletions	Balance June 30, 2012
Governmental Activities

Governmental activities capital assets, net	\$ 2,277,033	\$ 59,964	\$ -	\$ 2,336,997

Note 4: Long-Term Liabilities

The following is a summary of changes in the long-term liabilities for the fiscal year ended June 30, 2012:

Long-term obligations consisted of the following:

	Balance July 1, 2011	Additions	Deletions	Balance June 30, 2012
Compensated absences	\$ 19,314	\$ 18,284	\$ 18,577	\$ 19,021
Totals	\$ 19,314	\$ 18,284	\$ 18,577	\$ 19,021

Compensated Absences

The District recognizes the accumulated unpaid employee vacation time off as a liability and the long-term portion is recorded as compensated absences in the government-wide statement of net assets. The current portion, if any, is also recorded in the fund financial statement in the general fund.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS

JUNE 30, 2012

Note 5: Park Dedication Fund

The County maintains a separate fund for the benefit of the Rio Linda & Elverta Recreation and Park District. The corpus of the fund consists of in lieu fees paid by developers of subdivisions within the boundaries of the District. The use of these funds by the District is restricted for the purpose of providing park and recreation facilities to serve the population. The activity of this fund is recorded in the special revenue fund of the District.

Note 6: Risk Management

The District is exposed to various risks of loss related to torts; theft of, damage to, and destruction of assets; errors and omissions; injuries to employees; and natural disasters. The District together with other districts in the State carry California Association For Park And Recreation Insurance (CAPRI), a public entity risk pool currently operating as a common risk management and insurance program for member districts. The District pays an annual premium to CAPRI for its general insurance coverage. Furthermore the District carries workers compensation coverage with other districts in the State through the CAPRI. Membership in the California Association of Recreation and Park Districts is required when applying for CAPRI.

The Agreement for Formation provides that CAPRI will be self-sustaining through member premiums. CAPRI reinsures through commercial companies for claims up to \$10,000,000 for general and automobile liability and all risk property insurance, including boiler and machinery coverage, is subject to a \$2,000 deductible occurrence payable by the District. Financial statements for CAPRI are available at the District's office for fiscal year ending June 30, 2012.

The District carries commercial insurance for other risks of loss, including employees' health insurance.

Note 7: Lease Agreement

The District acting as lessor, is providing the community center facility to serve meals to senior citizens under the Sacramento Elderly Nutrition Program. This lease is treated as an operating lease by the District. The agreement is entered into on a yearly basis and has been renewed for the 2011-12 fiscal year. The District also has operating leases for the BMX track with the Capital Quarter Midget Association and for Ponderosa Farms.

Note 8: Defined Contribution Pension Plan

The District participates in a deferred compensation plan created in accordance with Internal Revenue Code Section 457. The plan is established as an alternative plan to social security and requires all District full time and part time employees to defer a portion of their salary until future years. Plan provisions are established or amended by District board resolution. The District contributes 7.5% of full time salaries and matches 3.75% of part time salaries. The total wages earned, during the fiscal year, by full time, part time participants and Board members was \$470,527. The contributions made by the District, during the fiscal year on behalf of full time, part time participants and Board members was \$29,267. The retirement plan includes 6 full time employees, 5 board members and 20 part time employees at June 30, 2012. Participants vest at service inception and are entitled to 100% of vested contributions.

Note 9: Contracts and Commitments

The District has entered into an agreement with the Monument Security Inc. whereby they provide security for the Park District and are reimbursed on a monthly basis. The District also has entered into an agreement with SAFCA for debris cleanup within the District. SAFCA bills the District for services performed.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

NOTES TO THE FINANCIAL STATEMENTS

JUNE 30, 2012

Note 10: Related Party Transactions

The District Board is the same Board for the non profit organization known as the Rio Linda-Elverta Foundation for the Future. The foundation maintains a separate bank account where donations are deposited for the nonprofit organization. The District Board can apply these funds towards paying for programs for disadvantaged enrollee's or for other approved expenditures. During the 2011/12 fiscal year the District collected \$7,000 from the Foundation fundraising for the swim team. The Foundation activity is not recorded in these financial statements.

Note 11: Net Assets/Fund Balances

Net Assets

The government-wide activities fund financial statements utilize a net assets presentation. Net assets are categorized as invested in capital assets (net of related debt), restricted and unrestricted.

- *Invested in Capital Assets, Net of Related Debt* – This category groups all capital assets, into one component of net assets. Accumulated depreciation and the outstanding balances of debt that are attributable to the acquisition, construction or improvement of these assets reduce the balance in this category.
- *Restricted Net Assets* – This category presents external restrictions imposed by creditors, grantors, contributors or laws and regulations of other governments and restrictions imposed by law through constitutional provisions or enabling legislation.
- *Unrestricted Net Assets* – This category represents net assets the District, not restricted for any project or other purpose.

Fund Balances

In the fund financial statements, reserves segregate portions of fund balance that are either not available or have been earmarked for specific purposes.

As of June 30, 2012, reservations of fund balance are described below:

The term “reserved” is used to indicate that a portion of reported fund balance is legally restricted to a specific purpose or not available for appropriation or expenditure. The District has reserved fund balances as follows:

- *Reserved for developer fees*- unavailable for appropriation because the District must use these funds for future capital improvements in lieu of developers directly making improvements.

Note 12: Contingent Liabilities:

Grants

Amounts received or receivable from grant agencies are subject to audit and adjustment by grantor agencies. Any disallowed claims, including amounts already collected, may constitute a liability of the applicable funds. The amount, if any, of expenditures that may be disallowed by the grantor cannot be determined at this time.

**NOTES TO THE REQUIRED SUPPLEMENTARY INFORMATION
JUNE 30, 2012**

Note 1: Budgets and Budgetary Accounting

As required by State law the District prepares and legally adopts a final operating budget. Public hearings were conducted on the proposed and final budget to review all appropriations and the sources of financing.

The budget for the general fund is adopted on the modified accrual basis of accounting. The budget for the general fund is the only legally adopted budgets.

At the object level, actual expenditures cannot exceed budgeted appropriations. Management can transfer budgeted amounts between expenditure accounts within an object without the approval of the Board of Directors. Significant amendments and appropriation transfers between objects or funds must be approved by the Board of Directors. Appropriations lapse at fiscal year end.

The budgetary data presented in the accompanying financial statements includes all revisions approved by the Board of Directors.

El Dorado Hills, CA 95762

REPORT ON INTERNAL CONTROL OVER FINANCIAL REPORTING

We have audited the financial statements of the Rio Linda & Elverta Recreation and Park District as of and for the fiscal year ended June 30, 2012, and have issued our report thereon dated March 11, 2013. In our report, our opinion was unqualified. We conducted our audit in accordance with auditing standards generally accepted in the United States of America.

Internal Control over Financial Reporting

In planning and performing our audit of the financial statements of Rio Linda Elverta Recreation and Park District (District) as of and for the year ended June 30, 2012, in accordance with auditing standards generally accepted in the United States of America, we considered the District's internal control over financial reporting (internal control) as a basis for designing our auditing procedures for the purpose of expressing our opinions on the financial statements, but not for the purpose of expressing an opinion on the effectiveness of the (District)'s internal control. Accordingly, we do not express an opinion on the effectiveness of the (District)'s internal control. Our consideration of internal control was for the limited purpose described in the preceding paragraph and was not designed to identify all deficiencies in internal control that might be significant deficiencies or material weaknesses and therefore there can be no assurance that all such deficiencies have been identified. We consider the matters noted as 12-1 and 12-2 in the schedule of findings following this report to be a significant deficiencies and material weaknesses in internal control.

A deficiency in internal control exists when the design or operation of a control does not allow management or employees, in the normal course of performing their assigned functions, to prevent, or detect and correct misstatements on a timely basis. A material weakness is a deficiency or combination of deficiencies in internal control, such that there is a reasonable possibility that a material misstatement of the entity's financial statements will not be prevented, or detected and corrected on a timely basis.

A significant deficiency is a deficiency, or a combination of deficiencies, in internal control that is less severe than a material weakness, yet important enough to merit attention by those charged with governance. We consider the matters noted as 12-3, 12-4, 12-5, 12-6, 12-7, 12-8 and 12-9 in the schedule of findings following this report to be significant deficiencies that were not deemed material weakness in internal control.

The Rio Linda Elverta Recreation and Park District's written response (if any) to the significant deficiencies identified in our audit and any follow up for subsequent year corrections has not been subjected to the audit procedures applied in the audit of the financial statements and accordingly, we do not express an opinion on it.

This communication is intended solely for the information and use of the Board of Directors, management, the Sacramento County Auditor Controller's Office and the Controller's Office of the State of California and is not intended to be and should not be used by anyone other than these specified parties.

Larry Bain, CPA,
An Accounting Corporation

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

FINDINGS AND RECOMMENDATIONS

JUNE 30, 2012

Significant Deficiencies Deemed to be Material Weaknesses:

Finding 12-1 (Prior year finding 11-1): During our audit we proposed recording the following material audit entries, recorded \$220,000 grant receivable, \$176,000 grant revenue and \$44,000 deferred revenue for state grant reimbursements received in the 2012/12 fiscal year for 2010/11 fiscal year expenditures. Recorded \$13,759 accounts payable discovered during our search for unrecorded liabilities. Reclassified \$51,142 from contingency expense account to due to other governments to properly reflect amount owed to the State for prior years Harvey House project cancellation.

Current Year Follow Up: During the current fiscal year audit we noted the District received \$176,000 of the grant proceeds, but needs to satisfy certain conditions prior to the remaining \$44,000 being paid by the granting agency. We proposed the current year audit entry to eliminate \$176,000 of the prior year receivable accrual offset by a reduction of \$176,000 to grant revenue.

Recommendation: Because the County closes the District books in early July the District is unable to process all year end closing entries with the County. We recommend the District maintain schedules for year-end entries that were not posted at the County and provide these entries to the auditor prior to the audit.

Management Response: District will track and record year-end entries that are not posted at the County and provide these entries to the auditor prior to the annual audit.

Finding 12-2 (Prior year finding 11-3): The District did not implement the provisions of Government Accounting Standards Board Statement 54 as required by U.S. generally accepted accounting policies. This new standard went into effect for fiscal year ending June 30, 2011. The new requirement categorizes fund balances into five separate categories and sets a new definition for special revenue funds.

Current Year Follow Up: During the current fiscal year we noted the District did adopt a GASB 54 policy, but we were not presented with a schedule showing the authorized beginning fund balance amount for each category and the authorized change in those amounts during the 2011/12 fiscal year.

Recommendation: We recommend the District prepare the schedule showing the beginning balances per category and the change in balances during the fiscal year for each category.

Management Response: The District will review provisions for implementing GASB 54 during the 2012/13 fiscal year.

Significant Deficiencies not Deemed Material Weaknesses:

Finding 12-3 (Prior year finding 11-4): During the audit we noted instances where employees took time off, but the schedule used to track compensated absences was not updated. We noted one instance where there was an addition error resulting in under accruing 3 hours of compensated time off. We also noted discrepancies between actual compensated absence accruals and expected accruals based on district policies or employment agreements. We brought these items to the attention of management and the record keeper who made the necessary corrections. We also noted the policy for the vacation accrual did not define if years of service as a part time employee will apply to years of service if employee converts to full time status. The effect of this deficiency is that lack of monitoring could result in valuation errors for accrued time off.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

FINDINGS AND RECOMMENDATIONS

JUNE 30, 2012

Significant Deficiencies not Deemed Material Weaknesses (Continued):

Current year follow up: During the current audit we noted several computational errors that were brought to the attention of the bookkeeper and corrected. We noted one instance where 16 hours vacation, which had been taken and logged in the prior fiscal year, was removed from the schedule during the current fiscal year increasing the employee's current vacation balance. Management was unable to substantiate why those hours were removed from the schedule.

Recommendation: Continue to monitor the vacation and sick leave in accordance with the District policy and employment agreements. An employee independent of the recordkeeping should monitor and reconcile the excel schedules and periodically perform internal checks to verify the accuracy of the accrual/usage activity and formulas.

Management Response: District will continue to monitor the vacation and sick leave in accordance with District Policy and employment agreements. Further, the District will provide additional staff training as needed to enable monitoring Excel schedules and perform periodic internal checks to verify the accuracy of the leave time accrual, usage, and associated formulas.

Finding 12-4 (Prior year finding 11-5): During our testing of cash receipts we noted, for the items tested, cash and check receipts were held at the District for 10 to 29 days before being deposited into bank. This increases the risk of cash larceny and kiting.

Current year follow up: During the current year testing cash and check receipts were held between 5 and 26 days from date of collection to date of deposit to outside bank.

Recommendation: We recommend the District make more frequent deposits to the outside holding account.

Management Response: Currently the District makes weekly deposits of revenues to its account at the Bank of America.

Finding 12-5: We noted the District had a lack of segregation of duties, as one person is capable of handling all aspects of processing transactions from beginning to end. A lack of segregation of duties increases the risk of potential errors or irregularities; however, due to a limited number of personnel an adequate segregation of duties is not possible without incurring additional costs. We have noted this comment in previous audits.

Recommendation: The District should attempt to segregate accounting functions to the greatest extent possible. The Board of Directors also plays a more vital oversight role in reviewing and authorizing accounting records such as cash disbursements, cash receipts, cash transfers, account write-offs, payroll and monthly bank reconciliations. The District could also consider hiring an outside consultant to review the current segregation of incompatible duties to determine the cost of correcting the weakness.

Management Response: The District will investigate the feasibility of contracting for an outside accounting consultant to review the current segregation of incompatible duties in order to determine alternative opportunities for correcting this weakness. The Board's Administration and Finance Committee, as well as the Board of Directors itself, will be encouraged to take a more vial oversight role in reviewing accounting records.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

FINDINGS AND RECOMMENDATIONS

JUNE 30, 2012

Significant Deficiencies not Deemed Material Weaknesses (Continued):

Finding 12-6: During our audit we noted the District did not have a written financial and accounting policy/manual that included internal control procedures. The District should create the financial and accounting policies that demonstrate how transactions are processed from beginning to end. The policy should include the processes for internal controls that are designed to provide reasonable assurance that objectives related to effectiveness and efficiency of operations, reliability of financial reporting and compliance with applicable laws and regulations are met. This also should include documenting controls over processing transactions, authorizing transactions and for maintaining and safeguarding assets.

The District also relies on the external auditor to ensure its financial statements are in accordance with GAAP. In addition, the District relies on the external auditor to ensure that all necessary disclosures are included in the notes to the financial statements. The District does not employ a staff member with the necessary knowledge and training to prepare governmental financial statements. In accordance with Statement of Auditing Standards No. 115 external auditors cannot be part of an entity's internal controls over preparation of the financial statements and are prohibited from auditing their own work, which would impair their independence. The District is limited in preparing GAAP financial statements because the County of Sacramento closes their books in mid July which does not give the District sufficient time to process all year end closing entries. We have noted this comment in previous audits.

Recommendation: We recommend the District create a written financial and accounting policy. The District should also consider training staff in preparing GAAP financial statements or hire an external qualified accountant to prepare the GAAP financial statements. The District should provide the auditor with all known year end accounting entries that were not posted at the County. The District could opt to take no action if it considers the cost will outweigh the benefit.

Management Response: District staff initiated development of a written financial and accounting policy manual in January 2012 and is exploring training opportunities for the Administrative Analyst to prepare the GAAP financial statements. It is unlikely the District can afford to contract with an external accountant for this service.

Finding 12-7: During our search of repair and maintenance accounts we discovered \$26,158 expenses that should have been recognized as capital expense. During our search for unrecorded accounts payable we also discovered an additional \$48,311 that should have been accrued and recorded as capital additions at June 30, 2012. We proposed reclassification/journal entries to properly recognize these items as capital expense in the fund financial statements and as capital assets in the government-wide financial statements.

Recommendation: We recommend the District review controls over account coding to ensure that expenses are recorded in the appropriate expense accounts. We also recommend the District provide the auditor with a list of accounts payables at fiscal year-end for items that meet the definition of an accrual, but were not recorded at the County because of the Counties short year end cut off period.

Finding 12-8: During our testing of cash in the outside holding account we noted that no formal bank reconciliation was being prepared. Furthermore we noted after the June 19, 2012 transfer to the County was made, there was a \$314.51 negative balance resulting in a \$35 overdraft fee. During our receipts testing we noted that when a credit card refund is made from this account there is no authorization from a management/supervisory employee approving the refund transaction. This increases the risk that refunds can be made for personal gain without being detected by District internal controls.

Recommendation: We recommend the District reconcile the outside holding account on a monthly basis. We also recommend that an employee independent of the receipting process review and approve credit card refunds.

RIO LINDA & ELVERTA RECREATION AND PARK DISTRICT

FINDINGS AND RECOMMENDATIONS

JUNE 30, 2012

Significant Deficiencies not Deemed Material Weaknesses (Continued):

Finding 12-9: During our testing of payroll we noted two instances where payments were made to independent contractors, however no contract could be located by the District to verify the payments being made and terms of the agreement.

Recommendation: We recommend obtaining/retaining independent contractor agreements to support the payment and terms for these individuals.

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION
1112 I Street, Suite #100
SACRAMENTO, California 95814
(916) 874-6458

August 7, 2013

TO: Sacramento Local Agency Formation Commission

FROM: Peter Brundage, Executive Officer

RE: **FORMATION OF COUNTY SERVICE AREA NO. 13 and**
REORGANIZATION
(LAFC 02-13) [CEQA: Responsible Agency SCH 2010062069]

RECOMMENDATION

1. **Adopt LAFC Resolution 2013-05-0807-02-13** related to CEQA Findings of Fact and Statement of Overriding Considerations by Sacramento Local Agency Formation Commission for the proposed formation of CSA No. 13, detachment from the Sacramento County Regional Parks Department County Service Area 4B, and annexation to the SASD and the SRCSD, the responsible agency is LAFCo. As a responsible agency, project consideration by LAFCo is governed by the requirements of CEQA Guidelines Section 15096 as set forth below.

The Cordova Hills EIR (SCH 2010062069) has been prepared by the County of Sacramento as a Project EIR pursuant to CEQA Guidelines Section 15161. The purpose of a project-level EIR is to provide environmental review of the planning, construction, and operational impacts of a project.

All other agencies with jurisdiction over aspects of the Cordova Hills project are considered to be “responsible agencies” for purposes of CEQA. As specified by Section 15096 of the CEQA Guidelines, the duties of a responsible agency in using an environmental document prepared by the lead agency include:

- Prior to reaching a decision on the project, the responsible agency must consider the environmental effects of the project as shown in the EIR or Negative Declaration.
- In considering the environmental conclusions of the EIR or Negative Declaration, the responsible agency must evaluate whether any of the conditions set forth in Sections 15162 or 15163 of the CEQA Guidelines

- requiring preparation of a subsequent or supplemental environmental document exist.
- When considering alternatives and mitigation measures, a responsible agency is more limited than a Lead Agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve.
 - When an EIR has been prepared for a project, the responsible agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment.
 - The responsible agency shall make the findings required by Section 15091 for each significant effect of the project and shall make the findings in Section 15093 if necessary.
 - The responsible agency should file a Notice of Determination in the same manner as a lead agency under Section 15075 or 15094 except that the responsible agency does not need to state that the EIR or Negative Declaration complies with CEQA. The responsible agency should state that it considered the EIR or Negative Declaration as prepared by a lead agency.
2. **Adopt LAFC Resolution 2013-06-0807-02-13** approving the Municipal Service Review and establishment of Sphere of Influence for County Service Area No. 13.
 3. **Adopt LAFC Resolution 2013-07-0807-02-13** approving the following reorganization:
 - a. Approve the formation of County Service Area No. 13.
 - b. Approve the annexation to Sacramento Regional County Sanitation District;
 - c. Approve the annexation to Sacramento Area Sewer District; and
 - d. Approve the detachment from County Service Area 4B (Wilton-Cosumnes Park and Recreation); and
 6. Condition approval of the Formation of County Service Area No. 13, annexations, and detachment on the terms and conditions listed below:
 - a. The effective date of said formation, annexations, and detachment will be upon the filing of the Certificate of Completion by the Executive Officer of the Sacramento Local Agency Formation Commission;
 - b. The name of the County Service Area shall be COUNTY SERVICE AREA No. 13, and it shall have the following miscellaneous extended services:
 - a. Recreation and Parks
 - b. Open Space and Trails

- c. Habitat Operations and Maintenance
 - d. Landscape Corridors
 - e. Road Maintenance
 - f. Transit Operations and Maintenance
 - g. Transportation Demand Management
 - h. Administration and Communications
 - i. Solid Waste
- c. The service boundary of the CSA No. 13 is set forth in Exhibit A, attached.
- d. Activation/Formation is dependent upon the landowner voter adoption of assessments, fees, charges and any Special Taxes as provided under Proposition 218 to fund services to be provided by the CSA No. 13.
7. Adopt a Sphere of Influence for County Service Area No. 13 which is coterminous with the CSA No. 13 boundary.
8. Pursuant to provisions of the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, your Commission may waive the Conducting Authority Hearing (protest hearings) since it is uninhabited and there is 100 percent landowner consent and no agency protest.
9. Order the formation of CSA No. 13 subject to approval by the voters of a Special Tax, the approval by the property owners of a Benefit Assessment, or the approval of property related fees or charges, as required by law. The County Board of Supervisors shall conduct the necessary election(s).
10. Direct the Executive Officer to record the Certificate of Completion after the 30-day Reconsideration period provided no request for Reconsideration is submitted to the Executive Officer.
11. Authorize your Chair to sign the Resolution making these determinations.

FPPC DISCLOSURE

None.

BACKGROUND

The Sacramento County Board of Supervisors has adopted Resolution No. 2013-0386 requesting the formation of County Service Area No. 13, a dependent special district, for the purpose of providing miscellaneous extended services to the proposed Cordova Hills Special Planning Area.

The County Board of Supervisors recently approved the Cordova Hills' entitlements on January 29, 2013, March 12, 2013 and April 23, 2013 that consisted of the following actions:

The following entitlements were approved on January 29, 2013 by the Board of Supervisors:

1. A General Plan Amendment to move the Urban Policy Area (UPA) boundary, which abuts the property at Grant Line Road, to include approximately 2,366.3 acres of the Cordova Hills project site.
2. A General Plan to amend the Land Use Diagram from General Agriculture to Low Density Residential, Medium Density Residential, Commercial and Office, Recreation, Natural Preserve, and Public/Quasi Public for approximately 2,366.3 acres.
3. A General Plan to include a new policy in the Land Use Element to address the provision of public water service to serve uses potentially allowed by the Cordova Hills Special Planning Area for 251 acres located in proximity to the Kiefer Landfill, and an to LU-1 to reference this exception.
4. An Amendment of the General Plan Transportation Plan to show new thoroughfares, arterials and collectors as shown in the Transportation Plan Diagram dated October 24, 2011.
5. An Amendment of the Bikeway Master Plan to add on and off-street bikeways as shown in the Bikeways Master Plan Diagram dated October 17, 2011.

The following entitlements were approved on March 12, 2013 by the Board of Supervisors:

1. A Zoning Ordinance to adopt the Cordova Hills Special Planning Area (SPA) and to incorporate a Master Plan including Design Guidelines and Development Standards. The SPA consists of a total of 2,668.7 acres in three distinct areas:
 - a. Cordova Hills urban areas - 2,119.7 acres.

- b. University/College Campus Center-246.6 acres, including 223 acres for the campus.
 - c. Buffer lands and floodplain outside the Urban Policy Area - 302.4 acres. The areas will be designated Agriculture, Recreation (sports park), and Avoidance in the SPA.
- 2. An Affordable Housing Plan consisting of on-site construction of affordable units and land dedication.
- 3. A Development Agreement by and between the County of Sacramento and the landowners.
- 4. A Public Facilities Financing Plan for Cordova Hills that includes a Capital Improvement Program and Financing Plan.
- 5. An Urban Services and Governance Plan.

On April 23, 2013, the Board of Supervisors approved the following additional entitlements:

- 1. A Large Lot Tentative Subdivision Map to create 155 large lot parcels for the purpose of creating legal parcels corresponding to villages within the Cordova Hills SPA. Included on the Map are requests for abandonment of easements.

In order to facilitate the provision of sanitary sewer services associated with the development of the Cordova Hills project that was approved by the Sacramento County Board of Supervisors; the following requested LAFCo actions must also be approved:

- 1. Annexation of the territory of Cordova Hills into the Sacramento Regional County Sanitation District; and
- 2. Annexation of the territory of Cordova Hills into the Sacramento Area Sewer District.

The Board of Supervisors has requested that the landowner make application for sanitary sewer service from Sacramento Regional County Sanitation District and Sacramento Area Sewer District.

LAFCo has received both applications and have merged the applications into a combined project file.

Project Description

The Cordova Hills Special Planning Area (Cordova Hills or Project) is vacant and located in the unincorporated area of Sacramento County on 2,668 acres just east of the approved Sunridge Specific Plan and the proposed Suncreek Specific Plan in the City of Rancho Cordova bordered to the west by Grant Line Road, to the north by Glory Lane (about one-third mile south of Douglas Road), and to the east by Carson Creek. The Kiefer Landfill and its associated buffer lands are southwest of the Project, and the required buffer lands extend into the southwest portion of Cordova Hills. Planned development in Cordova Hills consists of a maximum of 8,000 residential units on approximately 1,089 acres, and approximately 103 acres of commercial and office development

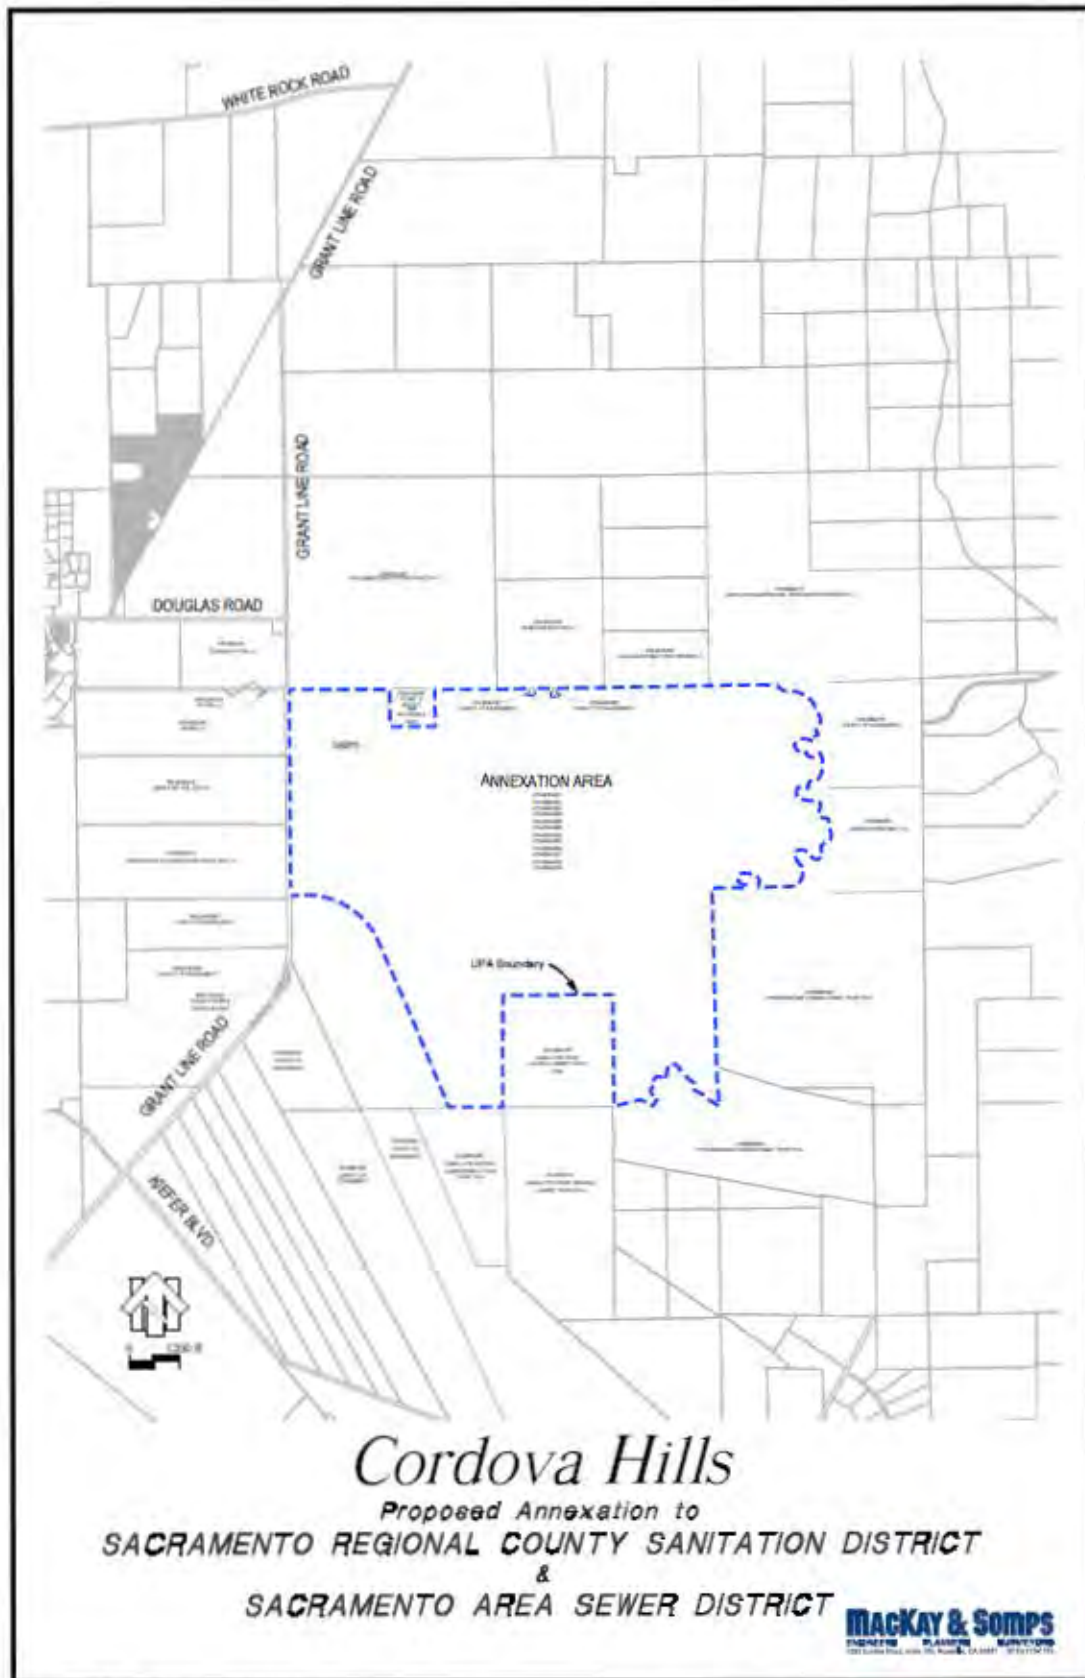

The Project will include a mix of uses consisting of residential, office, retail, university/college campus center, schools, parks, trails, open space, and public uses. The Project includes six distinct villages, the proposed university/college campus center, a large preservation (avoided) area, and other permanent open space that serves to separate villages. The Project includes a wide mix of residential uses, from high-density residential along the western edge, to low-density residential along the eastern edge. The majority of the commercial development is planned for the Town Center Village in the western part of the Project adjacent to Grant Line Road. A 223-acre university/college campus center is planned just southeast of the Town Center. The land uses and estimated development, population, and employees in this report are obtained from the Public Review Final Cordova Hills Public Facilities Financing Plan (Financing Plan).

The project lies within the Urban Services Boundary as designated on the County General Plan. Also, the affected territory lies within the Sphere of Influence of both Sacramento Regional County Sanitation District and Sacramento Area Sewer District.

The County of Sacramento has amended its General Plan, approved the Cordova Hills Development Project, and submitted a Resolution Making Application to LAFCo.

Map 1-1
Cordova Hills Vicinity

ANALYSIS OF PROPOSAL

Factors to be Considered by LAFCo

The Commission must evaluate the service plan, level of service, financing of services, and environmental considerations when reviewing a proposal. The following sections of this report will summarize these considerations for the proposed Formation of County Service Area No. 13, detachment from County Service Area 4B, annexation to Sacramento Regional County Sanitation District, and Sacramento Area Sewer District.

Policy Considerations

The Cortese-Knox-Hertzberg Local Government Reorganization Act recognizes that urban population densities and intensive residential, commercial, and industrial development necessitate a broad spectrum and high level of community services and controls. The Legislature also recognizes that when areas become urbanized to the extent that they need the full range of community services, priorities are required to be established regarding the type and levels of services that the residents of an urban community need and desire; that community service priorities be established by weighing the total community service needs against the total financial resources available for securing community services; and that those community service priorities are required to reflect local circumstances, conditions, and limited financial resources (Sec. 56001).

A core issue that your Commission may consider is that the Sacramento region is expected to gain one million new residents in the next 20 years. This anticipated growth raises an important question regarding sustainable economic development and job creation.

Formation of a County Service Area

Your Commission has the authority to establish new County Service Areas, pursuant to California Government Code Section 25210. A County Service Area may be established to provide a broad array of extended services, and "Miscellaneous extended services," including Transportation Services. At the time of the adoption of the resolution of intention to establish a county service area, the Board of Supervisors shall specify the type or types of services which are proposed to be provided within the area.

A County Service Area is capable of providing a dependable and adjustable revenue source by placing a proportionate service charge on properties which derive benefit from the service provided. It allows the levying of service charges either on the property tax bill, or on a utility billing; and facilitates annexations for new development to avail of the CSA service.

Process for Formation and Implementation

Your Commission has the power to review and approve or disapprove with or without, wholly, partially, or conditionally, proposals for the establishment of a dependent service district. If your Commission approves the formation of County Service Area No. 13, you may waive the protest hearing because it is uninhabited; there is 100 percent landowner consent, and no agency protest.

Staff recommends that your Commission direct the Executive Officer to record the Certificate of Completion after the close of the reconsideration period if no requests for reconsideration have been filed.

In the event of successful completion of LAFCo proceedings the following steps will provide the Board of Supervisors the authority to activate CSA No. 13 and levy the special tax.

1. The Board of Supervisors holds a public hearing and approves the election process pursuant to Proposition 218 and canvasses the results.
2. Board of Supervisors holds hearing to affirm the canvass results and impose the special tax, assessments, charges, fees, and establish rates based on the financing plan.

LAFCO STANDARDS AND POLICIES

Your Commission has adopted specific standards for actions to ensure that fair and consistent decisions are reached in accordance with the CKH Act. Your Commission may make exceptions to these specific standards if it determines that such exceptions:

- Are necessary due to unique circumstances;
- Are necessary due to conflicts between general and specific standards;
- Result in improved quality or lower cost of services available; or
- There exists no feasible or logical alternative.

Standards

1. LAFCo will encourage special district formation in areas that demonstrate a need for unmet or improved level of services due to the inadequate level or quality of services currently provided.
2. LAFCo requires a Municipal Service Review/Master Services Element which defines financing, service levels and how services are delivered.
3. LAFCo requires a definite Sphere of Influence map, plan and definite boundaries.

4. The proposed district formation should be consistent with the County's General Plan and any applicable Specific Plans.
5. LAFCo will not approve district formations when the Master Service Element conflicts with the Master Services Element of other agencies.
6. When considering applications for district formation, LAFCo will ensure that no special interest group is given the status of being a governmental agency.
7. LAFCo will not approve an application for district formation unless the proponent can demonstrate it can fund the services it intends to provide.
8. If a district becomes insolvent or unable to provide services, then LAFCo may approve consolidation with a solvent and capable district.

Each of the above standards and requirements have been satisfactorily met for the formation of the proposed County Service Area No. 13. Each of these items listed above has been discussed in detail in this report, and in the accompanying attachments.

SOI, Annexation and Formation Factors

LAFCo has sole discretion regarding formation of a CSA and the related local government reorganization actions, including completing a Municipal Services Review (MSR)/Plan for Services (PFS) and establishing an SOI for the new district. As part of the MSR/PFS, LAFCo will evaluate the service delivery of the CSA and make determinations regarding the effectiveness of the service delivery program and means and timing of financing. As part of its action on the proposed CSA application, LAFCo will determine whether the proposal is financially feasible.

Proposed CSA No. 13

This proposal to form a new county services area has been initiated by the Sacramento County Board of Supervisors. After conducting a public hearing, the Board adopted a Resolution of Application requesting the formation of County Service Area No. 13 (CSA No. 13). The purpose of CSA No. 13, along with other revenue sources, is to fund the annual operation and maintenance activities associated with the Cordova Hills Special Planning Area development project.

The formation of a County Service Area is pursuant to Government Code Section 25210 et.seq. Section 25213 provides that “a CSA may be established to provide certain miscellaneous extended services, which the county is authorized by law to perform and which the county does not also perform to the same extent on a countywide basis.”

Purpose of CSA No. 13

The purpose of the CSA is to enable the provision of extended miscellaneous urban services for Cordova Hills' development proposal. In addition, the Cordova Hills Development Project will receive core municipal services from current providers including Special Districts and the County of Sacramento.

The CSA is only proposed to provide certain urban services that are not or cannot be efficiently delivered by existing service providers. Therefore, the CSA has limited jurisdiction related only to services described herein.

The CSA is envisioned for two reasons. First, there are no special districts currently providing the type or level of services the Project will require during its initial phases of development and throughout build out. Second, and most importantly, the Cordova Hills Community is envisioned as a highly sustainable development in which water, soil, air, and habitat are carefully managed as integral components of the urban development. A locally governed entity with coordinated service responsibilities will be more efficient at achieving this sustainable vision than several overlapping single purpose districts.

The CSA will reduce the need for citizens to coordinate with numerous organizations. The CSA would provide services not provided by the County or independent agencies and enhanced levels of services from the level typically provided by the County. These services ultimately would be funded through an annual services special tax or assessment, although, initially, additional funding, such as developer funding, may be required. The CSA will be designed to provide the following services for the residents and businesses located in Cordova Hills:

- Parks and recreation
- Open space and trails
- Habitat
- Enhanced levels of landscaping
- Road maintenance
- Transit
- Transportation systems management
- Community communications
- Solid Waste

Cordova Hills will grow in time to a population of more than 21,000. As such, it will require construction and operation of substantial new municipal infrastructure, including water and sewer utilities, roads, drainage, parks and open spaces, and civic facilities, as described and evaluated in the Public Facilities Financing Plan. These facilities will require ongoing operations and maintenance. Meanwhile, the full range of urban services will be needed. The Governance Plan recognizes that urban services demanded must be efficient (i.e., take advantage of existing service capacities), provide enfranchisement of local residents, and have the revenue-generating capacity necessary to fund infrastructure and ongoing urban service standards and operations and maintenance costs.

Based on these objectives, the County Board of Supervisors has opted to augment the service delivery system by requesting LAFCo to form a County Service Area to provide additional services and funding.

Governance Objectives

The Governance Plan is intended to achieve several urban service and fiscal objectives for the Cordova Hills Community, including these:

1. Provide a high level of urban services to the Cordova Hills Community consistent with policies set forth in the County's General Plan and the Cordova Hills Master Plan.
2. Assure efficient and effective urban services at Cordova Hills by relying on the capacity of existing service providers when they offer the most efficient and cost-effective approach.
3. Establish a multi-purpose special district that (1) provides urban services not offered (or not offered effectively) by existing entities, and (2) enfranchises community residents regarding local urban service provision and future transitions.
4. Provide an adequate fiscal base for the new community so desired urban service levels can be achieved and maintained over time, while also maintaining "revenue neutrality" for the County and other urban service providers.

DISCUSSION

Overview of Urban Services to be Provided by CSA No. 13

The Urban Services and Governance Plan attached to this report describes the urban services, service levels, and funding of the urban services that will be provided to the Project's residents, businesses, and employees. The urban services provided in the Cordova Hills Community will include continuation or extension of existing services provided by the County and independent agencies, as well as new or enhanced services to be provided by the CSA. The Cordova Hills Sphere of Influence and CSA will be coterminous with the Cordova Hills boundary as described in the Cordova Hills Master Plan.

Funding of Services

The services provided by independent agencies and the County will be funded, as is the case with other urbanized portions of the unincorporated County, from the County General Fund, user fees, and property tax allocations to special districts (e.g., for fire and library services) and related connection fees.

The services provided by the CSA will be funded through user fees and special taxes or assessments, applied only in the CSA. The introduction of urban services will generally be phased-in over-time to match urban service costs with revenue sources as they increase with the Cordova Hills Community's growth.

For some services, however, a higher level of service will be necessary than can be funded by the development in the early years. An example is landscaping maintenance, which must be provided once the landscaping has been established, whether or not development is great enough to generate the necessary revenue. If available revenue from developed property is insufficient to meet minimum service levels, then special taxes/assessments will be levied against undeveloped property to pay for the service costs. It is projected, based on the phasing plan set forth in this report, that General Fund revenue, user fees, property tax allocations, and special taxes or assessments on developed property will be adequate to fund service costs before the end of the first phase of development, so the special tax/assessment on undeveloped property would no longer be needed.

Proposition 218 Process

LAFCo is responsible for the formation and configuration of the boundary of the CSA. After the CSA is formed, the County Board of Supervisors, acting as the CSA Board of Directors will set the funding question for a vote of affected landowners.

Registered Voters

There are no registered voters within the affected territory.

Land Ownership

The proposed project territory is owned by the same landowner/project proponent and therefore, there is 100 percent consent.

County Service Area No. 13 Sphere of Influence and Service Boundaries

Sphere of Influence

"Sphere of influence" (SOI) means a plan for the probable physical boundaries and service area of CSA 13, as determined by your Commission. The proposed Sphere of Influence is recommended to be coterminous with the CSA No. 13 boundary.

(1) The present and planned land uses in the area.

The Cordova Hills Development Project is currently undeveloped. The County of Sacramento has adopted a land use plan that includes residential, commercial, and a proposed university that contains approximately 2,669 acres in the eastern portion of the unincorporated county.

There is no present population within the boundaries of the Project. The maximum build out population from the Draft Cordova Hills Master Plan is estimated at 21,379. The university/college campus center at full development in several years may accommodate approximately 4,040 resident students out of a total student enrollment of 6,000. The student resident recreation needs will be met by on-campus sports and recreation facilities and programs.

The service area proposed for the CSA No. 13 is coterminous with the boundary of the Project. If, at some time in the future, the Project area is amended to include additional territory, then an SOI amendment must be considered, before any related annexation could be approved.

Currently, there are minimal services being provided to this area. The proposed County Service Area No. 13, together with existing special districts, and the County of Sacramento will provide urban and municipal services needed for development of this project.

The Cordova Hills Special Planning Area (Cordova Hills or Project) is located in the unincorporated area of Sacramento County on 2,668 acres just east of the approved Sunridge Specific Plan and the proposed Suncreek Specific Plan in the City of Rancho Cordova bordered to the west by Grant Line Road, to the north by Glory Lane (about one-third mile south of Douglas Road), and to the east by Carson Creek. The Kiefer Landfill and its associated buffer lands are southwest of the Project, and the required buffer lands extend into the southwest portion of Cordova Hills. Planned development in Cordova Hills consists of a maximum of 8,000 residential units on approximately 1,089 acres, approximately 103 acres of commercial and office development

The Project will include a mix of uses consisting of residential, office, retail, university/college campus center, schools, parks, trails, open space, and public uses. The Project includes six distinct villages, the proposed university/college campus center, a large preservation (avoided) area, and other permanent open space that serves to separate villages. The Project includes a wide mix of residential uses, from high-density residential along the western edge, to low-density residential along the eastern edge. The majority of the commercial development is planned for the Town Center Village in the western part of the Project adjacent to Grant Line Road. A 223-acre university/college campus center is planned just southeast of the Town Center. The land uses and estimated development, population, and employees in this report are obtained from the Public Review Final Cordova Hills Public Facilities Financing Plan (Financing Plan).

(2) The present and probable need for facilities and services in the area.

The SOI is a plan for the CSA No. 13 future probable physical and service area boundaries for the Cordova Hills Development project. The SOI may be subject

to terms and conditions imposed by the Commission to ensure orderly and planned growth is tempered by the need to preserve open space, habitat for species and agricultural land. No objections to the SOI have been raised by affected agencies or jurisdictions or the public.

The CSA would be authorized to provide the following services:

- a. Parks and recreation.
- b. Open space and trails.
- c. Habitat operations and maintenance.
- d. Enhanced levels of landscaping.
- e. Supplemental road maintenance.
- f. Transit operations and maintenance.
- g. Transportation systems management.
- h. Administration and community communications.
- i. Solid Waste.

The SOI is consistent with County General Plan and the Cordova Hills Development Plan approved by the County of Sacramento;

The SOI does not split parcels and does not create any areas that are difficult to serve. This finding is based on the Record of Proceedings, the Boundary Map, and the Executive Officer's report.

The SOI does not pose a threat to public health and safety. This finding is based on the Record of Proceedings, the Boundary Map, the Executive Officer's report, the Final EIR, and the MSR.

(3) The present capacity of Public Facilities and adequacy of Public Facilities that the agency provides or is authorized to provide

The SOI will not result in significant unmitigable adverse effects upon other service recipients or other agencies serving the affected area. This finding is based on the Record of Proceedings, the MSR, and the comments of affected agencies.

In addition, based on the Public Facilities Financing Plan, the County and affected Special Districts have the capacity to provide all other necessary public services

to area residents and commercial/industrial customers within the affected territory.

At this time, minimal services are provided to this area because of its rural character.

(4) The existence of any social or economic communities of interest in the area if the commission determines that they are relevant to the Agency

The territory within the SOI area is mostly rural and agricultural and has economic and social communities of interest similar to the existing characteristics of the County.

In many cases the territory within the SOI area directly benefits from the services provided by the County and indirectly benefits from the County's economic and social community, such as businesses, social clubs, recreational activities, churches, and other community organizations.

The County has provided information and data in the MSR concluding that development will not adversely affect adjacent communities of interest.

The SOI does not divide any existing communities or other areas having identifiable social and economic homogeneity.

Cordova Hills has been designed to provide an interdependent social and economic community. The CSA would be planned to be the organizational entity that enhances the sense of community identity and provides efficient coordinated community services, with a focus on communications, recreational activities, and transportation services. These networked activities will be the backbone of community activities. The only proximate existing entity that might provide some of the proposed activities of the CSA is CRPD. However, the CRPD does not provide the full range of services proposed for Cordova Hills. The CRPD currently provides only recreation and park services. Cordova Hills needs not only recreation and park services, but also open space and trails maintenance, habitat maintenance, landscape corridor maintenance, road maintenance, transit operations, and transportation management services. This range of services planned for Cordova Hills would place a burden on the CRPD, which does not have the staffing or facilities to provide these services.

It would be difficult for the CRPD to provide the services levels prescribed for Cordova Hills because Cordova Hills would be only a small part of the CRPD service area and the CRPD would not be providing the same services and service levels to the existing CRPD service area. The added services provided only in Cordova Hills would create a notable differentiation in services types and levels of service in the CRPD that would likely result in difficult management and policy issues. In addition, because Cordova Hills would be only a small part of the

CRPD service area, it is unlikely that there would be any representation for Cordova Hills on CRPD's Board of Directors until build out of the Project, and even then, representation on CPRD'S Board is uncertain.

The CSA, however, could provide all of the needed services to Cordova Hills. The CSA would establish a sense of community in Cordova Hills because it would provide services to Cordova Hills only and would serve as an organizing element to manage all of the needed services. A community communications network would be established to aid in management and administration of services.

There are no urban services currently being provided to the area. Cordova Hills is within the boundary of County Service Area 4B administered by the County Regional Parks Department. The County focuses on regional park facilities and does not provide local community and neighborhood parks. A reorganization that would remove Cordova Hills from the boundary of CSA 4B is part of the proposed LAFCo action.

Cordova Hills is currently within Sacramento Metropolitan Fire District, Sacramento-Yolo Mosquito and Vector Control District, as well as other districts and agencies that provide municipal services. This proposal also provides that Cordova Hills will be annexed into Sacramento Regional County Sanitation District and Sacramento Area Sewer District.

Summary of Level of Services and Financing to be Provided by CSA No. 13

The level of service delivered by the CSA will be established each year by the BOS appointed Advisory Board of Directors based on the goals for public services set out in the Cordova Hills' Master Plan and on input from the community. The estimated total annual service costs to be funded by the special tax or assessment at the completion of Phase 1 development and at build out are summarized below.

If formation of CSA No.13 is approved by your Commission, approval of the special taxes, assessments, fees, and charges will subject to a Prop. 218 election, to be called by the Board of Supervisors as provided in the Cordova Hills Financing Plan.

Summary of Estimated Revenue per Dwelling Unit

Development Phase	Estimated CSA Annual Service Costs Funded by Special Taxes/Assessments (2011\$)
Phase 1	\$1.70 Million
Build out	\$6.75 Million

The CSA costs were allocated to the various land uses, and a cost per dwelling unit or per 1,000 building square feet at completion of Phase 1 and at build out was estimated for each land use. Adjustments were made to the build out cost allocations to arrive at maximum special tax or assessment rates by land use. The adjustments reduced the tax burden on affordable and high density housing. The estimated maximum special tax or assessment rates by land use are summarized below.

Land Use [1]	Estimated CSA Maximum Annual Special Tax (2011\$)
Residential	
Estates Residential	\$1,400 per dwelling unit
Low Density Residential	\$1,400 per dwelling unit
Medium Density Residential	\$1,100 per dwelling unit
Residential 20 - Owner-Occupied	\$1,000 per dwelling unit
Residential 20 - Renter-Occupied	\$ 850 per dwelling unit
HDR - Owner-Occupied & Market Rate	\$ 850 per dwelling unit
HDR - Renter-Occupied & Market Rate	\$ 720 per dwelling unit
HDR - Renter-Occupied & Affordable	\$ 250 per dwelling unit
Nonresidential	
Commercial	\$ 160 per 1,000 bldg.sq.ft
Office	\$ 240 per 1,000 bldg.sq.ft

[1] No service costs have been estimated or allocated to the university/college campus center at this time, but it is possible that future reports will include university/college campus center cost allocations for some services.

Summary Description of Services to be Provided by CSA No. 13

The following section summarizes the services to be provided by CSA No. 13.

Recreation Services

Elements of Service

The CSA will provide recreation services and programs. The programs will include traditional sports activities, such as youth and adult basketball and soccer, and coordination with other sports organizations such as Little League. Programs also will include traditional special interest activities such as dance, music training, crafts, youth summer day camp, and others typically associated with a park district or department. The recreation service is envisioned as extending into community health and wellness education and environmental awareness and education. Thus, the recreation services might include classes on nutrition, gardening, individual wellness, walking, nature studies, and so on. In addition, the recreation services would coordinate a community gardens program and a local farmers market.

Preliminary Service Level Standards

The actual selection of programs and services will evolve and change with the needs and interests of the community and will be determined by the County BOS or CSA Advisory Board.

Park Maintenance

Elements of Service

Park maintenance services will be provided by the CSA and will comprise maintenance of park facilities and upkeep of all parklands, including turf, irrigation, playgrounds, and sports facilities. In addition, the CSA will be responsible for maintaining the lighting in the parks. Staff crews also will clean restrooms and repair facilities damaged by vandalism.

The park plan for Cordova Hills includes a combination of large sports facilities, a Community Park, and several neighborhood parks. In addition to the formal parks, there is an extensive network of open space areas that weave through the residential neighborhoods and along the edge of the major resource avoidance open space areas.

The Sports Park is a 50-acre complex located near the university/college campus center at the west side of Cordova Hills. This site will include soccer fields, baseball and softball fields, extensive picnic areas, and parking, among other amenities. The Sports Park is envisioned as a primary community resource that will serve much of the active sport's needs, particularly for league and tournament play.

The Community Park is located adjacent to the commercial center in East Valley near the geographic center of the community. The Community Park encompasses 18 acres and will abut the commercial site to provide an opportunity for a restaurant to be located overlooking the park. The park will be distinctly urban in character and will include a community center, a village green for a farmers market and large community events,

playgrounds and picnic areas, and a splash fountain, in addition to open turf and play fields.

Neighborhood parks will encompass 5 or 6 acres and will include open turf for soccer, picnic facilities, and a playground. Tot lots are not the obligation of the CSA but may be developed as part of subdivision development, with funding paid through a homeowners association (HOA).

Preliminary Service Level Standards

The County General Plan requires 5 acres of parkland per 1,000 residents. As detailed in the Draft Cordova Hills Master Plan, the maximum residential development of 8,000 units would generate a projected population of 21,379 at build out. This population would create a need for a total of 106.9 acres of designated parkland in the Cordova Hills community, in addition to the avoided areas and other non-credited open space/parks. The Cordova Hills Master Plan includes 99.1 acres of active neighborhood, community, and sports parks, leaving the Project with another 7.8 acres of required active parks. Consequently, the park maintenance cost estimates assume that 7.8 acres of open space will be developed as active parkland (see discussion below).

Open Space and Trails Maintenance

Elements of Service

The CSA will maintain all open space/greenbelts, open space edge conditions, paseos, and trails outside the public ROW, as well as the lighting located in paseos and along trails. Maintenance of the open spaces does not include maintenance of the three distinct preserves (referred to as avoided areas), which will be maintained through an endowment. The maintenance does, however, include treatment of physical edge conditions surrounding the avoided areas. All the edge conditions include a landscaped area, trail, and swale that create a hydrological barrier from urban runoff toward the avoidance area. This landscaped area would be located outside the avoidance area boundary and would serve as an additional buffer, decreasing “edge effects” on wildlife and habitat in the avoided area.

Habitat Operations and Maintenance

Elements of Service

Wetlands preservation will be required in the avoidance areas of the Project. Most of the avoidance areas are in the western third of the Project. In addition, offsite habitat mitigation will be required. The offsite mitigation costs will include creation, restoration, and preservation costs and are discussed in the Cordova Hills Financing Plan and proposed to be funded through the Cordova Hills Special Financing District.

The ongoing costs of operating and maintaining the onsite preserve are planned to be funded through the annual CSA tax or assessment. The ongoing operations and maintenance of the habitat includes legal, construction, survey, maintenance, operations, and reporting functions.

Landscape Corridors

Elements of Service

Landscaping in the Project refers to landscaping in road medians and adjacent to roads. It will include water features, traditional landscaping, landscaping with Low Impact Development (LID) features, rain gardens, gateways, sidewalks, walls and fences, directional and project signage, and accent and signage lighting. For the purposes of determining the landscaping that will be maintained by the CSA and the cost of that landscaping, the landscaping features have been divided into the following categories:

- Landscape Corridors
- Landscape Corridors with LID Features
- Median Landscaping
- Median Landscaping with LID features
- Sidewalks
- Sound Walls

The CSA will maintain some of these landscaping features, depending on the adjacent type of property. The CSA-maintained landscaping is detailed below by landscaping category.

Landscape Corridors and Landscape Corridors with LID Features

The CSA will maintain the following landscape corridors:

- All landscape corridors with LID features.
- All landscape corridors without LID features that do not directly front commercial, residential, or school district properties.

All landscape corridors without LID features that front commercial, residential, or school district properties will be privately maintained by commercial property owners, home owners, or the Elk Grove Unified School District (EGUSD).

Median Landscaping and Median Landscaping with LID Features

The CSA will maintain all median landscaping (with and without LID features).

Sidewalks and Sound Walls

The CSA will maintain the following sidewalks:

- All sidewalks in single-family residential areas.
- All other sidewalks that do not front commercial, multifamily, condominium, or school district properties.
- All sidewalks that front commercial, multifamily, condominium, or school district properties will be privately maintained by commercial property owners, home owners associations, or the EGUSD.
- The CSA will maintain all sound walls.

Preliminary Service Level Standards

The landscape maintenance standards will comply with the design vision and standards established in the Cordova Hills Master Plan/Special Plan Area Ordinance. This will require a low maintenance and low water demand landscape design. Regular periodic maintenance on a weekly schedule will be required to maintain visual quality and to sustain the viability of the plantings. The maintenance also will include vandalism and graffiti abatement in all public common areas outside the public street ROW.

Road Maintenance

Elements of Service

The County DOT will maintain the roads and adjacent facilities in the public street ROW consisting of paved section, curb and gutter. County DOT road maintenance services are funded through revenues recorded in the County's Road Fund (e.g., gas tax; property tax; Measure A half-cent sales tax). EPS prepared a Draft Fiscal Impact Analysis, which estimated whether Road Fund revenues generated by the Project would adequately cover the cost of the County DOT-provided road maintenance services described previously. The results of the Fiscal Impact Analysis indicated that the County Road Fund would result in an annual net deficit of \$34,000 in Phase 1 and an annual net deficit of \$201,000 at build out of the Project. This annual deficit is anticipated to be funded by the Mello-Roos CFD special tax. To the extent that there are surplus revenues in the County Road Fund (i.e., revenues are greater than expenditures), the CSA could provide supplemental road maintenance services consisting of expanded street sweeping or other on-site road maintenance.

Estimated Annual Maintenance Costs

The Draft Fiscal Impact Analysis prepared by EPS indicates an annual net fiscal deficit in the County Road Fund of \$34,000 for Phase 1 and \$201,000 at build out of the Project. As such, this Urban Services Analysis uses these deficits as costs to allocate to development in the Project.

Transit Operations and Maintenance

Elements of Service

The Cordova Hills proponent proposes including a local transit system consisting of two distinct but coordinated bus routes. An internal route will operate around a loop in the Cordova Hills Plan Area. An external loop will provide a connection to the Mather/Mills Light Rail Transit (LRT) station. The loops can operate independently with a transfer hub in the Cordova Hills Town Center, but the routes will be coordinated so they can operate as a single continuous route with no transfers required.

The planned system will connect to Sacramento Regional Transit (RT) system but will not be part of RT. The Cordova Hills system would be operated by a service operator under contract to the County or CSA.

The CSA will lease buses and will own and manage all bus shelters, turnouts, and signage associated with the transit system. The CSA also would provide Transportation Management Association (TMA) services or contract with another TMA for management of TMA services (detailed later in this chapter). The internal services may include a range of rideshare initiatives, travel demand management (TDM) methods, and alternative mode promotional activities undertaken by the TMA.

Preliminary Service Level Standards

The transit system will begin with limited services that may involve only an external shuttle to the Mather/Mills LRT station. The County BOS or CSA Board and General Manager of the transit system for Cordova Hills will assess the appropriate transit routes and timing for Phase 1 and subsequent phases based on funding and actual ridership. The transit plan summarized in this report is a guide for the CSA to follow. As the community grows, the transit plan envisions that an internal loop system will be developed. The internal loop will expand with the community along the primary street system, a modified grid form that allows flexibility for routing to serve the greatest number of potential riders. Transit service will provide “timed transfers” or continuous loops to minimize the need for transfer between the internal shuttle and external connection to the LRT station. The transit system is planned to operate 365 days per year with a full schedule on weekdays and a reduced schedule on weekends and holidays, as detailed in the remainder of this section.

Internal Route

At build out of the Project, the internal system would operate from 6:00 AM to 9:00 PM every day. The transit plan assumes two 2-hour peak periods on weekdays: one in the morning from 7:00 to 9:00 and one in the afternoon from 4:00 to 6:00. There would not be peak periods on weekends. Headways would be 15 minutes during peak hours and 30 minutes during all other times of the day. Routes would be run in both directions. Walk access distances to transit stops will be designed in the location of primary roads, pedestrian ways, and the location of major destinations and housing areas to achieve ¼-mile at maximum.

Transportation Demand Management (TDM) Services

Elements of Service

The CSA will provide TDM services through programs serving the community residents, as well as businesses and institutions. Services to the residents, businesses, and institutions in Cordova Hills that encourage more efficient use of transportation and parking resources may include these:

- Marketing and Promotion
- Parking Management and Brokerage
- Pedestrian and Bicycle Planning
- Pedways
- Rideshare Matching and Vanpool Coordination
- Shared Parking Coordination
- Shuttle Services
- Special Event Transport Management
- Telework Support
- Transit Improvements
- Transportation Access Guides
- Wayfinding and Multi-Modal Navigation Tools

The CSA would implement the TDM programs for the community residents, businesses, and institutions through a TMA. The CSA either would establish an internal TMA or would participate in another geographically broader TMA.

TMA's are generally public-private partnerships. They provide an institutional framework for the TDM services programs and allow small employers to provide commute trip reduction services comparable to those offered by large companies.

TMA's can provide a variety of services, including these:

- Access Management
- Commute Trip Reduction
- Commuter Financial Incentives
- Flextime Support
- Guaranteed Ride Home Services

Participation in the TMA will be required for land zoned Town Center (TC), Flex Commercial (FC), and Public/Quasi Public (P/QP) in Cordova Hills through one or more of the following mechanisms: the purchase and sale agreement for individual parcels; a Master Property Owners' Association; or the Conditions, Covenants, and Restrictions (CC&R).

CSA Administration and Communications

Elements of Service

Initially, the County will administer and coordinate the activity of all services provided directly by the CSA and County agencies and departments. The County also will coordinate with other service providers who are not directly under the administration of the CSA, such as the SMFD, the County DOT and others.

If a CSA is chosen as the most efficient governance option, the County will continue to administer and coordinate these services. The County BOS could also create a Local Advisory Board (CSA Board) comprised of local representatives to administer and coordinate services.

The CSA administration activities will include overseeing the daily operations of the services, preparing and administering the annual budget, providing a liaison to other service agencies, and providing a point of contact for the residents and businesses in the service area. In addition, each individual CSA service type (and associated cost estimate) is assumed to include an administrative component for daily administration of the particular service.

CSA administration will include a core community communication network to disseminate information about community activities; to facilitate services, such as rideshare opportunities and transit schedules; and to provide emergency service information. The communication network will take the form of a community intranet

that includes community and special interest Web sites, public meeting broadcasts, and such public services as may become apparent as the community grows.

Preliminary Service Level Standards

The CSA will provide adequate administrative support to manage all services administered and funded through the CSA. As development progresses and the level of demand for services increases, the level of administrative support also will increase.

To implement the community communication network aspect of the administration, the entire community will be wired with cable or wireless services that are capable of providing a communication link to all homes and businesses. This is intended to provide a public access channel that will “piggy-back” onto or supplement such commercial services that may be available in the community. The CSA will provide content for the network and will provide for maintenance of the system. Such maintenance may be by contract with a commercial provider.

Funding and Financing Plan Summary

Phasing of Services and Additional Funding

Initially, where possible, CSA services will be phased to match the special tax/assessment revenue, along with user fees and other revenues. Service levels will increase to meet the planned services standards over time. Minimum service levels are determined by the mitigation requirements in the EIR, tentative map conditions, and Development Agreement requirements.

For some services, however, a higher level of service will be necessary than can be funded by the special tax/assessment revenue in the early years of development. An example is landscaping maintenance, which must be provided once the landscaping has been established, whether or not development is great enough to generate the necessary revenue. If the annual special tax revenue on developed property is insufficient to meet minimum service levels, then the special tax/assessment will be levied against undeveloped property to help fund the annual services costs. The tax rate on undeveloped property will be on a per acre basis. The Draft Development Agreement proposes the following hierarchy for levying the special tax on undeveloped property if needed:

1. The special tax shall first be levied on undeveloped lots shown on recorded final small lot subdivision maps at up to 100% of the maximum special tax rate for developed property.
2. If the additional revenue from the undeveloped lots described above is insufficient to cover the funding shortfall, then a special tax shall be levied on property with approved tentative small lot subdivision maps at up to a specified percentage of the maximum special tax rate for developed

property. This percentage will be determined when the funding mechanism to pay for services is adopted.

3. If the additional revenue from the two sources above still is insufficient to cover the funding shortfall, then the special tax shall be levied on property with recorded final parcel maps at up to a specified percent of the maximum special tax rate for developed property. This percentage will be determined when the funding mechanism to pay for services is adopted. It should be noted that the estimated annual revenue from the tax on developed property is estimated to be sufficient to fully cover the annual Phase 1 services costs. Additional revenue from the tax on undeveloped property would only be needed in the event that the Phase 1 costs were higher than anticipated or Phase 1 development was less than anticipated.

ENVIRONMENTAL CONSIDERATIONS

According to §15096(f), the Commission only "considers" the County-certified EIR. As part of that consideration, the commission must adopt findings (15096(h)) and issue a Notice of Determination (15096(i)). The guidelines (15096g1) state that the responsible agency shall not approve the project as proposed if the responsible agency finds any feasible mitigation or alternative within its jurisdiction to implement. The findings demonstrate that the commission did not find any feasible mitigation measures or alternatives within its jurisdiction since they were all the responsibility of the county.

Also, the Commission finds that it has "considered the EIR as prepared by the Lead Agency and determined that all mitigation measures and alternatives identified in the EIR are within the purview of Sacramento County and not that of LAFCo. (Note: LAFCo staff and our environmental consultant provided comments as a Responsible Agency on the EIR prepared by the County).

The Commission finds that the County did adopt all of the mitigation measures and adopted an MMRP for the Cordova Hills project.

The Final Environmental Impact Report ("FEIR") prepared for the Cordova Hills Project (the "Project") as adopted by Sacramento County addresses the environmental effects associated with construction and operation of the proposed Cordova Hills Special Planning Area. As part of the implementation process of the Cordova Hills project, the Sacramento Local Agency Formation Commission ("LAFCo") would approve the formation of the County Service Area No. 13 (CSA) to serve the Cordova Hills Community, detachment from the Sacramento County Regional Parks Department County Service Area 4B, and annexation to the Sacramento Area Sewer District (SASD) for the collection of wastewater and the Sacramento Regional County Sanitation District (SRCSD) for conveyance and treatment of wastewater. These LAFCo actions are part of the larger Cordova Hills project described below and is the "LAFCo Project" subject to these findings.

These CEQA Findings of Fact and Statement of Overriding Considerations have been prepared to comply with the requirements of the California Environmental Quality Act (“CEQA”) (Public Resources Code, Section 21000 *et seq.*) and the CEQA Guidelines (Cal. Code of Regulations, Title 14, Section 15000 *et seq.*) These findings refer to the Final EIR (“FEIR”) where the material appears in that document. Otherwise, references are to the Draft EIR (“DEIR”).

CEQA generally requires that a lead agency must take reasonable efforts to mitigate or avoid significant environmental impacts when approving a project. For the Cordova Hills, the lead agency is Sacramento County. In order to effectively evaluate any potentially significant environmental impacts of a proposed project, an environmental impact report (“EIR”) must be prepared. The EIR is an informational document that serves to inform the agency decision-making body and the public in general of any potentially significant environmental impacts. The preparation of an EIR also serves as a medium for identifying possible methods of minimizing any significant effects and assessing and describing reasonable alternatives to the project.

The Cordova Hills EIR has been prepared as a Project EIR pursuant to CEQA Guidelines Section 15161. The purpose of a project-level EIR is to provide environmental review of the planning, construction, and operational impacts of a project.

All other agencies with jurisdiction over aspects of the Cordova Hills project are considered to be “responsible agencies” for purposes of CEQA. As specified by Section 15096 of the CEQA Guidelines, the duties of a responsible agency in using an environmental document prepared by the lead agency include:

- Prior to reaching a decision on the project, the responsible agency must consider the environmental effects of the project as shown in the EIR or Negative Declaration.
- In considering the environmental conclusions of the EIR or Negative Declaration, the responsible agency must evaluate whether any of the conditions set forth in Sections 15162 or 15163 of the CEQA Guidelines requiring preparation of a subsequent or supplemental environmental document exist.
- When considering alternatives and mitigation measures, a responsible agency is more limited than a Lead Agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve.
- When an EIR has been prepared for a project, the responsible agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment.
- The responsible agency shall make the findings required by Section 15091 for each significant effect of the project and shall make the findings in Section 15093 if necessary.

- The responsible agency should file a Notice of Determination in the same manner as a lead agency under Section 15075 or 15094 except that the responsible agency does not need to state that the EIR or Negative Declaration complies with CEQA. The responsible agency should state that it considered the EIR or Negative Declaration as prepared by a lead agency.

For the proposed formation of CSA No. 13, detachment from the Sacramento County Regional Parks Department County Service Area 4B, and annexation to the SASD and the SRCSD, the responsible agency is LAFCo. As a responsible agency, Project consideration by LAFCo is governed by the requirements of CEQA Guidelines Section 15096 as set forth above.

MUNICIPAL SERVICE REVIEW AND MASTER SERVICES ELEMENT

The formation of CSA No. 13 is consistent with LAFCo Policies and Procedures which require a Master Services Element for the establishment of a Sphere of Influence.

Spheres of Influence are the primary planning tool for LAFCo. Sacramento LAFCo has developed standards related to the Master Service Element of any agency's Sphere of Influence. Agencies must have an updated Master Services Element which meets the following standards:

- a. Is consistent with the Master Services Element of the Spheres of Influence of any overlapping jurisdiction;
- b. Demonstrates that adequate services will be provided within the time frame needed by the inhabitants of the area included within the proposed boundary;
- c. Identifies existing land use and a reasonable projection of land uses which would occur if services were provided consistent with the updated Element;
- d. Presents a map that clearly indicates the location of existing and proposed facilities, including plan for timing and location of facilities;
- e. Describes the nature of each service to be provided;
- f. Describes the service level capacity of the service provider's facilities;
- g. Identifies the anticipated service level to be provided;
- h. Describes any actions, improvements, or construction necessary to reach required service levels, including costs and financing methods;
- i. Provides copies of district enabling legislation pertinent to the provision of service levels, including costs and financing methods;

- j. Identifies projected revenue and identifies savings occurring as a result of the action; and
- k. Provides existing and five year population projects within agency boundaries.

The proponent has provided the EPS Public Facilities Financing Plan for the formation of CSA No. 13. The formation of the CSA, including its structure (organization), proposed services, and method of apportionment and charges that are described in the Report are based on recent studies prepared by EPS.

The Report complies with the Municipal Service Review and Master Services Element criteria.

The project is consistent with the County General Plan and the Cordova Hills Community Plan.

Municipal Service Review Determinations

LAFCo is required to make determinations related to several specific areas. Each of these areas is addressed below. This section only discusses responsibilities that would be related to the CSA and not other municipal services provided by existing entities. Based on the Public Facilities Financing Plan and Urban Service and Governance Plan, CSA No. 13 would be able to provide the proposed services to meet the standards set forth above.

The Following sections summarize the MSR Determinations:

1. Infrastructure needs or deficiencies.

There is no infrastructure in Cordova Hills. Construction of the infrastructure will be controlled by the Project conditions of approval, the Development Agreement with the County, and the EIR. The infrastructure funding program is detailed in the Financing Plan. The CSA would be responsible for construction of park and recreation facilities and landscaping in the open space corridors and in certain streetscape areas outside the public ROW. This will include some signage, lighting, and transit support facilities including bus shelters and bus parking. These facilities may be funded by a variety of sources, including direct developer funding, development impact fees, and a Cordova Hills Mello-Roos CFD.

2. Growth and population projections for the affected area.

There is no present population within the boundaries of the Project area. The maximum Build out population is estimated at 21,379.

3. Financing constraints and opportunity.

A Mello-Roos CFD special tax is planned to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes will be established to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes on undeveloped property would cover shortfalls in the early years until the tax base has grown to a sufficient level to fund needed services.

4. Cost avoidance opportunities.

The annual CSA budget would be evaluated by a County BOS-appointed advisory committee to provide the highest level of service for the least cost. Because the CSA would be a new entity, it could implement many “best practices” techniques as it begins to provide services.

5. Rate restructuring.

Because the CSA would be a new special district, it would have the opportunity to set the appropriate rate structure to pay for the necessary services. The rate structure would have a built-in cost-of-living escalation factor.

6. Opportunities for shared cost.

The goals of the Project include partnerships with other public entities. The most likely arrangement would be shared park and recreation facilities with the EGUSD. Another opportunity may be a joint partnership with the SMFD.

7. Government structure options, including advantages and disadvantages of consolidation or reorganization.

The Urban Services and Governance Plan has been designed to minimize the need for new government organizations. Many of the services are planned to be provided by existing service providers. The proposed services that would be provided by the CSA are more comprehensive than the authorized services for any other service provider. The CSA would be designed to be the community organizing vehicle that brings together all elements of the community. The communication, recreation, and transportation functions of the CSA would form the basis of the community network.

One advantage of a CSA is the efficiencies in the cost of providing the multiple services proposed. Where a multitude of single-purpose agencies would have administrative and other overhead costs associated with each agency, a CSA would have a single unified administration. Where a multitude of single purpose agencies would require individual employees with limited skill sets, the CSA would facilitate use of cross-trained, multifunctional personnel who can be allocated to diverse tasks efficiently. For example, park maintenance staff also would maintain the open space and trails network, signage,

streetscape, and bus shelters. The cost savings because of efficiencies in administrative overhead, continuing use of maintenance equipment, and staffing flexibility is one of the chief attributes of a multi-service CSA. In addition, the creation of a locally controlled Board of Directors would significantly rectify the limited representation that Cordova Hills residents and businesses would have in other organizations that could provide a similar set of services.

8. Evaluation of management efficiencies.

As a new entity, the CSA would be designed to promote management efficiencies. It would be funded adequately through the levy of a special tax without burdening other special districts. The CSA would have the advantage of starting out with a highly efficient network communications system, which should produce substantial savings in day-to-day operations. The CSA services plan would provide the option of contracting out many of the maintenance functions, which could provide cost effective delivery of these services.

9. Local accountability and governance.

A CSA would be planned to start out as a dependent district governed ex-officio by the County BOS. It would be managed by a five-member advisory board of directors appointed by the County BOS. At some point in the future, the residents of Cordova Hills could decide to become an independent district and elect their own Board of Directors. Outreach would be provided by the communications services function of the CSA. The CSA would establish and operate a communitywide intranet as the key component of a communications network that would distribute information about community activities and services and provide transportation management services such as ride-sharing bulletins, real-time bus location information, and transit system routing and schedules, as well as provide emergency information. Community meetings would be held in the CSA administrative building or other community meeting spaces.

Other Service Providers

The following table describes the other service providers that will serve the Cordova Hills Development project. All agencies have been notified and no protests or negative comments have been received. They have all indicated that they have the ability to provide the services within the boundaries of CSA No. 13.

Affected Districts

Service	Current Agency	Proposed Agency
Police	Sacramento County Sheriff Department	Sacramento County Sheriff Department
Fire	Sacramento Metro Fire	Sacramento Metro Fire
Water	Sacramento County Water Agency	Sacramento County Water Agency
Sewer	None	SRCS and SASD
Solid Waste	Sacramento County	Sacramento County
Street Lighting	CSA-1	CSA-1 and Cordova Hills CSA
Road Maintenance	Sacramento County	Sacramento County and CSA No. 13
Flood Control	Sacramento County	Sacramento County
Parks and Recreation	CSA-4b	CSA No.13
Library	Sacramento County Library Authority	Sacramento County Library Authority
Electricity/Gas	SMUD/PG&E	SMUD/PG&E
Transit	None	CSA No. 13
Code Enforcement	County of Sacramento	County of Sacramento
Storm Drainage	County of Sacramento	County of Sacramento
Animal Control	County of Sacramento	County of Sacramento
Mosquito/Vector	Sacramento-Yolo MVCD	Sacramento-Yolo MVCD
Cable TV	Various	Various
Cemetery District	None	Elk Grove-Cosumnes SOI
Schools	Elk Grove Unified Schools	Elk Grove Unified Schools

The proposal was routed for review and comment to Sacramento County and affected Special Districts and agencies.

No negative comments have been received from any affected district or agency.

MSR for Affected Agencies

Roads

The Cordova Hills Special Planning Area (Cordova Hills) provides a comprehensive transportation network designed in accordance with anticipated traffic volumes and travel demands of the planned land uses, as well as the regional system envisioned by the County General Plan.

At the time of preparation of this Cordova Hills Financing Plan, there were certain variables present that could affect Cordova Hills's fair share allocation of certain offsite roadway costs. These variables include roadway improvements within the jurisdictional boundaries of the City of Rancho Cordova and the City of Elk Grove, as well as the impact of the proposed Capital Southeast Connector Project on Grant Line Road improvements. The analyses included in the Financing Plan are based on the best assumptions and information currently available. For the implementation of the financing mechanisms and updates thereafter, revisions will be made if assumptions change or the outcome of discussions with the cities yields a different fair share cost obligation.

The County currently requires development projects to pay their fair share of offsite road improvements to other jurisdictions. The Board of Supervisors provided further direction that if a reciprocal agreement cannot be reached by both jurisdictions at the time of fee collection, then mitigation payments for impacts wholly in the other jurisdiction will not be collected. The County intends to enter into a Cross Jurisdictional Memorandum of Understanding (MOU) with other jurisdictions to collaboratively address the impacts of its development within neighboring jurisdictions.

The proposed Capital Southeast Connector Project is another variable that may result in a need to amend the assumptions of Cordova Hills' final cost and construction responsibilities at implementation. The County General Plan calls for Grant Line Road ultimately to be improved to a 6-lane thoroughfare configuration, which this Financing Plan takes into account; however, the proposed Connector Project likely would turn Grant Line Road into a limited access 4-lane expressway. Consequently, if and when the Connector Project develops, the implementation plan would reallocate Cordova Hills' fair share funding of Grant Line Road to the Connector Project configuration of Grant Line Road (anticipated to be a 4-lane expressway with grade separated interchanges). Cordova Hills' fair share cost might be reduced if Cordova Hills' fair share funding for the Connector project is less than its fair share cost allocation for the 6 lane Grant Line Road thoroughfare configuration. Cordova Hills' fair share allocation percent will not be increased as a result of this project change because the Cordova Hills project does not require the Connector project as a mitigation measure for its traffic impacts.

Offsite Roadway Costs

Cordova Hills has an obligation to construct many of the off-site roadways included in the Offsite Roadway CIP at various stages of development. The cost to Cordova Hills to construct these roadways would be reduced to just Cordova Hills' fair share if other regional development projects trigger and construct the roadways before Cordova Hills triggers them. In addition, Cordova Hills has a responsibility to fund its fair share of certain roadway improvements with no construction responsibility. Cordova Hills' total fair share of offsite roadway costs will be payable through the Cordova Hills SFD. The remainder of offsite Roadway CIP costs may be funded by other sources, such as County and City fee programs, state and federal funding, and other surrounding new development projects that are conditioned to participate in funding the improvements if required by California Environmental Quality Act (CEQA) mitigations prior to Cordova Hills' responsibility to construct. As noted earlier, the availability and timing of funding from other sources is uncertain.

Sanitary Sewer

In January 2012, Sacramento Area Sewer District's (SASD's) Board of Directors approved an SASD Sewer System Capacity Plan 2010 Update that outlines the District's most current midrange and long-term plan for sewer service to the Cordova Hills area. Sacramento Regional County Sanitation District (SRCSD) is in the process of finalizing its own Interceptor Sequencing Study that will aid SRCSD in planning and implementing regional conveyance projects based on SASD's local collection plans.

SRCSD's regional Interceptor facilities will convey sewage from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) located near the Sacramento River in Elk Grove. Cordova Hills is located outside of the SASD and SRCSD service areas and will thus need to be annexed into both of these service areas through LAFCO in order to receive sewer service.

Once annexed, the Project proponents will pay the applicable sewer impact fees and construct the required onsite and offsite local collection and trunk conveyance facilities in order to receive service. SRCSD constructs the regional interceptor facilities. Based on the most current planning documents, Cordova Hills will ultimately be served by the SRCSD Douglas Interceptor (DI). This Financing Plan is consistent with the most current SASD and SRCSD planning documents (SASD and SRCSD East Rancho Mid-Range Plans and SASD System Capacity Plan).

Storm Drainage

The Cordova Hills backbone storm drainage system is detailed in the Drainage Master Plan for Cordova Hills, prepared by MacKay & Soms (Drainage Master Plan). The Drainage Master Plan analyzes drainage impacts resulting from development of the proposed land uses in Cordova Hills. It conceptually defines at the master plan level how potential impacts of the proposed development on existing receiving waters can be fully

mitigated to existing or better than existing conditions. It preliminarily details construction of on-site combination Flood and Flow Duration Control Detention Basins that mitigate for the development impacts. Further more detailed analysis will be required prior to the next phase of the development process, tentative map approval or improvement map approval, whichever comes first. Estimated costs and facility location are described in further detail in the Public Facilities Financing Plan.

- Storm drainage pipes;
- Manholes;
- Drainage inlets; and
- Flood control and water quality basin facilities and land.

Water

With the exception of the Buffer lands, Cordova Hills is in the Sacramento County Water Agency (SCWA) Zone 40 Service Area. Zone 40 is responsible for construction of potable water facilities within its boundaries. Limited Zone 40 water facilities will be extended into the Buffer lands. Cordova Hills ultimately will be serviced from proposed storage tanks anticipated to be located just north of the Project, east of Ridgeline Road. The Cordova Hills potable water system ultimately will be integrated into the SCWA Zone 40 North Service Area system with connections along Grant Line Road. The potable water system includes the following types of improvements:

- Onsite and offsite water transmission mains;
- Pressure reducing station;
- Above ground water storage tanks (capacity of 3.5 million gallons); and
- Ground tank booster pumps.

Fire

The Sacramento Metropolitan Fire District (SMFD) is the fire protection service provider for Cordova Hills and will continue to provide services once the community has developed. The SMFD has indicated that development in the Cordova Hills area will increase the need for fire protection, including additional staffing, vehicles and equipment. Given the current mix of land uses, SMFD has indicated that one station will be adequate to serve Cordova Hills. SMFD has indicated that this station should be located in the commercial center in the East Valley Village in order to meet travel time standards. It is possible that a second station could be located in Cordova Hills if needed to serve neighboring development projects as well as Cordova Hills.

The Public Facility Financing Plan shows the estimated cost to construct a fire station and provide the major equipment needed for the station. It is estimated that a fire station of approximately 6,500 square feet will be required and that an engine, a truck, a medic vehicle, and staff and support vehicles will be required to service the area. The total cost is estimated at \$5.3 million.

All new development within the SMFD will be subject to the District-wide Capital Fire Facilities fee (SMFD fee) to fund construction and equipment costs for new fire stations. The Project will generate approximately \$2.0 million in fee revenue at the end of Phase 1 and \$9.7 million at build out. It is assumed that the total build out fee revenue will be sufficient to fund Cordova Hills' impact on fire facilities and that no other funding sources will be necessary. Fee revenue from the other communities served by the fire station(s) sited in Cordova Hills may also be available for the construction of new station(s).

At the time of this Financing Plan, there are too many variables to assess the precise timing of fire and medical services facilities for the Project. The timing of the fire station(s) located within the adjacent Sunridge or Suncreek Specific Plans will dictate the timing of when the Cordova Hills fire station will need to be constructed. SMFD has agreed to assess the phasing of fire and medical service facilities at the small lot tentative map stage of the Project. As such, this Financing Plan assumes that development in the Project will pay the SMFD fee and additional funding sources for any shortfalls will be evaluated at the time facilities are required. At build out the Project is projected to generate a surplus of SMFD fee revenues to cover the estimated facility costs of \$5.3 million.

The Cordova Hills developer will be required to dedicate land for the fire station site. Depending on the outcome of negotiations between the Cordova Hills developer and the SMFD, the developer may receive fee credits against the SMFD fee for all or a portion of the site acquisition costs.

Law Enforcement

The Sacramento County Sheriff's Department currently provides law enforcement services to Cordova Hills and will continue to provide services to the area. The Sheriff's Department plans to operate a substation in the Cordova Hills Town Center village through a lease with Cordova Hills. Expenditures associated with leasing a substation will be covered through the fiscal impact analysis surplus estimated in EPS's Draft Fiscal Impact Analysis. The Draft Fiscal Impact Analysis estimated that County General Fund and Police Services Community Facilities District (CFD) 2005-1 revenues would generate a fiscal surplus of \$750,000 in Phase 1 and \$2.7 million at build out of the Project, after accounting for the cost of providing countywide and County administered municipal services.

Library

Library services for Cordova Hills are provided by the Sacramento Public Library Authority (Library Authority). Cordova Hills will be required to contribute toward the provision of library services for its residents.

The County is in the process of implementing a countywide library development impact fee program. Cordova Hills will participate in this fee program if and when it is implemented. The estimated fee rates proposed for the program are \$827 for single-family detached dwelling units; \$643 for 2-4 units attached; \$537 for 5+ units attached; and \$530 for mobile homes and second residential units, based on this proposed fee level. At build out, the Project will generate approximately \$5.5 million in fee revenue. In the event that the County does not implement a countywide library development impact fee program, the Project will fund its fair share of library facilities through the proposed Cordova Hills SFD.

The Library Authority plans a 15,000 square foot library to serve Cordova Hills and adjacent areas. Cordova Hills could provide an appropriate library facility in the Town Center and lease the facility to the Library Authority. The development impact fee that Cordova Hills pays ultimately could be adjusted if this arrangement was established. However, it should be noted that the Cordova Hills developers are not required to construct a library facility.

As of the end of 2010, the Library Authority considered the estimated \$5.5 million from potential library fees adequate to fund the Cordova Hills' portion of construction, furnishing, and materials acquisitions for a 15,000 square foot library facility. Sufficiency of funding, however, is entirely dependent on economic conditions at the time of construction. The timing of constructing a library facility is at the discretion of the Library Authority and will be dependent on funding from all benefiting areas.

Further, no operating funds have been allocated to the Library Authority to support the opening and annual operation of a new library facility. Annual operations include staffing, collections, maintenance and security, and utilities. These additional costs are currently estimated at \$800,000 annually and would need to be budgeted and allocated to the Library Authority prior to construction. The operating costs and funding of these costs are discussed further in the Urban Services Plan.

Schools

Cordova Hills is within the boundaries of the Elk Grove Unified School District (EGUSD). Information regarding school costs was obtained from the EGUSD Development fee Justification Study/school facilities Needs Analysis (SFNA) dated June 2010.

Proposed Facilities

Cordova Hills will provide at build out three elementary school sites and one combination middle and high school site. Based on the number of units expected in Cordova Hills, student yield factors from the SFNA, and EGUSD typical school sizes, Cordova Hills will generate the need for approximately 3 elementary schools but only about 62 percent of a middle/high school. The students and funding for the portion of the high school not attributable to Cordova Hills will come from other nearby areas outside of Cordova Hills.

Benefit of CSA No. 13

The primary benefit of CSA No. 13 is that it will enhance service levels within the proposed Cordova Hills Development Project to augment additional amenities for the community. The proposed dedicated funding will be captured and stay within the community for its benefit.

RECOMMENDATION

I recommend your Commission adopt the Resolution approving 1) the Sphere of Influence for County Service Area No. 13; 2) the formation of County Service Area No. 13; 4) detachment from CSA No 4b; 5) annexation to Sacramento Regional County Sanitation District and Sacramento Area Sewer District; and 5) to waive the Conducting Authority (protest hearing) for CSA No. 13.

Respectfully,

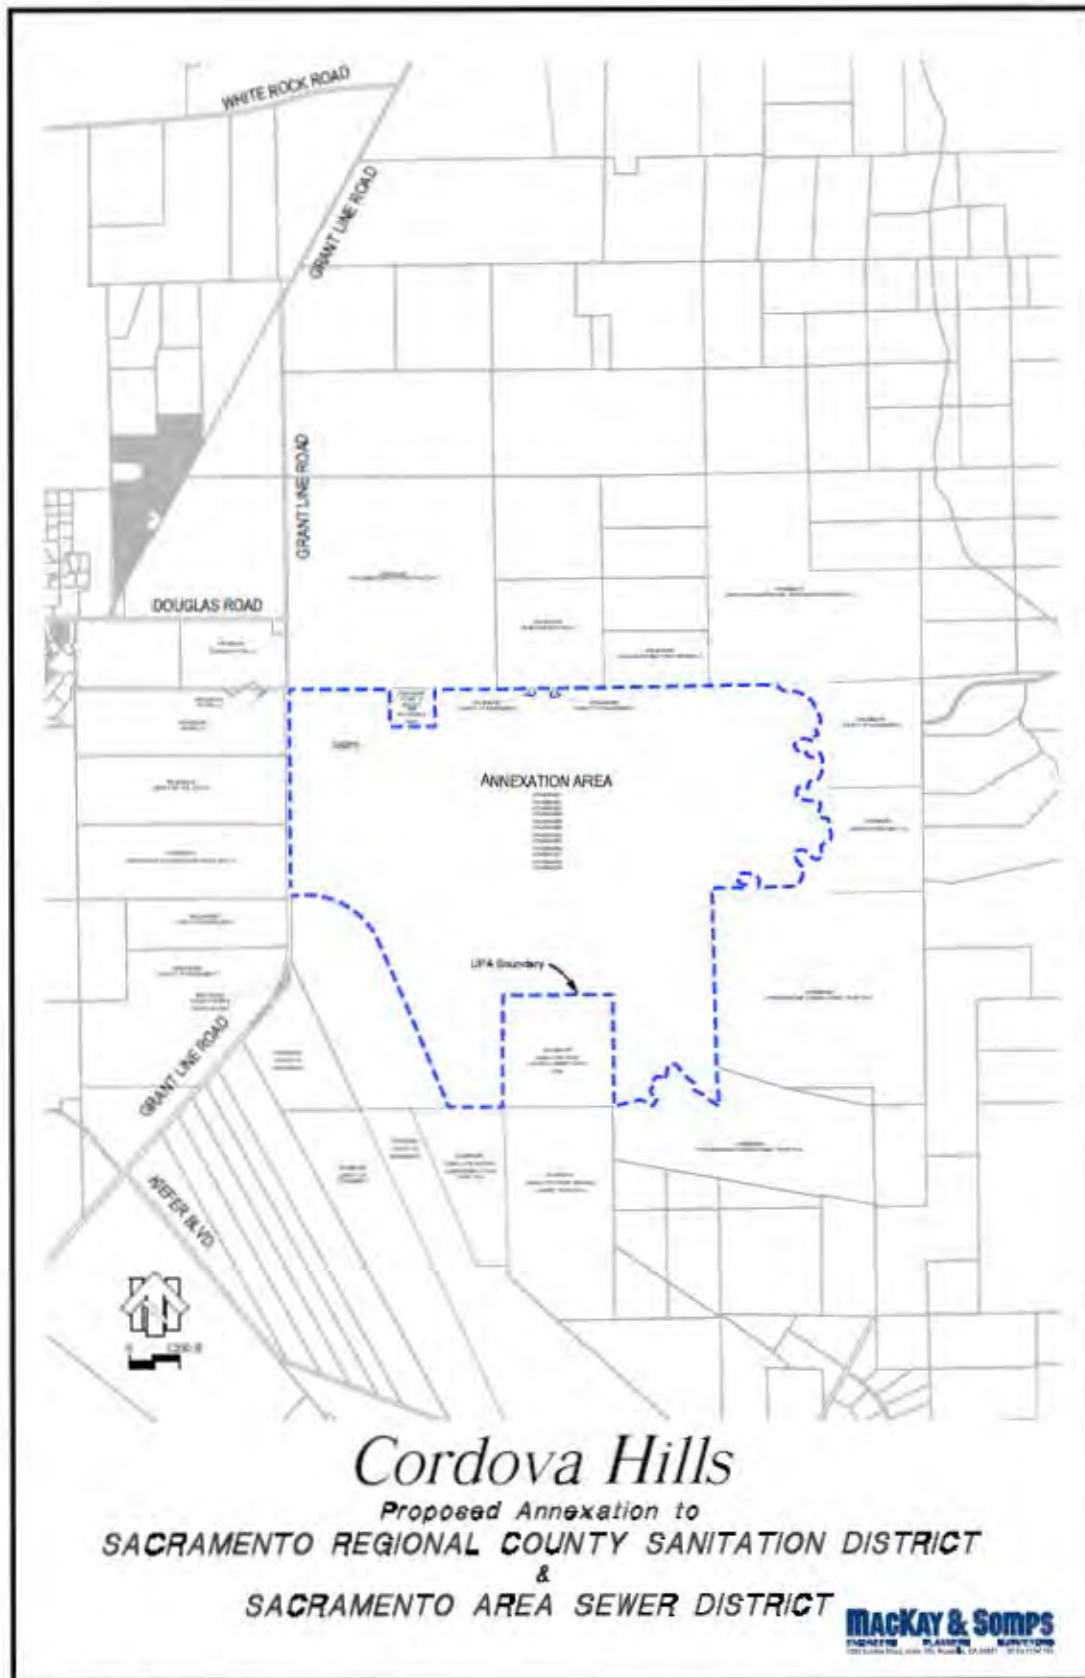

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

Peter Brundage
Executive Officer

Legal Description for CSA Formation and CSA-4B Detachment

Being a portion of Sections 13, 14, 22, & 23, Township 8 North, Range 7 East & a portion of Section 18, Township 8 North, Range 8 East, Mount Diablo Meridian, County of Sacramento, State of California, being more particularly described as follows:

Beginning at the Northwest corner of said Section 14, said corner being the **TRUE POINT OF BEGINNING;**

1. thence South 89°53'53" East along the North line of said Section 14 a distance of 2648.35 feet;
2. thence leaving said North line South 00°41'41" East along the West line of the Kellett property a distance of 987.11 feet;
3. thence North 89°43'47" East along the South line of said Kellett property a distance of 932.73 feet;
4. thence North 00°42'22" West along the East line of said Kellett property a distance of 981.05 feet to a point on the North line of said Section 14;
5. thence South 89°53'53" East along said North line a distance of 1694.42 feet to the Northeast corner of said Section 14;
6. thence North 89°04'12" East along the North line of said Section 13 a distance of 1706.57 feet;
7. thence leaving said North line South 00°55'48" East along the West line of Well Site #4 as described in Book 20090205, Page 0974 Official Records Sacramento County a distance of 200.00 feet;
8. thence North 89°04'12" East along the South line of said Well Site #4 a distance of 100.00 feet;
9. thence North 00°55'48" West along the East line of said Well Site #4 a distance of 200.00 feet to the North line of said Section 13;
10. thence North 89°04'12" East along said North line a distance of 839.33 feet to the North ¼ corner of said Section 13;
11. thence continuing along said North line North 89°06'59" East a distance of 2630.68 feet to the Northeast corner of Said Section 13;
12. thence North 88°53'52" East along the North line of said Section 18 a distance of 2933.82 feet ;
13. thence leaving said North line South 01°14'05" East along the West line of that certain real property as described in Book 3660, Page 633 Official Records Sacramento County a distance of 2639.82 feet to the Southwest corner of said property;
14. thence continuing South 01°14'05" East along the West line of that certain real property as described in Book 20080930, Page 0331, Official Records Sacramento county a distance of 2641.07 feet to the Southwest corner of said property coincident with the South line of said Section 18;

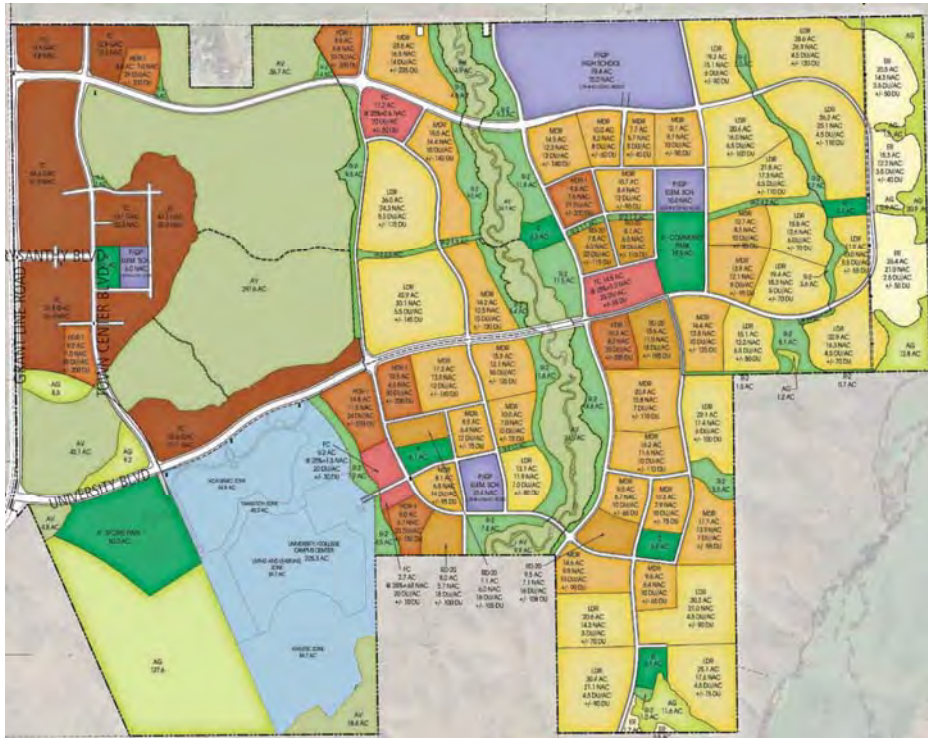

15. thence South 88°53'27" West along said South line a distance of 2917.90 feet to the southwest corner of said Section 18;
16. thence leaving said South line South 00°43'33" East along the East line of said Section 24 a distance of 5297.55 feet to the Southeast corner of said Section 24;
17. thence South 89°42'30" West along the South line of said Section 24 a distance of 2656.25 feet to the South $\frac{1}{4}$ corner of said Section 24;
18. thence North 00°48'17" West along the West line of the Southeast $\frac{1}{4}$ of said Section 24 a distance of 2634.97 feet to the Northwest corner of said Southeast $\frac{1}{4}$;
19. thence South 89°49'29" West along the South line of the northwest $\frac{1}{4}$ of said Section 24 a distance of 2662.82 feet to the West $\frac{1}{4}$ corner of said Section 24;
20. thence South 00°56'45" East along the East line of said Section 23 a distance of 2640.45 to the southeast corner of said Section 23;
21. thence South 89°34'49" West a distance of 2542.76 feet to the South $\frac{1}{4}$ corner of said Section 23;
22. thence South 89°32'16" West a distance of 1128.58 feet;
23. thence North 23°48'54" West a distance of 1525.00 feet;
24. thence North 23°24'29" West a distance of 875.00 feet;
25. thence North 23°37'04" West a distance of 1345.77 feet;
26. thence South 40°32'21" West a distance of 246.75 feet;
27. thence North 00°35'59" West a distance of 73.89 feet;
28. thence North 71°23'31" West a distance of 118.02 feet;
29. thence in a northerly direction with a non-tangent curve turning to the left with a radius of 2540.00 feet, having a chord bearing of North 13°20'05" East and a chord distance of 462.81, having a central angle of 10°27'16" and an arc length of 463.46;
30. thence North 00°35'59" West a distance of 1479.04 feet;
31. thence North 00°52'14" West a distance of 5273.59 feet; to the point of beginning.

Containing 2667.835 acres, more or less..

This Environmental Impact Report has been prepared pursuant to the California Environmental Quality Act of 1970 (Public Resources Code Division 13). An Environmental Impact Report is an informational document which, when this Division requires its preparation, shall be considered by every public agency prior to its approval or disapproval of a project. The purpose of an Environmental Impact Report is to provide public agencies with detailed information about the effect that a proposed project is likely to have on the environment; to list ways in which any adverse effects of such a project might be minimized; and to suggest alternatives to such a project.

TO: All Interested Parties

**SUBJECT: FINAL EIR FOR "CORDOVA HILLS"
(CONTROL NO: 2008-GPB-SDP-ZOB-AHP-00142)**

The subject Final Environmental Impact Report (FEIR) is attached for your review. The first Sacramento County Board of Supervisors hearing on the Project will be held in the Board of Supervisors Chambers, at 700 H Street in Sacramento, but the date has not been scheduled at this time. A notice of the date and time of the public hearing will be provided to all property owners within 500 feet of the Project site by the hearing body authorized to conduct the public hearing for the proposed project. Interested individuals not within this radius should contact the Clerk of the Board (<http://www.sccob.saccounty.net/pages/plan.html>) to be placed on the hearing notice mailing list. Interested individuals may also check the materials for upcoming hearings on the Sacramento County website (www.saccounty.net) by clicking on the Public Meetings link, and then on the Board of Supervisors Meeting Agenda link.

For questions about this environmental document, please contact Lauren Hocker or John Lundgren of this office at 874-7914.

Sincerely,

[Original Signature on File]

Catherine Hack,
Environmental Coordinator

EXECUTIVE SUMMARY AND MITIGATION MEASURES

The subject of this Environmental Impact Report (EIR) is a project known as Cordova Hills. The project is located on the eastern side of Grant Line Road, south of Glory Lane, in unincorporated Sacramento County.

The following environmental impact and mitigation summary table (*Table ES-1: Executive Summary of Impacts and Mitigation on page 2*) briefly describes the project impacts and the mitigation measures recommended to eliminate or reduce the impacts. The residual impact after mitigation is also identified. Immediately following the summary table is a description of mandated mitigation monitoring requirements (see *Mitigation Monitoring and Reporting Program on page 45*). Detailed discussions of each of the identified impacts and mitigation measures, including pertinent support data, can be found in the specific topic sections in the remainder of this report.

This report has identified project-related impacts associated with cultural resources, air quality (related to construction ozone precursors, toxic air contaminants, and odor), biological resources (bird species, western spadefoot toad, and plant species), hazardous materials (landfill gas migration), noise, and traffic and circulation (pedestrian/bicycle network, public transit, and some facilities) as potentially significant, which could be reduced to a less than significant level through inclusion of recommended mitigation measures.

This report identifies significant and unavoidable impacts related to aesthetics, air quality (related to construction particulate matter, operational ozone precursors, and implementation of the State Implementation Plan for ozone), biological resources (wetlands and vernal pool crustaceans), climate change, land use (SACOG Blueprint principles conflict), noise (substantial increases in existing ambient levels), public utility construction, and traffic and circulation (some facilities).

Impacts associated with agricultural resources, air quality (related to carbon monoxide emissions), geology and soils, hydrology and water quality, general land use, noise (Kiefer Landfill and Mather Airport), public services, and public utilities are considered less than significant.

Since publication of the DEIR, the university/college campus center portion of the Project has become an area of known controversy. At the time of the Project application, there was an identified tenant for the university use proposed as part of the Project. In July of 2011, the University of Sacramento announced that they were closing the University, and would no longer be the tenant on the Project site. As a result of this, there is now controversy over whether the university/college campus center should still be included as part of the Project. The basis of the controversy is the assertion that because a tenant is no longer identified that the proposed university/college campus center is a speculative use and/or that loss of this tenant should be treated as a change in the Project Description. The Sacramento Metropolitan Air Quality Management District has

commented that they no longer consider the Air Quality Mitigation Plan to be technically adequate because of this controversy.

The lead agency has considered these arguments, but has concluded that no portion of a Project can simply be excluded from analysis at the discretion of the EIR preparers; this could be characterized as an improper segmentation, as CEQA requires analysis of the whole of a Project (CEQA Guidelines Section 15378.a). The analysis examines the Project application which has been submitted to, and accepted by, the County. The Project Description identified and described the proposed use and the associated design standards proposed in the SPA Master Plan; none of these Project elements have been altered, and thus the Project Description has not changed. Furthermore, the identification of the end user of a project is not required under CEQA for purposes of the project's environmental analysis (see, *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 15 Cal.Rptr.3d 322; *American Canyon Community v City of American Canyon* (2006) 145 CalApp.4th 1062, 52 Cal.Rptr.3d 312; also see, *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004, 100 Cal.Rptr.2d 413.)

The applicant has proposed a university/college campus center as part of the Project, and has included a chapter in the SPA Master Plan which describes the proposed use. Any change to the proposed land use would require an SPA Amendment and environmental review pursuant to CEQA. Furthermore, mitigation requires that any SPA amendment include an analysis of the Air Quality Mitigation Plan and GHG Reduction Plan, to ensure that the performance criteria on which those plans are based will still be met despite the amendment. On these grounds, the FEIR still contains an analysis of the entire Project that has been proposed.

Table ES-1: Executive Summary of Impacts and Mitigation

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
AESTHETICS			
Degradation of Existing Views and Visual Quality			
The Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada significantly and negatively impacts the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed. The Project will substantially degrade the existing visual character and quality of the site.	S	None available.	SU
New Source of Light or Glare			
Project lighting will not result in sleep disruption or significant wildlife impacts, but will nonetheless introduce a substantial new source of light. This impact is not due to any individual feature or features, but due to the result of introducing a large urban development within a rural landscape. Though the impact cannot be made less than significant, usage of lighting fixtures that minimize glare and light trespass can reduce the impact to some degree.	S	AE-1. The SPA shall be amended to require all lighting applications subject to the 2008 Building Efficiency Standards Section 147 to use fixtures approved by the International Dark Sky Association.	SU

¹ PS = Potentially Significant S = Significant SU = Significant and Unavoidable LS = Less Than Significant

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
AGRICULTURAL RESOURCES			
<p>The proposed uses are permitted with approval of the Zoning Ordinance Amendment to adopt the Cordova Hills SPA, the Project does not convert the Unique Farmland outside of the USB to urban uses, and the land does not support intensive agricultural investment. Though there are soils that are considered prime when irrigated, the site is not irrigated. The Project will result in the loss of 8.6 acres of Unique Farmland and 242.4 acres of Grazing Land, which exceeds the 50-acre threshold established by the County; mitigation is required. The Project will not result in substantial conflicts with existing agricultural use of adjacent lands, though mitigation requiring deed notices is recommended.</p> <p>There is one existing Williamson Act Contract (72-AP-109) within the Project limits. The landowner initiated the non-renewal process for this contract in February 2007. Under the nonrenewal process the contract will expire in the year 2016, and the land will no longer be subject to Williamson Act contract restrictions. The Project proposal includes a large-lot subdivision map which would create parcels that range from less than an acre in size to approximately 35 acres, and also includes a rezone from an agricultural to an urban designation. In order to approve the subdivision map, the approval action would either need to be deferred until February 2013 (within three years of nonrenewal) or the Board of Supervisors would need to be make findings that the parcels can maintain agricultural use. In order to approve the rezoning, the approval action would need to stipulate that the zoning agreement will not become effective until 2016. Mitigation is included to ensure agricultural activities are maintained until expiration. Provided these actions take place, the Project would be consistent with the provisions of the Williamson Act.</p>	LS	<p>AG-1. <u>The applicant shall disclose to all</u> All prospective buyers of properties within 500 feet of the northern property boundary shall receive a recorded notice that would appear in the Title report that they could be subject to inconvenience or discomfort resulting from accepted farming practices as per provisions of the County Right-To-Farm Ordinance <u>and shall include a Note on all final maps disclosing the Right-To-Farm Ordinance.</u></p> <p>AG-2. The applicant shall enter into an agreement with an agricultural operator to maintain grazing use, or other more intensive use, on the land which is subject to Williamson Act contract 72-AP-109. Agricultural use shall be maintained until Williamson Act contract expiration. Documentation of this agreement shall be submitted to the Environmental Coordinator prior to approval of the zoning agreement for the Williamson Act contracted property.</p> <p>AG-3. Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, the applicant shall offset the loss of 8.6 acres of Unique Farmland and 242.4 acres of Grazing Land through 1:1 preservation of farmland within a permanent conservation easement. Preservation land must be in-kind or of similar resource value.</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
AIR QUALITY			
Construction Activities Would Increase NO_x Emissions			
The Project has the potential to result in significant impacts throughout most of the life of the Project, even after implementation of the Basic Construction Emission Control Practices and Enhanced Construction Emission Control Practices which are required by rule through the Sacramento Metropolitan Air Quality District (SMAQMD). Mitigation is included (which is in addition to the rules) to ensure that all subsequent projects which occur within the Project area conform to the SMAQMD mitigation and abatement requirements which are in effect at the time. This will offset Project emissions.	S	AQ-1. The following language shall be added to the SPA: All individual development projects shall implement Sacramento Metropolitan Air Quality Management District rules and mitigation pertinent to construction-related ozone precursor emissions, as defined by the most current version of the Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment.	LS
Operational Emissions of Ozone Precursors			
The Project will result in worst-case NO _x and ROG emissions of 415.22 pounds per day and 857.40 pounds per day, respectively, which is significantly above the threshold of 65 pounds per day. A mitigation plan is included to reduce emissions by 35%, but emissions will still exceed the threshold.	S	AQ-2. Comply with the provisions of the Air Quality Management Plan dated June 1, 2011, and incorporate the requirements of this plan into the Cordova Hills Special Planning Area conditions. <u>Also, the following text shall be added to the Cordova Hills SPA: “All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project and shall achieve the original 35% reduction in total overall project emissions. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.”</u>	SU

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Construction Activities Would Increase Particulate Matter Emissions			
Modeling conducted by SMAQMD has indicated that applying basic construction rules will ensure that impacts will not be significant provided that construction is limited to no more than 15 acres of active grading. On a project of this size, it is unreasonable to assume that construction will be limited to such a small area. The Project will generate particulate matter emissions which exceed thresholds.	S	None available.	SU
Conflict With or Obstruct Air Quality Plans			
The current State Implementation Plan (SIP) did not assume that the land east of Grant Line Road would develop, and thus even if the Project's emissions of ozone precursors were not significant, the Project would still conflict with implementation of the SIP.	S	Refer to AQ-2.	SU
Project Operation Would Generate CO Emissions			
Eighteen intersections would either be subject to degradation of LOS to a level of service E or worse, or add vehicles to an intersection already operating at an LOS of E or worse. Examining these facilities as compared to the SMAQMD screening methodology for CO impacts, Project traffic would not cause threshold exceedance.	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Project Operation Would Result in TAC Emissions			
<p>Using the published California Air Resources Board siting criteria for sources of toxic air contaminants (TAC) and sensitive receptors, there are no off-site TAC sources proximate to the sensitive receptors of the Project, and the Project will not generate TAC that would impact off-site sensitive receptors. The Project could result in exposure of proposed on-site uses to proposed on-site stationary source TAC, but mitigation is included to ensure that the siting of new uses conforms to ARB recommendations.</p>	PS	<p>AQ-3. <i>The following language shall be added to the SPA:</i></p> <p>Buffers shall be established on a project-by-project basis and incorporated during permit or project review to provide for buffer separations between sensitive land uses and sources of air pollution or odor. The California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective", or more current document, shall be utilized when establishing these buffers. Sensitive uses include schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency for people (this includes both single- and multiple-family). The buffers shall be applied to the source of air pollution or odor, and shall be established based either on proximity to existing sensitive uses or proximity to the property boundary of land designated for sensitive uses. Buffers current at the time of the establishment of this SPA indicate that sensitive uses should be:</p> <ul style="list-style-type: none"> A. A least 500 feet from auto body repair services. B. At least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons. C. At least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC, including furniture manufacturing and repair services. 	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Project Operation May Result in Exposure to Objectionable Odors			
<p>The Project is proximate to both the Boys Ranch and the Kiefer Landfill. The former facility includes wastewater treatment ponds. The facility is specifically prohibited from causing a nuisance odor condition, and nuisance odor is fully controllable through maintenance of aerated conditions in the ponds. Though based on historic operation of wastewater facilities in general and of this facility in specific it can be expected that there will be events when aeration fails (a pump malfunctions, for instance), it can also be expected that these will be infrequent events of short duration.</p> <p>Only considering the meteorological conditions and the proximity of the Project to the landfill, it would be likely that some significant odor impacts to the Project could occur; however, the SMAQMD Guide does provide further information regarding factors that can reduce odor impacts, if present. Kiefer Landfill has established an active gas-to-energy system that employs active gas extraction from the landfill for use in electrical generation. As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given the foregoing and the mitigation incorporated below, odor impacts are not expected to be substantial.</p>	PS	<p>AQ-4. Include in the SPA a requirement that the western perimeter of the Sports Park and University/College Campus Center (where these are within 2,000 feet of the Kiefer landfill) include a minimum 25-foot-wide landscaping area. This landscaping area shall include a dense mix of trees and shrubs, to screen the uses from the landfill. Acceptable tree species include those expected to reach minimum heights of 40 feet.</p>	LS
BIOLOGICAL RESOURCES			
Wetlands and Surface Waters			
<p>In total, there are approximately 89.11 acres of wetland resources on the Project site. The Project will result in the fill or dredge of 41.37 acres of wetlands on the site, which includes approximately 16 acres of vernal pool; three acres of seasonal wetland; 15 acres of seasonal wetland swale; six acres of intermittent drainage; and less than one acre of</p>	S	<p>BR-1. To compensate for the permanent loss of wetlands, the applicant shall perform one or a combination of the following prior to issuance of building permits, <u>and shall also obtain all applicable permits from the Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Central Valley Regional Water Quality</u></p>	SU

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
<p>seep, stock pond, and creek. Mitigation is required to offset these direct impacts, but given the extent of wetland loss (46% of the wetlands on the site) and the fact that this is in a Rank 1 Vernal Pool Recovery Plan area the mitigation is not sufficient to reduce impacts.</p> <p>Future development within the SPA could include amendments to the SPA which would modify the Avoided Area boundaries. This could result in additional incremental losses of needed uplands and/or wetlands, increasing the severity of what is already a significant impact in an area noted as vital to the recovery of vernal pool resources. For this reason, mitigation is also included which would require the establishment of a permanent conservation easement over all areas designed as Avoided.</p>		<p><u>Control Board, and the California Department of Fish and Game:</u></p> <p>A. Where a Section 404 Permit has been issued by the Army Corps of Engineers, or an application has been made to obtain a Section 404 Permit, the Mitigation and Management Plan required by that permit or proposed to satisfy the requirements of the Corps for granting a permit may be submitted for purposes of achieving a no net-loss of wetlands. The required Plan shall be submitted to the Environmental Coordinator, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service for approval prior to its implementation.</p> <p>B. If regulatory permitting processes result in less than a 1:1 compensation ratio for loss of wetlands, the Project applicant shall demonstrate that the wetlands which went unmitigated/uncompensated as a result of permitting have been mitigated through other means. Acceptable methods include payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.</p> <p>C. The Project applicant may participate in the South Sacramento Habitat Conservation Plan if it is adopted, and if the Project area and activities are covered. The applicant shall prepare Project plans in accordance with that Plan and any and all fees or land dedications shall be completed prior to construction.</p> <p>BR-2. Prior to issuance of building permits, all areas designated within the SPA as Avoided shall be placed within a permanent conservation easement, which shall be reviewed and approved by the Environmental Coordinator. At a minimum, the permanent conservation</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		easements must cover all areas which are required to be preserved as part of the Section 404 and Section 401 wetland permits.	
Special Status Species			
<i>Bird Species</i>			
<p>The following special status bird species are identified as having potential to occur on or near the Project site: burrowing owl, Cooper's hawk, ferruginous hawk, golden eagle, grasshopper sparrow, northern harrier, Swainson's hawk, tricolored blackbird, and white-tailed kite. Excluding the large avoided area and two adjacent smaller avoided areas on the western side of the site, the Project will result in the conversion of 2,120 acres of grassland habitat to urban uses (note that the central linear avoided area is not considered preserved for the purposes of Swainson's hawk habitat, which is why the mitigation requirement in BR-4 is higher than the total grassland lost). Except the tricolored blackbird, all of the species listed above use grasslands for foraging and/or nesting and will be impacted by Project development. The Swainson's hawk is the only Threatened species, and mitigation is included requiring 1:1 habitat mitigation. Mitigation of habitat for the benefit of the Swainson's hawk will also provide habitat compensation for other bird species.</p> <p>The Project site does not contain any trees for nesting, but there are offsite trees nearby; pre-construction nesting surveys have been included for tree-nesting raptors. Pre-construction nesting surveys are also included for burrowing owl (which is ground-nesting), and are also included for tricolored blackbird (for those areas which are within 300 feet of suitable habitat, such as cattail or blackberry).</p>	S	<p>BR-3. If construction, grading, or Project-related improvements are to occur between March 1 and September 15, a focused tree survey for <u>tree- or ground-</u>nesting raptors within 500 feet of the <u>construction site (1/2-mile for Swainson's hawk) and for ground-nesting grasshopper sparrow</u> shall be conducted by a qualified biologist within 14 days prior to the start of construction work (including clearing and grubbing). If active nests are found, the California Department of Fish and Game shall be contacted to determine appropriate protective measures. If no active nests are found during the focused survey, no further mitigation will be required.</p> <p>BR-4. Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, implement one of the options below to mitigate for the loss of Swainson's hawk foraging habitat on the Project site; based on current Project designs this is 2,267 acres. Based on current designs, this can be reduced to 2,231 acres of mitigation if the applicant establishes a permanent conservation easement over the areas designated Agriculture on the eastern and southeastern sides of the site (these are areas outside of the Urban Services Boundary). Foraging habitat preserved shall consist of grassland or similar habitat open habitat, not cropland, because this mitigation measure also offsets impacts to other species that do not use cropland habitat.</p> <p>A. The project proponent shall utilize one or more of the mitigation options (land dedication and/or fee payment)</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p>established in Sacramento County's Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code).</p> <p>B. The Project proponent shall, to the satisfaction of the California Department of Fish and Game, prepare and implement a Swainson's hawk mitigation plan that will include preservation of Swainson's hawk foraging habitat.</p> <p>C. Should the County Board of Supervisors adopt a <u>new</u> Swainson's hawk mitigation policy/program (which may include a mitigation fee payable prior to issuance of building permits) prior to the implementation of one of the measures above, the Project proponent may be subject to that program instead.</p> <p>If the design of the primary avoided area on the western plateau (currently 382 acres in size) is increased in size in response to Section 404 wetland permitting requirements, the total amount of mitigation land required may be adjusted downward to reflect this increased avoidance, at the discretion of the Environmental Coordinator.</p> <p>BR-5. Prior to construction activity (including site improvements, and building construction) focused surveys shall be conducted by a qualified biologist for burrowing owls in the construction area and within 500 feet of the construction area. Surveys shall be conducted no less than 14 days and no more than 30 days prior to commencement of construction activities. Surveys shall be conducted in accordance with "Burrowing Owl Survey Protocol and Mitigation Guidelines" published by The California Burrowing Owl Consortium (April 1993). The following shall also apply:</p> <p>A. If no occupied burrows are found in the survey area, a</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p>letter report documenting survey methods and findings shall be submitted to the County and no further mitigation is necessary.</p> <p>B. If an occupied burrow is found the applicant shall contact the Environmental Coordinator and consult with the California Department of Fish (CDFG), prior to construction, to determine if avoidance is possible or if burrow relocation will be required.</p> <p>C. If owls are to remain on-site, a minimum of 6.5 acres of foraging habitat for each occupied burrow needs to be permanently preserved according to California Department of Fish and Game guidelines. In addition, no activity shall take place within <u>160 feet</u> of an active burrow from September 1 to January 31 (wintering season) or <u>250 feet</u> from February 1 through August 31 (breeding season). Protective fencing shall be placed, at the distances above, around the active burrows and no activity shall occur within the protected buffer areas. Permanent improvements shall be a minimum of 250 feet from an occupied burrow.</p> <p>D. Any impact to active owl burrows, relocation of owls, or mitigation for habitat loss shall be done in accordance with the Fish and Game "Staff Report on Burrowing Owl Mitigation" (October 17, 1995) or the version current at the time of construction. Written evidence from Fish and Game staff shall be provided to the Environmental Coordinator attesting to the permission to remove burrows, relocate owls, or mitigate for lost habitat, and shall include a plan to monitor mitigation success.</p> <p>BR-6. If construction occurs between March 1 and July 31 pre-construction surveys for nesting tricolored blackbirds shall be performed by a qualified biologist. Surveys shall</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p>include the project construction site and areas of appropriate habitat within 300 feet of the construction site. The survey shall occur no longer than 14 days prior to the start of construction work (including clearing, grubbing or grading). The biologist shall supply a brief written report (including date, time of survey, survey method, name of surveyor and survey results) to the Environmental Coordinator prior to ground disturbing activity. If no tricolored blackbird were found during the pre-construction survey, no further mitigation would be required. If an active tricolored blackbird colony is found on-site or within 300 feet of the project construction site the project proponent shall do the following:</p> <p>A. Consult with the California Department of Fish and Game to determine if project activity will impact the tricolored blackbird colony(s), and implement appropriate avoidance and impact minimization measures if so directed. Provide the Environmental Coordinator with written evidence of the consultation or a contact name and number from the California Department of Fish and Game.</p> <p>B. The applicant may avoid impacts to tricolored blackbird by establishing a 300-foot temporary setback with fencing that prevents any project activity within 300 feet of the colony. A qualified biologist shall verify that setbacks and fencing are adequate and will determine when the colonies are no longer dependent on the nesting habitat (i.e. nestlings have fledged and are no longer using habitat), which will determine when the fencing may be removed. The breeding season typically ends in July.</p>	
Amphibians			

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
<p>The Project site contains suitable breeding habitat and suitable upland habitat for the western spadefoot toad. The latter species has been observed within the site. The Project will result in loss of approximately 19 acres of seasonal wetlands and vernal pools which are potential breeding habitat for the species, for which 1:1 mitigation is required pursuant to County policies regarding wetland loss.</p> <p>Western spadefoot, a Species of Concern, has been observed in several counties across the state, and a number of sites with suitable habitat for western spadefoot are already being protected. Additionally, 23 vernal pool species are federally protected; preservation efforts for those species and associated habitats will contribute to the conservation of the western spadefoot. While a localized population of the toad may be reduced through development of the Project site, the regional population will not be reduced significantly for the reasons stated above.</p>	LS	Refer to Mitigation Measure BR-1.	LS
<i>Invertebrates</i>			
<p>The site contains wetlands suitable for the California linderiella, midvalley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Published protocols for the vernal pool fairy shrimp and vernal pool tadpole shrimp contain survey requirement for determining absence, and mitigation to be applied in case of presence or if presence is being assumed. These same measures are applied to the Species of Concern, California linderiella and midvalley fairy shrimp as well. Mitigation being required for these species will also serve to provide mitigation for the Ricksecker's water scavenger beetle, which uses the same habitats. Though in-kind mitigation will be required for the loss of habitat on the site, the loss of 46% of the wetlands on the site within an area identified as vital to the recovery for vernal pool habitats and their dependent species is</p>	S	<p>BR-7. Presence of California linderiella, midvalley fairy shrimp, vernal pool fairy shrimp and vernal pool tadpole shrimp shall be assumed unless determinate surveys that comply with U.S. Fish and Wildlife protocol conclude that the species are absent. If the protocol surveys are performed and all listed crustacean species are absent, Ricksecker's water scavenger beetle may also be presumed absent, and no further mitigation shall be required for listed vernal pool invertebrates. If species are found, one or a combination of the following shall apply:</p> <p>A. <i>Total Avoidance: Species are present or assumed to be present.</i> Unless a smaller buffer is approved through formal consultation with the Fish and Wildlife Service, construction fencing shall be installed a minimum of 250 feet from all delineated vernal pool</p>	SU

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
significant even with mitigation.		<p>margins. All construction activities are prohibited within this buffer area. For all vernal pools where total avoidance is achieved, no further action is required.</p> <p>B. <i>Compensate for habitat removed.</i> Obtain all applicable permits from the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, California Department of Fish and Game, and the Central Valley Regional Water Quality Control Board for any proposed modifications to vernal pools and mitigate for habitat loss in accordance with the Biological Opinion and Section 404 permits obtained for the Project. At a minimum, mitigation ratios shall be consistent with County General Plan Policy, which requires no net loss of wetland resources. Any vernal pool loss not mitigated through the permitting process shall be mitigated for by payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.</p>	
<i>Plants</i>			
<p>The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc. The special status plant surveys revealed two special status species present on the Project site: legenere and Sacramento Orcutt grass. The wetlands containing these plants are located within Avoided Areas, but given the proximity of these wetlands to development areas, mitigation requires additional measures be implemented to control invasive species and to avoid pollution runoff from urban activities.</p>	PS	<p>BR-8. If construction activities encroach within the 250-foot buffer for vernal pools 358, 363, 370, 426 or 511 the applicant shall prepare a pesticide and pollution prevention plan. The plan shall include measures to reduce pollution run-off, pesticide drift, and other similar potential contaminates, to protect surrounding preserve areas from urban contaminates. Measures shall include the implementation of best management practices (e.g. straw wattles, silt fencing, and soil stabilization) for stormwater control. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.</p> <p>BR-9. The project applicant shall prepare an invasive species</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p>removal and prevention plan. The plan shall provide methods to remove invasive species from preservation areas and to restore the affected wetland features. The plan shall include methods for the prevention of the introduction of new invasive species from landscapes associated with the development. Minimum components of such a plan shall include: mapping of existing invasive plant populations within the avoided areas, with the map being updated a minimum of every five years; a description of acceptable methods for removing invasive species, examples of which include hand removal or biological controls (e.g. natural parasites); and a prohibition on the use of non-native plants within either the avoided areas or the Recreation-2 areas. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
CLIMATE CHANGE			
<p>In concert with state and federal activities, the design features of the SPA are intended to offset the Project climate change impact. Ideally, this mitigation would reduce the Project emissions and climate change impacts to levels that are not cumulatively significant, but there are many unknown variables and implementation challenges. Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling this analysis concludes that Project impacts may remain significant.</p> <p>The effects of climatic changes on the Sacramento region are potentially significant, and can only be mitigated through both adaptation and reduction strategies. By requiring mitigation of projects that may result in significant greenhouse gas emissions, and by adopting County programs and changes in government operations, the County is implementing all feasible strategies to reduce the effects of climate change on the region. Nonetheless, it is probable that these strategies will not be sufficient to offset all of the impacts of climate change, and that some of these impacts will be significant.</p>	S	<p>CC-1. The following text shall be added to the Cordova Hills SPA: All amendments to the SPA <u>with the potential to change SPA-wide GHG emissions</u> shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on <u>SPA-wide</u> greenhouse gas emissions. The Amendment shall not increase <u>SPA-wide</u> greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). <u>If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, in consultation with SMAQMD.</u></p>	SU
CULTURAL RESOURCES			
<p>The project area contains three historic era sites, and a fourth historical site that is included in a multi-component site. One prehistoric bedrock mortar station site and one prehistoric component of a multi-component site were discovered in the project area. None of the sites are associated with any important persons or events in California or national history. They are not considered to be unique and do not represent the work of a master or possess high artistic values. In all cases, the historic sites lack sufficient cultural material to address research questions. All of the historic sites were evaluated as not eligible under any criteria for the National Register of</p>	PS	<p>CR-1. If subsurface deposits believed to be cultural or human in origin are discovered during construction, then all work must halt within a 200-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for prehistoric and historic archaeology, shall be retained at the Applicant's expense to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
<p>Historic Places or the California Register of Historical Resources and are not considered a historical resource or unique archeological resource as defined by CEQA. There always remains a potential to encounter buried or as yet undiscovered resources during land clearing and construction work. Mitigation is included to ensure that such resources are treated appropriately if discovered.</p>		<p>American Heritage Commission shall be followed, and the monitor shall be retained at the Applicant's expense.</p> <p>Work cannot continue within the 200-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources.</p> <p>If a potentially-eligible resource is encountered, then the archaeologist, the Environmental Coordinator, and project proponent shall arrange for either 1) total avoidance of the resource, if possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to the Environmental Coordinator as verification that the provisions of CEQA for managing unanticipated discoveries have been met.</p> <p>In addition, pursuant to Section 5097.97 of the State Public Resources Code and Section 7050.5 of the State Health and Safety Code, in the event of the discovery of human remains, all work is to stop and the County Coroner shall be immediately notified. If the remains are determined to be Native American, guidelines of the Native American Heritage Commission shall be adhered to in the treatment and disposition of the remains.</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
GEOLOGY AND SOILS			
<p>Multiple topics were examined: soil erosion, expansive soils, naturally occurring asbestos, mineral resources, and geologic hazards. The Project has the potential to increase soil erosion due to disturbance of onsite soils, and some of the soils in the Project area have a high shrink-swell potential. There are existing regulations in place to address both of these issues, including the Sacramento County Land Grading and Erosion Control Ordinance, the Uniform Building Code, and the California Building Code. The Project site is not considered likely to include asbestos-containing soils, and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site, and furthermore, the Project includes a plan to use whatever suitable rock deposits are found on the site to serve Project construction needs; the Project will not obstruct access to mineral resources. Seismic ground-shaking hazards are low in Sacramento County, and existing building codes require adherence to seismic design standards.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
HAZARDOUS MATERIALS			
<p>The site was assessed for on-site hazardous conditions, and this assessment concluded that there is no evidence of any recognized hazardous conditions that may have a significant adverse effect on the development of the project site. There are three agency-listed contaminated sites within approximately one mile of the project site. These include the Sacramento County Boys Ranch (a juvenile correction facility within 1,000 feet of the eastern Project boundary), Aerojet (located just over a mile to the northwest), and the Kiefer Landfill (located approximately 2,000 feet to the south). The Boys Ranch hazardous condition was remediated and the case closed. Aerojet remediation activities are ongoing. Contaminated soils from Aerojet would not affect the Project, as these are off-site, while the groundwater contamination plumes are migrating away from the Project area. Groundwater contamination at Kiefer Landfill is likewise migrating away from the Project site. The Project will also be using public water provided through the Sacramento County Water Agency, not groundwater. Landfill gas migration from Kiefer Landfill also appears not to affect the site, but a mitigation measure is nonetheless included for the small portion of the site outside of the Urban Services Boundary that is within the 2,000 foot buffer established around the Kiefer Landfill.</p>	PS	<p>HM-1. Any structure within the project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety or the environment) within 1,000 feet of buried waste or proposed buried waste at Kiefer Landfill (refer to Plate HM-2 of the EIR) shall be continuously monitored <u>by the owner/operator of said structure</u> for landfill gas and be designed and constructed to prevent landfill gas accumulation in those structures.</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
HYDROLOGY AND WATER QUALITY			
7Hydrology			
<p>The Project included a Drainage Master Plan which evaluated the on- and off-site floodplains, the potential for hydromodification of stream channels, and the adequacy of existing and planned stormwater infrastructure. The existing floodplains on the site will be within the Avoided Areas where no development will occur, and detention basins have been included to ensure that the post-Project flow rates do not exceed pre-Project rates. Put in general terms, the design to prevent hydromodification is a detention basin outlet control structure which retains all stormwater runoff generated up to a 10-year event and slowly releases the runoff through a very small outlet. The Project also includes stormwater infrastructure which is sufficient to handle flows.</p>	LS	None required.	LS
Water Quality			
<p>Compliance with adopted Ordinances and standards will ensure that future development projects implemented as a result of Project approval will not cause violation of a water quality standard or waste discharge requirement, result in substantial erosion or siltation, and will not result in substantial increases to polluted runoff associated with construction. Compliance with the County Stormwater Ordinance, implementation of Low Impact Development Standards, and implementation of the Drainage Master Plan will ensure that development of the site will not alter the course of local waterways in a manner that results in substantial erosion or siltation, will not cause violation of a water quality standard or waste discharge requirement, and will not result in substantial increases to polluted runoff.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
LAND USE			
Conflict With Adopted Land Use Plans			
The Project uses are compatible with surrounding existing and proposed land use plans, and would not result in substantial conflicts with land use plans designed to avoid environmental effects.	LS	None required.	LS
Conflict With the SACOG Blueprint and General Plan Policy			
The Project includes a wide variety of transportation choices, an array of housing choices, a mix of uses, compact community design, and fosters a sense of place. While acknowledging that in terms of internal community design the Project appears to be an excellent example of “smart growth” development and is consistent with relevant General Plan policies, it must also be acknowledged that the Project conflicts with the principles with respect to the preservation of open space and the proximity to existing developed communities. In terms of open space preservation, the analysis is somewhat subjective, and the Project has directed preservation toward the most sensitive vernal pool areas of the site. In terms of directing development toward existing communities, the conflict is more clear. Though projected for future development, the Blueprint envisions growth occurring from the existing city centers outward rather than the reverse. This is a fundamental underpinning to the Blueprint, and as a result, the Project's inconsistency with this principle is considered substantial.	S	None available.	SU

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Conflict with General Plan Growth Management Policy			
A project must be consistent with LU-120 before it may be considered for approval. The Planning Division has reviewed the Project for consistency with LU-120 and has found in the affirmative. The Project has been deemed consistent with criteria PC-1 through PC-10, and has achieved a total of 21 points in the criteria-based standards (CB-1 through CB-5). A total of 18 points is required and 24 points are possible. Given that the Project has been deemed consistent, Project impacts related to conflict with growth management policy are <i>less than significant</i> .	LS	None recommended.	LS
Conflict With General Plan Policies Related to Growth Inducement			
The Project is inconsistent with Policy LU-1, and includes a General Plan Amendment to address this inconsistency. The General Plan Amendment includes language specifically intended to avoid growth-inducing impacts.	LS	None required.	LS
Conflict With General Plan Policies Related to Public Services and Utilities			
Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The Project includes a facilities financing plan which was submitted to all of the applicable service entities for review and approval. Long-term funding sources have been identified for the maintenance of public services. The Project will not result in any substantial environmental impacts related to conflict with General Plan policies which pertain to public services or utilities.	LS	None required	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Conflict With General Plan Policies Related to Air Quality and Transportation			
The Project results in significant impacts related to both transportation and air quality, but these impacts are not due to General Plan Policy inconsistency. The Project is consistent with policies intended to alleviate air quality and transportation impacts.	LS	None required.	LS
Conflict with General Plan Policies Related to Land Use Compatibility			
Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development. The Project is adjacent to two existing uses, the Boys Ranch and Kiefer Landfill, with the potential to result in conflicts. For the Boys Ranch, the distance from the majority of the site and the topographical changes between the site and the Boys Ranch act as a natural barrier. For the Kiefer Landfill, distance from the site combined with existing regulations for landfills will prevent substantial impacts. For both facilities, there remains the potential for nuisance impacts. For this reason, mitigation is included requiring disclosure of the facilities to prospective buyers.	LS	<p>LU-1. The location and nature of the Sacramento County Boys Ranch facility shall be disclosed to all prospective buyers of estate-residential properties.</p> <p>LU-2. The location and nature of the Kiefer Landfill facility shall be disclosed to all prospective buyers of properties within one mile of the ultimate active landfill boundary. <u>The disclosure notice shall include:</u></p> <p>A. <u>A statement substantially consistent with the following: “The landfill will expand in height and land area over time, and thus the visibility and proximity of the landfill from the property at the time of purchase does not reflect how visible or proximate the landfill will be in the future.” This statement shall be supplemented with relevant facts about ultimate landfill design, including the distance of the property to the ultimate planned edge of the landfill waste disposal area to the nearest 100 feet and the ultimate planned height of the landfill (as set forth in the Solid Waste Facilities Permit).</u></p> <p>B. <u>Notification that the landfill operates under a Solid Waste Facilities Permit and is required to control pests, vectors, litter, and odor to the extent</u></p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p><u>practicable, but that it is not possible to eliminate all of these nuisances. For this reason, property owners may experience some of these nuisance conditions.</u></p> <p>C. <u>Notification that the active landfill area is lighted at night.</u></p>	
Division/Disruption of An Established Community			
<p>The division or disruption of an established community is an impact considered by CEQA. Case law has established that a project must create physical barriers within the established community in order to be considered under this impact category. There is no existing development on the project site, nor are there developments north, south, or east of the site that could be divided or disrupted by the project. Furthermore, the Project includes stub streets so that if there is development north or south of the site in the future, those uses could connect into the Project. The project will not disrupt or divide an established community.</p>	LS	None required.	LS
Displacement of Housing			
<p>There is no existing housing on the Project site that could be displaced by the project, nor would the project uses cause the displacement of nearby housing. The site is not included in the affordable housing inventory as part of implementation of the Sacramento County General Plan Housing Element.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
NOISE			
Construction Noise			
It is acknowledged that construction related noise could be a nuisance to sensitive receptors; however, this increase in noise is short-term, and noise standards are intended to address long-term sources of noise. Construction-related noise would not result in a permanent increase in ambient noise. Though noise volumes would undergo short-term increases, the existing construction ordinance is designed to avoid significant community effects through the restriction of nighttime and weekend disturbance.	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Traffic Noise			
<p>Traffic on the internal Project roadways and on Grant Line Road will generate noise that has the potential to exceed General Plan noise standards related to both residential and non-residential uses. Mitigation is included to ensure that future subdivisions and non-residential developments are constructed in a manner that achieves compliance with General Plan standards.</p>	S	<p>NO-1. All residential development projects exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels to within General Plan Noise Element standards for exterior activity areas. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.</p> <p>NO-2. All residential development projects exposed to greater than 70 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to achieve an interior noise level of 45 dB L_{dn} or less. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the site.</p> <p>NO-3. Non-residential development projects such as churches, libraries, meeting halls, and schools exposed to greater than 60 dB L_{dn}, and all non-residential development projects such as transient lodging, hospitals and nursing homes, and office buildings exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall demonstrate that interior noise volumes will not exceed General Plan Noise Element standards for non-</p>	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
		<p>residential uses exposed to traffic noise. This may be accomplished by providing documentation that the type of use is within acceptable limits based on the location of the identified noise contours and assuming standard exterior-to-interior attenuation of 25 dB. If this cannot be demonstrated, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. The measure does not apply to commercial uses.</p> <p>NO-4. All parks exposed to noise volumes in excess of 70 dB (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels within park activity areas (benches, play structures, etc) to within General Plan Noise Element standards for parks. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. For barrier and other structural options, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.</p>	

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
On-Site Stationary and Community Noise			
<p>The Project includes uses which include noise-generating sources such as playing fields, loading docks, a corporation yard, and other uses. Mitigation is included to require that all such uses located adjacent to residential lands be designed so as not to cause the General Plan standards to be exceeded.</p>	S	<p>NO-5. All non-residential development projects located adjacent to residentially designated properties shall be designed and constructed to ensure that noise levels generated by the uses do not result in General Plan Noise Element standards being exceeded on adjacent properties. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the non-residential projects with the potential to generate substantial noise (e.g. car wash, auto repair, or buildings with heavy-duty truck loading docks) if those uses are adjacent to residentially designated properties. The acoustical analysis shall include, but not be limited to, consideration of potential noise conflicts due to operation of the following items:</p> <ul style="list-style-type: none"> • Outdoor playing fields; • Mechanical building equipment, including HVAC systems; • Loading docks and associated truck routes; • Refuse pick up locations; and • Refuse or recycling compactor units. 	LS
Kiefer Landfill Noise			
<p>All sensitive uses are located a sufficient distance from the landfill to avoid substantial noise exposure. Noise at the university/college campus center (the nearest area where residences would be located) would be 44 dB, which is well within standards.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Substantial Increase in Existing Ambient Noise			
<p>The Project would result in a substantial increase in existing ambient noise for multiple roadway segments, but only two of these include receptors which would be impacted: Sunrise Boulevard and Douglas Boulevard. Noise volumes would be increased by 2 dB on Sunrise Boulevard and by 7 dB and 10 dB along Douglas Boulevard. Based on the existing noise environments, these are substantial increases. On Sunrise Boulevard, a noise barrier is not appropriate because businesses rely on visibility to attract customers, and on Douglas Road a barrier is already present. Thus, no further improvements can be made to reduce impacts.</p>	S	None available.	SU

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Mather Airport			
<p>The project site is located approximately four miles east of Mather Airport. Although the project site is located outside the 60 dB CNEL contour of Mather Airport, the project site is located within the overflight path of approaching and departing aircraft that fly below 3,000 feet above ground level. During an average one-month time period, a very small percentage of total departure (two percent) and arrival (eight percent) flights are passing over the project site and there is less than 15 percent of the total touch-and-go flights passing over the project site. Though the Project will not expose people to excessive aircraft noise, continued and future use of Mather Airport has the potential to be a nuisance and generate objections by residents and other sensitive receptors. An Avigation Easement to inform future potential residential buyers will be required to help reduce the impact to Mather Airport from new complaints by future residents or other sensitive receptors of the proposed Project; these various conditions are included as mitigation.</p>	LS	<p>NO-6. The following conditions will be required to ensure adequate disclosure of Mather Airport operations:</p> <ol style="list-style-type: none"> 1. Notification in the Public Report prepared by the California Department of Real Estate shall be provided disclosing to prospective buyers that the parcel is located within the applicable Airport Planning Policy Area and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level. 2. Avigation Easements prepared by the Sacramento County Counsel's Office shall be executed and recorded with the Sacramento County Recorder on each individual residential parcel contemplated in the development in favor of the County of Sacramento. All Avigation Easements recorded pursuant to this policy shall, once recorded, be copied to the director of Airports and shall acknowledge the property location within the appropriate Airport Planning Policy Area and shall grant the right of flight and obstructed passage of all aircraft into and out of the appropriate airport. 	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
PUBLIC SERVICES			
Fire Protection			
<p>The Project site is located within an area of Sacramento County designated as a State Responsibility Area (SRA) by the California Department of Forestry and Fire Protection (CAL FIRE), and has been assigned a moderate fire hazard severity risk rating (the lowest fire hazard rating applied to SRAs). The site will be served by the Sacramento Metropolitan Fire District, which will need up to two fire stations on the site. The Project will be subject to the building standards and regulations of CAL FIRE and the Sacramento Metropolitan Fire District, and these regulations will be sufficient to ensure adequate protection.</p>	LS	None required.	LS
Police Protection			
<p>The Project is within the service area of the Sacramento County Sheriff's Department (SSD) and will increase the demand for SSD services. According to SSD, the development of the Project will "not likely necessitate the construction of additional police facilities". In order to meet staffing ratios, SSD would need to add 16 staff members. Law enforcement services will be funded through the County General Fund and through County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax, which will be levied on each new home. Existing funding mechanisms, policies and regulations will ensure that the Sheriff's Department can adequately serve the new growth.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Solid Waste			
An annual total of 18,592 tons of waste will require landfill disposal, and a total of 25,241 tons of construction debris will need to be disposed of in the Kiefer Landfill. The Sacramento County Department of Waste Management and Recycling has indicated that landfill capacity is adequate to support the waste disposal needs generated by the Project.	LS	None required.	LS
Schools			
Student enrolment resulting from the Project will be approximately 4,686 total students, with approximately 2,553 of these in grades K – 6 (elementary school), 748 in grades 7 – 8 (middle school), and 1,384 in grades 9 – 12 (high school). The Project will generate the need for three elementary schools but only about 62% of a middle/high school; the land use plan includes these school sites. Elk Grove Unified School District (EGUSD) Facilities and Planning Department staff (K. Williams) has indicated that EGUSD has been working with the Project proponents to be sure that adequate school facilities can be accommodated within the Project area and is satisfied with the proposed development and financing plans for the needed schools.	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Parks and Recreation			
<p>The Project area is located within CSA 4b which is staffed by the Sacramento County Regional Parks Department (Parks Department). The Project area will be detached from the CSA 4b, and will be provided park and recreation services under the proposed Cordova Hills <u>LSD</u> CSD; discretionary action by LAFCo is required for the detachment and formation actions. The Project generates a need for approximately 107 acres of parkland, and provides approximately 99 acres of formal parks and 150 acres of informal recreation areas (paseos, trails, etc) which may receive partial credit. The Parks Department has reviewed the plans and deemed them adequate.</p>	LS	None required.	LS
Libraries			
<p>The Cordova Hills SPA indicates that a new full service, 15,000 square foot branch library is planned within the proposed Town Center to serve the Cordova Hills community as well as residents in the surrounding area. According to the Sacramento Public Library Authority Facility Master Plan 2007 – 2025 (Library Master Plan), the proposed library size is adequate to serve the demands generated by the Project at buildout. The Project includes a funding mechanism for a new library that is of sufficient size to accommodate the expected population of the Project, which has been developed in coordination with the Sacramento Public Library System.</p>	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
PUBLIC UTILITIES			
Construction Impacts			
Water, sewer, and dry utility lines constructed within the Project boundaries would not cause any additional utility-specific construction impacts, as utility construction will occur within areas that will already urbanize as part of the Project. Most of the off-site utility lines are shown within areas already proposed for utility construction as part of service provider master planning documents. There are some improvement areas which have not already been studied or approved, and which are likely to contribute to wetland impacts and impacts to associated species.	S	Measures AQ-1, BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1 apply.	SU
Adequacy of Water Supply			
The projected annual water demand for the entire Project is 6,549.9 acre feet per year (AFY), including system losses. The Project will be served by the Sacramento County Water Agency (SCWA) Zone 40, which has total maximum water supply to Zone 40 of 102,151 AFY. There is sufficient capacity to serve the Project.	LS	None required.	LS
Adequacy of Sewage Disposal			
The Project will result in an average dry weather flow of 4.99 million gallons per day (mgd). The peak wet weather flow for Project buildout is 10.41 mgd. The Sacramento Regional Wastewater Treatment Plan has a permitted average dry weather flow (ADWF) design capacity of 181 mgd and wet weather flow (AWWF) of 392 mgd. The plant receives and treats approximately 141 mgd ADWF (Seyfried, 2008). The Project disposal demand can be met by this existing capacity.	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
Adequacy of Energy Services			
The estimated annual residential and commercial electricity demand for the Project will be 122,903,000 kilowatt hours and that the estimated annual residential and commercial natural gas demand for the Project will be 4,201,494 therms. The California Energy Commission's Energy Consumption Data Management System reports that 10,691.67 million kilowatt hours of energy and 315.57 million therms were consumed within Sacramento County in the year 2010. The estimated energy usage of the Project is substantially less than the annual energy production for either SMUD or PG&E.	LS	None required.	LS
Exceed Sustainable Groundwater Yield			
A long-term average annual yield of 40,900 AFY of groundwater has been identified in both the Water Forum Agreement (WFA) and Water Supply Master Plan for SCWA in the Central Basin. Additionally, as a signatory to the WFA and a member of the Sacramento Central Groundwater Authority (Groundwater Authority), SCWA recognizes the Water Forum-defined long-term sustainable average annual yield of the underlying groundwater basin of 273,000 AFY. The additional groundwater draw caused from implementation of the proposed Project will not result in exceedance of the agreed-upon sustainable yield of 273,000 AFY.	LS	None required.	LS
Groundwater Recharge			
The central intermittent drainage on the site is mapped as an area of high groundwater recharge potential. This area is being retained within open space in the Project, and will not be subject to direct impacts.	LS	None required.	LS

Impacts	Level of Significance Before Mitigation ¹	Mitigation Measure	Level of Significance After Mitigation
TRAFFIC AND CIRCULATION			
Existing Plus Project			
<p>The Project results in significant impacts to six County intersections, ten City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, two County roadway segments, one City of Elk Grove roadway segment, eleven City of Rancho Cordova roadway segments, two US 50 freeway segments, and bicycle and pedestrian facilities. Mitigation is included which will improve operating conditions to acceptable levels for most of these facilities, but there are some impacts for which no feasible mitigation exists. These are: the Zinfandel and US 50 freeway ramp intersection and Sunrise Boulevard from US 50 to White Rock Road. Furthermore, the County does not have land use authority in other jurisdictions, and cannot guarantee that non-County facilities will be constructed.</p>	S	<p>TR-1. The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.</p> <p>A. <i>Bradshaw Road and Jackson Road</i> – Provide a second westbound through lane.</p> <p>B. <i>Mather Boulevard and Douglas Road</i> – Construct a new traffic signal. Provide a shared through-right turn lane on the northbound approach; provide a separate left turn lane and a through lane on the southbound approach; and a provide separate left turn lane and a separate right turn lane on the westbound approach.</p> <p>C. <i>Eagles Nest Road and Jackson Road</i> – Construct a new traffic signal. Provide a left turn lane and a through-right turn shared lane on the northbound and southbound approaches.</p> <p>D. <i>Grant Line Road and Sunrise Boulevard</i> – Provide a separate southbound right turn lane so the southbound approach has one left turn lane, one through lane and one right turn lane.</p> <p>E. <i>Grant Line Road and White Rock Road</i> – Construct a new Modify the intersection and traffic signal to provide dual left turn lanes and a separate two through</p>	SU

TERMINOLOGY USED IN THIS EIR

This Draft EIR uses the following terminology to describe environmental effects of the project.

- **Significance Criteria.** A set of criteria used by the lead agency to determine at what level, or “threshold,” an impact would be considered significant. Significance criteria used in this EIR include those that are set forth in the CEQA Guidelines, or can be discerned from the CEQA Guidelines; criteria based on factual or scientific information; criteria based on regulatory standards of local, state, and federal agencies; and criteria based on goals and policies identified in the Sacramento County General Plan.
- **Less-than-Significant Impact.** A project impact is considered less than significant when it does not reach the standard of significance and would therefore cause no substantial change in the environment. No mitigation is required for less-than-significant impacts.
- **Potentially Significant Impact.** A potentially significant impact is a substantial, or potentially substantial, adverse change in the environment. Physical conditions which exist within the area will be directly or indirectly affected by the proposed project. Impacts may also be short-term or long-term. A project impact is considered significant if it reaches the threshold of significance identified in the EIR. Mitigation measures may reduce a potentially significant impact to less than significant.
- **Significant Unavoidable Impact.** A project impact is considered significant and unavoidable if it is significant and cannot be avoided or mitigated to a less-than-significant level once the project is implemented.
- **Cumulative Significant Impact.** A cumulative impact can result when a change in the environment results from the incremental impact of a project when added to other related past, present or reasonably foreseeable future projects. Significant cumulative impacts may result from individually minor but collectively significant projects.
- **Mitigation.** Mitigation measures are revisions to the project that would minimize, avoid, or reduce a significant effect on the environment. CEQA Guidelines §15370 identifies 5 types of mitigation:
 - a) Avoiding the impact altogether by not taking a certain action or parts of an action.
 - b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
 - c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
 - d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
 - e) Compensating for the impact by replacing or providing substitute resources or environments.

MITIGATION MONITORING AND REPORTING PROGRAM

Comply with the Mitigation Monitoring and Reporting Program (MMRP) for this project as follows:

1. It shall be the responsibility of the project applicant to reimburse the County for all expenses incurred in the implementation of the Mitigation Monitoring and Reporting Program (MMRP), including any necessary enforcement actions. The applicant shall pay an initial deposit of **\$15,000.00**, which includes administrative costs of **\$800.00**. Over the course of the project, the Environmental Coordinator will regularly conduct cost accountings and submit invoices to the applicant when the County monitoring costs exceed the initial deposit.
2. Until the MMRP has been recorded and the estimated MMRP fee has been paid, no final parcel map or final subdivision map for the subject property shall be approved; and no encroachment, grading, building, sewer connection, water connection or occupancy permit from Sacramento County shall be approved.

PREFACE

The Notice of Preparation (NOP) for the Project was published on June 22, 2010. An agency scoping meeting was held on July 19, 2010 at the Governor's Office of Planning and Research and a public scoping meeting was held on August 3, 2010 at the Sacramento County Department of Transportation Traffic Operations Center. At the time of NOP publication, the 2030 General Plan had not been approved, and it was unclear when the hearing process would be completed. The 2030 General Plan was adopted on November 9, 2011, and as a consequence this EIR includes the current adopted General Plan policies, not the policies of the 1993 General Plan which were in effect when the NOP was released.

Along with a Notice of Completion (NOC), the Draft EIR was released to the Governor's Office of Planning and Research to begin the public review period (Public Resources Code, Section 21161) on January 9, 2012. Concurrent with the NOC, the County also provided public notice of the availability of the Draft EIR for public review through publication in a local newspaper and with notices which were sent to individuals who had requested such notification. The written comment period began on January 9, 2012 was set to close on February 22, 2012 at 5 p.m, but was extended to March 5, 2012 at the request of the California Department of Transportation (Caltrans). Opportunity for oral comment on the DEIR was offered at the Sacramento County Planning Commission on September 24, 2012, at which time the comment period was closed and staff was directed to prepare this Final EIR.

Changes to text within the EIR follow two conventions to highlight them for the reader: text which is **bold and underlined** is new, and text which is shown in ~~striketrough~~ is deleted. There are also two chapters, the Project Description and the Traffic and Circulation chapters, which contain new text at the very outset of the chapter which provides some explanation of changes which are to be found in the chapter. Corrections to errors in pagination or format, spelling corrections, grammatical corrections, and other such editorial changes that are unrelated to the substantive content of the EIR are not highlighted. Also note that Sacramento County has undergone some internal organizational changes, and that Departmental and other name changes are reflected in the EIR but are not highlighted in the text.

The EIR and all appended materials are available electronically at www.dera.saccounty.net; under the "Major Projects" heading on the right-hand side of the page where reviewers will find a link titled "Cordova Hills". The direct link is: <http://www.dera.saccounty.net/PublicNotices/SQLView/ProjectDetails/tabid/71/Default.aspx?ProjectID=35697>.

The Board of Supervisors will use the Final EIR as one of the informational sources used to determine whether to approve or deny the Project.

1 PROJECT DESCRIPTION

Throughout the entire EIR, all references to the Cordova Hills Community Services District have been changed to Cordova Hills Local Services District. This latter term is more generic, and the change was made to reflect the fact that the government structure which ultimately provides services pursuant to the Urban Services Plan could be formed in a number of ways: by the creation of a Community Services District, creation of a new County services area, or a combination of the two. The proposed General Plan Transportation Plan Amendment exhibit and the proposed Large Lot Tentative Subdivision Map have also been updated; the DEIR version is shown with an “X” overlaid and the updated version follows immediately after. These two exhibits were changed to reflect conversion of the northern portion of Town Center Boulevard (north of North Loop) to the Chrysanthy arterial street section, at the request of the Sacramento County Department of Transportation. The Transportation Plan was also amended to show a wildlife grade separation.

PROJECT LOCATION

The proposed Project is located in the southeastern portion of Sacramento County on approximately 2,669 acres (Plate PD-1, Regional Location), adjacent to the City of Rancho Cordova (Plate PD-2, East County Location Map). The area is designated by the Sacramento County General Plan as General Agriculture (80 acres) and is currently zoned for AG-80 agricultural uses (Plate PD-3, Existing Zoning). Most of the Project is within the Urban Services Boundary (USB), but outside the Urban Policy Area (UPA). Grant Line Road, a two-lane thoroughfare, extends along the western Project boundary. The eastern side of the Project abuts Carson Creek and the northern boundary line of the property is Glory Lane, which is a two-lane gravel road that intersects Grant Line Road just south of Douglas Road. The Kiefer Landfill and the 2,000-foot buffer zone protecting the landfill from urban encroachment are southwest of the Project. Plate PD-4 is an aerial photograph of the Project area, taken in the year 2009.

ENVIRONMENTAL SETTING

The Project site is in the Cosumnes Community within Sacramento County, just east of the City of Rancho Cordova boundary. The Cordova Hills site is currently used for cattle grazing, and does not contain any structures or other developments. The elevation of the site ranges from approximately 130 feet to 280 feet with the greatest elevation occurring at the proposed university/college campus center site bluff in the southeastern portion of the site, and the lowest elevation occurring at the foot of a bluff area in the southeastern corner of the site. The topography on the western third of the Project is relatively flat, consisting of a plateau next to Grant Line Road. The eastern edge of the plateau slopes down easterly into a north-south intermittent drainage that is located in the center of the Project site. The topography climbs back upward in elevation east of the drainage, at which point the site begins to undulate into gently rolling hills.

Habitats present on the site include grassland, wetland and vernal pool areas, and intermittent drainages and swales. The wetland delineation for the Project catalogues a total of 89 acres of surface waters. There are no trees on the site. Much of the wetland habitat is concentrated on the western side of the Project, within a large plateau area that is relatively flat. The swales and intermittent drainages are found throughout the Project area, but there is a main intermittent drainage running north-south which nearly bisects the site. Many of the swales and other drainages flow into this central waterway; this central waterway ultimately connects to Deer Creek. Carson Creek runs past the eastern site boundary, and the floodplain from the creek extends onto the Project site. Carson Creek eventually connects to Deer Creek, south of the Project site; Deer Creek is a tributary to the Cosumnes River. Other than the small area encumbered by the Carson Creek floodplain there are no federal 100-year floodplains identified within the Project area because federal floodplain mapping of the area has not been conducted at this time.

Grant Line Road is a two-lane thoroughfare that lies along the western Project boundary, and Glory Lane is a two-lane gravel road that lies along the northern boundary; there are no public roadways within the Project area. The surrounding lands are essentially undeveloped, but the land along the western property boundary is within the City of Rancho Cordova and has one approved and one proposed Specific Plan – the Sunridge Specific Plan and the proposed Suncreek Specific Plan. A 120-kilovolt Pacific Gas & Electric tower line traverses the eastern edge of the Project in a north-south direction adjacent and parallel to Carson Creek. The nearest public water and sewer lines are within Douglas Road, approximately ¾-mile to the northwest.

The Kiefer Landfill is located approximately 5,000 feet from the most southwesterly portion of the Project. The portion of the site which lies outside of the Urban Services Boundary lies partially within the 2,000-foot buffer surrounding Kiefer Landfill. This buffer was designated to protect the landfill from urban encroachment.

PROJECT PROPOSAL

The Cordova Hills Project is located on approximately 2,669 acres in southeastern Sacramento County, adjacent to the eastern city limits of Rancho Cordova. Most of the Project is within the Urban Services Boundary (USB). The portions outside of the USB will be preserved as open space or developed with uses compatible with agriculture. The Project includes a mix of residential uses from high density residential along the western edge of the Project to low density residential along the eastern boundary approaching the USB. The Project includes a Town Center commercial area adjacent to Grant Line Road. Just southeast of the Town Center is the proposed location of the university/college campus center. The Project includes mixed uses consisting of residential, office, retail, a university/college campus center, schools, parks, and a trail network (Plate PD-5, Cordova Hills Land Use Plan). Cordova Hills is organized into six distinct districts/villages (Town Center, University Village, Ridgeline, East Valley, Creekside, and Estates, Plate PD-6).

The Project will require amendments to the General Plan in order to include the site within the Urban Policy Area and recognize the proposed land uses, streets, and bikeways on the Land Use Diagram, Transportation Plan, and Bikeway Master Plan. The entire site will be rezoned from Agriculture (AG-80) to Special Planning Area (SPA). The adopted SPA will then become the primary land use document which stipulates uses and designs that are allowable within the Project area. There are 485 acres in the southeastern portion of the site that are under Williamson Act contract (Plate PD-15). The contract is in non-renewal and is expected to expire in 2016. The Project will also require an amendment of the Zone 40 Water Supply Master Plan, as the Project area is not included in the existing planning document, and includes a General Plan Amendment to allow limited water service outside of the Urban Services Boundary.

Project features are detailed after the exhibits and entitlement requests below:

1. A **General Plan Amendment** to move the Urban Policy Area (UPA) boundary east to include approximately 2,366.3 acres of the Cordova Hills site (Plate PD-7; **UPA would be moved from location at Grant Line Road to encompass all portions of the Project site within the USB**).
2. A **General Plan Amendment** to amend the Land Use Diagram from General Agriculture to Low Density Residential, Medium Density Residential, Commercial and Office, Recreation, Natural Preserve, and Public/Quasi Public for approximately 2,366.3 acres (Plate PD-7).
3. A **General Plan Amendment** to include a new policy in the Land Use Element to address the provision of limited public water service to serve uses potentially allowed by the Cordova Hills Special Planning Area for 251 acres located in proximity to the Kiefer Landfill, and an Amendment to LU-1 to reference this exception.
4. **Amend the General Plan Transportation Plan** to show new thoroughfares, arterials and collectors as shown in the Transportation General Plan Amendment Diagram dated October 17, 2011 (Plate PD-8).

5. **Amend the Bikeway Master Plan to add on- and off-street bikeways** as shown in the Bikeways Master Plan Amendment Diagram dated October 17, 2011 (Plate PD-9).
6. **A Zoning Ordinance Amendment** to adopt the Cordova Hills Special Planning Area (SPA) to incorporate a Master Plan including Design Guidelines and Development Standards. The SPA consists of a total of 2,668.7 acres in three distinct areas (Plate PD-5):
 - a. Cordova Hills urban areas – 2,119.7 acres
 - b. University/College Campus Center – 246.6 acres (Plate PD-11)
 - c. Buffer lands and floodplain outside the Urban Policy Area – 302.4 acres. The areas will be designated Agriculture, Recreation (sports park), and Avoidance in the SPA.
7. **A Large Lot Tentative Subdivision Map** to create 155 large parcels for the purpose of creating legal parcels corresponding to villages within Cordova Hills SPA and within the approximately 2,668.7-acre SPA (Plate PD-10).
8. **An Affordable Housing Plan** consisting of on-site construction of affordable units and/or land dedication (Plate PD-12).
9. **A Development Agreement** by and between the County of Sacramento and the landowners.
10. **Adoption of a Public Facilities Financing Plan** for Cordova Hills that includes a Capital Improvement Program and Financing Plan.
11. **A Street Resolution** to allow certain County streets within the Cordova Hills Land Use Master Plan to be based on less than a 40-foot right-of-way, pursuant to the State Streets and Highways Code Section 906.
12. **Zone 40 Boundary:** Amend Zone 40 boundary to include the 251 +/- acres of the Cordova Hills project which lies outside of the Urban Services Boundary (Plate PD-13).
13. **Zone 41 Boundary:** Amend Zone 41 boundary to include 251 +/- acres of the Cordova Hills project which lies outside of the Urban Services Boundary (Plate PD-14).
14. **Adoption of the Cordova Hills Water Supply Master Plan Amendment:** Amends the existing Zone 40 Water Supply Master Plan to include provision of water service to Cordova Hills.

In addition to the above entitlements, the Project will require the following discretionary actions which would take place subsequent to County Board of Supervisors' Project approval and that would require Local Agency Formation Commission (LAFCo) review, proceedings, and action:

1. Cordova Hills ~~Community~~ **Local** Services District (**CHLSD**): The Project includes the formation of a ~~Community~~ **Local** Services District that will provide parks and recreation services; administration and communication services (including community intranet); transportation management services; and operation and maintenance of Project parks, open space, trails, landscape corridors, transit,

and supplemental road maintenance. **The CHLSD will be either a community services district formed pursuant to Government Code Sections 61000, et. seq., or a new county service area formed under Government Code Sections 25210, et. seq., or a combination of both.**

2. Sacramento Regional County Sanitation District and Sacramento Area Sewer District: the Project is within the Sphere of Influence for both Districts but would need to be annexed.
3. County Service Area #4B (Parks): All parks within the Project will be owned and maintained by the Cordova Hills ~~Community~~ **Local** Services District, and so detachment from the County service area will be needed.
4. County Service Area #10: Transit services and administration of other trip-reducing services will be administered by the Cordova Hills ~~Community~~ **Local** Services District, and so detachment from the County service area will be needed.

With regard to the Cordova Hills ~~Community~~ **Local** Services District, several steps within the Local Agency Formation Commission (LAFCo) process would be required, including a Municipal Services Review (MSR) and application to LAFCo for creation of the ~~any Community Services District~~ and related Sphere of Influence (SOI) determination, prior to or concurrently with the other LAFCo actions requested. MSR reviews capture and analyze information about the governance structures, fiscal feasibility, and efficiencies of current and proposed service providers and identify opportunities for greater coordination and cooperation between providers. The MSR is a prerequisite to proposed reorganization and a Sphere of Influence determination, and is not subject to CEQA.

Concurrent with or subsequent to the MSR process, a Sphere of Influence application to LAFCo must be submitted. This process would include definition of the ultimate geographical boundaries of the Cordova Hills ~~Community~~ **Local** Services District, disclose the present and planned land uses in the area, describe the present and probable need of public services and facilities in the area, describe the present capacity of those services and facilities, disclose the presence of any relevant social or economic communities of interest in the area, and include MSR completion. The ~~CSD~~ **CHLSD** formation would also require the preparation of a Plan for Services (which is the Cordova Hills Urban Services Plan) **if a community services district is formed**, which would identify the timing, capacity, and means of financing for the proposed ~~CSD~~ **CHLSD** services. The formation of the ~~Cordova Hills a Community Services District~~ and the Sphere of Influence process is subject to CEQA; LAFCo has the sole authority and discretion to act on the formation of the ~~a Community Services District~~ and establishment of the SOI, and as lead agency will contribute to and rely on this EIR.

The proposed Project will be developed in three main phases, with the earliest phase encompassing the area closest to Grant Line Road, and the last phase farthest to the east. Refer to Plate PD-16, Phasing Diagram.

DEVELOPMENT REGULATIONS

The Cordova Hills Land Use Master Plan identifies 16 land use classifications, which are described within the Cordova Hills SPA. Table PD-1 and Table PD-2 below provide a summary of the classifications and their use restrictions. The materials herein provide an overview; for more detailed descriptions please refer to the Cordova Hills SPA available for review at

<http://www.planningdocuments.saccounty.net/ViewProjectDetails.aspx?ProjectID=784>.

The Flex Commercial, Commercial Mixed Use, and Flex Office zones will allow some residential uses, though the SPA does restrict the type and amount of residential allowed in each zone. As stated in Table PD-1, the Town Center District allows all uses except the Flex-Residential Overlay and Estates. As stated in the application materials, the Town Center will be divided into districts (Retail/Entertainment, Business Mixed Use, Town Center North, Town Center East, and Southern Gateway). The SPA defines specific rules and guidelines applicable to each district. In the Town Center, a maximum of 1,750 dwelling units and 966,779 square feet of Commercial Mixed Use and Flex Office uses will be permitted.

In addition to the above, the SPA also includes a provision allowing a community-wide transfer of unit allocations. If a Village is developed with fewer units than originally allocated, these units may be transferred to another Village provided it does not significantly alter the character of the Village and it does not exceed the planned maximum cumulative average daily trips or dwelling units by 10%.

Table PD-1: Land Use Designations

Land Use Designations		Permitted Uses
(AG)	Agriculture	Agriculture, Sports Park, Solar Farm, District Energy Plant, Corporation Yard, Park and Ride Lot, Transit Parking Facility, Fueling Station, Roads, Storm Water and Storm Quality Basins, Community Gardens, Avoided Areas, Sewer Pump Station and Line, Water Tanks and Similar Utilities
(P/QP)	Public/Quasi Public	Churches, Schools, Parks, Public Utilities, Libraries, Fire Stations, Community Gardens, Flood Control and Storm Water Quality Treatment Facilities)
(R)	Recreation	Parks, Recreation Centers, Community Centers, Concessions, Minor Retail, Coffee Shop, Paseos, Open Space, Flood Control and Storm Water Quality Treatment Facilities
(R2)	Recreation and Open Space	Parks, Recreation Centers*, Community Gardens, Community Centers*, Concessions*, Minor Retail*, Coffee Shop*, Paseos, Open Space, Flood Control and Storm Water Quality Treatment Facilities
(AV)	Avoided Areas	Resource Avoidance, Trails, Outdoor Classroom, Interpretive Signage
(ER)	Estates Residential (1 to 4 du/acre)	Single Family Dwellings, Schools, Parks, Private Community Centers, Gardens, Landmark Features, Private Schools, Public Utilities, Flood Control and Storm Water Quality Treatment Facilities
(LDR)	Low Density Residential (4 to 7 du/acre)	Single Family Dwellings, Duplex and Halfplex Dwellings, Churches, Schools, Parks, Public and Private Community Centers, Gardens, Landmark Features, Private Schools, Public Utilities, Libraries, Fire Stations, Police Stations, Flood Control and Storm Water Quality Treatment Facilities
(MDR)	Medium Density Residential (7 to 15 du/acre)	Small Lot Single Family Dwellings, Greencourt, Motorcourt, Duplexes, Halfplexes, Townhomes, Live/Work Dwellings, Neighborhood Work Centers, Children and Senior Day Care Centers, Churches, Schools, Parks, Public and Private Community Centers, Gardens, Landmark Features Private Schools, Public Utilities, Libraries, Fire Stations, Police Stations, Flood Control and Storm Water Quality Treatment Facilities
(RD20)	Medium/High Density Residential (20 du/acre)	Same as MDR
(HDR1)	High Density Residential (20 to 30 du/acre)	Townhomes, Apartments, Live/Work Dwellings, Neighborhood Work Centers, Children and Senior Day Care Centers, Recreation Centers, Churches, Schools, Parks, Private Schools, Public Utilities, Libraries, Fire Stations, Flood Control and Storm Water Quality Treatment Facilities
(HDR2)	(30 to 40 du/acre)	Same as HDR 1
Land Use Designations		Permitted Uses
(FRO)	Flex Residential Overlay	Flex Residential Overlay applies to LDR, MDR, RD20, and HDR uses as indicated on the FRO Map. All uses allowed in the underlying land use designations, plus Retail and Work Centers, Live / Work Dwellings, Children and Senior Day Care Centers
(FC)	Flex Commercial	Please refer to the following description of permitted and prohibited uses.
(CMU)	Commercial Mixed-use	Hospital (100 bed maximum) Please refer to the following description of permitted and prohibited uses.
(FO)	Flex Office	Please refer to the following description of permitted uses.
(TC)	Town Center	TC permits all uses allowed in the other land use designations, except FRO and the Estates. Please refer to the following description.

* USES NOT ALLOWED IN THE PASEO CENTRAL AREA

UNIVERSITY/COLLEGE CAMPUS CENTER

The SPA reserves approximately 224 acres of land for a future college campus. At the time of this writing, a specific university or other higher-education institution had not been identified for the site. The SPA includes detailed concept plans for the future university/college campus center. For the purposes of environmental analysis, the anticipated enrollment is 6,000 students (4,300 undergraduate and 1,700 graduate) and 2,036 total employees. A total of 65% percent of students were assumed to live on the campus (4,040 students). It was also assumed that the university/college campus center will require approximately 1,870,000 square feet of facilities. Note that the phasing described below is a conceptual plan, and that the actual buildout will progress over the long-term planning horizon in response to demand and in response to the needs of the specific university which is ultimately located here – it cannot be predicted with precision. The specific floor areas, buildings, and uses identified in the following phases are conceptual and not intended as specific building entitlements. None of the environmental analyses in the main chapters rely on any aspect of this phasing plan to assess impacts; impacts are based on full buildout of the entire area reserved for the university/college campus center.

PHASE ONE

Phase One may span the first four years of facility operation, and could involve approximately 344,000 square feet of building construction. Phase One buildings are listed in Table PD-3. The Phase I campus could accommodate approximately 600 students and 207 employees.

Table PD-3: Phase One

Building	Gross Area (square feet)
Welcome Center	23,000
Student Union & Rec. Center	60,000
Administration Center	20,000
General Academic	20,000
General Academic & Library	20,000
Arts and Sciences	34,000
Campus Hotel	56,000
Housing	110,000
TOTAL	344,000

PHASE TWO

Phase Two may span years four through ten of facility operation, and could involve approximately 503,000 square feet of building construction. This phase could include the construction the buildings listed in Table PD-4.

Table PD-4: Phase Two – Additional Buildings

Building	Gross Area (square feet)
Performing Arts	45,000
Chapel	18,750
Library	120,000
Athletics and Wellness	130,000
Housing	189,250
TOTAL	503,000

PHASE THREE

Phase Three may span the years ten through twenty of facility operation, and could involve approximately 563,900 square feet of building construction. Phase Three buildings are listed in Table PD-5.

Table PD-5: Phase Three – Additional Buildings

Building	Gross Area (square feet)
Main Lecture Hall	48,000
Arts and Sciences	68,000
Executive Training Center	147,000
Physical Plant	30,000
Housing	270,900
TOTAL	563,900

ULTIMATE BUILD-OUT AND PHASE FOUR

The final phase may span years twenty to thirty of facility operation, and could add an additional 548,300 square feet of buildings, bringing the total university/college campus center size to 1,870,000 square feet. Phase four facilities are listed in Table PD-6. As stated, in this ultimate configuration the university/college campus center could accommodate 6,000 students and 2,036 total employees.

Table PD-6: Phase Four – Additional Buildings

Building	Gross Area (square feet)
Medicine and Nursing	41,100
Engineering	30,300
Business	33,450
Education	18,300
Law	16,800
Housing	408,350
TOTAL	548,300

RESIDENTIAL

The proposed Project includes a maximum of 8,000 residential units; assuming 2.54 persons per household for rental units and 2.71 persons per household for owner-occupied units, this will provide housing for a residential population of approximately 21,379 residents (persons per household data is from the Sacramento Area Council of Governments). In addition to this, the university/college campus center will include an on-campus population of 4,140, for a total Project residential total of 25,519. Table PD-7 and Table PD-8 below summarize the residential density ranges and the number of dwelling units that are proposed. Low Density Residential lot sizes will range from 5,000 to 20,000 square feet, and Medium Density Residential lot sizes will range from 2,000 to 4,999 square feet. High density residential zoning will be dedicated to attached condominiums and multi-family dwellings. The Project also includes on-site construction of affordable residential, totaling 1,044 units. In the aggregate, all residential units throughout Cordova Hills will have a total average density of ten or more dwelling units per acre of buildable land available for residential uses.

Table PD-7: Land Use Densities

Residential Type	Residential Density Per Acre	Dwelling Units
Estate Residential	1 – 4 du/acre	147
Low Density Residential	4 – 7 du/acre	1,930
Medium Density Residential	7 – 15 du/acre	3,110
RD-20	20 du/acre	888
High Density Residential 1	20 – 30 du/acre	1,620
High Density Residential 2	30 – 40 du/acre	150
NOTE: Units can build out at 75% of zoned maximum. Also, an additional 150 units are expected in the Flex Commercial designation.		

Table PD-8: Residential Unit Totals

Village	Number of Units	Net Residential Acres	Net Density
Town Center Village	1,750	194.6	9
Ridgeline Village	995	107.2	9
University Village	1,475	96.3	15
Estates Village	500	125.8	4
East Valley Village	1,740	188.6	9
Creekside Village	1,540	192.4	8
University/College Campus Center	1,010	39.7	25
Project Total	9,010	938.3	10

RETAIL/COMMERCIAL

The Project includes a total of 1.3 million square feet of commercial uses. The maximum commercial square footage permitted within the various villages where commercial uses are designated is: Ridgeline, 92,000; University Village, 88,860; East Valley, 111,200; and Town Center, 966,779. Adding up to 90,580 square feet of additional commercial uses within the Flex Residential Overlay yields a total maximum square footage of 1,349,419. The majority of the retail and office is located in the Town Center. The Town Center is proposed to contain a large array of retail types, including restaurants, movie theatres, book stores, home supply stores, electronic stores, and other types of similar retail. The application materials state that the Project is designed to accommodate this retail in a condensed “main street” atmosphere. The Town Center will also include some high density residential uses above the first-floor retail.

In the remaining districts there will be neighborhood-serving retail/office/mixed-use village centers. These neighborhood-serving retail villages will consist of grocery stores, dry cleaners, restaurants, and other retail stores that meet the daily needs of residents within the community.

RECREATION AND PRESERVES

PARKS AND TRAILS

The proposed Project SPA describes a mix of parks, open space, recreation, and non-vehicular circulation amenities, including: a sports park, community parks, neighborhood parks, pocket parks, linear parks, detention basin parks, community facilities, open space, utility easements, drainage corridors, wetland avoidance areas, and a large trail network. Proposed parks are listed in Table PD-9 and depicted on Plate PD-17.

Table PD-9: Parks Within The Project

Park Type	Quantity	Acreage Size	Service Area	Typical Features
Sports Park	1	50	Regional	Sports Fields
Community Park	1	18	3 miles	Sports Fields, Trails, Dog Park
Neighborhood Parks	6	4 - 5 acres	1/2 mile	Green space, Tot Lot, Restrooms, Sports Court

In addition to the formal parks above, the Project includes approximately 150 acres of land designated as R-2, which is for more passive recreation uses (paseos, trails, picnic areas, and informal play areas, along with detention basins). These areas provide opportunities for additional parkland resources, and the additional parkland needed will be provided in these areas at the time when small-lot tentative maps are proposed. The Project will also include 26 miles of Community Class II on-street bicycle paths and 22 miles of off-street trails and paths. Refer to Plate PD-18 for the trails exhibit. Every home will be no more than a ¼ mile from one of the trails, parks, or other open space.

The main Cordova Hills trail will traverse 3 miles from the western boundary of the Project to the eastern boundary without any at-grade crossings of a major arterial street. This trail will cross the major resource avoidance areas. The Project is situated adjacent to the Laguna Creek trail system vision area (which would connect Rancho Cordova to Elk Grove). Cordova Hills is designed to connect to this trail system, if the trail becomes a formal Project.

Plate PD-17: Proposed Parks

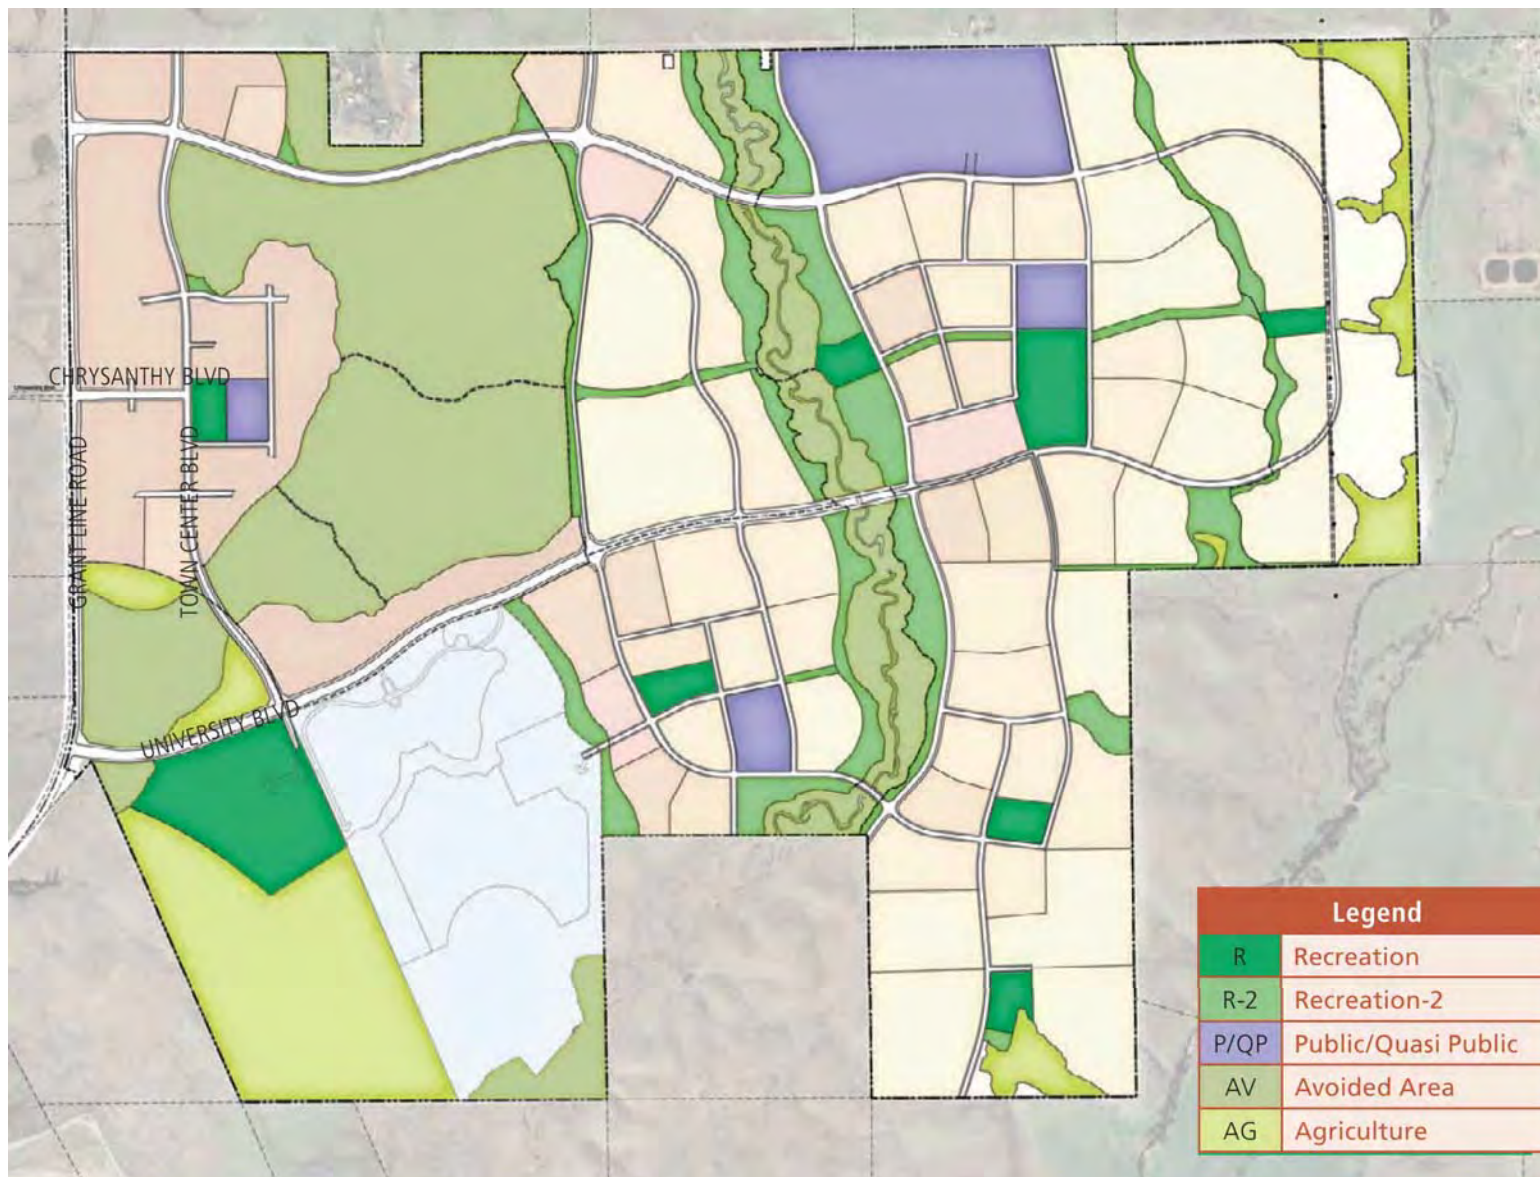

Plate PD-18: Proposed Trails Plan

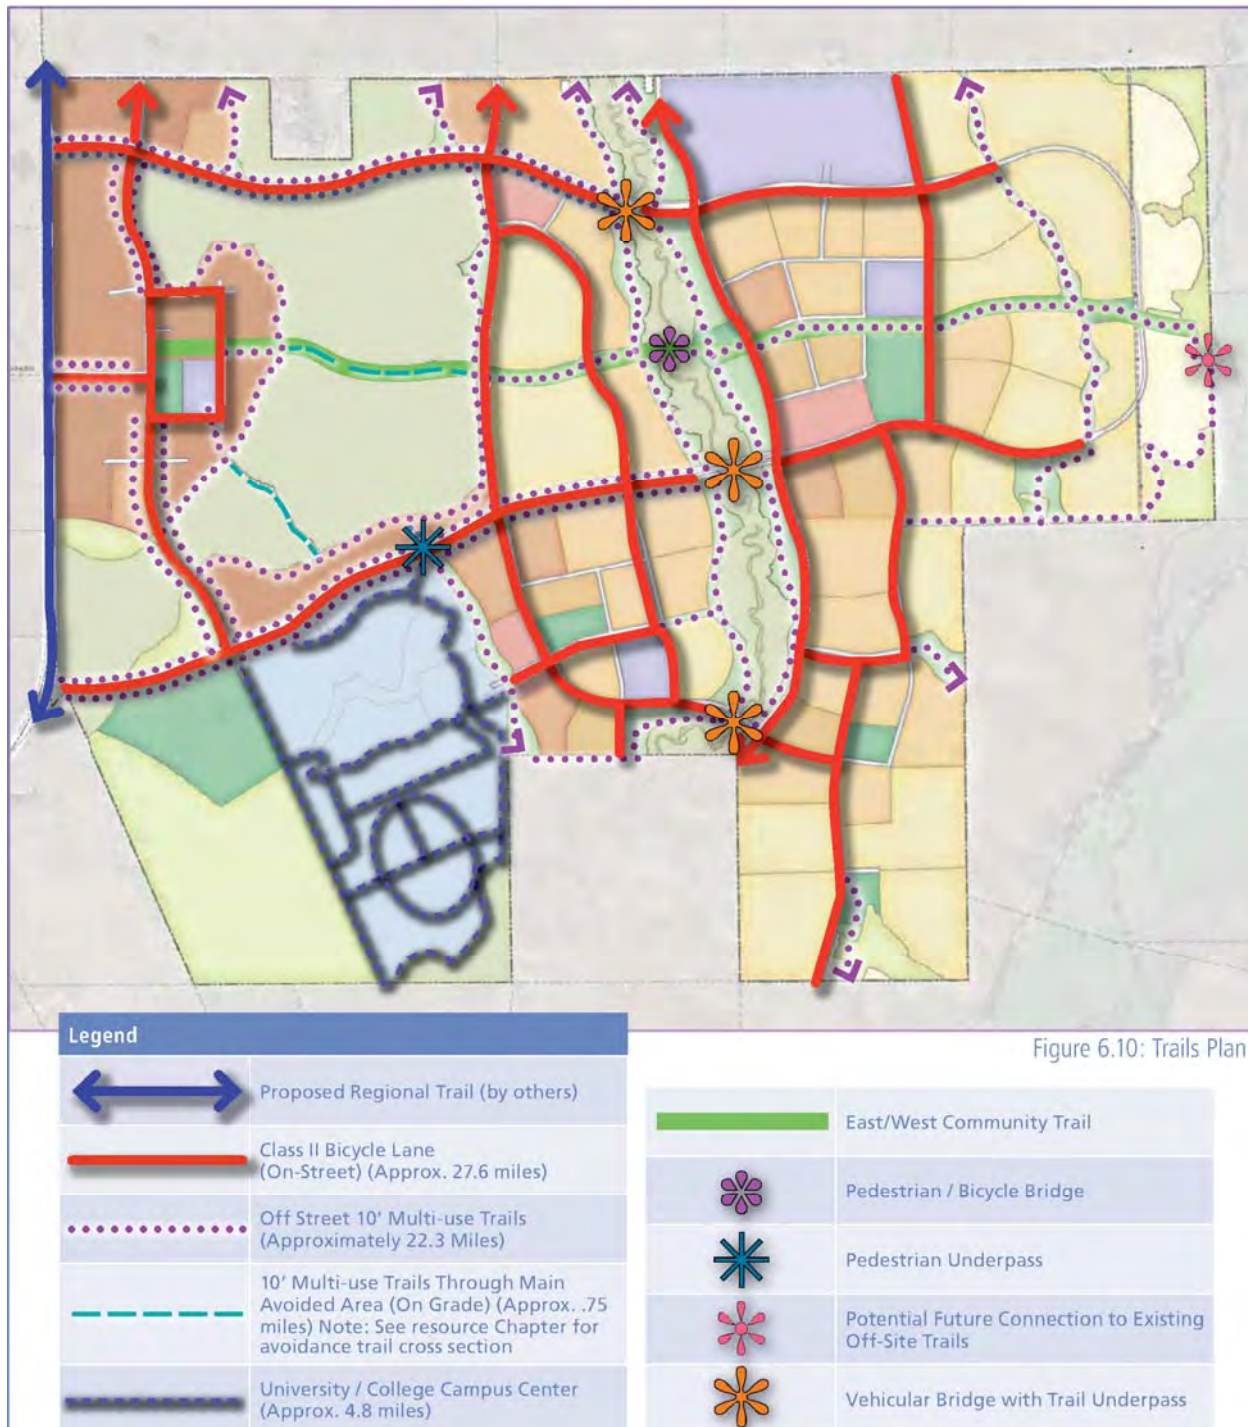

Figure 6.10: Trails Plan

AVOIDANCE AREA

The largest wetland avoidance area is proposed on the western third of the Project where the majority of the wetlands exist. This area extends from the southwestern property boundary of the Project to the northern boundary line. A north-south drainage that bisects the central portion of the Project will be avoided within an open space corridor – along with some of the wetlands connected to the drainage. Detention basins will be placed along the outer edges of the avoidance areas, in areas designated Recreation 2, which will both detain and treat water prior to discharge into the wetland systems. This drainage corridor exits the central portion of Cordova Hills to the south and then re-enters the site at the university/college campus center's southeastern corner. The drainage corridor's re-appearance on the university/college campus center site is proposed for avoidance in the same manner as it is on the central portion of the Project.

THE "BUFFERLANDS" AND AGRICULTURE

The Project includes multiple areas designated as Agriculture, which, according to the SPA development regulations, is a land use designation that allows many uses in addition to agriculture. Allowable uses include: agriculture, sports park, solar facility, district energy plant, corporation yard, park and ride lots, transit parking facilities, fueling stations, roads, stormwater basins, community gardens, Avoided Areas, sewer pump station and lines, water tanks and similar utilities. Many of these uses are specifically proposed within what the SPA calls the "bufferlands" area, in reference to the fact that the area lies partly within the 2,000-foot buffer surrounding Kiefer Landfill; this EIR will refer to these lands as those which lie outside of the USB. Among the uses which will lie in the portion of the Project outside of the USB is a sewer force main that will connect to the university/college campus center area (refer to the Public Utilities chapter) and a Sports Park proposed near the southern Project entrance (refer to the Public Services chapter). Other uses are conceptually laid out in the SPA, but there are no specific land use designations or master plans which describe them (the corporation yard, solar farm, and district energy plant). Because this portion of the Project is outside of the USB, public sewer systems cannot serve the sports park or other planned uses (pursuant to General Plan Policy; refer to the Public Utilities chapter). Uses in this area will rely on septic systems for sewer disposal. General Plan policy also excludes the use of public water to serve this area, but the Project includes a policy amendment that would allow the use of public water (refer to the Public Utilities chapter).

The SPA contains a specific section (Section 4.7, Development Standards in Agricultural Bufferlands) describing uses within the large Agriculture area outside of the USB. This section indicates that development of a corporation yard, solar farm, and district energy plant will not require a Use Permit as long as performance standards listed within the SPA are met. The SPA includes a figure noting approximate conceptual locations for these uses (Plate PD-19). Design-level plans are not included at this time, but the sections which follow provide general descriptions of facilities of this type.

Plate PD-19: Approximate Location of “Bufferlands” Uses

CORPORATION YARD

Corporation yards typically involve several buildings, an equipment maintenance shop, and an entirely paved surface for the parking of vehicles and other equipment. It is assumed that a fleet fueling station will also be constructed with the corporation yard.

SOLAR FACILITY

The SPA does not specify the size of the solar facility that may be constructed within the portion of the Project outside of the USB, so this discussion describes solar facilities in general. Approximately ten photovoltaic solar array applications have been processed in Sacramento County within the past few years. These large systems are installed by constructing a mounting system and then assembling the panels on top of the system. The panels are wired together in series to form long chains or rows of panels.

System construction typically involves trenching in long rows to enable installation of underground cables and wiring, vibratory driving of pipe pier supports, installation of the mounting system onto the supports (which may also include a tracking system, if the panels are designed to move with the sun), installation of the photovoltaic panels and wiring, construction of concrete pads for equipment, installation of inverters and transformers (energy must be switched from DC to AC), and construction of a substation.

The systems proposed in the County have varied in size from 20 acres to nearly 300 acres, and with a generation capacity of 3 megawatts to 30 megawatts. On average, systems in the County are capable of generating between 1 and 1.5 megawatts for every ten acres of land.

DISTRICT ENERGY PLANT

The applicant submitted a short description of the purpose and potential design of the energy plant, but no details are contained within the SPA, which simply states in Section 2.1.1 that one power source could be methane gas routed from the Kiefer Landfill (which operates a methane recapture program). The applicant indicates that the configuration with the best economic promise includes electric chillers, gas boilers, a thermal energy storage system, and an engine-based combined heat and power system.

A chiller uses electricity to reduce the temperature of water, and this water would then be circulated through a network of underground chilled water piping to air conditioning units which use the cold water to cool the air. The water is then recirculated back to the chiller to be cooled again. The gas boilers would use the opposite mechanism, using natural gas to generate hot water which is distributed through a heating system. Thermal Energy Storage includes a number of different technologies, but in essence would involve the storage of chilled water at night that could then be used to cool environments during the day. Chilling the water at night would shift some of the electricity load to off-peak periods and commensurately reduce the amount of energy needed during the day. Hot water would be similarly stored. Natural gas from the landfill would power the combined heat and power system that will generate electricity

for the system. The applicant provided some estimates of phasing and equipment needs for the system (Table PD-10), which may take up approximately ½-acre of land.

Table PD-10: Potential District Energy Plant Equipment

Equipment	Unit Size	# Units Total			
		Phase 1	Phase 2	Phase 3	Phase 4
Chiller, tons	750	2	4	4	5
Boiler, MVBTUh	10	2	2	2	2
Boiler, MVBTUh	20		2	2	3
Hot Water Storage, gallons	18,000	1	1	1	1
Chilled Water Storage, gallons	1,000,000	1	1	2	2
Engine, MW	1.4	2	2	2	2

CIRCULATION

The central proposed point of access into the Project site is an extension of the existing Chrysanthy Boulevard, which would bisect the center of the Project and provide the access point into the proposed Town Center. Two additional access points are proposed between ½-mile and ¾-mile north and south of the Chrysanthy access. The two access points to the south and north of Chrysanthy will traverse into the eastern area of the Project creating a loop where both the roads will eventually connect. These three access points into the Project will be four lanes and decrease to two lanes at the eastern side of the Project.

The Town Center and western third of the Project on the plateau will consist of a grid street network due to the flat topography and high density of land uses that exist in the area. Further to the east the density of land uses and topography do not provide as much of an opportunity for the traditional grid street network.

Cordova Hills will include a diversity of streets at full development, consisting of a Town Center Boulevard, four-lane arterials, two-lane Community Boulevards, two-lane Neighborhood Collectors, residential streets with detached sidewalks, and rural streets.

Traffic calming measures such as, traffic circles, roundabouts, intersection bulb-outs, lane width restrictions, and other measures will be utilized in order to reduce vehicle speeds and enhance pedestrian safety.

PUBLIC SERVICES

SCHOOLS

The Project includes three areas designated as elementary school sites (two of which are approximately ten acres each and one of which is approximately six acres), and one area designated as a high school (approximately 78 acres). Cordova Hills is within the Elk Grove Unified School District.

PUBLIC UTILITIES

WATER SUPPLY

Within the Urban Services Boundary, Cordova Hills is located within the Zone 40 service area of the Sacramento County Water Agency (SCWA). The areas outside of the Urban Services Boundary are likewise outside of Zone 40. The Project requires off-site extension of water lines. On-site transmission lines will be routed throughout the Project area. Due to the varying elevations of the Project, several booster pumps as well as pressure-reducing stations will be required to maintain system pressures to Zone 40 standards throughout the Project. Generally, the on-site transmission system will consist of 16-inch to 24-inch mains extending through the Project. A grid of 8-inch to 12-inch distribution mains will extend from the transmission system to serve local developments. Water infrastructure will be phased with development to meet end user demands as well as operational criteria of the system. The Project will ultimately include the construction of water storage tanks either within the Project site or on property controlled by the applicant which is just north of the Project boundary (refer to the Public Utilities chapter for details).

The Project also includes a request for Zone 40 water to be extended to the portion of the Project outside of the Urban Services Boundary. This will require an amendment to General Plan Policy LU-57. Policy LU-57 states: "The County shall not provide urban services beyond the Urban Policy Area, except when the County determines the need for health and safety purposes." New language is proposed as follows:

Policy LU-57. The County shall not provide urban services beyond the Urban Policy Area, except when the County determines the need for such services for health and safety purposes or where provision of such services is permitted pursuant to Policy LU-XX.

Policy LU-XX (numbering would be added after approval). Limited public water service and facilities can be extended beyond the Urban Policy Area/Urban Services Boundary to serve the 251 acre area located in proximity to Kiefer Landfill, as shown in Exhibit "A". Permitted uses within this area include agriculture, sports park, solar farm, district energy plant, corporation yard, park and ride lot, transit parking facility, fueling station, roads, storm water and storm water quality basins, community gardens, avoided areas, sewer pump station and lines, water tanks and similar utilities. Water facilities shall be sized adequately to only serve these permitted uses. Furthermore, proposed uses must be consistent with these permitted uses, act as a buffer between urban and open space uses, and help strengthen and preserve the current location of the Urban Services Boundary.

In addition to the General Plan policy amendment, the Project will require amendment of the Zone 40 and 41 boundaries to include the 241-acre area outside of the Urban Services Boundary.

WASTEWATER

The Cordova Hills Project area will need to be annexed into the Sacramento Area Sewer District (SASD) and the Sacramento Regional County Sanitation District (SRCSD). SASD owns and operates sewer trunk and collection systems throughout Sacramento County. SRCSD owns and operates the Sacramento Regional Wastewater Treatment Plant (SWRTP) and interceptor system throughout Sacramento County. Cordova Hills is in the Sphere of Influence (SOI) for SASD and SRCSD. Their SOI is coterminous with the Urban Services Boundary and their service boundary is coterminous with the Urban Policy Area. The Project requires off-site extension of sewer lines. On-site transmission lines will be routed throughout the Project area. A recycled water distribution system (purple pipe) will be installed for future use, so that recycled water may be used if an off-site treatment facility and recycled water delivery system to the Project site is made available.

STORM DRAINAGE

The waterways within Cordova Hills are tributary to two major creek systems. The western portions of the Project include intermittent drainages within the headwaters of Laguna Creek, the central and eastern portions drain to a tributary of Deer Creek, and a smaller portion in the east drains into Carson Creek, which is a tributary to Deer Creek. The Project includes detention basins and open stormwater swales, as well as an underground pipe system for stormwater.

Water quality will be conserved and enhanced through the use of local water quality features such as grassy swales, settling basins, and natural filters to clean surface runoff water before it reaches the natural drainage channels. These features will be incorporated in the pedestrian open space corridors and in dual-use park land. Low Impact Design (LID) principles such as bio swales, landscape retention areas, rain gutters dispensing to lawns, cobblestone driveways, and Hollywood driveways (two strips of pavement for the tires of the vehicle, with grass or landscaping in between) will be incorporated to the greatest extent feasible and when soil conditions permit.

CONSTRUCTION AND IMPLEMENTATION

As a master planned development, the Project will build out in response to market demand over the course of decades. Individual development Projects would be submitted to the County pursuant to the SPA requirements, with development generally progressing from the west (adjacent to Grant Line Road) to the east. Section 7.10 of the SPA (Materials Conservation) contains specific language noting that the Project site may contain aggregate material suitable for construction of road beds and other improvements, and that excavation and use of these materials is permitted as a temporary ancillary use in all development areas of the Cordova Hills Master Plan; it also notes that export of these materials off-site is expressly prohibited. The potential impacts of this are described in multiple chapters, including Geology and Soils, Noise, and Air Quality.

The Implementation chapter of the SPA (Chapter 9) indicates that amendments to the Master Plan may be permissible, including changing land use designations, design criteria, development standards, or policies. Definitions are included to describe a

Major Amendment or a Minor Amendment, with Major Amendments requiring the same process as the original Project (discretionary approval process) and Minor Amendments requiring approval by the Planning Director (non-discretionary approval process).

PROJECT OBJECTIVES

Outlined below are the primary objectives for the proposed Cordova Hills Project.

1. Develop a mixed use community that is designed in a manner that provides compatible land uses and reduces overall internal vehicle trips.
2. Develop an economically feasible master-planned community that reasonably minimizes its impact on biologically sensitive natural resources with feasible on-site wetland avoidance and preservation.
3. Develop a sustainable, multi-service town center that promotes walkability and alternative transit modes including but not limited to Neighborhood Electric Vehicles (NEVs), light rail, shuttle bus, and carpool facilities.
4. Provide uses for two underserved markets in the southeast Sacramento region:
 - a. Provide for the development of a major private university facility in Sacramento County.
 - b. Provide residential neighborhoods that are age restricted in order to serve seniors and larger lot sizes for executive housing to serve corporate executives.
5. Develop internal Project infrastructure and circulation networks of multiple modes that provide efficient connections to various land use components throughout the Project; specifically, trail opportunities to enhance the integration between the university/college campus center, town center, schools, and preserves/open space corridors surrounding the Project.
6. Develop recreational and open space opportunities that include neighborhood and community parks that are fully integrated into the Project through adequate trail connections and provide critical regional trail connections associated with adjacent trail systems
7. Allow for the inclusion of alternative energy sources to serve the mixed use community.

2 ALTERNATIVES TO THE PROPOSED PROJECT

INTRODUCTION

This chapter describes alternative versions of the proposed Project which could lessen impacts or that provide meaningful information to foster informed decisions. Impact discussions are more brief than those found in the Project chapters, consistent with CEQA Guidelines Section 15126.6(d). This chapter does not repeat background discussions or other subject matter which has already been described in the topical chapters of this EIR, but focuses on those Alternative impacts which are substantively different than the impacts described for the Project. Reviewers are encouraged to read the topical chapters describing Project impacts prior to reading the Alternatives chapter. A brief table of contents is included which lists the page number of each topical section.

TABLE OF CONTENTS

Alternatives Considered but Rejected:	2-2
Description Of Alternatives:	2-14
Aesthetics:	2-24
Agricultural Resources:	2-28
Air Quality:	2-32
Biological Resources:	2-38
Climate Change:	2-45
Cultural Resources:	2-48
Geology and Soils:	2-49
Hazards and Hazardous Materials:	2-53
Hydrology and Water Quality:	2-53
Land Use:	2-55
Noise:	2-59
Public Services:	2-73
Public Utilities:	2-74
Traffic and Circulation:	2-79
Environmentally Superior Alternative:	2-140

RANGE OF ALTERNATIVES

According to Section 15126.6 of the California Environmental Quality Act (CEQA) Guidelines:

An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.

The purpose of this section is to identify alternative project designs that would mitigate, lessen, or avoid the significant effects of the Project. To foster meaningful public discussion and informed decision-making, a range of reasonable alternatives to the Project is provided. This range includes the “No Project” alternative, the purpose of which is to allow the hearing body to compare the impacts of approving the Project to the impacts of not approving the Project. The “No Project” alternative describes what would happen if the existing land use designations remained in effect.

The Project would result in significant impacts related to aesthetics, air quality, biological resources, climate change, and transportation. Many of these impacts are significant and unavoidable, because they are the inevitable result of developing such a large master planned community. Changing the location or the layout of the Project could reduce impacts to some degree, but it is unlikely that they could be reduced to levels which are not significant without radically changing the objectives and scope of the Project. The exception is Biological Resources, in which impacts are due to the location and layout of the Project. For this reason, though Alternatives are designed to reduce impacts to many topical areas, changes to the Project layout and location focus on avoidance of biological resources.

In addition to the No Project Alternative, this EIR includes detailed analysis of two Alternatives: “Expanded Preserve” and “Expanded Footprint”. Other alternatives were considered but ultimately eliminated from detailed analysis; these are also described below.

ALTERNATIVES CONSIDERED BUT REJECTED

Multiple Alternatives to the Project were considered but ultimately rejected. CEQA Guidelines section 15126.6 states that:

The EIR should also identify any alternatives that were considered by the lead agency but were rejected as infeasible during the scoping process and briefly explain the reasons underlying the lead agency’s

determination. Additional information explaining the choice of alternatives may be included in the administrative record. Among the factors that may be used to eliminate alternatives from detailed consideration in an EIR are: (i) failure to meet most of the basic project objectives, (ii) infeasibility, or (iii) inability to avoid significant environmental impacts.

An agency need not find that a project is literally impossible before it can reject an alternative as infeasible. The finding may be made based on policy considerations or project objectives (ex: *California Native Plant Society, et al. v. City of Santa Cruz, et al.*) or based on specific economic, legal, social, technological, or other considerations (CEQA Guidelines Section 15091). There is no ironclad definition of infeasibility, only guidance, and so it is left to the discretion of the lead agency to determine and explain what reasons are sufficient to exclude an alternative from analysis.

SWALE PRESERVATION ALTERNATIVE

A number of potential onsite alternatives were initially evaluated for feasibility and further detailed analysis, one of which was the “Swale Preservation Alternative.” As described in the Biological Resources chapter, the verified wetland delineation identified approximately 88.1 acres of jurisdictional waters (Table ALT-1). The Project focuses much of the avoidance area on vernal pools and seasonal wetlands, but this Alternative would focus additional avoidance on the swales and other linear waters.

Table ALT-1: Swale Preservation Wetland Impacts Compared to the Project

Wetland Type	Project		Swale Alternative	
	Impact	Avoided	Impact	Avoided
Vernal Pool	15.6	31.9	13.9	33.5
Seasonal Wetland	3.06	1.71	1.94	2.83
Seasonal Wetland Swale	13.9	4.35	8.15	10.1
Seep	0.012	0.00	0.012	0.00
Intermittent Drainage	6.36	10.4	1.12	15.8
Creek	0.00	0.174	0.00	0.174
Stock Pond	0.688	0.835	0.69	0.835
Total	39.6	49.3	25.9	63.2

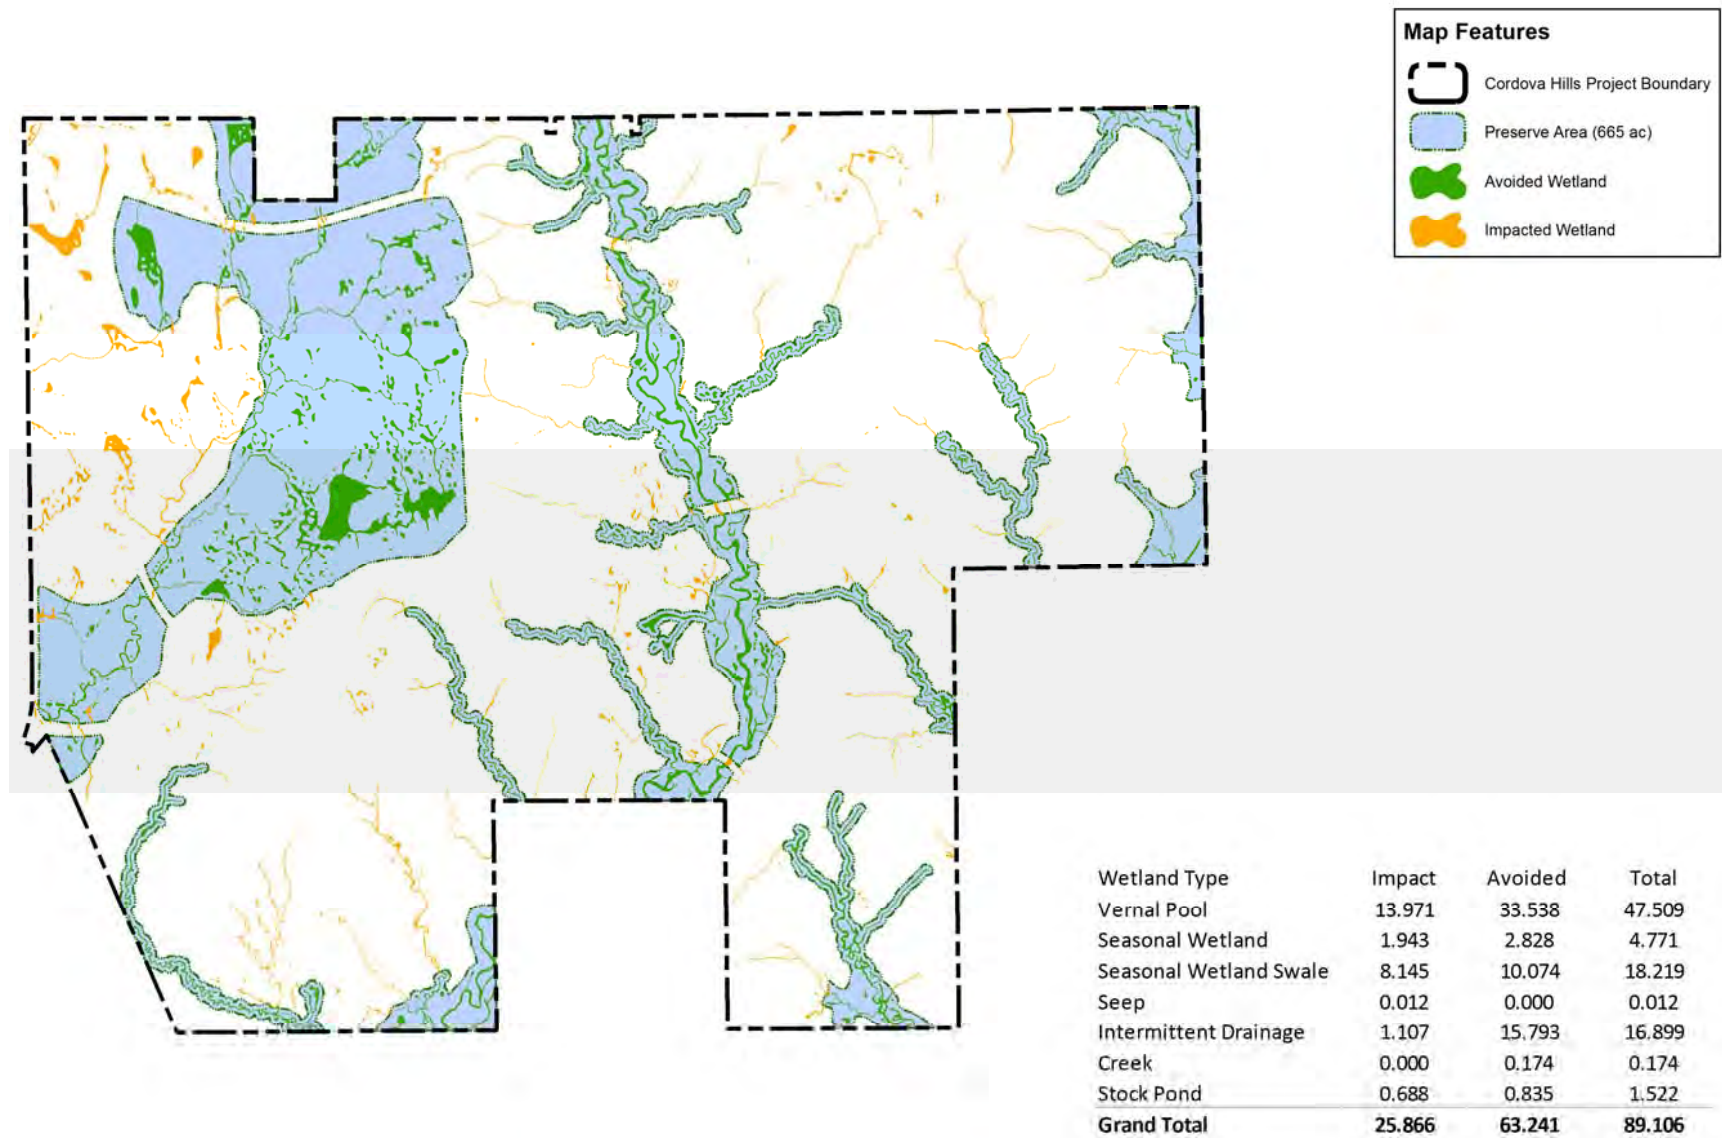

As part of the evaluation of the feasibility of potential onsite alternatives, the EIR preparers looked at whether the Swale Preservation Alternative would be able to substantially meet the basic Project objectives. As shown on Plate ALT-1, maintaining a portion of the swales connected to the primary intermittent drainages would break up the buildable areas of the site into segments, which would require significantly more retaining walls and street work associated with avoiding and working around the

retained swales. In addition to overall reductions in buildable area associated with avoidance of the features and construction of additional infrastructure, it would become more difficult to grade the larger, flatter areas which are necessary for high density development. The Project has included the higher density units on the western side of the property, where it is closest to the Town Center and the University/College Campus Center, and it is these areas which would be most affected by loss of buildable area. Thus, in addition to reducing the overall amount of land available for development, the alternative would result in a lowering of the density units on some of the remaining developable land.

The applicant indicated that the Alternative could increase infrastructure costs from \$323,030,000 to \$351,873,000. That is an increase of \$28,843,000 or approximately 9% in total infrastructure costs. In addition, the applicant estimated that the Alternative would result in a loss of 43.32 non-residential/open space acres, 52.78 acres of residential, and 30.4 acres of roads/misc./OS, for a total loss of 126.5 developable acres. The loss of 52.78 acres of residential land results in a loss of 870 dwelling units, which reduces the total unit count from 8,000 dwelling units to 7,130. While only an 11% reduction in total units, since the Alternative also increases total infrastructure costs, the overall effect would be to increase costs per unit by 22.2%. The CEQA Guidelines Section 15126.4(f)(1) provide that "among the factors that may be taken into account when addressing the feasibility of alternatives are ... economic feasibility...." A per-unit cost increase of 22.2% is a substantial increase, and was deemed infeasible.

In addition to financial issues, the segmentation of the developed areas by the preservation of many individual swales would either require a multitude of roadway overpasses (which would be even more costly than described in the calculations above) or would require substantial changes to circulation patterns which would ultimately deviate from the modified grid pattern currently proposed. Sacramento County General Plan Policy LU-120, criteria PC-5, requires interconnected streets with short block lengths, the achievement of which would be seriously hampered by the Alternative. The Swale Preservation Alternative breaks up the short block connections of streets and increases the isolation of neighborhoods throughout the plan. Unless the Alternative is able to meet PC-5, it cannot be considered for approval pursuant to General Plan policy. Both for fiscal reasons and for potential inability to meet required General Plan policy, this Alternative was rejected from further consideration.

Plate ALT-1: Swale Preservation Alternative

OFF-SITE ALTERNATIVES

Changing the location of the site is a major deviation from the intent of the Project, as a substantial amount of language in the Special Planning Area references the views of the Sierra and the landscape setting as informing and driving many of the design choices and other layout considerations of the Project. The Project site is also already owned by the applicants, and purchasing other property or entering into other development agreements in order to pursue an off-site alternative poses a substantial logistical and financial hurdle. Given that a change in location already represents a fundamental change in Project scope and poses a substantial challenge to implement, it was determined that any off-site location should allow the other basic Project designs and objectives to remain essentially intact. On-site alternatives have been designed to make more substantive changes to proposed uses and total developed area, but it was determined that the total land area and uses of the proposed Land Plan should be able to remain essentially intact for any offsite alternative.

Multiple factors were considered when investigating off-site alternatives. The Project includes approximately 1,732 acres of urban uses (exclusive of areas designated as Avoided Area, Agriculture, or Recreation), and will need an additional 107 acres of parkland, for a total of 1,837 acres. An alternative location should be able to accommodate a similar amount of development. The area also must be suitable for a mix of uses which is substantially consistent with the Project mix – both in terms of types of uses and proportions of those uses – in order to be considered consistent with the basic objectives of the Project (e.g. a site suited for industrial and commercial uses, with little residential, would be rejected).

Consistent with the intention to create an urban development, most properties lying outside of the Urban Services Boundary were excluded from consideration. The Urban Services Boundary is designed to be the ultimate edge of urban development in the County, and all long-range plans for infrastructure (such as roadways and utilities) have assumed that areas outside of the Urban Services Boundary would remain rural in nature. Development of land outside of the Urban Services Boundary would therefore result in greater environmental impacts, particularly due to growth inducement, as it would require a significant precedent-setting amendment to a central policy of the General Plan.

Another factor in the suitability of a site is the ability to obtain enough separate parcels of sufficient size. The Project area consists of ten parcels and only three owners, all of whom have elected to move forward with this single Project. Though there are many other properties within the Urban Services Boundary, these properties may not be obtainable, as there may be a multitude of separate owners who may be unwilling to sell or enter into some other agreement, the land may be within conservation easements, or the land may be in some other use which precludes urban development.

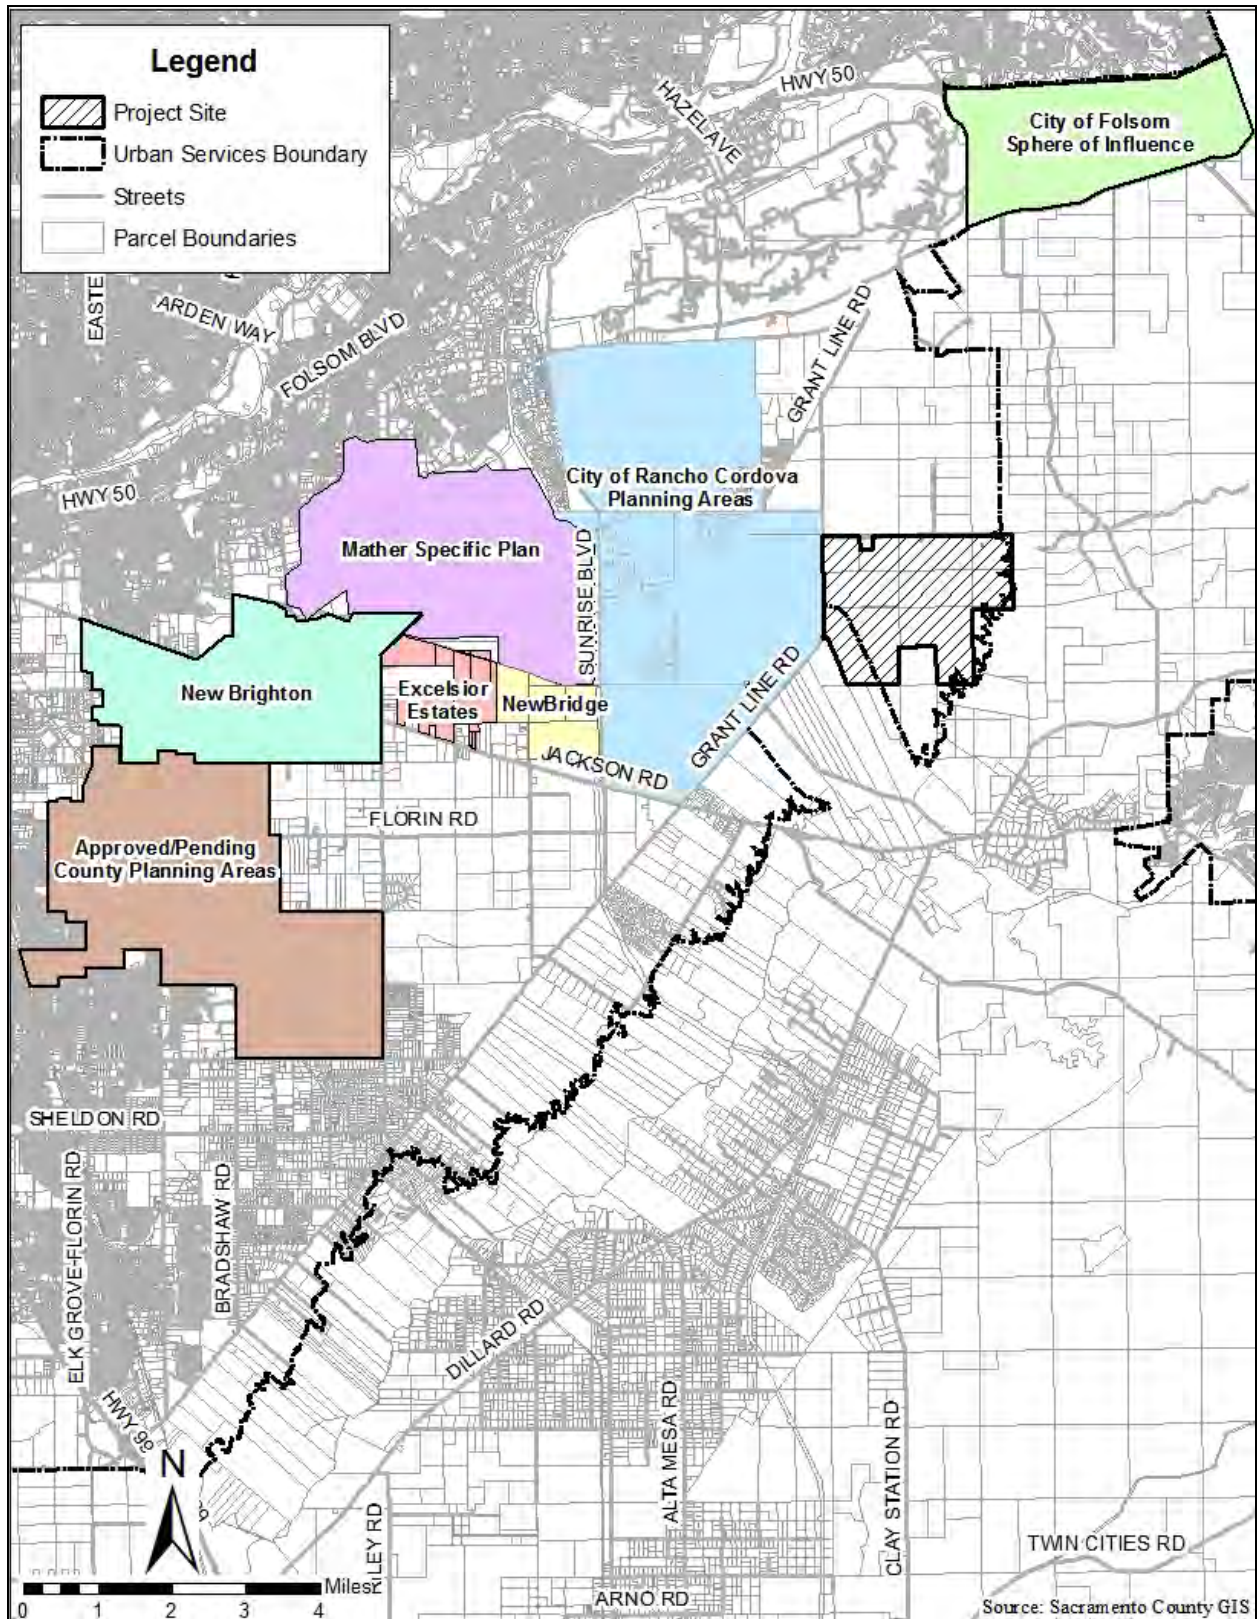

Land which is already in the process of obtaining local land use entitlements for development would be nominally suitable if the proposed mix of uses was similar to that of the Project, but then the Project would be subject to the master planning done for that

area – the SPA could no longer be part of the Project. Since many of the Project objectives relate to the development regulations contained in the SPA, land already subject to master planning proposals was excluded from consideration as both potentially infeasible to acquire and for failure to meet basic Project objectives.

The proposal for a large retail center (the Town Center) requires relative proximity to a major existing or proposed transportation corridor (such as a freeway system or thoroughfare). Alternative locations which are too far from such a corridor would make the retail component too inconvenient to reach, and would likely result in trips continuing to other retail centers which were more proximate or more accessible. To remain economically viable, the Town Center needs to be near a major transportation corridor. The following transportation corridors were identified as suitable: Highway 50, Jackson Highway (State Route 16), Sunrise Boulevard, Folsom Boulevard, White Rock Road, Prairie City Road, and Grant Line Road. Other locations were considered infeasible.

Plate ALT-2 depicts areas which may contain sufficient land area but are already the subject of existing proposed or approved master planning. New Brighton, Excelsior Estates, and NewBridge are master plan proposals that are within pre-application processing with the County of Sacramento. The City of Folsom Sphere of Influence is outside of the Urban Services Boundary, but was included because it is existing, and the negative physical consequences of the expansion would not be due to the Project. The City of Rancho Cordova Planning Areas (the depicted boundaries are approximate, not exact) include the approved Sunridge Specific Plan, the pending Rio Del Oro land plan, the pending Suncreek Specific Plan, and the pending Arboretum Specific Plan. The Sacramento County planning areas include the approved Florin Vineyard Gap Community Plan, Vineyard Springs Comprehensive Plan, and the Vineyard Station Specific Plan. The areas on the exhibit all encumber large portions of land, and all but the Mather Specific Plan are infeasible due to problems with acquisition and the inability to meet Project objectives (as described previously). The Mather Specific Plan area is further discussed below because it is a County-initiated project, and thus is within the ability of the County to amend to fit the Project, if possible.

Plate ALT-2: Locations With Existing Master Planning Proposals/Approvals

Remaining lands that could be considered include properties north of the Project site, properties between Grant Line Road and the various existing planning areas, and properties south of the City of Elk Grove (Plate ALT-3); these areas are further discussed below. Note that most of the large area north of the City of Rancho Cordova planning areas is part of a Federal Superfund site owned by Aerojet, a propulsion manufacturer, and is unavailable for development at this time.

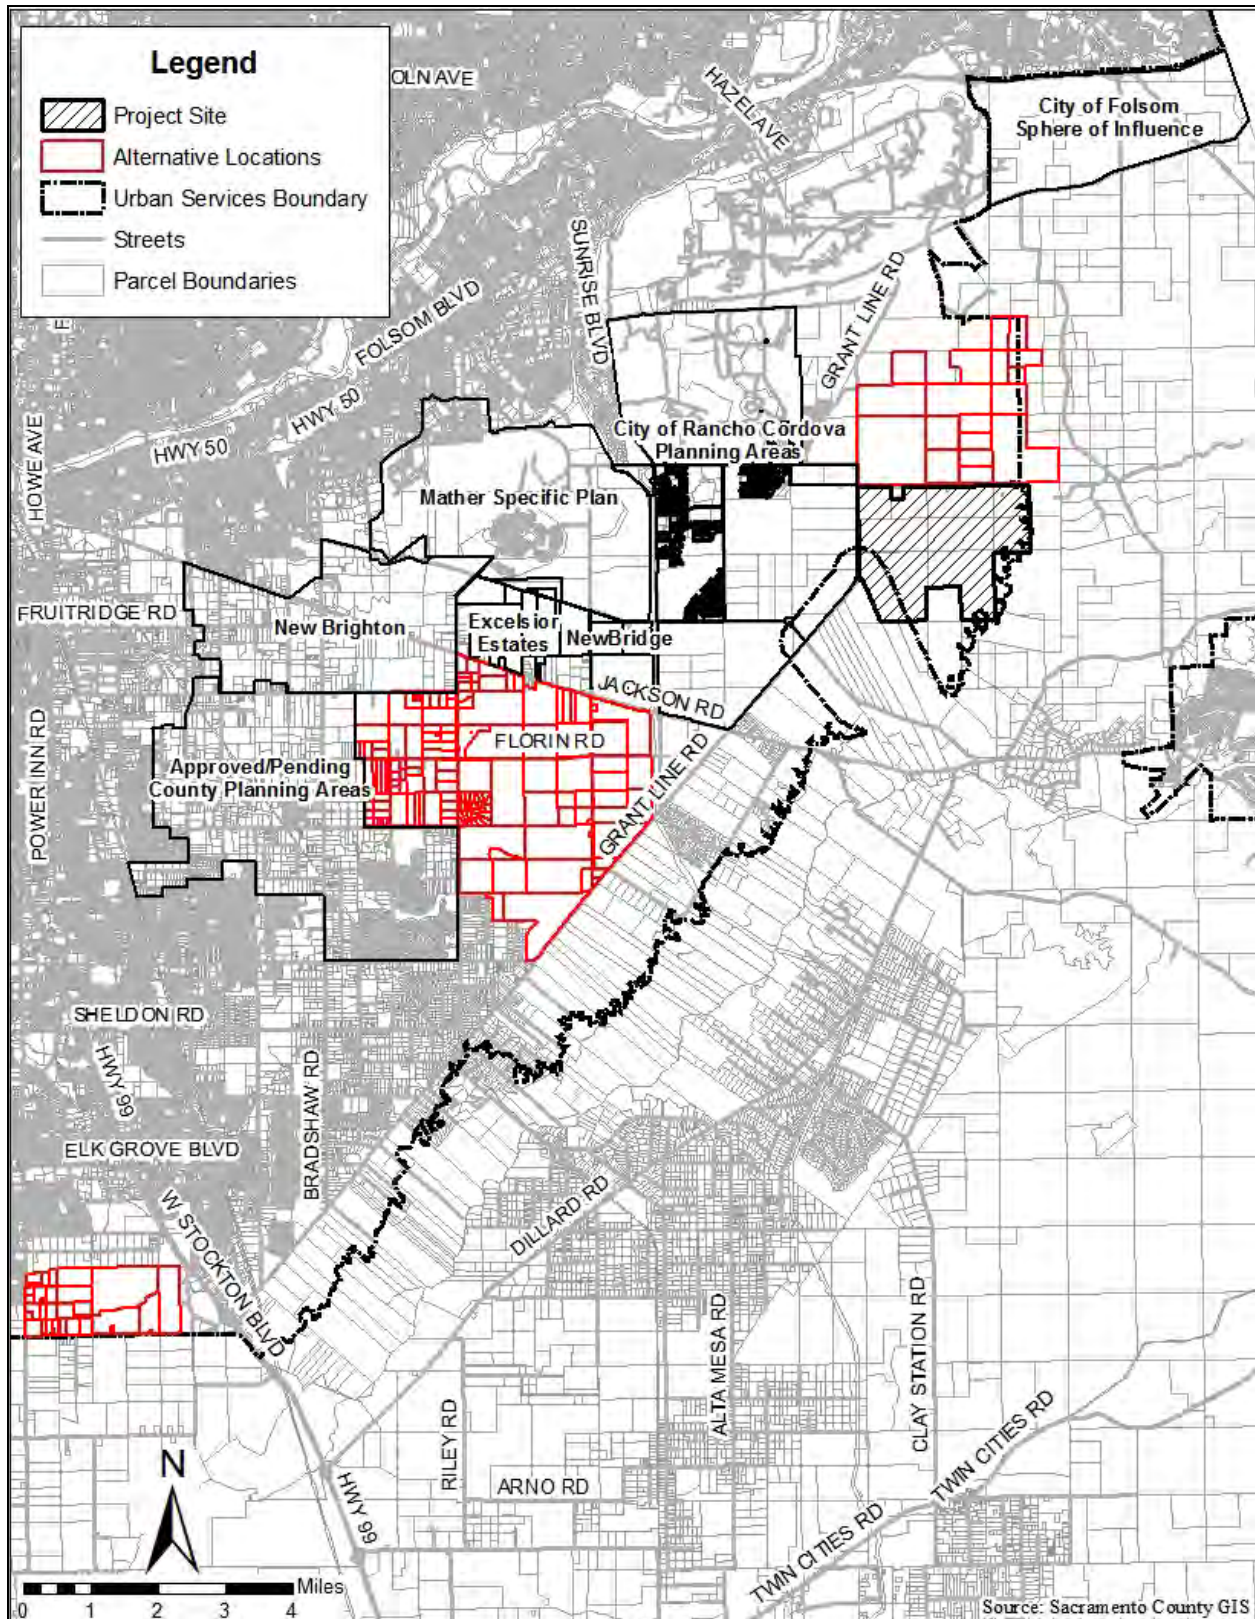

MATHER FIELD SPECIFIC PLAN

A university has been proposed within the Mather Field area – the proposed Mather Field Specific Plan (County Control Number 2006-0151) includes a 272-acre area labeled “Sports Complex” and a 593-acre area labeled “University and Village/Residential”. The Mather Field Specific Plan area contains approximately 5,700 acres of land, but a significant portion of this property is within the direct influence of Mather Airport and would be unsuitable for residential uses. A review of the proposed Specific Plan indicates that unless the proposed Specific Plan were modified, only approximately 1,000 acres would be suitable for Project uses. This figure is obtained by excluding the airport; existing development; approximately 220 acres of the land designated as Sports Complex; and areas designated as a preserve or riparian buffer, as a golf course, as Airport Commercial, as Economic Development, and as Commerce Center.

The Mather Field Specific Plan Sports Complex is approximately 270 acres, and so could accommodate the 50-acre sports park concept of the Project, but the remaining 220 acres would still be used for other sports facilities; it could not be used for other Project uses. The land designated Economic Development is excluded because it is a small “island” of uses over 2 miles away from the other available urban uses designated in the Specific Plan. The Commerce Center lands are excluded because the Specific Plan includes approximately 550 acres of commercially-designated lands, but the Project only requires approximately 230 acres. Without amending the proposed Mather Field Specific Plan, the residential development envisioned by the Project would need to be reduced by approximately 550 acres – which is more than half of the Project residential land.

In addition to a substantial reduction in the proposed residential uses of the Project, pursuing this alternative would place the commercial uses of the Town Center a minimum of one mile away from the University and residential lands. The Specific Plan locates the Sports Complex, Mather Lake, and a golf course in between the University and Village/Residential area and the Commercial Development area. As a result, the direct connectivity between the Town Center and University envisioned by the Project would not be possible. This connection was considered integral to the Town Center, as the student body represents an important spending base.

Plate ALT-3: Potential Alternative Locations

The Mather Field Specific Plan was reviewed to determine whether changes could be made to the Specific Plan uses so that the Project could be accommodated – since the Specific Plan is a County-initiated project – but it was determined to be infeasible. The Specific Plan land uses have been located in areas that are compatible with the noise and safety zones that exist around Mather Airport. Commercial uses are proposed in areas where residential land uses are incompatible, and thus the conversion of some of the commercial land to residential uses is infeasible. Likewise, the Sports Complex, golf course, and commercial uses are located in areas where those uses are compatible, and cannot be switched to bring the commercial uses closer to the residential and University area.

This alternative was considered but rejected during the scoping process due to the following factors: inability to accommodate the residential uses of the Project, inability to maintain connectivity between the retail component and the spending base, and inability to provide multimodal connections supporting non-automotive travel between important project components. On the latter point, placing the commercial and residential/university components of the Project one mile apart would result in failure to achieve objectives 1, 3, and 5 of the Project.

PROPERTY SOUTH OF ELK GROVE

This area includes approximately 1,400 acres of contiguous land, which falls below the approximately 1,800 acres needed to accommodate the Project uses. This location is also adjacent to the approved Elk Grove Promenade Mall project, which was under construction when the recession caused all work to halt. It is unlikely to be economically feasible to include the intensive retail of a large mall and the retail uses of the Town Center. Given that the mall is already approved and is partially constructed, the Town Center would need to be removed from the Project. The mall cannot be considered a replacement for the Town Center, because while the Elk Grove Promenade Mall is designed to be a more standard retail-only development, the Town Center is designed to be a mixed use development consisting of retail, office, and residential. Given that this location does not include sufficient land area and would require the removal of a major component of the Project, this site was eliminated from detailed consideration.

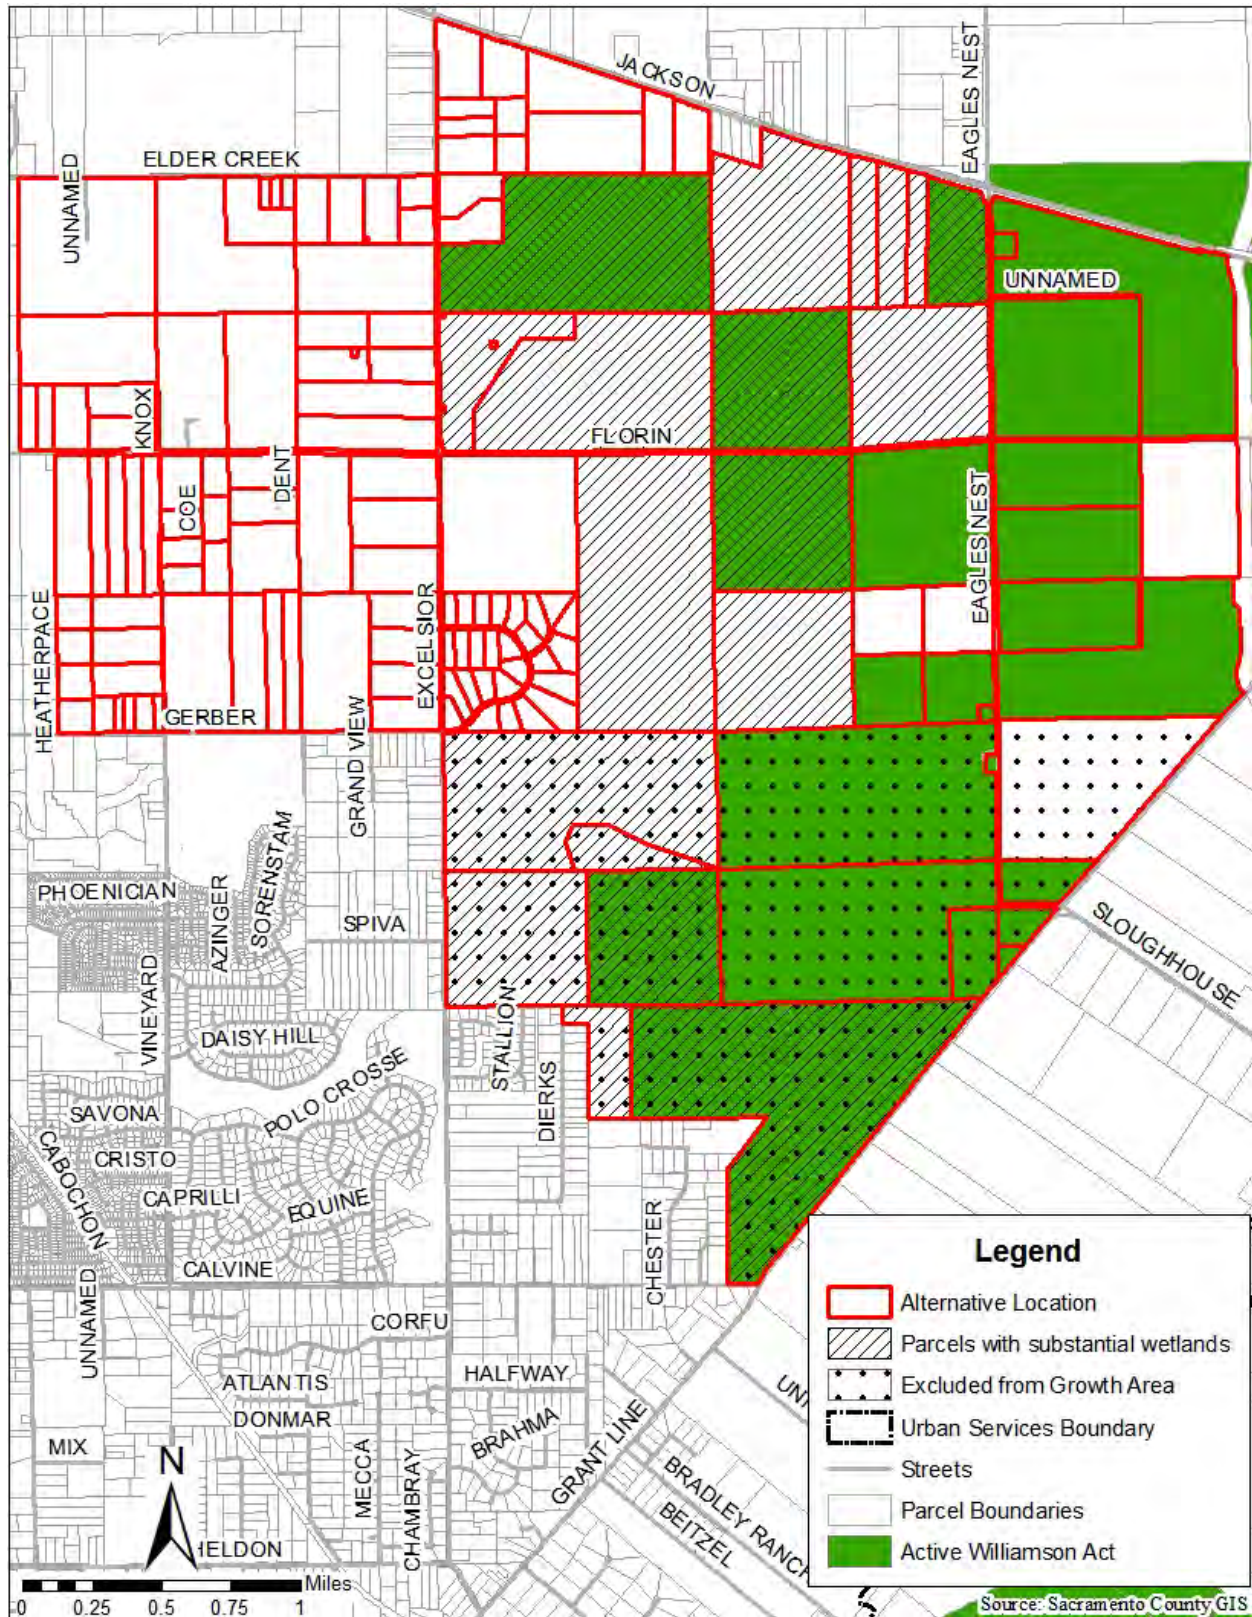

PROPERTY BETWEEN GRANT LINE ROAD AND OTHER PLANNING AREAS

This area includes approximately 7,500 acres, 153 different parcels, and over 100 different owners (Plate ALT-4). Not all of this land would be needed, so an analysis was done to identify a more specific area to consider. Review of aerial photography indicates that significant land area includes wetland complexes; some of this property is already owned by organizations such as the Sacramento Valley Conservancy and some is being considered for inclusion in the anticipated Draft South Sacramento Habitat Conservation Plan as preserve area or protected area. Plate ALT-4 shows the land areas with the densest concentrations of wetlands. Other areas also include wetlands, but they do not appear to be as densely concentrated or as intact. In addition, the land

south of Florin Road has been the subject of discussion before the Sacramento County Board of Supervisors, for potential inclusion in the Draft 2030 General Plan as a new growth area, and was ultimately excluded from consideration. Notwithstanding the change in growth management strategy which was approved subsequent to this decision-making, it remains questionable whether this decision would be reversed for a Project alternative. The final major constraint is the presence of substantial amounts of land under active Williamson Act contract. These various constraints exclude most of the property from consideration on the dual basis that development here would not reduce impacts to wetlands and may be infeasible to develop due to the presence of multiple Williamson Act contracts and other land use restrictions.

Excluding the existing subdivision at the corner of Excelsior and Gerber Roads, the remaining land area that is not encumbered by significant wetlands or Williamson Act contracts encompasses approximately 2,300 acres and 80 parcels. Various parcels are being used for the operation of businesses, such as a plant nursery and an equestrian facility, but most are agricultural or agricultural-residential parcels with single-family homes. The significant number of parcels and the fact that many of them have single-family homes would make acquisition of the land infeasible both due to logistical and financial reasons. The other option would be to enter into a development agreement with the property owners, which would be similar to the model used to develop the Florin Vineyard Gap Community Plan. This is also logistically challenging, and in order to work would require that the entire SPA be revisited in consultation with the many different property owners. It is unlikely that the SPA and the Project objectives would remain intact as a result of this process. Furthermore, each owner would be operating under separate financial constraints and under separate timeframes, and thus it would be infeasible to develop large, coherent pieces at the same time. This alternative was ultimately rejected due to failure to meet Project objectives and due to logistical infeasibility.

Plate ALT-4: Constraints on Property West of Grant Line Road

PROPERTY NORTH OF THE PROJECT

This area includes parcels which are north of the Project site, but excludes land operated as an aggregate mine by Teichert. There are eighteen parcels in this area, for a total of approximately 3,200 acres. Approximately 862 acres of this land is currently owned by the Project proponents. Five of the eighteen parcels include some land outside of the Urban Services Boundary, which would not be available for urban development; removing this area, which is approximately 370 acres, leaves 2,830 acres for development. This is sufficient land to accommodate the Project uses, and is located along the same major transportation corridor as the Project. Aside from the Project proponents, there are eight property owners of this land. It may be difficult to acquire the remaining land or otherwise enter into development agreements with the owners.

Aside from some difficulty with acquisition, the primary issue with this site is that development of this site would not result in lesser environmental impacts than development of the Project site. This alternative site is adjacent to the Project site, and as such shares most of the same constraints and issues described for the Project. Review of aerial photography clearly indicates that the property north of the Project site also includes plateau areas with dense aggregations of vernal pools, as well as intermittent drainages, seasonal wetlands, and other features. In addition, the only two parcels adjacent to Grant Line Road (totaling 960 acres) are within active Williamson Act. There are no existing public water or sewer lines proximate to the site. Though the site is farther from the Kiefer Landfill, it is adjacent to an active mining area. Ultimately, it was clear that this alternative would not result in a reduction in significant impacts, and so was eliminated from more detailed consideration.

Note that although relocating the entire Project to these northern properties has been rejected, a detailed analysis has been included for an alternative that would include a portion of the property to the north (Expanded Footprint Alternative).

DESCRIPTION OF ALTERNATIVES

NO PROJECT

The No Project alternative may either be considered to be maintenance of the existing condition, development to the degree that would be allowed without any further discretionary review or entitlements, or an in-between version. In the case of the Project site, there is little difference between these versions of the No Project. The site is zoned AG-80 (Agricultural properties of a minimum of 80 acres in size), and encompasses ten parcels. In the No Project Alternative, each of these parcels could be developed with one single-family home. Given the rural nature of the area, it is assumed that urban services such as public water and sewage disposal would not be used, and that homes would rely on individual wells and septic systems. Though analyzed as though up to ten homes would be constructed, it is probable that if homes

were built there would be fewer than this number. Many of the parcels do not have access to existing roadways, and it would be costly to build roads to provide that access. It is more typical in Sacramento County to see a few of the parcels containing homes for the primary property owner(s) and relatives, while the “back” areas without frontage remain undeveloped agriculture. Thus, grazing of the majority of the land would be presumed to continue.

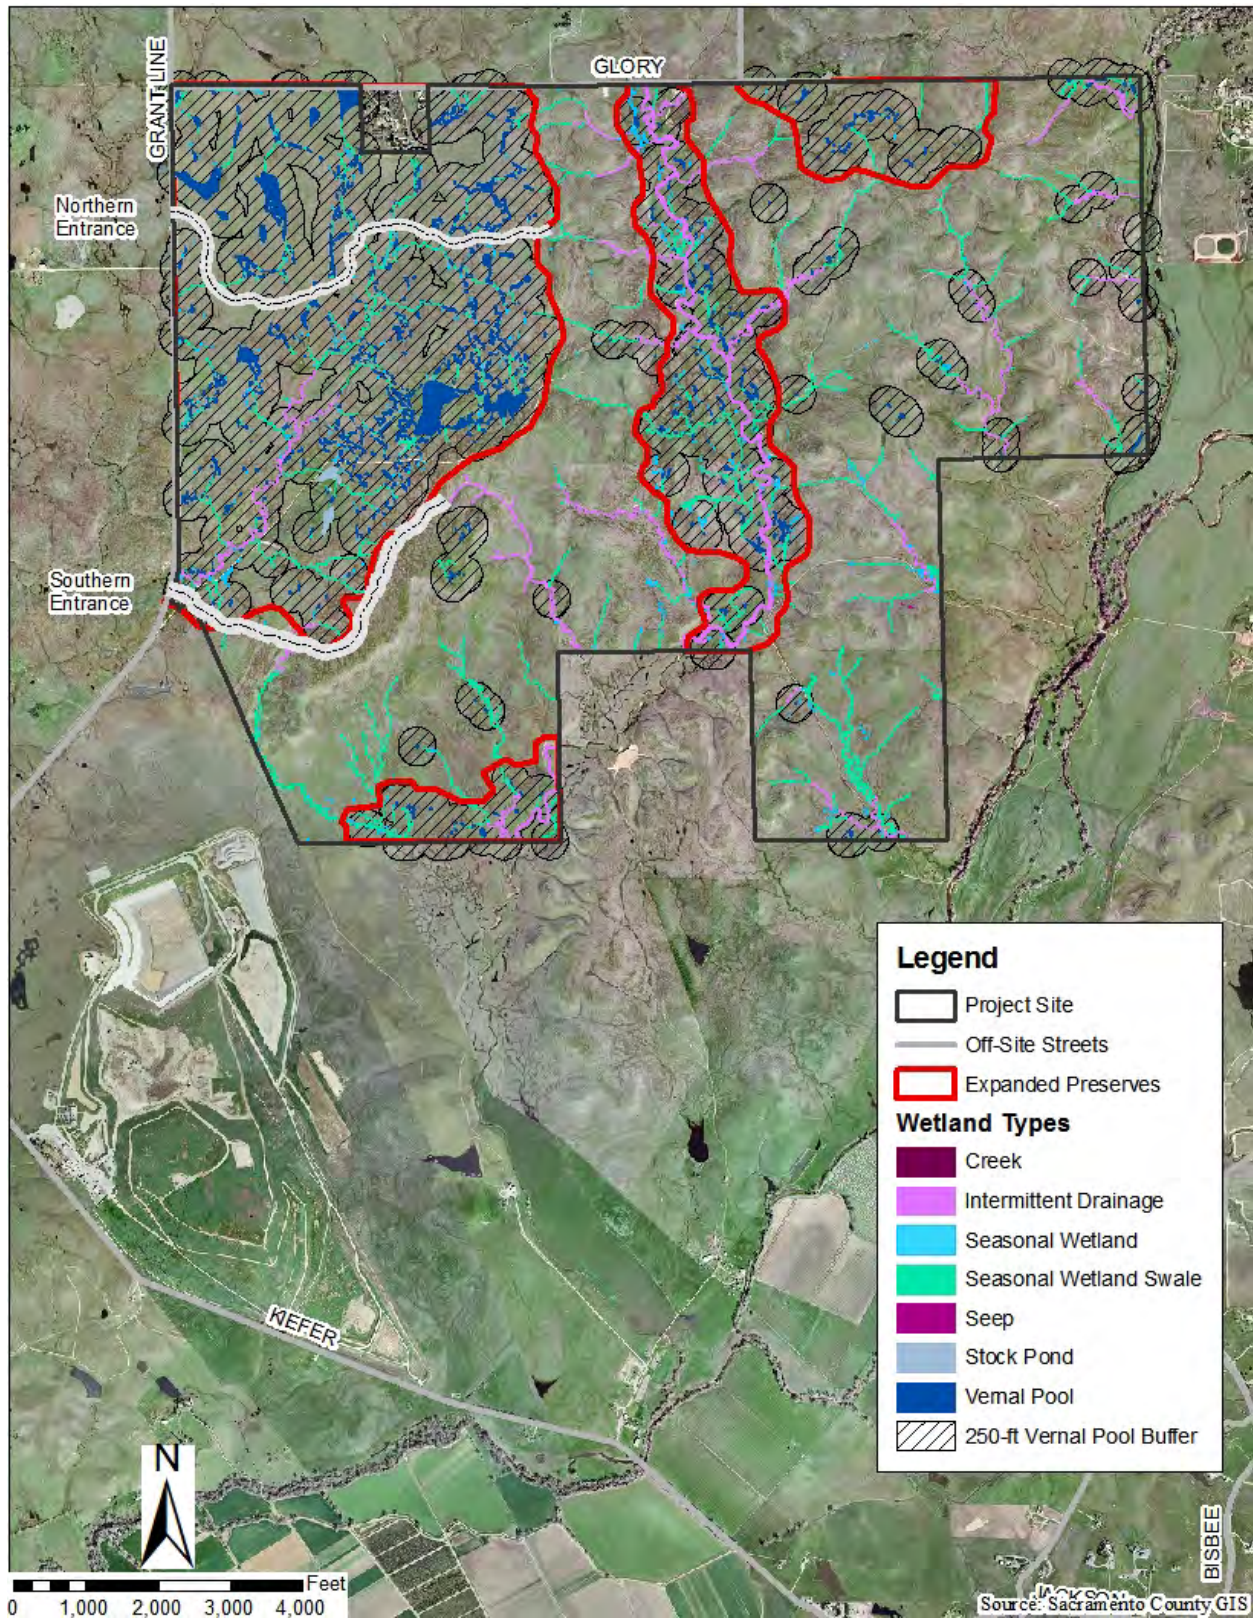

It is conservatively assumed that each home could involve up to one acre of land being taken out of agricultural use; this assumption includes access roads, the homes and appurtenant improvements, landscaped area, and areas fenced in for gardens and/or family pets. In the worst case, this could result in a total of ten acres of land being encumbered.

ALTERNATIVE 1: EXPANDED PRESERVES

This Alternative would place approximately 1,142 acres into preserves primarily by increasing the size of the western preserve area, while simultaneously reducing the developable area to 1,527 acres. The proposed preserve boundaries and Alternative’s revised access points are shown in Plate ALT-5. The preserve boundaries are defined by the standard 250-foot buffer typically requested around vernal pools in order to avoid both direct and indirect impacts (refer to the Biological Resources chapter). Note that in this alternative these areas are preserves, not avoided areas, as the Alternative includes the placement of the areas into permanent preservation/conservation easements.

The westernmost preserve is approximately 748 acres (108 acres is outside the USB), the preserve around the central site waterway is approximately 246 acres, the preserve in the northeastern area is approximately 88 acres, and the preserve in the southwestern portion of the site is approximately 60 acres. Just as with the proposed project, there would be an opportunity to create small linear preserves around some of the seasonal wetland swales and intermittent drainages to create a connected mixed-use trail system. Access into the Project site from Grant Line Road would be reduced from three locations to two locations; the central access would be removed, leaving a northern and southern entrance. As shown on Plate ALT-5, access to the site must cross the westernmost vernal pool preserve, but the two conceptual locations were chosen in order to minimize vernal pool disturbance.

Plate ALT-5: Expanded Preserves – Wetland Preserves and Access Points

Enlarging the westernmost preserve will require the removal of the proposed Town Center, resulting in the removal of 966,779 square feet of commercial/retail uses. Relocation of the Town Center elsewhere was considered, but this poses two difficulties. Firstly, this area was located along Grant Line Road because its regional retail and commercial mixed uses and densities can only be supported if it is located in a very “visible” area – i.e. along a high-capacity transportation corridor. A regional mixed use retail and commercial center is not likely to be viable if it is not highly visible and accessible. It is conceivable that the uses could be amended and rescaled to serve as a more local destination shopping area, which would attract users less through visibility than through local reputation; however, relocating the entire town center interior to the Project would require the loss of 200 acres of residentially-designated lands. The relocation would remove all 156 acres of the Ridgeline Village as well as another 50 or so acres of the University Village component. The result would be a project with a significantly unbalanced ratio of commercial to residential product. For these reasons the Alternative assumes that the Town Center is removed without replacement elsewhere.

Though this Alternative does represent a fundamental Project change, and would result in the failure of the Alternative to meet one of the primary and basic objectives of the Project, it is the only design which would avoid nearly all impacts to vernal pools (some impacts may occur as part of construction of the access road across the preserve). Project impacts to wetland resources are significant and unavoidable, and also result in significant and unavoidable impacts to special status species such as vernal pool branchiopods. For this reason, the Expanded Preserves Alternative has been included for detailed analysis, despite conflict with Project objectives.

The expansion of the various preserve areas will also require the removal of other portions of the Project, including approximately: 23 acres of the Academic Zone of the University/College Campus Center, 20 acres of the Sports Park, 9 acres of medium density residential land within the Ridgeline Village, 10 acres of high density residential land within the Ridgeline Village, 3 acres of low density residential land within the Ridgeline Village, 29 acres of medium density residential land within the University Village, 31 acres of low density residential land within the East Valley Village, and 39 acres of Public/Quasi-Public within the East Valley Village. This is conceptually shown on Plate ALT-6. These boundaries are intended to be conceptual, not exact, so the figures described in this paragraph, above, are approximate and represent the major changes.

The proposed Land Use Plan describes the densities and units assumed within each of the proposed large lots of the Project. Using this information, it can be calculated that Expanded Preserves will result in the removal of all 1,750 units from the Town Center, approximately 300 units from the Ridgeline Village, 250 units from the University Village, and 125 units from the East Valley Village. It will also reduce the proposed High School site to 39 acres, eliminate an elementary school site (which is in the Town Center), reduce the Athletic Zone of the University/College Campus Center to 38 acres, and reduce the Academic Zone of the University/College Campus Center to 45 acres. Though the Sports Park is reduced to 25 acres by the preserve expansion, it is

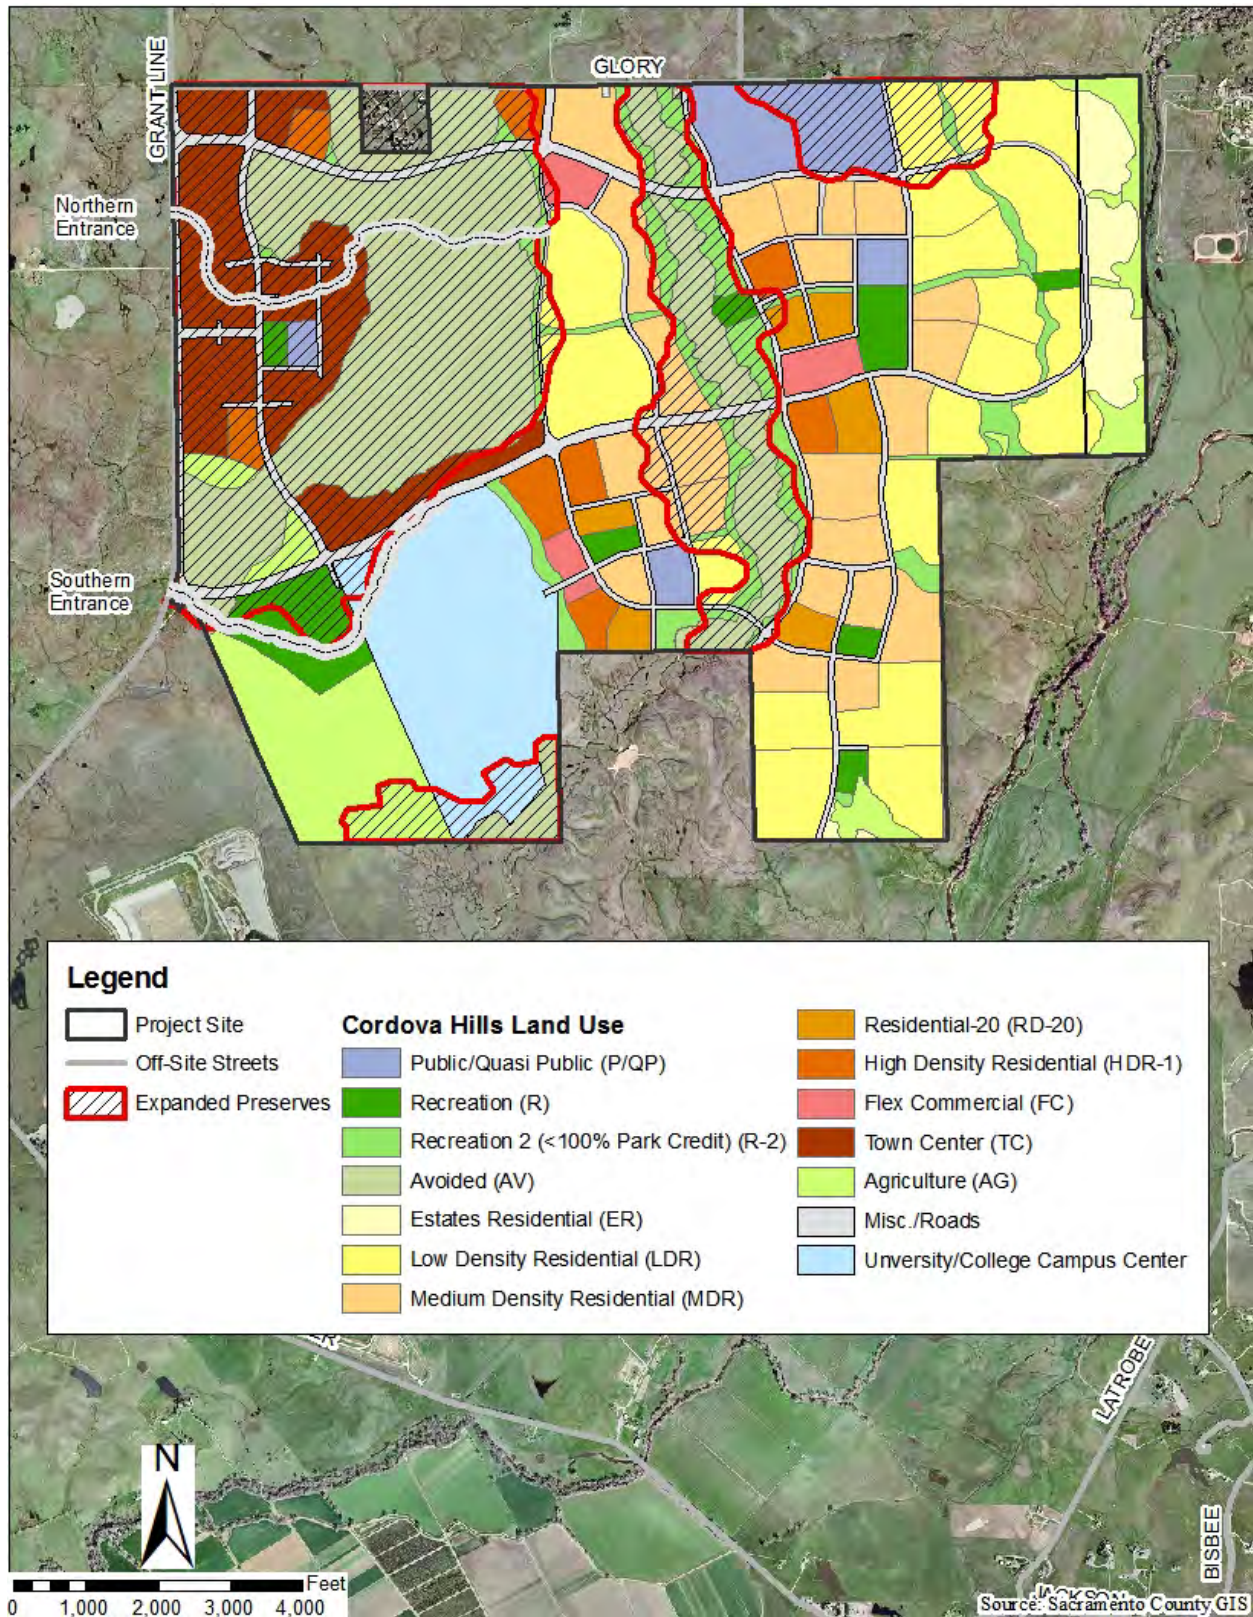

assumed that the park will simply be moved farther south and that the full 50-acre park will be developed.

One of the core objectives of the Project is to achieve high on-site residency rates for future college students. To offset the loss of 29 acres of medium density residential lands in the University Village (which is potential student housing), this Alternative assumes that approximately 29 acres of the Ridgeline Village low density residential lands will be medium density residential. The table below (Table ALT-2) provides the residential densities expected as part of Expanded Preserves.

Table ALT-2: Expanded Preserves Residential Unit Totals

Village	Approximate Number of Units	Approximate Net Residential Acres	Approximate Net Density
Ridgeline Village	945	90	11
University Village	1,235	70	18
Estates Village	500	125.8	4
East Valley Village	1,615	165	10
Creekside Village	1,540	192.4	8
University/College Campus Center	1,010	55.5	18
<i>Project Total</i>	<i>6,845</i>	<i>698.7</i>	<i>10</i>

Plate ALT-6: Expanded Preserves – Preserve Areas and Project Land Uses

ALTERNATIVE 2: EXPANDED FOOTPRINT

Alternative 2 includes the enlarged preserves of the Expanded Preserves Alternative but also expands the total Project footprint to include an 862-acre northern property referred to as Grant Line Pilatus (Plate ALT-7); again, these areas are placed within a permanent preservation/conservation easement. Portions of the Project site and the northern property are owned by separate limited liability companies, some of which share a common ownership. This Grant Line Pilatus property was a part of the original project application submitted to the Sacramento County Planning and Community Development Department. It was subsequently removed from the proposal prior to the Sacramento County Board of Supervisors decision to accept the application. Before that decision was made, the applicants had already submitted an application for a Clean Water Act Section 404 permit to the United States Army Corps of Engineers. That application included the Grant Line Pilatus property. As a result, during the Notice of Preparation Agency Scoping Meeting the United States Army Corps of Engineers and the United States Environmental Protection Agency specifically requested that the impacts of including this northern property be assessed in an Alternative.

CEQA Guidelines section 15126.6 states that the dual purpose of an Alternative is to “substantially lessen any of the significant effects of the project” and to “consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation”. Despite the fact that inclusion of the Grant Line Pilatus property increases the physical footprint of the site and thereby expands the area of impact, this Alternative has been included in order to achieve the goal of fostering informed decision making and at the request of the federal agencies.

The total area of this Alternative is 3,531 acres, with 2,016 acres designated as developable area and 1,515 acres within preserves. With this design, it becomes possible to relocate a modified Town Center into the Ridgeline Village area, while the housing from Ridgeline Village can be moved into the Grant Line Pilatus property. This still creates a problem with visibility, as the Town Center will not be immediately accessible from Grant Line Road, but the commercial and residential lands will remain balanced, and the Town Center will still be supported by the university population. The Town Center of this Alternative is also smaller, recognizing that the traffic to the retail will be lower.

The Grant Line Pilatus property also includes wetlands and linear waterways; as part of this Alternative, a system of preserves was identified for the Grant Line Pilatus property which relies on the 250-foot buffer typically requested around vernal pools in order to avoid both direct and indirect impacts (refer to the Biological Resources chapter). Approximately 373 acres of the 862-acre Grant Line Pilatus property would be within preserves, while the remaining 489 would be potential development area.

Plate ALT-8 shows the conceptual locations of the Alternative 2 Town center, the preserve areas, and the area within the Grant Line Pilatus property potentially available for development. A conceptual layout of uses on the northern parcel is not shown, but the approximate uses within these areas are described herein.

Plate ALT-7: Expanded Footprint – Wetland Preserves and Access Points

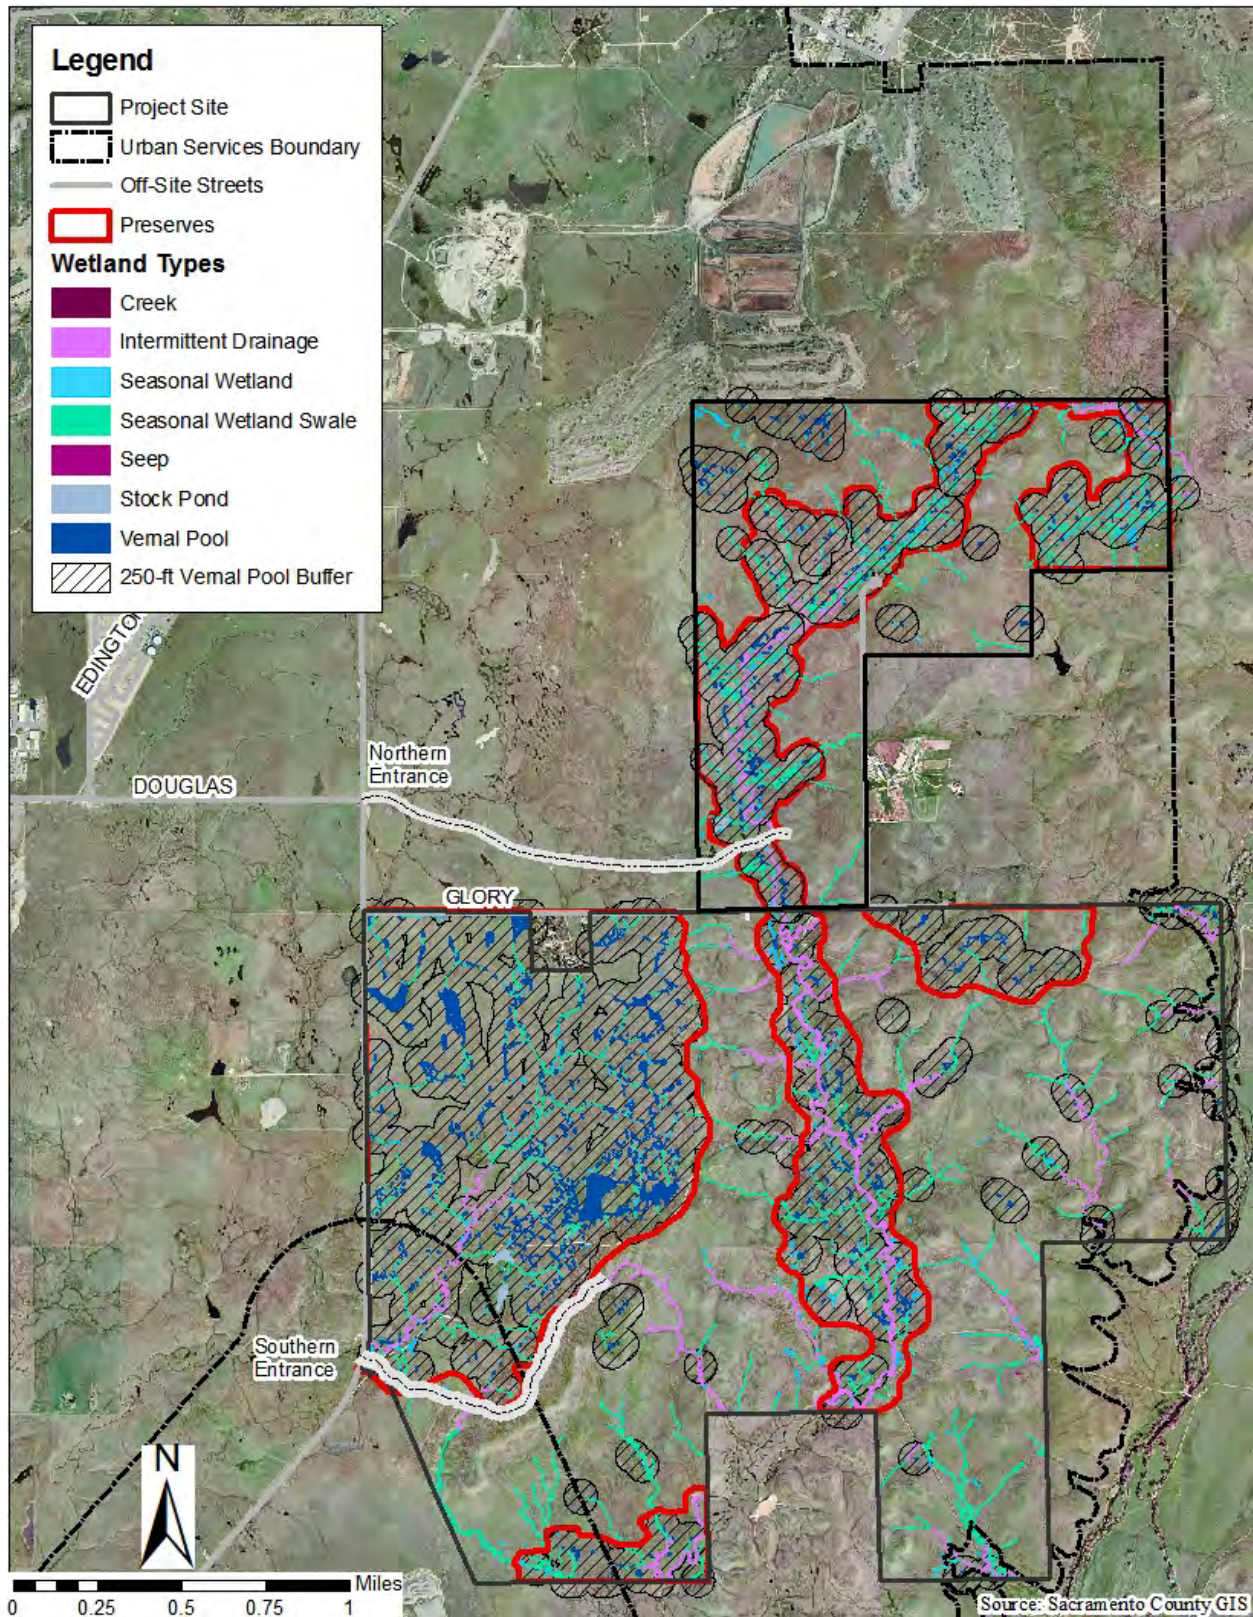

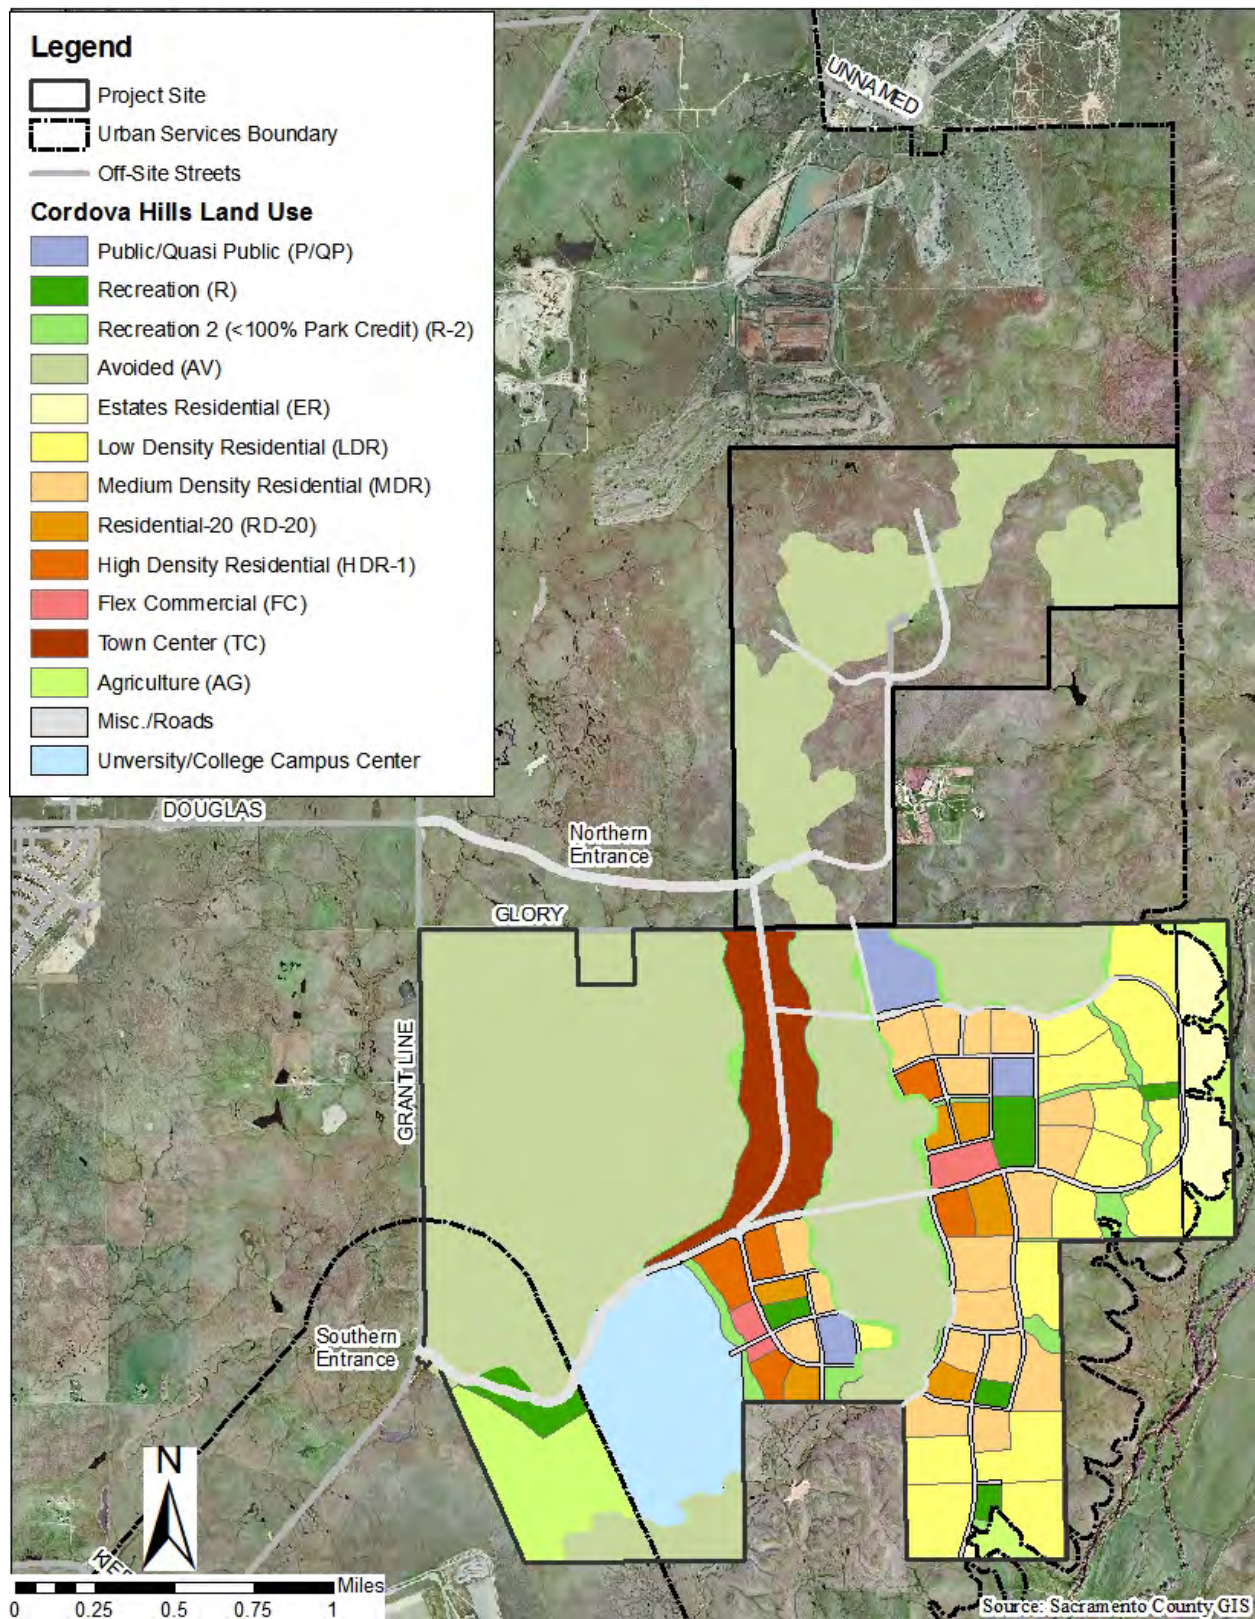

Plate ALT-8: Expanded Footprint – Conceptual Development Areas

The modified Town Center encompasses approximately 150 acres, as compared to the more than 200 acres encompassed by the Project Town Center. As with the Project Town Center, the Alternative 2 Town Center will include retail, entertainment, employment, and residential uses but the ultimate mix will depend on what is delivered by market forces and development interests. While the Project Town Center is envisioned as a regional center, the Alternative 2 Town Center will not be on a major transportation corridor and thus will only serve the Project area and some portion of adjacent future development (such as areas of Rancho Cordova to the west of the Project). The Alternative 2 Town Center cannot support the same total commercial square footage or density as the Project. At the maximum, it is assumed that the Town Center buildout will include 650,000 square feet of commercial and office uses and approximately 1,200 residential units (all HDR-1 or MDR, high or medium density residential), which is approximately 2/3 of the amount assumed for the Project (which is 1,750 units).

Relocating the Town Center would displace all 995 units of residential development within the Ridgeline Village; these units will be accommodated in the northern parcel. It is assumed that the northern parcel design would follow roughly the same design as the overall community, with some Estate Residential located at the parcel margins or within areas surrounded on three sides by preserves, Medium Density Residential located on the southern end where it is closer to the Town Center and proposed high school site, and Low Density Residential within the intervening areas.

Alternative 2 assumes that of the 995 units, approximately 100 would be Estate Residential (± 50 acres), approximately 350 would be Low Density Residential (± 120 acres), and approximately 545 units would be Medium Density Residential (± 120 acres). It is also assumed that at least one additional school and two parks will be located in the northern parcel, to replace the school (± 15 acres) and two parks (± 20 acres) removed by the preserve expansion. The proposed high school site would be expanded into the northern parcel by approximately 40 acres to replace the area removed as part of the preserve expansion. These developments leave 124 acres for roads, public spaces, open space corridors, linear parks, multi-use trail corridors, and buffer areas.

In addition to the above land use changes, the northern site access has also been shifted to an off-site location as part of this Alternative, to extend from the intersection of Grant Line Road and Douglas Road. This would be a logical roadway extension of Douglas Boulevard to the east and would be more consistent with the spacing and configurations that would be needed if Grant Line Road were to become an expressway as part of the Connector project (refer to the Transportation and Circulation chapter). The new northern entrance would require gaining access over off-site property that is not owned by the Project proponents. Review of aerial photography clearly indicates that the area through which the roadway will pass contains a vernal pool area of similar density to the Project site. Thus, whether the access is located on the site as proposed through the Project or off-site as proposed through Alternative 2, wetland impacts due to construction of this road are likely to be similar.

SUMMARY COMPARISON OF ALTERNATIVES

The Expanded Preserves Alternative includes approximately 77% of the Project population while the Expanded Footprint Alternative includes approximately 90% of the Project population. While the Project includes 18% of the land within avoided areas, the Expanded Preserves Alternative includes 43% of the land within avoided areas and the Expanded Footprint includes 57% of the land within avoided areas. The general differences between the Project and the Alternatives are included below in Table ALT-3.

Table ALT-3: Summary of Alternative Development Assumptions

	Number of Dwelling Units	Population	Non-Residential Square Footage	Acreage Designated for Urban Uses	Acres Avoided
No Project	10	27	--	0	2,659
Expanded Preserves	6,845	19,690	382,640	1,527	1,142
Expanded Footprint	8,045	22,850	1,032,640	2,016	1,515
Project	9,010	25,419	1,349,419	2,175	493

IMPACT ANALYSIS

AESTHETICS

No PROJECT

IMPACT: DEGRADATION OF EXISTING VIEWS AND VISUAL QUALITY

The existing viewshed is described in the Aesthetics chapter of this EIR. Three of the ten parcels on the site have frontage on Grant Line Road and include the plateau area. Houses constructed on these parcels would be visible to the Grant Line Road and Douglas Road/Rancho Cordova viewer groups. Adding three homes to this view would reduce the intactness of the site, but given that most of the land area would remain unaffected these encroachments would have minimal impact. More land area is visible from the residences to the north, but again, most of the viewshed would remain unencumbered by encroachments. It is likely that homes would not be visible at all from either Kiefer Road or Latrobe Road. No Project impacts to the existing visual character and quality of the site would be *less than significant*.

IMPACT: NEW SOURCES OF LIGHT OR GLARE

The existing site does not include any structures, and thus there are no sources of light or glare. Either this condition would be maintained, or up to ten homes could be constructed (one on each of the ten parcels). In the latter case, each home would be surrounded by large areas of open land, consistent with a rural landscape. Such

minimal development would not generate significant light or glare, and impacts would be *less than significant*.

EXPANDED PRESERVES

IMPACT: DEGRADATION OF EXISTING VIEWS AND VISUAL QUALITY

In this alternative, none of the proposed development would occur on the plateau area adjacent to Grant Line Road, but would instead occur on the portions of the property which are not currently visible by either Grant Line Road or the Douglas Road/Rancho Cordova viewer groups. Views of the Sierra Nevada would remain largely unimpeded, and the plateau area, which extends nearly a mile into the site, would remain intact. This would maintain most of the continuity of the existing views. It is probable that the tops of the larger structures would be visible in the distance, but this would be similar to the Project impacts described for the Latrobe Road viewer group. In the existing condition, vividness is rated 2 (low), while unity and intactness is rated 6 (high), for an average rating of 5 (moderately high). After the Alternative, unity and vividness would remain unchanged, while intactness would be reduced to a rating of 4 (moderate), for an average rating of 4 (moderate). This reduction is not considered substantial; the impacts to the Douglas Road/Rancho Cordova and Grant Line Road viewer groups would be *less than significant*.

The Expanded Preserves Alternative impacts related to the Kiefer Road and Latrobe Road viewer groups would remain very similar to Project impacts. Though larger preserves are included, the Alternative would still involve substantial urban development on the eastern and southern areas of site; these are the areas that would be most visible from Kiefer Road and Latrobe Road. As concluded for the Project, due to distance from the site, intervening landforms blocking views of the site, and lack of viewer sensitivity (for viewers at the Kiefer landfill), impacts are *less than significant*.

The residential area to the north of the Project would not be as close to other residential uses due to the inclusion of an avoided area adjacent to the proposed high school. Though this preserve would lessen the impact of the development to a certain degree, the majority of the viewshed would be altered to accommodate urban development. Though slightly improved, the improvement would not be substantial enough to change the quantification already provided for Project impacts (visual quality would be reduced from a rating of moderately high to a rating of moderately low). Impacts to this viewer group would be significant, and given that no mitigation exists that would substantially reduce impacts, impacts would be *significant and unavoidable*.

IMPACT: NEW SOURCES OF LIGHT OR GLARE

The new source of nighttime lighting would be farther from many existing residential areas, and the avoided areas would be much larger, which would make the impact less substantial than Project impacts. Nonetheless, placing more than 6,000 new homes and nearly 400,000 square feet of commercial uses in a rural area will introduce a

substantial new source of nighttime lighting. For the same reasons articulated for the Project, impacts would be significant. Mitigation Measure AE-1 included for the Project would also apply to this alternative, but impacts would remain *significant and unavoidable*.

EXPANDED FOOTPRINT

IMPACT: DEGRADATION OF EXISTING VIEWS AND VISUAL QUALITY

From the Douglas Road/Rancho Cordova and Grant Line Road viewer groups, the impacts of the Expanded Footprint Alternative would be very similar to the impacts of the Expanded Preserves Alternative; impacts would be *less than significant*. Though additional development would occur to the north, this would also be at a lower elevation than the viewer groups, taking place in lower areas east of the plateau edge along Grant Line Road. Impacts to the Kiefer Road and Latrobe Road would also be the same as those described for the Expanded Preserves Alternative; impacts would be *less than significant*. There would be no impacts to residents to the north, because these residences exist on the property that would be developed, and would no longer be present. There would be a new viewer group affected, however, and this would be drivers along Scott Road plus one residence on Scott Road.

The Project and other alternatives do not impact Scott Road viewers, because there are landforms and trees which block views of the main site. Extending development to the north would change this circumstance, bringing development closer to Scott Road in an area where the topography rises up from the roadway toward the Alternative site. (Plate ALT-9). Views from this location are very similar to those from Kiefer Road and Latrobe Road. Where the site is visible the foreground is composed of rolling, grassy hills dotted with trees. The variations in topography and the mature oak trees in the landscape increase the diversity of the views by introducing additional colors, varying the lines and angles of the horizon, and introducing multiple textures (smooth grass, rough trees). Though the vividness of this view is higher than from either Douglas or Grant Line Road, it is still moderate-to-low; the view is not highly distinctive or memorable. From most perspectives there are few negative encroachments in the view; only some fencelines and other minor structures. Vividness is rated 2, intactness is rated 6 (high), and unity is rated 6, for an average of 5 (moderately high).

Plate ALT-9: Location of Alternative Relative to Scott Road

Though site development would be visible to drivers and the residence along Scott Road, the nearest development edge would be approximately 4,300 feet from the viewpoint. Photosimulations were not development for the Alternative, but given the similarities in topography and distance, impacts would be similar to those described for viewers along Latrobe Road. Where it was visible, the development would give a rough edge to the horizon, but would not be particularly obtrusive or distinctive; vividness would not increase. Observers passing by along the road may perceive the Alternative mainly as a rough, multi-hued edge to the horizon, which means that unity will not appreciably decrease. People who stop to observe and the residents of the single affected home may take more notice of the individual buildings and other Project components, but will still be at too great a distance to make out clear details. Intactness will decrease slightly, since it will be recognizable that the new feature in the landscape is of human construction. Ratings for vividness and unity will remain the same as existing condition ratings, but intactness will decrease to 5 (moderately high), for an average rating of 4 (average). Though the Project will decrease visual quality from moderately high to average, this is not a large drop in quality; visual impacts to this viewing location are *less than significant*.

IMPACT: NEW SOURCES OF LIGHT OR GLARE

Impacts would be similar to the Expanded Preserve Alternative. Though the new sources of lighting would be farther from residential areas, placing more than 8,000 new homes and approximately 650,000 square feet of commercial uses in a rural area will introduce a substantial new source of nighttime lighting. For the same reasons articulated for the Project, impacts would be significant. Mitigation Measure AE-1 included for the Project would also apply to this alternative, but impacts would remain *significant and unavoidable*.

AGRICULTURAL RESOURCES

No PROJECT

Either the existing condition would be maintained, or single-family homes would be constructed on each parcel. In either case, the parcels would remain in their present sizes and existing agricultural activities could be maintained. The placement of individual homes on large parcels is consistent with agricultural areas, which often include residences associated with the farms, and would not conflict with adjacent agricultural activities. It is permissible to build a home on land under Williamson Act contract, as long as the home is part of the agricultural use of the land. The No Project would not conflict with existing agricultural designations or use, conflict with a Williamson Act contract, or convert agricultural lands to non-agricultural uses.

*EXPANDED PRESERVES***IMPACT: CONFLICT WITH EXISTING AGRICULTURAL USE AND ZONING**

The Expanded Preserves Alternative would result in less urbanization of the existing grazing land than the Project, and otherwise the impacts would be similar to that of the Project. None of the land is designated as Prime Farmland, and although some soils are prime when irrigated none of the site is irrigated. In this alternative, most of these potential prime soils would be retained within a preserve, though could not be farmed. The land does not support intensive agricultural investment. The Alternative would have slightly less potential for conflicts with existing off-site agricultural uses, given that some of the proposed residential uses would be removed, but impacts are not significant regardless. Project mitigation measure AG-1 is nonetheless recommended to apply to this Alternative, requiring deed notices of the Right-To-Farm Ordinance. For the foregoing reasons, impacts are *less than significant*.

IMPACT: CONFLICT WITH WILLIAMSON ACT CONTRACT

Impacts related to the Williamson Act would be identical to those described for the Project. In order to approve the subdivision map, the approval action would either need to be deferred until February 2013 (within three years of nonrenewal) or the Board of Supervisors would need to make findings that the parcels can maintain agricultural use. In order to approve the rezoning, the approval action would need to stipulate that the zoning agreement will not become effective until 2016, and Mitigation Measure AG-2 would be included to ensure continuance of agricultural use on the site until 2016. Provided these actions take place, the Project would be consistent with the provisions of the Williamson Act; impacts are *less than significant*.

IMPACT: CONVERT PROTECTED FARMLAND TO NON-AGRICULTURAL USES

The 8.6-acre Unique Farmland area would be located within the expanded preserve area, as would some of the Grazing Land located outside of the USB. Though this designated farmland area inside the preserves would not be disturbed by construction, its location within the preserved area would preclude unrestricted farming activities. As described for the Project, it should be assumed that all 255.6 acres affected will require mitigation pursuant to Mitigation Measure AG-3. With mitigation, impacts related to the conversion of farmland are *less than significant*.

*EXPANDED FOOTPRINT***IMPACT: CONFLICT WITH EXISTING AGRICULTURAL USE AND ZONING**

The added northern properties are zoned and designated for the same use designations as the Project area: Agricultural 80 (AG-80) by the Sacramento County Zoning Code and General Agriculture by the General Plan. The Alternative would rezone the land to SPA and redesignate the land for a variety of urban General Plan uses (Low Density Residential, Commercial and Offices, etc). The Alternative would have a higher

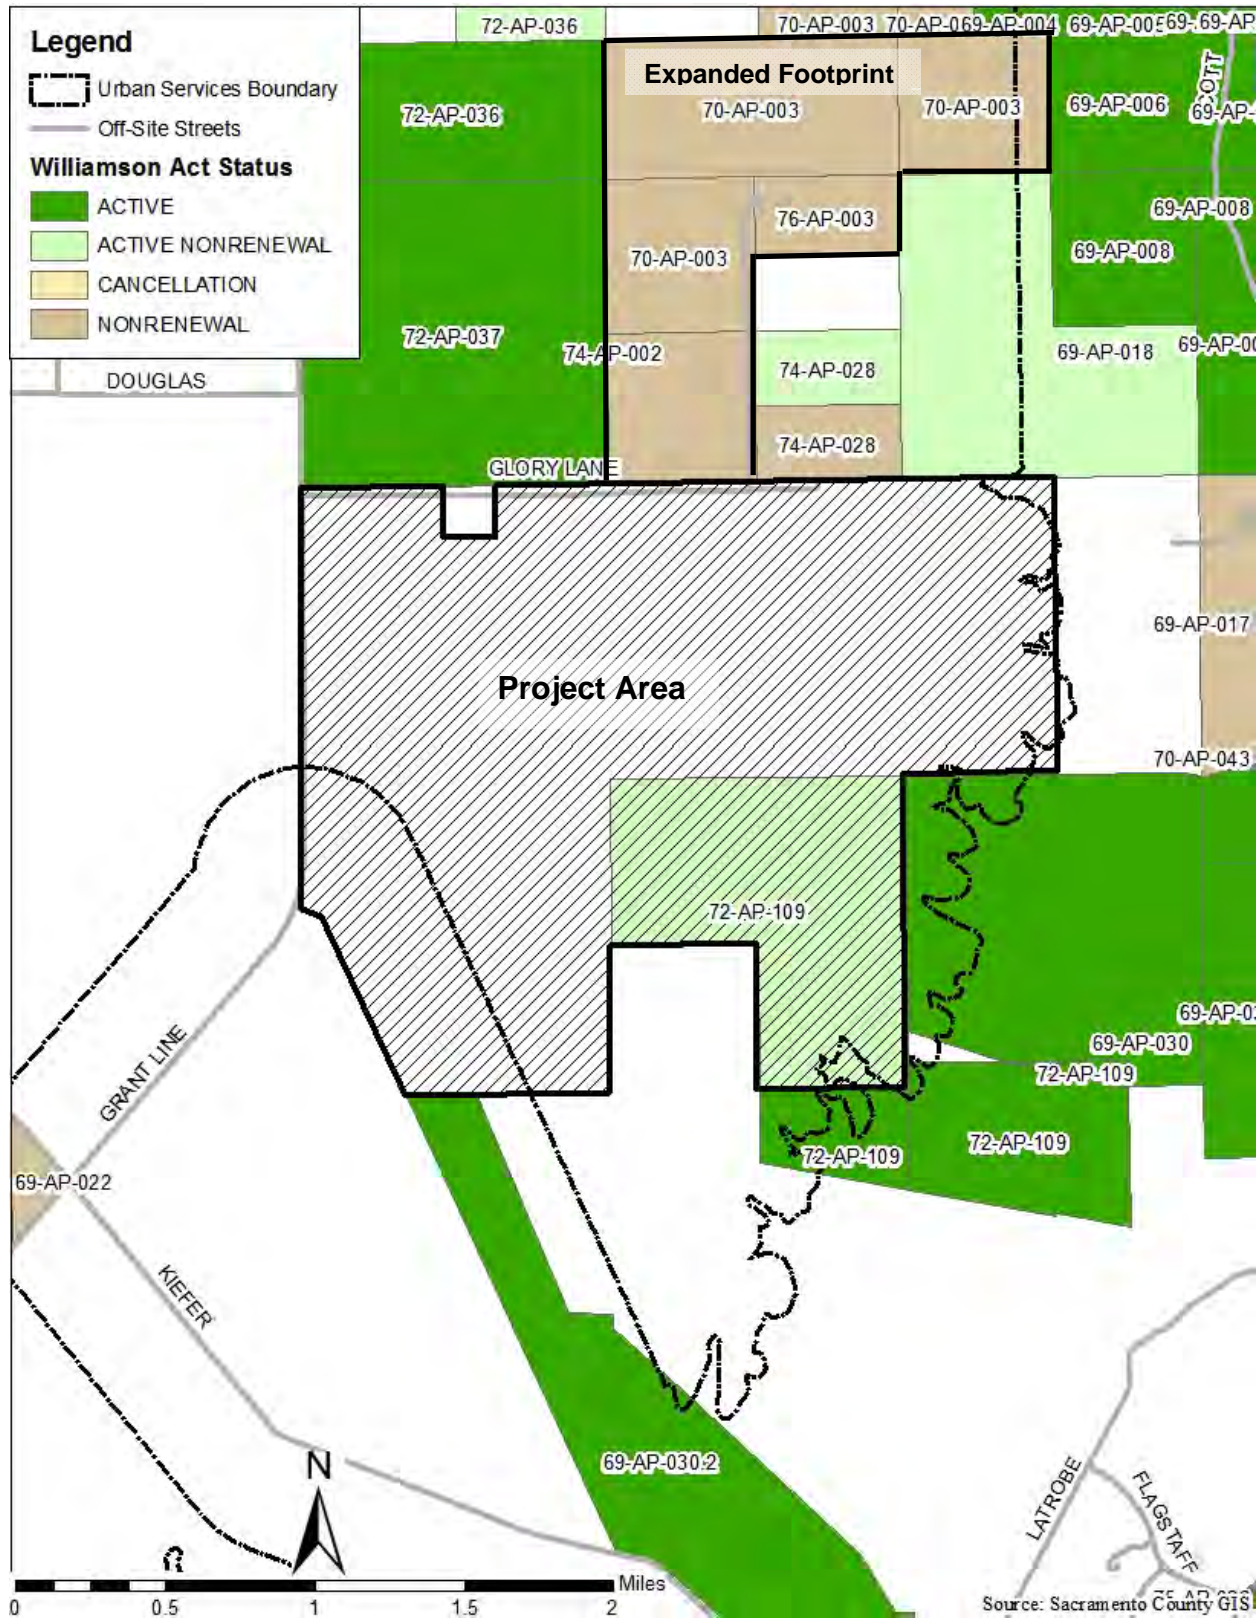

potential for conflicts with existing off-site agricultural uses, given that it would include more area interfacing with grazing land and would include a northern access road crossing grazing land which is not included as part of a development proposal. The road would have the potential to isolate the agricultural land between the roadway and the project development to the south; this area which would be isolated is approximately 100 acres of land designated as Grazing Land. Though 100 acres is of sufficient size to support grazing operations, its relative isolation may result in cessation of grazing. This is dependent on how easily the grazing stock could be moved across the roadway, and on factors such as whether there is a water source on the isolated acreage. Conservatively assuming that the land falls out of agricultural use, and assuming the land to the north has similar productivity as the Project land, the loss of 100 acres would reduce the productivity of the total contracted area by only seven animals. This potential conflict is not considered substantial. Project mitigation measure AG-1 is recommended to apply to this Alternative, requiring deed notices of the Right-To-Farm Ordinance. For the foregoing reasons, impacts are *less than significant*.

IMPACT: CONFLICT WITH WILLIAMSON ACT CONTRACT

Though historically all of the parcels in the added northern area were the subject of Williamson Act contracts (70-AP-003, 74-AP-002, and 76-AP-003) nonrenewal was filed for all of the contracts, and became effective on December 6, 1991; August 12, 1991; and May 5, 1993, respectively (refer to Plate ALT-10). Alternative impacts related to the Williamson Act lands within the Alternative boundaries would be identical to those of the Project. In order to approve the subdivision map, the approval action would either need to be deferred until February 2013 (within three years of nonrenewal) or the Board of Supervisors would need to make findings that the parcels can maintain agricultural use. In order to approve the rezoning, the approval action would need to stipulate that the zoning agreement will not become effective until 2016, and Mitigation Measure AG-2 would be included to ensure continuance of agricultural use on the site until 2016. Provided these actions take place, the Project would be consistent with the provisions of the Williamson Act.

The inclusion of the northern access must also be considered, because the parcel north of the site (over which the road would travel) is within an active Williamson Act contract (72-AP-37). This contract specifically lists “roads, streets, highways, railways and other surface vehicle transportation” as a compatible uses, so on its face the construction of a roadway is compatible with the contract; however, as described above, the roadway could result in the cessation of farming on approximately 100 acres of the contracted land. Though allowing the land to remain unused is not contrary to the terms of the contract, it is contrary to the purpose of a Williamson Act contract, which is intended to support the maintenance of agricultural activities. From this perspective, the Alternative could negatively impact 100 acres of contracted grazing land. As noted above, this would not be considered a substantial conflict. Given that the Alternative is consistent with the requirements of the Williamson Act contract, and that it would not result in substantial losses to agricultural productivity within contracted lands, impacts are *less than significant*.

Plate ALT-10: Expanded Footprint Alternative Williamson Act Contracts

IMPACT: CONVERT PROTECTED FARMLAND TO NON-AGRICULTURAL USES

The added northern properties are designated as Grazing Land as are the lands through which the northern access would be constructed; impacts are identical to those described for the Expanded Preserves alternative. As described for the Project, it should be assumed that all 255.6 acres affected will require mitigation pursuant to Mitigation Measure AG-3. With mitigation, impacts related to the conversion of farmland are *less than significant*.

AIR QUALITY

*No PROJECT***IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE NO_x EMISSIONS**

Under the No Project Alternative, there could be construction emissions associated with the potential development of one single-family residence on each of ten agricultural properties. The SMAQMD Guide provides screening tables for construction emissions which can be used to determine whether modeling is required to determine significance.

According to these screening tables, single-family residential construction would need to involve 180 units before modeling would be required. Projects involving fewer units can be presumed to have less than significant impacts. Since the No Project would involve no more than 10 homes, and furthermore it is unlikely that these homes would be constructed concurrently, construction NO_x emissions would be *less than significant*.

IMPACT: OPERATIONAL EMISSIONS OF OZONE PRECURSORS (NO_x OR ROG)

The SMAQMD Guide includes screening tables for operational emissions of NO_x, just as it does for construction. According to the screening tables a project would need to involve 375 homes before modeling would be required. Projects involving fewer units can be presumed to have less than significant impacts. Since the No Project would involve no more than 10 homes, operational NO_x emissions would be *less than significant*.

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE PARTICULATE MATTER EMISSIONS

As discussed in the Air Quality chapter, a project will result in less than significant impacts with the implementation of the Basic Construction Emission Control Practices if no more than 15 acres of active site disturbance occurs at any given time. Even if all ten potential homes were constructed at the same time, which is unlikely, on average each homesite would need to involve more than 1.5 acres in order to exceed this screening threshold. Even on agricultural properties where home sizes could be larger, construction of a single home would not involve such a substantial disturbance footprint.

The No Project condition would not exceed the screening threshold for particulate matter emissions, and impacts would be *less than significant*.

IMPACT: IMPLEMENTATION COULD CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF AIR QUALITY PLANS

According to the SMAQMD, development projects that exceed emissions of 85 lbs/day of NO_x during construction activities or 65 lbs/day of NO_x or ROG during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and, therefore, would be considered significant and require mitigation. The No Project would not result in significant construction or operational emissions, and thus impacts would be *less than significant*.

IMPACT: PROJECT OPERATION WOULD GENERATE CO EMISSIONS

This alternative could increase the cumulative traffic in the area, but by a maximum of 70 daily trips. Since localized CO concentrations near major vehicular access routes associated with the proposed project were not found to exceed ambient standards, CO impacts associated with the less traffic intensive No Project Alternative would also be *less than significant*.

IMPACT: OPERATION WOULD RESULT IN TAC EMISSIONS EXPOSURE

Single-family homes are not considered by the Air Resources Board to be sources of toxic air contaminants (TAC). As described in the Air Quality chapter, there are no significant sources of TAC within proximity of the site. The No Project will not expose existing sensitive receptors to substantial risk related to TAC exposure; impacts are *less than significant*.

IMPACT: OPERATION MAY RESULT IN EXPOSURE TO OBJECTIONABLE ODORS

Three of the parcels are within one mile of Kiefer Landfill, and one parcel is proximate to Boy's Ranch. The significance criteria asks whether "a substantial number of people" would be impacted by odor. The No Project Alternative would not involve a substantial number of people, and impacts are *less than significant*.

EXPANDED PRESERVES

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE NO_x EMISSIONS

The changes made for the Expanded Preserves Alternative would be unlikely to impact the worst-case amount of daily construction that could be expected, as these are driven by market conditions combined with decisions about the most effective way to phase construction over a large site. A substantial land area would be involved in construction activities regardless of total master plan size. It is reasonable to assume that the Expanded Preserves Alternative will result in construction activities which exceed significance thresholds. Mitigation Measure AQ-1 applied to the Project would also apply to this alternative, and would render impacts *less than significant*.

IMPACT: OPERATIONAL EMISSIONS OF OZONE PRECURSORS (NO_x OR ROG)

The Expanded Preserves Alternative includes 77% of the population of the Project, and for the purposes of this analysis it was assumed that emissions would be 77% of Project emissions. As shown in Table ALT-4, emissions would exceed the threshold.

Table ALT-4: Expanded Preserves NO_x and ROG Operational Emissions

	Emissions in lbs/day
NO_x	319.72 ¹
ROG	660.20 ²
1 – Winter emissions. Summer emissions are 223.44 lbs/day.	
2 – Summer emissions. Winter emissions are 565.99 lbs/day.	

An Air Quality Mitigation Plan (AQMP) would be required for this Alternative just as it is for the Project. The exact same AQMP could not be used, as some changes would need to be made to reflect the changes incorporated into the Alternative, but it would be required to achieve the same 35% reduction in emissions. Reducing emissions by 35% would result in worst-case emissions of 207.82 lbs/day of NO_x and 429.13 lbs/day of ROG, which would still exceed significance thresholds. Mitigation Measure AQ-2 would need to be modified for this Alternative, to reflect the fact that an AQMP does not currently exist for the Alternative, though one would be required prior to Project approval. The amended language is below; this language could be replaced to refer to a specific AQMP date prior to approval of the Alternative. Despite application of feasible mitigation, impacts would remain *significant and unavoidable*.

MITIGATION MEASURES:

ALT-1. Prepare an Air Quality Mitigation Plan (AQMP) which achieves a minimum 35% reduction of ozone precursor emissions, to the satisfaction of the Environmental Coordinator and in consultation with the Sacramento Metropolitan Air Quality Management District. Measures included within the AQMP shall be selected from SMAQMD's "Guidance for Land Use Emission Reductions" (most current version). The AQMP Measures shall be incorporated as requirements within the SPA.

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE PARTICULATE MATTER EMISSIONS

The discussion included for the Project applies to this Alternative. It is reasonable to assume that construction within the site will result in disturbance of more than 15 acres at any given time, which will result in significant emissions of particulate matter. Despite the application of feasible measures though existing rules and regulations, the Expanded Preserves Alternative will result in a *significant and unavoidable* impact related to PM₁₀ and PM_{2.5} emissions generated by construction.

IMPACT: IMPLEMENTATION COULD CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF AIR QUALITY PLANS

According to the SMAQMD, development projects that exceed emissions of 85 lbs/day of NO_x during construction activities or 65 lbs/day of NO_x or ROG during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and, therefore, would be considered significant and require mitigation.

The Expanded Preserves Alternative would result in significant operational emissions of NO_x and ROG. Therefore, the Alternative has the potential to obstruct the success of regional ozone attainment and would result in a *significant and unavoidable* impact.

IMPACT: PROJECT OPERATION WOULD GENERATE CO EMISSIONS

This Alternative would increase the cumulative traffic in the area, but to a lesser degree than the Project. Since localized CO concentrations near major vehicular access routes associated with the proposed project were not found to exceed ambient standards, Expanded Preserves Alternative CO impacts would also be *less than significant*.

IMPACT: OPERATION WOULD RESULT IN TAC EMISSIONS EXPOSURE

There are no existing sources of TAC in proximity to the site. The Alternative will include some uses which have the potential to generate TAC, such as gasoline stations.

The same mitigation applied to the Project would apply to this Alternative. Alternative impacts related to TAC emissions would be essentially the same as those described for the Project. The Alternative will not expose existing sensitive receptors to substantial risk related to stationary-source TAC exposure, and will not expose proposed sensitive receptors to substantial risk related to mobile-source TAC exposure. Mitigation Measure AQ-3 would apply to ensure that the siting of new uses conforms to California Air Resources Board recommendations. Project impacts related to TAC exposure are *less than significant*.

IMPACT: OPERATION MAY RESULT IN EXPOSURE TO OBJECTIONABLE ODORS

The Expanded Preserves Alternative will still result in the placement of sensitive uses in proximity to both the Kiefer Landfill and Boy's Ranch. The same discussion and mitigation provided for the Project applies to this Alternative; impacts are *less than significant*.

*EXPANDED FOOTPRINT***IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE NO_x EMISSIONS**

The same discussion included for the Expanded Preserves Alternative would apply here. Though the amount of units constructed is reduced compared to the Project, it is reasonable to assume that the Expanded Footprint Alternative will result in construction activities which exceed significance thresholds. Mitigation Measure AQ-1 applied to the

Project would also apply to this alternative, and would render impacts *less than significant*.

IMPACT: OPERATIONAL EMISSIONS OF OZONE PRECURSORS (NO_x OR ROG)

The Expanded Footprint Alternative includes 90% of the population of the Project, and for the purposes of this analysis it was assumed that emissions would be 90% of Project emissions. As shown in Table ALT-5, emissions would exceed the threshold.

Table ALT-5: Expanded Footprint NO_x and ROG Operational Emissions

	Emissions in lbs/day
NO_x	373.70 ¹
ROG	771.66 ²
1 – Winter emissions. Summer emissions are 261.16 lbs/day. 2 – Summer emissions. Winter emissions are 661.55 lbs/day.	

An Air Quality Mitigation Plan (AQMP) would be required for this Alternative just as it is for the Project. The exact same AQMP could not be used, as some changes would need to be made to reflect the changes incorporated into the Alternative, but it would be required to achieve the same 35% reduction in emissions. Reducing emissions by 35% would result in worst-case emissions of 207.82 lbs/day of NO_x and 429.13 lbs/day of ROG, which would still exceed significance thresholds. Mitigation Measure AQ-2 would need to be modified for this Alternative, to reflect the fact that an AQMP does not exist for the Alternative, though one would be required prior to Project approval. The amended language would be the same as described for the Expanded Preserves Alternative (Measure ALT-1); this language could be replaced to refer to a specific AQMP date prior to approval of the Alternative. Despite application of feasible mitigation, impacts would remain *significant and unavoidable*.

IMPACT: EXPOSURE TO OFFSITE EMISSIONS OF PARTICULATE MATTER

The Grant Line Pilatus portion of the Alternative is adjacent to a mine and approximately ½-mile from a processing plant area operated by Teichert Aggregates. The mine is associated with alluvial deposits rather than hardrock. Mining primarily involves the use of heavy equipment to excavate deposits; blasting activities and the creation of substantial open pits does not occur in alluvial mining. Thus, the impacts associated with proximity to this facility are exposure to dust, diesel particulates, and noise associated with the use of large earthmoving equipment.

The mining activities on the adjacent properties were approved in 1997, but have been suspended for the last several years due to decreased demand resulting from a poor economy. Though currently inactive, the Use Permit was recently extended (County Control Number 2008-00171) a further twelve years, which would result in a 2021 expiration year. According to the Use Permit, mining activities are permitted from the hours of 6 a.m. to 10 p.m. Monday through Friday, and from 6:00 a.m. until dusk during weekends and holidays. The maximum depth of mining is 45 feet. The site plans

included as part of the Use Permit also indicate that the areas nearest the Alternative boundary were part of Phase I and Phase II, while the later phases are more than ½-mile from the boundary.

The Environmental Impact Report prepared for the original Use Permit application (County Control Number 1995-0658; available for review at 827 7th Street, Room 220, Sacramento) indicated that approximately 16 pounds per day of particulate matter would be generated. Mitigation measures were included to help control particulate matter emissions. Note that particulate matter in the context of impacts to the Alternative is a function of pollutant concentration. Thus, exposure to substantial particulate matter can be avoided simply by an adequate buffer distance, to ensure that the particulates disperse before reaching sensitive receptors. Dispersion modeling usually requires that the study area extend approximately twice the width of the disturbance area (from the SMAQMD CEQA Guide). For the mining area, this would be approximately 2,500 feet from the mining boundary. Particulate matter concentrations were not measured in the EIR due to a difference in standards at the time, and lack of nearby sensitive receptors. Though modeling has not been completed, it is reasonable to assume that if homes were constructed within 2,500 feet of active mining activities, residents could be exposed to substantial particulate matter concentrations.

Though no further emission controls can be enacted for the mining activities as part of this Alternative, further controls are not necessary to avoid the impact. The Alternative areas nearest to the mining areas would be among those properties developed last, based on the need to phase infrastructure into the site. As already noted, the mining area nearest to the Alternative is part of the first two phases, and mining activities are likely to be completed in this area by the time the Alternative develops. Provided the mining activities occur on land designated as Phase III or later, the mining activities would be a minimum of ½-mile from the Alternative boundary. If this Alternative were approved, mitigation (below) would specify that development within 2,500 feet of active mining would be prohibited. Mitigation would ensure that impacts are *less than significant*.

MITIGATION MEASURES:

ALT-2. Add the following condition to the SPA: Development is prohibited within 2,500 feet of active or approved and planned mining operations.

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE PARTICULATE MATTER EMISSIONS

The discussion included for the Project applies to this Alternative. It is reasonable to assume that construction within the site will result in disturbance of more than 15 acres at any given time, which will result in significant emissions of particulate matter. Despite the application of feasible measures though existing rules and regulations, the Expanded Footprint Alternative will result in a *significant and unavoidable* impact related to PM₁₀ and PM_{2.5} emissions generated by construction.

IMPACT: IMPLEMENTATION COULD CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF AIR QUALITY PLANS

According to the SMAQMD, development projects that exceed emissions of 85 lbs/day of NO_x during construction activities or 65 lbs/day of NO_x or ROG during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and, therefore, would be considered significant and require mitigation. The Expanded Footprint Alternative would result in significant operational emissions of NO_x and ROG. Therefore, the Alternative has the potential to obstruct the success of regional ozone attainment and would result in a *significant and unavoidable* impact.

IMPACT: PROJECT OPERATION WOULD GENERATE CO EMISSIONS

This Alternative would increase the cumulative traffic in the area, but to a lesser degree than the Project. Since localized CO concentrations near major vehicular access routes associated with the proposed project were not found to exceed ambient standards, Expanded Preserves Alternative CO impacts would also be *less than significant*.

IMPACT: OPERATION WOULD RESULT IN TAC EMISSIONS EXPOSURE

There are no existing sources of TAC in proximity to the site. The Alternative will include some uses which have the potential to generate TAC, such as gasoline stations. The same mitigation applied to the Project would apply to this Alternative. Alternative impacts related to TAC emissions would be essentially the same as those described for the Project. The Alternative will not expose existing sensitive receptors to substantial risk related to stationary-source TAC exposure, and will not expose proposed sensitive receptors to substantial risk related to mobile-source TAC exposure. Mitigation Measure AQ-3 would apply to ensure that the siting of new uses conforms to California Air Resources Board recommendations. Project impacts related to TAC exposure are *less than significant*.

IMPACT: OPERATION MAY RESULT IN EXPOSURE TO OBJECTIONABLE ODORS

The Expanded Footprint Alternative will still result in the placement of sensitive uses in proximity to both the Kiefer Landfill and Boy's Ranch. The same discussion and mitigation provided for the Project applies to this Alternative; impacts are *less than significant*.

BIOLOGICAL RESOURCES

No PROJECT

The No Project Alternative could result in some minimal losses of habitat associated with construction of single-family homes and access roads. For the purposes of this analysis, it is conservatively assumed that each home would result in the loss of one acre of habitat. This is based not just on the physical footprint of construction, but also assumes that some portion of land would be landscaped and/or fenced in for gardens or

household pets, rendering is unavailable as habitat. The loss of up to 10 acres of predominantly grassland habitat encompasses less than 1% of the total land area, and would not result in significant habitat losses. Existing regulations for the protection of wetlands and special status species prohibit direct impacts without obtaining appropriate permits (and through that means satisfying mitigation requirements). Thus, it is assumed that some wetland impacts may occur, but that these would be minimal; most of the approximately 89 acres of wetlands would be retained. It is also assumed that no take of special status species would occur. No Project Alternative impacts to biological resources would be *less than significant*.

EXPANDED PRESERVES

WETLANDS AND SURFACE WATERS

Approximately 1,142 acres of the site would be within preserves as part of this Alternative, including approximately 72 acres of wetlands, with a further 37.3 acres within areas designated Agriculture which would be within a conservation easement. Some amount of this area would be impacted by construction of roads across the preserves, but the Alternative assumes that direct impacts to all vernal pools or seasonal wetlands would be avoided by roadways, and that impacts would be to linear features. Examining the sizes of the features present in the potential impacted areas and assuming an 85-foot right-of-way for the major roads, it is estimated that less than two acres of linear wetlands would be directly impacted by roadways crossing the preserves. This Alternative would place approximately 81% of the wetlands on the site into preserves, and would preserve all of the vernal pools on the eastern plateau – where the most dense vernal pool complexes are located. Of the 47.51 vernal pool acres on the site, a total of 46.39 would be within preserves as part of this Alternative. Mitigation Measure BR-1 for the Project would also apply to this Alternative. An estimated 17 acres of wetlands would require mitigation. It is concluded that mitigation would reduce impacts to *less than significant* levels, given that 81% of the total wetlands on the site would be preserved and that 98% of the vernal pools would be preserved.

SPECIAL STATUS SPECIES

The Expanded Preserves Alternative would retain 1,142 acres within preserves while impacting a total of 1,527 acres of mixed grassland and wetland habitat. As with the Project, the areas designated as Agriculture on the eastern and southeastern side of the site would be placed within an easement which would preclude developed uses, and thus would also be retained as habitat. This increases the area where impacts are avoided to 1,179 acres, while impacted areas drop to 1,490 acres. As discussed in the Biological Resources chapter, there are many species which are reliant on grassland and wetland habitats for foraging, nesting, aestivation, and/or breeding. The Expanded Preserves Alternative does not avoid the impacts described for the Project, but does reduce the severity of those impacts. All of the mitigation described in the Biological Resources chapter would apply to the Expanded Preserves Alternative, but the total

amounts of resources requiring mitigation would be altered. The sections below briefly discuss these differences.

BIRDS

Though the Expanded Preserves Alternative will retain 1,179 acres within preserves and other protected areas, whether foraging habitat is maintained for landscape-level predators such as raptors depends on the size and structure of the preserve. On this basis, the central linear preserve of the Expanded Preserves Alternative will not be counted as preserved foraging habitat for most raptors. Including this area in the total impact (which is 1,490 acres developed with urban uses), the Expanded Preserves Alternative will result in the loss of 1,736 acres of foraging habitat for the Swainson's hawk, ferruginous hawk, golden eagle, northern harrier and white-tailed kite. Each of the preserves will be large enough to support habitat for the grasshopper sparrow, tricolored blackbird, and burrowing owl, and thus the total impacted acreage for these species is 1,490 acres. Mitigation Measures BR-3, BR-5, and BR-6 for the Project would apply, unchanged, to this Alternative. Mitigation Measure BR-4 would also apply, but the total acreage requiring mitigation would be 1,736 acres. As described for the Project, mitigation would reduce impacts to *less than significant* levels.

AMPHIBIANS

The Expanded Preserves Alternative retains more wetlands and more upland area for the western spadefoot toad than the Project. Project impacts to the western spadefoot were determined to be less than significant, and the conclusion remains the same for the Alternative; impacts are *less than significant*.

INVERTEBRATES

The Expanded Preserves Alternative would result in the loss of 17 acres of wetlands which could provide suitable habitat for listed invertebrates. Individual permit requirements are varied, depending upon the quality of the habitat lost, the nature of the impact, and the quality of the mitigation land offered – among other factors. This variation can be observed through review of the BOs in Appendix BR-4. Ultimately, mitigation requirements will be defined through the individual permitting process, but consistent with Sacramento County General Plan policy the mitigation below stipulates a minimum of 1:1 mitigation for wetland habitat lost. It is probable that the individual permit requirements will require a larger amount of mitigation.

The Expanded Preserves Alternative will place 81% of the wetlands on the site into preserves. For this reason, it is concluded that this preservation in combination with the mitigation will reduce impacts to *less than significant* levels.

PLANTS

Most of the same discussion provided for the Project also applies to this Alternative. All development will remain a minimum of 250 feet from vernal pools, which includes those

pools containing legumere and Sacramento orcutt grass. For this reason, Mitigation Measure BR-9 would not apply to this Alternative. Mitigation Measure BR-10 would still apply, because although the vernal pools containing Sacramento orcutt grass will be in a much larger preserve, developed uses will still be within 300 feet of development areas, and could still be impacted by invasive species. As described for the Project, avoidance of direct impacts coupled within mitigation for potential indirect impacts will ensure that impacts to Sacramento orcutt grass resulting from this Alternative are *less than significant*.

EXPANDED FOOTPRINT

In addition to the 1,142 acres of preserves noted in the Expanded Preserves Alternative, this Alternative includes an additional 373 acres of preserves in the Grant Line Pilatus property. A wetland delineation for this property was prepared by ECORP Consulting, Inc. Environmental Consultants (dated July 9, 2008; Appendix ALT-1) and catalogues a total of 20.7 acres of wetlands. For this Alternative, a total of 1,515 acres would be in preserves while 2,016 acres would be designated for developable uses. Again, the areas designated as Agriculture on the eastern and southeastern side of the site would be placed within an easement which would preclude developed uses, and thus would also be retained as habitat. This increases the area where impacts are avoided to 1,552 acres, while impacted areas drop to 1,979 acres. Of the approximately 21 acres of wetlands in the Alternative, approximately 17 acres would be located within preserves (Table ALT-6), making the impact only four acres. Adding the wetland acreage from the Grant Line Pilatus property to the main Cordova Hills property, the Expanded Footprint Alternative includes approximately 110 acres of wetlands, approximately 89 acres of which would within preserves. The Expanded Footprint Alternative places approximately 81% of the wetland acres within preserves. Of the 54.09 acres of vernal pools on the site, a total of 51.44 acres would be preserved; this is 95% of the vernal pool acreage on the site.

Analysis showed that roadways through the preserves of the Expanded Preserves Alternative would involve less than two acres of additional impacts. This is likely to be increased by the Expanded Footprint Preserve, which would involve three crossings of the central preserve on the Grant Line Pilatus property. The Alternative would also include shifting the northern access road off-site, farther to the north. There are dense wetlands in this area which would be impacted by roadway construction, but given that the property is not owned by the applicants or their affiliates, there is no wetland delineation on this property. It is probable that whether the northern access crosses on the site or off-site, the wetland impacts of the roadway would be similar.

Wetland impacts due to the Expanded Footprint Alternative are *less than significant*, for the same reasons described for the Expanded Preserves Alternative.

Table ALT-6: Wetlands and Impacts on the 862-Acre Northern Property

Wetland Type	Acreage Impacted	Acreage Preserved	Total Acreage
Intermittent Drainage	0.19	3.18	3.37
Seasonal wetland	1.09	2.96	4.05
Seasonal wetland swale	1.29	5.05	6.34
Seep	--	0.02	0.02
Stock Pond	--	0.34	0.34
Vernal Pool	1.53	5.05	6.58
<i>TOTAL</i>	<i>4.10</i>	<i>16.6</i>	<i>20.7</i>

SPECIAL STATUS SPECIES

The Expanded Footprint Alternative would retain 1,552 acres within preserves and other protected areas while impacting a total of 1,979 acres of mixed grassland and wetland habitat. As discussed in the Biological Resources chapter, there are many species which are reliant on grassland and wetland habitats for foraging, nesting, aestivation, and/or breeding. The Expanded Footprint Alternative does not avoid the impacts described for the Project, but does reduce the severity of those impacts. All of the mitigation described in the Biological Resources chapter would apply to the Expanded Footprint Alternative, but the total amounts of resources requiring mitigation would be altered. The sections below briefly discuss these differences.

BIRDS

While the linear preserve within the main Cordova Hills area is still considered impacted, the preserve within the Grant Line Pilatus Property is wider in many locations, and is also connected at multiple points to off-site areas which will remain in open space. The preserve within the Grant Line Pilatus property is considered retained habitat for landscape-level raptors such as the Swainson's hawk. Adding the 489 acres of urban development land on the Grant Line Pilatus property to the 1,736 acres impacted in the main Cordova Hills portion results in a total impacted area of 2,225 acres of foraging habitat for Swainson's hawk, ferruginous hawk, golden eagle, northern harrier and white-tailed kite. Each of the preserves will be large enough to support habitat for the grasshopper sparrow, tricolored blackbird, and burrowing owl, and thus the total impacted acreage for these species is 1,979 acres. Mitigation Measures BR-3, BR-5, and BR-6 for the Project would apply, unchanged, to this Alternative. Mitigation Measure BR-4 would also apply, but the total acreage requiring mitigation would be 2,225 acres. As described for the Project, mitigation would reduce impacts to *less than significant* levels.

AMPHIBIANS

The Expanded Footprint Alternative retains more wetlands and more upland area for the western spadefoot toad than the Project. Project impacts to the western spadefoot

were determined to be less than significant, and the conclusion remains the same for the Alternative.

INVERTEBRATES

VERNAL POOL CRUSTACEANS

The Expanded Footprint Alternative would result in the loss of 17 acres of wetlands on the Cordova Hills portion and four acres of wetlands on the Grant Line Pilatus portion of the site, all of which could provide suitable habitat for listed invertebrates. Individual permit requirements are varied, depending upon the quality of the habitat lost, the nature of the impact, and the quality of the mitigation land offered – among other factors. This variation can be observed through review of the BOs in Appendix BR-4. Ultimately, mitigation requirements will be defined through the individual permitting process, but consistent with Sacramento County General Plan policy the mitigation below stipulates a minimum of 1:1 mitigation for wetland habitat lost. It is probable that the individual permit requirements will require a larger amount of mitigation.

The Expanded Footprint Alternative will place 81% of the wetlands on the site into preserves. For this reason, it is concluded that this preservation in combination with the mitigation will reduce impacts to *less than significant* levels.

VALLEY ELDERBERRY LONGHORN BEETLE

Though the main Project area does not contain any habitat for this species, the Grant Line Pilatus property contains a single elderberry plant which could provide habitat for the valley elderberry longhorn beetle (refer to Table BR-3 of the Biological Resources chapter for a species description). This plant would be located within the preserve area, and would not be subject to direct or indirect impacts; thus, impacts are *less than significant*.

PLANTS

For the Cordova Hills portion of the site, the same discussion provided in the Expanded Preserves Alternative applies to this Alternative. Rare plant surveys were not completed on the Grant Line Pilatus property, so the following discussions are based on probability of occurrence. The Grant Line Pilatus property contains surface waters which provide suitable habitat for the following species (for descriptions, refer to Table BR-3 of the Biological Resources chapter): Dwarf downingia, Boggs lake hedge-hyssop, Ahart's dwarf rush, legenere, pincushion navarretia, slender orcutt grass, Sacramento orcutt grass, and Sanford's arrowhead. These species are recorded in the California Natural Diversity Database as being within five miles of the site.

Determinate surveys for wetland-associated rare plants would be required as mitigation for this Alternative. Surveys would be required for all vernal pools, seasonal wetlands, and seasonal wetland swales within 250 feet of construction activities. Mitigation would be required for any species encountered, dependent upon the rarity of the species. For

pincushion navarretia, dwarf downingia, Boggs lake hedge-hyssop, or legenere, mitigation would be in-kind replacement at restoration or creation mitigation sites. The upper layer of soil from the pools can be removed and used as a seed bank to populate the mitigation area. Mitigation prohibits loss of wetlands containing Ahart's dwarf rush, Sacramento orcutt grass, and slender orcutt grass, because these species are extremely rare. Mitigation will ensure that impacts would be *less than significant*.

ALT-1. Rare plant surveys will be required in vernal pool, seasonal wetland, and seasonal wetland swale habitats prior to any grading, grubbing, or excavation within 250 feet of a vernal pool or other suitable habitat. Species surveys shall include Dwarf downingia, Boggs lake hedge-hyssop, Ahart's dwarf rush, legenere, pincushion navarretia, slender orcutt grass, Sacramento orcutt grass, and Sanford's arrowhead. Surveys must be conducted in accordance with Fish and Game "Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered plants and Natural Communities" or a newer protocol that is accepted by CDFG and/or USFWS. The rare plant surveyor shall have experience as a botanical field investigator and familiarity with the local flora and potential rare plants in the habitats to be surveyed. The surveys shall be conducted when the rare plants at the construction site will be easiest to identify (i.e. flowering stage), and when the plants reach that stage of maturity. A minimum of three construction site visit shall be required, during the plants flowering period in order to determine absence. Each construction site visit must be no less than 7 days apart.

Submit a written report to the Environmental Coordinator. The survey report should include a brief description of the vegetation, survey results, photographs, time spent surveying, date of surveys, a map showing the location of the survey route and any rare plant populations and copies of any rare plant occurrence forms. If no rare plants are found, no further action is required. If rare plants are encountered then the following applies (these measures may be superseded by a mitigation plan approved by Fish and Wildlife):

- A. Wherever pincushion navarretia, dwarf downingia, Boggs lake hedge-hyssop, or legenere is found during protocol-level surveys and the habitat is proposed for development, the upper layer of the habitat will be scraped and used as inoculum for restoration or creation sites. The material will be gathered late in the dry season (early fall) and spread over the new or restored substrates, which will be raked to provide a loose subsoil cover to which the vernal pool inoculum will be added before or immediately after the wet season begins (mid to late fall). Surveys will be conducted after the first year and every five years thereafter to monitor success. If after the first year, or any five-year interval thereafter, the restored habitat is not meeting restoration criteria standards of 60 percent survivorship, the efforts will be deemed to have failed. The survivorship percentage shall be based upon the population which had been present in the parent pool(s). The expected population which is used to determine survivorship shall be adjusted annually

based on fluctuations in reference pool populations, in order to account for variations in climate which may result in higher or lower populations in any given year. For example, if 80 individuals were present in the parent pool and 100 in the reference pool, and if in a later year there are 70 individuals in the reference pool, then 100% survivorship would be 56 individuals in the mitigation pool. Remediation of failed restoration efforts must occur within one year after efforts are deemed unsuccessful.

- B. Wherever Ahart's dwarf rush, Sacramento orcutt grass, or slender orcutt grass are found, the wetlands in which they occur shall be preserved. The minimum buffer shall be 250 feet from the edge of the wetland.

CLIMATE CHANGE

Note that the climate change impacts to the study area would be very similar regardless of the Alternative, so the discussions below only describe the greenhouse gas emissions (GHG) of the Alternatives. For impacts to the site from climate change, refer to the Climate Change chapter.

No PROJECT

GREENHOUSE GAS EMISSIONS

Either existing greenhouse gas emissions from the site would remain unchanged, or emissions could increase due to the presence of up to ten homes on the site. Using the Business As Usual calculations of the Cordova Hills GHG Plan, ten homes could emit approximately 1.5 metric tons (MT) per capita (Table 23 of the GHG Plan). Assuming residency figures of 2.71 people per home, this would be approximately 41 MT due to energy usage. The Business As Usual figures for the transportation sector is 8.01 MT per capita, or 217 MT annually. No Project total emissions are calculated as 258 MT annually, or 9.51 MT per capita. This is well above the significance thresholds, but any action exempt from CEQA is likewise exempted from the thresholds. Even if the No Project were discretionary, given that the total emissions are only a tiny fraction of total County emissions (0.005%, based on unincorporated County emissions of 5.2 million MT annually), the total emissions are insignificant; No Project impacts to climate change are *less than significant*.

EXPANDED PRESERVES

GREENHOUSE GAS EMISSIONS

Although the Expanded Preserves Alternative involves fewer homes and businesses, it is assumed that the per capita and per square-foot energy sector emissions would be essentially unchanged from the Project totals (from page 33 of the GHG Plan), which is 1.18 MT (residential) and 5.75 MT per 1,000 square feet (commercial). With 6,845

homes and 382,640 square feet of commercial space, total emissions from energy usage would be 8,460 MT annually.

Table 17 of the GHG Plan shows the methodology and data used to calculate transportation-related GHG emissions. The traffic study also provided data for the Alternatives (Table ALT-7). Using the same methodology shown in Table 17 of the GHG Plan, the transportation emissions of the Expanded Preserves Alternative is 88,283 MT per day, or 4.48 MT per capita annually. The anticipated further reductions from the GHG Plan (Table 19 of the GHG Plan) would reduce these emissions by 15.9%, resulting in per capita emissions of 3.77 MT per capita.

Compared to the thresholds in effect at the time of the NOP, the Expanded Preserves Alternative would be below all three sector thresholds. Compared to the current thresholds, the Alternative would be above the transportation sector threshold. Converting the commercial and industrial sector threshold to per capita (0.62 MT according to page 33 of the GHG Plan) and then combining all sectors, total emissions would be 5.57 MT per capita or 96,743 MT annually. Converting the commercial and industrial threshold to per capita and combining all sectors, the aggregate threshold is 4.97 MT per capita. Aggregating the sectors to account for “overachievement” in the energy usage sectors still does not result in emissions which are below the threshold. The same conclusion applied to the Project applies to this Alternative, and impacts remain *significant and unavoidable*.

EXPANDED FOOTPRINT

GREENHOUSE GAS EMISSIONS

Although the Expanded Preserves Alternative involves fewer homes and businesses, it is assumed that the per capita and per square-foot energy emissions would be essentially unchanged, which is 1.18 MT (residential) and 5.75 MT per 1,000 square feet (commercial), based on page 33 of the GHG Plan. With 8,045 homes and 1,032,640 square feet of commercial space, total emissions from energy usage would be 10,526 MT annually.

Table 17 of the GHG Plan shows the methodology and data used to calculate transportation-related GHG emissions. The traffic study also provided data for the Alternatives (Table ALT-7). Using the same methodology shown in Table 17 of the GHG Plan, the transportation emissions of the Expanded Preserves Alternative is 102,814 MT per day, or 4.50 MT per capita annually. The anticipated further reductions from the GHG Plan (Table 19 of the GHG Plan) would reduce these emissions by 15.9%, resulting in per capita emissions of 3.78 MT per capita.

Compared to the thresholds in effect at the time of the NOP, the Expanded Footprint Alternative is below all three sector thresholds. Compared to the current thresholds the Expanded Footprint Alternative is above the transportation sector threshold. Aggregating all emissions, the Expanded Footprint Alternative results in emissions of 5.61 MT per capita or 113,3403 MT annually, which is also above the aggregated

threshold. Aggregating the sectors to account for “overachievement” in the energy usage sectors still does not result in emissions which are below the threshold. The same conclusion applied to the Project applies to this Alternative, and impacts remain *significant and unavoidable*.

Table ALT-7: Traffic Data Used in the GHG Analysis for Alternative 1 and 2

NOTES

VMT: vehicle miles traveled

1. Including the 15.9% Reduction from Table 19 of the GHG Plan

CULTURAL RESOURCES

NO PROJECT

The discussions found in the Cultural Resources chapter apply to this Alternative. There are no known historical resources on the site, as defined by CEQA. The No Project Alternative involves a much smaller potential construction footprint, and thus there is a much lower probability of encountering undiscovered subsurface resources. Though mitigation cannot be applied to a No Project Alternative, it is expected to be unnecessary for such minor potential changes; since there are no significant resources on the site, impacts of the No Project Alternative are *less than significant*.

EXPANDED PRESERVES

The discussions found in the Cultural Resources chapter apply to this Alternative. There are no known historical resources on the site, as defined by CEQA. The impacts of this Alternative would essentially be the same as the Project, though with a slightly reduced likelihood of encountering undiscovered subsurface resources, because the Expanded Preserves Alternative involves a smaller construction footprint. Mitigation Measure CR-1 would reduce potential impacts to *less than significant* levels.

EXPANDED FOOTPRINT

For the main Cordova Hills portion of this Alternative, impacts to cultural resources are the same as those discussed above in the Expanded Preserves discussion. A cultural resources survey has not been conducted on the Grant Line Pilatus property, but a record search was performed at the North Central Information Center in this area as part of the Draft 2030 Sacramento County General Plan EIR. According to the record search, there are six historical isolates recorded within or adjacent to the Grant Line Pilatus property. The isolates consist of miscellaneous farming equipment, such as a tractor, and an oil can. Isolates lack historical context and data potential, thus are not considered significant resources. Thus, there are no known significant cultural resources within the Grant Line Pilatus area.

The area was historically utilized for intensive mining and, later, ranching and farming activities. The intensive use of the this growth area for placer mining purposes, resulted in substantial topographic changes that are very prevalent today, which act as artificial monuments of the historic land use in this area. Such activities have resulted in massive changes to stratigraphy, which likely obliterated many prehistoric cultural resources sites within the area. Though no known significant sites exist, and it is likely that any sites that were present have been damaged by use of the property over time, the presence of the isolates does indicate some sensitivity for the presence of undiscovered historical resources. Furthermore, as is the case with all development, there is the potential to discover previously undocumented archeological resources. A cultural resources field survey must be conducted on the site prior to development, to ensure that all reasonable steps have been taken to identify significant resources;

mitigation to that effect has been included, along with a requirement to preserve any significant sites. This mitigation (ALT-2), in combination with Project measure CR-1, would reduce potential impacts to *less than significant* levels.

MITIGATION MEASURES:

ALT-2. Prior to issuance of building permits or recordation of the final map, whichever occurs first, a cultural resources survey prepared by a qualified professional shall be provided to the Environmental Coordinator. Any significant resources (as defined by the National Historic Preservation Act, the California Environmental Quality Act Guidelines, and the California Public Resources Code) shall be preserved, to the satisfaction of the Environmental Coordinator.

GEOLOGY AND SOILS

NO PROJECT

The discussions found in the Geology and Soils chapter apply to this Alternative. As described, there are existing regulations in place to ensure that construction on the site does not cause substantial soil erosion, and will avoid substantial risk to life and property associated with expansive soils or geological hazards (such as seismicity). The site is not considered likely to include asbestos-containing soils, and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site which would be obstructed by the Alternative, and moreover, the construction of up to ten homes would not preclude future mining of the site. Impacts related to this topical area are *less than significant* for the same reasons described for the Project.

EXPANDED PRESERVES

The discussions found in the Geology and Soils chapter apply to this Alternative. As described, there are existing regulations in place to ensure that construction on the site does not cause substantial soil erosion, and will avoid substantial risk to life and property associated with expansive soils or geological hazards (such as seismicity). The site is not considered likely to include asbestos-containing soils, and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site which would be obstructed by the Alternative, and moreover, this Alternative would include the same aggregate-recovery plan as the Project. Impacts related to this topical area are *less than significant* for the same reasons described for the Project.

EXPANDED FOOTPRINT

The discussion for this Alternative is the same as the one provided for Expanded Preserves, above, except that some additional discussion is necessary to address the additional land area. The Grant Line Pilatus area is designated MRZ-1 and MRZ-3, and

it contains the same soil types as the Project area (refer to Plate ALT-11 and Plate ALT-12; on the latter exhibit, prime soils are hatchmarked). The expansion of the site brings the existing MRZ-2 areas to within 1.5 miles of the Alternative, but still does not make the Alternative likely to obstruct access to mineral resources. Like the rest of the site, the Grant Line Pilatus area is not mapped as likely to include asbestos-containing soils. Ultimately, since the additional property has the same geologic characteristics as the primary Project area, the discussions and conclusions for the Project apply to the Expanded Footprint Alternative. Impacts related to this topical area are *less than significant* for the same reasons described for the Project.

Plate ALT-11: Expanded Footprint and Sacramento County MRZ Zones

The map displays the Project Site, outlined in black, situated within a larger area defined by the Urban Services Boundary, indicated by a dashed line. The map is overlaid with a grid of soil type designations, each represented by a unique color and pattern. The Project Site is primarily composed of 125 - Corning Complex (light blue) and 126 - Corning-Redding Complex (light green) soils. The Urban Services Boundary area includes a variety of soil types, including 101 - Amador-Gillender Complex (light yellow), 125 - Corning Complex (light blue), 126 - Corning-Redding Complex (light green), 132 - Creviscreek Sandy Loam (light orange), 156 - Hadselville-Pentz Complex (light purple), 158 - Hicksville Loam (light pink), 160 - Hicksville Sandy Clay Loam (light brown), 163 - Keyes Sandy Loam (light yellow), 187 - Pardee Ranchoseco Complex (light green), 188 - Pentz-Lithic Xerorthents Complex (light blue), 189 - Peters Clay (light orange), 192 - Red Bluff Loam (light pink), 193 - Red Bluff-Redding Complex (light yellow), 198 - Redding Gravelly Loam (light green), 215 - San Joaquin Silt Loam (light blue), and 242 - Xerofluvents (light orange). The map also shows off-site streets, including Solsberry, Raymer, Nike, Edington, Douglas, Glory, and Ant Line. A north arrow and a scale bar (0 to 2 miles) are located in the bottom left corner. The source is cited as Sacramento County GIS.

HAZARDS AND HAZARDOUS MATERIALS

No PROJECT

The impacts discussed in the Hazards and Hazardous Materials chapter are largely related to the proximity of known hazards or hazardous materials to the Project site, and are typically unrelated to the specific uses proposed within the site. For this reason, the impact discussions for the Project apply to the No Project Alternative. Known existing or historic hazardous conditions near the site include the Boy's Ranch, Aerojet (soil and groundwater contamination), and Kiefer Landfill (groundwater contamination). The Boy's Ranch was remediated and is a closed case, and does not have the potential to impact homes developed on the site. The No Project Alternative would involve the use of wells to supply both potable and non-potable water supply, but since groundwater contamination stemming from the Aerojet and Kiefer Landfill properties are migrating away from the site, the wells would not be negatively impacted by contamination. Only one of the parcels is affected by the buffer of the Kiefer Landfill, and it is highly unlikely that a home would be constructed within the relatively narrow area where the buffer exists – it is more probable that a home would be constructed at a point farther from the landfill, and thus would not be impacted by gas migration. Impacts related to this topical area are *less than significant*, as described for the Project.

EXPANDED PRESERVES

The same discussions provided for the Project apply to this Alternative; also refer to the No Project discussion above for a summary. Impacts related to this topical area are *less than significant*, as described for the Project. Mitigation Measure HM-1 would apply.

EXPANDED FOOTPRINT

The Project search radius for hazardous sites was one mile – an area which includes the Grant Line Pilatus area. Though this Alternative includes additional land area, it does not change the conclusions of the analysis. Impacts related to this topical area are *less than significant*, as described for the Project. Mitigation Measure HM-1 would apply.

HYDROLOGY AND WATER QUALITY

No PROJECT

The No Project Alternative would impact less than one percent of the watershed area on the site, and thus would not result in substantial hydrologic changes on the site. Existing County ordinances and regulations described in the Hydrology and Water Quality chapter would ensure that any homes constructed would not be placed within a 100-year floodplain and would not impede or redirect flood flows.

Water quality impacts could occur during construction from increased soil erosion and sedimentation due to clearing of vegetation, alteration of drainages, and grading, though on a much smaller scale than for the Project. Depending on the size of the construction area and the amount of soil moved, construction of homes may require the State's General Construction Permit, which requires preparation of an erosion control plan. Developments which do not meet permit requirements are exempted because they are considered to be too small to generate substantial construction-related pollution. Either the No Project Alternative will require appropriate erosion controls, through permitting requirements, or will not have the potential to generate substantial polluted runoff.

The No Project Alternative would not be subject to the design requirements of the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*; the area for each home is too small. Like construction water quality, the No Project Alternative is considered too small to have substantial impacts. It should also be noted that ample undisturbed grasslands would remain after construction to filter and treat runoff from the home sites.

For the foregoing reasons, No Project impacts to hydrology and water quality are *less than significant*.

EXPANDED PRESERVES

The Drainage Master Plan would require amendment for this Alternative. Given that the Alternative converts less land area to urbanized uses than the Project, it can be concluded that fewer detention and water quality basins would be needed for this Alternative. The basin locations would also need to change, given that many of the basins for the Project are shown in areas which would be within Avoided Areas in the Alternative condition. Though moved, it is assumed that the new basin locations would all be within the site boundaries in areas already analyzed for impacts related to urbanization, and thus would not result in additional unstudied physical impacts. Ultimately, though specific Drainage Master Plan designs would require change, the conclusions of the Project analysis with respect to avoidance of floodplain impacts, hydromodification, and impacts to stormwater infrastructure still applies to this Alternative; impacts are *less than significant*.

Construction-related and operational water quality impacts of the Expanded Preserves Alternative would be the same as those described for the Project. Existing regulations are sufficient to ensure that the Alternative will not contribute substantial sources of polluted runoff; impacts are *less than significant*.

EXPANDED FOOTPRINT

The Expanded Footprint Alternative includes more overall land area, but nonetheless includes less conversion of land to urban uses than the Project. The Expanded Footprint Alternative also includes the same watersheds as the Project area, though the Drainage Master Plan would need to be expanded to include the added portions of the

Carson Creek watershed associated with the Grant Line Pilatus area. A similar number of basins may be required, though in different locations within the portions designated for urban uses. For these reasons, though the Drainage Master Plan would require amendment for this Alternative, it is presumed that the same conclusions reached for the Project would ultimately be reached for this Alternative; as described for the Project, impacts would be *less than significant*.

Construction-related and operational water quality impacts of the Expanded Footprint Alternative would be the same as those described for the Project. Existing regulations are sufficient to ensure that the Alternative will not contribute substantial sources of polluted runoff; impacts are *less than significant*.

LAND USE

NO PROJECT

The No Project Alternative would involve very little change in conditions, in terms of land use impacts. The Alternative would retain the same site zoning and other land use designations, and would develop consistent with those designations. As such, the No Project Alternative would not result in significant conflicts with existing land use plans or existing land use policies intended to avoid significant environmental effects. The No Project Alternative would be consistent with the SACOG Blueprint, inasmuch as urbanization of the site is not identified in the Blueprint until the cumulative planning horizon. The No Project Alternative would not disrupt an existing community or displace housing elsewhere, given that the site does not contain existing housing. Land use impacts related to the No Project Alternative are *less than significant*.

EXPANDED PRESERVES

CONFLICT WITH LAND USE PLANS

The impact of the Expanded Preserves Alternative is essentially the same as the Project impact. The Alternative would involve less urbanization across from the City of Rancho Cordova, but this would not conflict with uses across Grant Line Road. For the same reasons discussed for the Project, the Expanded Preserves Alternative would not result in substantial conflicts with a land use plan which avoids environmental impacts; impacts are *less than significant*.

CONFLICT WITH LAND USE POLICIES AND REGULATIONS

SACOG BLUEPRINT, LU-23, LU-26, AND LU-113

The Alternative includes the same basic internal designs as the Project, so in this respect the conclusions for the Project related to provision of a variety of transportation choices, compact building and community design, and a range of housing, as well as fostering a sense of place apply to this Alternative. The discussion related to directing

development toward existing communities also applies to this Alternative. Where the Alternative differs from the Project is in the preservation of open space. Where the Project preserves 18% of the total site area, the Expanded Preserves Alternative places 43% of the land area into preserves. This is substantial land area, and furthermore results in the preservation of 81% of the wetland resources on the site. For these reasons, the Expanded Preserves Alternative is considered consistent with the “preservation of open space” Blueprint principle. Though consistent with most of the Blueprint principles, the Alternative is nonetheless inconsistent with the major underpinning principle of the Blueprint, which is to grow outward from the existing urban core. For this reason, impacts are still considered *significant and unavoidable*, as they are for the Project.

GENERAL PLAN POLICIES RELATED TO GROWTH INDUCEMENT

The Expanded Preserves Alternative would include a General Plan Amendment to allow the use of public water for the sports park and other uses and would extend infrastructure through Rancho Cordova to reach the site. The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

GENERAL PLAN POLICIES RELATED TO PUBLIC SERVICES AND UTILITIES

Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The Alternative would include a facilities financing plan, just like the Project which would be submitted to all of the applicable service entities for review and approval. Long-term funding sources would be identified for the maintenance of public services. Impacts are *less than significant*, just as they are for the Project.

GENERAL PLAN POLICIES RELATED TO TRANSPORTATION AND AIR QUALITY

The Expanded Preserves Alternative would result in substantial impacts related to air quality and transportation, but like the Project this would not be due to conflict with General Plan policies. In terms of Policy LU-25, the Alternative use mix would be approximately 23% public, 74% residential, and 3% commercial. The commercial category is below the minimum 10% included in the policy for developments with a residential emphasis, though this is partly due to the limitations described in the Land Use chapter: the acreage designated for commercial uses does not reflect the actual amount of commercial area, since there are land use categories which are residential but allow a certain proportion of commercial uses.

Though an acreage analysis indicates that the Expanded Preserves Alternative is inconsistent with LU-25, the Alternative nonetheless involves lower per-person travel and thus lower per-person emissions (refer to the Climate Change discussion for the Alternative) than the Project, which is consistent with the policy. Thus it is concluded that Expanded Preserves inconsistency with the policy is not resulting in significant transportation or air quality impacts; impacts are *less than significant*.

GENERAL PLAN POLICIES: LAND USE COMPATIBILITY

Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development, which in the vicinity of the site includes the Boy's Ranch and Kiefer Landfill. The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

DIVISION OR DISRUPTION OF ESTABLISHED COMMUNITY

The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

DISPLACEMENT OF HOUSING

The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

EXPANDED FOOTPRINT

CONFLICT WITH LAND USE PLANS

The impact of the Expanded Footprint Alternative is essentially the same as the Project impact. The Alternative would involve less urbanization across from the City of Rancho Cordova, but this would not conflict with uses across Grant Line Road. Where the Grant Line Pilatus area is added, there are no nearby land use plans. For the same reasons discussed for the Project, the Expanded Footprint Alternative would not result in substantial conflicts with a land use plan which avoids environmental impacts; impacts are *less than significant*.

CONFLICT WITH LAND USE POLICIES AND REGULATIONS

SACOG BLUEPRINT

The Alternative includes the same basic internal designs as the Project, so in this respect the conclusions for the Project related to provision of a variety of transportation choices, compact building and community design, and a range of housing, as well as fostering a sense of place apply to this Alternative. The discussion related to directing development toward existing communities also applies to this Alternative. Where the Alternative differs from the Project is in the preservation of open space. Where the Project preserves 18% of the total site area, the Expanded Footprint Alternative places 57% of the land area into preserves. Note, however, that this is because the overall Project area has been expanded. Although the Expanded Footprint Alternative results in a far greater percentage of preserved land, the Alternative only reduces the amount of urbanized land by approximately 159 acres.

The conclusion for the Project as it relates to open space preservation was based largely on the fact that the open space in question contains vernal pools and other wetland resources which have been identified as vital to the recovery of vernal pool species. Though the Expanded Footprint Alternative reduces the amount of urbanized land by only a small amount, it does result in the preservation of 81% of the wetland habitat on the site. For this reason, the Expanded Footprint Alternative is considered consistent with the Blueprint principle related to preservation of open space.

Though consistent with most of the Blueprint principles, the Alternative is nonetheless inconsistent with the major underpinning principle of the Blueprint, which is to grow outward from the existing urban core. For this reason, impacts are still considered *significant and unavoidable*, as they are for the Project.

GENERAL PLAN POLICIES RELATED TO GROWTH INDUCEMENT

The Expanded Footprint Alternative would include a General Plan Amendment to allow the use of public water for the sports park and other uses and would extend infrastructure through Rancho Cordova to reach the site. As it related to these policies, the impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

GENERAL PLAN POLICIES RELATED TO PUBLIC SERVICES AND UTILITIES

Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The Alternative would include a facilities financing plan, just like the Project which would be submitted to all of the applicable service entities for review and approval. Long-term funding sources would be identified for the maintenance of public services. Impacts are *less than significant*, just as they are for the Project.

GENERAL PLAN POLICIES RELATED TO TRANSPORTATION AND AIR QUALITY

The Expanded Footprint Alternative would result in substantial impacts related to air quality and transportation, but like the Project this would not be due to conflict with General Plan policies. In terms of Policy LU-25, the Alternative use mix would be approximately 24% public, 64% residential, and 12% commercial. This is within the general parameters described by LU-25. Impacts are *less than significant*, just as they are for the Project.

GENERAL PLAN POLICIES: LAND USE COMPATIBILITY

Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development, which in the vicinity of the site includes the Boy's Ranch, Kiefer Landfill, and Teichert Aggregates Grantline processing facility and appurtenant mining areas. As it relates to the Boy's Ranch and Kiefer Landfill, impacts of the Alternative are the same as those described for the Project. With regard to the Teichert properties, the

edge of the Expanded Footprint Alternative is adjacent to a mining area and approximately ½-mile from the processing plant area. The mine is associated with alluvial deposits rather than hardrock. Mining primarily involves the use of heavy equipment to excavate surface deposits; blasting activities do not occur in alluvial mining. Thus, the impacts associated with proximity to this facility are exposure to dust, diesel particulates, and noise associated with the use of large earthmoving equipment. These issues are discussed in the air quality and noise analysis sections, but are summarized here.

The Environmental Impact Report prepared for the original Use Permit application (County Control Number 1995-0658; available for review at 827 7th Street, Room 220, Sacramento) indicated that approximately 16 pounds per day of particulate matter would be generated. The analysis also indicated that noise levels could reach volumes of 70 dB at distances of 225 feet from the equipment. To avoid impacts related to particulate matter emissions, mitigation has been included restricting development to areas at least 2,500 feet from active mining operations. This restriction also prevents noise impacts, and thus impacts are *less than significant*.

DIVISION OR DISRUPTION OF ESTABLISHED COMMUNITY

The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

DISPLACEMENT OF HOUSING

The impacts of the Alternative are the same as those described for the Project; impacts are *less than significant*.

NOISE

NO PROJECT

The construction of up to ten single-family homes would not result in substantial construction noise, nor would those homes generate sufficient traffic to make an appreciable change in roadway noise. Single-family homes are also not significant sources of stationary noise. The Project discussion of noise related to Mather Airport and Kiefer Landfill would apply to the No Project Alternative. The No Project Alternative would not result in exposure of people to a substantial noise source, or exceed a noise standard; impacts are *less than significant*.

EXPANDED PRESERVES

CONSTRUCTION WOULD TEMPORARILY INCREASE NOISE LEVELS

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

ON-SITE TRAFFIC NOISE

Using the same assumptions of roadway width as used for the Project analysis and the average daily traffic (ADT) calculated for the Expanded Preserves Alternative, the FHWA modeling indicates that cumulative on-site roadway noise volumes would be the same or less than the Project noise volumes (Table ALT-8). Though on-site volumes are in many cases lower, they are still above the 65 dB standard for exterior residential noise environments. There are no residential or commercial areas which would be subject to exterior noise environments which exceed 70 dB, which means that with standard exterior-to-interior noise reduction of 25 dB, all interior noise would be a maximum of 45 dB. While Mitigation Measure NO-1 and NO-3 of the Project would apply, Mitigation Measure NO-2 and NO-4 would not be necessary. As discussed for the Project, mitigation would reduce noise volumes to within General Plan standards; impacts are *less than significant*.

ON-SITE COMMUNITY AND STATIONARY NOISE

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

NOISE DUE TO ACTIVITIES AT KIEFER LANDFILL

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

SUBSTANTIAL INCREASE IN THE AMBIENT NOISE LEVEL

Table ALT-9 displays the change in existing ambient noise volumes which would be caused by the Expanded Preserves Alternative. Table ALT-10 is also included to disclose probable future conditions, but note that the threshold only applies to development subject to substantial increases in *existing* ambient noise. In any case, the table shows that in the majority of cases the Alternative contribution to cumulative noise is negligible. Most of the same roadway segments impacted by the Project would be impacted by the Alternative. The same discussion provided for the Project applies to this Alternative, and impacts are *significant and unavoidable*.

MATHER AIRPORT

The same discussion and mitigation provided for the Project is applicable to the Alternative; impacts are *less than significant*.

EXPANDED FOOTPRINT

CONSTRUCTION WOULD TEMPORARILY INCREASE NOISE LEVELS

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

ON-SITE TRAFFIC NOISE

Using the same assumptions of roadway width as used for the Project analysis and the average daily traffic (ADT) calculated for the Expanded Footprint Alternative, the FHWA modeling indicates that cumulative on-site roadway noise volumes would be the same or less than the Project noise volumes (Table ALT-8). Though on-site volumes are in some cases lower, they are still above the 65 dB standard for exterior residential noise environments. There are no residential or commercial areas which would be subject to exterior noise environments which exceed 70 dB, which means that with standard exterior-to-interior noise reduction of 25 dB, all interior noise would be a maximum of 45 dB. While Mitigation Measure NO-1 and NO-3 of the Project would apply, Mitigation Measure NO-2 and NO-4 would not be necessary. As discussed for the Project, mitigation would reduce noise volumes to within General Plan standards; impacts are *less than significant*.

ON-SITE COMMUNITY AND STATIONARY NOISE

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

NOISE DUE TO ACTIVITIES AT KIEFER LANDFILL

The same discussion provided for the Project is applicable to the Alternative; impacts are *less than significant*.

SUBSTANTIAL INCREASE IN THE AMBIENT NOISE LEVEL

Table ALT-13 displays the change in existing ambient noise volumes which would be caused by the Expanded Preserves Alternative. Table ALT-14 is also included to disclose probable future conditions, but note that the threshold only applies to development subject to substantial increases in *existing* ambient noise. In any case, the table shows that in the majority of cases the Alternative contribution to cumulative noise is negligible. Most of the same roadway segments impacted by the Project would be impacted by the Alternative. The same discussion provided for the Project applies to this Alternative, and impacts are *significant and unavoidable*.

MATHER AIRPORT

The same discussion and mitigation provided for the Project is applicable to the Alternative; impacts are *less than significant*.

PUBLIC SERVICES

No PROJECT

The addition of up to ten new homes would marginally increase demands on public services, but the demand would not be substantial enough to trigger the need for increased staffing or facilities. Impacts are *less than significant*.

EXPANDED PRESERVES

The Expanded Preserves Alternative would result in a population of 19,690 residents including the university/college campus center, and a population of 15,650 residents excluding the university/college campus center. This is approximately 77% of the residents expected for the Project, and thus would reduce service demands when compared to the Project. Service demand changes were estimated as follows:

- Fire station assumptions remain unchanged.
- 13 additional Sacramento County Sheriff's Department staff members (77% of the Project total).
- 14,292 tons of annual waste generation and 19,436 tons of construction waste (which is 77% of the Project totals).
- Total school needs remain unchanged, but the proportion of students generated by the Alternative changes. A total of 1,837 elementary school students, 540 middle school students, and 999 high school students (based on student generation rates in the Draft Financing Plan multiplied by the unit totals of the Alternative).

- 79 acres of parkland, based on a population of 15,650 residents and dedication requirements of 5 acres per 1,000 people.
- Library assumptions remain unchanged.

Existing regulations, ordinances, codes, and fee mechanisms will ensure that the above facilities are constructed and adequately funded; impacts are *less than significant* for the same reasons as described for the Project.

EXPANDED FOOTPRINT

The Expanded Preserves Alternative would result in a population of 22,850 residents including the university/college campus center, and a population of 18,810 residents excluding the university/college campus center. This is approximately 90% of the residents expected for the Project, and thus would reduce service demands when compared to the Project. Service demand changes were estimated as follows:

- Fire station assumptions remain unchanged.
- 15 additional Sacramento County Sheriff's Department staff members (90% of the Project total).
- 16,733 tons of annual waste generation and 22,717 tons of construction waste (which is 90% of the Project totals).
- Total school needs remain unchanged, but the proportion of students generated by the Alternative changes. A total of 2,406 elementary school students, 705 middle school students, and 1,306 high school students (based on student generation rates in the Draft Financing Plan multiplied by the unit totals of the Alternative).
- 94 acres of parkland, based on a population of 18,810 residents and dedication requirements of 5 acres per 1,000 people.
- Library assumptions remain unchanged.

Existing regulations, ordinances, codes, and fee mechanisms will ensure that the above facilities are constructed and adequately funded; impacts are *less than significant* for the same reasons as described for the Project.

PUBLIC UTILITIES

No PROJECT

The No Project Alternative would not involve the use of public water or sewer supply, but would instead rely on private wells and septic systems. Any septic systems that are installed on the site must be installed pursuant to Sacramento County Code Chapter 6.32, which is enforced by the Sacramento County Environmental Management

Department. Sacramento County has established restricted areas for septic tank installation based on soil types and other factors. The project site lies within the area that requires percolation tests and/or soil boring. Any septic system installed in accordance with County standards will not result in significant public health impacts, and will provide adequate service.

Sacramento County Code Section 6.28 governs the installation and operation of private wells, which includes minimum setbacks from other facilities. The setbacks include a minimum distance of 100 feet from any septic tank or septic leach line, and 150 feet from a septic leaching pit. These regulations prevent contamination of well water. Any well installed in accordance with County standards will not result in significant public health impacts, and will provide adequate service. Serving up to ten new homes will marginally increase groundwater consumption, but not by a substantial degree.

Electrical lines would need to be extended to each new home constructed, and it is reasonable to assume that these lines would follow the pathway of the access road to the home. No additional physical impacts are likely due to utility line construction, and given that SMUD and PG&E have indicated that adequate energy services are available to the Project, it is reasonable to assume that there would likewise be sufficient service for the No Project Alternative.

The No Project Alternative would not result in substantial physical impacts as a result of utility construction and would not exceed the sustainable groundwater yield; impacts are *less than significant*.

EXPANDED PRESERVES

CONSTRUCTION OF INFRASTRUCTURE

The Non-Potable Water Supply Master Plan, the Water Master Plan, and the Sewer Master Plan would all require amendment for this Alternative, as fewer on-site lines would be needed for the smaller development footprint and less total demand would be incurred. Though these changes would need to be made, ultimately the same regional and off-site improvements would be required, and the conclusions described for the Project apply to this Alternative. Impacts are *significant and unavoidable*.

ENERGY EFFICIENCY

Like the Project, the Alternative will include exceedance of Title 24 standards, installation of Energy Star rated appliances, and the usage of renewable energy to supply 20% of residential energy. The Alternative will likewise result in more efficient usage of non-residential electricity, and of both residential and non-residential natural gas. The Alternative will not result in the wasteful, inefficient, and unnecessary consumption of energy, and impacts are *less than significant*.

RESULT IN A PROJECT WATER DEMAND THAT CANNOT BE MET BY SUPPLY

Water demands in the Water Supply Assessment were based on the acreage of the uses proposed by the Project, and the demand assumptions for those use types. The Water Supply Assessment is quite detailed in the assignment of water demands and the breakdown of uses. The analysis of this Alternative does not attempt to replicate this level of detail, as it is not necessary in order to compare the Project to the Alternative. Using the data in Table PU-3 of the Public Utilities chapter, the reduction in water demand associated with the Expanded Preserves Alternative was calculated by removing the additional acreage included in the Medium Density Residential category (due to removal of the Town Center), aggregating the remaining residential demand, and reducing the total based on the overall change in acreage. The Expanded Preserves includes 90% of the acreage designated for residential uses – the bulk of the population and housing reductions associated with the Alternative are due to removal of the Town Center.

The Project residential water demand is 3,803.5 acre-feet per year (AFY). Excluding the Medium Density Residential added for the Town Center reduces demand to 3,042.6 AFY, and 90% of this is approximately 2,738 AFY. This would result in an approximated total Expanded Preserves water demand of 5,484 AFY. It was determined that Zone 40 has sufficient water supply to provide water service to the Project, and thus it can be concluded that the smaller demands of the Expanded Preserves Alternative could also be met; impacts are *less than significant*.

RESULT IN A SEWER DISPOSAL DEMAND THAT CANNOT BE MET BY DISPOSAL OR CONVEYANCE CAPACITY

The sewage disposal demand in the Sewer Master Plan was, like water demand, calculated based on the acreage of uses proposed by the Project, and the demand assumptions for those use types. Residential sewage disposal demand for the Alternative was calculated by assuming 90% of the residential demand totals, and the demands were further adjusted by removing the equivalent single-family dwellings (ESDs) associated with the Town Center. This results in a total demand of 12,484 ESD.

It was concluded that the Project would not exceed existing or planned disposal and conveyance capacity, and it can likewise be concluded for the lower demands of the Expanded Preserves Alternative; impacts are *less than significant*.

RESULT IN AN ENERGY DEMAND THAT CANNOT BE MET BY ENERGY SERVICE PROVIDERS

Energy demand was calculated by adjusting the data used for the Project analysis in the Public Services chapter. The Expanded Preserves Alternative includes 6,849 units, which is 76% of the Project total, and thus would consume roughly 59,258 MWh (59,258,000 kilowatt hours (kWh)) of electricity for residential uses. The Expanded Preserves Alternative includes 382,640 square feet of commercial area, which is 28% of the Project total, and would thus consume roughly 12,745 MWh (12,745,000 kWh) of electricity for commercial uses. Natural gas usage was calculated using the same factors from the Project analysis (144 therms per capita and 401.03 therms per 1,000

square feet), which results in Expanded Preserves natural gas consumption of 2,835,360 therms for residential uses and 153,450 therms for commercial usage. As stated in the Project analysis, these usage totals represent a small fraction of total energy consumption in the County, and will not exceed available supply; impacts are *less than significant*.

EXCEED THE SUSTAINABLE GROUNDWATER YIELD

The Alternative results in less water consumption than the Project, and it was already concluded that the Project would not exceed the sustainable groundwater yield; impacts are *less than significant*.

ADVERSELY AFFECT GROUNDWATER RECHARGE

The same discussion included for the Project applies to this Alternative; impacts are *less than significant*.

EXPANDED FOOTPRINT

CONSTRUCTION OF INFRASTRUCTURE

The Non-Potable Water Supply Master Plan, the Water Master Plan, and the Sewer Master Plan would all require amendment for this Alternative, as fewer on-site lines would be needed on the main Cordova Hills portion while additional lines would be needed extending into the Grant Line Pilatus property. As with the rest of the development area, these additional on-site lines would extend underneath roadways and through other development areas, and would not result in utility-specific impacts. Though these changes would need to be made, ultimately the same regional and off-site improvements would be required, and the conclusions described for the Project apply to this Alternative. Impacts are *significant and unavoidable*.

ENERGY EFFICIENCY

Like the Project, the Alternative will include exceedance of Title 24 standards, installation of Energy Star rated appliances, and the usage of renewable energy to supply 20% of residential energy. The Alternative will likewise result in more efficient usage of non-residential electricity, and of both residential and non-residential natural gas. The Alternative will not result in the wasteful, inefficient, and unnecessary consumption of energy, and impacts are *less than significant*.

RESULT IN A PROJECT WATER DEMAND THAT CANNOT BE MET BY SUPPLY

The Expanded Footprint Alternative includes only a slightly smaller total urbanization footprint than the Project, and this is largely due to changes in the Town Center, not due to changes in residential acreage. The Expanded Footprint Alternative also changes the amount of acreage in each of the residential use types, but an analysis at this level

of detail is not necessary or included. The Town Center will be approximately 73% of the size of the Project Town Center. To calculate changes in water demand, the Medium Density Residential acreage reported in Table PU-3 of the Public Utilities chapter was changed to 460 acres, with a resultant demand of 1,704 AFY. Using this number in place of the 1,909.9 AFY calculated for the Project results in a total demand of 6,344 AFY. It was determined that Zone 40 has sufficient water supply to provide water service to the Project, and thus it can be concluded that the smaller demands of the Expanded Footprint Alternative could also be met; impacts are *less than significant*.

RESULT IN A SEWER DISPOSAL DEMAND THAT CANNOT BE MET BY DISPOSAL OR CONVEYANCE CAPACITY

The sewage disposal demand in the Sewer Master Plan was, like water demand, calculated based on the acreage of uses proposed by the Project, and the demand assumptions for those use types. The equivalent single-family dwellings (ESD) associated with the Town Center were adjusted by assuming 73% of the demand was equivalent to the Expanded Footprint Alternative. This results in a total demand of 15,346 ESD. It was concluded that the Project would not exceed existing or planned disposal and conveyance capacity, and it can likewise be concluded for the lower demands of the Expanded Preserves Alternative; impacts are *less than significant*.

RESULT IN AN ENERGY DEMAND THAT CANNOT BE MET BY ENERGY SERVICE PROVIDERS

Energy demand was calculated by adjusting the data used for the Project analysis in the Public Services chapter. The Expanded Footprint Alternative includes 8,045 units, which is 89% of the Project total, and thus would consume roughly 69,606 MWh (69,606,000 kWh) of electricity for residential uses. The Expanded Footprint Alternative includes 1,032,640 square feet of commercial area, which is 77% of the Project total, and would thus consume roughly 34,396 MWh (34,396,000 kWh) of electricity for commercial uses. Natural gas usage was calculated using the same factors from the Project analysis (144 therms per capita and 401.03 therms per 1,000 square feet), which results in Expanded Footprint natural gas consumption of 3,290,400 therms for residential uses and 414,264 therms for commercial usage. As stated in the Project analysis, these usage totals represent a small fraction of total energy consumption in the County, and will not exceed available supply; impacts are *less than significant*.

EXCEED THE SUSTAINABLE GROUNDWATER YIELD

The Alternative results in less water consumption than the Project, and it was already concluded that the Project would not exceed the sustainable groundwater yield; impacts are *less than significant*.

ADVERSELY AFFECT GROUNDWATER RECHARGE

The same discussion included for the Project applies to this Alternative; impacts are *less than significant*.

TRAFFIC AND CIRCULATION

No PROJECT

The traffic impact study refers to the existing condition without the Project and the cumulative condition without the Project as the “no Project”, but note that this is not the No Project Alternative. The existing condition analysis and cumulative condition “no Project” analyses include present site conditions, which is no development. It does not analyze the potential for a limited number of homes to be built on the site, though it accurately describes the conditions which would exist if the present site conditions were maintained throughout the cumulative timeframe.

The traffic volumes generated by ten single-family homes is too low to meet the screening thresholds which would typically require a traffic impact analysis. In Sacramento County, screening thresholds require the addition of 1,000 daily trips or 100 peak hour trips before a traffic study is required. Exceptions are made at the discretion of the Sacramento County Department of Transportation in cases where there is a known localized hazard or other deficiency to which the traffic engineer decides a project may contribute.

Using standard trip rates from the Institute of Transportation Engineers (8th ed.), each home could be expected to contribute 9.57 vehicle trips per day, and 1.01 trips during the peak hour. This is equivalent to approximately 96 trips per day and 10 trips during the peak travel hours. Even assuming that all of this traffic was distributed along the studied roadway segment with the smallest existing volumes (Scott Road, with a volume of 2,300 vehicles per day), the No Project would only increase traffic volumes by 4%. These are the maximum probable impacts which could result from the No Project Alternative, as it is possible that fewer homes – or even no homes – will have been constructed on the site by the year 2035. The No Project Alternative would not cause any level of service standard to be exceeded, nor would the small volumes generated cause significant impacts to the current pedestrian and bicycle facility deficiencies on Grant Line Road and Douglas Road. Just as for the Project, the No Project would not obstruct or conflict with any adopted transit plan or other non-automotive facility master plan. Impacts in both the existing and cumulative condition would be *less than significant*.

EXPANDED PRESERVES

The Expanded Preserves Alternative reduces the number of access locations on Grant Line Road from three locations to two locations, and the inclusion of larger preserves also eliminates several internal roadways. Other than these internal site changes, the vehicle network studied for this Alternative is the same as the network studied for the Project. Assumptions for non-automotive networks are also the same as the Project. Note that all tables referenced are found at the conclusion of the discussion.

EXISTING PLUS EXPANDED PRESERVES CONDITIONS

Table ALT-14 describes the trip generation assumptions for the Alternative in the existing condition. Existing conditions and existing plus Expanded Preserves conditions for all studied facilities are included in Table ALT-16, Table ALT-18, Table ALT-20, and Table ALT-21.

INTERSECTION ANALYSIS

SACRAMENTO COUNTY

The Expanded Preserves Alternative causes significant impacts to six intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 22 of Appendix TR-1). Recommended facility improvements are the same as those listed for the Project in Mitigation Measure TR-1 A – F. Mitigation would improve all operating conditions from unacceptable to acceptable levels, and impacts would be *less than significant*.

- *Bradshaw Road and Jackson Road* – Operating conditions deteriorate from an acceptable LOS E to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS E.
- *Mather Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS E to LOS F in the a.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Expanded Preserve traffic. Mitigation would improve operating conditions to LOS D.
- *Eagles Nest Road and Jackson Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the p.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Expanded Preserve traffic. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road and Sunrise Boulevard* – Operating conditions deteriorate from an acceptable LOS D to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS E.
- *Grant Line Road and White Rock Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This intersection meets peak hour signal warrants without and with the addition of Expanded Preserve traffic. Mitigation would improve operating conditions to LOS A.
- *Prairie City Road and White Rock Road* – Operations conditions already at an unacceptable LOS E degrade to LOS F in the a.m. peak hour, with an increase in delay of more than five seconds. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This

intersection meets peak hour signal warrants without and with the addition of Expanded Preserve traffic. Mitigation would improve operating conditions to LOS D.

CITY OF ELK GROVE

The intersection of Grant Line Road and Calvine Road will operate at an acceptable LOS B in the a.m. and p.m. peak hours with the Expanded Preserves traffic. Impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Expanded Preserves Alternative causes significant impacts to eight intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 22 of Appendix TR-1). The facility improvements listed in Mitigation Measure ALT-3 would improve all but one operating condition (the condition at Grant Line Road and Jackson Road) from unacceptable to acceptable levels. Though operating conditions would remain unacceptable at Grant Line Road and Jackson Road, the mitigation would offset the Alternative's contribution to that unacceptable condition. As with the Project, the implementation of some of the below measures cannot be guaranteed because the facility lies wholly outside of the jurisdiction of Sacramento County. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included, the impact is considered potentially *significant and unavoidable*. Note that some of the facilities below are within both the City of Rancho Cordova and Sacramento County, and they have been included in this section simply to reflect the fact that they have been analyzed using the more conservative City of Rancho Cordova LOS standards.

- *Sunrise Boulevard and White Rock Road* – Operating conditions deteriorate from an acceptable LOS C to LOS E in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS D to LOS F in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Sunrise Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS A to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Sunrise Boulevard and Jackson Road* – Operating conditions deteriorate from an unacceptable LOS E to LOS F in the a.m. peak hour, with an increase in V/C ratio of more than 0.05. Operating conditions deteriorate from an acceptable LOS D to LOS E in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.

- *Grant Line Road and Jackson Road* – During the a.m. and p.m. peak hours, operating conditions remain at an unacceptable LOS F, with an increase in V/C ratio of more than 0.05. After mitigation the operating conditions would remain at LOS F, but the change in v/c ratio would be less than 0.05, which renders the impact less than significant.
- *Grant Line Road and Kiefer Boulevard* – During the a.m. and p.m. peak hours, operation conditions deteriorate from an acceptable LOS B to LOS F. This intersection meets peak hour signal warrants without and with the addition of Expanded Preserves traffic. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road and Douglas Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS B to LOS F in the p.m. peak hour. This intersection meets peak hour signal warrants with the addition of Expanded Preserves traffic. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road and North Loop Road* – This new intersection operates at LOS F during the a.m. and p.m. peak hours. This intersection meets peak hour signal warrants with the addition of Expanded Preserves traffic. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road and University Boulevard* – This new intersection operates at LOS F during the a.m. and p.m. peak hours. This intersection meets peak hour signal warrants with the addition of Expanded Preserves traffic. Mitigation would improve operating conditions to LOS D.

CALTRANS

None of the Caltrans State Highway intersection impacts exceed the significance criteria. Impacts are *less than significant*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY ROADWAY SEGMENTS

None of the Sacramento County roadway segment impacts exceed the significance criteria. Impacts are *less than significant*.

CITY OF ELK GROVE ROADWAY SEGMENT

The Expanded Preserves Alternative will increase the v/c ratio by more than 0.05 along the Grant Line Road segment from Sheldon Road to Calvine Road; this segment is already operating at LOS E, which is unacceptable. Mitigation Measure TR-4, for the Project, would improve operating conditions to LOS A; impacts are *less than significant*.

CITY OF RANCHO CORDOVA ROADWAY SEGMENTS

The Expanded Preserves Alternative causes significant impacts to ten roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 23 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-5, for the Project, would improve all but one operating condition from unacceptable to acceptable levels.

- *Grant Line Road from Jackson Road to Kiefer Boulevard* – Operations deteriorate from an acceptable LOS D to LOS F. Mitigation improves operating conditions to LOS A.
- *Grant Line Road from Kiefer Boulevard to University Boulevard* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation improves operating conditions to LOS A.
- *Grant Line Road from University Boulevard to Chrysanthy Boulevard* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation improves operating conditions to LOS A.
- *Grant Line Road from Chrysanthy Boulevard to North Loop* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation improves operating conditions to LOS A.
- *Grant Line Road from North Loop to Douglas Road* – Operations deteriorate from an acceptable LOS C to LOS F. Mitigation improves operating conditions to LOS B.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an acceptable LOS D to LOS E. Mitigation improves operating conditions to LOS A.
- *Jackson Road from Sunrise Boulevard to Grant Line Road* – Operations deteriorate from an acceptable LOS D to LOS E. Mitigation improves operating conditions to LOS A.
- *Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation improves operating conditions to LOS A.
- *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation improves operating conditions to LOS A.
- *Sunrise Boulevard from Folsom Boulevard to White Rock Road* – Operations remain at an unacceptable LOS E, with an increase in V/C ratio of more than 0.05. No mitigation is available (see below discussion).

The same discussion provided for the intersection analysis applies here. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for most facilities, the impact is considered potentially *significant and unavoidable*. In addition, the only mitigation available for Sunrise Boulevard would be to widen the roadway, but this roadway is at full build-out according to the City of Rancho Cordova General Plan. Widening would require a General Plan Amendment, as well as significant acquisition of right-of-way which would involve property losses and the loss of improvements on what is currently private property. This being the case, the mitigation is considered infeasible, and impacts to this facility are *significant and unavoidable*.

CALTRANS FREEWAYS

MAINLINE

The Expanded Preserves Alternative causes significant impacts to two freeway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation. The facility improvements listed in Mitigation Measure TR-6 would improve all operating conditions from unacceptable to acceptable levels, but Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for the affected facilities, the impact is considered potentially *significant and unavoidable*.

- *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – There is an increase in traffic volume on this freeway segment already operating at LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS E.
- *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – There is an increase in traffic volume on this freeway segment already operating at LOS F. Mitigation would improve operating conditions to LOS D.

RAMP JUNCTIONS

Expanded Preserves Alternative traffic does not cause a level of service standard to be exceeded, nor does it significantly contribute to an existing unacceptable operating condition; impacts are *less than significant*.

BICYCLE AND PEDESTRIAN ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. Though involving somewhat less traffic, the Alternative nonetheless contributes substantial additional volume to Grant Line Road and Douglas Road, which are deficient for bicycle and pedestrian facilities. The same mitigation included for the Project (Mitigation Measure TR-7) would apply to this Alternative; mitigation will reduce impacts to *less than significant* levels.

TRANSIT ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. The Alternative assumes that an internal transit system will still be provided, and this system would be sufficient to serve the needs of residents. Development within the site will not conflict with the implementation of any adopted transit plan. Impacts are *less than significant*.

MITIGATION MEASURES:

ALT-3. The applicant shall comply with Mitigation Measure TR-2 C, D, G, and J, and shall modify TR-2 B, E, F and H to the following:

Sunrise Boulevard and White Rock Road – Provide overlap phasing on the eastbound approach.

Grant Line Road and Jackson Road – Provide a left turn lane and a through-right shared turn lane on the eastbound, westbound, and northbound approaches. Provide a separate left turn lane, a through lane and a separate right turn lane on the southbound approach.

Grant Line Road and Kiefer Boulevard – Construct a new traffic signal. Provide a left turn lane, a through lane and a through-right turn shared lane on the northbound approach; provide a left turn lane and a through-right turn shared lane on the eastbound, westbound, and southbound approaches. To be consistent with the segment mitigations a second southbound through lane is included.

Grant Line Road and North Loop Road – Construct a new traffic signal. Provide a through lane and a separate right turn lane on the northbound approach, dual left turn lanes and one through on the southbound approach, and one left turn lane and one free-right turn lane on the westbound approach. Also an extra northbound departure lane is needed for the westbound free-right movement. To be consistent with the segment mitigations a second northbound and southbound through lane is included.

CUMULATIVE PLUS EXPANDED PRESERVES CONDITIONS

Expanded Preserves trip generation for the cumulative scenario are provided in Table ALT-15. Cumulative conditions and cumulative plus Expanded Preserves conditions for all studied facilities are included in Table ALT-17, Table ALT-19, Table ALT-20, and Table ALT-21.

INTERSECTION ANALYSIS**SACRAMENTO COUNTY**

The Expanded Preserves Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF FOLSOM

The Expanded Preserves Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF ELK GROVE

The Expanded Preserves Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Expanded Preserves Alternative causes significant impacts to four intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 31 of Appendix TR-1). The facility improvements listed in Mitigation Measure ALT-4 would improve all but one operating condition from unacceptable to acceptable levels. Note that the facility improvement for Sunrise Boulevard and Douglas Road is identical to Project improvements, but that the improvements for the Grant Line Road facilities are not the same as the Project improvements.

- *Sunrise Boulevard and Douglas Road* – Operating conditions deteriorate from an unacceptable LOS E to LOS F in the a.m. peak hour, with an increase in V/C ratio of greater than 0.05. Operating conditions deteriorate from an acceptable LOS D to LOS E in the p.m. peak hour. Mitigation would improve operating conditions to LOS E, which remains unacceptable, but the Alternative would no longer result in a change of v/c ratio of more than 0.05.
- *Grant Line Road and Douglas Road* – Operating conditions deteriorate from an acceptable LOS A to LOS E in the a.m. and p.m. peak hours. Mitigation would improve operating conditions to LOS C.
- *Grant Line Road and North Loop Road* – This new intersection operates at LOS F during the a.m. and p.m. peak hours. Mitigation would improve operating conditions to LOS C.
- *Sunrise Boulevard and International Drive* – Operating conditions deteriorate from an acceptable LOS D to LOS E in the a.m. peak hour. No feasible mitigation is available (see below discussion).

Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for the Grant Line Road and Douglas Road intersection, the impact is considered potentially *significant and unavoidable*. Sunrise Boulevard and International Drive was already modeled at maximum capacity, and a General Plan Amendment would be required to further increase capacity. Since neither right-of-way nor funding for this further expansion have been identified or acquired, the mitigation is considered infeasible. Impacts to the Sunrise Boulevard and International Drive intersection would remain *significant and unavoidable*.

CALTRANS

The Expanded Preserves Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY

The Expanded Preserves Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF ELK GROVE

The Elk Grove Roadway Segment does not exceed the impact significance criteria. Impacts are less than significant.

CITY OF RANCHO CORDOVA

The Expanded Preserves Alternative causes significant impacts to two roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 32 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-10.C and TR-10.D, for the Project, would improve all operating conditions from unacceptable to acceptable levels, and impacts would be *less than significant*.

- *Grant Line Road from North Loop to Douglas Road* – Operations deteriorate from an acceptable LOS B to LOS F. Mitigation would improve operating conditions to LOS D.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an unacceptable LOS E to LOS F, with an increase in V/C ratio of greater than 0.05. Mitigation would improve operating conditions to LOS C.

CALTRANS FREEWAYS

MAINLINE

The Expanded Preserves Alternative causes significant impacts to five freeway segments, which are listed below. Further widening of these freeway segments would be required in order to reduce impacts, but Caltrans currently has no plans to expand the segments beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect money to fund such improvements. No feasible mitigation exists to offset impacts to freeway segments; impacts are *significant and unavoidable*.

- *Eastbound US 50 from Watt Avenue to Bradshaw Road – LOS F in a.m. and p.m. peak hours.*
- *Eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue – LOS F in a.m. and p.m. peak hours.*
- *Westbound US 50 from Hazel Avenue to Rancho Cordova Parkway – LOS F in the a.m. peak hour.*
- *Westbound US 50 from Bradshaw Road to Watt Avenue – LOS F in a.m. and p.m. peak hours.*
- *Westbound US 50 from Watt Avenue to Power Inn/Howe Avenue – LOS F in a.m. peak hour.*

RAMP JUNCTIONS

The Expanded Preserves Alternative causes significant impacts to three freeway ramps, which are listed below. Caltrans currently has no plans to expand the following ramp junctions beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect monies to fund such improvements. No feasible mitigation exists to offset impacts to freeway ramps; impacts are *significant and unavoidable*.

- *Eastbound US 50 Slip Ramp Entrance from Watt Avenue – LOS F in a.m. and p.m. peak hours.*
- *Westbound US 50 Exit Ramp to Watt Avenue – LOS F in a.m. peak hour.*
- *Westbound US 50 Slip Ramp Entrance from Watt Avenue – LOS F in a.m. peak hour.*

BICYCLE AND PEDESTRIAN ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. By the cumulative time horizon, improvements will have been installed on Grant Line Road

and Douglas Road as part of buildout within Rancho Cordova, and as part of other improvements to Grant Line Road consistent with the Sacramento County General Plan, the Sacramento County Bicycle Master Plan, and the City of Rancho Cordova General Plan. The Alternative will not eliminate or adversely affect bicycle or pedestrian facilities, result in unsafe conditions, or interfere with implementation of planned bicycle or pedestrian facilities; impacts are *less than significant*.

TRANSIT ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. The Alternative assumes that an internal transit system will still be provided, and this system would be sufficient to serve the needs of residents. Development within the site will not conflict with the implementation of any adopted transit plan. Impacts are *less than significant*.

MITIGATION MEASURES:

ALT-4. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the eastbound and westbound right turns.
- B. *Grant Line Road and Douglas Road* – Provide an eastbound free-right turn lane. Also a third southbound departure lane is needed for the eastbound free-right movement.
- C. *Grant Line Road and North Loop Road* – Provide a free-right turn lane on the westbound approach. Also a third northbound departure lane is needed for the westbound free-right movement.

Table ALT-14: Existing Plus Expanded Preserves Trip Generation

EXPANDED FOOTPRINT

The Expanded Footprint Alternative reduces the number of access locations on Grant Line Road from three locations to two locations, and the inclusion of larger preserves also eliminates several internal roadways. The northern access location has been moved to align with Douglas Road. Other than these internal site changes, the vehicle network studied for this Alternative is the same as the network studied for the Project. Assumptions for non-automotive networks are also the same as the Project. Note that all tables referenced are found at the conclusion of the discussion.

EXISTING PLUS EXPANDED FOOTPRINT CONDITIONS

Table ALT-22 describes the trip generation assumptions for the Alternative in the existing condition. Existing conditions and existing plus Expanded Footprint conditions for all studied facilities are included in Table ALT-24, Table ALT-26, Table ALT-28, and Table ALT-29.

INTERSECTION ANALYSIS

SACRAMENTO COUNTY

The Expanded Footprint Alternative causes significant impacts to six intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 22 of Appendix TR-1). The facility improvements listed in Mitigation Measure ALT-5 would improve all operating conditions from unacceptable to acceptable levels, and impacts would be *less than significant*.

- *Mather Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS E to LOS F in the a.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Expanded Footprint traffic. Mitigation would improve operating conditions to LOS E.
- *Eagles Nest Road and Jackson Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the p.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Expanded Footprint traffic. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road and Sunrise Boulevard* – Operating conditions deteriorate from an acceptable LOS D to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Grant Line Road and White Rock Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This intersection meets peak hour signal warrants without and with

the addition of Expanded Footprint traffic. Mitigation would improve operating conditions to LOS B.

- *Prairie City Road and White Rock Road* – Operations conditions already at an unacceptable LOS E degrade to LOS F in the a.m. peak hour, with an increase in delay of more than five seconds. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This intersection meets peak hour signal warrants without and with the addition of Expanded Footprint traffic. Mitigation would improve operating conditions to LOS D.
- *Street D and North Loop Road* – This new intersection operates at LOS F during the a.m. peak hour. Mitigation would improve operating conditions to LOS E.

CITY OF ELK GROVE

The intersection of Grant Line Road and Calvine Road will operate at an acceptable LOS B in the a.m. and p.m. peak hours with the Expanded Footprint traffic. Impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Expanded Preserves Alternative causes significant impacts to eight intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 22 of Appendix TR-1). The facility improvements necessary for this Alternative differ in many ways from those needed for the Project, and thus a new measure (Mitigation Measure ALT-6) is included, which would improve all but two operating conditions (see below) from unacceptable to acceptable levels. Though operating conditions would remain unacceptable at two facilities, the mitigation would offset the Alternative's contribution to that unacceptable condition. Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed, and thus despite mitigation it must be assumed that impacts are potentially *significant and unavoidable*.

- Zinfandel Drive and White Rock Road - Operations conditions remain at an unacceptable LOS E in the p.m. peak hour, with an increase in V/C ratio of more than 0.05. After mitigation operating conditions would remain LOS E, but Alternative traffic would result in a change in v/c ratio of less than 0.05.
- Sunrise Boulevard and White Rock Road - Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS D to LOS F in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.

- Sunrise Boulevard and Douglas Road - Operating conditions deteriorate from an acceptable LOS A to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- Sunrise Boulevard and Jackson Road - Operating conditions deteriorate from an unacceptable LOS E to LOS F in the a.m. peak hour, with an increase in V/C ratio of more than 0.05. Operating conditions deteriorate from an acceptable LOS D to LOS E in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.
- Grant Line Road and Jackson Road - During the a.m. and p.m. peak hours, operating conditions remain at an unacceptable LOS F, with an increase in V/C ratio of more than 0.05. After mitigation operating conditions would remain LOS F, but Alternative traffic would result in a change in v/c ratio of less than 0.05.
- Grant Line Road and Kiefer Boulevard - During the a.m. and p.m. peak hours, operation conditions deteriorate from an acceptable LOS B to LOS F. This intersection meets peak hour signal warrants without and with the addition of alternative 2 traffic. Mitigation would improve operating conditions to LOS B.
- Grant Line Road and Douglas Road - Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS B to LOS F in the p.m. peak hour. This intersection meets peak hour signal warrants with the addition of alternative 2 traffic. Mitigation would improve operating conditions to LOS B.
- Grant Line Road and University Boulevard - This new intersection operates at LOS F during the a.m. and p.m. peak hours. This intersection meets peak hour signal warrants with the addition of alternative 2 traffic. Mitigation would improve operating conditions to LOS D.

CALTRANS

None of the Caltrans State Highway intersection impacts exceed the significance criteria. Impacts are *less than significant*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY ROADWAY SEGMENTS

The Expanded Footprint Alternative would degrade operating conditions on the segment of Prairie City Road from US 50 to White Rock Road from an acceptable LOS C to an unacceptable LOS E. Mitigation included in measure TR-3.A, for the Project, would improve operating conditions to LOS D; with mitigation impacts are *less than significant*.

CITY OF ELK GROVE ROADWAY SEGMENT

The segment of Grant Line Road from Sheldon Road to Calvine Road operates at an unacceptable LOS E, and the Expanded Footprint Alternative will result in a change of v/c ratio of more than 0.05. Mitigation Measure TR-4 would improve operating conditions to LOS A; with mitigation, impacts are *less than significant*.

CITY OF RANCHO CORDOVA ROADWAY SEGMENTS

The Expanded Footprint Alternative causes significant impacts to eight roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 23 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-5 (excluding items C – E), for the Project, would improve all but two operating conditions from unacceptable to acceptable levels.

- *Grant Line Road from Jackson Road to Kiefer Boulevard* – Operations deteriorate from an acceptable LOS D to LOS F. Mitigation improves operating conditions to LOS B.
- *Grant Line Road from Kiefer Boulevard to University Boulevard* – Operations deteriorate from an acceptable LOS C to LOS F. Mitigation improves operating conditions to LOS B.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an acceptable LOS D to LOS F. Mitigation improves operating conditions to LOS A.
- *Jackson Road from Sunrise Boulevard to Grant Line Road* – Operations deteriorate from an acceptable LOS D to LOS E. Mitigation improves operating conditions to LOS A.
- *Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation improves operating conditions to LOS B.
- *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation improves operating conditions to LOS B.
- *Sunrise Boulevard from US 50 to Folsom Boulevard* – Operations remain at an unacceptable LOS F, with an increase in V/C ratio of more than 0.05. No mitigation is available (see below discussion).
- *Sunrise Boulevard from Folsom Boulevard to White Rock Road* – Operations remain at an unacceptable LOS E, with an increase in V/C ratio of more than 0.05. No mitigation is available (see below discussion).

Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed, and thus despite mitigation impacts must be considered potentially *significant and unavoidable*. Furthermore, the only mitigation available for Sunrise Boulevard would be to widen the roadway, but this roadway is at full build-out according to the City of Rancho Cordova General Plan. Widening would require a General Plan Amendment, as well as significant acquisition of right-of-way which would involve property losses and the loss of improvements on what is currently private property. This being the case, the mitigation is considered infeasible, and impacts to these two facilities are *significant and unavoidable*.

CALTRANS FREEWAYS

MAINLINE

The Expanded Footprint Alternative causes significant impacts to two freeway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation. The facility improvements listed in Mitigation Measure TR-6 would improve all operating conditions from unacceptable to acceptable levels. Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed, and thus despite mitigation impacts must be considered potentially *significant and unavoidable*.

- *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – There is an increase in traffic volume on this freeway segment already operating at LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS E.
- *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – There is an increase in traffic volume on this freeway segment already operating at LOS F. Mitigation would improve operating conditions to LOS D.

RAMP JUNCTIONS

Expanded Footprint Alternative traffic does not cause a level of service standard to be exceeded, nor does it significantly contribute to an existing unacceptable operating condition; impacts are *less than significant*.

BICYCLE AND PEDESTRIAN ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. Though involving somewhat less traffic, the Alternative nonetheless contributes substantial additional volume to Grant Line Road and Douglas Road, which are deficient for bicycle and pedestrian facilities. The same mitigation included for the Project (Mitigation Measure TR-7) would apply to this Alternative; mitigation will reduce impacts to *less than significant* levels.

TRANSIT ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. The Alternative assumes that an internal transit system will still be provided, and this system would be sufficient to serve the needs of residents. Development within the site will not conflict with the implementation of any adopted transit plan. Impacts are *less than significant*.

MITIGATION MEASURES:

ALT-5. The applicant shall comply with Mitigation Measure TR-1 items B through F, and shall construct the below improvement.

- A. *Street D and North Loop Road* – Provide a separate through lane and a separate right turn lane on the northbound approach.

ALT-6. The applicant shall fund the implementation of the mitigation measures below by means of a phasing and financing plan, to the satisfaction of the Sacramento County Department of Transportation and in consultation with the City of Rancho Cordova. The phasing and financing plan shall ensure construction of traffic improvements prior to degradation of LOS below standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Zinfandel Drive and White Rock Road* – Provide separate dual right turns on the westbound approach so the westbound approach has two left turn lanes, two through lanes and two right turn lanes.
- B. *Sunrise Boulevard and White Rock Road* – Provide overlap phasing on the eastbound approaches.
- C. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the westbound approach.
- D. *Sunrise Boulevard and Jackson Road* – Provide dual through lanes on the eastbound and westbound approaches.
- E. *Grant Line Road and Jackson Road* – Provide a left turn lane and a through-right shared turn lane on the eastbound westbound, and northbound approaches. Provide a separate left turn lane, a through lane and a separate right turn lane on the southbound approach.
- F. *Grant Line Road and Kiefer Boulevard* – Construct a new traffic signal. Provide a left turn lane and a through-right shared lane on the northbound approach; and dual left turn lanes and a through-right shared lane on the southbound approach. Provide a left turn lane, dual through lanes, and a separate right turn lane on the eastbound approach; and a left turn lane, dual through lanes, and a separate free-right turn lane on the westbound

approach. Also an extra northbound departure lane is needed for the westbound free-right movement.

- G. *Grant Line Road and Douglas Road* – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound and dual left turn lanes and a through-right shared lane on the southbound approach. Provide a left turn lane, dual through lanes, and a separate right turn lane on the eastbound approach; and a left turn lane, dual through lanes, and a separate free-right turn lane on the westbound approach. Also an extra northbound departure lane is needed for the westbound free-right movement.
- H. *Grant Line Road and University Boulevard* – Construct a new traffic signal. Provide a through lane and a separate free-right turn lane on the northbound approach, dual left turn lanes and one through lanes on the southbound approach, and dual left turn lanes and a right turn lane on the westbound approach. Also an extra eastbound departure lane is needed for the northbound free-right movement.

CUMULATIVE PLUS EXPANDED FOOTPRINT CONDITIONS

Cumulative condition trip generation for the Expanded Footprint Alternative is provided in Table ALT-23. Cumulative conditions and cumulative plus Expanded Footprint conditions for all studied facilities are included in Table ALT-25, Table ALT-27, Table ALT-28, and Table ALT-29.

INTERSECTION ANALYSIS

SACRAMENTO COUNTY

The Expanded Footprint Alternative intersection at Street D and North Loop Road would operate at LOS F during the a.m. peak hour. Mitigation Measure ALT-7 would improve operating conditions to LOS E; impacts would be *less than significant*.

CITY OF FOLSOM

The Expanded Footprint Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF ELK GROVE

The Expanded Footprint Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Expanded Footprint Alternative causes significant impacts to four intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 31 of Appendix TR-1). The facility improvements listed for the Project are different from those needed for this Alternative, so a list of measures specific to this Alternative is included in Mitigation Measure ALT-8. These measures would improve all but one operating condition from unacceptable to acceptable levels.

- *Sunrise Boulevard and Douglas Road* – Operating conditions deteriorate from an unacceptable LOS E to LOS F in the a.m. peak hour, with an increase in V/C ratio of greater than 0.05. Mitigation would improve operating conditions to LOS E, which remains unacceptable, but the Alternative would no longer result in a change of v/c ratio of more than 0.05.
- *Grant Line Road and Douglas Road* – Operating conditions deteriorate from an acceptable LOS A to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Grant Line Road and University Boulevard* – This new intersection operates at an unacceptable LOS E during the a.m. peak hour and LOS F during the p.m. peak hour. Mitigation would improve operating conditions to LOS C.
- *Sunrise Boulevard and International Drive* – Operating conditions deteriorate from an acceptable LOS D to LOS E in the a.m. peak hour. No feasible mitigation exists (see below).

Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed, and thus despite mitigation impacts must be considered potentially *significant and unavoidable*. Furthermore, Sunrise Boulevard and International Drive was already modeled at maximum capacity, and a General Plan Amendment would be required to further increase capacity. Since neither right-of-way nor funding for this further expansion have been identified or acquired, the mitigation is considered infeasible. Impacts to the Sunrise Boulevard and International Drive intersection would remain *significant and unavoidable*.

CALTRANS

The Expanded Footprint Alternative does not cause a level of service standard to be exceeded, nor does it contribute substantially to any existing deficiency; impacts are *less than significant*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY

The Expanded Footprint Alternative internal roadway Street A (from University Boulevard to Street B) would operate at LOS F. Mitigation Measure ALT-9 would improve conditions to LOS A; impacts are *less than significant*.

CITY OF ELK GROVE

The Elk Grove Roadway Segment does not exceed the impact significance criteria. Impacts are less than significant.

CITY OF RANCHO CORDOVA

The Expanded Preserves Alternative causes significant impacts to three roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 32 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-10 (excluding item C), for the Project, would improve all operating conditions from unacceptable to acceptable levels. Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed, and thus despite mitigation impacts must be considered potentially *significant and unavoidable*.

- *Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road from Kiefer Boulevard to University Boulevard* – Operations deteriorate from an acceptable LOS A to LOS E. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an unacceptable LOS E to LOS F, with an increase in V/C ratio of greater than 0.05. Mitigation would improve operating conditions to LOS C.

CALTRANS FREEWAYS

MAINLINE

The Expanded Footprint Alternative causes significant impacts to six freeway segments, which are listed below. Further widening of these freeway segments would be required in order to reduce impacts, but Caltrans currently has no plans to expand the segments beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect money to fund such improvements. No feasible

mitigation exists to offset impacts to freeway segments; impacts are *significant and unavoidable*.

- *Eastbound US 50 from Watt Avenue to Bradshaw Road* – LOS F in a.m. and p.m. peak hours.
- *Eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 from Hazel Avenue to Rancho Cordova Parkway* – LOS F in the a.m. peak hour.
- *Westbound US 50 from Mather Field Road to Bradshaw Road* – LOS F in a.m. peak hour.
- *Westbound US 50 from Bradshaw Road to Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 from Watt Avenue to Power Inn/Howe Avenue* – LOS F in a.m. peak hour.

RAMP JUNCTIONS

The Expanded Footprint Alternative causes significant impacts to four freeway ramps, which are listed below. Caltrans currently has no plans to expand the following ramp junctions beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect monies to fund such improvements. No feasible mitigation exists to offset impacts to freeway ramps; impacts are *significant and unavoidable*.

- *Eastbound US 50 Exit Ramp to Watt Avenue* – LOS F in p.m. peak hour.
- *Eastbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 Exit Ramp to Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. peak hour.

BICYCLE AND PEDESTRIAN ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. By the cumulative time horizon, improvements will have been installed on Grant Line Road and Douglas Road as part of buildout within Rancho Cordova, and as part of other improvements to Grant Line Road consistent with the Sacramento County General

Plan, the Sacramento County Bicycle Master Plan, and the City of Rancho Cordova General Plan. The Alternative will not eliminate or adversely affect bicycle or pedestrian facilities, result in unsafe conditions, or interfere with implementation of planned bicycle or pedestrian facilities; impacts are *less than significant*.

TRANSIT ANALYSIS

The impacts of the Alternative are nearly identical to those described for the Project. The Alternative assumes that an internal transit system will still be provided, and this system would be sufficient to serve the needs of residents. Development within the site will not conflict with the implementation of any adopted transit plan. Impacts are *less than significant*.

MITIGATION MEASURES:

ALT-7. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *Street D and North Loop Road* – Provide dual left turn lanes on the eastbound approach.

ALT-8. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the westbound right turns.
- B. *Grant Line Road and Douglas Road* – Provide three through lanes on the northbound approach and three through lanes on the westbound approach.
- C. *Grant Line Road and University Boulevard* – Provide a free-right turn lane on the northbound approach. Also an extra eastbound departure lane is needed for the northbound free-right movement.

ALT-9. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *Street A from University Boulevard to Street B* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with low access control.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The No Project Alternative is environmentally superior to the Project and other Alternatives, as the No Project Alternative will result in less than significant impacts to all impact categories. CEQA Guidelines Section 15126.6(e)(2) states that if the No Project Alternative is the environmentally superior Alternative, then a superior Alternative shall be identified from among the other Alternatives. Table ALT-30 and Table ALT-31 provide comparisons between the Project and the Alternatives. Table ALT-30 includes many of the quantifiable differences between the Project and Alternatives as it relates to impacts and utility demands. The table does not include impacts such as noise or transportation, because these impacts span multiple facilities and cannot be summarized in a single number. Table ALT-31 includes a list of the impact topics and notes whether the Project and Alternatives resulted in less than significant, significant but mitigable, or significant and unavoidable impacts.

Examining the comparison of significance conclusions included in Table ALT-31, the significance conclusions for the Expanded Preserves and the Expanded Footprint Alternatives are identical except for aesthetics, in which the conclusion for the Expanded Footprint Alternative was less than significant. This was due to the fact that the off-site homes north of the site would no longer be present, and thus would not be affected by the change in views. Though the Expanded Footprint Alternative results in one fewer significant impact, examining Table ALT-30 clearly shows that the Expanded Preserves Alternative results in the least amount of land being urbanized, of pollutants such as ozone precursors and ROG, of wetlands and other habitat loss, of greenhouse gas emissions, and of utility demand. For these reasons, the Expanded Preserves Alternative is considered the environmentally superior alternative.

Table ALT-30: Summary Comparison Of Quantified Impacts

Impact Topic	Project	No Project	Expanded Preserves	Expanded Footprint
Total Area	2,669 acres	2,669 acres	2,669 acres	3,531 acres
Total Urban Area	2,120 acres	10 acres	1,490 acres	1,979 acres
Total Avoided Area¹	549 acres (18%)	2,659 acres (96%)	1,179 acres (43%)	1,552 acres (57%)
Air Quality NO_x and ROG (lbs/day)	415.22 and 857.40	Not calculated	319.72 and 660.20	373.70 and 771.66
Biological Resources				
Wetland Loss	46% or 41 acres	0% or 0 acres	19% or 17 acres	19% or 21 acres
Grassland Loss	79% or 2,120 acres	<1% or 10 acres	56% or 1,490 acres	56% or 1,979 acres
Swainson's Hawk Habitat ¹ Loss	84% or 2,231 acres	<1% or 10 acres	65% or 1,736 acres	63% or 2,225 acres
Climate Change				
Greenhouse gas emissions per capita	5.80 MT	9.51 MT	5.57 MT	5.61 MT
Total greenhouse gas emissions	147,386 MT	258 MT	82,706 MT	96,993 MT
Water Demand	6,550 AFY	No public water	5,484 AFY	6,344 AFY
Sewage Disposal	16,094 ESD	No public sewer	12,484 ESD	15,346 ESD
Electricity Demand	122,903,000 kWh	Not calculated	72,003,000 kWh	104,002,000 kWh
Natural Gas Demand	4,201,494 therms	Not calculated	2,988,810 therms	3,704,664 therms

1. This total includes some areas designated Agriculture, which are to be placed in a conservation easement.

2. For landscape-level raptors, the central linear preserve is, conservatively, not considered viable foraging habitat.

3 AESTHETICS

INTRODUCTION

The quality of the visual experience associated with a project is not only dependent on the character of the project site, but also the individual perspective and values of the viewer. Typically, residents and recreational viewer groups are especially concerned about the appearance of their visual environment because their viewing experience is more than merely transitory. Perceived adverse visual impacts associated with a project can be the source of concerned opposition, even to projects that may otherwise be well-received.

It should be emphasized that when a viewer group perceives a negative change in the viewshed, this is not necessarily because the new development is unattractive. If a viewer had never seen pre-project conditions, their perception of the visual quality of a given project might be quite high. Thus, the impact typically occurs not because of the quality of the project in question, but rather because of the substantial change in the nature of the view. Many viewers value undisturbed open space views much more highly than views of urbanized or developed property, however well-designed and visually balanced the development may be.

Aesthetic impacts are subjective, and therefore are often treated as an impact topic where thorough objective analysis is not possible. Although visual impacts are subjective and may be viewed differently by various individuals, it is also true that residents of the United States agree on the high visual quality of many landscapes. These areas are often designated as national parks and scenic spots. These agreed-upon factors and concepts of natural beauty can be used to assess the visual impacts of a project.

This chapter addresses aesthetics and visual quality issues related to the development of the proposed Project and its alternatives. Existing aesthetic and visual resources of the Project area are documented. Standards to judge visual sensitivity are presented and relevant scenic resource issues are addressed.

EXISTING SETTING

VISUAL CHARACTER OF REGION

Sacramento County lies near the center of California's Central Valley, at the southern end of the Sacramento Valley. Open space views within the valley region are generally characterized by broad sweeping panoramas of flat agricultural lands and open space

dotted with trees, divided by numerous rivers and creeks. To the east, the Sierra Nevada and their foothills form a background, and the Coast Range provides a backdrop on the western horizon.

VISUAL CHARACTER OF PROJECT AREA

From the perspective of travelers on Grant Line Road, the Project site appears to have the flat topography typical of Sacramento County. This flat area is actually a plateau, after which the site elevations drop sharply into the first of three large intermittent drainages present on the site. All of the property to the east of the plateau – the bulk of the property – exhibits highly variable topography with many small rises and lower valleys. The eastern edge of the property is at a significantly higher elevation than the lands to the east of the site, providing expansive off-site views of rolling and oak-studded terrain, as well as views of the more-distant Sierra Nevada. The Project site is dominated by grassland and wetland areas. Property to the north is similar in character, while the property to the south is visually dominated by the presence of the Kiefer landfill. Land to the west is typical of Sacramento County – flat open fields, and some residential and commercial development within the City of Rancho Cordova, currently about one mile to the west.

SCENIC VIEWS AND RESOURCES

Visual resources are classified in two categories: scenic views and scenic resources. Scenic resources are described in the CEQA Environmental Checklist as specific features of a viewing area (or viewshed) such as trees, rock outcroppings, and historic buildings. They are specific features that act as the focal point of a viewshed and are usually foreground elements. Scenic views are elements of the broader viewshed such as mountain ranges, valleys, and ridgelines. They are usually middle ground or background elements of a viewshed that can be seen from a range of viewpoints, often along a roadway or other corridor. The Sierra Nevada mountain range, which is visible from various viewing locations (though haze can block views), is an important scenic view in the area. Scott Road and Latrobe Road, which lie to the east and south of the site, are designated by the Sacramento County General Plan Scenic Highways Element as “scenic corridors”.

LIGHT AND GLARE SOURCES

The unincorporated urban areas of the County include existing sources of daytime glare and nighttime lighting and illumination. Sources of daytime glare include direct beam sunlight and reflections from windows, architectural coatings, glass and other shiny reflective surfaces. Such glare usually only impacts the immediate environment, except in cases where buildings are high-rise and can be seen from greater distances. Nighttime light illumination and associated glare can be divided into stationary and mobile sources. Stationary sources of nighttime light include structure illumination, decorative landscape lighting, and lighted parking lots. Mobile sources are the vehicles traveling on roadways. The unincorporated rural and agricultural areas of the County,

which includes the site, are sparsely developed and used for agriculture. These rural land uses typically do not generate substantial amounts of glare, lighting, or illumination, and the ambient nighttime lighting and illumination levels are very low.

REGULATORY SETTING

TITLE 24 OUTDOOR LIGHTING

The 2008 Building Efficiency Standards of Title 24 include regulations for outdoor lighting characteristics such as maximum power and brightness, shielding, and sensor controls to turn lighting on and off. Different lighting standards are set by classifying areas by lighting zone, which are zones LZ1 through LZ4. The ambient illumination for LZ1 is “dark”, for LZ2 is “low”, for LZ3 is “medium”, and for LZ4 is “high” (see Table 10-114-A of the Building Efficiency Standards). Lighting regulations for areas of lower ambient lighting are more strict – providing lower wattage allowances – in order to protect those areas from new sources of light pollution and light trespass. The Project is within zone LZ2.

2030 SACRAMENTO COUNTY GENERAL PLAN

The General Plan policies applicable to the Project are:

- CI-53. Roadway improvements along established scenic corridors shall be designed and constructed so as to minimize impacts to the scenic qualities of the corridor.
- CI-58. Continue to provide scenic corridor protection for Scott Road from White Rock Road south to Latrobe Road, Michigan Bar Road, and Twin Cities Road from Highway 160 east to Highway 99.
- CI-61. Study additional roads which would appropriately be designated as County Scenic Corridors. Roads to be considered are Jackson Highway in the foothills, Stonehouse Road, approach roads to the City of Folsom, the balance of Twin Cities Road, Lone Road, Meiss Road, and all roads running through the Permanent Agricultural lands.
- CO-117. Public roads, parking, and associated fill slopes shall be located outside of the stream corridor, except at stream crossings and for purposes of extending or setting back levees. The construction of public roads and parking should utilize structural materials to facilitate permeability. Crossings shall be minimized and be aesthetically compatible with naturalistic values of the stream channel.
- LU-18. Encourage development that complements the aesthetic style and character of existing development nearby to help build a cohesive identity for the area.

LU-31. Strive to achieve a natural nighttime environment and an uncompromised public view of the night sky by reducing light pollution.

In addition to the policies from the Land Use Element above, the Conservation element states its primary goal as: “Natural resources managed and protected for the use and **enjoyment** of present and future generations while maintaining the long-term ecological health and balance of the environment.” [emphasis added] The concept of enjoyment includes appreciation of scenic resources and visual beauty.

SACRAMENTO COUNTY ZONING CODE

Title 1 (General Provisions) of the Zoning Code contains standards requiring that illumination of buildings, landscaping, signs, and parking and loading areas be shielded and directed so that no light trespasses onto adjacent properties. Title III (Use Regulations and Development Standards) requires that lighting shall be directed away from residential areas and public streets so that glare is not produced that could impact the general safety of vehicular traffic and the privacy and well-being of residents.

SIGNIFICANCE CRITERIA

The degree of impact of a project, either negative or beneficial, to the visual character of the area is largely subjective. Few objective or quantitative standards are available to analyze visual quality, and individual viewers respond differently to changes in the physical environment. Based on the CEQA Guidelines Appendix G, a project would have a significant impact on aesthetics if it would:

1. Have a substantial adverse effect on a scenic vista;
2. Substantially damage scenic resources, including but not limited to trees, rock outcroppings, and historic buildings within a state scenic highway;
3. Substantially degrade the existing visual character or quality of the site and its surroundings; and/or
4. Create a new substantial source of light and glare, which would adversely affect day or nighttime views in the area.

METHODOLOGY

The United States Department of Transportation, Federal Highway Administration (FHWA) developed a manual to aid in the preparation of visual assessments for highway projects. Although the proposed Project is not for a highway or other roadway, the key concepts established by FHWA apply to all visual settings and were used to

help evaluate the visual character and quality of the region and the Project site. Many of these same key concepts are used to evaluate aesthetics in many contexts, including artistic compositions, architecture, and residential landscaping design. For the purposes of landscapes, the concepts of vividness, intactness, and unity define visual quality. Definitions of key terms and the Project impacts to visual quality and character are described below.

- *Vividness* is a measure of the visual impression that remains in the memory of the viewer (e.g. Niagra Falls). Vivid visual experiences are striking and distinctive.
- *Intactness* is the visual integrity of the natural and built landscape. Intact landscapes are unobstructed visual experiences.
- *Unity* is the coherent inter-compatibility of connected landscape elements. A high degree of unity creates a harmonious visual pattern.

Visual character is derived from visual pattern elements and their dominance, scale (apparent size relationship), diversity, and/or continuity (uninterrupted flow of patterns). Visual pattern elements include form (visual mass or shape), line (silhouette), color, and texture (apparent coarseness). Although visual character and quality can be described objectively, there is no established official process that will identify all areas of high visual quality. Therefore in part visual quality is often defined by viewer sensitivity. Viewer sensitivity is defined using the following criteria:

- Visibility of resources in the landscape
- Proximity of viewers to the visual resource
- Elevation of viewers relative to the visual resource
- Frequency and duration of views
- Number of viewers
- Types and expectations of individuals and viewer groups

Plate AE-1 and Plate AE-2, below, are examples of high and low visual quality in Sacramento County. In the first image there are no encroachments (highly intact), the site is unified, and the clouds and landscape combine to provide diversity in the view. In the second image, the view is diverse, but the entire view is taken up by encroachments and the site contains multiple elements that are not cohesive.

Plate AE-1: Example of High Visual Quality

Deer Creek Hills Preserve, photo from the Sacramento Valley Open Space Conservancy

Plate AE-2: Example of Low Visual Quality

VIEWER GROUPS

The visual experience is a combination of visual resources and viewer response. Different viewer groups respond differently to visual environments. The opinions or preferences of different groups depend on viewer activity and awareness, local values and the cultural significance of the visual resources. Viewer activity affects the viewers' ability to perceive the landscape. Depending on the activity, a viewer may be attracted or distracted from the landscape. For example, a person reclining in a backyard or sitting on a bench will be encouraged to view the landscape, whereas a person driving along a road on an errand will be distracted from the landscape and concentrate more on the road itself.

Viewer awareness also affects the viewer's receptivity to the landscape. Viewer awareness is affected by position, preconceptions, and recent visual experience. If viewer sensitivity is very high, any visible change in the area may be discouraged. The following groups are likely to have views of the Project: people passing by on Douglas Road and/or living in Rancho Cordova near Douglas Road, people passing by on Grant Line Road, people passing by on Kiefer Road, people in the vicinity of Latrobe Road, and existing residents to the north. To aid in the analysis, the firm Post, Buckley, Schuh, & Jernigan, Inc (hereinafter called PBS&J, though the company is now called Atkins) conducted a site visit and took photographs from different vantage points in and around the community. Representative photos have been included in this document, as have photosimulations of the Project. Views from Scott Road were not considered because after examining the views it was determined that the presence of trees and hills in between the site and the roadway would largely prevent the site from being viewed.

The visual character and availability of site views varies considerably depending on the viewing location. For this reason, the analyses to follow are separated by viewing location/viewer group. Photo exhibits accompany each of the viewing location/group discussions: a photograph of the existing viewing condition and a photosimulation of the Project from that viewing location. An exhibit of these photo locations and the viewing direction is included as Plate AE-3.

IMPACT QUANTIFICATION METHODOLOGY

The FHWA guidance manual contains a numeric formula to quantify the change in visual quality. Each of the three primary characteristics (vividness, intactness, and unity) is given a numeric rating between 1 and 7 (from very low to very high). The following formula is then applied: $(\text{Vividness} + \text{Intactness} + \text{Unity})/3$. The numeric difference between the existing visual quality and the proposed visual quality is a representation of the impact to the Project site. Table VA-1 provides a basic explanation of some (not all) factors to take into account when applying the scale.

The perceived impact to the quality of a view is not a strict linear function. If a project resulted in a decrease of 2 points of visual quality, the degree to which viewers would be affected by that decrease would depend on the initial quality of the site. When a site

is considered of high visual quality, even small decreases in the quality are much more noticeable and remarked on. However, when a site is only of moderate or low visual quality, observers do not tend to be as affected by the change. The significance of a decrease in visual quality will also depend on how often and for how long the site will be viewed.

Table AE-1: Evaluation Scale

Scale	Vividness	Human-made development	Encroachments or Eyesores	Unity/Intactness
7	Very High	None	None	Very High
6	High	Little	Few	High
5	Moderately High	Some	Some	Moderately High
4	Average	Average	Average	Average
3	Moderately Low	Moderately High	Several	Moderately Low
2	Low	High	Many	Low
1	Very Low	Very High	Very Many	Very Low

Plate AE-3: Viewpoint Map

IMPACTS AND ANALYSIS

IMPACT: DEGRADATION OF EXISTING VIEWS AND VISUAL QUALITY

DOUGLAS ROAD/RANCHO CORDOVA VIEWER GROUP (VIEWPOINT 1)

In the existing condition, the views from Douglas Road include the relatively flat grassland plateau of the site against the backdrop of the distant Sierra Nevada mountains (refer to Plate AE-4). There is a series of radio transmission towers on property north of the site, but these do not dominate the viewshed because though they are tall and striped with red, they are also quite thin. The towers are visible in Plate AE-4 rising above the trees.

The primary visual break in this view is a grouping of trees at the northern end of the Project site. Most of these trees are part of an olive orchard that surrounds a home and other appurtenant structures that are just off-site (none of the structures are apparent). This collection of trees is particularly dominant in the landscape during the late summer, because while the majority of the viewshed is taken up by smooth-textured, low-profile, and wheat-colored grasslands, the trees are tall, dark green, and rough-textured. During the winter the contrast is not as high, and thus the trees are not as dominant. The grasses and trees are both green as the winter rains begin, and then in the spring there are areas of various colors (including white, yellow, and purple) where flowers are blooming. In late spring and early summer, the site becomes two-toned, as upland grasses begin to dry to shades of brown but the wetland areas remain green.

The grouping of trees actually detracts from the visual quality of the view, because they are so unique and dominant in the landscape that they are not unified with the rest of the view. The trees draw the eye of the viewer somewhat away from the whole. Nonetheless, the overall impression is still one of openness and continuity; the views are highly intact – meaning that there are few unattractive or negative encroachments in the view. The only encroachments are the line of telephone poles, some fencing, and the road itself. Though the terrain off-site to the east of the Project actually drops off and the landscape alters significantly to become rolling and tree studded, this is not perceptible from Douglas Road. The grasslands appear to continue unbroken all the way up to the foot of the Sierra Nevada visible in the distance. Though unified and intact, the uniformity of the view means that it is not particularly vivid. One cannot distinguish the Project site from the surrounding grasslands – there is nothing particularly memorable or striking. Existing condition vividness is rated 2 (low), while unity and intactness is rated 6 (high), for an average rating of 5 (moderately high).

Plate AE-4: View from Douglas Road

Viewpoint 1 – Before Project Implementation (Existing Conditions)

Viewpoint 1 – After Project Implementation

As shown on Plate AE-4, the Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada has the potential to significantly and negatively impact the quality of the views. Project condition vividness is rated 5, intactness is rated 1 (very low), and unity is rated 2 (low), for an average rating of 3 (moderately low). Reducing visual quality from moderately high to moderately low is a *significant* impact.

GRANT LINE ROAD VIEWER GROUP (VIEWPOINT 2)

The views from Grant Line Road are very similar to those from Douglas Road, except that viewers passing along the road will see the Project from multiple perspectives as they approach and then pass the site. The example photograph and photosimulation are shown from the perspective of a northbound driver to the south of the site (Plate AE-5). The grouping of trees that is so dominant in the Douglas Road views is either absent or more distant in the majority of views from Grant Line Road. Because of this, there is little to distract from the flat line and smooth texture of the grasslands that stretch away from the road. The visual “end” of the site is the Sierra Nevada mountain range in the distance – provided that regional haze does not obscure it. As with the view from Douglas Road, the unity and intactness of the views is high, but the vividness is low. Existing condition vividness is rated 2 (low), while unity and intactness is rated 6 (high), for an average rating of 5 (moderately high).

As shown on Plate AE-5 and very much like impacts to the Douglas Road Viewer Group, the Project will remove the illusion of continuity, both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Viewers at the south end of Grant Line Road will be at a high enough elevation to see beyond the Project in some areas, so that portions of the backdrop Sierra Nevada will still be visible. Though this will increase the diversity of the view, the loss of continuity has the potential to significantly and negatively impact the quality of the views. Project condition vividness is rated 5, intactness is rated 1 (very low), and unity is rated 2 (low), for an average rating of 3 (moderately low). Reducing visual quality from moderately high to moderately low is a *significant* impact.

Plate AE-5: View from Grant Line Road

Viewpoint 2 –Before Project Implementation (Existing Conditions)

Viewpoint 2 – After Project Implementation

KIEFER ROAD VIEWER GROUPS (VIEWPOINT 3)

From some perspectives along Kiefer Road the site is not visible, because it is blocked from view by Kiefer Landfill. Where the site is visible the color and the continuity of the views are similar to those previously described (see Plate AE-6). Viewers see a sweep of grassland backed by the Sierra Nevada. The primary difference is that the topographical changes on the east side of the site are visible, as well as some of the tree-lined drainages located off of the site. Viewers on Kiefer Road can also see the rolling and tree-dotted terrain to the east of the site, as well as a few rural agricultural residences and buildings (note the far right of Plate AE-6).

The differences noted above increase the diversity of site views by introducing additional colors, varying the lines and angles of the horizon, and introducing multiple textures (smooth grass, rough trees). Though the diversity of the view is increased, these elements remain visually unified; the transition from one visual element to another is smooth. This is unlike the grouping of trees in the viewshed of Douglas Road, which is so unique in the view that it stands out as a distinct object rather than as a unified part of the whole. Though the vividness of this view is higher than from either Douglas or Grant Line Road, it is still moderate-to-low; the view is not highly distinctive or memorable.

From most perspectives there are few negative encroachments in the view. This is not the case for people viewing the site from the actual Kiefer Landfill, in which case the view includes a significant amount of negative visual encroachments as part of the foreground of the view. Viewers from the landfill are expected to have low sensitivity to any change in the view, as it is not typical to expect an attractive view when depositing trash at a landfill. Employees may have more appreciation for the existing views, but nonetheless are engaged in their work and in many cases may not even be able to see the site for large parts of the day. From the actual landfill area, vividness is rated 2 (low), intactness 1 (very low), and unity 1, for an average of 1. From other areas along the road vividness is rated 2, intactness is rated 6 (high), and unity is rated 6, for an average of 5 (moderately high).

The Project will have very little impact on the views from Kiefer Road. Kiefer Road is much lower in elevation than the areas of the Project site that will be developed, and the development on the eastern part of the site is planned to be both low density and set back from the edge of the plateau. The result is that only the very tops of some of the structures and landscape trees may be visible edging over the horizon. Project condition views from non-landfill areas of Kiefer Road are essentially unchanged, and retain their existing condition ratings. Impacts to visual quality from this viewpoint are *less than significant*.

Plate AE-6: View From Kiefer Road

Viewpoint 3 – Before Project Implementation (Existing Conditions)

Viewpoint 3 – After Project Implementation

LATROBE ROAD VIEWER GROUP (VIEWPOINT 4)

One large difference between the views from Latrobe Road and all other viewpoints is that the viewer of the Project will have their back to the Sierra Nevada – the Sierra Nevada are not part of the viewshed. Also, from this perspective viewers cannot see beyond the Project site. The Latrobe Road viewshed contains a major encroachment in the form of a line of transmission towers. Otherwise, the form, line and color are very similar to the view from Kiefer Road and receive the same ratings (average of 5, or moderately high).

The Project will be more visible from Latrobe Road than from Kiefer Road, because the relative elevations and topography between the site and Latrobe Road allow viewers to see up onto the site plateau. Though visible, the large distance between the viewer and the development on the site will mute many of the details of the development, and thus will not appreciably increase vividness. Observers passing by along the road may perceive the Project mainly as a rough, multi-hued edge to the horizon, which means that unity will not appreciably decrease. People who stop to observe may take more notice of the individual buildings and other Project components, but will still be at too great a distance to make out clear details. Intactness will decrease slightly, since it will be recognizable that the new feature in the landscape is of human construction. Since viewers could not see beyond the Project site in pre-Project conditions, the Project will alter but not block existing views. Project condition ratings for vividness and unity will remain the same as existing condition ratings, but intactness will decrease to 5 (moderately high), for an average rating of 4 (average). Though the Project will decrease visual quality from moderately high to average, this is not a large drop in quality. Furthermore, views from this area are largely transitory and are thus not as sensitive to change. For the foregoing reasons, visual impacts to this viewing location are *less than significant*.

Plate AE-7: View from Latrobe Road

Viewpoint 4 –Before Project Implementation (Existing Conditions)

Viewpoint 4 – After Project Implementation

NORTHERN RESIDENTS VIEWER GROUP (VIEWPOINT 5)

Viewers to the north of the site have the most unique view, because the land to the north is at a higher elevation than most of the site. While all other viewpoints can only see portions of the site, the northern viewer group can see the entire Project area as well as the land to the east of the site where the terrain becomes more wooded. The views from the north are therefore the most expansive and the most diverse when compared with the other viewpoints. Plate AE-8 is an example of this view, though the camera lens is aimed south-southwest so the foothills and the Sierra Nevada are not visible in this photograph.

Depending on the location of the viewer, there are some encroachments in the view, such as fencelines or telephone poles, but the view is largely intact. The view also has high unity, consisting mainly of grasslands that are ultimately backed by a more wooded landscape in the distance. The diversity of the view is influenced by these two vegetation cover types, but also by the topography. From the north, the changes in topography are visible to the viewer; the site begins on a plateau, then drops steeply off into more rolling terrain, and ultimately drops off again down to Carson Creek. Vividness is rated as 3 (moderately low), and unity and intactness are rated 6 (high), for an average existing condition rating of 5 (moderately high).

The viewing locations are high enough in elevation that viewers will be able to see beyond the Project after it is completed. Nonetheless, the Project will remove the illusion of continuity, both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the introduction of major encroachments will substantially reduce the quality of the current views. Project condition vividness is rated 5, and intactness and unity is rated 2 (low), for an average rating of 3 (moderately low). Reducing visual quality from moderately high to moderately low is a *significant* impact.

This viewer group will be most sensitive to any changes the Project will make to the viewshed. There are three reasons for this sensitivity: in the existing condition the entire site is visible, the viewers are relatively close to the site, and the viewpoints are from residences. Residents usually consider the surrounding views to be part of their property, and are thus more protective of existing scenic views. Residents also observe views for much longer periods of time, and during times of relaxation and enjoyment when scenic resources are typically more appreciated.

Viewpoint 5 –Before Project Implementation (Existing Conditions)

Viewpoint 5 – After Project Implementation

SUMMARY OF VIEWSHED IMPACTS

Views from Kiefer Road and Latrobe Road will not be significantly impacted. From Kiefer Road only the very tops of some of the structures and landscape trees may be visible edging over the horizon. Project condition views from non-landfill areas of Kiefer Road are essentially unchanged, and retain their existing condition ratings. The Project will be more visible from Latrobe Road than from Kiefer Road, because the relative elevations and topography between the site and Latrobe Road allow viewers to see up onto the site plateau. Though visible, the large distance between the viewer and the development on the site will mute many of the details of the development.

Project impacts to the views from Douglas Road/Rancho Cordova, Grant Line Road, and residents to the north will be *significant*. The Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada significantly and negatively impacts the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed. The Project will substantially degrade the existing visual character and quality of the site; impacts are *significant and unavoidable*.

MITIGATION MEASURES:

No mitigation is available.

IMPACT: NEW SOURCES OF LIGHT OR GLARE

The Project does not involve any elements with particularly reflective surfaces, and thus will not introduce a significant new source of glare. The Project will, on the other hand, involve a substantial amount of new residential and commercial development that will include lighting sources such as street lights and security lights. Nighttime lighting has been associated with negative human health impacts and ecological impacts. Birds may collide with lighted transmission towers at night¹ and animals that rely on the darkness to hide them will be visible to predators and prey. In humans, the primary effect is sleep disruption. Nighttime lighting is necessary for safety, for work productivity, and for recreation, but Title 24 and County Ordinances were instituted in recognition that excess lighting should be avoided.

¹ Poot, H., B. J. Ens, H. de Vries, M. A. H. Donners, M. R. Wernand, and J. M. Marquenie. [Green light for nocturnally migrating birds](#). *Ecology and Society* 13(2): 47, 2008.

The Project site is within a rural area that has minimal lighting, and is designated as an LZ2 zone (low levels of ambient nighttime light). The nearby Kiefer landfill includes nighttime lighting sources, but the distance of the landfill from the Project site ensures that its impact is diffused and insignificant. Because the Project is in an LZ2 zone, the lighting restrictions will be more robust than if the Project were in a more urban environment. For instance, Table 147-B of the 2008 Building Efficiency standards indicates that building entrances in an LZ2 zone are limited to 75 watts, while in an LZ4 (urbanized) zone the allowance is 120 watts. The SPA also includes narrative requirements for exterior Project lighting, beginning in Section 4.15.5.

Most of the Project will result in standard urban lighting systems with average light output, such as porch lights, parking lot lights, and similar. The exceptions are the sports fields at the University/College Campus Center and the sports park. Both areas will include facilities for organized sporting events such as baseball, soccer, and football, and this will require stadium lighting for after-sunset games. Stadium lighting has a much higher light output than other lighting sources, and is generated from a greater height than the average lighting source. This allows the light output to be spilled over a larger area, and for the lights to be directly visible even from large distances. Moreover, lighting for athletic fields is exempt from the lighting limitations of the 2008 Building Efficiency Standards.

Both stadium lighting areas are located adjacent to commercial uses, university buildings, or open space. The nearest existing residential areas to the proposed athletic fields are more than a mile away. The nearest Project residential areas will be approximately 2,000 feet from the athletic fields. These distances are sufficient to ensure that nighttime sleep will not be disrupted by the light source.

Though there are existing restrictions that will help to minimize the impacts of new lighting sources on existing nighttime conditions, the Project will still result in a substantial new source of light. This will not result in substantial nighttime sleep disruption for existing residential areas, because those areas are more than a mile from the site. There will be some disruption for wildlife which use the habitats surrounding the site because sky glow will increase ambient lighting conditions in the area, and direct light spill will impact areas directly adjacent to the Project. Many wildlife species in the area can adapt to these conditions, as they have to other urbanizing areas. There are no special status species in the area known to be particularly susceptible to disruption resulting from nighttime lighting.

Though the Project lighting will not result in sleep disruption or significant wildlife impacts, the significance question asked is whether the Project introduces a substantial new source of light that adversely impacts views; it does. There are existing regulations which will minimize lighting impacts, but the Project will nonetheless result in a *significant* impact related to new lighting sources. This impact is not due to any individual feature or features, but due to the result of introducing a large urban development within a rural landscape. Though the impact cannot be made less than significant, there are means available to further reduce the level of light pollution produced by the Project.

The International Dark-Sky Association (IDA) is a world-recognized authority on nighttime lighting and light pollution. IDA operates a program which reviews and rates outdoor lighting fixtures, giving IDA-approved status to fixtures that minimize glare and light trespass. The IDA maintains a list of fixtures that have been approved; mitigation recommends that the SPA section on outdoor lighting be revised to include a requirement to use IDA-approved fixtures. Though feasible mitigation is applied, the Project will generate a substantial new source of light; impacts are *significant and unavoidable*.

MITIGATION MEASURES:

AE-1. The SPA shall be amended to require all lighting applications subject to the 2008 Building Efficiency Standards Section 147 to use fixtures approved by the International Dark Sky Association.

4 AGRICULTURAL RESOURCES

INTRODUCTION

This chapter describes the existing agricultural resources within the Project area and analyzes possible impacts to agricultural uses and agricultural lands from implementation of the Project. The chapter focuses on the impact of converting the designated farmland on the site to non-agricultural uses, and on impacts related to the Williamson Act contract on the site.

ENVIRONMENTAL SETTING

The Project site is located in the eastern portion of Sacramento County, within the Cosumnes community, on approximately 2,669 acres. The Project is bounded by the City of Rancho Cordova to the west, Carson Creek to the east, and Glory Lane to the north. The Keifer Landfill is located south of the Project site. Most of the Project is within the Urban Services Boundary (USB); however, none of the Project site is within the Urban Policy Area (UPA).

The Project site is designated by the Sacramento County General Plan as General Agriculture (80 acres) and is zoned for AG-80 agricultural uses (Plate AR-1). The site is also predominantly grassland which is used for cattle grazing; there are no structures on the site. There was a small eucalyptus grove in the southwest quadrant of the site, which had not been used for agricultural purposes for many years and was cut down by the property owner several years ago. The land underlying the historic grove is designated Unique Farmland due to the historic potential use of the eucalyptus as a crop. There are no intensive agricultural uses on the site (Plate AR-2 and Plate AR-3).

Properties to the north, east, and south of the site are zoned for agriculture uses (AG-80 and AG-20). To the north the landscape is similar to that of the site – predominantly grassland suitable for grazing. The lands east of the site lie across Carson Creek, and are also grazed, though the grassland begins to transition into oak woodland. South of the site is the Kiefer landfill and southeast there are areas within the Deer Creek floodplain that are used for row crops.

There are approximately 480 acres in the southeastern quadrant of the site that are under a Williamson Act contract. The contract is in non-renewal and is expected to expire in 2016 (Plate AR-4). There are two off-site active contracts adjacent to this contract on the east and south. These contracts encompass approximately 1,100 acres.

REGULATORY SETTING

FARMLAND MAPPING AND MONITORING PROGRAM

The California Department of Conservation's Farmland Mapping and Monitoring Program (FMMP) was established in 1984 to document the location, quality, and quantity of agricultural lands and conversion of those lands over time. The program provides impartial analysis of agricultural land use changes throughout California.

The FMMP is tasked with mapping and monitoring important farmlands for most of the State's agricultural areas. The maps are prepared on the basis of soil survey information and land inventory and monitoring criteria developed by the US Department of Agriculture (USDA), Natural Resources Conservation Service. The minimum mapping unit used for all agricultural land categories except grazing land is 10 acres. The minimum unit for grazing land is 40 acres. Though the FMMP typically updates its farmland maps every two years based on information from local agencies and recent aerial photography, the most recent Sacramento County Important Farmland Map is dated 2008. For inventory purposes, the following categories were developed to describe the qualities of land in terms of its suitability for agricultural production.

- *Prime Farmland* is defined by the state as "land with the best combination of physical and chemical features able to sustain long-term production of agricultural crops." Prime Farmland has the soil, quality, growing season, and moisture supply needed to produce sustained high yields. To be designated as Prime Farmland, the land must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- *Farmland of Statewide Importance* is defined by the state as "land similar to Prime Farmland that has a good combination of physical and chemical characteristics for the production of agricultural crops." This land has less ability to store moisture than Prime Farmland. In order for land to be designated as Farmland of Statewide Importance, it must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- *Unique Farmland* consists of lower-quality soils but is nonetheless used for production of the state's leading agricultural crops. Unique Farmland is usually irrigated, but may include nonirrigated orchards or vineyards in some climatic zones in California. To qualify for this designation, land must have been used for crops at some time during the four years prior to the mapping date.
- *Farmland of Local Importance* is determined by each county's board of supervisors and a local advisory committee. For Sacramento County, this classification refers to lands which do not qualify as Prime, Statewide, or Unique designation but are currently irrigated crops or pasture or nonirrigated crops; lands that would be Prime or Statewide designation and have been improved for

irrigation but are now idle; and lands which currently support confined livestock, poultry operations, and aquaculture.

- *Grazing Land* is land which is suitable for grazing of livestock. The minimum mapping unit for this category is 40 acres.

WILLIAMSON ACT

The Williamson Act, also known as the California Land Conservation Act of 1965, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space uses. When the County enters into a contract with the landowners under the Williamson Act, the landowner agrees to limit the use of the land to agriculture and compatible uses for a period of at least ten years and the County agrees to tax the land at a rate based on the agricultural production of the land, rather than its real estate market value. The County has designated areas as agricultural preserves within which the County will enter into contracts for the preservation of the land in agriculture.

2030 SACRAMENTO COUNTY GENERAL PLAN

The following policies of the 2030 General Plan are applicable to the Project:

- AG-1. The County shall protect prime, statewide importance, unique, and local importance farmlands located outside of the USB from urban encroachment.
- AG-2. The County shall not accept applications for General Plan amendments outside the Urban Services Boundary (USB) redesignating prime, statewide importance, unique and local importance farmlands or lands with intensive agricultural investments to agricultural/residential or urban use (i.e., residential, commercial, industrial) unless the applicant demonstrates that the request is consistent with the General Plan Agriculture-Residential expansion policies (please refer to Land Use Element Policies regarding Agriculture-Residential uses).
- AG-3. The County shall permit agricultural uses on buffers, provided such uses are conducted in a manner compatible with urban uses. Buffers shall be used to separate farming practices incompatible with adjacent urban uses. Any homeowners' association or similar entity within the development shall assist in determining compatible use. Buffers shall not adversely conflict with agricultural uses on adjoining property.
- AG-4. Prospective buyers of property adjacent to agricultural land shall be notified through the title report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County's right-to-farm ordinance.
- AG-5. Projects resulting in the conversion of more than fifty (50) acres of farmland shall be mitigated within Sacramento County, except as specified in the paragraph

below, based on a 1:1 ratio, for the loss of the following farmland categories through the specific planning process or individual project entitlement requests to provide in-kind or similar resource value protection (such as easements for agricultural purposes):

- prime, statewide importance, unique, local importance, and grazing farmlands located outside the USB;
- prime, statewide importance, unique, and local importance farmlands located inside the USB.

The Board of Supervisors retains the authority to override impacts to Unique, Local, and Grazing farmlands, but not with respect to Prime and Statewide farmlands. However, if that land is also required to provide mitigation pursuant to a Sacramento County endorsed or approved Habitat Conservation Plan (HCP), then the Board of Supervisors may consider the mitigation land provided in accordance with the HCP as meeting the requirements of this section including land outside of Sacramento County.

Note: This policy is not tied to any maps contained in the Agricultural Element. Instead, the most current Important Farmland map from the Department of Conservation should be used to calculate mitigation.

AG-6. If a property owner is required to mitigate for the loss of farmland under Policy AG-5, and the approved master plan or community plan includes land permanently set aside for an urban farm, a 1:1 farmland credit will be given to projects that incorporate urban farming within the project that permanently preserves farmland. Urban farms may qualify for credit for the proposed master plan or community plan and will be considered as part of the master plan or community plan process subject to the following criteria:

- The required minimum urban farm size to qualify for the credit shall be at least 5 acres.
- Only land that is fully available for farming shall count towards the credit. Ancillary facilities such as education buildings, farmer's markets, and parking areas shall not be included in the acreage calculation.
- Community gardens shall not count toward the credit.
- The zoning shall be a permanent agricultural zone, or similar zone, that ensures the permanency of the agricultural use.
- An appropriate source of water shall be identified and provided.

- A permanent agricultural easement shall be recorded over the site. The agricultural easement shall be dedicated to the County of Sacramento or an organization approved by the County to preserve the farmland.
- If there is a separate farm management entity, a recorded farming management agreement shall be required between the landowner and the farm manager.

Any reversion to a non-farming use on an urban farm site that received farmland credit shall trigger farmland mitigation regardless of the size. The mitigation shall be equivalent to the mitigation required at the time of the original project approval. In addition, the mitigation shall be based on the farmland category at the time of original project approval; however, in the event the farmland category has been upgraded to a higher category as shown on the latest Important Farmland Map from the Department of Conservation, that farmland category shall be used as the basis in determining equivalent mitigation.

AG-9. Agricultural land divisions shall not adversely affect the integrity of agricultural pursuits. Agricultural land divisions may be denied if the reviewing authority finds that the division of land is likely to create circumstances inconsistent with this policy.

CO-51. Direct development away from prime or statewide importance farmlands or otherwise provide for mitigation as required by AG-5 slowing the loss of additional farmland conversion to other uses.

CO-52. Recreational uses shall not be constructed on prime, statewide importance, unique or local farmland outside of the Urban Services Boundary where the use would impede agricultural practices.

SACRAMENTO COUNTY ZONING CODE

The Agricultural Land Use Zone is designed to promote and protect the public health, safety, and general welfare within Sacramento County. As stated in the General Plan:

Farmland is the fundamental agricultural resource. Urban development, wildlife preserves, and outdoor recreation facilities are encroaching upon farmlands. With rare exceptions, conversions of farmland to nonfarm uses are irreversible. Farmland conversions affect agricultural productivity directly by reducing the farmland base, and indirectly by increasing production costs or reducing yields on neighboring farmlands. Farmland losses reduce the ability of the county to supply food to local and export markets. The cumulative effects of individual farmland conversions include urban growth inducement, unstable rural real estate markets, world competition for existing markets, low commodity prices, and reduced viability of the local agricultural economy.

The converse relationship is also true: lack of viable agricultural productivity tends to lead to conversions of land to other, often conflicting uses. The real or perceived lack of viability may be caused by many factors including: growth pressures, unstable or reduced real estate values, cost of water or energy, government regulation, low commodity prices, and world competition for existing markets.

In general the agricultural land use zone is designed to:

- Eliminate encroachment of incompatible land uses on agricultural lands;
- Preserve the supply of agricultural land in order to conserve the County's economic resources;
- Discourage premature and unnecessary conversion of agricultural land to urban uses;
- Preserve agricultural lands as open space and for production of agricultural products so as to preserve an important physical, social, esthetic and economic asset of the residents of the County ; and
- Encourage retention of large agricultural lots to assure viable agricultural units.

SIGNIFICANCE CRITERIA

The CEQA Guidelines define “significant” as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the Project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. Based on the CEQA Guidelines, an impact to agricultural resources is significant if the Project results in any of the following:

1. Substantial conflict with existing zoning for agricultural use, or a Williamson Act contract.
2. Conversion of a substantial amount of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use.
3. Substantial conflict with existing, adjacent agricultural uses.

In addition to the CEQA Guidelines criteria for significance of farmland loss, General Plan Policy AG-5 defines a substantial farmland loss as 50 acres. The CEQA Guidelines indicate that that Prime, Statewide Importance, and Unique Farmland loss may be a significant impact, but the General Plan further includes Farmland of Local Importance and Grazing Land – though in the case of Grazing Land, the threshold specifically applies only to such lands which occur outside of the Urban Services Boundary.

METHODOLOGY

An evaluation of potential impacts associated with agricultural resources was based on a review of planning documents, including policies of the Sacramento County General Plan, and field reviews. The Project was analyzed in terms of its consistency with Sacramento County General Plan policies and other state regulations as presented above.

IMPACTS AND ANALYSIS

IMPACT: CONFLICT WITH EXISTING AGRICULTURAL USE AND ZONING

The Project site is currently designated as Agricultural 80 (AG-80) by the Sacramento County Zoning Code. The Project requests a Zoning Ordinance Amendment to adopt the Cordova Hills Special Planning Area (SPA). Upon adoption of the SPA 223.5 acres will be allotted for the University/College Campus Center, 493.2 acres will be designated Avoided Area, 194 acres will be designated Agriculture, 249.7 acres will be designated for recreation uses, and the remaining 1,508.1 acres will be designated for a variety of urban developments (roads, commercial uses, residential areas, and public/quasi-public).

The Sacramento County General Plan land use designation for the site is General Agriculture. The Project requests a General Plan Amendment to change the Land Use Designation from General Agriculture to Low Density Residential, Medium Density Residential, Commercial and Office, Recreation, Natural Preserve, and Public/Quasi Public for approximately 2,366.3 acres.

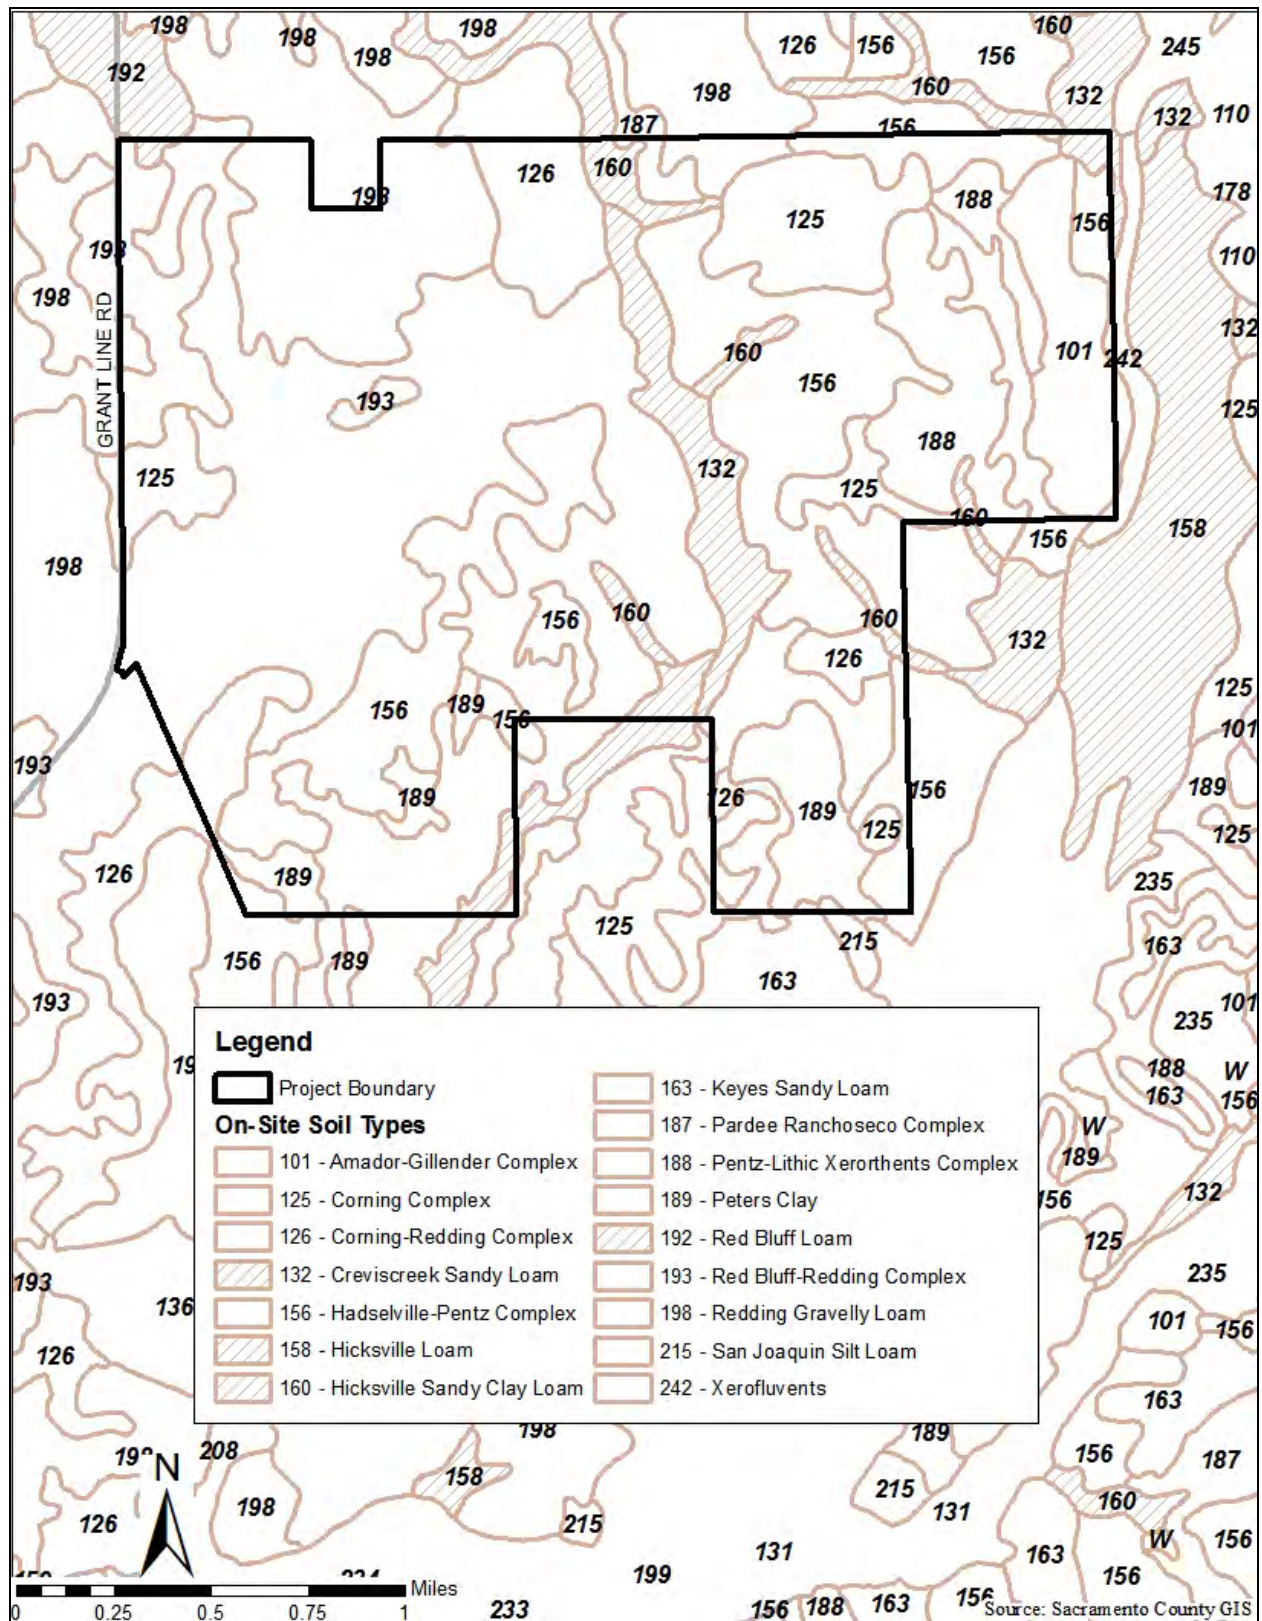

Policies AG-1 and AG-2 protect farmlands outside of the USB from urban encroachment (farmlands are defined as Prime, Statewide Importance, Unique, and Local Importance farmlands). Further, one of the objectives presented in the Agricultural Element of the General Plan is: "Protect prime, statewide importance, unique, and local importance farmlands and lands with intensive agricultural investments (such as orchards, vineyards, dairies, and other concentrated livestock or poultry operations) from urban encroachment."

According to the Sacramento County Important Farmland Map published by the California Department of Conservation, the Project site contains a small patch of Unique Farmland that straddles the USB in the southwestern portion of the site (see Plate AR-3 above), and is otherwise designated as Grazing Land. The patch of Unique Farmland is so designated because of a small eucalyptus grove that was planted many years ago as a crop for firewood. The trees were removed several years ago by the property owner and the grove no longer exists. For this reason, this area may be redesignated to another farmland classification by the Department of Conservation during the next farmland mapping update.

According to the Department of Conservation “Soil Survey of Sacramento County, California”, there are sixteen different soil types within the Project boundaries (Plate AR-5). While the Important Farmland Map reflects the actual use of the land, the soil survey reflects the capability of the underlying soils. Four of the soils on the site are listed as prime soils, if irrigated; these are identification numbers 132, 158, 160, and 192, and are hatchmarked on Plate AR-5. The Storie Index ratings for these soils are 66, 61, 46, and 51. The Storie Index expresses the relative suitability of soil for general intensive agricultural or rangeland uses on a scale of zero to 100, with 100 being best.

The land use capability class of soil 132 is IIIs, the class of soils 158 and 160 are is IIIw, and the class of soil 192 is IIle. The land use capability classes are listed Roman numerals I thru VIII, with the first four representing land suitable for crops and the last four representing land suitable for pasture or rangeland uses. The limitations on use increase as the Roman numeral increases. The letter “e” indicates that the soils are subject to erosion, the letter “s” indicates that soils are shallow and/or rocky, and the letter “w” indicates excess wetness.

Plate AR-5: On-Site Soil Types

The four soil classes described are only prime if they are irrigated. Though there are wells on the site to provide water for cattle, the site has not been irrigated. The topography of the site is highly varied (there are slopes of 30% – 50%), which would make installation of an irrigation system expensive and difficult to operate. Moreover, as shown on the exhibit, the area of prime soils is small relative to the site as a whole; approximately 170 acres out of 2,669, or 6%. The largest area is a mix of soil type 132 and 160, and follows the main north-south ephemeral drainage that passes through the site (located within a proposed preserve on the Project land plan).

Much of the site is currently being used for cattle grazing. The applicant has indicated that the site currently supports one head of cattle for every 15 acres. Grazing cattle is not considered an intensive agricultural investment because the cattle are not densely concentrated and they require minimal infrastructure.

Policy AG-2 defines “urban” uses as residential, commercial, or industrial. The portion of the Unique Farmland area outside of the USB will be designated as Avoided Area and Agriculture by the Project. The SPA definition of Agriculture does include some more developed uses, such as a corporation yard and solar farms, but these uses are conditionally allowable within the County agricultural zoning as well. Thus, the Project is consistent with current policy AG-1 and AG-2, because the Unique Farmland outside of the USB will not be designated for urban uses.

There are no agricultural uses taking place on any of the lands adjacent to the Project site that would be incompatible with the proposed Project. Agricultural uses and residential uses typically come into conflict due to dust generation from tilling, the application of pesticides and fertilizers, and noise from equipment. The nearest row-cropped farmland that would generate these conflicts is over ½-mile to the southeast of the site, in an area of the Deer Creek floodplain. Cattle grazing usually involves a lesser degree of conflict, because the intensity of the activity is reduced when compared to row crops, but may nonetheless result in complaints related to noise, dust, or odors generated by cattle at times when the herd moves closer to residences. Though the Project will not result in significant conflicts between an agricultural and non-agricultural use, buyers of properties adjacent to the northern property boundary should receive notice through the title report that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-To-Farm Ordinance; this notification would be consistent with General Plan Policy AG-4.

The proposed uses are permitted with approval of the Zoning Ordinance Amendment to adopt the Cordova Hills SPA, will not convert Unique farmland outside of the USB to urban uses, and the land does not support intensive agricultural investment. Though there are soils that are considered prime when irrigated, the site is not irrigated. The Project will not result in substantial conflicts with existing agricultural use of adjacent lands, though mitigation requiring deed notices is recommended. For the foregoing reasons, impacts are *less than significant*.

MITIGATION MEASURES:

AG-1. The applicant shall disclose to all All prospective buyers of properties within 500 feet of the northern property boundary ~~shall receive a recorded notice that would appear in the Title report that they could be subject to inconvenience or discomfort resulting from accepted farming practices as per provisions of the County Right-To-Farm Ordinance~~ **and shall include a Note on all final maps disclosing the Right-To-Farm Ordinance.**

IMPACT: CONFLICT WITH WILLIAMSON ACT CONTRACT

There is one existing Williamson Act Contract (72-AP-109) within the Project limits (see Plate AR-4 above). The contract was initiated on February 23, 1972 and encompasses approximately 480 acres on APN 073-0040-024. The landowner initiated the non-renewal process for this contract in February 2007. Under the nonrenewal process the contract will expire in the year 2016, and the land will no longer be subject to Williamson Act contract restrictions.

The Project proposal includes a large-lot subdivision map which would create parcels that range from less than an acre in size to approximately 35 acres. Pursuant to the Subdivision Map Act, subdivision maps involving parcels less than 40 acres in size cannot be approved on contracted lands except in two cases: the contract is three years from nonrenewal or if findings are made. As to the former, the on-site contract will expire in 2016, which would allow approval of subdivision maps within the contracted area beginning in 2013. In the case of findings, Section 66474.4 of the Subdivision Map Act states that the Board of Supervisors must find either that:

- (1) The parcels can nevertheless sustain an agricultural use permitted under the contract, or are subject to a written agreement for joint management pursuant to Section 51230.1, provided that the parcels which are jointly managed total at least 10 acres in size in the case of prime agricultural land or 40 acres in size in the case of land which is not prime agricultural land.
- (2) One of the parcels contains a residence and is subject to Section 428 of the Revenue and Taxation Code; the residence has existed on the property for at least five years; the landowner has owned the parcels for at least 10 years; and the remaining parcels shown on the map are at least 10 acres in size if the land is prime agricultural land, or at least 40 acres in size if the land is not prime agricultural land.

The Project proposal includes changing the General Plan land use designation of the contracted land from General Agriculture to non-agricultural uses (Low Density Residential, Medium Density Residential, Commercial and Offices, Recreation, and Natural Preserve). The Project also includes a rezone from AG-80 to SPA. This rezone is also required in order to subdivide the property as proposed. While the Williamson Act states that a contract cannot be initiated unless the land is located within an area designated as an "agricultural preserve", it does not address whether the zoning or other land use designations of contracted land can be amended during the contract life. Though not addressed by the Williamson Act, the text of contract 72-AP-109 states "It

is the intent of this Board that all land within this Preserve be zoned to the AG-80 Exclusive Agricultural Zone.” On this basis, it would appear that rezoning the land prior to 2016 would conflict with the Williamson Act contract. The applicant has proposed that the Board of Supervisors approve the rezone, but stipulate that the zoning agreement will not become effective until 2016.

Though the zoning agreement would be in abeyance until 2016, the approval of this agreement could result in the discontinuation of grazing activities during the interim period. To prevent this circumstance, mitigation has been included which requires that grazing be continued on the contracted land until the contract expires.

The Agricultural Commissioner’s office was contacted for comment. The Agricultural Commissioner (F. Carl) provided the following comment:

“The proposed site is not prime agricultural land and has been used for grazing. Proposed development on less than prime agriculture land that is contiguous with existing urban development is preferred over other possible alternatives. To my knowledge there are no intensive agricultural uses adjacent to the project that will be significantly impacted. Cancellation of the contracts is preferred since the properties are clearly being planned for development; therefore the tax benefit of an agricultural conservation easement should not be continued.”

Though the Agricultural Commissioner has indicated a preference for contract cancellation, this is not required in order to be consistent with the Williamson Act. According to the Department of Conservation:

“A Williamson Act contract is an enforceable restriction pursuant to Article 13, section 8 of the California Constitution and §51252. Williamson Act contracts are not intended to be cancelled and in fact, cancellation is reserved for unusual, "emergency" situations. Therefore, the nine-year nonrenewal process has been identified as the legally preferred method for terminating a Williamson Act contract.”

If the Board of Supervisors makes appropriate findings pertinent to the subdivision proposal and defers the effective date of the rezone until contract expiration, and grazing is continued until contract expiration, the Project will not result in significant conflicts with the Williamson Act. Following the outlined procedures is consistent with the Williamson Act provisions; impacts are *less than significant*.

MITIGATION MEASURES:

AG-2. The applicant shall enter into an agreement with an agricultural operator to maintain grazing use, or other more intensive use, on the land which is subject to Williamson Act contract 72-AP-109. Agricultural use shall be maintained until Williamson Act contract expiration. Documentation of this agreement shall be

submitted to the Environmental Coordinator prior to approval of the zoning agreement for the Williamson Act contracted property.

IMPACT: CONVERT PROTECTED FARMLAND TO NON-AGRICULTURAL USES

According to the Sacramento County Important Farmland Map published by the California Department of Conservation, the Project site is mostly Grazing Land with a small patch of Unique Farmland in the southwest quadrant of the site (see Plate AR-2 and Plate AR-3 above). Based on Policy AG-5, the Project will result in impacts to the farmland located outside of the USB in the southwestern corner of the site (which is Grazing Land and Unique Farmland), and to the remaining portion of the Unique Farmland which is within the USB. The area outside of the USB is 251 acres, approximately 247 acres of which is Grazing Land, and the remainder of which is Unique Farmland. The total size of the Unique Farmland, both inside and outside of the USB, is 8.6 acres, which brings the total mitigation requirement to 255.6 acres. Aerial and field investigations revealed that the Unique Farmland area historically consisted of a eucalyptus grove, though it is no longer present and the land may be reclassified as a different farmland category during the next mapping cycle. With mitigation, impacts related to the conversion of farmland are *less than significant*.

MITIGATION MEASURE:

- AG-3.** Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, the applicant shall offset the loss of 8.6 acres of Unique Farmland and 247 acres of Grazing Land through 1:1 preservation of farmland within a permanent conservation easement. Preservation land must be in-kind or of similar resource value.

5 AIR QUALITY

INTRODUCTION

This section assesses the potential air quality effects caused by stationary, mobile, and area sources related to construction and operation of the Project. This section also describes the climate in the Project area; existing air quality conditions in the Project area for criteria air pollutants and toxic air contaminants; odors; and applicable federal, state, and regional air quality standards.

SETTING

LOCATION, CLIMATE AND ATMOSPHERIC CONDITIONS

The Cordova Hills Project site consists of approximately 2,669 acres located immediately east of Grant Line Road and south of Glory Lane in the southeastern portion of Sacramento County, at the southern end of the Sacramento Valley Air Basin. The Sacramento Valley Air Basin is bound by the North Coast Ranges to the west and the Sierra Nevada Mountains to the east. Hot, dry summers and mild, rainy winters characterize the Mediterranean climate of the Sacramento Valley. Throughout the year, the temperature may range from a low of 20 degrees Fahrenheit to a high of 110 degrees, with summer highs usually in the 90s and winter lows occasionally below freezing. Average annual rainfall is about 20 inches, with very rare snowfall. The prevailing winds are moderate in strength and vary from moist breezes from the south to dry land flows from the north. Winds within the Project area are predominantly from the south.

The mountains surrounding the Sacramento Valley create a barrier to airflow, which can trap air pollutants in the valley when meteorological conditions are right and a temperature inversion exists. The situation of having warm air on top of cooler air is referred to as a temperature inversion, because the temperature profile of the atmosphere is "inverted" from its usual state.¹ The highest frequency of air stagnation occurs in the autumn and early winter, when large high-pressure cells lie over the valley. The lack of surface wind during these periods and the reduced vertical flow caused by less surface heating reduces the influx of outside air and allows air pollutants to become concentrated in the air. The surface concentrations of pollutants are highest

¹ National Oceanic and Atmospheric Administration
<http://www.wrh.noaa.gov/slc/climate/TemperatureInversions.php>. Accessed November 8, 2010

when these conditions are combined with smoke from agricultural burning or when temperature inversions trap cool air, fog, and pollutants near the ground.

The ozone (O₃) season (May through October) in the Sacramento Valley is characterized by stagnant air or light winds, with the delta sea breeze arriving in the afternoon out of the southwest. Usually, the evening breeze transports the airborne pollutants to the north, out of the Valley. During about half of the days from July to September, however, a phenomenon called the “Schultz Eddy” prevents this from occurring. Instead of allowing for the prevailing wind patterns to move north, carrying the pollutants out of the Valley, the Schultz Eddy causes the wind pattern to circle back south. This phenomenon’s effect exacerbates the pollution levels in the area and increases the likelihood of violating federal or state standards.² The Schultz Eddy normally dissipates around noon, when the delta sea breeze arrives.

AIR POLLUTANTS AND AMBIENT AIR QUALITY STANDARDS

The Clean Air Act, which was last amended in 1990, requires the Environmental Protection Agency (EPA) to set National Ambient Air Quality Standards (NAAQS) for pollutants considered harmful to public health and the environment. The Clean Air Act established two types of national air quality standards: primary and secondary standards. Primary standards set limits to protect public health, including the health of “sensitive” populations, such as asthmatics, children, and the elderly. Typically, primary pollutants are substances directly emitted from a process, such as ash from a volcanic eruption or carbon monoxide gas emitted from a motor vehicle exhaust. Secondary standards set limits to protect public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings. Secondary pollutants are not emitted directly; they form in the air when primary pollutants react or interact to create substances, such as ground-level ozone, which is a component of photochemical smog.

The EPA Office of Air Quality Planning and Standards (OAQPS) has set NAAQS for six principal pollutants, which are called “criteria” pollutants. Criteria air pollutants are a group of pollutants for which federal or state regulatory agencies have adopted ambient air quality standards. Federal criteria pollutants include ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, particulate matter less than 10 and 2.5 microns in diameter, and lead. State-designated criteria pollutants also include visibility-reducing particles, sulfates, and hydrogen sulfide.³ Criteria air pollutants are classified in each air basin, county, or, in some cases, within a specific urbanized area. The classification is determined by comparing actual monitoring data with state and federal standards. If a pollutant concentration is lower than the standard, the area is classified as in “attainment” for that pollutant. If an area exceeds the standard, the area is classified as in “non-attainment” for that pollutant. If there are not enough data available to

<http://www.airquality.org/ceqa/cequguideupdate/Ch1IntroAQFINAL.pdf>. Accessed November 8, 2010

³EPA; <http://www.epa.gov/air/criteria.html>. Accessed November 9, 2010

determine whether the standard is exceeded in an area, the area is designated “unclassified.” Sacramento County is designated as nonattainment areas for national and state ambient air quality standards (AAQS) for ozone, PM₁₀ and PM_{2.5}. The County was designated in attainment or unclassified for all remaining pollutants.⁴ The main criteria pollutants are described below.

Ozone (O₃) is not usually emitted directly into the air, but is created at ground level by a chemical reaction between oxides of nitrogen (NO_x) and volatile organic compounds (VOC) in the presence of sunlight. **The United States Environmental Protection Agency formerly called VOC reactive organic gases, or ROG – the latter term is still in use in most modeling programs and by the Sacramento Metropolitan Air Quality Management District. The term ROG is used throughout this document.** Ozone has the same chemical structure whether it occurs miles above the earth or at ground level. In the earth's lower atmosphere, ground-level ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and can cause substantial damage to vegetation and other materials. Motor vehicle exhaust and industrial emissions, gasoline vapors, and chemical solvents, as well as natural sources, emit NO_x and VOC **ROG** that help form ozone. Ground-level ozone is the primary constituent of smog. Sunlight and hot weather cause a chemical reaction between ozone precursors and increase the levels of ozone to potentially harmful concentrations. As a result, it is known as a summertime air pollutant. Many urban areas tend to have high levels of ground-level ozone, but even rural areas are subject to increased ozone levels because wind carries ozone and the pollutants that form it hundreds of miles away from their original sources.

Carbon Monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes about 56 percent of all CO emissions nationwide. Other sources of CO emissions include industrial processes such as metals processing and chemical manufacturing, residential wood burning, and natural sources such as forest fires. The highest levels of CO in the outside air typically occur during the colder months of the year when inversion conditions are more frequent. The air pollution becomes trapped near the ground beneath a layer of warm air.

Particulate Matter (PM₁₀ and PM_{2.5}) is a complex mixture of extremely small particles and liquid droplets. Particle pollution is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. The size of particles is directly linked to their potential for causing health problems. EPA is concerned about particles that are 10 micrometers in diameter or smaller because those are the particles that generally pass through the throat and nose and enter the lungs. EPA groups particle pollution into two categories:

⁴ Sacramento Metropolitan Air Quality Management District.
<http://www.airquality.org/aqdata/attainmentstat.shtml> Accessed: June 27, 2011.

"Inhalable coarse particles," such as those found near roadways and dusty industries, are larger than 2.5 micrometers and smaller than 10 micrometers in diameter.

"Fine particles," such as those found in smoke and haze, are 2.5 micrometers in diameter and smaller. These particles can be directly emitted from sources such as forest fires, or they can form when gases emitted from power plants, industries, and automobiles react in the air.

Nitrogen Dioxide (NO₂) is one in a group of highly reactive gasses known as nitrogen oxides (NO_x). Other nitrogen oxides include nitrous acid and nitric acid. While EPA's NAAQS covers this entire group of NO_x, NO₂ is the component of greatest interest and the indicator for the larger group of nitrogen oxides. NO₂ forms quickly from emissions from cars, trucks and buses, power plants, and off-road equipment. In addition to contributing to the formation of ground-level ozone and fine-particle pollution, NO₂ is linked to a number of adverse effects on the respiratory system.

Sulfur Dioxide (SO₂) is one of a group of highly reactive gasses known as oxides of sulfur. The largest sources of SO₂ emissions are from fossil fuel combustion at power plants (73%) and other industrial facilities (20%). Smaller sources of SO₂ emissions include industrial processes such as extracting metal from ore, and the burning of high sulfur-containing fuels by locomotives, large ships, and non-road equipment.

Lead (Pb) is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. As a result of EPA's regulatory efforts to remove lead from gasoline, emissions of lead from the transportation sector declined by 95 percent between 1980 and 1999, and levels of lead in the air decreased by 94 percent during the same time period. Today, the highest levels of lead in air are usually found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.⁵

Exposure to these pollutants is associated with numerous effects on human health, including increased respiratory symptoms, hospitalization for heart or lung diseases, and even premature death. Health effects of the main criteria pollutants are shown below in Table AQ-1.

⁵ <http://www.epa.gov/airquality/urbanair/>. Accessed November 9, 2010

Table AQ-1: Health Effects of Main Criteria Pollutants

Pollutant	Adverse Effects
Ozone	<ul style="list-style-type: none"> ▪ Ozone can irritate lung airways and cause inflammation. Other symptoms include wheezing, coughing, and breathing difficulties during exercise or outdoor activities. People with respiratory problems are most vulnerable, but even healthy people that are active outdoors can be affected when ozone levels are high. ▪ Repeated exposure to ozone pollution for several months may cause permanent lung damage. ▪ Even at very low levels, ground-level ozone triggers a variety of health problems including aggravated asthma, reduced lung capacity, and increased susceptibility to respiratory illnesses like pneumonia and bronchitis. ▪ Ground-level ozone interferes with the ability of plants to produce and store food, which makes them more susceptible to disease, insects, other pollutants, and harsh weather. ▪ Ozone reduces crop and forest yields and increases plant vulnerability to disease, pests, and weather.
Carbon Monoxide	<ul style="list-style-type: none"> ▪ The health threat from lower levels of CO is most serious for those who suffer from heart disease. For a person with heart disease, a single exposure to CO at low levels may cause chest pain and reduce that person's ability to exercise; repeated exposures may contribute to other cardiovascular effects. ▪ Healthy people can be affected by high levels of CO as well. People who breathe high levels of CO can develop vision problems, reduced ability to work or learn, reduced manual dexterity, and difficulty performing complex tasks. At extremely high levels, CO is poisonous and can cause death. ▪ CO contributes to the formation of ground-level ozone, which can trigger serious respiratory problems.
Particulate Matter	<ul style="list-style-type: none"> ▪ Particle pollution, especially fine particles, contains microscopic solids or liquid droplets that are so small that they can get deep into the lungs and cause serious health problems. Numerous scientific studies have linked particle pollution exposure to a variety of problems, including: increased respiratory symptoms, such as irritation of the airways, coughing, or difficulty breathing; decreased lung function, aggravated asthma, development of chronic bronchitis; irregular heartbeat, nonfatal heart attacks; and premature death. ▪ Particles can be carried over long distances by wind and then settle on ground or water. The effects of this settling include: making lakes and streams acidic; changing the nutrient balance in coastal waters and large river basins; depleting the nutrients in soil; damaging sensitive forests and farm crops; and affecting the diversity of ecosystems.
Nitrogen Dioxide	<ul style="list-style-type: none"> ▪ One of the main ingredients involved in the formation of ground-level ozone, which can trigger serious respiratory problems. ▪ Reacts to form nitrate particles, acid aerosols, as well as NO₂, which also cause respiratory problems. ▪ Contributes to formation of acid rain; to nutrient overload that deteriorates water quality; and to atmospheric particles that cause visibility impairment. ▪ Reacts to form toxic chemicals.
Sulfur Dioxide	<ul style="list-style-type: none"> ▪ SO₂ causes a wide variety of health and environmental impacts because of the way it reacts with other substances in the air. ▪ Peak levels of gaseous SO₂ can cause temporary breathing difficulty for people with asthma who are active outdoors. Longer-term exposures to high levels of SO₂ gas and particles cause respiratory illness and aggravate existing heart disease. ▪ SO₂ reacts with other chemicals in the air to form tiny sulfate particles. When these are breathed, they gather in the lungs and are associated with increased respiratory symptoms and disease, difficulty in breathing, and premature death.
Lead	<ul style="list-style-type: none"> ▪ People, animals, and fish are mainly exposed to lead by breathing and ingesting it in food, water, soil, or dust. Lead accumulates in the blood, bones, muscles, and fat. Infants and young children are especially sensitive to even low levels of lead.

Pollutant	Adverse Effects
	<ul style="list-style-type: none"> ▪ Excessive exposure to lead causes seizures, mental retardation, behavioral disorders, memory problems, and mood changes. Low levels of lead damage the brain and nerves in fetuses and young children, resulting in learning deficits and lowered IQ. ▪ Lead exposure causes high blood pressure and increases heart disease, especially in men. Lead exposure may also lead to anemia.

Toxic Air Contaminants (TACs) are airborne pollutants that may be expected to result in an increase in mortality or serious illness or which may pose a present or potential hazard to human health. TACs are also referred to as toxic air pollutants or hazardous air pollutants. A wide range of sources, from industrial plants, gasoline stations, dry cleaners, automobiles (diesel exhaust), to households emits TACs. Because it is not practical to eliminate all TACs, these compounds are regulated through risk management programs. These programs are designed to eliminate, avoid, or minimize the risk of adverse health effects from exposures to TACs. TACs are known to be highly hazardous to health, even in small quantities.⁶

Both the federal and state governments have established ambient air quality standards for outdoor concentrations of various pollutants in order to protect public health. The federal and state ambient air quality standards have been set at levels where concentrations could be generally harmful to human health and welfare and to protect the most sensitive persons from experiencing health impacts with a margin of safety. Table AQ-2 identifies the federal and state ambient air quality standards that are applicable in California.

EXISTING AIR QUALITY CONDITIONS

The California Air Resources Board (ARB) collects ambient air quality data through a network of air monitoring stations throughout the state. Many of the monitoring stations are part of the state and local air monitoring plans, which collect data on ambient levels of gaseous and particular air pollutants used to determine attainment status.

EMISSION SOURCES

Stationary sources of air pollution near the Project site include A. Teichert & Son Aggregate, Aerojet, Puente Wood Products, Sacramento Rendering Company, Teledyne MEC, Granite Construction, and concrete recycling. There are also hard-rock quarries to the north and east of the site which have either been approved (Teichert Quarry) or are proposed and have a published Draft Environmental Impact Report (Stoneridge Quarry). Mobile sources of air pollution include cars, trucks, buses, motorcycles, off-road equipment, construction activities, and consumer products, as well as gas-powered lawn tools and mowers, farm and construction equipment, recreational vehicles, planes, and trains. Sources of toxic air contaminants include manufacturing facilities, the Kiefer Landfill, and emissions from auto body shops, auto machine shops, dry cleaners, and gas stations. Indirect sources of air pollution, including diesel exhaust, are predominantly from vehicle trips along major thoroughfares in the vicinity of the Project area. There are some existing agriculture uses in the vicinity of the Project site and Mather Airport is located approximately 4.4 miles to the west.

Some individuals are considered to be more sensitive than others to air pollution. Reasons for greater sensitivity can include existing health problems, duration of exposure to air pollutants, or certain peoples' increased susceptibility to pollution-related health problems due to factors such as age.

The ARB issued a guidance document on air quality and land use called *Air Quality and Land Use Handbook: A Community Health Perspective*, which recommends that sensitive land uses not be located within 500 feet of a freeway or other high traffic roadway and that a site-specific health risk assessment be performed as a way to more accurately evaluate the risk for sensitive uses planned within 500 feet of such roads.⁷

MONITORING DATA

The Sacramento Metropolitan Air Quality Management District (SMAQMD) and ARB maintain several air quality monitoring sites in the Sacramento area; however, none are located in Cordova Hills and not all monitoring sites measure all air pollutants. The nearest monitoring site for ozone is at Sloughhouse, and the nearest monitoring site for carbon monoxide, PM_{2.5}, nitrogen dioxide, and sulfur dioxide is at Del Paso Manor at

⁷ <http://www.arb.ca.gov/ch/landuse.htm>. Accessed November 12, 2010

2701 Avalon Dr. in Sacramento. The nearest monitoring site for PM₁₀ is the Sacramento Branch Center Road site, located near Bradshaw Road south of U.S. 50. Based on these monitoring sites, all federal ambient air quality standards have been met in the County, with the exception of ozone, which exceeded the eight-hour average on 24 occasions in 2009. Also, California standards for PM₁₀ and ozone were exceeded in the County in 2007, 2008, and 2009 as shown in Table AQ-3.

Table AQ-3: Exceedance of National and State Air Pollution Standards in the Sacramento Area

Pollutant	2007	2008	2009
OZONE (1-hour)¹			
Highest 1-hour (ppm)	0.097	0.148	0.122
Days>0.09 ppm (State)	2	16	11
OZONE (8-hour)

ADDITIONAL SITE-SPECIFIC AIR QUALITY ISSUES

TOXIC AIR POLLUTANTS

The ARB has identified approximately 200 toxic substances, including those identified by EPA on the California Air Toxic's Program TAC List. Toxic air contaminants are different from the criteria pollutants, in that ambient air quality standards have not been established for toxic air contaminants, largely because there are hundreds of air toxics and their effects on health tend to be local rather than regional. The dose of a TAC to which receptors are exposed is the primary factor used to determine health risk. Duration of exposure, concentration of TAC exposure, and breathing rate in relationship to body size are important factors used in determining health risks. Health effects associated with TACs include cancer, birth defects, neurological damage, genetic damage; or short-term acute effects such as eye watering, respiratory irritation, running nose, throat pain, and headaches. As mentioned above, TACs can be emitted from various common sources such as industrial plants, gasoline stations, dry cleaners, automobiles, and trucks (in the form of diesel exhaust).

ODORS

The issue of odor as a health concern is still a relatively new idea. Merely identifying the hundreds of sources that cause offensive odors poses a big challenge. Odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can cause respiratory complications. Second, the chemicals that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

SENSITIVE RECEPTORS

Sensitive receptors are populations that are more susceptible to the effects of air pollution than is the population at large. While the ambient air quality standards are designed to protect public health and are generally regarded as conservative for healthy adults, there is greater concern to protect adults who are ill or have long-term respiratory problems and young children whose lungs are not fully developed. According to ARB, sensitive receptors include children less than 14 years of age, the elderly over 65 years of age, athletes, and people with cardiovascular and chronic respiratory diseases.

Land uses such as day care centers, primary and secondary schools, hospitals, and convalescent homes are considered to be sensitive receptors to poor air quality because the very young, the old, and the infirm are more susceptible to respiratory infections and other air quality related health problems than the general public. Residential uses are considered sensitive because people in residential areas are often at home for extended periods of time, so they can be exposed to pollutants for extended

periods. Recreational areas are considered moderately sensitive to poor air quality because vigorous exercise associated with recreation places a high demand on human respiratory function.

REGULATORY SETTING

FEDERAL

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY

The EPA is the federal agency responsible for setting and enforcing the federal ambient air quality standards for atmospheric pollutants. The EPA regulates emission sources that are under the exclusive authority of the federal government, such as aircraft, ships, and certain locomotives. The EPA also has jurisdiction over emission sources outside state waters (outer continental shelf), and establishes various emissions standards for vehicles sold in states other than California.

As part of its enforcement responsibilities, the EPA requires each state with non-attainment areas to prepare and submit a State Implementation Plan (SIP) that demonstrates the means to attain the federal standards. The SIP must integrate federal, state, and local plan components and regulations to identify specific measures to reduce pollution in non-attainment areas, using a combination of performance standards and market-based programs.

FEDERAL CLEAN AIR ACT

The Clean Air Act (CAA) of 1970 and the CAA Amendments of 1971 required the EPA to establish NAAQS with states retaining the option to adopt more stringent standards or to include other specific pollutants. These standards are the levels of air quality considered, with an adequate margin of safety, to protect the public health and welfare. They are designed to protect those “sensitive receptors” most susceptible to further respiratory distress such as asthmatics, the elderly, very young children, people already weakened by other disease or illness, and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

Current NAAQS and area attainment status is discussed under Regional and Local Air Quality above. The CAA and its subsequent amendments require each state to prepare a SIP. The CAA Amendments dictate that states containing areas violating the NAAQS revise their SIPs to include extra control measures to reduce air pollution. The SIP includes strategies and control measures to attain the NAAQS by deadlines established by the CAA. The SIP is periodically modified to reflect the latest emissions inventories, plans, and rules and regulations of air basins as reported by the agencies with

jurisdiction over them. The EPA has the responsibility to review all SIPs to determine if they conform to the requirements of the CAA.

STATE

CALIFORNIA AIR RESOURCES BOARD

ARB, a part of the California EPA (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, the ARB conducts research, sets California Ambient Air Quality Standards (CAAQS), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. The ARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. The ARB has primary responsibility for the development of California's SIP, for which it works closely with the federal government and the local air districts.

In addition to standards set for the six criteria pollutants, the state has set standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles. These standards are designed to protect the health and welfare of the populace with a reasonable margin of safety. Further, the state has established a set of episode criteria for ozone, carbon monoxide, sulfur dioxide, nitrogen dioxide, and particulate matter. These criteria refer to episode levels representing periods of short-term exposure to air pollutants that actually threaten public health. The attainment status of the CAAQS for the Project area is discussed under Air Pollutants and Ambient Air Quality Standards, above.

CALIFORNIA CLEAN AIR ACT

The CCAA of 1988 requires non-attainment areas to achieve and maintain the CAAQS by the earliest practicable date and local air districts to develop plans for attaining the state ozone, carbon monoxide, sulfur dioxide, and nitrogen dioxide standards. The CCAA also requires that by the end of 1994 and once every three years thereafter, the air districts are to assess their progress toward attaining the air quality standards. The triennial assessment is to report the extent of air quality improvement and the amounts of emission reductions achieved from control measures for the preceding three-year period.

THE AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT

California Health and Safety Code Section 44300 et seq., provides for the regulation of over 200 air toxics and contain the primary air contaminant legislation in the state. Under the Act, local air districts may request that a facility account for its TAC emissions. Local air districts then prioritize facilities on the basis of emissions, and high-priority designated facilities are required to submit a health risk assessment and

communicate the results to the affected public. The TAC control strategy involves reviewing new sources to ensure compliance with required emission controls and limits, maintaining an inventory of existing sources of TACs, and developing new rules and regulations to reduce TAC emissions. The purpose of AB 2588 is to identify and inventory toxic air emissions and to communicate the potential for adverse health effects to the public.

On November 16, 2006, the Air Resources Board adopted amendments to the AB 2588 Air Toxics "Hot Spots" Emission Inventory Criteria and Guidelines Regulation (Title 17, California Code of Regulations, Section 93300.5) that will accommodate stationary diesel engines in the "Hot Spots" Program.

ASSEMBLY BILL 1807

AB 1807, enacted in September 1983, sets forth a procedure for the identification and control of TACs in California. AB 1807 defines a TAC as an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health. The ARB prepares identification reports on candidate substances under consideration for listing as TACs. The reports and summaries describe the use of and the extent of emissions in California resulting in public exposure, together with their potential health effects.

In 1998, the ARB identified diesel particulate matter (DPM) as a toxic air contaminant under the AB 1807 program. DPM is emitted into the air via heavy-duty diesel trucks, construction equipment, and passenger cars. In October 2000, the ARB released a report entitled Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles. This plan identifies DPM as the predominant TAC in California and proposes methods for reducing diesel emissions.

LOCAL

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT.

The SMAQMD was created by state law to enforce local, state, and federal air pollution regulations within the Sacramento Valley Air Basin. The SMAQMD's overall mission is to achieve clean air goals by leading the Sacramento region in protecting public health and the environment through effective programs, community involvement, and public education. The SMAQMD interacts with local, state, and federal government agencies, the business community, environmental groups, and private citizens to achieve these goals. The SMAQMD regulates air pollutant emissions from stationary sources through permit limitations and inspection programs and oversees compliance with state and federal mandates by adopting rules and regulations as necessary.

Because the Sacramento Valley Air Basin is in nonattainment for ozone, PM₁₀, and PM_{2.5}, the SMAQMD requires the implementation of the following Basic Construction Emission Control Practices (BCECPs), regardless of the project's significance determination under CEQA.

- Water all exposed surfaces two times daily. Exposed surfaces include, but are not limited to, soil piles, graded areas, unpaved parking areas, staging areas, and access roads;
- Cover or maintain at least two feet of free board space on haul trucks transporting soil, sand, or other loose material on the site. Any haul trucks that would be traveling along freeways or major roadways should be covered;
- Use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day. Use of dry power sweeping is prohibited;
- Limit vehicle speeds on unpaved roads to 15 miles per hour (mph);
- All roadways, driveways, sidewalks, and parking lots to be paved should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used;
- Minimize idling time by either shutting equipment off when not in use or reducing time of idling to 5 minutes. Provide clear signage that posts this requirement for workers at the entrances to the site; and
- Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determine to be running in proper condition before it is operated.

If implementation of BCECPs does not reduce construction emissions to below the regulatory thresholds, the following Enhanced Construction Emission Control Practices (ECECPs) should be included to further reduce project NO_x, PM₁₀, and PM_{2.5} emissions.

- The project shall provide a plan for approval by the District demonstrating that the heavy-duty (50 horsepower or more) off-road vehicles to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project wide fleet-average 20% NO_x reduction and a 45% particulate reduction compared to the most recent ARB fleet average. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available;
- The project shall ensure that emissions from all off-road, diesel-powered equipment used on the project site do not exceed 40% opacity for more than three minutes in any one hour. Any equipment found to exceed 40 percent opacity shall be repaired immediately, and the lead agency and District shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least weekly, and a monthly summary shall include the quantity and type of vehicles surveyed, as well as the dates of each survey;
- If, at the time of construction, the District has adopted a regulation applicable to construction emissions, compliance with the regulation may completely or

partially replace this regulation. Consultation with the District prior to construction will be necessary to make this determination;

- Water exposed soil with adequate frequency for continued moist soil. However, do not overwater to the extent that sediment flows off the site;
- Suspend excavation, grading, and/or demolition activities when wind speeds exceed 20 mph;
- Install wind breaks (e.g., plant trees, solid fencing) on windward sides of construction areas;
- Plant vegetative ground cover (fast-germinating native grass seed) in disturbed areas as soon as possible. Water appropriately until vegetation is established;
- Install wheel washers for all exiting trucks, or wash off all trucks and equipment leaving the site;
- Treat site access to a distance of 100 feet from the paved road with a 6- to 12-inch layer of wood chips, mulch, or gravel to reduce generation of road dust and road dust carryout onto public roads; and
- Post a publicly visible sign with the telephone number and person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The phone number of the District shall also be visible to ensure compliance.

The SMAQMD issued its *2009 Triennial Report* in December of 2009, which identifies “all feasible measures” the SMAQMD would study or adopt over the ensuing three years to make progress toward attainment of state ozone standards. The measures include additional control programs for mobile and stationary sources, land use and transportation programs, community education programs, and ozone transport mitigation in order to reduce NO_x and ROG emissions in order to achieve the state ozone standard. The SMAQMD anticipates an additional reduction in NO_x and ROG emissions of 1.68 tons per day and 1.32 tons per day, respectively, with the implementation of the *2009 Triennial Report and Plan Revision*. In addition to the Triennial Report, ARB requires the SMAQMD to prepare an annual progress report. The *2007 Annual Progress Report*, the most recent, adopted in October 2008, provides updates for all the proposed SMAQMD control programs, the schedule for adopting control measure commitments, and the evaluation of further study measures.

2030 SACRAMENTO COUNTY GENERAL PLAN

The General Plan includes the following policies that pertain to air quality:

AQ-1. New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.

- AQ-2. Support Regional Transit's efforts to secure adequate funding so that transit is a viable transportation alternative. Development shall pay its fair share of the cost of transit facilities required to serve the project.
- AQ-3. Buffers and/or other appropriate mitigation shall be established on a project-by-project basis and incorporated during review to provide for protection of sensitive receptors from sources of air pollution or odor. The California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective", and the AQMD's approved Protocol (Protocol for Evaluating the Location of Sensitive Land uses Adjacent to Major Roadways) shall be utilized when establishing these buffers.
- AQ-4. Developments which meet or exceed thresholds of significance for ozone precursor pollutants as adopted by the Sacramento Metropolitan Air Quality Management District (SMAQMD), shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by the Sacramento Metropolitan Air Quality Management District.
- AQ-5. Reduce emissions associated with vehicle miles travelled and evaporation by reducing the surface area dedicated to parking facilities; reduce vehicle emissions associated with "hunting" for on-street parking by implementing innovative parking solutions including shared parking, elimination of minimum parking requirements, creation of maximum parking requirements, and utilize performance pricing for publicly owned parking spaces both on- and off-street, as well as creating parking benefit districts.
- AQ-8. Promote mixed-use development and provide for increased development intensity along existing and proposed transit corridors to reduce the length and frequency of vehicle trips.
- AQ-10. Encourage vehicle trip reduction and improved air quality by requiring development projects that exceed the SMAQMD's significance thresholds for operational emissions to provide on-going, cost-effective mechanisms for transportation services that help reduce the demand for existing roadway infrastructure.
- AQ-16. Prohibit the idling of on-and off-road engines when the vehicle is not moving or when the off-road equipment is not performing work for a period of time greater than five minutes in any one-hour period.
- AQ-17. Promote optimal air quality benefits through energy conservation measures in new development.
- AQ-19. Require all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects.

- AQ-20. Promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits by encouraging four main strategies including, but not limited to: plant trees, selective use of vegetation for landscaping, install cool roofing, and install cool pavements.
- AQ-21. Support SMAQMD's particulate matter control measures for residential wood burning and fugitive dust.
- EN-5. Reduce travel distances and reliance on the automobile and facilitate increased use of public transit through appropriate land use plans and regulations.
- CI-40. Whenever possible, the applicant/developer of new and infill development projects shall be conditioned to fund, implement, operate and/or participate in TSM programs to manage travel demand associated with the project.
- CI-41. Consider TSM programs that increase the average occupancy of vehicles and divert automobile commute trips to transit, walking, and bicycling.
- CI-43. The County shall promote transit-supportive programs in new development, including employer-based trip-reduction programs (employer incentives to use transit or non-motorized modes), "guaranteed ride home" for commute trips, and car-share or bike-share programs.
- CI-67. When feasible, incorporate lighter colored (higher albedo) materials and surfaces, such as lighter-colored pavements, and encourage the creation of tree canopy to reduce the built environment's absorption of heat to reduce the urban "heat island" effect.
- HM-12. Continue the effort through the Sacramento Metropolitan Air Quality Management District (AQMD) to inventory and reduce toxic air contaminants as emission standards are developed.
- LU-27. Provide safe, interesting and convenient environments for pedestrians and bicyclists, including inviting and adequately-lit streetscapes, networks of trails, paths and parks and open spaces located near residences, to encourage regular exercise and reduce vehicular emissions.
- LU-37. Provide and support development of pedestrian and bicycle connections between transit stations and nearby residential, commercial, employment or civic uses by eliminating physical barriers and providing linking facilities, such as pedestrian overcrossings, trails, wide sidewalks and safe street crossings.
- LU-39. Support implementation of the ADA Transitional Plan and the Pedestrian Master Plan to create a network of safe, accessible and appealing pedestrian facilities and environments.

- LU-40. Employ appropriate traffic calming measures in areas where pedestrian travel is desirable but made unsafe by a high volume or excessive speed of automobile traffic. Preference shall be given to measures that slow traffic and improve pedestrian safety while creating the least amount of conflict with emergency responders.
- LU-42. Master planning efforts for new growth areas shall provide for separated sidewalks along all arterials and thoroughfares to make walking a safer and more attractive transportation option.
- PF-21. Property buffering the County landfill shall remain in agricultural, recreational or other open space uses and extend at least 2,000 feet in all directions, measured from the landfill's permitted boundary, unless the Department of Waste Management and Recycling determines that the use is compatible with landfill operations and the Board of Supervisors makes the finding that the uses are compatible with the existing or future operations of the landfill.

SIGNIFICANCE CRITERIA

A project may be deemed to have a significant effect on the environment if it will violate any ambient air quality standard, contribute substantially to an existing or projected air quality violation, conflict or obstruct the implementation of applicable air quality plans, or expose sensitive receptors to substantial pollutant concentrations. SMAQMD has adopted significance thresholds for CEQA projects within the District, as published in the SMAQMD's *Guide to Air Quality Assessment in Sacramento County* (SMAQMD Guide). The adopted significance thresholds for criteria pollutants of the greatest concern in the Sacramento area (those for which the region is in non-attainment) include the following:

- Short-term (construction) emissions of NO_x above 85 pounds per day;
- Long-term (operational) emissions of NO_x or ROG above 65 pounds per day;
- PM₁₀ concentrations equal to or greater than five percent of the state ambient air quality standard (i.e., 50 micrograms/cubic meter (µg/m³) for 24 hours) at off-site receptors. The SMAQMD holds that if project emissions of NO_x and ROG are below 65 pounds per day then the project would not threaten violations of the PM₁₀ AAQS;
- CO concentrations that exceed the 1-hour state ambient air quality standard (i.e., 20.0 ppm) or the 8-hour state ambient standard (i.e., 9.0 ppm);
- TAC exposures that create a risk of 10 in 1 million for stationary sources;
- A substantial increase to the risk of exposure to TACs from mobile sources;

The CEQA Guidelines Appendix G indicates that a Project should be analyzed to determine whether objectionable odors would be created which would affect a substantial number of people. Numeric thresholds for odor impacts have not been established by the SMAQMD; however, the air district recommends that several factors be taken into account when determining the significance of a potential odor impact. For the purposes of this report, the following were considered when making a determination as to whether a substantial number of people would be affected by objectionable odors:

- The nature of the odor source is typically considered objectionable and offensive to most individuals;
- The buffer zone, in conjunction with meteorology, is insufficient to mitigate for source odors;
- Area meteorology increases the potential for odor impacts; and/or
- There are a substantial number of odor complaints for an existing odor source.

The SMAQMD states that a project's contribution to impacts would be considered to be cumulatively considerable if:

- There is a net increase of any criteria pollutant for which the project area is in non-attainment under an applicable federal or state ambient air quality standard (including the release of emissions that exceed quantitative thresholds for ozone precursors).

METHODOLOGY

CONSTRUCTION IMPACT METHODOLOGY

DETERMINATION OF CONSTRUCTION NO_x IMPACTS

Emissions of NO_x from construction activities are generated from the operation of heavy equipment. Proposed Project-generated construction emissions of NO_x were calculated through URBEMIS 2007 version 9.2.4 (URBEMIS), using the construction phasing plan provided by MacKay & Soms⁸ and follows the methodologies included in the SMAQMD's Guide to Air Quality Assessment in Sacramento County. For projects that exceed NO_x thresholds with the inclusion of the BCECP, the SMAQMD recommends the implementation of EECs (a full account of these measures is included in Appendix AQ-1); these are considered to be the feasible available measures.

⁸ MacKay & Soms Phasing Plan, November 2010.

DETERMINATION OF CONSTRUCTION PM_{10} AND $PM_{2.5}$ IMPACTS

The SMAQMD recommends that construction emissions of PM_{10} be addressed as a localized pollutant. Further, because $PM_{2.5}$ is a subset of PM_{10} , the District assumes that construction projects not exceeding thresholds for PM_{10} would also not exceed thresholds for $PM_{2.5}$. Dispersion modeling by the SMAQMD indicates that if projects implement all of the Basic Construction Emission Control Practices (BCECP) and do not exceed 15 acres of active grading at any one time, that particulate matter emissions will be less than significant. Any project which exceeds this amount of grading is assumed to exceed the significance threshold of $50 \mu\text{g}/\text{m}^3$. The Project was evaluated using the above screening criteria and the Project-specific construction phasing provided by MacKay and Soms.

OPERATIONAL IMPACT METHODOLOGY

DETERMINATION OF OPERATIONAL NO_x AND ROG EMISSIONS

Most of the ozone precursor emissions from the Project result from mobile and area sources. Mobile sources include motor vehicle traffic, while area sources include pollutants generated from furnaces, water heaters/boilers, facility maintenance equipment, and consumer products. Project-generated NO_x and ROG emissions were calculated through URBEMIS, with the model estimates adjusted to reflect the trip rates defined by the Project-specific traffic study. Emissions reductions ~~were accomplished~~ **were calculated** through the production of an Air Quality Management Plan⁹ (AQMP), which ~~was~~ **is** designed to achieve a minimum 35% emissions reduction **at full build-out of the Project** (per guidance from SMAQMD, indicating that this represents the feasible mitigation that should be applied). The AQMP is included as Appendix AQ-2.

DETERMINATION OF OPERATIONAL CO EMISSIONS

Emissions and ambient concentrations of CO have decreased dramatically with the increase in vehicle efficiencies and emission-control feature effectiveness. Although the Basin is designated as an attainment area by both ARB and the EPA, elevated localized concentrations of CO still warrant consideration with respect to environmental analysis. Occurrences of localized “hot spots” are typically associated with heavy traffic congestion occurring at signalized intersections of high-volume roadways. The SMAQMD recommends two methods for analyzing CO concentrations: a screening level analysis and dispersion modeling. The Project was evaluated using the below screening criteria and the traffic and Level of Service (LOS) information from the Project traffic study.

⁹ William Hezmalhalch Architects, Inc., Cordova Hills Operational Air Quality Management Plan, January 24, 2011.

SCREENING CRITERIA FOR CARBON MONOXIDE HOTSPOTS

The SMAQMD screening criteria are divided into two tiers, developed to help lead agencies analyze potential CO impacts when site-specific CO dispersion modeling may not be warranted. This two-tiered approach provides a conservative indication of the potential for project-generated vehicle trips to result in the exceedance of significance thresholds. According to the First Tier of the SMAQMD Screening Criteria, a project would be less than significant for local CO emissions if:

- Traffic generated by the Project would not result in deterioration of intersection LOS to LOS E or F; or
- The project would not contribute additional traffic to an intersection that already operates at LOS E or F.

If the first screening level tier is not met, the Project would be considered less than significant if it meets all of the following:

- The project would not result in an affected intersection experiencing more than 31,600 vehicles per hour;
- The project would not contribute traffic to a tunnel, parking garage, bridge underpass, urban street canyon, or below-grade roadway, or other locations where horizontal or vertical mixing of air would be substantially limited; and
- The mix of vehicle types at the intersection is not anticipated to be substantially different from the County average.

TOXIC AIR CONTAMINANTS

The ARB indicates that one of the highest public health priorities is the reduction of diesel particulate matter (DPM) generated by vehicles on California's highways, as it is one of the primary TACs. Other potential TAC generators within the County of Sacramento are associated with specific types of facilities, such as dry cleaners, gas stations, and chrome plating facilities, and are the focus of ARB's control efforts. ARB has made specific recommendations with respect to considering existing sensitive uses when siting new TAC-emitting facilities or with respect to TAC-emitting sources when siting sensitive receptors. ARB¹⁰ recommends that following buffer distances be observed when locating TAC emitters or sensitive land uses:

- Freeways or major roadways – 500 feet;
- Dry cleaners using perchloroethylene – 500 feet;
- Auto body repair services – 500 feet;

¹⁰ ARB *Air Quality and Land Use Handbook—A Community Health Perspective* April 2005.

- Gasoline dispensing stations with an annual throughput of less than 3.6 million gallons – 50 feet;
- Gasoline dispensing stations with an annual throughput at or above 3.6 million gallons – 300 feet;
- Other TAC sources including furniture manufacturing and repair services that use methylene chloride or other solvents identified as a TAC – 300 feet;
- Distribution centers with more than 100 trucks per day; more than 40 trucks with operating transport refrigeration units per day; or where transport refrigeration unit operations exceed 300 hours per week – 1,000 feet;
- Rail yards for major service and maintenance operations – 1,000 feet;
- Chrome platers – 1,000 feet;
- Port developments should not site the heavily impacted areas immediately upwind of sensitive land uses; and
- Petroleum refineries should not site the heavily impacted areas immediately upwind of sensitive land uses.

Several of the uses in the list above are industrial in nature and would not be permissible in the Project area based on the Project land uses allowed in the SPA. These include chrome platers, rail yards, major distribution centers, and refineries. California regulations prohibit the installation of new perchloroethylene dry cleaning equipment; since there are no existing dry cleaners in the Project area, that item is not relevant. The SMAQMD recommends that site-specific health risk assessments be performed to accurately document potential cancer risk when siting sensitive land uses within the above buffer zones.

For the assessment of significant impacts from exposure to TACs from mobile sources, the SMAQMD has issued the Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways. The Protocol does not establish a threshold of significance for mobile sources, but indicates an evaluation criterion of that level of increased individual risk corresponding to a 70 percent reduction from the highest risk calculated at 50 feet (currently of 276 cases of cancer per million, Sacramento Metropolitan Air Quality Management District 2011). At this level, a Health Risk Assessment is recommended, the results of which should be disclosed in an environmental document.

ODOR IMPACTS

Odiferous compounds can be generated from a variety of sources, including both construction and operational activities and from specific land uses. Land uses that typically generate significant odor impacts include, but are not limited to: wastewater treatment plants, sanitary landfills, composting/green waste facilities; recycling facilities; petroleum refineries, chemical manufacturing plants, painting/coating operations, and food packaging plants.

Thresholds for odor impacts have not been established by the SMAQMD; however, the air district recommends that several factors be taken into account when determining the significance of a potential odor impact. Those parameters include:

- **Nature of the Odor Source:** Odors generated by source types such as wastewater treatment plants, landfills, or rendering plants are typically considered objectionable and offensive to most individuals. Evaluations of the nature of odor sources should include the intensity of the source's operation as well as the time of day and duration of odor emissions.
- **Buffer Zone:** The SMAQMD considers the inclusion of a sufficient buffer zone to be one of the most effective methods to ensure land use compatibility with respect to odors. Distance alone can allow odor emissions to disperse to lower, undetectable levels before reaching receptors. The SMAQMD uses a screening distance of one mile for landfills.

Because the Project site is within one mile of the Kiefer landfill, it is considered to have an increased potential to be impacted by odors from the landfill. A buffer zone that includes dense vegetative cover from trees and shrubs could further reduce the level of the impact by acting as a filter and enabling more vertical or mechanical mixing to occur.

All odor impact discussions should provide the buffer distance and a description of the land features and topography in the buffer zone that separates receptors and the odor source.

- **Meteorology:** Meteorological conditions affect the dispersion of odor emissions, thereby affecting the significance of the impact. The analysis should determine predominant wind direction and the frequency of temperature inversions in the project area and evaluate whether receptors would be upwind or downwind of the odor source.
- **Odor Complaint History:** Projects that would locate receptors near a potential odor source should consider the odor complaint history for the past three years of the source's operations. In reviewing the complaint history, lead agencies should consider the distance of the receptors making the complaint and the upwind/downwind orientation with respect to the source. The SMAQMD considers odor sources to have a substantial number of odor complaints if they have had one confirmed complaint per year averaged over a three-year period or three unconfirmed complaints per year averaged over a three-year period. In general, when a source has a substantial number of odor complaints, that source would be considered to have a potentially significant odor impact.

IMPACTS AND ANALYSIS

The analysis in this section focuses on the nature and magnitude of the change in the air quality environment due to implementation of the Project. The Project would allow for development of 8,000 residential units, 1,350,000 square feet (sf) of commercial-retail development, a 240-acre university for 6,000 students (with 1,010 dorms), and approximately 700 acres of open space to be used as recreation areas, parks, natural preserves, and open space corridors. Air quality impacts are estimated with respect to regional air quality standards and localized sensitive receptors such as schools and residential land uses. The health of people on these properties (including residents of the Project) may be adversely impacted if air emissions exceed a level deemed significant by federal or state agencies. The net increase in site emissions generated by the Project was qualitatively and quantitatively evaluated and compared to thresholds of significance established by the SMAQMD.

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE NO_x EMISSIONS

Construction activities require the use of various combinations and types of construction equipment. Much of this equipment is likely to be diesel-fueled and would emit NO_x as part of the fuel combustion process. Because of the low regulatory threshold (85 pounds per day within the SMAQMD), total daily emissions of NO_x from standard development projects within the Cordova Hills Master Plan Area could exceed the threshold on most days.

During construction of the Project, emissions of NO_x would occur from the operation of equipment necessary to complete the development. These emissions were estimated through the URBEMIS model using the three-phase construction schedule detailing an approximate level of construction per year and default URBEMIS equipment lists. Buildout of the Project will occur over a span of decades, and will be driven by prevailing market conditions in any given year. Based on historical trends within Sacramento County, it can be expected that there will be periods of intense construction in which multiple large areas are subject to concurrent construction, and periods of minimal activity in which the demand for construction abates. This makes it infeasible and speculative to provide an accurate forecast of year-to-year emissions. An example URBEMIS modeling scenario was created to estimate the potential of the Project for impacts, but these results should not be construed as predictive.

For the example modeling scenario, Project buildout could span approximately 30 years with various levels of construction anticipated per year, depending on market demands. The modeling assumes that within each year, each type of residential development and each non-residential land use type is an individual project. Further, it assumes that, as a worst-case scenario, grading phases and construction phases overlap and each project would disturb the total phase acreage daily. In terms of the pounds of emissions per day, the Project impacts could ultimately be greater or less than those reported below depending upon how actual buildout of the Project progresses. Table AQ-4 summarizes the NO_x emissions from the modeled yearly construction activities up to the

year 2035, prior to and after implementation of the BCECP and ECECP measures. It is reasonable to expect that as the planning area nears buildout annual construction activities will decline, as construction occurs on small areas which still remain after the bulk of construction has been completed.

As shown in the table, the Project does have the potential to result in significant impacts throughout most of the life of the Project, even after implementation of the BCECPs and ECECPs. Construction specifications and URBEMIS output are included in Appendix AQ-3. Mitigation is included to ensure that all subsequent projects which occur within the Project area conform to the SMAQMD mitigation and abatement requirements which are in effect at the time. Currently, these requirements include reduction of NO_x pollutants by 20%, and the payment of a fee for projects with NO_x emissions that remain significant even after the 20% reduction. SMAQMD uses the mitigation fees to help fund regional air quality programs, such as the replacement of older construction equipment with newer models and the retrofitting of older equipment with pollution-reducing components. Since NO_x is a precursor to regional ozone formation, mitigation fees are used on projects anywhere within the ozone non-attainment area that meet the cost-effectiveness criteria used to determine the fee. Compliance with SMAQMD regulations and recommended mitigation will ensure that impacts are *less than significant*.

MITIGATION MEASURES:

- AQ-1.** The following language shall be added to the SPA: All individual development projects shall implement Sacramento Metropolitan Air Quality Management District rules and mitigation pertinent to construction-related ozone precursor emissions, as defined by the most current version of the Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment.

Table AQ-4: Project NO_x Emissions During Construction (lbs/day)

Year	SMAQMD Threshold	Construction emissions without control measures		Construction emissions with BCECP and ECECP measures	
		NO _x	Significant ?	NO _x	Significant?
2014	85	171.31	Yes	143.51	Yes
2015	85	190.69	Yes	161.44	Yes
2016	85	272.32	Yes	232.34	Yes
2017	85	220.79	Yes	189.02	Yes
2018	85	345.15	Yes	296.19	Yes
2019	85	318.96	Yes	273.64	Yes
2020	85	405.27	Yes	346.38	Yes
2021	85	401.01	Yes	337.91	Yes
2022	85	394.68	Yes	331.58	Yes
2023	85	251.13	Yes	207.39	Yes
2024	85	363.25	Yes	300.55	Yes
2025	85	283.14	Yes	231.45	Yes

IMPACT: OPERATIONAL EMISSIONS OF OZONE PRECURSORS (NO_x OR ROG)

Sacramento County is currently in nonattainment for the federal and state ozone standards. The completed Project would result in emissions of NO_x and ROG generated from area and mobile sources. Emissions from the Project at full buildout in the year 2035 were calculated using the URBEMIS model, with worst-case results provided in Table AQ-5. The URBEMIS defaults were changed to reflect Project-specific data derived from the traffic study performed for the Project (trip rates and lengths). These data already reflect many of the Project features which reduce trip generation, such as the provision of a transit system. The URBEMIS data sheets are included in Appendix AQ-4.

As shown in Table AQ-5, emissions will substantially exceed the threshold of 65 lbs/day. General Plan policy AQ-4 requires that projects with substantial ozone precursor emissions develop a plan to reduce those emissions, and the SMAQMD typically recommends likewise. The typical reduction amount required is 15%; however, SMAQMD indicated that the Project was not included in the land use assumptions of the State Implementation Plan (SIP) for the regional reduction of ozone precursors emissions, and recommended a greater reduction of 35%. Note that these required reductions are reductions from a Business As Usual scenario which was developed by SMAQMD, not from the Project as-designed. The purpose of the Business As Usual scenario is to provide a level playing field, so that projects which already incorporate many emissions-reducing features are not penalized.

Table AQ-5: Project NO_x and ROG Operational Emissions at Buildout

	Emissions in lbs/day ¹
NO_x	415.22 ²
ROG	857.40 ³
1 – PBS&J URBEMIS analysis 2011. 2 – Winter emissions. Summer emissions are 290.18 lbs/day. 3 – Summer emissions. Winter emissions are 735.05 lbs/day.	

In conformance with General Plan policy and SMAQMD recommendations, an AQMP was prepared for the Project to define the processes by which emissions of NO_x and ROG would be reduced; the Business As Usual scenario is described in the AQMP. The full text of the AQMP is included as Appendix AQ-2 and is summarized herein. SMAQMD's "Guidance for Land Use Emission Reductions" v 2.5 (January 2010) provides a description of the most current feasible mitigation measures and their corresponding NO_x and ROG reduction potential; this was the source for most of the reduction measures used in the AQMP. Through design features detailed in the AQMP, the Project would implement the following measures to actively reduce NO_x and ROG emissions, which would result in a 35.32 percent reduction from Business As Usual emissions:

- SMAQMD 28 – Onsite Renewable Energy
- SMAQMD 29 – Exceed Title 24
- SMAQMD 33 – TMA Membership
- SMAQMD 99B – Roundabouts
- SMAQMD 99A – VMT Reduction

The final three items in the AQMP were part of the development of the traffic study, because they reflect the Project as it is designed, and so those reductions are already reflected in the emissions described in Table AQ-5. Giving additional consideration to the first two measures, onsite renewable energy and exceeding Title 24, the AQMP indicates that these measures will further reduce emissions by 4%. Thus, the total mitigated Project emissions will be 398.61 lbs/day of NO_x and 823.10 lbs/day of ROG.

The proposed Project will result in approximately 35% less ozone precursor emissions than a Business As Usual project design. However, even with the reduction afforded by implementation of the AQMP the Project would still exceed the daily emissions thresholds of 65 lbs/day for long-term NO_x and ROG emissions. Therefore, the Project would result in a *significant and unavoidable* impact with respect to operational emissions of NO_x and ROG.

MITIGATION MEASURES:

AQ-2. Comply with the provisions of the Air Quality Management Plan dated June 1, 2011, and incorporate the requirements of this plan into the Cordova Hills Special Planning Area conditions. **Also, the following text shall be added to the Cordova Hills SPA: “All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project and shall achieve the original 35% reduction in total overall project emissions. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.”**

IMPACT: CONSTRUCTION ACTIVITIES WOULD INCREASE PARTICULATE MATTER EMISSIONS

The Project would disturb up to approximately 2,669 acres during a three-phase development schedule estimated to span thirty years. As discussed in the Construction Impact Methodology section, a project will result in less than significant impacts with the implementation of the Basic Construction Emission Control Practices if no more than 15 acres of active site disturbance occurs at any given time. Because the specific construction schedule is unknown and the development of individual projects may overlap, it is likely that construction activities will not be limited to 15 acres. In fact standard SMAQMD guidance indicates that it should be assumed that 25% of a total site will be actively graded at any one time, which means that any site of greater than 60 acres will involve more than 15 acres of active grading. It is reasonable to expect that there will be many projects within the Project area which will involve grading that exceeds the SMAQMD screening threshold, and should be presumed to have significant impacts.

Dust abatement practices are required pursuant to SMAQMD Rule 403 and California Code of Regulations, Title 13, sections 2449(d)(3) and 2485; the SMAQMD Guide simply lays out the basic practices needed to comply. Since these are already required by existing rules and regulations, it is not necessary to include them as mitigation. These practices also constitute all feasible measures available to reduce the impact.

Limiting future projects to no more than 15 acres of active grading has been considered, but is infeasible for a variety of reasons. Firstly, subsequent development under the SPA will be constructed by separate developers, each with their own schedules, so such a measure would require coordinating among all these developers to set schedules which would not result in cumulative exceedance of the 15-acre limitation. The likely result of this would be to prevent certain development projects from progressing until a later construction season. In addition, it would require constant on-site monitoring by County staff to ensure that the measure was being carried out. The measure is impracticable, and is furthermore not recommended by SMAQMD. Despite the application of feasible measures through existing rules and regulations, the Project will result in a *significant and unavoidable* impact related to PM₁₀ and PM_{2.5} emissions generated by construction.

MITIGATION MEASURES:

None available.

IMPACT: IMPLEMENTATION OF THE PROJECT COULD CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF AIR QUALITY PLANS

In 1994, the SMAQMD established a Clean Air Plan, or State Implementation Plan (SIP), for attaining the federal 1-hour ozone standard in the Sacramento Air Basin (SMAQMD 1994). This plan includes assumptions and allowances for growth and development in the region and details the control measures and Best Management Practices that must be used for the region to make progress toward attainment. The 1994 Clean Air Plan has been updated numerous times since its promulgation. The most recent update to the Clean Air Plan is the *State of Progress Plan* and *2011 Reasonable Further Progress Plan*, both of which address attainment of the federal 8-hour ozone standard. The *2008 Triennial Report* and the *2007 Annual Progress Report* address the attainment of the state ozone standard. The current SIP and the current 2035 Metropolitan Transportation Plan (MTP) published by the Sacramento Area Council of Governments both used the same growth assumptions. A draft update to the MTP has been published, but has not been adopted at this time. The project area is shown in the draft MTP as being “not identified for development during the MTP/SCS [Sustainable Communities Strategy] planning period”.

The Project would develop a residential/mixed-use community, including a potential university or college, on approximately 2,669 acres. The Cordova Hills Master Plan area is within the jurisdiction of the SMAQMD and, therefore, would be required to comply with the regulatory plans of the district with respect to air quality. According to the SMAQMD, development projects that exceed emissions of 85 lbs/day of NO_x during construction activities or 65 lbs/day of NO_x or ROG during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and, therefore, would be considered significant and require mitigation.

The existing standards and mitigation have been established based on the underlying targets and assumptions of the SIP; however, the SIP is tied to a “motor vehicle emissions budget”, and growth east of Grant Line Road was not included as part of the growth assumptions when developing the budget. As a result, SMAQMD has indicated that even if the Project included standard mitigation and met the current operational significance thresholds, a significant impact would still occur. It is for this reason that an increased requirement for operational ozone precursor emissions reductions – from 15% to 35% – was recommended by SMAQMD.

Emissions of NO_x and ROG from construction and operational activities are discussed in detail in the previous impacts. NO_x emissions during construction are anticipated to exceed the 85 lbs/day threshold; therefore, the Project’s construction impact would be considered significant. Mitigation measures AQ-2 and AQ-3 would reduce ozone precursors either directly through the use of low ROG emitting paints, or indirectly, through the reduction of fuel combustion which emits NO_x and ROGs. However, even with the incorporation of Project design features and Mitigation Measures AQ-2 and AQ-3, the operation of the Project is anticipated to emit NO_x and ROG at levels above the 65 lbs/day threshold. Even if the Project fell below the thresholds, emissions would still be significant because the Project was not assumed in the SIP. Therefore, the Project has the potential to obstruct the success of regional ozone attainment and would result in a *significant and unavoidable* impact.

MITIGATION MEASURES:

Implement Mitigation Measure AQ-2, which represents all feasible mitigation.

IMPACT: PROJECT OPERATION WOULD GENERATE CO EMISSIONS

Motor vehicle usage is the primary source of CO, a primary air pollutant that concentrates near congested intersections. The Project would result in a net increase in traffic within Sacramento County. According to the traffic study prepared for the Project, eighteen intersections would either be subject to degradation of LOS to a level of service E or worse, or add vehicles to an intersection already operating at an LOS of E or worse (refer to Table AQ-6). These identified intersections do not meet the First Tier SMAQMD screening criteria for CO and must be further examined.

None of the affected intersections would result in an hourly traffic volume of more than 31,000 vehicles. A review of area topography indicates that these intersections are located in open areas, not in locations where vertical or horizontal mixing would be limited. The background data from the traffic study further indicate that the implementation of the Project would not substantially change the mix of vehicle fleets typical to Sacramento County at these intersections. Therefore, based on SMAQMD screening methodology as described in the Methodology section, the Project would result in a *less than significant* impact with respect to local CO emissions. The screening level analysis is included in Appendix AQ-5.

MITIGATION MEASURES:

None required.

IMPACT: PROJECT OPERATION WOULD RESULT IN TAC EMISSIONS

Though Project-level details are unavailable at the master planning stage, based on the land uses of the Project, it is reasonable to assume that some TAC-generating uses (such as gasoline stations and dry cleaners) would be constructed within the Project in areas designated for non-residential uses. The most stringent applicable ARB buffer for uses that generate TACs is 500 feet; the nearest existing receptor location is a single-family home on Glory Lane that is well over 700 feet from the nearest potential TAC-generating Project area. The nearest existing daycares, hospitals, and other more sensitive receptors are located more than a mile from the nearest non-residential Project land uses. Because of the distance between the Project site and the nearest sensitive receptors, the Project would not expose existing sensitive receptors to substantial risk related to stationary-source TAC.

Within the Project there is the potential for the future construction of new sensitive receptors in proximity to new stationary TAC sources. Because the exact location of the potential new stationary TAC sources relative to new proposed sensitive receptors will be determined as part of later individual development proposals, it is not possible to conduct a proximity analysis at this time. Though General Plan policy AQ-3 states that buffers between sensitive land uses and sources of air pollution or odor should be provided, some of these future projects may only require building permits, and would not be subject to any review for TAC impacts unless conditions are imposed as part of the SPA. Mitigation is included below to stipulate that a condition be added to the SPA requiring that all uses conform to the siting recommendations outlined by ARB.

Aside from the stationary sources described above, an additional potential TAC source in the Project area is Grant Line Road. According to SMAQMD's Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways, a high traffic volume roadway is defined as a freeway, urban roadway with greater than 100,000 vehicles per day, or rural roadway with 50,000 vehicles per day. The current project area is rural, but by the time the Project is completed the area will be urban. In the existing plus project scenario, Grant Line Road carries less than 50,000 trips (42,400 in the worst case) and is thus not a high traffic volume roadway. In the cumulative plus project scenario, Grant Line Road carries less than 100,000 trips (50,200 in the worst case) and is still not a high traffic volume roadway¹¹. A review of the Draft Environmental Impact Report for the Capitol Southeast Connector Project indicates that the highest anticipated traffic volumes would be 66,900 trips in the worst case. Therefore, the Project uses will not be subject to significant TAC sources due to high traffic volume roadways.

As analyzed, the Project will not expose existing sensitive receptors to substantial risk related to stationary-source TAC exposure, and will not expose proposed sensitive

¹¹ Traffic volumes in the existing and cumulative scenarios are from the Cordova Hills Traffic Analysis prepared by DKS Associates Transportation Solutions.

receptors to substantial risk related to mobile-source TAC exposure. The Project could result in exposure of proposed future uses to proposed future stationary source TAC, but mitigation is included to ensure that the siting of new uses conforms to ARB recommendations. Project impacts related to TAC exposure are *less than significant*.

MITIGATION MEASURES:

AQ-3. *The following language shall be added to the SPA:* Buffers shall be established on a project-by-project basis and incorporated during permit or project review to provide for buffer separations between sensitive land uses and sources of air pollution or odor. The California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective", or more current document, shall be utilized when establishing these buffers. Sensitive uses include schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency for people (this includes both single- and multiple-family). The buffers shall be applied to the source of air pollution or odor, and shall be established based either on proximity to existing sensitive uses or proximity to the property boundary of land designated for sensitive uses. Buffers current at the time of the establishment of this SPA indicate that sensitive uses should be:

- A. A least 500 feet from auto body repair services.
- B. At least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons.
- C. At least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC, including furniture manufacturing and repair services.

IMPACT: PROJECT OPERATION MAY RESULT IN EXPOSURE TO OBJECTIONABLE ODORS

Odiferous compounds can be generated from a variety of sources. The ARB's Air Quality and Land Use Handbook includes a list of the most common sources of odor complaints received by local air districts. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations, which typically occur within areas designated for industrial or intensive agriculture uses. The Project proposes the designation of commercial and residential land uses, along with a university. These land uses do not typically result in a source of nuisance odors associated with operation. Though some areas will remain designated for agriculture, intensive agricultural uses (such as feed lots) would not be permitted. Therefore, substantial objectionable odors would not be generated as a result of the Project's construction and operation.

KIEFER LANDFILL

The Kiefer Landfill is located at 12701 Kiefer Boulevard and Grant Line Road in Sloughhouse, California. There are several landfill boundaries to consider: the boundary of County-owned landfill property, which abuts the Project boundary; the ultimate planned boundary of the active landfill, which is approximately 50 feet from the Project boundary; and the 2,000-foot buffer established around the ultimate planned landfill boundary, which is within the Project site (refer to Plate AQ-1). SMAQMD recommends a one mile buffer from landfills, which is also shown on the exhibit based on the proposed ultimate active landfill boundary. Though one mile is not meant to be a hard-line buffer for determining significance, it is a useful screening tool. The land in between the Project and the landfill contains landforms similar to the site: rolling grassland of varying elevations. The site is at a higher elevation than the land to the south.

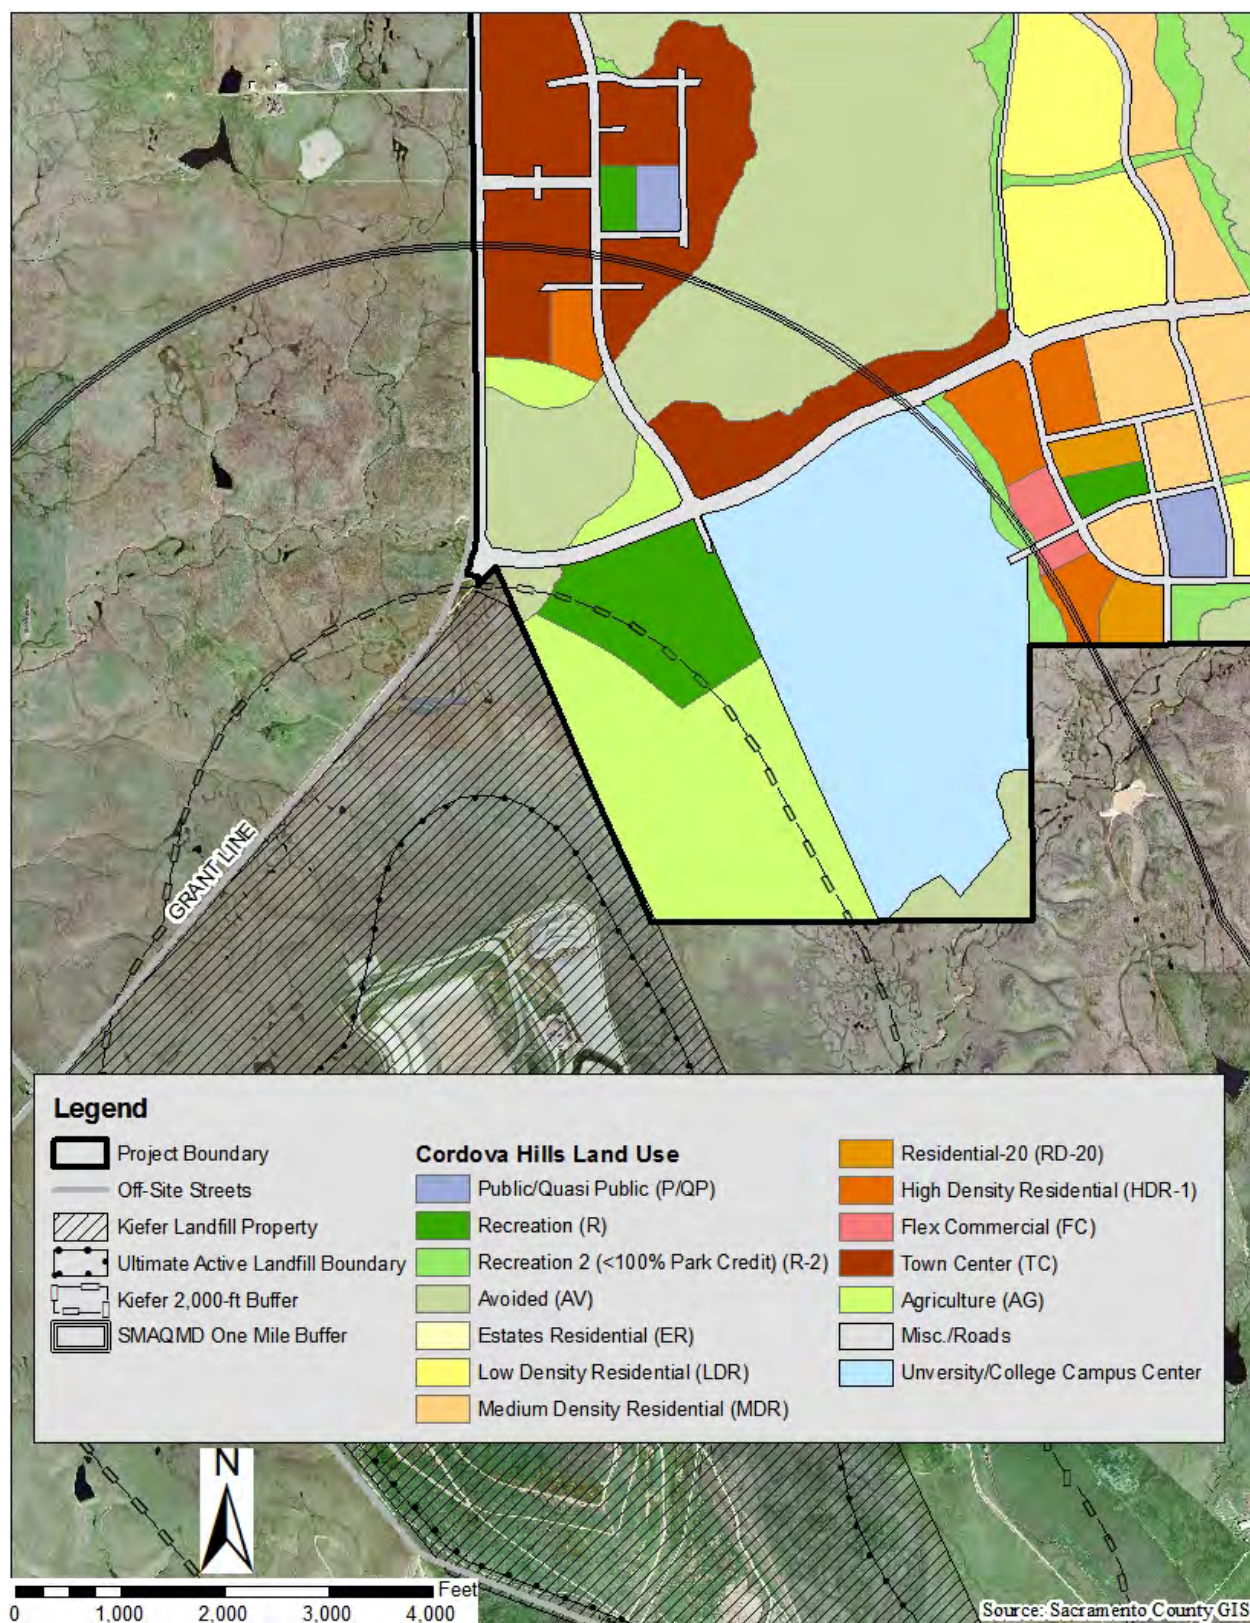

The Project area which directly abuts the landfill property, and is within the 2,000-foot buffer area, is the area of the Project outside the Urban Services Boundary: the sports park and the large area designated agriculture. These uses are acceptable within the 2,000-foot buffer, according to General Plan Policy PF-21. With the exception of the park, most of the uses proposed or permitted in the agriculture area involve uses such as solar arrays and corporation yards, which are relatively passive and do not involve large numbers of sensitive receptors. The areas within one mile of the ultimate landfill boundary include the potential university, a small portion of the uses east of the potential university, and the southern half of the Town Center District.

Meteorological conditions for the Project site were collected at Mather Air Force Base.¹² The six years of data show that winds blow predominantly from the south, with winds blowing from the south-southwest approximately 18% of the time, winds blowing from the south approximately 12% of the time, and winds blowing from the southeast 27% of the time. Thus, approximately 57% of the time prevailing winds would blow across Kiefer landfill and toward some portion of the site. The Project's location downwind of the landfill has the potential to expose Project receptors to landfill odors. Also, the area in between the landfill boundary and the Project is currently covered in low-growing grassland, with little tall vegetation to enhance vertical and mechanical mixing of the air which could help to disperse odor¹³.

¹³ SMAQMD *CEQA Guide* December 2009.

Plate AQ-1: Kiefer Landfill Boundaries in Relation to the Project

The generation of odors when most people are inside would have a decreased probability of negative effects¹⁴. On this basis, uses which involve larger amounts of extended outdoor use would be more susceptible to nuisance; within one mile of the landfill, this includes the sports park and potentially the playing fields and outdoor areas which could be constructed on the University/College Campus Center. The dorms, classrooms, businesses, and the multiple-family residential site that are within one mile of the landfill will primarily be associated with indoor activity, and will be less sensitive to odor impacts. The SMAQMD Guide indicates that the presence of dense vegetative cover in the form of trees and shrubs can filter, mix, and diffuse odors. This would be of particular importance for the sports park, because it is the most proximate use to the landfill. A landscaping requirement is already included in the SPA for the potential solar farm, corporation yard, and district energy plant, but mitigation recommends that a similar requirement be established in the SPA for the sports park and the University/College Campus Center.

According to the SMAQMD, the landfill would be considered to have a significant odor complaint history if it had more than one confirmed or three unconfirmed complaints per year over the past three years. The SMAQMD does not have any odor complaints on record for the Kiefer Landfill for the past three years. Though there are no odor complaints on record, it is difficult to conclude that this is evidence of minimal odor; there are no existing receptors within one mile of the landfill in the direction of prevailing winds, and very few within one mile in any direction. During multiple site visits of several hours duration, County staff members did not detect any objectionable odors, but this is also not absolute evidence.

Only considering the meteorological conditions and the proximity of the Project to the landfill, it would be likely that some significant odor impacts to the Project could occur; however, the SMAQMD Guide does provide further information regarding factors that can reduce odor impacts, if present. Kiefer Landfill has established an active gas-to-energy system that employs active gas extraction from the landfill for use in electrical generation. As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors.^{15,16} Given all of the foregoing – with particular emphasis on the ability of the gas extraction system to reduce the potency and density of landfill odor – and the mitigation incorporated below, odor impacts are not expected to be substantial, and impacts are *less than significant*. Note that an additional measure is recommended in the Land Use section related to Kiefer Landfill, to reduce potential nuisance impacts.

BOY'S RANCH

The Boy's Ranch, a juvenile correction facility which has been operated by the Sacramento County Probation Department, is adjacent to the northeastern Project boundary. Though budget cuts have resulted in the closure of the facility, there is the potential for the facility to reopen in the future. This facility includes a wastewater treatment system consisting of a gravity collection system, a 9,000 gallon temporary storage/holding tank, a sewage distribution box, and two unlined percolation/evaporations ponds. The two ponds cover an area of approximately 2.9 acres and would be the source of any nuisance odors. The wastewater treatment facility is regulated by the Central Valley Regional Water Quality Control Board through adopted Waste Discharge Requirements (Order NO. R5-2004-0003); the Waste Discharge Requirements are the source of data for this discussion.

Wastewater ponds which are properly aerated and managed do not result in significant nuisance odors. Odors are generated when oxygen concentrations in ponds drop too low to maintain an aerobic treatment environment; the Waste Discharge Requirements for the facility indicate that these conditions generally result when dissolved oxygen drops to concentrations below 1.0 milligrams per liter. Historic monitoring reports related to the facility do indicate that concentrations have dropped below this level occasionally, but that they have generally been well above this level (as high as 18.2 milligrams per liter). Furthermore, discharge specification number four states: "objectionable odors originating at this facility shall not be perceivable beyond the limits of the wastewater treatment and disposal areas". The facility is specifically prohibited from causing a nuisance odor condition, and nuisance odor is fully controllable through maintenance of aerated conditions in the ponds. Though based on historic operation of wastewater facilities in general and of this facility in specific it can be expected that there will be events when aeration fails (a pump malfunctions, for instance), it can also be expected that these will be infrequent events of short duration. Therefore, nuisance odor impacts are expected to be *less than significant*.

MITIGATION MEASURES:

- AQ-4.** Include in the SPA a requirement that the western perimeter of the Sports Park and University/College Campus Center (where these are within 2,000 feet of the Kiefer landfill) include a minimum 25-foot-wide landscaping area. This landscaping area shall include a dense mix of trees and shrubs, to screen the uses from the landfill. Acceptable tree species include those expected to reach minimum heights of 40 feet.

6 BIOLOGICAL RESOURCES

INTRODUCTION

This chapter identifies and analyzes impacts to biological resources based on the proposed Project. The analysis focuses on impacts to the grassland and wetland habitats which predominate the site and the special status species which rely on these habitats. Species covered include a variety of special status birds, insects, plants, and amphibians such as Swainson's hawk, vernal pool fairy shrimp, legenere, Sacramento Orcutt grass, and western spadefoot toad.

ENVIRONMENTAL SETTING

The Project site is located in eastern Sacramento County east of Grant Line Road and west of Carson Creek. The Project site is approximately 2,669 acres and is located on varying topography ranging in elevation from 130 to 270 feet above mean sea level. The dominant vegetation type is non-native grassland comprised of ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), barley (*Hordeum* species), and ryegrass (*Lolium multiflorum*). **Other herbaceous species include sticky tarplant (*Holocarpha virgata*), common tarweed (*Hemizonia pungens*), cut-leaved geranium (*Geranium dissectum*), hairy hawkbit (*Leontodon taraxacoides*), common vetch (*Vicia sativa*), and filaree (*Erodium botrys*).** Interspersed through the grassland community are wetland complexes consisting of vernal pools, seasonal wetlands, swales, and ponds. Both the wetland and grassland communities provide habitat for several special status species. Examples of the **special status** species located on or near the Project site include: Swainson's hawk, Sacramento Orcutt grass, vernal pool branchiopods, and the western spadefoot toad. There are no trees within the Project area.

Currently, land surrounding the Project site is mostly undeveloped. To the south is the Sacramento County owned and operated Kiefer landfill. A 2,000-foot buffer was established around the landfill to preclude urban development from encroaching on landfill activities. Portions of the County-owned land within this buffer area are protected under a conservation easement to mitigate for loss of both wetland habitat and Swainson's hawk foraging habitat that was impacted by landfill activities. A portion of the Project site is within the 2,000-foot buffer; however, the land in question is not protected by conservation easements. To the east is the Sacramento County Boys Ranch facility (a juvenile correction facility, currently closed) and agricultural farmlands. To the north is agricultural farmland (primarily nonirrigated grazing land). In the City of Rancho Cordova to the west is land that is largely undeveloped, but includes an

approved and partially constructed planning area called the Sunridge Specific Plan (a mix of commercial and residential development of approximately 2,606 acres).

WETLANDS

The County of Sacramento contains a number of wetland habitats, most of which are naturally occurring, although some were artificially created as mitigation for prior impacts. Federal regulation (Clean Water Act Section 404) has defined the term wetland to mean “those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions”. The term “wetlands” includes a diverse assortment of habitats such as perennial and seasonal freshwater marshes, vernal pools, and wetted swales. These wetland features share a number of physical characteristics, including frequent or seasonal inundation by water, soil saturated long enough to exclude organisms intolerant of anaerobic conditions, and plants that are adapted to wetted conditions. A general term for all water habitats is “surface waters”.

SEASONAL WETLANDS

Seasonal wetlands are scattered throughout the County, most in association with the County’s rivers and creeks, many within floodplains. These wetlands typically begin to form after the first winter rains and fill as rain continues through the season. They drain primarily via drainage swales during high runoff, or via combination of ground percolation and evaporation. By mid-summer or early fall these features will typically be dry. Depending on water depth and duration, seasonal wetlands can harbor federally-listed invertebrates and provide habitat for a large number of species, including the listed western spadefoot toad. Seasonal wetlands primarily differ from vernal pools (see below) in their underlying soils. Seasonal wetland soils are typically more permeable than the soils associated with vernal pools.

VERNAL POOLS

Vernal pools are small basins, depressions on the landscape that collect seasonal rains to support a specialized collection of plant and animal species. Typically, semi-impermeable soil underlies most vernal pools and restricts downward percolation of collected rain water. As a result, water slowly evaporates during the spring creating showy displays of tiny flowers blooming in concentric circles as the water recedes. Most plants found in vernal pools are endemic (found only in these habitats) and have adapted to survive partially-submerged conditions. These conditions have kept the non-native grasses that comprise much of the County’s grazing lands from invading or at least dominating the pools. Thus, vernal pools are small pockets of mostly native vegetation surrounded by mostly non-native grass species.

SEASONAL SWALES

Depending on the underlying soils, swales share similar characteristics with either seasonal wetlands or vernal pools. Typically, swales are shallow, linear features that may serve as drainage features into or out of a seasonal wetland or vernal pool. Although common throughout much of the County's wetland landscapes, the wetland functions of a swale are less pronounced than either of the aforementioned wetlands. Shallowness and topography of swales limit the duration of ponded water, thus reducing the expression of typical wetland characteristics.

HUMAN-MADE STOCK PONDS

In the County's rural lands ranchers have established water features, or stock ponds, typically by damming small drainages to form relatively deeper ponds which can hold water through much of the summer months. These ponds typically provide a deeper water habitat for some amphibian species.

REGULATORY SETTING

2030 SACRAMENTO COUNTY GENERAL PLAN

The General Plan contains numerous goals, policies, concepts and strategies to protect and/or preserve biological resources. The following provides the goals and policies applicable to the proposed Project:

AG-10. The County shall balance the protection of prime, statewide importance, unique and local importance farmlands and farmlands with intensive agricultural investments with the preservation of natural habitat so that the protection of farmland can also serve to protect habitat.

AG-17 The establishment of conservation easements combining preservation of agricultural uses, habitat values, and open space on the same property should be encouraged where feasible.

CI-60. Encourage maintenance of natural roadside vegetation and landscaping with native plants which usually provide the best habitats for native wildlife.

CO-25. Support the preservation, restoration, and creation of riparian corridors, wetlands and buffer zones.

CO-58. Ensure no net loss of wetlands, riparian woodlands, and oak woodlands.

CO-59. Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function:

- vernal pools,

- wetlands,
- riparian,
- native vegetative habitat, and
- special status species habitat.

CO-60. Mitigation should be directed to lands identified on the Open Space Vision Diagram and associated component maps (please refer to the Open Space Element).

CO-61. Mitigation should be consistent with Sacramento County-adopted habitat conservation plans.

CO-62. Permanently protect land required as mitigation.

CO-64. Consistent with overall land use policies, the County shall support and facilitate the creation and biological enhancement of large natural preserves or wildlife refuges by other government entities or by private individuals or organizations.

CO-65. Create a network of preserves linked by wildlife corridors of sufficient size to facilitate the movement of species.

CO-66. Mitigation sites shall have a monitoring and management program including an adaptive management component including an established funding mechanism. The programs shall be consistent with Habitat Conservation Plans that have been adopted or are in draft format.

CO-67. Preserves and conservation areas should have an established funding mechanism, and where needed, an acquisition strategy for its operation and management in perpetuity. This includes existing preserves such as the American River Parkway, Dry Creek Parkway, Cosumnes River Preserve and other plans in progress for riparian areas like Laguna Creek.

CO-68. Preserves shall be planned and managed to the extent feasible so as to avoid conflicts with adjacent agricultural activities (Please also refer to the Agricultural Element).

CO-69. Avoid, to the extent possible, the placement of new major infrastructure through preserves unless located along disturbed areas, such as existing roadways.

CO-70. Community Plans, Specific Plans, Master Plans and development projects shall:

- include the location, extent, proximity and diversity of existing natural habitats and special status species in order to determine potential impacts, necessary mitigation and opportunities for preservation and restoration.
- be reviewed for the potential to identify nondevelopment areas and establish preserves, mitigation banks and restore natural habitats, including those for

special status species, considering effects on vernal pools, groundwater, flooding, and proposed fill or removal of wetland habitat.

- be reviewed for applicability of protection zones identified in this Element, including the Floodplain Protection Zone, Stream Corridor Ordinance, Cosumnes River Protection Combining Zone and the Laguna Creek Combining Zone.

CO-71. Development design shall help protect natural resources by:

- Minimizing total built development in the floodplain, while designing areas of less frequent use that can support inundation to be permitted in the floodplain,
- Ensuring development adjacent to stream corridors and vernal pools provide, where physically reasonable, a public street paralleling at least one side of the corridor with vertical curbs, gutters, foot path, street lighting, and post and cable barriers to prevent vehicular entry.
- Projects adjacent to rivers and streams shall integrate amenities, such as trail connectivity, that will serve as benefits to the community and ecological function.
- Siting of wetlands near residential and commercial areas should consider appropriate measures to minimize potential for mosquito habitation.
- Development adjacent to stream corridors and vernal pools shall be designed in such a manner as to prevent unauthorized vehicular entry into protected areas.

CO-72. If land within river and stream watersheds in existing agricultural areas is developed for non-agricultural purposes, the County should actively pursue easement dedication for recreation trails within such development as a condition of approval.

CO-75. Maintain viable populations of special status species through the protection of habitat in preserves and linked with natural wildlife corridors.

CO-78. Plans for urban development and flood control shall incorporate habitat corridors linking habitat sites for special status species. (Please also refer to the Open Space Element for related policies.)

CO-83. Preserve a representative portion of vernal pool resources across their range by protecting vernal pools on various geologic landforms, vernal pools that vary in depth and size, and vernal pool complexes of varying densities; in order to maintain the ecological integrity of a vernal pool ecosystem.

CO-84. Ensure that vernal pool preserves are large enough to protect vernal pool ecosystems that provide intact watersheds and an adequate buffer, have sufficient number and extent of pools to support adequate species populations and a range of vernal pool types.

CO-85. Utilize proper vernal pool restoration techniques as approved by United States Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDF&G) and the Army Corps of Engineers (CORPS).

CO-86. Limit land uses within established preserves to activities deemed compatible with maintenance of the vernal pool resource, which may include ranching, grazing, scientific study and education.

CO-91. Discourage introductions of invasive non-native aquatic plants and animals.

CO-134. Maintain and establish a diversity of native vegetative species in Sacramento County.

CO-135. Protect the ecological integrity of California Prairie habitat.

CO-147. Increase the number of trees planted within residential lots and within new and existing parking lots.

CO-149. Trees planted within new or existing parking lots should utilize pervious cement and structured soils in a radius from the base of the tree necessary to maximize water infiltration sufficient to sustain the tree at full growth.

LU-15. Planning and development of new growth areas should be consistent with Sacramento County-adopted Habitat Conservation Plans and other efforts to preserve and protect natural resources.

OS-1. Actively plan to protect, as open space, areas of natural resource value, which may include but are not limited to wetlands preserves, riparian corridors, woodlands, and floodplains associated with riparian drainages.

OS-2. Maintain open space and natural areas that are interconnected and of sufficient size to protect biodiversity, accommodate wildlife movement and sustain ecosystems.

OS-9. Open space easements obtained and offered as mitigation shall be dedicated to the County of Sacramento, an open space agency, or an organization designated by the County to protect and manage the open space. Fee title of land may be dedicated to the County, the open space agency, or organization provided it is acceptable to the appropriate department or agency (Please also refer to Section V of the Conservation Element for related policies).

The major goal outlined in the Conservation Element of the General Plan is for the management and protection of natural resources for the use and enjoyment of present and future generations, while maintaining the long-term ecological health and balance of the environment. In addition to the Conservation Element goals and objectives, the Open Space Element further identifies two key concepts that form the basis of the goals, objectives and policies contained in the element: (1) protecting the urban edge and (2) establishing natural area linkages.

The urban edge is defined as the Urban Services Boundary (USB) in the Land Use Element. This boundary is the ultimate boundary of the urban area and is based upon natural and environmental constraints to urban growth. Protection of the urban edge allows accommodation of large scale urban development, while maintaining substantial rural, natural open space areas. Confining urban development within the USB prevents urban sprawl into the rural and open space areas of the County; protecting the urban edge protects the existing open space and rural areas of the County from being lost to development.

Open space linkages increase the ecological value of the open space lands by connecting ecosystems and wildlife habitats. This is beneficial to species higher in the food chain since mammals and birds of prey require considerable supporting territory. When the habitat is reduced to isolated patches, the long term viability of the species is threatened. Furthermore, the establishment of natural habitat corridors facilitates migration of species between breeding populations, thus enlarging the gene pool and helping to ensure genetically diverse and healthy populations of individual species. In the rural areas of the County, contiguous open space already exists, allowing for preservation of larger, high quality natural areas.

SWAINSON'S HAWK IMPACT MITIGATION FEE PROGRAM ORDINANCE

The California Department of Fish and Game requires that mitigation for foraging habitat be provided within the known foraging radius of a nesting Swainson's hawk. In 1997, in response to the need to mitigate for the loss of Swainson's hawk foraging habitat in Sacramento County, the Board of Supervisors adopted an ordinance that established a Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code). The Program has been amended several times; the latest amendment went into effect December 2009. By adopting the Program, the Board of Supervisors found that "the most effective means of mitigation for the loss of suitable Swainson's hawk foraging habitat is the direct preservation, in perpetuity, of equally suitable foraging habitat on an acre-per-acre basis based on the Project's determined acreage impact".

Under the Swainson's Hawk Impact Mitigation Program, only projects which have an impact of less than 40 acres are eligible to pay fees. Projects impacting 40 acres or more of foraging habitat must provide land acceptable to Fish and Game and the County. Land can be provided in fee title or through conservation easement. The Sacramento County Community Planning and Development Department, Planning Division (Planning Division) administers the Swainson's Hawk Impact Mitigation Program and more information on lands likely to be determined as acceptable replacement habitat can be found at their website <http://www.saccounty.net/planning/swainsons-hawk-ordinance/index.html>.

FEDERAL AND STATE REGULATORY AUTHORITY

The two major federal laws regulating impacts to wetlands and wildlife species are the Clean Water Act (Section 404 and 401) and the Endangered Species Act (Section 7, 9,

and 10). The U.S. Army Corps of Engineers (Army Corps) is responsible for administering the Clean Water Act (CWA), Section 404, with the US Environmental Protection Agency serving in an oversight capacity. The US Fish and Wildlife Service (Fish and Wildlife) is responsible for administering the Endangered Species Act, Sections 7, 9, and 10. The state Regional Water Quality Control Board is the regulatory agency that enforces Section 401 of the CWA. The three most important state laws regulating wildlife species, streams, and wetlands are the California Endangered Species Act (Section 2081), Section 1600 of the Fish and Game code, and the Porter-Cologne Water Quality Control Act. The first two are administered by the state Department of Fish and Game (Fish and Game), and the latter is administered by the Regional Water Quality Control Board (Regional Water Board).

CLEAN WATER ACT SECTION 401 AND 404 PERMIT GUIDELINES

The Army Corps regulates discharge of dredged or fill material into waters of the United States under Section 404 of the CWA. Waters of the U.S. are generally defined as “navigable waters,” which are defined as traditional navigable waters that are or were used for commerce, or may be used for interstate commerce; tributaries of navigable waters; and wetlands adjacent to navigable waters. “Discharge of fill material” is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines [33 C.F.R. §328.2(f)]. The Solid Waste Agency of Northern Cook County (SWANCC) vs. United States Army Corps of Engineers decision made by the Supreme Court in 2001 altered the types of wetlands that can be regulated by Section 404. Isolated wetlands, that is, wetlands that are not hydrologically connected to other “navigable” surface waters (or their tributaries), are not considered to be subject to Federal jurisdiction. However the SWANCC decision only prohibits Federal jurisdiction over isolated waters; State and local jurisdiction still applies.

The California State Regional Water Quality Control Board (Regional Water Board) regulates wetlands pursuant to Section 401 of the CWA. Section 401 of the CWA (33 U.S.C. 1341) requires any applicant for a federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

FEDERAL ENDANGERED SPECIES ACT

Under the Federal Endangered Species Act (FESA) of 1973, the Secretary of the Interior and the Secretary of Commerce jointly have the authority to list a species as endangered or threatened. FESA defines “endangered” species as any species in danger of extinction throughout all or a significant portion of its range. A “threatened” species is any species that is likely to become an “endangered” species within the

foreseeable future throughout all or a significant portion of its range. Additional special-status species include “candidate” species and “species of concern.” “Candidate” species are those for which Fish and Wildlife has enough information on file to propose listing as endangered or threatened. “Species of concern” are those for which listing is possibly appropriate but for which Fish and Wildlife lacks sufficient information to support a listing proposal. A species that has been “delisted” is one whose population has met its recovery goal target and is no longer in jeopardy of extinction. Taking of federally listed species is prohibited under Section 9 of FESA. To “take” is defined by FESA (Section 2[19]) to mean “to harass, harm, pursue, hunt, shoot, would, kill, trap, capture, or collect, or attempt to engage in any such conduct.”

All government agencies must review their actions and determine if a “may affect” situation occurs with respect to a federally listed or proposed species. If the agency makes a “may affect” determination, it is then required to formally consult with National Oceanic and Atmospheric Administration, Fisheries (NOAA Fisheries).

For federal agencies, the consultation is conducted under Section 7 of FESA. The agency submits a Biological Assessment to Fish and Wildlife that evaluates the potential adverse effects to federally listed species. Fish and Wildlife then prepares a Biological Opinion that addresses the requirements that must be followed to avoid, minimize, and compensate for impacts to federally listed species and their habitats.

For non-federal agencies or individuals (i.e. private applicants), the consultation is conducted under Section 10 of FESA. The agency or individual submits an incidental take¹ permit application to Fish and Wildlife accompanied by a habitat conservation plan (HCP). The purpose of the habitat conservation planning process associated with the permit is to ensure there is adequate minimization and mitigation of the effects of the authorized incidental take. The purpose of the permit is to authorize the incidental take of a listed species, not to authorize the activities that result in take (USFWS 2005).

Further explanation is provided in the following notification, which was submitted to the County by Fish and Wildlife for inclusion² into all environmental documents when threatened or endangered species may be adversely affected:

As a requirement of the Department of Interior, U.S. Fish and Wildlife Service, the following notification is provided to proponents of any Project that has the potential to adversely affect threatened or endangered species:

“The applicant is hereby notified of additional conditions as stipulated by the U.S. Fish and Wildlife Service. Features of the applicant’s Project may adversely

¹ Incidental take is take of listed fish or wildlife species that results from, but is not the purpose of, carrying out an otherwise lawful activity conducted by a federal agency or applicant (50 CFR 402.2).

² As a condition of the Fish and Wildlife Biological Opinion for the “Fazio Water” 101-514 water contract, the County of Sacramento has agreed to include Fish and Wildlife notification language in Initial Studies and EIRs when endangered and threatened species may be adversely affected.

affect federally listed threatened or endangered species. An applicant must go through one of two processes to obtain authorization to take federally listed species incidental to completing his or her Project. One of the processes is formal consultation. When the authorization or funding of a Federal agency is an aspect of a Project that may affect federally listed species, Section 7 of the Endangered Species Act requires the Federal agency to formally consult with the Service.

Formal consultation is concluded when the Service issues a biological opinion to the Federal agency. The biological opinion includes terms and conditions to minimize the effect of take on listed species. The Federal agency must make the terms and conditions of the biological opinion into binding conditions of its own authorization to the Project applicant. An example of this process is when the U.S. Army Corps of Engineers consults with the Service prior to issuing a permit to fill jurisdictional waters under Section 404 of the Clean Water Act. The terms and conditions of the biological opinion become binding on the Project applicant through the Corps' 404 authorization. When no Federal funding or authorization is involved in a Project, an applicant must prepare a habitat conservation plan and obtain a permit directly from the Service in accordance with Section 10(a)(1)(B) of the Act. For additional information on these processes please contact the Endangered Species Division of the U.S. Fish and Wildlife Service's Sacramento Fish and Wildlife Office at (916) 414-6600".

CALIFORNIA ENDANGERED SPECIES ACT (CESA)

The California Endangered Species Act (established in Fish and Game Code §2050) generally parallels the main provisions of the FESA and is administered by Fish and Game for most terrestrial species, with assistance from the NOAA Fisheries (formerly known as the National Marine Fisheries Services, or NMFS) for most freshwater fishery species. The CESA prohibits the taking of state listed species except as otherwise provided by state law. Unlike the federal ESA, the CESA extends the take prohibitions to not only listed species but also for species petitioned for listing. "Take" is defined in Section 86 of the Fish and Game Code as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." Section 2081 of the CESA identifies the following criteria that must be met for Fish and Game to authorize the take of endangered, threatened or candidate species:

- The taking of a listed or candidate species can be minimized and fully mitigated.
- The take would not jeopardize the continued existence of the species.
- Authorization for take must be based on the best scientific material that is reasonably available, and that due consideration will be given to the species' ability to survive and reproduce.

*CALIFORNIA FISH AND GAME CODE***ANIMALS AND PLANTS**

Section 3503 makes it unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by the Fish and Game Code or any regulation made pursuant thereto. Section 3503.5 make it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the Fish and Game Code or any regulation adopted pursuant thereto. Sections 1908, 3511, 4700, 5050 state that Fully Protected plant and animals or parts thereof may not be taken or possessed at any time.

SURFACE WATERS

Fish and Game Code Section 1602 requires any person, state or local governmental agency, or public utility to notify Fish and Game before beginning any activity that will do one or more of the following: 1) substantially obstruct or divert the natural flow of a river, stream, or lake; 2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or 3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake. Fish and Game Code Section 1602 applies to all perennial, intermittent, and ephemeral rivers, streams, and lakes in the state.

Notification is generally required for any project that will take place in the vicinity of a river, stream, or lake. Fish and Game will determine whether a Lake or Streambed Alteration Agreement is required for the activity. An agreement will be required if the activity could substantially adversely affect an existing fish and wildlife resource. If an agreement is required, it will be prepared by Fish and Game in coordination with the applicant. The agreement will include measures, as necessary, to protect fish and wildlife resources while conducting the project.

MIGRATORY BIRD TREATY ACT

The Migratory Bird Treaty Act (MBTA) of 1916 established federal responsibilities for the protection of nearly all species of birds, their eggs, and nests. Section 16 U.S.C. 703–712 of the Act states “unless and except as permitted by regulations, it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill” a migratory bird. A migratory bird is any species or family of birds that live, reproduce or migrate within or across international borders at some point during their annual life cycle. Currently, there are 836 migratory birds protected nationwide by the MBTA, of which 58 are legal to hunt.

PORTER-COLOGNE WATER QUALITY CONTROL ACT

This Act (State Water Code Section 13020) mandates that all the waters of the state be protected, that activities and factors affecting water quality be regulated to attain the

highest water quality “within reason”, and that the state be prepared to exercise its power and jurisdiction to protect water quality from degradation. Waters of the state are defined as any surface or groundwater within the boundaries of the state. The Regional Water Board issues permits, with varying conditions, to allow the discharge of dredge or fill material or a waiver of waste discharge into waters of the state **(the Project would not qualify for a waiver). Any “isolated” waters not subject to the Clean Water Act as a result of the SWANCC decision are still subject to the Porter-Cologne Water Quality Control Act, and still require mitigation pursuant to the state’s no net-loss policy. In such a case, fill of isolated wetlands would be permitted through Waste Discharge Requirements rather than a Section 401 Water Quality Certification.**

FEDERAL AVIATION ADMINISTRATION REGULATIONS

The Federal Aviation Administration (FAA) is the federal agency responsible for developing and enforcing air transportation safety regulations. Many of these regulations are codified in the Federal Aviation Regulations (FARs). The FAA also publishes a series of guidelines for airport operators to follow called Advisory Circulars (ACs). Advisory Circulars in the 150 series deal with airport safety issues, including wildlife hazards. In addition to FARs and ACs, the FAA periodically issues Certalerts for internal distribution and to provide recommendations on specific issues for inspectors and airport personnel. All of the above-mentioned regulations, Advisory Circulars, and Certalerts are frequently changed or updated, and their current status should be verified on a regular basis. This may be accomplished by contacting the FAA directly or by visiting their website at www.faa.gov/arp/hazard.htm or www.faa.gov/faadocs.htm for the most current revision.

On August 28, 2007, the Federal Aviation Administration (FAA) released a revised Advisory Circular (AC) for Hazardous Wildlife Attractants on or near Airports (AC 150/5200-33B), which among other things addresses stormwater detention facilities as potential hazardous wildlife attractants. The AC states the following:

New storm water management facilities.

The FAA strongly recommends that off-airport storm water management systems located within the separations identified in Sections 1-2 through 1-4 be designed and operated so as not to create above-ground standing water. Stormwater detention ponds should be designed, engineered, constructed, and maintained for a maximum 48-hour detention period after the design storm and remain completely dry between storms. To facilitate the control of hazardous wildlife, the FAA recommends the use of steep-sided, rip-rap lined, narrow, linearly shaped water detention basins. When it is not possible to place these ponds away from an airport’s AOA, airport operators should use physical barriers, such as bird balls, wire grids, pillows, or netting, to prevent access of hazardous wildlife to open water and minimize aircraft-wildlife interactions. When physical barriers are used, airport operators must evaluate their use and ensure they will not

adversely affect water rescue. Before installing any physical barriers over detention ponds on Part 139 airports, airport operators must get approval from the appropriate FAA Regional Airports Division Office. All vegetation in or around detention basins that provide food or cover for hazardous wildlife should be eliminated. If soil conditions and other requirements allow, the FAA encourages the use of underground storm water infiltration systems, such as French drains or buried rock fields, because they are less attractive to wildlife.

According to the FAA, all stormwater facilities must drain within 48 hours of the design storm if they are located within 10,000 feet of all airports' operations areas. Furthermore, for a five mile radius (nearly 20 square miles) the AC discourages hazardous wildlife attractants and therefore detention basins that do not drain within 48 hours. In a January 17, 2008 comment letter on the Natomas Levee Improvement project, the FAA informed the Army Corps that,

FAA Advisory Circular 150/5200-33 recommends a separation distance of 10,000 feet between aircraft movement areas such as runways and taxiways, aircraft loading ramps, aircraft parking areas, and any wildlife attractant at airports normally serving turbine-powered (jet) aircraft. FAA Advisory Circular 150/5200-33 also recommends a distance of 5 statute miles between approach and departure airspace and any wildlife attractant which may cause wildlife movements into or across the approach or departure airspace. An additional resource providing information regarding aircraft-wildlife strike hazards is *Wildlife Hazard Management at Airports: A Manual for Airport Personnel (2005)* available on-line from the University of Nebraska, Lincoln at http://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=1127&context=icwdm_usdanwrc, or by searching the World Wide Web.

The 10,000 foot separation is considered a critical area where there should be no hazardous wildlife attractants. Out to five miles, the language is less absolute and, according to the Sacramento County Airport System, focuses on how multiple attractant sources may cause wildlife to move across approach and departure airspace. For example, a corn field may in itself not provide a hazard if located 4.5 miles out and not in line with a runway but if a source of water was located such that it caused wildlife to move from the corn field across an approach departure zone to get to the water, the AC advises against the land use.

The AC differentiates between detention ponds and retention ponds as follows:

Detention ponds. Storm water management ponds that hold storm water for short periods of time, a few hours to a few days.

Retention ponds. Storm water management ponds that hold water for several months.

Within Sacramento County, development is required to comply with the Stormwater Quality Design Manual for the Sacramento and South Placer Regions -

<http://www.sactostormwater.org/SSQP/development.asp>. As part of the development process, developers are commonly required to provide stormwater detention facilities. These facilities serve to collect runoff and provide treatment for water quality purposes and additionally they buffer peak stream flows by holding water and discharging after peak events. This detention of water and temporary storm flow storage can conflict with the AC if water is held over 48 hours and the facility is located within five miles of an airport.

SOUTH SACRAMENTO COUNTY HABITAT CONSERVATION PLAN

The anticipated South Sacramento County Habitat Conservation Plan (SSHCP) is a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space preservation, and agricultural protection. To develop the SSHCP, the County is partnering with Rancho Cordova, Elk Grove, Galt, the Sacramento Regional County Sanitation District, the Connector Joint Powers Authority and the Sacramento County Water Agency. The intent of the anticipated SSHCP is to minimize regulatory hurdles and streamline the permitting process for projects that engage in development-related activities inside the urban development area or UDA. The UDA corresponds to land within the County's Urban Services Boundary (USB), and to land within the city limits of Rancho Cordova, Elk Grove and Galt, and Galt's adopted sphere of influence. As currently envisioned, the SSHCP would consolidate environmental efforts to protect and enhance vernal pool habitat and other aquatic and upland habitats to provide ecologically viable conservation areas in south Sacramento County for numerous species. The intent of the SSHCP is to provide a mechanism by which the County and its partners could be authorized to issue permits that allow landowners to engage in specific development activities (covered activities) that could result in the incidental take of listed species (covered species). The intent is that the County and its partners would adopt a developer-paid fee based on loss of habitat acreage, habitat type, and long-term management costs. Fees would fund the habitat preservation, restoration and management elements of the anticipated SSHCP.

SIGNIFICANCE CRITERIA

The significance of an environmental impact cannot always be determined through use of a specific quantifiable threshold. CEQA Guidelines Section 15064(b) affirms this by the statement: "An ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting." Significance of an impact to the biological resources discussed in this chapter rely on the policies, codes, and regulations described in the Regulatory Setting section, as well as the following CEQA Sections:

Section 15065:

- (a) A lead agency shall find that a project may have a significant effect on the environment and thereby require an EIR to be prepared for the project where there

is substantial evidence, in light of the whole record, that any of the following conditions may occur:

- (1) The project has the potential to: substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; substantially reduce the number or restrict the range of an endangered, rare or threatened species; or eliminate important examples of the major periods of California history or prehistory.

Section 15382:

"Significant effect on the environment" means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

Standards for determining thresholds of significance were established based on the State CEQA Guidelines and professional standards. Impacts to biological resources were considered significant if the project would result in the following:

1. Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a special-status-species in local or regional regulatory guidance, plans, policies, or regulations or by Fish and Game or Fish and Wildlife;
2. Have a substantial adverse effect on protected surface waters, as defined by the Army Corps of Engineers Wetland Delineation Manual (1987 ed.) and/or as defined by Sections 401 and 404 of the Clean Water Act (including, but not limited to, seeps, vernal pools, swales, drainages, and perennial waterways) through direct removal, filling, hydrological interruption, or other means;
3. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
4. Conflict with any local policies or ordinances protecting biological resources; or
5. Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or approved local, regional, or state habitat conservation plan.

Note that there are no approved habitat conservation plans applicable to the Project area, and thus criteria five does not apply.

METHODOLOGY

The methodologies used to determine significance rely on documents published by or endorsed by regulatory agencies. The applicable documents and methods are cited and described in the applicable impact discussions below. In absence of such published documents, the analyses rely on the general definitions of significance.

IMPACTS AND ANALYSIS

OVERALL PROJECT IMPACT AREAS AND AVOIDED AREAS

Out of the 2,669-acre Project site, approximately 493 acres will be within areas designated as Avoided Area (Plate BR-1) while the remaining 2,175 acres will be designated for urban uses (residential, commercial, university/college campus center, etc), recreation, and agriculture (Plate BR-2). Those areas to be avoided contain grasslands with large complexes of vernal pools, wetland swales, and seasonal wetlands.

Of the approximately 493 acres that will be avoided, the largest contiguous portion is located near the western boundary and is approximately 298 acres. Two multi-purpose trails will be constructed through this primary avoided area. The trails will be elevated over swales and other linear drainages. There are two avoidance areas adjacent to the primary area, separated from it by internal roads. Together these areas are approximately 84 acres. In the center of the development is an intermittent drainage extending lineally from north to south totaling approximately 94 acres of avoided land. This area is divided by the roadway and pedestrian trail network. Some of these crossings will be overpasses which avoid wetlands. This area is buffered with low-intensity recreational land (Recreation 2), increasing the distance between the Avoidance Area and residential or commercial development. The final avoidance area is approximately 18 acres located on the southeast corner of the university/college campus center.

Approximately 194 acres of the land outside the USB is proposed to be designated as Agriculture. Approximately 49 acres of this Agriculture land is within a Federal Emergency Management Agency 100-year floodplain. The proposed Cordova Hills Special Planning Area (SPA) includes a list of facilities that would be permissible within the Agriculture designation, including a sports park, corporation yard, community garden, and solar facility. The applicant has assumed that several of the areas designated Agriculture which will be outside of the USB will not be impacted. These are the lands on the eastern Project boundary and the area on the southeastern side of the property. If a conservation easement is placed over these areas, then impacts will be avoided and the total urbanized footprint shrinks to 2,120 acres.

Plate BR-1: Proposed Avoided Areas (Project Roadways Shown)

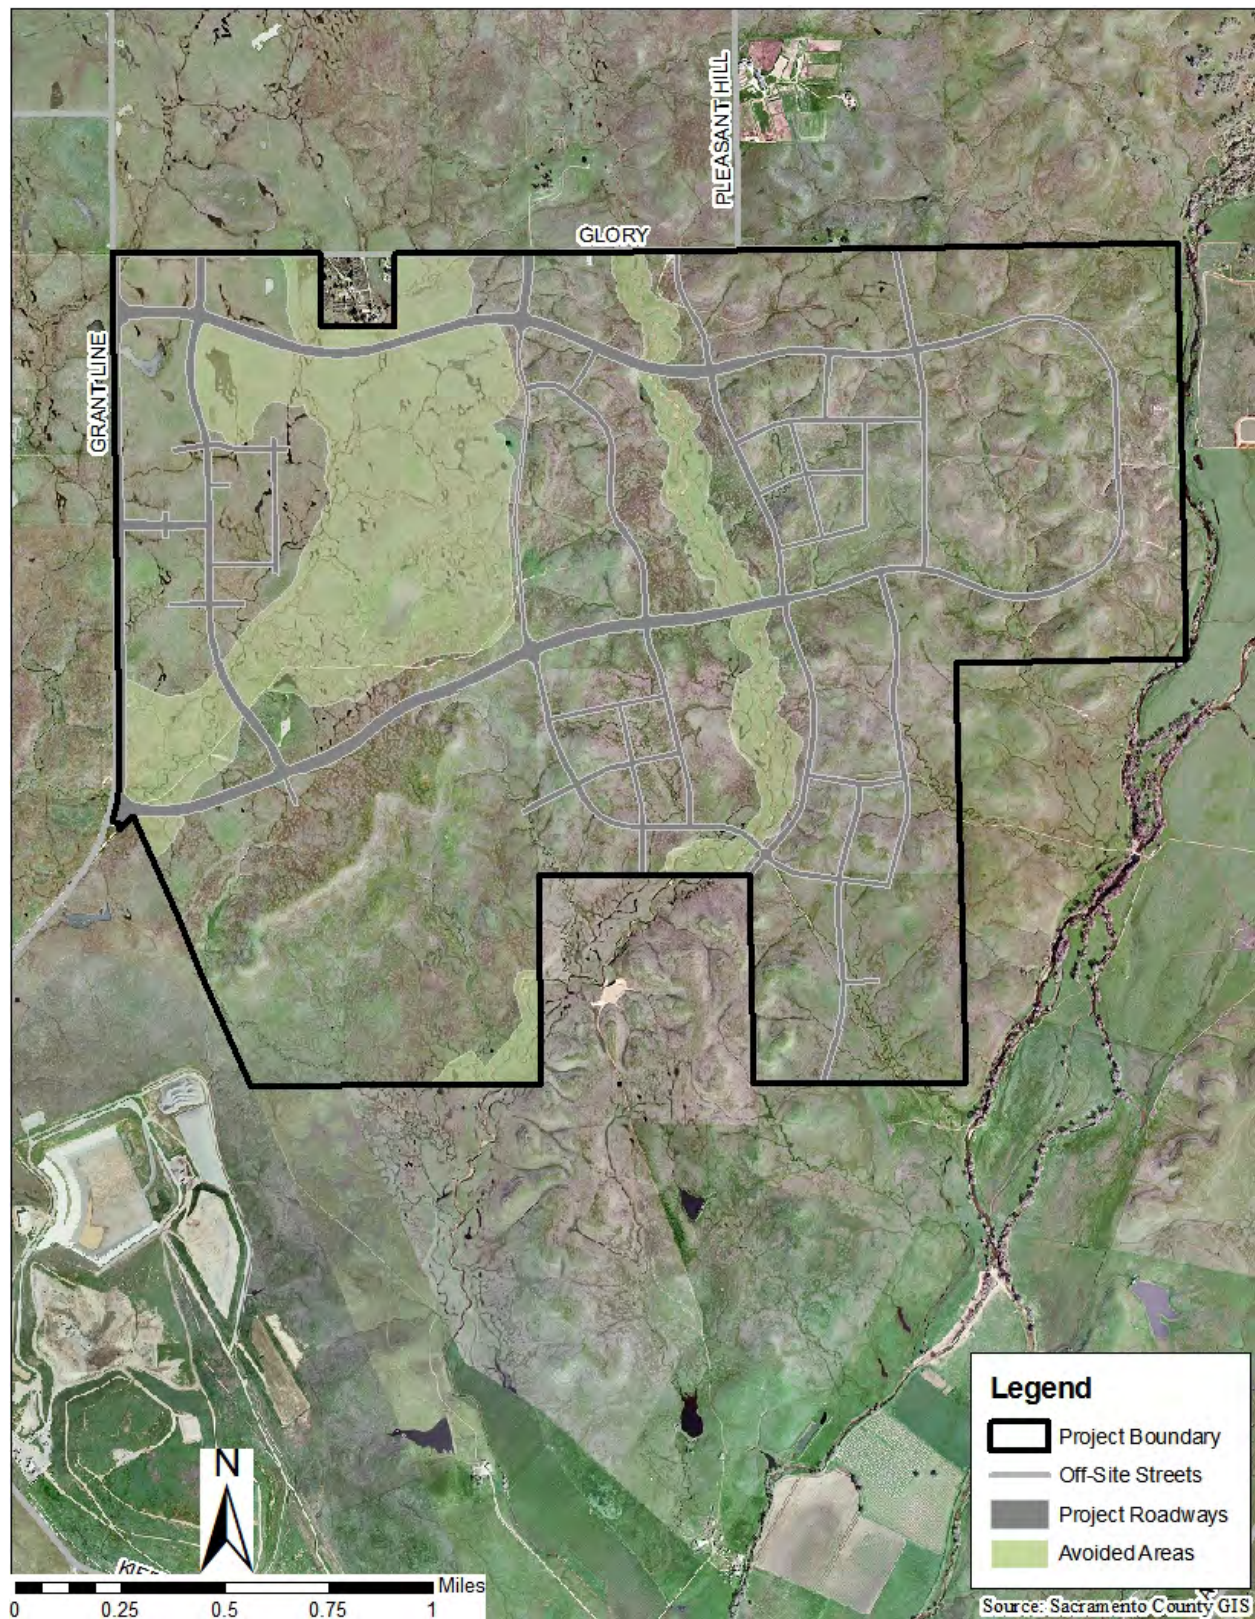

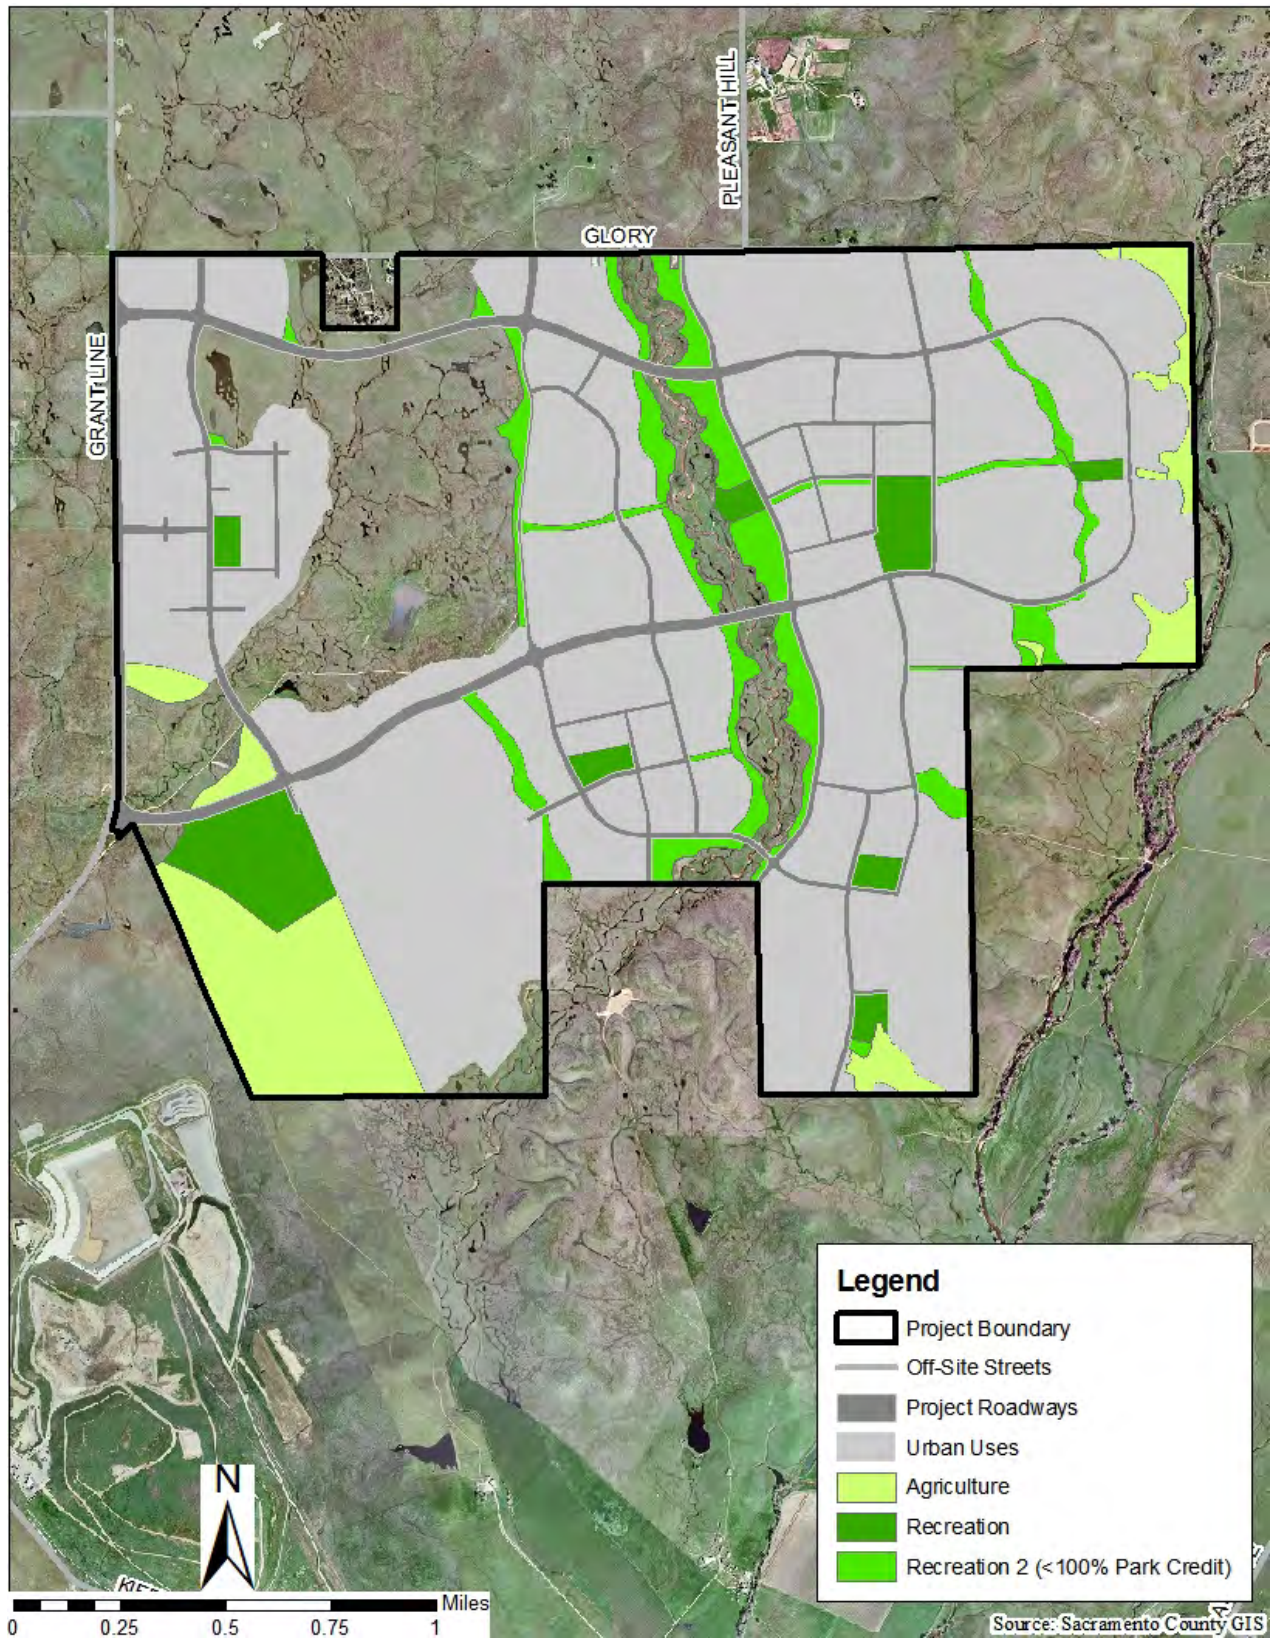

Plate BR-2: Proposed Urban, Recreation, and Agriculture Areas

WETLANDS AND SURFACE WATERS

Wetland delineations were prepared for the proposed Project by ECORP Consulting, Inc (see Appendix BR-1). Due to the changes in the Project boundaries during the planning of the development, there are several delineations that cover different portions of the Project site. **Note that in the case of the Project site, all of the delineated waters are both Waters of the State and Waters of the United States, and are thus subject to both federal and state regulation.** As shown in Plate BR-3, there are three distinct properties: Cordova Hills (Conwy), Grant Line Mesa (bufferlands), and Solitu. The wetland delineation prepared for the Conwy property identified 68.44 acres of jurisdictional wetlands. The delineation was verified by the Army Corps on March 6, 2009. The wetland delineations prepared for the Grant Line Mesa and Solitu properties identified 6.24 and 14.43 acres of jurisdictional wetlands respectively. The delineations were verified by the Army Corps on September 30, 2009. In total, there are approximately 89.1 acres of wetland resources on the Project site (Plate BR-3). Of that, the applicant has estimated that approximately 39.6 acres will be disturbed or removed to accommodate development (Plate BR-4 and Plate BR-5). The wetland resources provide habitat for several endangered or threatened species that are discussed later in this chapter. Wetland resources on the Project site vary from vernal pools to seasonal wetlands, swales, ephemeral drainages, and stock ponds. Table BR-1 identifies the classification and acreage of wetlands present on the Project site and Table BR-2 identifies the impacts.

Table BR-1: Wetland Resources

Classification	Acreage
Vernal Pool	47.51
Seasonal Wetland	4.77
Seasonal Wetland Swale	18.22
Intermittent Drainage	16.90
Seep, Stock Pond, Creek	1.71
Total	89.11

Plate BR-4: Applicant Estimate of Wetland Avoidance and Impacts

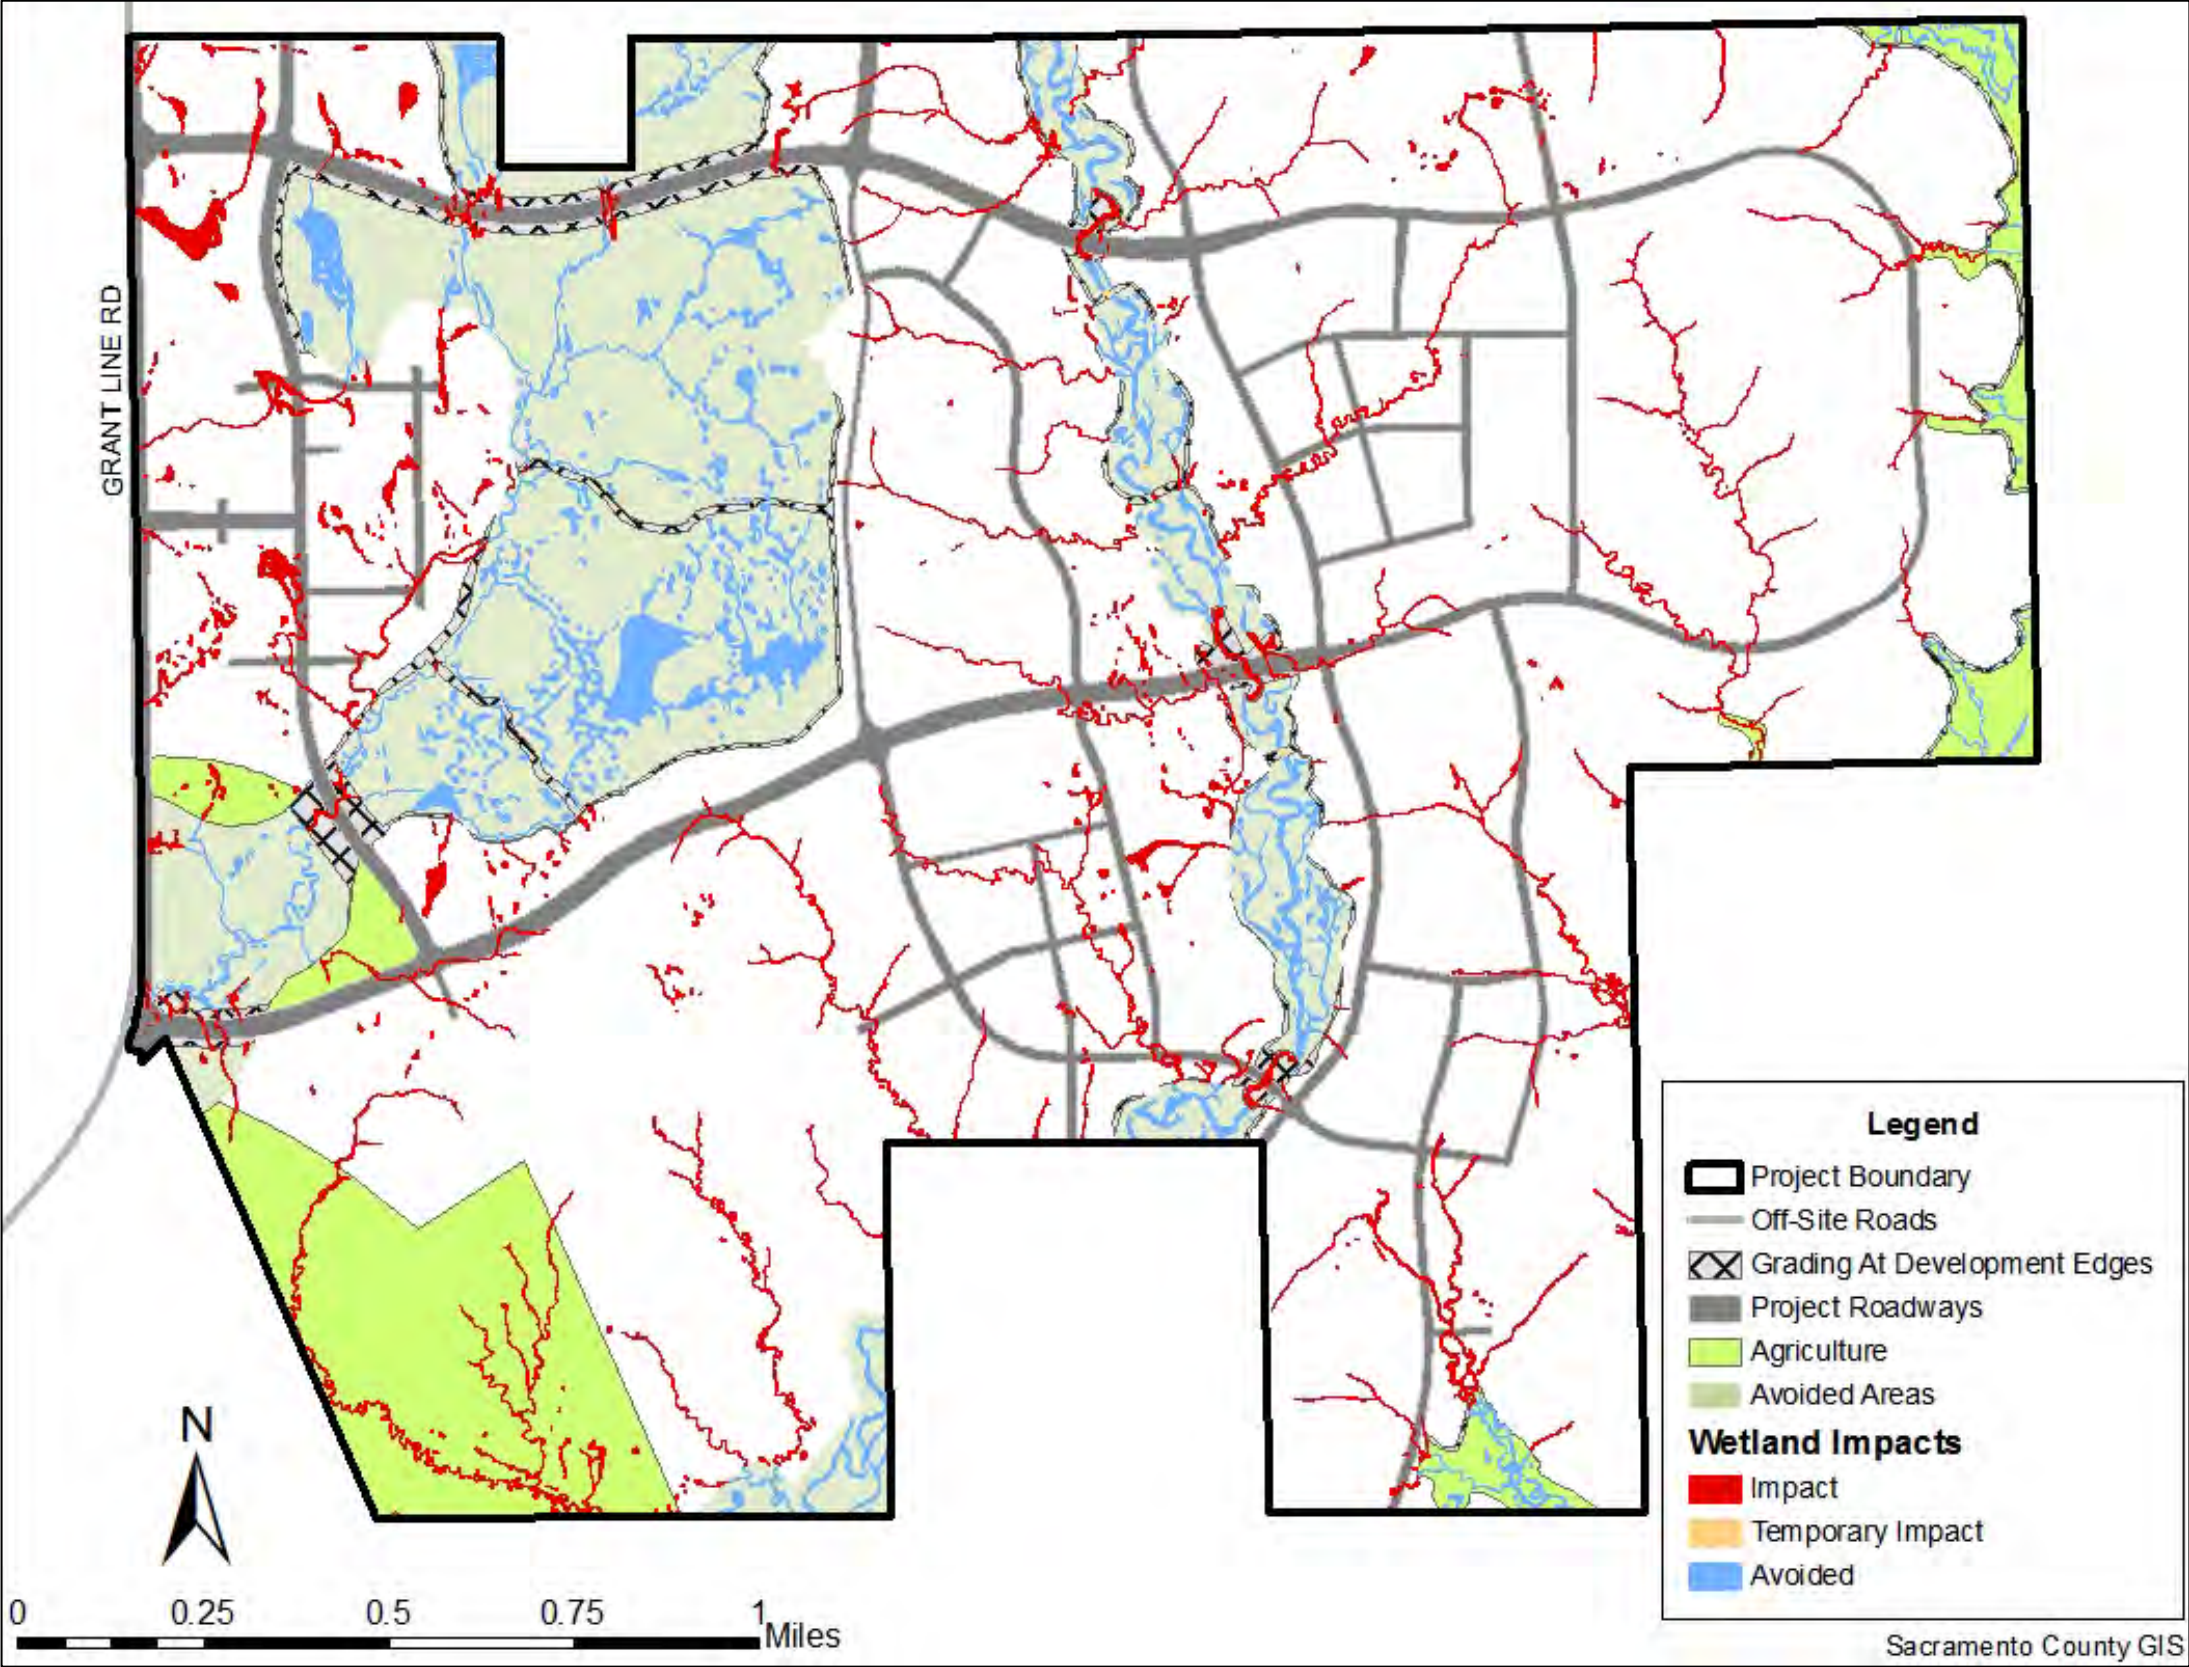

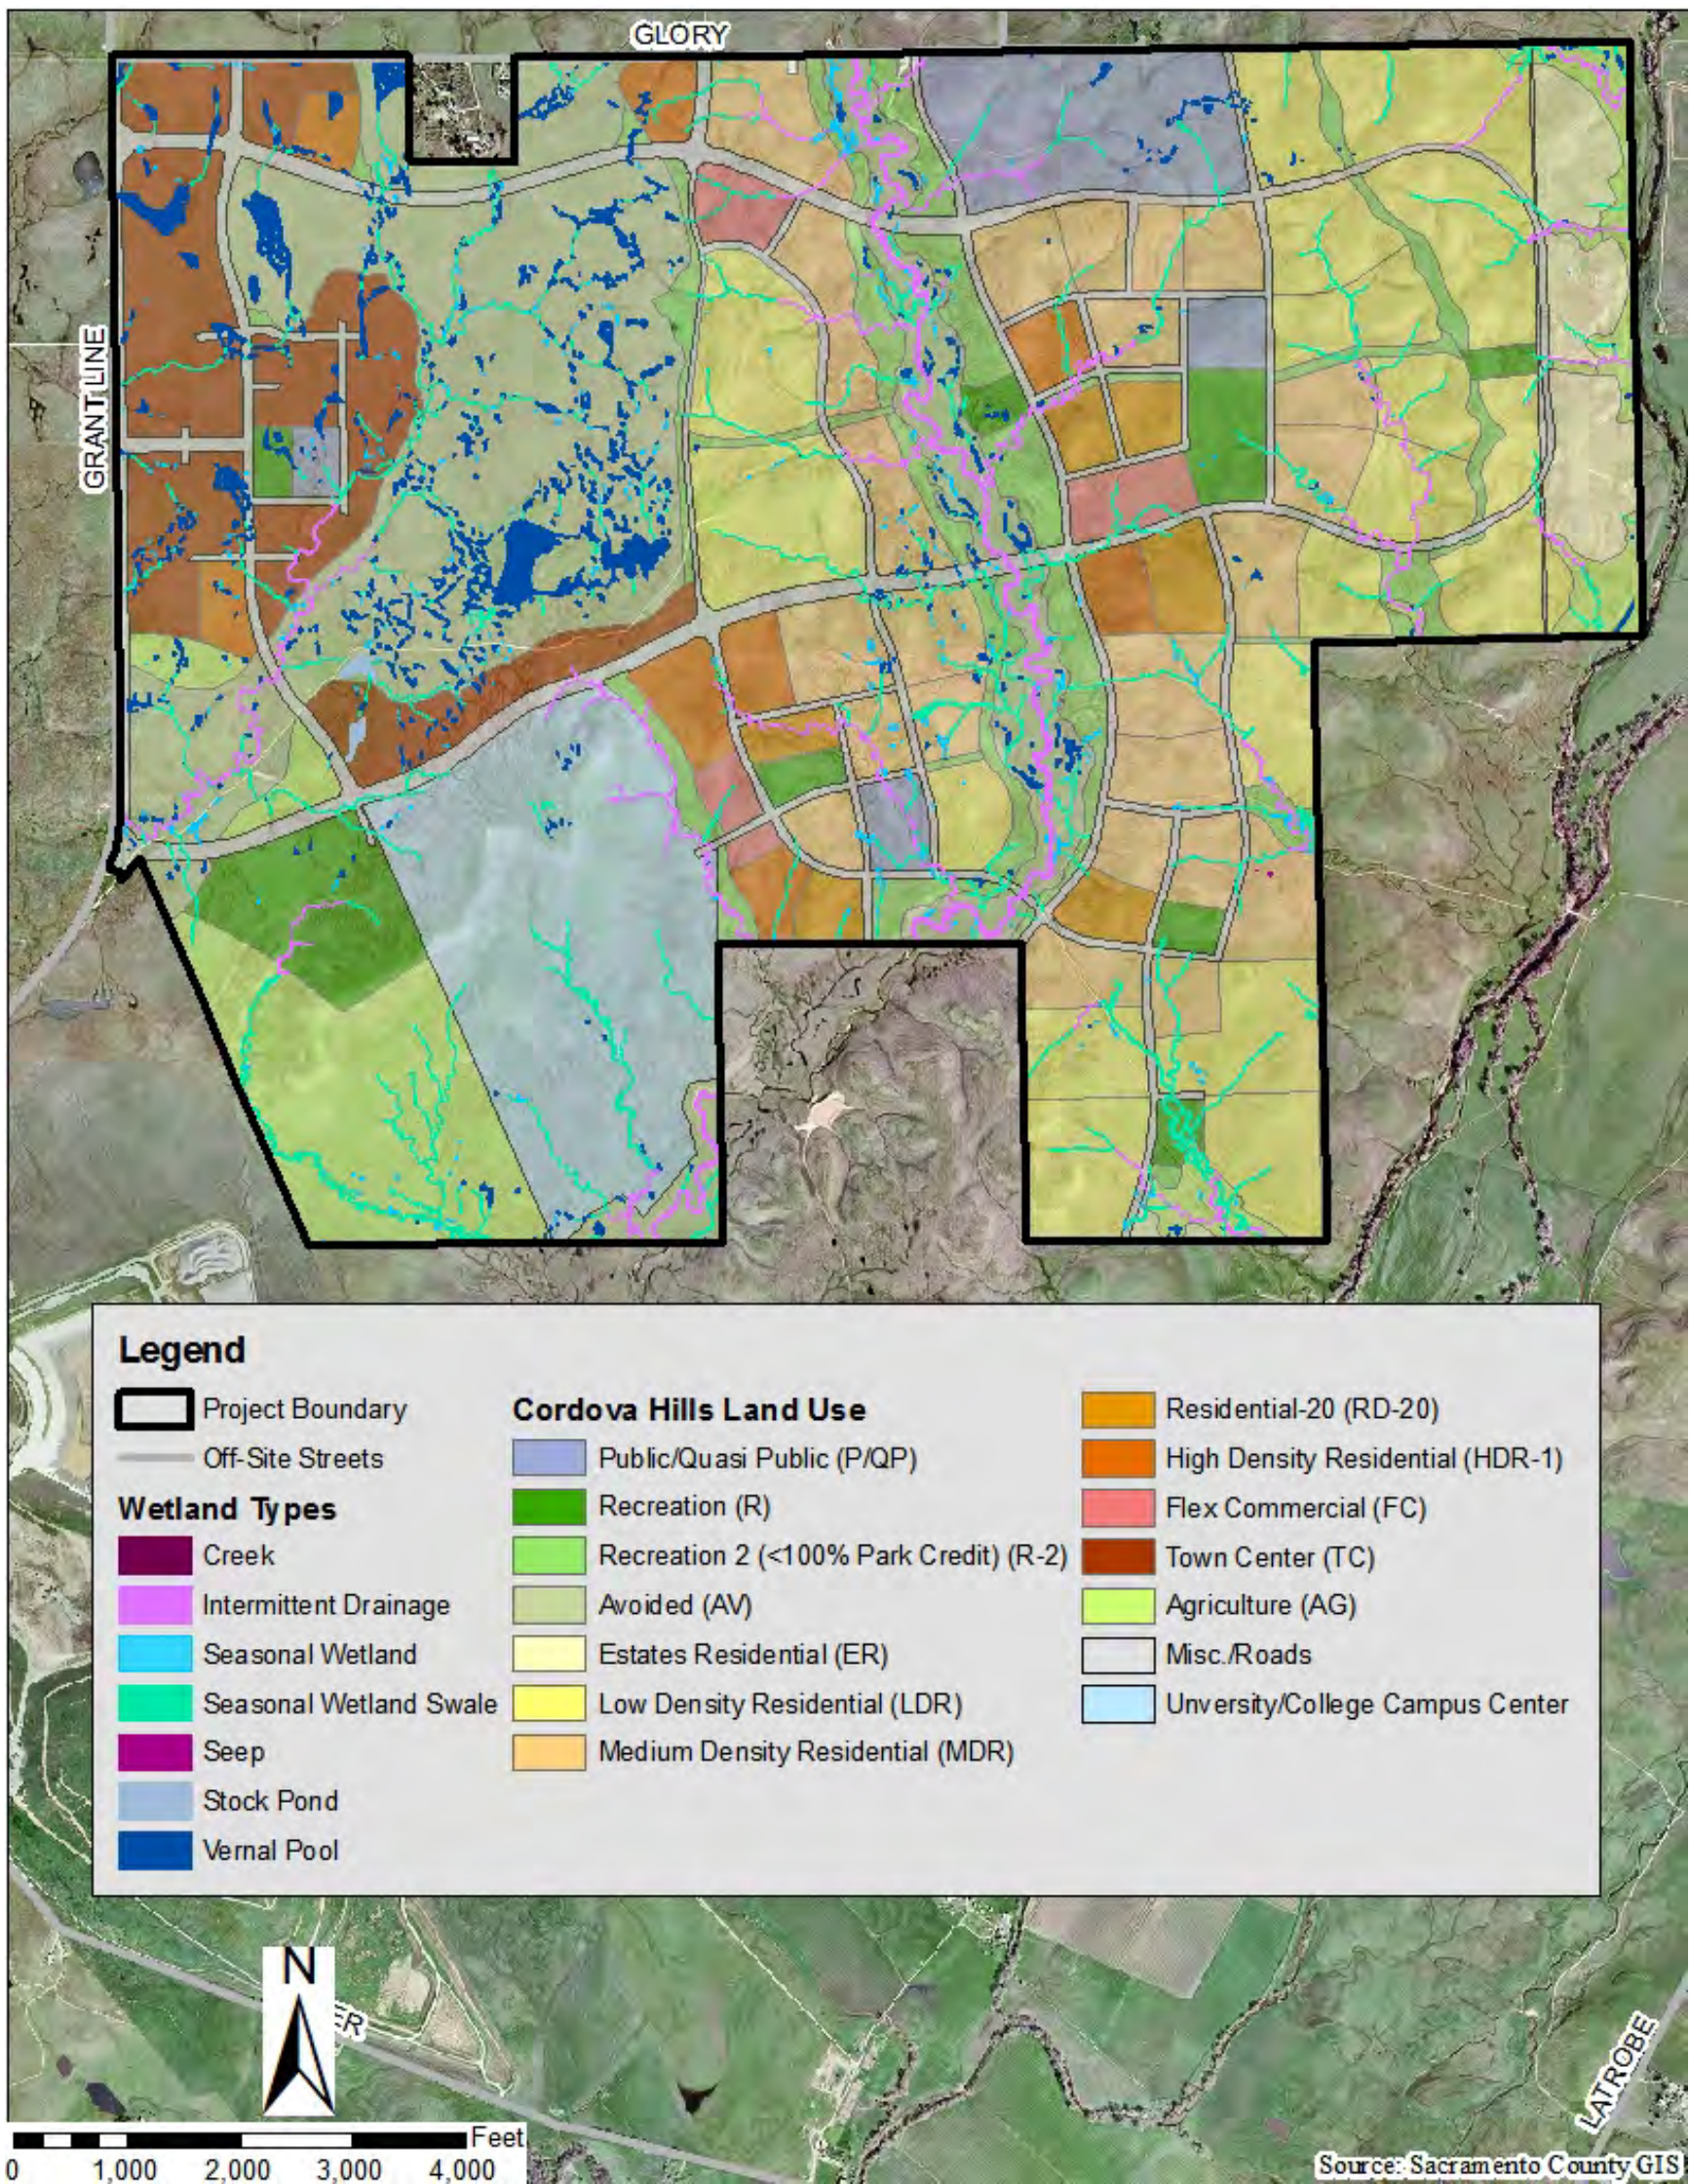

Plate BR-5: Wetlands and Project Land Uses

There are two general types of impact to habitats: direct and indirect. An indirect impact occurs when activities near the wetland cause secondary effects, such as hydrologic changes which reduce the amount of water flowing to the wetland, or drift of pesticides and other pollutants into the wetland. For wetlands which may contain special status species, the rule of thumb for total avoidance of both direct and indirect impacts requires that construction and other activities occur at least 250 feet from the wetland³. For surface waters that do not contain special status species, Environmental Review has established a buffer of 50 feet as a rule of thumb. Note that these rules may be supplanted by site-specific analyses of hydrologic and other conditions. A direct impact occurs when a wetland is destroyed by construction activities within the wetland margin; however, the programmatic consultation for vernal pool resources states that if any part of a vernal pool is destroyed, then the entire pool is directly affected. This statement is applied to all other non-linear wetlands for this analysis. For linear wetlands, this analysis considers all affected areas within 50 feet of the filled area to be directly affected (based on the Environmental Review wetland buffer).

As illustrated by the avoidance plan and land use plan (Plate BR-4 and Plate BR-5), two land use categories are located in areas where on-site wetlands will be avoided. The first is Avoided Area, in which the proposed SPA allows only trails, outdoor classrooms, and interpretive signage. The second land use is agriculturally zoned land, in which the proposed SPA allows a variety of uses such as park and ride lots, detention basins, solar farms, corporation yards, community gardens, and other developed uses. Approximately 2.7 acres of wetlands are shown as avoided within some of the agriculturally designated areas primarily due to the presence of a flood zone. The strategic placement of the Avoided Area encompasses the greatest concentrations of wetland features (including lineal features) on the Project site.

The overarching goals of General Plan Policies CO-64 and -65, OS-1 and -2 are to preserve large, high quality, contiguous pieces of land which support habitat for a large range of plant and animal species. Project design includes large areas of avoided open space that incorporates several types of wetland resources (varying vernal pools, seasonal drainages and associated upland) and species. Project design appears to meet the intent of the General Plan policies.

DIRECT IMPACTS

According to the plan as depicted in Plate BR-4 and as tabulated Table BR-2, the Project will directly impact 39.63 acres of wetland resources, which is 44 percent of the wetlands on the Project site. Conversely, 49.48 acres of wetland resources will be avoided. The wetland delineations have been verified by the Army Corps and an

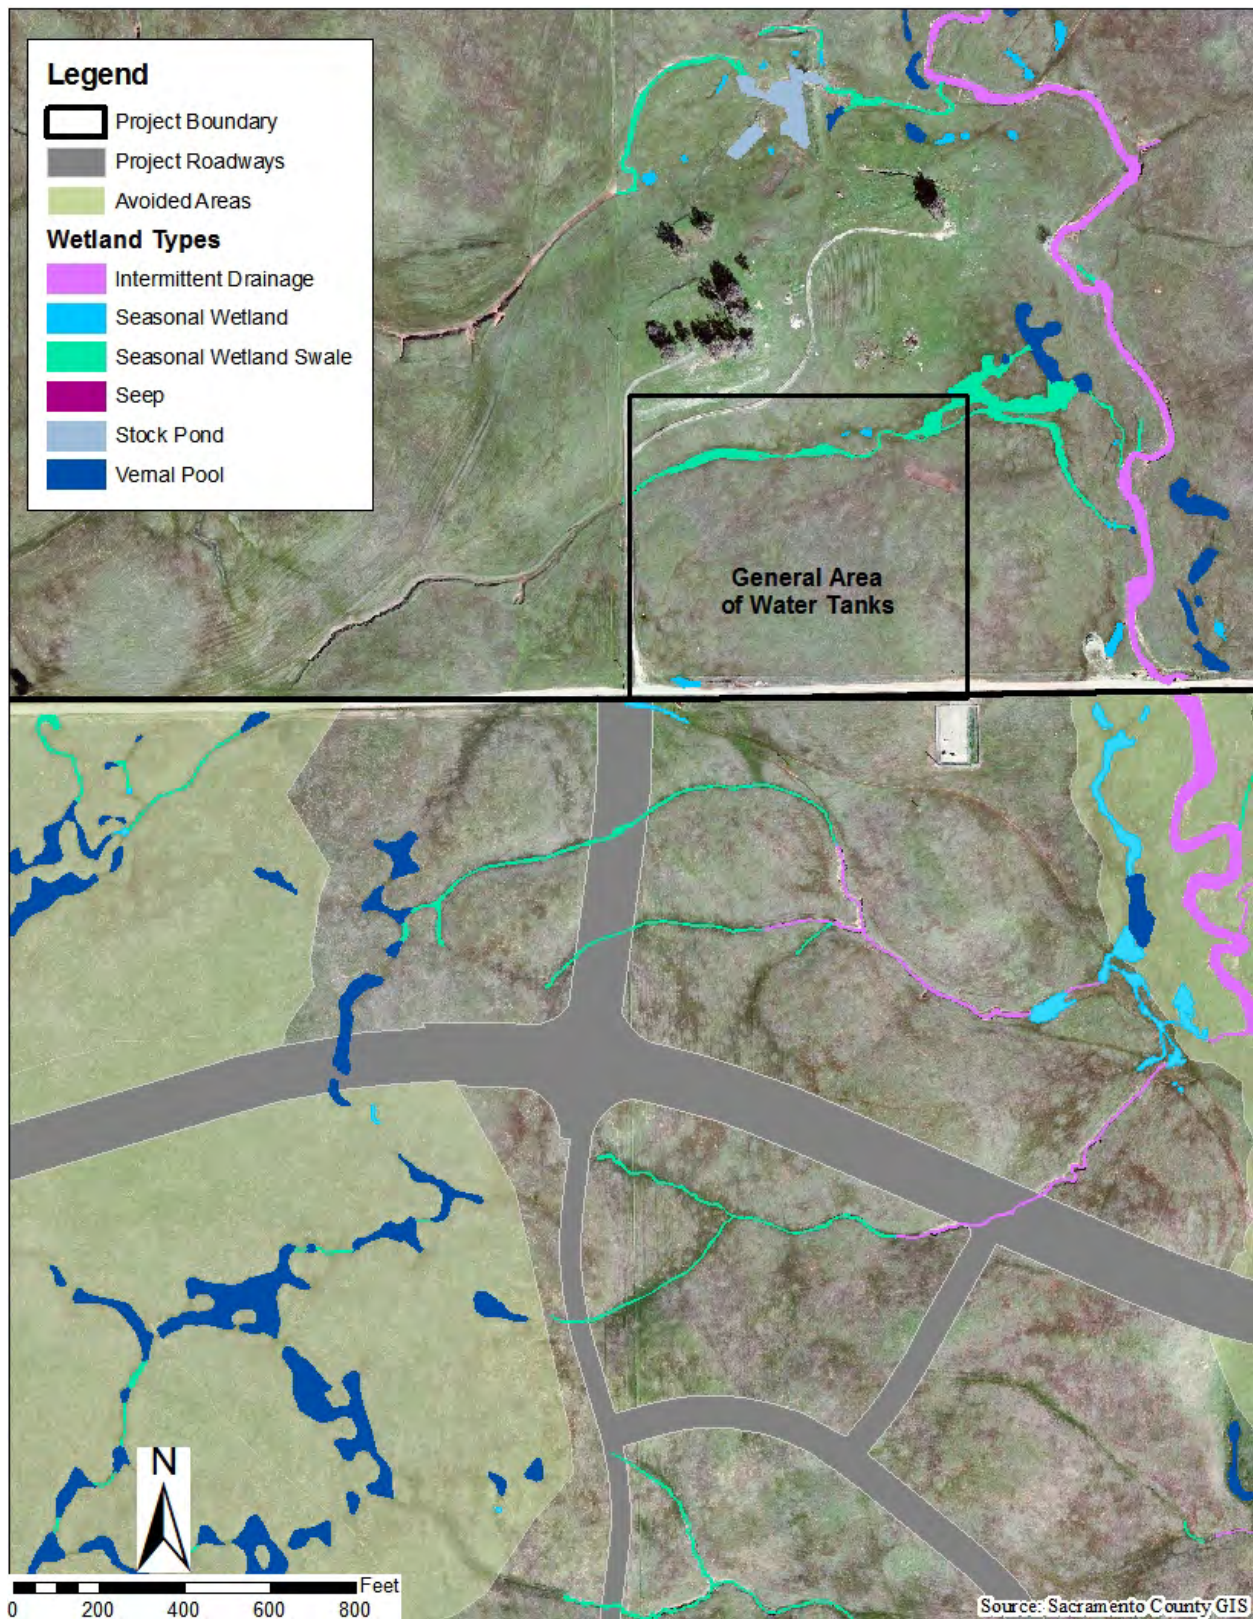

³ Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans Within the Jurisdiction of the Sacramento Field Office, California (February 28, 1996)

application for a Section 404 permit for wetland loss has been submitted, but a permit has not yet been issued. Thus, the amount of wetland area that will require mitigation has not been determined by Army Corps. The applicant has prepared a Wetland Avoidance and Impact Plan exhibit (Impact exhibit), which has been summarized in Plate BR-4. Review of the Impact exhibit indicates that the applicant's analysis properly shows that if any part of a non-linear wetland is destroyed, then the entire pool is directly affected. Linear wetlands, on the other hand, are only shown to be directly impacted where the portion will be destroyed. Further work to supplement the applicant's analysis was performed by Environmental Review, to determine how much additional non-linear wetland would be impacted by applying the 50-foot buffer rule. The analysis found that an additional 0.33 acres of intermittent drainage would be impacted, and an additional 1.11 acres of seasonal wetland swale would be impacted. This brings the total direct impacts to 41.04 acres, and total wetland loss to 46 percent.

In addition to the above, the Project may also involve off-site wetland impacts associated with the construction of water tanks and other utilities. Plate BR-6 depicts the general location of the proposed water tanks, and the wetlands delineated within that area. The area includes three seasonal wetlands of 0.001 acres, 0.006 acres, and 0.019 acres and approximately 0.3 acres of a seasonal wetland swale. The tanks will not be designed until later Project phases, when the infrastructure is needed, so although at this time it is conservatively assumed that all of the wetlands described could be lost, it is likely that this overestimates the impact; the applicant has stated that total avoidance is intended, which is reflected by their current Section 404 permit application. Nonetheless, the conservative estimate brings total impacts to 41.37 acres (46%).

According to Army Corps mitigation guidelines and County mitigation requirements, minimum mitigation requirements are 1:1 (no net loss). Based on the minimum requirements, the Project applicant would have to mitigate for direct impacts to 41.37 acres of wetlands. It should be noted that species habitat mitigation (described later in this chapter) generally requires greater mitigation ratios. If wetland mitigation is pursued through purchasing credits at agency approved mitigation banks or through land dedication outside of the project area, suitable land is first sought within the same watershed that is disturbed, thereby preserving a portion of the micro-ecosystem of the watershed. Some areas to the south of the Project site are already under conservation easements to mitigate landfill activities. However, north of the Project site are extensions of the same drainage swale features and preservation of those features would connect and protect a greater, more contiguous area.

Plate BR-6: Water Tank Wetland Impacts

It should also be noted that Fish and Wildlife has published the “Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon” (Recovery Plan), the purpose of which is to achieve self-sustaining populations of many species which rely on vernal pools. The Recovery Plan identifies “core areas”, which are areas that are vital to achieve the goals of the plan. Core areas are ranked 1, 2, or 3 depending on their overall priority for recovery, with rank 1 being highest priority. The majority of the Project site lies within the Mather core area (Plate BR-7), which is ranked 1. Fish and Wildlife has indicated in comments at the scoping meeting for the Project that preservation of vernal pools in the Mather core area is of high priority, and that any mitigation required for the Project should take place within the core area.

INDIRECT IMPACTS

Avoided areas may not fully protect wetland features if not designed correctly. Among the possible indirect impacts are alterations to existing watersheds that cause a reduction in water flow to the wetland areas. In order to assess potential hydrologic impacts, a watershed analysis for existing wetlands was prepared by ECORP Consulting, Inc in 2011 (incorporated by reference and available for review at the Division of Environmental Review and Assessment, 827 7th Street, Rm. 220, Sacramento, CA). This analysis is helpful to determine if the proposed avoided areas are sufficient to support the wetland features contained within them. Other indirect impacts relate to effects on the species that use the habitat, and thus those impacts are discussed in the Special Status Species section.

The analysis used a LIDAR (light imaging detecting and ranging) based model to develop topographic contours of the Project site. The topographic contours were mapped and the wetland delineation was overlaid. The individual watersheds of the features were then defined and mapped. Seasonal wetlands and their respective watersheds were evaluated to determine the appropriate watershed size to sustain normal hydrologic function. Statistical regression analysis⁴ yielded a linear relationship between the size of a wetland and the corresponding size of the watershed. The modeling concluded that for each acre of seasonal wetland and vernal pool, 1.299 and 1.405 acres, respectively, of upland watershed is required to sustain normal hydrologic function. The impact analysis applied these ratios to wetland features within the avoided areas and determined that two vernal pools would not have the minimum watershed necessary to maintain normal hydrologic function. These two wetlands were included in the assessment of direct impacts. According to the watershed analysis, two vernal pools may be impacted; however, the proposed avoided areas provide adequate watershed area to sustain normal hydrologic functions for the majority of avoided wetland features.

⁴ Regression analysis is used to predict the value of one variable (dependent) based on the value of one or more (independent) variables. For this analysis the size of a wetland (independent variable) is used to predict the size of corresponding micro-watersheds (dependent variable).

6-27

CONCLUSION OF DIRECT AND INDIRECT IMPACTS

Prior to direct impacts to wetland features the Project applicant will be required to obtain all required permits from the Army Corps, Fish and Wildlife, Fish and Game, and the Regional Water Board. Permits may be obtained through individual permits from the agencies, or if the County adopts the SSHCP and the Project is a covered activity, it would be subject to all requirements of that plan. At the time of writing this document, the small portion of the Project outside of the USB is not in the anticipated Urban Development Area of the SSHCP; therefore, even if the SSHCP were adopted, development activities within this area may still require individual permits from the various agencies. Based on the analysis herein, the County will require 1:1 mitigation for up to 41.37 acres of direct wetland impacts.

Future development within the SPA could include amendments to the SPA which would modify the Avoided Area boundaries. This could result in additional incremental losses of needed uplands and/or wetlands, increasing the severity of what is already a significant impact in an area noted as vital to the recovery of vernal pool resources. For this reason, mitigation is also included which would require the establishment of a permanent conservation easement over all areas designated as Avoided.

Impacts to wetland resources are significant without mitigation. While the Project applicant is proposing to avoid a considerable number of vernal pools, swales and seasonal wetlands, the Project nonetheless will result in the loss of a considerable amount of wetlands – 41.37 total wetland acres, which is approximately 46% of the total wetlands on the site, of which 15.6 acres are vernal pools (which is 33% of the vernal pools on the site). Impacted wetlands will be off-set through permitting replacement credits and requirements; however, the loss of 46% of wetlands located on the Project site, especially given that this is in a rank-1 recovery area, is still considered significant after mitigation. Impacts to wetlands are considered *significant and unavoidable*.

MITIGATION MEASURES:

BR-1. To compensate for the permanent loss of wetlands, the applicant shall perform one or a combination of the following prior to issuance of building permits, **and shall also obtain all applicable permits from the Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Central Valley Regional Water Quality Control Board, and the California Department of Fish and Game:**

- A. Where a Section 404 Permit has been issued by the Army Corps of Engineers, or an application has been made to obtain a Section 404 Permit, the Mitigation and Management Plan required by that permit or proposed to satisfy the requirements of the Corps for granting a permit may be submitted for purposes of achieving a no net-loss of wetlands. The required Plan shall be submitted to the Sacramento County Environmental Coordinator, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service for approval prior to its implementation.

- B. If regulatory permitting processes result in less than a 1:1 compensation ratio for loss of wetlands, the Project applicant shall demonstrate that the wetlands which went unmitigated/uncompensated as a result of permitting have been mitigated through other means. Acceptable methods include payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.
- C. The Project applicant may participate in the South Sacramento Habitat Conservation Plan if it is adopted, and if the Project area and activities are covered. The applicant shall prepare Project plans in accordance with that Plan and any and all fees or land dedications shall be completed prior to construction.

BR-2. Prior to issuance of building permits, all areas designated within the SPA as Avoided shall be placed within a permanent conservation easement, which shall be reviewed and approved by the Environmental Coordinator. At a minimum, the permanent conservation easements must cover all areas which are required to be preserved as part of the Section 404 and Section 401 wetland permits.

SPECIAL STATUS SPECIES

A "special status" species is one which has been identified as having relative scarcity and/or declining populations. Special status species include those formally listed as threatened or endangered, those proposed for formal listing, candidates for federal listing, and those classified as species of special concern. Also included are those species considered to be "fully protected" by Fish and Game, those granted "special animal" status for tracking and monitoring purposes, and those plant species considered to be rare, threatened, or endangered in California by the California Native Plant Society (CNPS).

There are multiple status designations applied to animal and plant species; the relevant definitions are provided below⁵:

Endangered Species: Any species which is in danger of extinction throughout all or a significant portion of its range.

Threatened Species: Any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

⁵ Source: California and Federal Endangered Species Acts, <http://www.dfg.ca.gov/wildlife/nongame/ssc/>, http://www.dfg.ca.gov/wildlife/nongame/t_e_spp/fully_pro.html, and <http://www.cnps.org/cnps/rareplants/ranking.php>.

Species of Concern: Any species with declining population levels, limited ranges, and/or other factors that make them vulnerable to extinction and may ultimately qualify the species for threatened or endangered status.

Fully Protected: The classification of Fully Protected was California's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Most have subsequently been defined as endangered or threatened, but there are exceptions.

Special Animals: A general term that refers to all of the taxa that Fish and Game is interested in tracking, regardless of their legal or protection status. Though the species themselves have not declined to the extent that they are listed by one of the classifications noted above (endangered, etc), such species are closely associated with a habitat that is declining in California.

List 1B Plants: Plants that are rare throughout their range, and have declined significantly over the last century. The majority of plants on this list are endemic to California.

List 2 Plants: The same as List 1B plants, except that List 2 plants are common outside of California.

Relevant species for analysis were identified based on species information gathered from the Fish and Wildlife Sacramento office for federally listed species, from Fish and Game, and from CNPS. A Fish and Game California Natural Diversity Database (CNDDDB 2011) search was also conducted. For the initial CNDDDB search the study area was all lands within ten miles of the Project boundary, while the Fish and Wildlife list was based on species present within the Buffalo Creek 7.5-minute United States Geological Survey quadrangle. For plants, the analyses below rely on rare plant surveys performed by ECORP Consulting, Inc (Appendix BR-3).

Table BR-3 reports the species identified in the species searches and rare plant surveys. The table reports the likelihood of occurrence based on habitat presence either on the site or in proximity of the site, survey results (if any), and nearby recorded species occurrences. Habitat proximity is based on published buffers established by a regulatory agency. For instance, guidance for the Swainson's hawk establishes a nesting buffer of ½-mile, and includes mitigation requirements for construction activities in that range. Note that some species are listed for loss of foraging habitat, while others may be listed for loss of breeding habitat. If the species is listed for loss of a particular habitat, it is so reported in Table BR-3 and the likelihood of occurrence will be based specifically on that habitat type. Likelihood of occurrence is rated as Not Present, Low Potential, Moderate Potential, High Potential, or Present, which are defined as:

Not Present: A survey was performed by a qualified biologist, and the species was not found or habitat is absent both on the site and within one mile of the site.

Low Potential: Absence cannot be definitively stated because no surveys were performed, but habitat is near-absent or marginal.

Moderate Potential: Habitat is present, but the species has not been observed within five miles of the site.

High Potential: Habitat is present and the species has been observed within five miles of the site.

Present: The CNDDDB contains a recorded occurrence on the site, or the species was found during site-specific surveys.

Species which are not present or were found to have a low potential of occurrence are not discussed further in subsequent analysis sections.

Table BR-3: Special Status Species Matrix

Species	Status ¹	Habitat ¹	Potential for Occurrence
BIRDS			
Bald Eagle <i>Haliaeetus leucocephalus</i>	FSC	Bald eagles generally nest near coastlines, rivers, large lakes or streams that support an adequate food supply. Bald eagles are opportunistic feeders. Fish comprise much of their diet, but they also eat waterfowl, shorebirds/colonial waterbirds, small mammals, turtles, and carrion.	Low Potential. There are no large trees, cliffs, or other structures for nesting. There are no large impoundments or rivers within the Project site. Carson Creek flows nearby, but the creek is not very large or deep.
Bank Swallow <i>Riparia riparia</i>	ST	Requires vertical banks and cliffs with fine-textured or sandy soils near streams, rivers, ponds, lakes, and the ocean for nesting. Feeds primarily over grassland, shrubland, savannah, and open riparian areas. Primarily listed for destruction of nesting habitat.	Low Potential. There is no nesting habitat on the Project site, nor does Carson Creek provide nesting habitat in the vicinity of the Project.
Burrowing Owl <i>Athene cunicularia hypugea</i>	FSC, CSC	Frequents open grasslands and shrublands with perches and burrows. Nests and roosts in old burrows of small mammals and rubble piles (Zeiner et. al., 1990).	Present. Two recorded occurrences in the CNDDDB in the northwestern portion of the Project site; presence was also noted during a site visit. Suitable nesting and foraging habitat exists over the entire Project site.
Cooper's hawk <i>Accipiter cooperii</i>	SA	Frequents landscapes with wooded patches and groves, along with woodland edge habitats. Nests in riparian areas. Listed for nesting impacts.	Moderate Potential. Foraging habitat is not present on the site, but the site is within 500 feet of suitable nesting trees. Impacts are addressed in the "Nesting Raptors" section.
Double-crested cormorant <i>Phalacrocorax auritus</i>	SA	Associated with estuaries, rivers, and oceans, the species is known to occur along major rivers in the Central Valley. A colonial nester, the species prefers cliffs, rugged slopes, or tall trees beside water. Range is restricted to 5 – 10 miles of the nesting area. Listed for the protection of nesting colonies.	Not Present (nesting). Carson Creek does not provide suitable foraging area, as it is not a large or deep enough open water habitat. The nearest recorded nesting colony is along the American River, over six miles to the north. During the site visit Carson Creek was investigated for the presence of nesting colonies and none were observed. The point of observation was at an elevation that allowed observation of the tree tops.

Species	Status ¹	Habitat ¹	Potential for Occurrence
Ferruginous hawk <i>Buteo regalis</i>	SA	Frequents open grasslands, sagebrush flats, desert scrub, low foothills surrounding valleys, and fringes of pinyon-juniper habitats. Listed for preservation of wintering habitat.	Moderate Potential. The nearest recorded occurrence is just under six miles west of the site. The site contains foraging habitat for the species.
Golden Eagle <i>Aquila chrysaetos</i>	CFP	Found in rolling foothills with open grasslands, scattered trees, and cliff-walled canyons. Nests on cliffs and in large trees in open areas (Zeiner et. al., 1990).	Moderate Potential. Land to the east of the site provides the rolling wooded foothills suitable to the species, and may provide nesting habitat – though the species does prefer cliffs. The species could forage on the grassland of the site. There are no recorded occurrences for this species within ten miles.
Grasshopper sparrow <i>Ammodramus savannarum</i>	SA	Occurs in dry, dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches. Builds nest of grasses and forbs in a slight depression in ground, hidden at base of an overhanging clump of grasses or forbs. Listed for loss of nesting habitat.	Moderate High Potential. The nearest recorded occurrence is approximately 2.5 miles east of the site. The site contains potential foraging and nesting habitat, although there is a lack of shrubs or other singing perches which may inhibit use of the site.
Great blue heron <i>Ardea herodias</i>	SA	Associated with estuaries, rivers, and oceans, the species is known to occur along major rivers in the Central Valley. A colonial nester, the species prefers tall trees beside water. The range is restricted to within 10 miles of the nesting area. Listed for the protection of nesting colonies.	Not Present (nesting). The species was observed foraging in Carson Creek during a site visit. The point of observation was at an elevation that allowed observation of the tree tops, and no nesting colonies were observed along Carson Creek in the vicinity of the site. The site itself does not contain habitat, and the nearest recorded nesting colonies are over six miles to the north, along the American River.
Great egret <i>Ardea alba</i>	SA	Associated with estuaries, rivers, and oceans, the species is known to occur along major rivers in the Central Valley. A colonial nester, the species prefers cliffs, rugged slopes, or tall trees beside water. Listed for the protection of nesting colonies.	Not Present (nesting). The site itself does not contain habitat, and the nearest recorded nesting colonies are over six miles to the north, along the American River. During the site visit Carson Creek was investigated for the presence of nesting colonies and none were observed. The point of observation was at an elevation that allowed observation of the tree tops.

Species	Status ¹	Habitat ¹	Potential for Occurrence
Loggerhead Shrike <i>Lanius ludovicianus</i>	CSC	Listed for loss of breeding habitat, the species breed mainly in shrublands or open woodlands with a fair amount of grass cover and areas of bare ground.	Low Potential. Though the site contains foraging habitat, there are no shrublands or open woodlands on the site, and thus no breeding habitat. The nearest recorded occurrence is just over three miles to the west.
Northern Harrier <i>Circus cyaneus</i>	FSC, CSC	Frequents meadows, grasslands, open rangelands, desert sinks, and fresh and saltwater emergent wetlands (Zeiner et. al., 1990). Nests on ground in shrubby vegetation, usually at marsh edge.	Moderate High Potential. Foraging habitat is present on the site, and though no occurrences are recorded within ten miles the species was observed foraging during a site visit . The site lacks the shrubby vegetation preferred for nesting, though dense, tall grasses on the site could be used .
Swainson's Hawk <i>Buteo swainsoni</i>	ST	Breeds in stands with few trees in juniper-sage flats, riparian areas, and oak savannah. Requires adjacent suitable foraging areas such as grasslands or grain fields supporting rodent populations (Zeiner et. al., 1990).	High Potential. Species recorded nesting less than ½-mile from the site, along Deer Creek. On this basis, the species is highly likely to forage on the Project site.
Tricolored Blackbird <i>Agelaius tricolor</i>	FSC, CSC	The species is listed for breeding habitat. Known to nest near marshes in large (several hundred to several thousand birds) breeding colonies in habitat made up of blackberry thickets, bulrush (<i>Scirpus</i> sp.) or cattails (<i>Typha</i> sp.) patches.	Moderate Potential. No breeding habitat is present on the site, but portions of the site are within 300 feet of the nearest potential habitat alongside Carson Creek. This places portions of the Project within the typical buffer established to avoid construction disturbance of nesting birds.
White-tailed Kite <i>Elanus leucurus</i>	CFP	Inhabit low-elevation grasslands, wetlands dominated by grasses, oak woodlands, and agricultural and riparian areas (Dunk 1995).	High Potential. Foraging habitat is present on the Project site and nesting habitat is available within ½-mile along Carson and Deer Creeks. The nearest recorded nest site is just over one mile to the southwest.
MAMMALS			
American Badger <i>Taxidea taxus</i>	CSC	Occurs in a variety of habitats, including grasslands and oak woodlands with friable soils for digging (Zeiner et. al., 1990).	Low Potential. The nearest recorded occurrence is approximately 2.5 miles to the west. The only suitable denning habitat is possible along the banks of Carson and Deer Creeks to the east and south of the Project site. There is no proposed development within the floodplain of the creek.

Species	Status ¹	Habitat ¹	Potential for Occurrence
REPTILES			
Northwestern Pond Turtle <i>Clemmys marmorata</i>	FSC, CSC	Occurs in perennial ponds, lakes, rivers, and streams with suitable basking habitat (mud banks, mats of floating vegetation, partially submerged logs) and submerged shelter (Zeiner et. al., 1990). Require some slack- or slow-water aquatic habitat. Nests upland, on unshaded south-facing slopes with friable soils that have a high percentage of clay or silt (Jennings and Hayes, 1994).	Low Potential. There is one recorded observance of the species less than a mile to the east of the Project site, within the Carson Creek floodplain. The Project does not propose any development within the Carson Creek floodplain, and the areas of the site that are upland to the floodplain are on steep eastward-facing slopes. There is no suitable habitat on the Project site. Rathburn et. al. (1992) recommended protecting at least 500 meters (approximately 1,600 feet) from known occupied aquatic habitat. The project is beyond this distance from known habitat.
Giant Garter Snake <i>Thamnophis gigas</i>	FT, ST	Endemic to valley floors of the Sacramento and San Joaquin Valleys. Prefers freshwater marsh and low gradient streams. Has adapted to rice agriculture, drainage channels, and irrigation ditches. Requires permanent water, emergent vegetation, and upland habitat for basking and cover (USFWS, 1999).	Low Potential. The Project site is located north of the Cosumnes River and east of Grant Line Road. Streams north of Jackson Highway and east of Sunrise Boulevard are not considered Giant Garter Snake habitat as noted in the Giant Garter Snake Recovery Plan and in consultation with Fish and Wildlife staff. Further, the snake is not known to travel major rivers due to predatory species, lack of cover and basking habitat. The species would need to travel up the Cosumnes River, a major waterway, in order to reach Carson Creek.
AMPHIBIANS			
California Tiger Salamander <i>Ambystoma californiense</i>	FT, ST	Endemic to annual grasslands and valley-foothill habitats in California. Adults spend most time in subterranean refugia, particularly in ground squirrel burrows (CDFG, 2005). Seasonal ponds or vernal pools are required for breeding.	Moderate Potential. The nearest recorded occurrence is nearly nine miles south of the site. The site contains suitable breeding habitat and upland habitat for the species.
California Red-legged Frog <i>Rana draytonii</i>	FT, CSC	Adults prefer dense, shrubby or emergent riparian vegetation near deep (at least two feet), still, or slow-moving water. The species aestivate in upland burrows and in leaf litter. (Jennings and Hayes 1994)	Low Potential. The nearest confirmed, documented breeding population is located approximately 30 miles northeast of the Project near Pollock Pines in El Dorado County (CNDDDB occurrence 586). There are no occurrences documented in Sacramento County, and the species is considered extirpated in the Central Valley (USFWS 2002).

Species	Status ¹	Habitat ¹	Potential for Occurrence
Western Spadefoot Toad <i>Scaphiopus (Spea) hammondi</i>	FSC, CSC	Occurs primarily in grasslands but occasionally populates valley-foothill hardwood woodlands (Zeiner et. Al., 1990). Almost entirely terrestrial, but requires temporary rain pools that lack predators (fish, bullfrogs, crayfish) for breeding. Also needs burrows for refuge.	Present. Populations of western spadefoot toad have been documented to the west of the Project site. Species was observed on the Project site during rare plant surveys. Appropriate breeding and aestivation habitat is present throughout the Project site.
FISH			
Delta Smelt <i>Hypomesus transpacificus</i>	FT, CE	The delta smelt is a small, slender-bodied fish with a typical adult size of two to three inches that is found only in the Sacramento-San Joaquin Estuary. This species occurs in the Sacramento River as far upstream as the confluence with the American River. Delta smelt may also be found in the Cosumnes River and San Joaquin River.	Low Potential. Carson Creek, which borders the eastern portion of the property, is hydrologically connected to the Sacramento Delta via the Cosumnes River. It is possible that some smelt exist within Carson Creek, but based on their relative scarcity at the confluence with the Cosumnes River, the population's levels would be very low. The Project will not result in any direct impacts to Carson Creek, or hydromodification of Carson Creek, and thus the species does not occur within the Project impact area.
Central Valley Steelhead <i>Oncorhynchus mykiss</i>	FT	Most of Sacramento County is within the distinct population segment area for this species. Critical habitat has been designated within Sacramento County on the Sacramento River, American River, Mokelumne River, and Dry Creek (both north and south creeks). Spawning has been documented on the Cosumnes River. (NMFS 2009)	Low Potential. Some spawning may occur within Carson Creek, which is ultimately connected to the Cosumnes River. The Project will not result in any direct impacts to Carson Creek, or hydromodification of Carson Creek, and thus the species does not occur within the Project impact area.
Central Valley Spring and Winter-run Chinook Salmon <i>Oncorhynchus tshawytscha</i>	FT, FE	Distribution occurs throughout the Sacramento River and through a portion of the American River, but the distribution maps do not include the Cosumnes River as habitat. (NMFS 2009)	Low Potential. Habitat is not present within or adjacent to the Project site.

Species	Status ¹	Habitat ¹	Potential for Occurrence
INVERTEBRATES			
California Linderiella <i>Linderiella occidentalis</i>	FSC	A fairy shrimp which most often occupies pools that are vegetated and contain clear water. Not uncommon to observe the species in mud-bottomed pools with slightly turbid water. (Eriksen and Belk, 1999).	High Potential. The nearest recorded occurrence is approximately 1.5 miles to the southwest. The vernal pools and seasonal wetlands on the Project site provide suitable habitat.
<u>Molestan Blister Beetle</u> <u><i>Lytta molesta</i></u>	<u>None</u>	<u>Flowers and uplands of vernal pools.</u>	<u>Low Potential. Though the species is found within vernal pool areas, there are no recorded occurrences in Sacramento County, San Joaquin, or Placer counties, and thus the site falls outside of the known distribution or range of the species.</u>
Ricksecker's Water Scavenger Beetle <i>Hydrochara rickseckeri</i>	FSC	The Ricksecker's water scavenger beetle is an aquatic beetle that lives in weedy, shallow, open water, associated fresh water seeps, springs, farm ponds, vernal pools, and slow moving stream habitats. The beetle is known to occur with other vernal shrimp species.	High Potential. The nearest recorded occurrence is just over three miles to the west. Vernal pools, seasonal wetlands, seasonal wetland swales within the Project site provide suitable habitat.
Valley Elderberry Longhorn Beetle <i>Desmocerus californicus dimorphus</i>	FT	Associated with mature elderberry (<i>Sambucus</i> spp.) trees found in riparian forests in the Central Valley (USFWS, 2003a).	Not Present. Elderberry host plant not present in the Project site.
Midvalley Fairy Shrimp <i>Branchinecta mesoatlantica</i>	FSC	Inhabit shallow vernal pools, vernal swales, and various artificial ephemeral wetland habitats in the Sacramento, Solano, Contra Costa, San Joaquin, Madera, Merced, and Fresno Counties (USFWS, 2003a).	High Potential. The nearest recorded occurrence is just over three miles to the west. Vernal pools, seasonal wetlands, seasonal wetland swales within the Project site provide suitable habitat.

Species	Status ¹	Habitat ¹	Potential for Occurrence
Vernal Pool Fairy Shrimp <i>Branchinecta lynchi</i>	FT	Inhabit alkaline pools, ephemeral drainages, rock outcrop pools, ditches, stream oxbows, stockponds, vernal pools, vernal swales, and other seasonal wetlands. Also found in basalt flow depression pools in unplowed grasslands (Eriksen and Belk, 1999).	High Potential. The nearest recorded occurrence is just over three miles to the west. Vernal pools, seasonal wetlands, seasonal wetland swales within the Project site provide suitable habitat.
Vernal Pool Tadpole Shrimp <i>Lepidurus packardii</i>	FE	Inhabits small to large vernal pools containing clear to highly turbid water (USFWS, 2003a).	High Potential. The nearest recorded occurrence is just over three miles to the west. Vernal pools, seasonal wetlands, seasonal wetland swales within the Project site provide suitable habitat.
PLANTS			
lone Manzanita <i>Arctostaphylos myrtifolia</i>	FE, List 1B	Native to the sandy clay soils of the lone formation in the western Sierra Nevada foothills.	Not Present. This species requires serpentinite, volcanic, or gabbroic soils or soils of the lone formation, none of which are present on-site. Further, species occur within chaparral cismontane woodlands; this habitat is not present on the Project site.
Bandage's Clarkia <i>Clarkia biloba</i> app. <i>Brandegeeae</i>	List 1B	Chaparral and cismontane woodlands; elevation 240 – 3,000ft	Not Present. Habitat type not present within the Project site or vicinity.
lone Buckwheat <i>Eriogonum apricum</i> var. <i>apricum</i>	FE, CE, List 1B	Native to the sandy clay soils of the lone formation in the western Sierra Nevada foothills.	Not Present. This species requires serpentinite, volcanic, or gabbroic soils or soils of the lone formation, none of which are present on-site. Further, species occur within chaparral cismontane woodlands; this habitat is not present on the Project site.
Irish Hill Buckwheat <i>Eriogonum apricum</i> var. <i>prostratum</i>	FE, CE, List 1B	Native to the sandy clay soils of the lone formation in the western Sierra Nevada foothills.	Not Present. This species requires serpentinite, volcanic, or gabbroic soils or soils of the lone formation, none of which are present on-site. Further, species occur within chaparral cismontane woodlands; this habitat is not present on the Project site.
Tuolumne Button-Celery <i>Eryngium pinnatisectum</i>	CE, List 1B	Mesic areas within cismontane woodland and lower montane coniferous forests; elevation 230 – 3,000ft	Not Present. Habitat type not present within the Project site.

Species	Status ¹	Habitat ¹	Potential for Occurrence
Dwarf downingia (<i>Downingia pusilla</i>)	List 2	Vernal pools and mesic areas in valley and foothill grasslands; elevation 3 – 1,460 ft (blooms Mar. – May)	Not present. Suitable habitat present on the Project site. Nearest occurrence is approximately 11.4 miles southwest of the site. Rare plant surveys conducted in 2008 and 2010 did not observe the species.
Boggs Lake Hedge-Hyssop <i>Gratiola heterosepala</i>	SE, List 1B	Marshes and swamps, vernal pools/clay; elevation 30 – 7,790ft (blooms Apr. – Aug.)	Not Present. Suitable habitat present on the Project site. Nearest occurrence is approximately ¼-mile southwest of the Project site. Rare plant surveys conducted in 2008 and 2010 did not observe the species.
Parry's Horkelia <i>Horkelia parryi</i>	List 1B	Native to the sandy clay soils of the lone formation in the western Sierra Nevada foothills.	Not Present. This species requires serpentinite, volcanic, or gabbroic soils or soils of the lone formation, none of which are present on-site. Further, species occur within chaparral cismontane woodlands; this habitat is not present on the Project site.
Northern California Black Walnut <i>Juglans hindsii</i>	List 1B	Riparian scrub, riparian woodland; elevation 0 – 1,320ft (blooms Apr. – May)	Not Present. There are no trees present on the Project site.
Ahart's Dwarf Rush <i>Juncus leiospermus</i> var. <i>ahartii</i>	List 1B	Valley and foothill grassland/mesic; elevation 100 – 330ft (blooms Mar. – May)	Not Present. The vernal pools, seasonal wetlands and seasonal swales on-site provide suitable habitat for this species. The plant surveys in 2008 and 2010 did not observe the species within the Project boundary and the nearest occurrence listed in the CNDDB is approximately 4.5 miles to the west.
Legenere <i>Legenere limosa</i>	List 1B	Vernal pools; elevation 0 – 2,900ft (blooms Apr. – Jun.)	Present. Species were observed in two vernal pools during the plant surveys in 2008 and 2010. The vernal pools, seasonal wetlands, seasonal wetland swales, drainages, ditches, and stock pond represent suitable habitat.
Pincushion Navarretia <i>Navarretia myersii</i>	List 1B	Vernal pools; elevation 65 – 1,100ft (blooms May)	Not Present. The vernal pools, seasonal wetlands and seasonal swales on-site provide suitable habitat for this species. The plant surveys in 2008 and 2010 did not observe the species within the Project boundary and the nearest occurrence is 5.9 miles to the southeast.

Species	Status ¹	Habitat ¹	Potential for Occurrence
Slender Orcutt Grass <i>Orcuttia tenuis</i>	FT, SE List 1B	Vernal pools; elevation 115 – 5,775ft (blooms May – Oct.)	Not Present. The vernal pools, seasonal wetlands and seasonal swales on-site provide suitable habitat for this species. The nearest listed occurrence in the CNDDDB is 2.3 miles west of the Project site. The plant surveys in 2008 and 2010 did not observe the species within the Project boundary.
Sacramento Orcutt Grass <i>Orcuttia viscida</i>	FE, SE, List 1B	Vernal pools; elevation 100 – 330ft (blooms Apr. – Jul.)	Present. Species observed along the northern boundary of the site during plant surveys (ECORP, 2007 and 2008). The vernal pools, seasonal wetlands and seasonal swales on-site provide suitable habitat for this species.
Sanford's Arrowhead <i>Sagittaria sanfordii</i>	List 1B	Marshes and swamps; elevation 0 – 2,000ft (blooms May – Oct.)	Not Present. The vernal pools, seasonal wetlands and seasonal swales on-site provide suitable habitat for this species. The nearest listed occurrence in the CNDDDB is 2.2 miles east of the Project site. The plant surveys in 2008 and 2010 did not observe the species within the Project boundary.

BIRDS

Based on the species table and types of habitat present on or near the Project site, the following special status avian species are identified as having potential to occur on or near the Project site: burrowing owl, Cooper's hawk, ferruginous hawk, golden eagle, grasshopper sparrow, northern harrier, Swainson's hawk, tricolored blackbird, and white-tailed kite. The section also addresses nesting raptors in general, which are afforded minimum protections pursuant to the Fish and Game code regardless of status.

SWAINSON'S HAWK

The Swainson's hawk (*Buteo swainsoni*) is listed as a Threatened species by the State of California and is a candidate for federal listing as threatened or endangered. It is a migratory raptor typically nesting in or near valley floor riparian habitats during spring and summer months. Swainson's hawks were once common throughout the state, but various habitat changes, including the loss of nesting habitat (trees) and the loss of foraging habitat through the conversion of native Central Valley grasslands to certain incompatible agricultural and urban uses has caused an estimated 90% decline in their population.

Swainson's hawks feed primarily upon small mammals, birds, and insects. Their typical foraging habitat includes native grasslands, alfalfa and other hay crops that provide suitable habitat for small mammals. Certain other row crops and open habitats also provide some foraging habitat. The availability of productive foraging habitat near a Swainson's hawk's nest site is a critical requirement for nesting and fledgling success. In central California, about 85% of Swainson's hawk nests are within riparian forest or remnant riparian trees. CEQA analysis of impacts to Swainson's hawks consists of separate analyses of impacts to nesting habitat and foraging habitat.

The CEQA analysis provides a means by which to ascertain impacts to the Swainson's hawk. When the analysis identifies impacts, mitigation measures are established that will reduce impacts to the species to a less than significant level. Project proponents are cautioned that the mitigation measures are designed to reduce impacts and do not constitute an incidental take permit under the California Endangered Species Act (CESA). Anyone who directly or incidentally takes a Swainson's hawk, even when in compliance with mitigation measures established pursuant to CEQA, may violate the California Endangered Species Act.

NESTING HABITAT

For determining impacts to and establishing mitigation for nesting Swainson's hawks in Sacramento County, Fish and Game recommends implementing the measures set forth in the Fish and Game Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (*Buteo swainsoni*) in the Central Valley of California (November 1, 1994). These state that no intensive new disturbances, such as heavy equipment operation associated with construction, should be initiated within ¼ mile of an active Swainson's

hawk nest in an urban setting or within ½ mile in a rural setting between March 1 and September 15.

FORAGING HABITAT

Swainson's hawks are known to forage up to 18 miles from their nest site; however, that is the extreme range of one individual bird's daily movement. It is more common for a Swainson's hawk to forage within 10 miles of its nest-site. Therefore it is generally accepted and Fish and Game recommends evaluating projects for foraging habitat impacts when they are within 10 miles of a known nest site.

Statewide, Fish and Game recommends implementing the measures set forth in the Fish and Game Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (*Buteo swainsoni*) in the Central Valley of California (November 1, 1994) for determining impacts to Swainson's hawk foraging habitat unless local jurisdictions develop an individualized methodology designed specifically for their location. Sacramento County has developed such a methodology and received confirmation from Fish and Game in May of 2006 that the methodology is a better fit for unincorporated Sacramento County and should replace the statewide, generalized methodology for determining impacts to foraging habitat.

Swainson's hawk foraging habitat value is greater in large expansive open space and agricultural areas than in areas which have been fragmented by agricultural-residential or urban development. The methodology for unincorporated Sacramento County is based on the concept that impacts to Swainson's hawk foraging habitat occur as properties develop to increasingly more intensive uses on smaller minimum parcel sizes. Therefore, the methodology relies mainly on the minimum parcel size allowed by zoning to determine habitat value. For the purpose of the methodology, properties with zoning of AG-40 and larger are assumed to maintain 100% of their foraging habitat value and properties with AR-5 zoning and smaller are assumed to have lost all foraging habitat value. Table BR-4 below illustrates the continuum between AG-40 and AR-5 that represents the partial loss of habitat value that occurs with fragmentation of large agricultural land holdings. The large, 50% loss of habitat value between AG-20 and AR-10 is due to the change in land use from general agriculture to agricultural-residential. The methodology does allow case-by-case analysis for projects with unique characteristics.

Table BR-4: Swainson's Hawk Foraging Habitat Value by Zoning Category

Zoning Category	Habitat Value Remaining
AG-40 and above (e.g., AG-80, 160 etc.)	100%
AG-20	75%
AR-10	25%
AR-5 and smaller (e.g., AR-2, 1 or RD-5, 7, 10, 15, 20 etc.)	0%

CONCLUSION

According to the CNDDDB, 2008, the nearest recorded species occurrence for the Swainson's hawk, #660, is approximately ½ mile to the east of the Project site along Deer Creek. According to the information provided in the CNDDDB Rare Find program, a nesting pair was observed in 1993. The Project site provides foraging habitat for the hawk and development of the site would result in a potentially significant loss of that habitat. The entire Project site is zoned AG-80 and therefore retains 100 percent of foraging habitat value. The Project will be rezoning the entire 2,669 acres to urban uses (AG-80 to SPA). According to the impact methodology, the habitat value of all 2,669 acres would be lost, but it is acknowledged that there are areas of the site which are designated as Avoided Areas under the proposed SPA zoning and therefore would not be subject to typical urban development. For this reason, a case-by-case analysis has been used for these areas. The analysis below relies upon the known habitat needs of the species, and compares that to what will be remaining on the site.

The Project includes some Avoided Areas which can be removed from the total impact area, but this depends on the size and structure of the area to be avoided. Reported mean home ranges in the Central Valley range from 6,820 acres (Estep 1989) to 9,978 acres (Babcock 1995). Swainson's hawk forage only incidentally in edge habitats or areas such as orchards which have narrow zones of available forage (Estep 1989), and prefer agricultural fields with row crops and open grassland areas. The need for large areas of open habitat makes the species sensitive to habitat fragmentation (Estep and Teresa 1992). The species must have suitable foraging habitat within three to five miles from the nest tree to successfully fledged young (England et al. 1995).

On the basis of the above research, the 298-acre Avoided Area on the western side of the site, plus two adjacent Avoided Areas to the north and south, will remain suitable habitat; this collective area is 382 acres, which will be connected to thousands of acres of open space to the north and west **in the existing condition. The onsite Avoided Areas will also be connected to the Kiefer Landfill preserves, which provides a permanent linkage to thousands of acres of grassland and cropland south of Kiefer Landfill and the Project – land which all lies outside of the USB.** In this way, it is like and similar to large contiguous properties zoned AG-80. There are also multiple areas on the site which are on the edge of the property bordering the USB, and as such these areas will also be connected to large, agriculturally zoned properties. These areas include an 18.4-acre Avoided Area to the south of the University/College Campus Center which will remain connected to open space and agriculture outside of the USB to the west and south. This drops the total mitigation requirement from 2,669 acres to 2,269 acres. In addition, the areas on the eastern and southeastern side of the site which are designated Agriculture by the SPA are located outside of the USB, and will remain connected to large areas of contiguous habitat. Provided that these areas are not developed with some of the industrial uses unconditionally allowed by the Agriculture designation of the SPA, these areas can also be considered retained. Mitigation has been written such that if the applicant establishes conservation easements over these areas, that the areas – which total 37.3 acres – will not be considered impacted. This would drop the total mitigation requirement to 2,231 acres.

The Avoided Area surrounding the central linear drainage will not maintain full habitat value, because it is narrow (less than 600 feet wide and averages approximately 400 feet wide), is often steeply sloped, and will be surrounded by urban uses. This area will functionally be edge habitat; Swainson's hawk may continue to forage incidentally in this linear Avoided Area, but based on observed habitat preferences will no longer rely on this area. Applying the intent of the methodology leads to the same conclusion. Though this area includes 93.6 acres, it is not configured in the manner of an AG-40 or AG-80 parcel. The minimum width for an AG-80 parcel stipulated in the zoning code is 1,000 feet, and the minimum width for an AG-40 or AG-20 parcel is 500 feet. The central linear Avoided Area is less than 500 feet wide for most of its length. The minimum width in an AR-10 zone is 300 feet, and there are multiple locations where the Avoided Area drops well below this width also. Furthermore, the methodology considers an AR-10 designation as retaining a fractional amount of habitat because the larger AR-10 zoning category tends to occur on urban fringes, where the majority of the land so designated occurs adjacent to larger agricultural properties. In the case of the Project, the linear Avoided Area will be surrounded by dense urban development for approximately 1.5 miles on either side, which is entirely uncharacteristic of an AR-10 property.

Preconstruction surveys will be required to determine if there are nesting Swainson's hawk within ½-mile of the Project site. The purpose of the survey requirement is to ensure that construction activities do not agitate nesting hawks, potentially resulting in nest abandonment or other harm to nesting success. If Swainson's hawk nests are found, the developer is required to contact Fish and Game to determine what measures need to be implemented in order to ensure that nesting hawks remain undisturbed. The measures selected will depend on many variables, including the distance of activities from the nest, the types of activities, and whether the landform between the nest and activities provides any kind of natural screening. According to the Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (*Buteo swainsoni*) in the Central Valley of California (November 1, 1994), the mitigation described above will ensure that impacts to nesting Swainson's hawk will be less than significant.

The Project will require 2,231 acres of mitigation to compensate for the loss of Swainson's hawk foraging habitat. This can be done by utilizing the County's Swainson's Hawk Impact Mitigation Program or by implementing a mitigation plan acceptable to CDFG. Alternatively, if the SSHCP is approved, mitigation as specified in the SSHCP would be available. Mitigation measures that compensate for the loss of Swainson's hawk foraging habitat will reduce singular and cumulative impacts to *less than significant* levels. Note that additional analysis and mitigation requirements are included in the Cumulative and Growth Inducing Impacts chapter.

SWAINSON'S HAWK IMPACT MITIGATION PROGRAM

In 1997, in response to the need to mitigate for the loss of Swainson's hawk foraging habitat in Sacramento County, the Board of Supervisors adopted an ordinance that established a Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the

Sacramento County Code). The Program has been amended several times; the latest amendment went into effect in December of 2009.

By adopting the Program, the Board of Supervisors found that “the most effective means of mitigation for the loss of suitable Swainson’s hawk foraging habitat is the direct preservation, in perpetuity, of equally suitable foraging habitat on an acre-per-acre basis based on the project’s determined acreage impact”. On an individual basis, the acquisition of lands for habitat conservation may not always be feasible or prudent and many small, disconnected preserves do not benefit the species as well as large, connected preserve systems. Therefore, the ordinance provides for the establishment of impact mitigation fees, which in some circumstances, may be paid in-lieu of providing habitat lands. These fees accumulate and are held in trust by the County until used for the acquisition of foraging habitat of a size large enough to be biologically and economically viable. The current fee is \$12,925 per acre. In addition, there is a one time administrative fee of \$500. These fees may be amended from time to time to ensure they accurately reflect market-rate land prices.

Under the Swainson’s Hawk Impact Mitigation Program, only projects which have an impact of less than 40 acres are eligible to pay fees. Projects impacting 40 acres or more of foraging habitat must provide land acceptable to CDFG and the County. Land can be provided in fee title or through conservation easement. The Sacramento County Planning and Community Development Department (Planning) administers the Swainson’s Hawk Impact Mitigation Program and more information on lands likely to be determined as acceptable replacement habitat can be found at their website <http://www.msa2.saccounty.net/planning/Pages/Swainsons-Hawk-Ordinance.aspx>.

NESTING RAPTORS

Raptors are defined as members of the order Falconiformes (vultures, eagles, hawks, and falcons) and the order Strigiformes (owls). Common species of raptors found locally include Cooper’s hawk (*Accipiter cooperii*) red-tailed hawk (*Buteo jamaicensis*), red-shouldered hawk (*Buteo lineatus*), American kestrel (*Falco sparverius*), barn owl (*Tyto alba*), and great horned owl (*Bubo virginianus*).

Raptors and their active nests are protected by the California Fish and Game Code Sections 3503.5, 3511, and 3513. The Code states the following: “It is unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds of prey) or to take, possess, or destroy the nest or eggs of any such bird.” Because most raptors migrate they are also protected by the Federal Migratory Bird Treaty Act of 1918, which states “unless and except as permitted by regulations, it shall be unlawful at any time, by any means or in any manner, to pursue, hunt, take, capture, kill, attempt to take, capture, or kill” a migratory bird. Section 3(18) of the Federal Endangered Species Act defines the term “take” means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. Causing a bird to abandon an active nest may cause harm to egg(s) or chick(s) and is therefore considered “take.”

The Project site predominately contains open annual grassland. Mature trees of sufficient size to support tree-nesting raptors are located along the banks of Carson Creek outside of the eastern Project boundary. Some hawk species less susceptible to human disturbance may also use some of the taller trees near the home sites just outside of the northern property boundary. There are no trees within the Project boundary, and thus no tree-nesting habitat on the site. Raptors, in general, build nests in large mature trees, though there are some ground-nesting species such as the northern harrier and the burrowing owl (refer to species-specific discussions, below).

Since the Project is adjacent to suitable tree nesting habitat, construction activities may impact nesting raptors if they occur within 500 feet of suitable nesting trees; 500 feet is the buffer used by Sacramento County and other nearby jurisdictions as a screening tool, and has been accepted by Fish and Game. To avoid impacts to tree-nesting raptors, mitigation is recommended requiring pre-construction nesting surveys. The purpose of the survey requirement is to ensure that construction activities do not agitate nesting raptors, potentially resulting in nest abandonment or other harm to nesting success. If raptor nests are found, the developer is required to contact Fish and Game to determine what measures need to be implemented in order to ensure that nesting raptors remain undisturbed. The measures selected will depend on many variables, including the distance of activities from the nest, the types of activities, whether the landform between the nest and activities provides any kind of natural screening, and other variables.

Prior to construction or land clearing activities which occur during nesting season (generally March through mid-September), all mature trees within 500 feet of Project construction activities shall be surveyed for nesting raptors. If nesting raptors are observed, the Project developer shall consult with Fish and Game and determine the appropriate measures that must be implemented. If no nesting raptors are observed, no further mitigation will be required. With implementation of recommended mitigation, impacts to nesting raptors are *less than significant*.

BURROWING OWL

The burrowing owl (*Athene cunicularia hypugea*) is a California Species of Concern. Burrowing owl habitat can be found in annual and perennial grasslands, deserts, and arid scrublands characterized by low-growing vegetation (Zarn 1974). Suitable owl habitat may also include trees and shrubs if the canopy covers less than 30 percent to the ground surface. Burrows are the essential component of burrowing owl habitat. Both natural and artificial burrows provide protection, shelter, and nesting habitat for burrowing owls (Henny and Blus 1981). Burrowing owls typically use burrows made by fossorial mammals, such as ground squirrels or badgers, but also use man-made structures such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement.

Burrowing owls may use a site for breeding, wintering, foraging, and/or migration stopovers. Breeding season takes place from February 1 to August 31 and wintering takes place from September 1 to January 31. Occupancy of suitable burrowing owl

habitat can be verified at a site by detecting a burrowing owl, its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance. Burrowing owls exhibit high site fidelity, reusing burrows year after year (Rich 1984, Feeney 1992).

Burrowing owls have been documented on the Project site and are listed in the CNDDB (occurrence #91). The recorded occurrence was listed in 1989 and identified two active burrows. The owls are located within the northern portion of the 298-acre avoided area, and were observed during a site visit. There is another recorded occurrence, #307 just south of the Project site. This occurrence details the observation of one active burrow in 1994 within the footprint of the ultimate landfill boundaries. During the field visit by Environmental Review staff the presence of rodent burrows that could be suitable for nesting was observed throughout the landscape. ECORPs special status species evaluation also identified burrowing owl within the central linear Avoided Area.

The Fish and Wildlife "Status Assessment and Conservation Plan for the Western Burrowing Owl in the United States, Biological Technical Publication" (BTP-R6001-2003) indicates that the protocols set forth in the "Burrowing Owl Survey Protocol and Mitigation Guidelines" published by The California Burrowing Owl Consortium (April 1993) should be used. Fish and Game published a "Staff Report on Burrowing Owl Mitigation" on October 17, 1995, which is to be used to assess impacts. Though there is some variation, these documents generally mirror one another. To avoid impacts to nesting birds, surveys should be performed for all potential habitat areas within 500 feet of construction activities. The protocols recommend both wintering and breeding season surveys. Avoidance is defined as maintaining a minimum distance of 250 feet from an occupied burrow in addition to preserving a minimum of 6.5 acres of habitat around the occupied burrow for each pair or unpaired resident. If avoidance is not possible, recommended mitigation includes enhancement or creation of burrows in adjacent suitable habitat that is contiguous with the affected habitat. Relocation techniques to move owls out of the affected area are also permitted. If habitat replacement must occur off-site, the mitigation recommendation is increased from 6.5 acres per pair or single resident to between 9.75 and 19.5 acres (depending on the quality and location of the habitat).

The existing documented burrowing owl nest on the site is within an avoided area and will result both in an adequate buffer and adequate retained habitat. It should also be noted that all of the Avoided Areas are large enough to support multiple pairs of burrowing owls, so unlike for the Swainson's hawk, all of the Avoided Area can be considered to be retained habitat. In order to reduce potential impacts to owl nests which may be undiscovered, the applicant shall have a qualified biologist perform a focused survey, prior to the construction of improvements or buildings, for burrowing owls according to the "Burrowing Owl Survey Protocol and Mitigation Guidelines" published by The California Burrowing Owl Consortium (April 1993). If no active burrows are found during the focused survey, no further mitigation will be required. If active burrows are found, mitigation shall be implemented consistent with the Fish and Game staff report recommendations. Both Fish and Game and Environmental Review shall be contacted and provided with an avoidance and mitigation plan. With mitigation,

the development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to burrowing owls are *less than significant*.

FERRUGINOUS HAWK

According to the Fish and Game Life History Account for the ferruginous hawk, the species is an uncommon winter resident and migrant at lower elevations and open grasslands in the Central Valley. The species requires large, open tracts of grasslands, sparse shrub, or desert habitats with elevated structures for nesting. The species is migratory, and generally arrives in California in September and departs by mid-April. The Life History Account also indicates that the species has a tendency to displace red-tailed hawks and Swainson's hawks. There is no published regulatory guidance on mitigation of foraging habitat for this species.

Any species wintering in the general Project area would likely be in competition with the known Swainson's hawk that forage in the vicinity of the site. The fact that Swainson's hawk are successfully occupying the area makes it less likely that ferruginous hawk use the site. Nonetheless, the Project has the potential to remove winter foraging habitat for the species. Mitigation for foraging habitat loss has already been required as part of Swainson's hawk impacts, and since the two species use the same habitats, additional mitigation is unnecessary. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to ferruginous hawk habitat are *less than significant*.

GOLDEN EAGLE

According to the Fish and Game Life History Account for the golden eagle, the species is an uncommon permanent resident migrant throughout California, but does not occur in the center of the Central Valley. The species uses rolling foothills and mountain terrain, wide arid plateaus deeply cut by streams and canyons, open mountain slopes, and cliffs and rock outcrops – features that are not present in the center of the Central Valley. The Project is located at the edge of the foothills, where this rolling terrain just begins, and thus may provide some foraging habitat for the species. There is no published regulatory guidance on mitigation of foraging habitat for this species.

The Project has the potential to remove foraging habitat for the species. Mitigation for foraging habitat loss has already been required as part of Swainson's hawk impacts, so additional mitigation for the golden eagle is unnecessary. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to golden eagle habitat are *less than significant*.

GRASSHOPPER SPARROW

According to the Fish and Game Life History Account for the grasshopper sparrow, the species is an uncommon and local summer resident and breeder in foothills and lowlands, arriving in California from March to May and migrating south in August or

September. The species occurs in dry, dense grasslands, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches. Nests are built of grasses and forbs in a slight depression in the ground, hidden at the base of an overhanging clump of grasses or forbs. There is no published regulatory guidance on mitigation of foraging habitat for this species.

The Project has the potential to remove foraging and nesting habitat for the species. Unlike impacts for landscape-level predators such as the Swainson's hawk, all of the Avoided Areas on the site are considered to be retained habitat for more localized foragers such as the grasshopper sparrow. Mitigation for grassland habitat loss has already been required as part of Swainson's hawk impacts, so additional mitigation for the grasshopper sparrow is unnecessary. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to grasshopper sparrow habitat are *less than significant*.

NORTHERN HARRIER

According to the Fish and Game Life History Account for the northern harrier the species occurs in a wide range of habitat types and elevations, from grasslands in the Central Valley to alpine meadows as high as 10,000 feet. The species is a widespread winter resident and migrant, though an uncommon nesting season resident in the Central Valley. The population has declined in California, largely due to destruction of breeding habitat. The species is mostly found in flat or hummocky open areas of tall, dense grasses, moist or dry shrubs, with edges for nesting, cover, and feeding. There is no published regulatory guidance on mitigation of foraging habitat for this species.

The Project has the potential to remove foraging habitat for the species. Mitigation for foraging habitat loss has already been required as part of Swainson's hawk impacts, so additional mitigation for the northern harrier is unnecessary. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to northern harrier are *less than significant*.

TRICOLORED BLACKBIRD

According to the Fish and Game Life History Account for the tricolored blackbird, the species is mostly a resident in California, and common locally throughout the Central Valley. The species is a colonial nester which breeds near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, and tall herbs. Nesting colonies usually support a minimum of 50 pairs. The species feeds in grassland and cropland habitats. The usual breeding season is mid-April into late July.

According to the CNDDDB, the nearest CNDDDB recorded species occurrence (#178) is approximately 2.3 miles to the south. This occurrence was documented in 1994 and noted the nesting of approximately 60 pairs in blackberries. The nearest available nesting habitat is located along Carson Creek just outside of the eastern boundary of

the Project site. Due to known occurrences of nesting colonies in the vicinity it is possible that tricolored blackbirds may have nesting colonies near the Project site.

In order to reduce potential impacts to nesting tricolored blackbirds, mitigation measures have been included. Equipment operation and noise associated with construction activities may disturb nesting birds. If construction activities are proposed during the breeding season (March 1 through July 15) pre-construction surveys shall be conducted where suitable nesting habitat is present within 300 feet of the Project site. If tricolored blackbirds are found nesting within 300 feet of the survey area, the California Department of Fish and Game shall be contacted and appropriate avoidance and impact minimization measures shall be implemented. This may include establishing a buffer or postponing construction until fledging of all nestlings (about July 15). Specific measures cannot be outlined at this time, because the extent and type of measures required are highly situational, depending on distance to the nest, the number of nesting individuals, the type of nesting substrate, and other factors. If no tricolored blackbirds are found during the pre-construction survey, no further mitigation would be required.

In addition to potential impacts to nesting birds, the Project site provides suitable foraging habitat. The loss of 2,120 acres of grassland habitat would decrease the availability of foraging habitat. However, to the east of the Project site is open habitat that will continue to provide suitable foraging habitat. In addition, even though foraging habitat mitigation for the tricolor blackbird is not required, the Project does require foraging habitat mitigation for Swainson's hawk impacts. This mitigation will benefit all other species which may forage in this same habitat type. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to tricolored blackbirds are *less than significant*.

WHITE-TAILED KITE

According to the Fish and Game Life History Account for the white-tailed kite, the species is a resident in coastal and valley lowlands which is rarely found away from agricultural areas. The species forages in undisturbed grasslands, meadows, farmlands, and emergent wetlands. Substantial groves of dense, broad-leaved deciduous trees are used for nesting and roosting. The species is listed as Fully Protected due to nesting impacts.

The loss of 2,120 acres of grassland habitat would decrease the availability of foraging habitat. Mitigation for foraging habitat loss has already been required as part of Swainson's hawk impacts, so additional mitigation for the white-tailed kite is unnecessary. The development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to white-tailed kite are *less than significant*.

MITIGATION MEASURES:

BR-3. If construction, grading, or Project-related improvements are to occur between March 1 and September 15, a focused tree survey for tree- or ground-nesting

raptors within 500 feet of the construction site (1/2-mile for Swainson's hawk) and for ground-nesting grasshopper sparrow shall be conducted by a qualified biologist within 14 days prior to the start of construction work (including clearing and grubbing). If active nests are found, the California Department of Fish and Game shall be contacted to determine appropriate protective measures. If no active nests are found during the focused survey, no further mitigation will be required.

- BR-4.** Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, implement one of the options below to mitigate for the loss of Swainson's hawk foraging habitat on the Project site; based on current Project designs this is 2,267 acres. Based on current designs, this can be reduced to 2,231 acres of mitigation if the applicant establishes a permanent conservation easement over the areas designated Agriculture on the eastern and southeastern sides of the site (these are areas outside of the Urban Services Boundary). Foraging habitat preserved shall consist of grassland or similar habitat open habitat, not cropland, because this mitigation measure also offsets impacts to other species that do not use cropland habitat.
- A. The project proponent shall utilize one or more of the mitigation options (land dedication and/or fee payment) established in Sacramento County's Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code).
 - B. The Project proponent shall, to the satisfaction of the California Department of Fish and Game, prepare and implement a Swainson's hawk mitigation plan that will include preservation of Swainson's hawk foraging habitat.
 - C. Should the County Board of Supervisors adopt a new Swainson's hawk mitigation policy/program (which may include a mitigation fee payable prior to issuance of building permits) prior to the implementation of one of the measures above, the Project proponent may be subject to that program instead.

If the design of the primary avoided area on the western plateau (currently 382 acres in size) is increased in size in response to Section 404 wetland permitting requirements, the total amount of mitigation land required may be adjusted downward to reflect this increased avoidance, at the discretion of the Environmental Coordinator.

- BR-5.** Prior to construction activity (including site improvements, and building construction) focused surveys shall be conducted by a qualified biologist for burrowing owls in the construction area and within 500 feet of the construction area. Surveys shall be conducted no less than 14 days and no more than 30 days prior to commencement of construction activities. Surveys shall be conducted in accordance with "Burrowing Owl Survey Protocol and Mitigation

Guidelines” published by The California Burrowing Owl Consortium (April 1993). The following shall also apply:

- A. If no occupied burrows are found in the survey area, a letter report documenting survey methods and findings shall be submitted to the County and no further mitigation is necessary.
 - B. If an occupied burrow is found the applicant shall contact the Environmental Coordinator and consult with the California Department of Fish (CDFG), prior to construction, to determine if avoidance is possible or if burrow relocation will be required.
 - C. If owls are to remain on-site, a minimum of 6.5 acres of foraging habitat for each occupied burrow needs to be permanently preserved according to California Department of Fish and Game guidelines. In addition, no activity shall take place within 160 feet of an active burrow from September 1 to January 31 (wintering season) or 250 feet from February 1 through August 31 (breeding season). Protective fencing shall be placed, at the distances above, around the active burrows and no activity shall occur within the protected buffer areas. Permanent improvements shall be a minimum of 250 feet from an occupied burrow.
 - D. Any impact to active owl burrows, relocation of owls, or mitigation for habitat loss shall be done in accordance with the Fish and Game “Staff Report on Burrowing Owl Mitigation” (October 17, 1995) or the version current at the time of construction. Written evidence from Fish and Game staff shall be provided to the Environmental Coordinator attesting to the permission to remove burrows, relocate owls, or mitigate for lost habitat, and shall include a plan to monitor mitigation success.
- BR-6.** If construction occurs between March 1 and July 31 pre-construction surveys for nesting tricolored blackbirds shall be performed by a qualified biologist. Surveys shall include the ~~project~~ construction site and areas of appropriate habitat within 300 feet of the construction site. The survey shall occur no longer than 14 days prior to the start of construction work (including clearing, grubbing or grading). The biologist shall supply a brief written report (including date, time of survey, survey method, name of surveyor and survey results) to the Environmental Coordinator prior to ground disturbing activity. If no tricolored blackbird were found during the pre-construction survey, no further mitigation would be required. If an active tricolored blackbird colony is found on-site or within 300 feet of the ~~project~~ construction site the project proponent shall do the following:
- A. Consult with the California Department of Fish and Game to determine if project activity will impact the tricolored blackbird colony(s), and implement appropriate avoidance and impact minimization measures if so directed. Provide the Environmental Coordinator with written evidence of the

consultation or a contact name and number from the California Department of Fish and Game.

- B. The applicant may avoid impacts to tricolored blackbird by establishing a 300-foot temporary setback with fencing that prevents any project activity within 300 feet of the colony. A qualified biologist shall verify that setbacks and fencing are adequate and will determine when the colonies are no longer dependent on the nesting habitat (i.e. nestling have fledged and are no longer using habitat), which will determine when the fencing may be removed. The breeding season typically ends in July.

AMPHIBIANS

As identified on Table BR-3 the Project site supports suitable habitat for two amphibian species: the California tiger salamander (*Ambystoma californiense*) and the western spadefoot toad (*Spea hammondi*).

WESTERN SPADEFOOT TOAD

The western spadefoot (*Scaphiopus (Spea) hammondi*) occurs in shallow, seasonal wetlands in valley and foothill habitats such as grasslands, open chaparral, sage scrubland, short-grass plains, and pine woodlands. Spadefoot occur in both grazed and ungrazed habitat. Adult spadefoot occupy burrows up to three feet in depth in upland habitat during dry periods to avoid desiccation (Zeiner et al., 1990). Individuals may remain in these burrows for eight to nine months. Most surface activity is nocturnal. The spadefoot leave their upland burrows for wetlands during the breeding season, which lasts from January to August, depending on rainfall. It appears that vernal pools and other temporary wetlands may be optimal for breeding due to the absence or reduced abundance of both native and nonnative predators (bullfrogs, fish, and crawfish), many of which require more permanent water sources. Current research on amphibian conservation suggests that average habitat utilization falls within 1,200 feet of aquatic habitats (USFWS 2005).

During the rare plant surveys western spadefoot toad was observed on the Project site. Wetland and vernal pool complexes on the Project site vary in size and depth and some retain water for several months. The surrounding upland area is grassland with many burrows. The Project site provides suitable breeding and non-breeding habitat to support the toad. There is no published regulatory guidance on habitat mitigation for this species.

Project development will remove potential habitat and may involve possible take of the species. According to the Vernal Pool Recovery Plan (USFWS, 2005), the western spadefoot was added as a Species of Concern in 2004. Western spadefoot has been observed in several counties across the state, and a number of sites with suitable habitat for western spadefoot are already being protected through National Wildlife Refuges, National Monuments, State Parks, State Ecological Reserves, private preserves, mitigation banks, and conservation easements. Additionally, 23 vernal pool

species are federally protected; preservation efforts for those species and associated habitats will contribute to the conservation of the western spadefoot.

While a localized population of the toad may be reduced through development of the Project site, the regional population will not be reduced significantly for the reasons stated above. Locally, conservation lands which provide habitat for the western spadefoot toad include the Mather Regional Park, Burke Ranch (1,000 acres), Gill Ranch Conservation bank (1,800 acres) and Sunrise Douglas Preservation Bank (480 acres). Further, Project preservation of 450 acres of vernal pool and associated upland habitat and other preservation/creation requirements included in mitigation for vernal pool invertebrates and wetland habitats will contribute to the local and regional conservation of western spadefoot habitat. Project impacts to the western spadefoot toad are *less than significant*.

CALIFORNIA TIGER SALAMANDER

California tiger salamander (*Ambystoma californiense*) is a Threatened species which breeds within longer-lasting vernal pools, some permanent and semi-permanent ponds, and slow-moving sections of streams. Juveniles and adults migrate from these pools to rodent burrows (ground squirrel, voles, and gopher) where they enter a dormant state during the dry months. However, in very dry years breeding may not take place at all.

California tiger salamander larvae require significantly more time to transform into juvenile adults than other species of amphibians. Ponds that can support California tiger salamander should typically sustain ponding into June, although this can be influenced by the month during which inundation began. If inundation occurs earlier in the season, the wetland need not last through June. The larval stage of the species lasts 3 to 6 months, and the larvae will die if they have not metamorphosed into adults before the pond dries. Therefore, in order to be considered potential habitat, ponding must be maintained for a minimum of approximately 90 days (USFWS, 2004). Water bodies that do not dry during the summer months are typically not considered habitat, because such persistent water bodies support bullfrogs (*Rana catesbeiana*) and other predators. A strong negative association between bullfrogs and California tiger salamanders has been documented.

The Project site contains vernal pools, which is suitable breeding habitat, and the surrounding grasslands are suitable as upland habitat for California tiger salamander. Although suitable habitat is present, the Project site is outside of the current known range of the species; California tiger salamander have only been observed south of the Cosumnes River. ECORPs Consulting Incorporated provided a memorandum discussing the probability of species occurrence on the Project site, which included a review of surveys conducted north of the Cosumnes River and east of the Sacramento River, as well as a review of Fish and Wildlife Biological Opinions (BO) covering projects occurring north of the Cosumnes River. None of the surveys detected the species, and all eight BOs reviewed indicated that the projects were outside of the species' range (the memorandum dated 11-1-11 and BOs are contained in Appendix BR-4). On this

basis, it is concluded that the species does not occur on the site, and that no mitigation is required; impacts are *less than significant*.

INVERTEBRATES

The Project site contains vernal pool complexes and seasonal wetlands that support a variety of species. However, the following invertebrates have either been observed on the site or have a high potential to exist on the Project site: California linderiella, midvalley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp. All of these species are associated with vernal pool and wetland environments and are not readily observed through casual observation. Thus, lack of recorded sightings is not cause to conclude that the species is not present.

If suitable habitat is present, the species must be assumed to be present unless surveys have found the species to be absent. Discussion of the California linderiella, midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp are grouped under the heading of Vernal Pool Crustaceans, because the survey protocols and mitigation requirements are applied to all four species.

VERNAL POOL CRUSTACEANS

California linderiella, midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp use the same habitat types, though California linderiella tends to prefer deeper pools. The shrimp feed on algae, bacteria, protozoa, rotifers and bits of detritus. The females carry their eggs in a ventral brood sac until they are dropped to the bottom of the pool, or the mother dies and sinks. At the end of the rainy season, as the pool dries up, the eggs remain in a dormant stage in the dried pool until the rains of the next season, or other environmental stimuli cause them to hatch. Cysts will hatch when the pool refills, although not all cysts present will hatch during the following rainy season, and they may remain dormant in the soil for multiple seasons.

Survey requirements and mitigation protocols published by Fish and Wildlife ("Interim Survey Guidelines to Permittees for Recovery Permits under Section 10(a)(1)(A) of the Endangered Species Act for the Listed Vernal Pool Branchiopods" published April 19, 1996 and the Programmatic Formal Endangered Species Act Consultation published on February 28, 1996) are only required by Fish and Wildlife for the two species listed under the ESA: vernal pool fairy shrimp and vernal pool tadpole shrimp. However, the discussions and mitigation below apply them to the two Species of Concern, California linderiella and midvalley fairy shrimp.

All four crustacean species are recorded in the CNDDDB as occurring within 1.5 miles of the site, while the nearest CNDDDB record (#128, vernal pool tadpole shrimp) is adjacent to the southwestern Project boundary (tadpole shrimp were observed in pools within the footprint for the landfill expansion Project in 1994). Based on the proximity of recorded sightings, it is reasonable to assume that the various shrimp species are present on the site as well. Furthermore, protocol surveys have not been performed for the site.

Surveys to determine presence of absence of ESA-listed crustaceans must include either 2 years of wet season surveys completed within a 5-year period or consecutive

wet season and dry season surveys. In the absence of surveys, presence should be assumed.

A Fish and Wildlife programmatic consultation was published for ESA-listed vernal pool crustaceans on February 28, 1996. Programmatic consultation can only be used by Projects involving a maximum impact of one acre, and thus the Project must be individually permitted through the Army Corps and the Fish and Wildlife. Individual permit requirements are varied, depending upon the quality of the habitat lost, the nature of the impact, and the quality of the mitigation land offered – among other factors. This variation can be observed through review of the BOs in Appendix BR-4, which were included as part of the California Tiger Salamander discussion, but which also cover special status branchiopods.

The programmatic consultation indicates that all habitats within 250 feet of proposed development may be subject to indirect impacts, though this buffer distance can be smaller as part of the individual permitting process. In absence of the permit, for complete avoidance vernal pools must be avoided by a minimum of 250 feet. Encroachment within this buffer may only occur if approved by Fish and Wildlife. Based on this guidance all vernal pools within 250 feet of proposed roads, trails, and land development will be indirectly impacted. Further, the watershed analysis described in the wetland impacts section noted that some vernal pools on the fringe of the Avoided Areas may have shorter inundation durations. Shorter inundation durations may mean a change in the pools temperature, depth, and pH. Features that may have been utilized by species that required specific inundation durations for the completion of breeding cycles may no longer provide suitable habitat. While the features will likely retain some function for other special status species and plants, the loss of suitable habitat for other species would constitute an indirect loss for the local biological community. The Project will both remove some wetlands and encroach within the 250-foot buffer of other wetlands not removed.

Ultimately, mitigation requirements will be defined through the individual permitting process, but consistent with Sacramento County General Plan policy the mitigation below stipulates a minimum of 1:1 mitigation for habitat lost. It is probable that the individual permit requirements will require a larger amount of mitigation, and it is also possible that Fish and Wildlife will require that mitigation occurs within the Mather core area. The Project will reduce local populations of California linderella, midvalley fairy shrimp, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Though in-kind mitigation will be required for the loss of habitat on the site, the loss of 46% of the wetlands on the site within an area described as vital to the recovery for vernal pool habitats and their dependent species is significant even with mitigation; impacts are *significant and unavoidable*.

RICKSECKER'S WATER SCAVENGER BEETLE

The Ricksecker's water scavenger beetle is an aquatic beetle that lives in weedy, shallow, open water, associated fresh water seeps, springs, farm ponds, vernal pools, and slow-moving stream habitats. The Fish and Wildlife species profile⁶ only contains listing status and a general map, as little is known about the life history of the species. It is listed primarily due to its association with in-decline habitats, rather than based on known population trends. The beetle is known to co-occur with vernal pool fairy shrimp. There are no recorded occurrences of Ricksecker's water scavenger beetle in the Project vicinity, but they are assumed to be present in the Project area due to the presence of suitable habitat.

Neither survey nor mitigation protocols for this species have been published by Fish and Wildlife. Since population trends have not been well established, it is unclear to what extent the species relies on the rarer vernal pool and seasonal wetland habitats versus more abundant surface water types. For the purposes of this analysis, it is assumed that local populations of the species have at least some dependency on vernal pool and seasonal wetland habitats, since this is the more conservative assumption. Since the Project is within an area described as vital for the conservation of vernal pool habitats, loss of 46% of the wetlands on the site will result in *significant and unavoidable* impacts to the species.

Mitigation below indicates that if protocol surveys indicate absence of all four species of crustacean, as described in the section above, then it may also be assumed that Ricksecker's water scavenger beetle is absent. Since the species occupies the same habitat as listed crustaceans, mitigation for wetland crustaceans will also serve as feasible mitigation for impacts to the Ricksecker's water scavenger beetle.

MITIGATION MEASURE:

BR-7. Presence of California linderiella, midvalley fairy shrimp, vernal pool fairy shrimp and vernal pool tadpole shrimp shall be assumed unless determinate surveys that comply with U.S. Fish and Wildlife protocol conclude that the species are absent. If the protocol surveys are performed and all listed crustacean species are absent, Ricksecker's water scavenger beetle may also be presumed absent, and no further mitigation shall be required for listed vernal pool invertebrates. If species are found, one or a combination of the following shall apply:

- A. *Total Avoidance: Species are present or assumed to be present.* Unless a smaller buffer is approved through formal consultation with the Fish and Wildlife Service, construction fencing shall be installed a minimum of 250 feet from all delineated vernal pool margins. All construction activities are

⁶ <http://ecos.fws.gov/speciesProfile/profile/speciesProfile.action?spcode=I0FE>

prohibited within this buffer area. For all vernal pools where total avoidance is achieved, no further action is required.

- B. *Compensate for habitat removed.* Obtain all applicable permits from the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, California Department of Fish and Game, and the Central Valley Regional Water Quality Control Board for any proposed modifications to vernal pools and mitigate for habitat loss in accordance with the Biological Opinion and Section 404 permits obtained for the Project. At a minimum, mitigation ratios shall be consistent with County General Plan Policy, which requires no net loss of wetland resources. Any vernal pool loss not mitigated through the permitting process shall be mitigated for by payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.

PLANTS

Plant species that have been known to occur within the Project area, based on databases maintained by Fish and Wildlife and Fish and Game, are noted in Table BR-3. The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc. The surveys were conducted in accordance with guidelines developed by Fish and Wildlife (2000), Fish and Game (1983), and the California Native Plant Society (CNPS, 2001). The special status plant surveys revealed two special status species present on the Project site: *Legenere* (*Legenere limosa*) and Sacramento Orcutt grass (*Orcuttia viscida*). Species for which habitat is present but that were not observed on the Project site include: dwarf downingia (*Downingia pusilla*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), pincushion navarretia (*Navarretia myserii*), slender Orcutt grass (*Orcuttia tenuis*), and Sanford's arrowhead (*Sagittaria sanfordii*).

Sacramento Orcutt grass was previously observed on the Project site in 1995 (described in further detail below). Based on the comparison between location information and population size of the original species observation as detailed in the CNDDB and the recent surveys conducted for the proposed Project, the species has not successfully migrated from this known source pool to colonize other pools in the survey area. Thus, the probability of this species colonizing other pools over the life of the phased Project is low. However, Fish and Wildlife may require new surveys if the original surveys become outdated (defined as more than five years old).

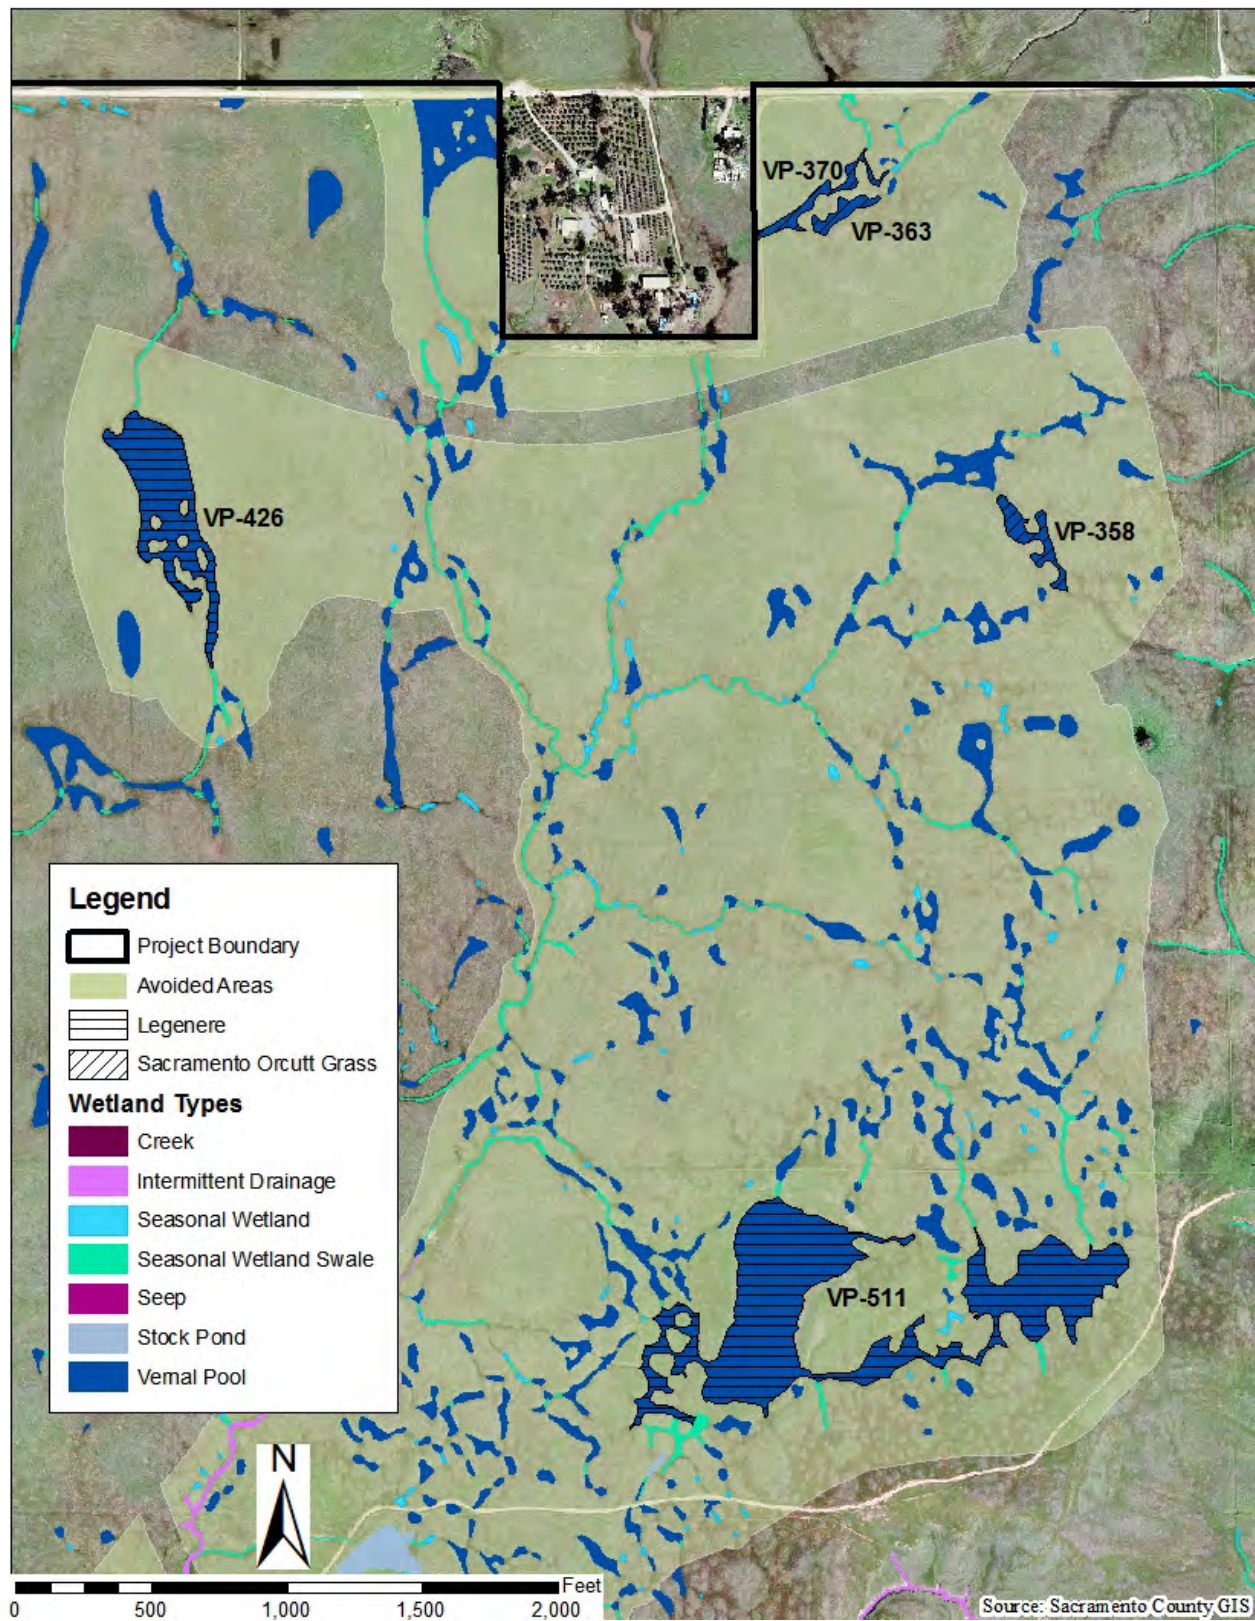

LEGENERE

Legenere is a weakly erect or decumbent annual herb that grows in moist or wet ground. The plant has yellow flowers, which are produced between May and June and extend from the main body of the plant on long, slender pedicels. This species occurs in drying beds of vernal pools in valley grassland ranging from sea level to 1,400 feet in elevation. It has been found throughout the Sacramento Valley.

During the rare plant survey in 2008, legenere was observed on the Project site. The plant was found in two vernal pools (VP-426 and VP-511; Plate BR-8). According to the survey, several hundred individuals were estimated to occur within each vernal pool. Both the avoidance/impact plan and the open space overlay clearly indicate that the pools containing legenere will be avoided. However, based on rough measurements using the aerial photo overlay, ground disturbing activities may occur within the 250 ft avoidance buffer for VP-426. Possible indirect impacts to legenere may include pollution run-off and pesticide drift. Mitigation is recommended to either remain outside of the 250 foot buffer, or if development occurs within the 250 foot buffer to prepare a pesticide and pollution prevention plan to mitigate for any indirect impacts to legenere, subject to Fish and Wildlife approval.

It is recognized that the SPA does indicate that landscaping design requirements will ensure that the Avoided Area interface with urban areas will include landscaping and stormwater treatments that are designed to protect natural resources (SPA Section 4.14.6). Details have not been provided at this time, so a determination of the sufficiency of these measures cannot be made. Mitigation has been added to ensure impacts to legenere are *less than significant*.

Plate BR-8: Location of Legenere and Sacramento Orcutt Grass

SACRAMENTO ORCUTT GRASS

Sacramento Orcutt is a small, densely tufted annual grass. It grows to about one to four inches tall. The plant is covered with small glandular hairs and is sticky. The plant has few to many stems and spike-like inflorescence clustered near the apex (USFWS, 2010). Orcutt grasses are strongly adapted to the more extreme hydrological cycles encountered in the spectrum of vernal pool types, e.g., they are typically associated with larger and/or deeper vernal pools. Orcutt grass plants are able to produce most of their aboveground vegetative growth, as well as flowers and seed as the vernal pools dry down in late spring and early to mid-summer (Crampton 1959). Sacramento Orcutt grass seeds germinate during the later spring months after cessation of winter rains as the shallow water at the pool margins begins to warm and recede (Griggs 1974, Holland 1987, Stone et al. 1988). Sacramento Orcutt grass plants flower and set seed as the margins and basin of the vernal pools dry from April through July.

Several occurrences of Sacramento Orcutt grass have been reported within 10 miles of the site (CDFG 2003) including two CNDDDB recorded occurrences, #19, just south of Glory Lane along the northern boundary of the site and #1, immediately southwest of the Project. Occurrence #1 was originally observed in 1998 with an estimated population of several thousand. Occurrence #19 was originally observed in 1995 with an estimated population of 1.2 million individuals. In 2008, the plant was observed in three vernal pools during Project specific plant surveys. These features coincide with the general area that was previously documented in the CNDDDB.

The vernal pools in which the plant was found are VP-358, VP-363, and VP-370 (Plate BR-8). According to the 2008 report, approximately 200 – 400 individuals were estimated within VP-370 and VP-363, and several thousand individuals were estimated within VP-358. ECORP botanists noted that manna grass (*Glyceria declinata*) appears to be invading VP-370 and that Sacramento Orcutt did not grow where manna grass was present. According to the Fish and Wildlife Five Year Review report prepared as part of the Recovery Plan, this population of Sacramento Orcutt grass is one of eight identified populations within the county. The greatest threats to Sacramento Orcutt are development and invasive species. Both the avoidance/impact plan and the open space overlay clearly indicate that the pools containing Sacramento Orcutt grass will be avoided. However, invasive species, primarily manna grass, are present within pool VP-370. Invasive species may also be introduced from private gardens and landscaping that surround preserved areas. Measures should be taken to reduce the threat of invasive species to existing wetland complexes. Mitigation is recommended to develop an invasive species prevention plan which includes provisions for restoration of vernal pools should preventive measures fail. Avoidance of direct impacts coupled within mitigation for potential indirect impacts will ensure that impacts to Sacramento Orcutt grass are *less than significant*.

MITIGATION MEASURES:

BR-8. If construction activities encroach within the 250-foot buffer for vernal pools 358, 363, 370, 426 or 511 the applicant shall prepare a pesticide and pollution

prevention plan. The plan shall include measures to reduce pollution run-off, pesticide drift, and other similar potential contaminants, to protect surrounding preserve areas from urban contaminants. Measures shall include the implementation of best management practices (e.g. straw wattles, silt fencing, and soil stabilization) for stormwater control. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.

- BR-9.** The project applicant shall prepare an invasive species removal and prevention plan. The plan shall provide methods to remove invasive species from preservation areas and to restore the affected wetland features. The plan shall include methods for the prevention of the introduction of new invasive species from landscapes associated with the development. Minimum components of such a plan shall include: mapping of existing invasive plant populations within the avoided areas, with the map being updated a minimum of every five years; a description of acceptable methods for removing invasive species, examples of which include hand removal or biological controls (e.g. natural parasites); and a prohibition on the use of non-native plants within either the avoided areas or the Recreation-2 areas. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.

7 CLIMATE CHANGE

INTRODUCTION TO CLIMATE CHANGE AND GLOBAL WARMING

The average surface temperature of the Earth has risen by about 1 degree Fahrenheit in the past century, with most of that occurring during the past two decades (World Meteorological Organization, 2005). To the layperson, this apparently small amount of warming may appear insignificant. Correspondingly, the probable increases in average temperatures of between 3 to 8 degrees Fahrenheit (Cayan, et al., 2006) may appear noticeable, but still insignificant. The word *average* is of critical importance to understanding climate change and global warming. In July, the average high temperature in Sacramento is 94 degrees Fahrenheit (The Weather Channel website, 2007). Therefore, applying an average increase of 8 degrees in a strictly linear way (omitting forcing effects) would mean that the *average* July temperature in Sacramento would be 102 degrees, and that temperatures could get as hot as 122 degrees in an extreme event (the current record is 114) and could regularly reach 112 degrees. This kind of temperature shift would have significant consequences to citizens and the environment alike.

The principal greenhouse gases (GHGs) that enter the atmosphere because of human activities are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and fluorinated gases. From 1750 to 2004, concentrations of CO₂, CH₄, and N₂O have increased globally by 35, 143, and 18 percent, respectively. Other greenhouse gases, such as fluorinated gases, are created and emitted solely through human activities (EPA 2006). Carbon dioxide is the gas that is most commonly referenced when discussing climate change because it is the most commonly emitted gas. While some of the less common gases do make up less of the total greenhouse gases emitted to the atmosphere, some have a greater climate-forcing effect per molecule and/or are more toxic than carbon dioxide.

CARBON DIOXIDE

Carbon dioxide emissions are mainly associated with combustion of carbon-bearing fossil fuels such as gasoline, diesel, and natural gas used in mobile sources and energy-generation-related activities. The U.S. EPA estimates that CO₂ emissions accounted for 84.6% of greenhouse gas emissions in the United States in 2004 (EPA 2006). The California Energy Commission (CEC) estimates that CO₂ emissions account for 84% of California's anthropogenic (manmade) greenhouse gas emissions, nearly all of which is associated with fossil fuel combustion (CEC 2005). Total CO₂ emissions in the United States increased by 20% from 1990 to 2004 (EPA 2006).

METHANE

CH₄ has both natural and anthropogenic sources. Landfills, natural gas distribution systems, agricultural activities, fireplaces and wood stoves, stationary and mobile fuel combustion, and gas and oil production fields categories are the major sources of these emissions (EPA 2006). The U.S. EPA estimates that CH₄ emissions accounted for 7.9% of total greenhouse gas emissions in the United States in 2004 (EPA 2006). The CEC estimates that CH₄ emissions from various sources represent 6.2% of California's total greenhouse gas emissions (CEC 2005). Total CH₄ emissions in the United States decreased by 10% from 1990 to 2004 (EPA 2006).

NITROUS OXIDE

N₂O is produced by microbial processes in soil and water, including those reactions which occur in fertilizers that contain nitrogen. Global concentration for N₂O in 1998 was 314 ppb, and in addition to agricultural sources for the gas, some industrial processes (fossil fuel fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. (EPA 2006)

The U.S. EPA estimates that N₂O emissions accounted for 5.5% of total greenhouse gas emissions in the United States in 2004 (EPA 2006). The CEC estimates that nitrous oxide emissions from various sources represent 6.6% of California's total greenhouse gas emissions (CEC 2005). Total N₂O emissions in the United States decreased by 2% from 1990 to 2004 (EPA 2006).

FLUORINATED GASES (HFCs, PFCs, AND SF₆)

Fluorinated gases, such as hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulfur hexafluoride (SF₆), are powerful greenhouse gases that are emitted from a variety of industrial processes. The primary sources of fluorinated gas emissions in the United States include the production of HCFC-22, electrical transmission and distribution systems, semiconductor manufacturing, aluminum production, magnesium production and processing, and substitution for ozone-depleting substances. The U.S. EPA estimates that fluorinated gas (HFC, PFC, and SF₆) emissions accounted for 2.0% of total greenhouse gas emissions in the United States in 2004 (EPA 2006). The CEC estimates that fluorinated gas emissions from various sources represent 3.4% of California's total greenhouse gas emissions (CEC 2005). Total fluorinated gas emissions in the United States increased by 58% from 1990 to 2004 (EPA 2006).

WORLDWIDE, NATIONAL, AND STATEWIDE EMISSIONS

Table CC-1 presents estimated GHG emissions from California, the United States, and from worldwide sources. The results are presented in units of million metric tons per year of CO₂ equivalents (MMTCO₂Eq).

**Table CC-1:
Greenhouse Gases Emissions Worldwide, United States, and California**

Geographic Region	CO ₂	CH ₄	N ₂ O
	MMTCO ₂ Eq ^a	MMTCO ₂ Eq ^b	MMTCO ₂ Eq ^c
Worldwide GHG Emissions for calendar year 2000 ¹	38,000	5,434	3,002
United States GHG Emissions for calendar year 2004 ²	5,973.0	639.5	353.7
California GHG Emissions for calendar year 2004 ³	427.4	25.9	15.1

Notes:

^aMMTCO₂Eq means million metric tons per year of CO₂ equivalent, using Global Warming Potential (GWP) values provided by IPCC in its Fourth Assessment Report (TAR) (IPCC 2007a). The GWP for CO₂ is 1.

^bThe GWP from IPCC's TAR for CH₄ is 21.

^cThe GWP from IPCC's TAR for N₂O is 310.

CO₂ = carbon dioxide; N₂O = Nitrous oxide; CH₄ = Methane.

¹ Worldwide GHG emissions taken from Intergovernmental Panel on Climate Change 4th Assessment Report, Climate Change 2007: Synthesis Report, page 36.

² United States GHG emissions taken from *Emissions of Greenhouse Gases in the United States 2004*, Energy Information Administration, U.S. Department of Energy, Washington, DC, December 2005.

³ California GHG emissions taken from *Inventory of California Greenhouse Gas Emissions and Sinks: 1990 to 2004*, California Air Resources Board, November 2007.

SACRAMENTO COUNTY EMISSIONS

The ICLEI (Local Governments for Sustainability) Clean Air and Climate Protection Model (CACP) was used to estimate unincorporated Sacramento County emissions, along with the emissions of all of the incorporated cities in the County. This complete inventory was done to provide a regional picture, but the County does not have control over incorporated city emissions

(<http://www.sustainability.saccounty.net/ReportsPublications/default.htm>), click on the Reports and Publications link to download the full Greenhouse Gas Emissions Inventory for Sacramento County). The baseline year 2005 was chosen based on availability of information. In cases where 2005 data was unavailable, 2006 or other recent-year data was substituted. The software inventories community GHG emissions for all operations, with a separate government analysis tab that determines GHG emissions of local government operations as a subset of the community analysis. The community analysis divides GHG emissions among residential (energy usage), commercial and industrial (energy usage), transportation (exhaust emissions), off-road vehicle use (exhaust emissions), waste (landfill emissions), wastewater treatment (energy usage), agriculture (fertilizers, enteric fermentation, etc), High GWP (high global warming potential, such as refrigerants), and airport (emissions from County buildings and fleets – does not

include fleet owned by airlines) sectors. The government analysis divides emissions among buildings, vehicle fleet, employee commute, streetlights, water/sewage, and waste sectors.

For the community analysis, energy use was obtained for the Sacramento Municipal Utility District (SMUD) and the Pacific Gas and Electric Company (PG&E). Community waste generation for Sacramento County was collected through the California Integrated Waste Management Board (CIWMB) web site and through consultation with staff of Sacramento County Municipal Services Agency. The SMUD reported its 2005 GHG emissions and an emissions factor for all electricity sold to customers that was verified and certified by the California Climate Action Registry. This emissions factor was input into the model as a replacement for the statewide emissions factor for electricity consumption to generate more accurate GHG emissions estimates for Sacramento County electricity consumption. The analysis also uses localized vehicle miles traveled information using the outputs from the Sacramento Regional Travel Demand Model (SACMET) and the emissions factors from the Emission Factors Model 2007 (EMFAC 2007). The software default emissions factors for other GHGs, which is based on statewide averages, were used in all other instances.

As shown in Table CC-2, the County 2005 emission baseline is approximately 5.2 MMT per year, with the transportation sector as the largest contributor at 40% of the total. The emissions per sector drop precipitously from there, with the residential sector emitting only half of the transportation sector total. However, the residential and commercial sectors can be combined to give a more overarching view, because though these sectors operate differently, the source of emissions are the same: private building and interior equipment energy usage. Combining these sectors, transportation accounts for 40% of emissions, and operation of residential, commercial, and industrial buildings accounts for 35% of emissions. The off-road vehicle, waste, wastewater, agriculture, and high global warming potential greenhouse gases (High GWP GHG) sectors combined are responsible for only 21% of the County emissions, with the airport as an additional 4%.

Table CC-2: 2005 Community Emissions by Sector

Sector	CO₂e (metric tons)	Percent
Residential	1,033,142	19.9
Commercial and Industrial	772,129	14.8
Transportation	2,046,617	39.3
Off-Road Vehicle Use	236,466	4.5
Waste	435,348	8.3
Wastewater Treatment	70,662	1.4
Agriculture	197,132	3.8
High GWP GHGs	203,528	3.9
Airport	200,404	3.9
Total	5,201,313	100

EMISSIONS THRESHOLDS

The United Nations Intergovernmental Panel on Climate Change (IPCC) constructed several emission trajectories of carbon dioxide needed to stabilize global temperatures and climate change impacts. It concluded that a stabilization of greenhouse gases at 400 – 450 ppm carbon dioxide-equivalent concentration is required to keep global mean warming below 2°C, which in turn is assumed to be necessary to avoid dangerous climate change (IPCC 2007a). The California Climate Change Center (CCCC) at UC Berkeley has determined that an 11 percent reduction of greenhouse gases from 2005 levels is required by year 2010, a 25 percent reduction is required by 2020, and an 80 reduction by 2050 in order to stabilize greenhouse gases at 400 – 450 ppm carbon dioxide-equivalent concentrations and avoid potentially dangerous climate change impacts (CCCC 2006). The California Legislature required these reduction levels by enacting Assembly Bill 32.

Though reduction rates were established in California law (AB 32), as of the writing of this document there are no established CEQA thresholds for greenhouse gases. AB 32 requires ARB to adopt a statewide greenhouse gas emissions limit equivalent to the statewide greenhouse gas emissions levels in 1990 to be achieved by 2020, as specified.

AB 1493 – GREENHOUSE GAS EMISSION STANDARDS FOR AUTOMOBILES

California Assembly Bill (AB) 1493 in 2002 required the California Air Resources Board (CARB) to develop and adopt the nation's first GHG emission standards for automobiles. The legislature declared in AB 1493 that global warming was a matter of increasing concern for public health and environment in the state. It cited several risks

that California faces from climate change, including reduction in the state's water supply, increased air pollution creation by higher temperatures, harm to agriculture, and increase in wildfires, damage to the coastline, and economic losses caused by higher food, water energy, and insurance prices. Further the legislature stated that technological solutions to reduce GHG emissions would stimulate California economy and provide jobs.

The State of California in 2004 submitted a request for a waiver from federal clean air regulations (as the State is authorized to do under the Clean Air Act) to allow the State to require reduced tailpipe emissions of CO₂. In late 2007, the EPA denied California's waiver request and declined to promulgate adequate federal regulations limiting GHG emissions. In early 2008, the State brought suit against EPA related to this denial.

A recent CARB study (CARB 2008a) showed that in calendar year 2016, AB 1493 (also referred to as the Pavley standard or the Pavley rules) would reduce California's GHG annual emissions by 16.4 million metric tons (MMT) of carbon dioxide equivalents (CO₂e). This is almost 50% more than the 11.1 MMT reduction produced by currently proposed federal fleet average standards for model years 2011 – 2015.

Further, by 2020, California is committed to implement revised, more stringent GHG emission limits, the Pavley Phase 2 rules (See discussion of scoping plan below). California's requirements would reduce California GHG emissions by 31.7 MMTCO₂e in calendar year 2020, 45 percent more than the 21.9 MMTs reductions under the proposed federal rules in that year. Since the California rules are significantly more effective at reducing GHGs than the federal CAFE (fuel economy) program, they also result in better fuel efficiency – roughly 43 miles per gallon (mpg) in 2020 for the California vehicle fleet as compared to the new CAFE standard of 35 mpg.

EXECUTIVE ORDER S-3-05

Executive Order S-3-05 was the precursor to Assembly Bill 32 (AB 32 is described in the next section) and was signed by Governor Schwarzenegger in June 2005. This Executive Order was significant because of its clear declarative statements that climate change poses a threat to the State of California. The Executive Order states that California is "particularly vulnerable" to the impacts of climate change, and that climate change has the potential to reduce Sierra snowpack (a primary source of drinking water), exacerbate existing air quality problems, adversely impact human health, threaten coastal real estate and habitat by causing sea level rise, and impact crop production. The Executive Order also states that "mitigation efforts will be necessary to reduce greenhouse gas emissions".

To address the issues described above, the Executive Order established emission reduction targets for the state: reduce GHG emissions to 2000 levels by 2010, to 1990 levels by 2020 and to 80% below 1990 levels by 2050. The Secretary of the California Environmental Protection Agency was named as coordinator for this effort, and the Executive Order required a progress report by January 2006 and biannually thereafter. As a result, the Climate Act Team was created by the California Environmental

Protection Agency. The first report from the Climate Act Team was released in March of 2006, which proposed to meet the emissions targets through voluntary compliance and state incentive and regulatory programs.

Currently only the 2020 target has been adopted by the state through legislation (see Assembly Bill 32, below). As a result, all of the impact discussions, mitigation, and strategies are based on meeting the 2020 target, not the longer-term 2050 target. If the 2050 target is adopted during the life of the General Plan, amendments to the General Plan strategies outlined in the sections to follow will become necessary.

ASSEMBLY BILL 32

In September 2006, Assembly Bill (AB) 32 was signed by Governor Schwarzenegger of California. AB 32 requires that California GHG emissions be reduced to 1990 levels by the year 2020, just like Executive Order S-3-05. However, AB 32 is a comprehensive bill that requires the California Air Resources Board (ARB) to adopt regulations requiring the reporting and verification of statewide greenhouse gas emissions, and it establishes a schedule of action measures. AB 32 also requires that a list of emission reduction strategies be published to achieve emissions reduction goals.

As of this writing, the first six critical path items have occurred. AB 32 is in effect and the list of early action measures was adopted by the ARB on June 21, 2007 (Resolution 07-25), and many other measures were added at a hearing on October 25, 2007. The Scoping Plan was adopted on December 11, 2008. Regulations to implement various early action measures have been adopted (such as the Low Carbon Fuel Standard).

SENATE BILL 375

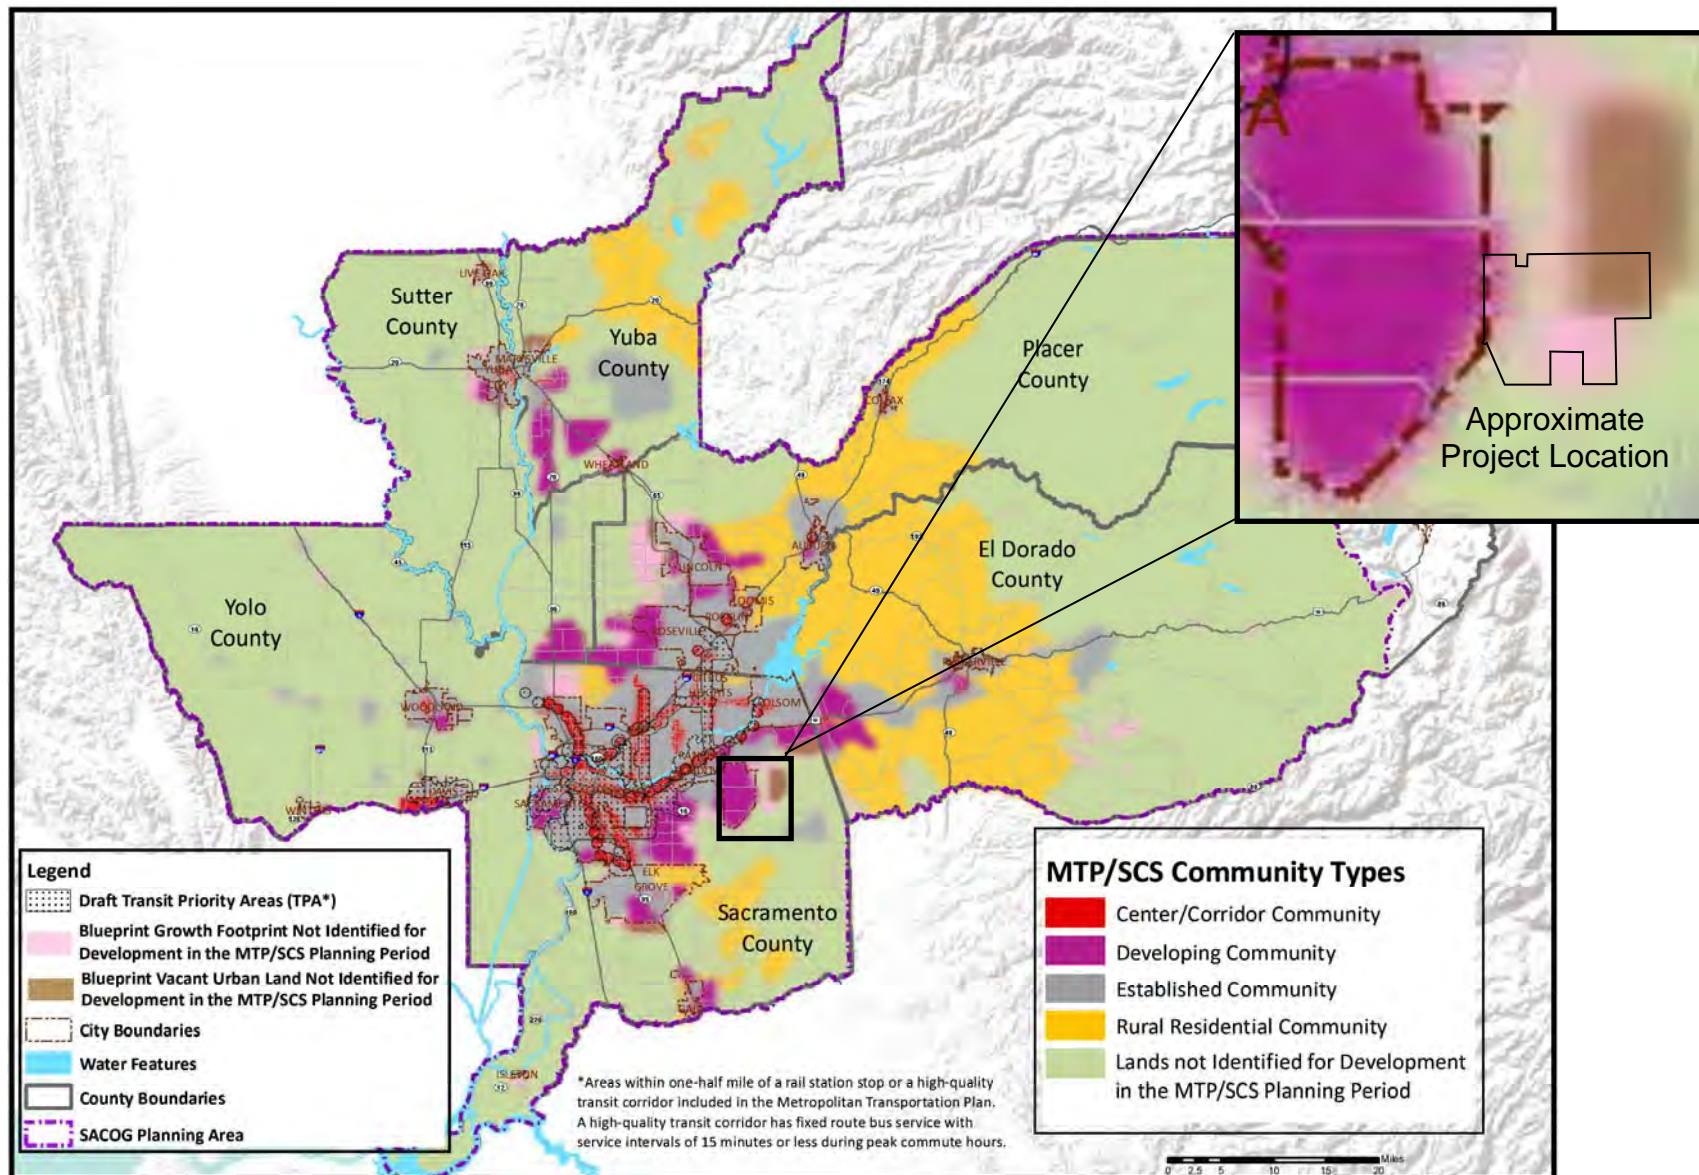

On September 30, 2008, Senate Bill (SB) 375 was signed by Governor Schwarzenegger of California. SB 375 combines regional transportation planning with sustainability strategies in order to reduce greenhouse gas emissions in California's urbanized areas. Existing law requires each regional transportation planning agency, which in Sacramento County's case is the Sacramento Area Council of Governments (SACOG), to adopt a Metropolitan Transportation Plan. SB 375 required the California Air Resources Board (ARB) to set performance targets for reduction of passenger vehicle emissions per capita in each of 16 Metropolitan Planning Organizations (MPOs) in the state for 2020 and 2035. For the SACOG MPO, these targets were set at 7% below 2005 per capita emissions for 2020 and 16% below 2005 per capita emissions for 2035. MPOs are not required to meet the greenhouse gas emission targets established by ARB, but if they conclude it is not feasible to do so, they must prepare an Alternative Planning Scenario to demonstrate what further land use and/or transportation actions would be required to meet the targets. SB 375 also requires that the Metropolitan Transportation Plan for each MPO include a Sustainable Communities Strategy (SCS) that integrates the land use and transportation components, and amends CEQA to provide incentives for housing and mixed use projects that help to implement an MTP/SCS that meets the ARB targets.

SACOG released a draft MTP/SCS and associated Draft Environmental Impact Report in November 2011. Projects which are consistent with the SCS may gain certain CEQA streamlining benefits, among which is the presumption that if consistent with the SCS, passenger vehicle greenhouse gas emissions from the project do not need analysis. The draft SCS land use map is included below (Plate CC-1), and as shown the Project is not identified as a developing community, and thus cannot use draft SCS consistency for streamlining. Even if it were consistent, the SCS is in draft form and is undergoing its own CEQA review, and thus cannot be relied upon for streamlining in any case. Furthermore, the SCS recognizes that there are alternative methods of achieving emissions reductions targets which are available. Once adopted, consistent projects can obtain streamlining benefits, but the MTP/SCS explicitly states that the opposite conclusion – that inconsistent projects have significant emissions – should not automatically be made:

Moreover, the SCS does not establish a threshold of significance under CEQA Guidelines Section 15064.7 or a legal presumption that a project inconsistent with the MTP/SCS does not meet greenhouse gas emissions reduction targets or AB 32 goals. (Draft MTP/SCS 2035, page 1-6)

The MTP/SCS is a recently-released draft which is not adopted, and thus any analysis is somewhat speculative at this time. In addition, SACOG has not issued any guidance on how the SCS relates to projects which are not within an area designated as a developing community, except to note that the SCS does not establish CEQA thresholds, and that the purpose of the SCS is to provide incentives – not to provide disincentives. For these reasons and because the Project is not included as a Developing Community, this EIR includes a detailed analysis of the Project's greenhouse gas emissions, below, and does not rely on any CEQA streamlining benefits or other analysis pertinent under SB 375.

Plate CC-1: Draft SCS Land Use Map

SENATE BILL 97 CHAPTER 185, STATUTES OF 2007

Senate Bill 97 (SB 97) requires the Office of Planning and Research (OPR) to prepare guidelines to submit to the California Resources Agency regarding feasible mitigation of greenhouse gas emissions or the effects of GHG emissions as required by CEQA. The California Resources Agency is required to certify and adopt these revisions to the State CEQA Guidelines by January 1, 2010. The Natural Resources Agency adopted the amendments on December 30, 2009. On February 16, 2010, the Office of Administrative Law approved the Amendments, and filed them with the Secretary of State for inclusion in the California Code of Regulations. The Amendments became effective on March 18, 2010.

ENDANGERMENT FINDING

On December 7, 2009, the U.S. EPA made an Endangerment Finding and a Cause or Contribute Finding related to greenhouse gases. The U.S. EPA Administrator found that the current and projected concentrations of the six key well-mixed greenhouse gases – carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆) – in the atmosphere threaten the public health and welfare of current and future generations (endangerment). The Administrator also found that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution which threatens public health and welfare (Cause or Contribute).

STATE OF CALIFORNIA EMISSION REDUCTION/ADAPTATION STRATEGIES

Several strategies to reduce vehicle emissions have been identified by the California Environmental Protection Agency's Climate Action Team. These include, but are not limited to, the following:

VEHICLE CLIMATE CHANGE STANDARDS

With the passage of AB 1493, Pavley, Chapter 200, Statutes of 2002, California moved to the forefront of reducing vehicle climate change emissions. This bill required the state to develop and adopt regulations that achieve the maximum feasible and cost-effective reduction of climate change emissions emitted by passenger vehicles and light duty trucks. Regulations were adopted by the ARB in September 2004. The ARB analysis of this regulation indicates emissions savings of 1 million tons CO₂ equivalent (MMTCo₂e) by 2010 and 30 million tons CO₂ equivalent by 2020.

DIESEL ANTI-IDLING

Reduced idling times and the electrification of truck stops can reduce diesel use in trucks by about 4 percent, with major air quality benefits. In July 2004 the ARB adopted a measure to limit diesel-fueled commercial motor vehicle idling. AB 32 analysis indicates that anti-idling measures could reduce climate change emissions by 1.2 MMTCO₂e in 2020.

OTHER NEW LIGHT DUTY VEHICLE TECHNOLOGY IMPROVEMENTS

In September 2004 the California Air Resources Board approved regulations to reduce climate change emissions from new motor vehicles. The regulations apply to new passenger vehicles and light duty trucks beginning with the 2009 model year. The standards adopted by the Board phase in during the 2009 through 2016 model years. When fully phased in, the near term (2009 – 2012) standards will result in about a 22 percent reduction as compared to the 2002 fleet, and the mid-term (2013 – 2016) standards will result in about a 30 percent reduction.

New standards would be adopted to phase in beginning in the 2017 model year (following up on the existing mid-term standards that reach maximum stringency in 2016). Assuming that the new standards call for about a 50 percent reduction, phased in beginning in 2017, this measure would achieve about a 4 MMT reduction in 2020. The reduction achieved by this measure would significantly increase in subsequent years as clean new vehicles replace older vehicles in the fleet – staff estimates a 2030 reduction of about 27 MMT.

EXECUTIVE ORDER S-01-07

This Executive Order was signed by Governor Schwarzenegger on January 18, 2007 and directed the Climate Action Team to determine whether the items in the Order could be established as an early action measure pursuant to AB 32 – which the Climate Action Team has now done. The Executive Order states that the State of California relies on petroleum-based fuels for 96% of its transportation needs, there were more than 24 million motor vehicles registered in California, and statewide gasoline consumption was almost 16 billion gallons in 2005. To address the carbon emitted by this use of fuel, the Executive Order states that a statewide goal must be established to reduce the “carbon intensity of California’s transportation fuels” by at least 10% by the year 2020 and that a Low Carbon Fuel Standard for transportation fuels be established. The Low Carbon Fuel Standard applies to all “refiners, blenders, producers or importers of transportation fuels in California”.

CALIFORNIA CLIMATE ADAPTATION STRATEGY

In December 2009, the California Resources Agency, in coordination and partnership with multiple other state agencies, released their California Climate Adaptation Strategy. This document summarizes the best known science on climate change impacts in seven specific sectors, including: public health, biodiversity-habitat, ocean & coastal

resources, water management, agriculture, forestry, and transportation and energy infrastructure. The strategy provides recommendations on how to manage against threats to these sectors. The strategy is in direct response to Gov. Schwarzenegger's November 2008 Executive Order S-13-08 that specifically asked the Natural Resources Agency to identify how state agencies can respond to rising temperatures, changing precipitation patterns, sea level rise, and extreme natural events.

SACRAMENTO COUNTY REDUCTION STRATEGIES

2030 SACRAMENTO COUNTY GENERAL PLAN

Though there are a multitude of policies within the General Plan which support the reduction of greenhouse gas emissions by promotion of transit, mixed use, and other land use designs, there are two policies which specifically address reduction of greenhouse gases:

AQ-22. Reduce greenhouse gas emissions from County operations as well as private development.

LU-115. It is the goal of the County to reduce greenhouse gas emissions to 1990 levels by the year 2020. This shall be achieved through a mix of State and local action.

CLIMATE ACTION PLAN

In May of 2009 Sacramento County published a Phase I Draft Climate Action Plan (Phase I CAP). The Phase I CAP provides a framework and overall policy strategy for reducing greenhouse gas emissions and managing our resources in order to comply with AB 32. It also highlights actions already taken to become more efficient, and targets future mitigation and adaptation strategies. This document is available at <http://www.sustainability.saccounty.net/ClimateActionPlan/default.htm>. The Phase I CAP, which was adopted as part of the 2030 General Plan (November 9, 2011), contains policies/goals related to agriculture, energy, transportation/land use, waste, and water.

Goals in the section on agriculture focus on promoting the consumption of locally-grown produce, protection of local farmlands, educating the community about the intersection of agriculture and climate change, educating the community about the importance of open space, pursuing sequestration opportunities, and promoting water conservation in agriculture. Actions related to these goals cover topics related to urban forest management, water conservation programs, open space planning, and sustainable agriculture programs.

Goals in the section on energy focus on increasing energy efficiency and increasing the usage of renewable sources. Actions include implementing green building ordinances

and programs, community outreach, renewable energy policies, and partnerships with local energy producers.

Goals in the section on transportation/land use cover a wide range of topics but are principally related to reductions in vehicle miles traveled, usage of alternative fuel types, and increases in vehicle efficiency. Actions include programs to increase the efficiency of the County vehicle fleet, and an emphasis on mixed use and higher density development, implementation of technologies and planning strategies that improve non-vehicular mobility.

Goals in the section on waste include reductions in waste generation, maximizing waste diversion, and reducing methane emissions at Kiefer landfill. Actions include solid waste reduction and recycling programs, a regional composting facility, changes in the waste vehicle fleet to use non-petroleum fuels, carbon sequestration at the landfill, and methane capture at the landfill.

Goals in the section on water include reducing water consumption, emphasizing water efficiency, reducing uncertainties in water supply by increasing the flexibility of the water allocation/distribution system, and emphasizing the importance of floodplain and open space protection as a means of providing groundwater recharge. Actions include metering, water recycling programs, water use efficiency policy, water efficiency audits, greywater programs/policies, river-friendly landscape demonstration gardens, participation in the water forum, and many other related measures.

Implementation Measure H of General Plan Policy LU-115 requires preparation of a Phase II CAP within three years of General Plan adoption (adoption occurred on November 9, 2011). This Phase II CAP is intended to flesh out the strategies involved in the Phase I CAP, and will include economic analysis, intensive vetting with all internal departments, community outreach/information sharing, timelines, and detailed performance measures.

CHICAGO CLIMATE EXCHANGE

In February 2007, the County joined the Chicago Climate Exchange. The Chicago Climate Exchange is the world's first and North America's only voluntary, legally binding rules-based greenhouse gas (GHG) emission reduction and trading system. Chicago Climate Exchange Phase I members commit to reduce GHG emissions 1% per year over the years 2003 through 2006 relative to a 1998 through 2001 average baseline. Members agree to reduce GHG emissions by a total of 4% below the baseline by 2006. Chicago Climate Exchange Phase II members commit to reduce GHG emissions from 1¼% to ½% per year through the years 2007 through 2010 for grand total of 6% below the baseline.

ENERGY CONSERVATION/ENERGY EFFICIENCY PROGRAM

The Board of Supervisors approved an Energy Conservation/Energy Efficiency Program in 2001. The essence of the program is to reduce electrical energy usage during peak

periods of the day. The program contains ten measures such as participating in Sacramento Municipal Utility District's Voluntary Emergency Curtailment Program, setting building temperatures to 78° F to decrease cooling demand and dual switching of lights. The preliminary baseline for direct and indirect emissions for the County is 226,700 metric tons of CO₂.

CALIFORNIA CLIMATE ACTION REGISTRY

The County joined the California Climate Action Registry (Registry) in December 2006. The Registry is a non-profit public/private partnership that serves as a voluntary GHG registry to protect, encourage and promote early actions to reduce GHG emissions. Registry participants agree to calculate, certify and publicly report GHG emissions. The Registry provides a reporting tool, standards and protocol for reporting GHG emissions.

AB32 recognizes participation in the Registry in a number of ways. First, AB 32 requires the ARB to incorporate the standards and protocols developed by the Registry in the rulemaking process. Second, AB 32 provides that entities that join the Registry prior to December 31, 2006 and report their emissions according to the Registry protocols will not be required to significantly alter their reporting program.

LOCAL GOVERNMENTS FOR SUSTAINABILITY (ICLEI)

The Local Governments for Sustainability is administered under the International Council for Local Environmental Initiatives (ICLEI), which the County joined in 2007. Cities for Climate Protection™ (CCP) is ICLEI's flagship campaign. The program is designed to educate and empower local governments worldwide to take action on climate change. CCP is a performance-oriented campaign that offers a framework for local governments to reduce greenhouse gas emissions and improve livability within their municipalities. This campaign would give Sacramento County a framework and tools to develop a plan for greenhouse emissions. The basic framework is called the 5 Milestones and consists of the following steps: completion of a baseline emissions inventory and forecast, adoption of an emissions reduction target, development of a Local Action Plan, implementation of policies and measures, and monitoring and verification of results.

The County has completed the emissions inventory and it is available on the Department of Environmental Review and Assessment website at www.dera.saccounty.net (see the home page under special studies).

GREEN FLEETS

The City and County of Sacramento have adopted a heavy-duty low-emission vehicle (LEV) acquisition policy. The policy goal is to reduce oxides of nitrogen (NOx) emissions from heavy-duty fleet vehicles to meet the year 2005 standard for ozone in the Sacramento Federal Ozone Non-attainment area. The efforts will focus on the conversion of the on-road, heavy-duty equipment fleets to certified low-emission vehicles as these vehicles are replaced as part of regular systematic replacement

programs. As of 2004 the County has committed to replace 50% off the fleet to low-emission vehicles.

COOL COUNTIES INITIATIVE

On July 16, 2007 at the National Association of Counties Annual Conference in Richmond, Virginia, 12 pioneering counties representing 17 million people launched “Cool Counties.” The Cool Counties initiative seeks to marshal the resources of all 3,066 counties across the nation to address the challenges climate change poses to our communities. On May 27, 2008 the Sacramento County Board of Supervisors approved a resolution to become a Cool County and participate in the initiative.

Participating counties commit to four smart actions:

1. reducing our own contributions to climate change through our internal operations;
2. demonstrating regional leadership to achieve climate stabilization and protect our communities;
3. helping our community become climate resilient;
4. urging the federal government to support our efforts.

These actions are consistent with the state requirements under Assembly Bill (AB) 32 and Executive Order S-3-05, including:

- Assessing local operations that impact greenhouse gas emissions;
- Working to reduce greenhouse gas emissions 80% below current levels by 2050;
- Identifying local vulnerabilities to climate change and creating a plan to address them;
- Working with counties nationally to urge the federal government to adopt legislation to reduce greenhouse gas emissions 80% below current levels by 2050.

SIGNIFICANCE CRITERIA

CEQA Guidelines section 16064.4 states that an agency should make a “good faith effort . . . to describe, calculate, or estimate the amount of greenhouse gas emissions resulting from a project”. It is left to the lead agency’s discretion to use a quantitative or qualitative approach. Factors that should be considered when determining significance are:

1. The extent to which the project may increase or decrease greenhouse gas emissions compared to the baseline;
2. whether the project exceeds any applicable significance threshold; and
3. the extent to which the project complied with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.

The guidelines do not include a numeric significance threshold, but instead defer to the lead agency to determine whether there are thresholds which apply to the project. With regard to the third item, statewide plans include AB 32 and SB 375, as described in the Regulatory setting. The underlying strategy and assumptions of the AB 32 Scoping Plan were used to develop County thresholds. AB 32 requires emissions be reduced to 1990 levels by the year 2020, which is estimated in the AB 32 Scoping Plan to be 15% below *existing (2005) emissions*. The text is emphasized to note that the goal is not 15% below what is known as “business-as-usual” conditions or unmitigated project emissions; it is 15% below the emissions which were existing in California in the year 2005.

As previously discussed, Sacramento County prepared a GHG emissions inventory for the County, and as an offshoot of that process has published a Climate Action Plan. Thresholds for GHG emissions were published within the Environmental Impact Report for the 2030 Sacramento County General Plan. These thresholds were most recently amended April 2011, over a year after the Notice of Preparation (NOP) for the Project was published. As part of the April thresholds update, Environmental Review indicated that projects would be required to use the threshold in effect at the time the NOP (or other environmental document) was published. Though not required, after discussions with the applicant it was decided to analyze the Project based on both the April thresholds, and the thresholds in effect at the time the NOP was published; tables with both of these thresholds are included below (Table CC-3 and Table CC-4).

As shown in the tables, separate thresholds have been included for each sector. The purpose of this division is to provide additional information about the source of emissions. When making a final determination of significance, these thresholds can be combined to generate a total emissions threshold; it is this total threshold that will ultimately determine whether impacts are found to be significant. The trucks subsector was added to the April 2011 revised thresholds in order to account for projects whose new trips are almost exclusively heavy-duty vehicles, not passenger vehicles.

Table CC-3: GHG Significance Thresholds in Effect at NOP, in Metric Tons

Sector	2005 Baseline	2020 Target	Thresholds
Residential Energy	1,033,142	877,883	1.30 per capita
Commercial & Industrial Energy	772,129	656,660	8.08 per Kft ²
Transportation	2,046,617	1,740,000	4.56 per capita

Table CC-4: April 2011 GHG Significance Thresholds, in Metric Tons

Sector	2005 Baseline	2020 Target	Thresholds
Residential Energy	1,033,142	877,883	1.33 per capita
Commercial & Industrial Energy	772,129	656,660	7.87 per Kft ²
Transportation	2,046,617	1,740,000	2.64 per capita
<i>Trucks</i>	<i>488,806</i>	<i>415,218</i>	<i>0.10 per 100 VMT</i>

METHODOLOGY

William Hezmalhalch Architects, Inc prepared a technical study for the Project which includes both an analysis of GHG emissions and an analysis of proposed mitigation measures. This plan, called the Cordova Hills Greenhouse Gas Plan (GHG Plan, dated May 2011) was deemed technically adequate by the Sacramento Metropolitan Air Quality Management District on June 2, 2011. The GHG Plan is included as Appendix CC-1. The discussions that follow summarize the GHG Plan.

The GHG analysis adopted the approach of developing and reporting a “Business As Usual” (BAU) scenario, the purpose of which is to determine what the impact would be if the Project was designed according to baseline standards – for example, if the Project resulted in trip generation identical to that established through the Institute of Transportation Engineers trip rates. Energy-related emissions from the Project were then calculated as a reduction from the BAU. Transportation emissions for the Project were calculated independently of the BAU. Refer to the descriptions below. Emissions factors used throughout the analysis are shown in Table CC-5. The BAU analysis is not used to determine the significance of Project emissions, but is included to indicate the efficacy of the reduction measures included in the Project, and to help determine whether all reasonable efforts to provide mitigation have been undertaken.

Table CC-5: Emission Factors

GHG	Electricity	Natural Gas
CO ₂	555.26 pounds per megawatt hour	0.0546 kilograms per cubic feet
CH ₄	0.0302 pounds per megawatt hour	0.005 kilograms per million British thermal units
N ₂ O	0.0081 pounds per megawatt hour	0.0001 kilograms per million British thermal units

BAU ANALYSIS

Public sector data (year 2009) from California Energy Commission (CEC) for both electricity and gas usage was used to determine the annual MT of CO₂e emitted per capita. The protocol for determining BAU emissions was from CAPCOA’s *Quantifying Greenhouse Gas Mitigation Measures*. The annual household electricity use data from the *California Energy Demand 2010 – 2020 Staff Report (CEC)* dated 2009 using 2009 numbers as suggested by SMAQMD’s *CEQA Guide* dated December 2009 was used to determine the Cordova Hills electricity use (4,621 gigawatt hours by 534,072 households). The formulas for converting annual total kilowatt hours (kWh) to MT of CO₂e were provided by CCAR.

The natural gas per capita usage was obtained from the *Greenhouse Gas Emissions Inventory for Sacramento County* dated June 2009. The total natural gas usage for the unincorporated Sacramento County of 80,910,929 therms was divided by the unincorporated Sacramento County population of 561,625 (144 therms per person).

The annual kWh use per square foot for nonresidential uses was determined from CEC's *California Energy Demand 2009 – 2020 Staff Revised Forecast* dated December 2009 using 2009 numbers. All commercial and industrial spaces were assumed to be occupied. The same formulas used for converting annual kWh and million British thermal units (MMBtu) to MT of CO₂e in the Residential Sector were used for the nonresidential calculations.

To determine the nonresidential natural gas emissions, the total gas consumption for Sacramento County was obtained from the CEC Energy Consumption Data Management System website for 2009. The Sacramento Municipal Utility District (SMUD) Planning Area commercial floor space was obtained from the CEC staff demographic assumptions found in the *California Energy Demand 2010 – 2010 Adopted Forecast Staff Form 2.2 SMUD Planning Area* on page 185.

To determine the BAU transportation emissions for the Cordova Hills Project, the Institute of Transportation Engineers (ITE) trip generation rates were input to the Urban Emissions model (URBEMIS 9.2.4). To determine the annual VMT, the total daily VMTs were multiplied by 320 days rather than 365 days. This difference is to allow for the variations in travel behavior associated with weekends and holidays (source: SACOG's DEIR for the Metropolitan Transportation Plan for 2035). The annual VMT were then multiplied by emissions factors from the *California Climate Action Registry General Reporting Protocol* Table C.4 for all vehicle model years (0.0048 g/mile for N₂O and 0.0051 g/mile for CH₄). These numbers were multiplied by the Global Warming Potential (GWP) values provided by IPCC in its Fourth Assessment Report (GWP for CH₄ is 21 and for N₂O is 310).

PROJECT ANALYSIS

Residential BAU emissions were reduced based on the following three factors: all homes within the Project will be 20% more efficient than the 2008 Title 24 standards, an Energy Star dishwasher and ceiling fan will be installed in every home, and at least 20% of the overall residential energy will be provided through renewable energy sources. Nonresidential BAU emissions were reduced based on all buildings being 20% more efficient than the 2008 Title 24 standards. CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* was used to develop the assumed reductions for each of these measures. This reduced amount represents the Project residential and nonresidential emissions.

Project transportation emissions were calculated based on VMT information extracted from the background data of the traffic study prepared for the Project by DKS Associates Transportation Solutions (DKS Associates). Note that VMT were provided for the baseline traffic modeling year and the cumulative traffic year of 2035. Since the

threshold is based on compliance in the year 2020, a simple regression of the VMT between the modeling years was performed to find the Project VMT in the year 2020. The BAU analysis of transportation emissions was, by necessity, simple since detailed data were not available. The Project VMT data provided by DKS Associates provided detailed breakdowns of VMT by vehicle speed, and thus the Project VMT analysis is more detailed. The Emission Factor Model 2007 (EMFAC) background data on emissions by vehicle speed and type was used to analyze Project vehicle emissions. The calculated emissions do not include additional reductions that can be expected from the adopted Low Carbon Fuel standard because no protocol for estimating the effect of this standard has been established.

CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* was used to quantify additional reductions related to transportation emissions. The traffic study already included most of the trip-reducing features of the Project in its assumptions. The only measures not accounted for, which were then added to reach the ultimate Project condition, were CAPCOA measures LUT-9 (Improved Design of Development), SDT-2 (Provide Traffic Calming Measures), and TRT-1 (Voluntary Commute Trip Reduction Features).

IMPACTS AND ANALYSIS

The following section discloses the potential impacts of the proposed project on global climate change, and the potential impacts of global climate change on the proposed project. Mitigation measures have been identified where feasible.

IMPACT: GENERATION OF GREENHOUSE GAS EMISSIONS

Table CC-6 through Table CC-14 provide the BAU and Project emissions calculations for the residential energy sector, the commercial/industrial (nonresidential) sector, and the transportation sector. All of the calculations below are based on accepted, quantifiable measurements both of initial emissions and measures to reduce greenhouse gases.

Table CC-6: BAU Residential Electricity GHG Emissions

Use Type	Total No of Units	Total Annual Electricity Use (MWh) ¹	Annual MT of CO ₂ e ²

Source: VMT from DKS Associates Transportation Solutions				
1. Some data is negative because the Project trips were calculated by subtracting the No Project miles from the Project miles. The Project reduces VMT in certain speed categories when compared to the No Project.				

The analysis results indicate that the Project will result in emissions of 1.18 MT per capita for residential energy and 5.75 MT per thousand square feet for nonresidential energy. Each of these numbers essentially reflects mitigated conditions, because the Project incorporates many emissions-reducing features which are established within the Cordova Hills Special Planning Area (SPA). With the measures listed in the GHG Plan and included in the SPA, Project emissions related to residential and commercial energy use will be below the thresholds in effect at the time of the NOP.

The initial quantified analysis for transportation (which used the vehicle miles traveled output of the traffic modeling) results in 4.76 MT per capita for transportation emissions. After this analysis, the GHG Plan then includes measures from CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures*. A wide array of measures from the CAPCOA document apply to the Project, but most were not analyzed because they were already

incorporated into the construction of the traffic modeling. The measures already incorporated into the traffic analysis are:

- Increased density
- Location efficiency
- Increased diversity of urban & suburban developments
- Increased destination accessibility
- Increase transit accessibility
- Orientation of project toward non-auto corridors
- Location of project near bike path/bike lanes
- Neighborhood site enhancements (interconnection of street network, sidewalks and traffic calming)
- NEV network
- Parking reductions
- Expansion of transit network
- Increase in Transit Services Frequency/Speed
- Improvement of traffic flow

In addition to the above measures which were captured in the traffic modeling, the GHG Plan applies three measures from the CAPCOA document: LUT-9, SDT-2, and TRT-1. LUT-9 measures VMT reductions resulting from enhancements to walkability and connectivity, as measured by the number of intersections per square mile. The GHG Plan calculates a possible 21.33% reduction in VMT, but the CAPCOA document allows a maximum credit of 10% for the measure. SDT-2 measures VMT reductions as a function of the number of intersections and streets which will incorporate traffic calming measures (this includes crosswalk countdowns and median islands). The GHG Plan calculates a 0.5% reduction in VMT related to this measure. Lastly, TRT-1 measures VMT reductions as a function of the percent of employees that will be eligible for the program and the percent commute reduction (the latter is from a table in the CAPCOA document). The GHG Plan calculates a 5.4% VMT reduction resulting from application of this measure. These three measures result in additional VMT reductions of 15.9%, resulting in a decrease of emissions from 4.76 MT per capita to 4.02 MT per capita (total annual emissions of 102,182 MT).

At 4.02 MT per capita, transportation emissions are below the threshold in effect at the time of the NOP, but exceed the threshold published in April 2011. In an additional effort to reduce these emissions, the GHG Plan calculates a credit for planting trees (related to sequestration and to cooling and shading effects) found in Table 22 of the CAPCOA document. The calculated offset is relatively small, amounting to a 0.02 MT reduction per capita (531 MT annually). Applied to the transportation sector emissions, this credit further reduces emissions to 4.00 MT per capita, which remains above the April 2011 threshold. A summary of Project emissions is included in Table CC-15 and a

comparison of Project emissions to regional and state-wide emissions is included in Table CC-16.

Table CC-15: Summary of Mitigated Project Emissions

Sector	BAU MT/Capita	BAU Total Annual MT	Project MT/Capita	Project Total Annual MT
Residential Energy	1.50	38,018	1.18	30,100
Commercial/Industrial Energy	0.68	17,187	0.62	15,634
Transportation	8.01	203,551	4.00*	101,651*
<i>All Sectors</i>	<i>10.18</i>	<i>258,756</i>	<i>5.80</i>	<i>147,386</i>
*reflects the 531 MT tree credit				

Table CC-16: Relative CO₂ Emissions (in CO₂ Equivalents)

Source	CO ₂	% of State - 2004	% of State - 1990	% of Entire County	% of Unincorporated County
Project	0.15 MMT/yr	2.9 <u>0.04</u> %	4.3 <u>0.04</u> %	0.04 <u>1.3</u> %	0.04 <u>2.9</u> %
Unincorporated County	5.2 MMT/yr	1.2%	1.3%	43%	
Entire County	12 MMT/yr	2.8%	3.1%		
State – 1990	389 MMT/yr				
State – 2004	427 MMT/yr				

MMT: Million Metric Tons

Though the Project incorporates an array of emissions-reducing features, resulting in Project emissions that are less than half of the BAU emissions, the Project still exceeds the April 2011 thresholds. The source of these emissions is the transportation sector. After thorough analysis and review it was concluded that the Project includes all reasonable and feasible design features which could reduce these emissions, including a robust pedestrian and bicycle network and a community transit system. Ultimately, the transportation sector emissions are not the result of improper or poor design, but due to the Project location. The number and length of trips have been reduced through Project design, but those trips which remain are long.

The applicant has stated that the standard traffic model (Sacramento Regional Travel Demand Model, or SACMET) cannot adequately account for the effects of mixed use and other Project features, because it is a gross-scale model. The argument has also been made that the typical paradigm of most worker trips traveling to downtown Sacramento is shifting, and that many trips will remain within the Project or go to the

much closer job center of Rancho Cordova. There is some merit to these arguments – in particular, the issue with SACMET.

The model aggregates uses in order to build the travel demand scenario. As an example, a retail supercenter (one that includes both retail and groceries) will be treated as simply retail by the model. Thus, the grocery component, even though it could substantially alter travel behavior, would be lost in the SACMET model. Though these are known and acknowledged modeling limitations, it is not clear whether a more refined modeling tool would result in higher or lower Project VMT. It should not be assumed that more precise modeling would demonstrate lower Project impacts. The Project is below all of the thresholds in effect at the time of the NOP, but transportation emissions remain above the April 2011 significance thresholds.

The Project has included all reasonable and feasible measures to reduce impacts. These measures are required to ensure that the Cordova Hills project does not make it difficult for the County and the State to meet reduction targets. A mitigation measure imposing these measures is not required, because they are design features already embedded in the SPA; however, it is possible that a future project could include an SPA amendment that would change some of these critical design features. Mitigation is included requiring that all SPA amendments include an analysis demonstrating that the change to the SPA will not result in an increase in greenhouse gas emissions above 5.80 metric tons per capita. This will ensure that as the master plan builds out, it will remain consistent with this analysis.

In concert with state and federal activities, the design features of the SPA are intended to offset the Project climate change impact. Ideally, this mitigation would reduce the Project emissions and climate change impacts to levels that are not cumulatively significant, but there are many unknown variables and implementation challenges. Refinements to the County baseline modeling has already resulted in a change to the significance thresholds – a change which takes the Project from a conclusion of less than significant to a conclusion of significant. Furthermore, it is possible that the 15% emissions reduction estimated by the state will be revised upward. Aside from changes to the targets, the quantification of Project emissions has used the best available evidence, but there is a lack of research on the accuracy of such modeling compared to the actual emissions which result from the constructed master planning area. Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling this analysis concludes that Project impacts may remain significant. For these reasons, even though the Project has included a range of feasible design features which reduce emissions below the thresholds in effect at the time of the NOP, it is concluded that impacts are *significant and unavoidable*.

MITIGATION MEASURES

CC-1. The following text shall be added to the Cordova Hills SPA: All amendments to the SPA **with the potential to change SPA-wide GHG emissions** shall include an analysis which quantifies, to the extent practicable, the effect of the

Amendment on **SPA-wide** greenhouse gas emissions. The Amendment shall not increase **SPA-wide** greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). **If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the Sacramento County Environmental Coordinator on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, who will coordinate with SMAQMD.**

IMPACT: CLIMATE CHANGE EFFECTS ON THE PROJECT

Global climate change is a complex phenomenon that is influenced by many environmental factors. There are also many different climate or hydrologic modeling tools available, each with strengths and weaknesses. While changes to the existing climate landscape can be demonstrated by looking at the historic record, it becomes challenging to predict future trends. The process must be simplified to some extent. Climatologists and others who model climate change must make certain assumptions, such as establishing a fixed rate of temperature change, in order to proceed with modeling. Therefore, scientists involved in these modeling efforts do not try to be absolutely predictive, but instead use different model types with different sets of assumptions to capture a range of possible scenarios. It is also necessary to update the model with the latest available data on a regular basis in order to sync the models with current conditions. There is no single, certain prediction related to the probability of environmental effects. Scenarios are rated as being very likely if many different models come up with very similar results, and as uncertain if many different models report very different results. The sections below rely on information from several different published sources and provide a qualitative analysis of potential impacts as they affect North America, California, Sacramento County, and the project area.

TEMPERATURE

Significant increases in the frequency, intensity, and duration of summertime extreme heat days, defined as the 10% warmest days of summer, are projected due to climate change (Miller et. al., 2007). Temperature change is the driver for climate change, impacting environmental processes that will in turn impact human life. There is strong agreement that many of the most damaging effects of climate change will begin to occur after temperatures increase beyond 2 degrees Celsius into the 3 or 4 degree range. The IPCC Working Group III report determined that reductions of 50 to 80% would be needed by 2050 in order to stabilize temperature rise at no more than 2 degrees Celsius (IPCC, 2007c). The limits set forth in Executive Order S-3-05 and in AB 32 mirror this research.

For California as a whole, the total number of days of extreme heat is projected to *double* relative to historical mean of 12 days per summer, to an average of 23 – 24 days per summer by 2034. By 2064, this is projected to increase to 27 – 39 days. Aside

from this global research, various research papers and technical studies have been produced that look specifically at impacts in California. One of these is a white paper titled “Climate Scenarios for California”, sponsored by the California Energy Commission, which used many of the same assumptions and scenarios as the IPCC reports, but scaled the modeling down to the California level. This paper postulates that the average temperature change from the 1961 – 1990 period to the 2070 – 2099 future will be more marked during the summer months than during the winter months (Cayan et. al., 2006a).

Higher temperatures would have direct effects on the health of many organisms, including humans. It is probable that rising temperatures will cause an increase in the number of humans who die or become ill due to heat waves, may change the range (geographically or seasonally) of various infectious disease vectors (such as mosquitoes), and increase cardio-respiratory disease prevalence and mortality associated with ground-level ozone (IPCC, 2007b). Many individual plants may also die or become damaged during heat waves, as even if there is ample water in the soil, water loss through the leaves will outpace the ability of the plant to draw water from the soil. Warmer winters would bring some benefits to some parts of California, where cold-related deaths and illnesses during the wintertime would be reduced. (Cayan et. al., 2006a) However, the greater Sacramento area does not typically experience extreme cold under current conditions, and in any case the stated negative effects would be expected to outweigh this positive effect.

The most severe human health impacts typically occur to people in distressed circumstances, who do not have access to a cooler home environment. The Project does not include any design features which would expose residents or visitors to any unique risk related to future increases in average temperature. All homes within the Project will be built to modern building codes, which require efficient cooling systems, double-paned windows, and insulation, all of which help to maintain tolerable indoor temperatures. In the exterior environment, the SPA includes a requirement for shade trees distributed throughout the public pathways and building areas. The Project also integrates greenspaces throughout the Project, which can help to reduce the urban heat island effect. These represent feasible and reasonable adaptive measures, which are already incorporated into the Project through the SPA or through California building standards.

WATER SUPPLY AND FLOODING

Although current forecasts vary, the effects of global climate change on precipitation and temperature regimes in California could lead to significant challenges in securing an adequate water supply for a growing population and California’s agricultural industry. An increase in precipitation falling as rain rather than snow could also lead to increased potential for floods because water that would normally be held in the Sierra Nevada until spring could flow into the Central Valley concurrently with winter storm events. This scenario would place more pressure on California’s levee/flood control system. California also relies heavily on gradual snowmelt from the Sierra Nevada to supply water.

According to the Intergovernmental Panel on Climate Change (IPCC) 2007 report, the annual mean warming in North America is likely to exceed the global mean warming in most areas and snow season length and snow depth are very likely to decrease in most of North America (IPCC, 2007a). These trends have already been observed, as the snow pack in the Sierra Nevada and the Cascade Range has been declining over the last few decades of record, and the average temperature in California has increased one degree Fahrenheit over the past 50 years (Cayan et.al., 2006a). Although these general statements are made, it is recognized that although there is high model agreement on warming trends the agreement among precipitation and hydrologic trend models is not nearly so strong.

The Climate Scenarios for California white paper modeled changes in Snow Water Equivalent as of April 1, when the snow season begins to taper off. Snow Water Equivalent is the amount of water contained within the snowpack. It can be thought of as the depth of water that would theoretically result if you melted the entire snowpack instantaneously. The analysis results differ widely depending on which model and emissions scenario is used. As compared to the 1961 – 1990 period of record, the net change in Snow Water Equivalent ranges from +6% to -29% (for the 2005 – 2034 period), from -12% to -42% (for 2035 – 2064), and from -32% to -79% (for the 2070 – 2099 period). These results highlight the lack of agreement found amongst hydrologic models. The ranges of projected change vary widely, and in the near-term some modeling even predicts an *increase* in Snow Water Equivalent. However, in the long-term all of the models do agree that Snow Water Equivalent will be reduced, even though further refinement of the modeling will need to be completed to narrow down the range of reductions. (Cayan et. al., 2006a)

The modeling results indicate that snow losses have greatest impact in relatively warm low-middle and middle elevations between about 3280 feet and 6560 feet (losses of 60% to 93%) and between about 6560 feet and 9840 feet (losses of 25% to 79%). The central and northern portions of the Sierra Nevada contain large portions of this low-middle and middle elevations, and are subject to the heaviest reductions in snow accumulation. (Cayan et. al., 2006a).

The effect of climate change on future demand of water supply remains uncertain (DWR 2006), but changes in water supply are expected. The California Department of Water Resources (DWR) has sponsored or published a number of papers on the interaction between climate change and water supply, and has included a Climate Change Portal on the DWR website (www.climatechange.water.ca.gov). Climate change is also addressed in the 2009 California Water Plan update (public review draft of Volumes 1, 2, and 3 released January 2009). Adaptation is the primary thrust of the strategies outlined in the public review draft, with a focus on reducing water demand, improvements in operational efficiency, and increasing water supply.

The American River and many other major and minor rivers within the County are largely fed by snowmelt within the low-middle and middle elevation range that is expected to suffer the greatest reductions in snowpack. It can be concluded that Sacramento County will see a significant reduction in snowmelt-driven water supply by

the end of this century. In the shorter term, it is less clear whether there will be a significant reduction in snowpack. Modeling results indicate that snowpack may either increase by 6% or decrease by as much as 29% by the year 2034. Given this uncertainty, it would be speculative to attempt to provide a quantified analysis of the effects of climate change on current water sources within Sacramento County.

None of the floodplains affecting the Project site are influenced by snowmelt, because the watersheds on the site are not connected to the Sierra Nevada. Local precipitation patterns will determine whether climate change noticeably impacts the onsite floodplains. In addition, all of the onsite waterways are relatively narrow and steep features which do not contain water year-round; water passes swiftly through these features, and so the floodplains are likewise narrowly confined along the drainages. Because the waterways do not retain water for very long, the surface water elevation does not tend to build cumulatively over a series of storms. The floodplains associated with the on-site drainages are only likely to be affected by an increase in the intensity of individual precipitation events. Those drainages that will remain after the Project is completed will be located within relatively large open space environments, giving the drainages ample room to increase the floodplain edges without infringing on development. Regarding Carson Creek, which is a perennial stream that could be affected by cumulative buildup of water surface elevations, the Project is at a much higher elevation than either the floodplain or the land to the east of the creek. Any floodplain expansion would largely occur away from Project uses.

Project water will be supplied by the Sacramento County Water Agency (SCWA) Zone 40, which is a conjunctive use water system. SCWA has taken climate change into account in its water supply planning, having assumed that surface water supplies could diminish by 25% (according to the Programmatic Water Supply Assessment prepared for the Sacramento County Draft 2030 General Plan Update). In addition, the 2010 California Green Building Standards Code requires the installation of water-efficient fixtures in all new construction, including low-flow showerheads, faucets, and toilets. The SPA also indicates that many of the public landscaped areas within the Project will consist of drought-tolerant species fed by drip irrigation or similar low-water systems. Taken together, the requirements for water efficiencies and the planning for water reduction should ensure that the Project has adequate water supply in the long-term.

SURFACE WATER QUALITY

Water quality is affected by several variables, including the physical characteristics of the watershed, water temperature, and runoff rate and timing. A combination of a reduction in precipitation, and/or shifts in volume and timing of runoff flows, and the increased temperature in lakes and rivers could affect a number of natural processes that eliminate pollutants in water bodies. For example, although there may be more flood events, the overall stream flow decrease from a lack of summer snowpack could potentially concentrate pollutants and prevent the flushing of contaminants from point sources. The increased storm flows could tax urban water systems and cause greater flushing of pollutants to the Sacramento-San Joaquin Delta and coastal regions (Kiparsky and Gleick 2003). Still, considerable work remains to determine the potential

effect of global climate change to water quality. In any case, the Project includes low impact development designs, as discussed in the Hydrology and Water Quality chapter, which represent the feasible adaptive measures the Project can incorporate.

FISHERIES AND AQUATIC RESOURCES

The health of river ecosystems is highly dependent on water temperatures and stream flows. The IPCC Working Group II report recites a litany of temperature and flow effects on fisheries that have already been observed: the sea-run₃ salmon stocks are in steep decline throughout much of North America (Gallagher and Wood, 2003), Pacific salmon have been appearing in Arctic rivers (Babaluk et al., 2000), and salmonid species have been affected by warming in U.S. streams (O'Neal, 2002). It is probable that increases in average temperatures in the state will cause corresponding increases in water temperatures. Rates of fish-egg development and mortality increase with temperature rise within species-specific tolerance ranges (Kamler, 2002). Also, many fish species migrate into Sacramento County waterways during specific seasons to breed, and these fish rely on increased late-fall and early winter flows in order to complete the migration. If increased flows are delayed, possibly as a result of lessened groundwater recharge or shifts in the onset of the rainy season, this would be a barrier to migration. These potential effects could further endanger the sustainability of aquatic populations that are already listed through the Federal or California Endangered Species Acts, or could cause non-listed species to require listing under the Act.

The waterways on the Project site are not habitat for fish, though eventually the on-site waterways do connect to perennial streams. The Project already includes low impact development designs within the SPA, and also included a hydromodification analysis to ensure that the Project does not contribute substantially to the degradation of waterways. These measures represent the reasonable adaptive responses the Project can include so as not to exacerbate any deleterious effects on fisheries which result from climate change.

WILDLAND FIRE RISK

With climate change, the potential for wildland fires may change due to changes in fuel conditions (transitioning forests to chaparral/grasslands for example), precipitation (longer dry seasons, higher extreme temperatures), and wind (affecting potential spread), among other variables.

Westerling and Bryant (2006) estimated future statewide wildfire risk from a statistical model based on temperature, precipitation, and simulated hydrologic variables. These are conservative estimates because they do not include effects of extreme fire weather. Projections made for the probabilities of “large fires” – defined as fires that exceed an arbitrary threshold of 200 hectares (approximately 500 acres) – indicate that the risk of large wildfires statewide would rise almost 35% by mid-century and 55% by the end of the century under a medium-high emissions scenario, almost twice that expected under lower emissions scenarios. Estimates of increased damage costs from the increases in

fire season severity (Westerling and Bryant 2006) are on the order of 30% above current average annual damage costs.

A second study explored, through a case study in Amador and El Dorado Counties, the effects of projected climate change on fire behavior, fire suppression effort, and wildfire outcomes (California Climate Change Center 2006b). Climate and site-specific data were used in California Department of Forestry and Fire Protection (CDF) standard models to predict wildfire behavior attributes such as rate of spread and burning intensity. The study found an increase in the projected area burned (10% – 20%) and number of escaped fires (10% – 40%) by the end of century, under the drier climate scenarios. However, the less dry model showed little change.

The Project site is designated as a State Responsibility Area (SRA) by the California Department of Forestry and Fire Protection, and has been assigned the lowest fire hazard rating applied to SRAs. Fire hazard in the area could increase as a result of climate change, but it is also true that by the time these impacts occur much of the area within the Urban Services Boundary – that is, the areas north and south of the site, will have become urbanized, and will not be subject to wildland fire risks. The area to the east will remain wildland, and fire risks from this area may increase over time. The California Building Code already contains standards that would apply to the Project, because it is within an SRA, and these represent the reasonable and feasible measures to reduce wildland fire risk to the structures.

RAPID CLIMATE CHANGE

Most global climate models project that anthropogenic climate change will be a continuous and fairly gradual process through the end of this century (DWR 2006). California is expected to be able to adapt to the water supply challenges posed by climate change, even at some of the warmer and dryer projections for change. However, sudden and unexpected changes in climate could leave many of the agencies responsible for management of vulnerable sectors (water supply, levees, health, etc) unprepared, and in extreme situations would have significant implications for California and the health and safety of its denizens. For example, there is speculation that some of the recent droughts that occurred in California and the western United States could have been due, at least in part, to oscillating oceanic conditions resulting from climatic changes. The exact causes of these events are, however, unknown, and evidence suggests such events have occurred during at least the past 2000 years (DWR 2006). There are no adaptive responses available to the Project which would be feasible to include as part of the Project. It is unlikely that rapid climate change will occur, and if it did the effects are highly uncertain.

CONCLUSION

The effects of climatic changes on the Sacramento region are potentially significant, and can only be mitigated through both adaptation and reduction strategies.

Sacramento County is requiring that this Project, as well as other projects in the

County, mitigate for their emissions. Adaptation strategies related to climate change may involve new water supply reservoirs or other storage options, changes to dam release schedules, changes to medical and social service programs, and other broad-level actions. Most of these strategies are within the auspices of the State of California, not local government. This is recognized within the AB 32 Scoping Plan that has been adopted by the State, as well as publications by agencies such as the California Department of Water Resources. Therefore, by requiring mitigation of projects that may result in significant greenhouse gas emissions, and by adopting County programs and changes in government operations, the County is implementing all feasible strategies to reduce the effects of climate change on the region. Nonetheless, it is probable that these strategies will not be sufficient to offset all of the impacts of climate change, and that some of these impacts will be significant; despite the application of feasible strategies, impacts remain *significant and unavoidable*.

8 CULTURAL RESOURCES

INTRODUCTION

Under CEQA, lead agencies must consider the effects of their projects on historical resources. This chapter describes the potential impacts to cultural resources that could occur as a result of implementation of the proposed Cordova Hills Project. Cultural resources may include historic buildings and structures, historic districts, historic sites, culturally sacred sites, prehistoric and historic archaeological sites, and other prehistoric and historic objects and artifacts. The Cordova Hills Project area and vicinity is traversed by several creeks and/or tributaries, which were important resources during both prehistoric and historic time periods. The Project area also provides substantial upland areas overlooking creek resources, which according to known land use patterns, were optimal locations for settlement during the prehistoric and historic era. These factors indicate sensitivity for known and unknown cultural resources within the Cordova Hills Project area.

Overall, cultural resources that are known to exist and those that may be present in the Cordova Hills Project area could include the categories described in Table CR-1, identified pursuant to *California Code of Regulations, Title 14, Section 4852*. The following analysis provides an overview of known cultural resources within the Cordova Hills Project area and identifies any potential adverse impacts to them associated with the Project. Potential unknown resources are also addressed. The analysis also recommends mitigation measures to reduce impacts to cultural resources within the Project area. The following cultural resources surveys, testing programs and evaluations of resources for the Cordova Hills Project site were prepared by ECORP Consulting, Inc (ECORP) and submitted to DERA:

1. "Cultural Resources Survey Report: Cordova Hills, Sacramento County, California" January 2007
2. "Cultural Resources Survey Report: Solitu Property, Sacramento County, California" November 2007
3. "Cultural Resources Survey Report: Grant Line Mesa, Sacramento County, California" May 2008
4. "Test Program Results and Evaluation for Cultural Resources In the Conwy and Solitu Projects, Sacramento County, California" August 2008

This chapter is based on and contains portions of the above-listed cultural resources studies. Although the above reports were conducted in a segmented fashion, as properties were added to the Project area, the following analysis aggregates the above listed reports and provides a combined analysis to cultural resources impacts on the Cordova Hills Project area as a whole.

Table CR-1: Categories of Cultural Resources

Category	Description	Example
Building	Structures created principally to shelter or assist in carrying out any form of human activity. May also refer to a historically and functionally related unit (e.g., courthouse and jail).	Houses, barns, churches, factories, and hotels
Site	A site is the location of a significant event, a prehistoric or historic occupation or activity, or a building or structure, whether standing, ruined, or vanished, where the location itself possesses historical, cultural, or archeological value regardless of the value of any existing building, structure, or object. A site need not be marked by physical remains if it is the location of a prehistoric event, and if no buildings, structures, or objects marked it at that time.	Trails, designed landscapes, battlefields, habitation sites, Native American ceremonial areas, petroglyphs, and pictographs
Structure	The term "structure" is used to describe a construction made for a functional purpose rather than creating human shelter.	Mines, bridges, and tunnels
Object	The term "object" is used to describe those constructions that are primarily artistic in nature or are relatively small in scale and simply constructed, as opposed to a building or a structure. Although it may be moveable by nature or design, an object is associated with a specific setting or environment. Objects should be in a setting appropriate to their significant historic use, role, or character. Objects that are relocated to a museum are not eligible for listing in the California Register.	Fountains, monuments, maritime resources, sculptures, and boundary markers
Historic District	Unified geographic entities which contain a concentration of historic buildings, structures, objects, or sites united historically, culturally, or architecturally. Historic districts are defined by precise geographic boundaries. Therefore, districts with unusual boundaries require a description of what lies immediately outside the area, in order to define the edge of the district and to explain the exclusion of adjoining areas.	---

CULTURAL RESOURCES SETTING

LOCATION

Cordova Hills is located in the eastern portion of unincorporated Sacramento County. The Project area is made up of portions of Sections 14, 13, 23, and 24 in Township 8 North, Range 7 East, and the western half of Section 18 in Township 8 North Range 8 East of the Mount Diablo Base and Meridian, USGS Buffalo Creek, CA, 7.5 minute quadrangle. The Project area is topographically diverse and includes large areas of flat fields and corresponding areas of hills and ridges with moderate to steep slopes. The Project area also includes many seasonal pools, small drainages, and creek tributaries (see the Biological Resources Chapter for specific information on wetland and creek features within the Project area). Additionally a segment of Carson Creek occurs just east of the Project area. The wetland resources along with the flora and fauna present in the Project area paired with the range of local relief present, makes the Project area attractive and conducive to settlement by people in both the prehistoric and historic era.

REGIONAL PREHISTORY CONTEXT

PRE-ARCHAIC PERIOD (10,000-8,500 B.C.)

The earliest occupants of California were generally believed to be reliant for their subsistence on the hunting of big game – the Pleistocene megafauna such as mammoths and giant sloths -- a strategy that kept them constantly on the move. Although tools for grinding are occasionally found on sites dating to this period, archaeological evidence indicates that the gathering of plant material may have been only a small part of their subsistence strategy. Evidence for this wide-ranging, highly nomadic occupation has been found all over the West, from sites at what are today deserts, but were then inland lakes with resource-rich marshlands, to the vast expanses of the great Plains, to the high elevations of the Rocky mountains. Few sites from this period have been found in California, suggesting a small, widely dispersed population. A dearth of sites at higher elevations is probably due to climate. The final Ice Age of the Pleistocene (1.8 million to about 10,000 years ago) was just ending, glaciers still existed in the Sierra Nevada, and conditions in general were much cooler and wetter than today, making the mountains an inhospitable habitat for humans. Most of the sites dating to this period have been found in the vicinity of, or on, the ancient shorelines of the large pluvial lakes that were common during this time (Chartkoff and Chartkoff 1984).

EARLY TO MIDDLE ARCHAIC PERIOD (8,500-4,000 B.C.)

With the end of the Pleistocene, the climate began a warming and drying trend that lasted for several thousand years. The great inland lakes that had covered large areas

of the Great Basin began to dry up, and the megafauna – the mainstay of the Pre-Archaic Period subsistence – suffered mass extinction. People adapted to these changes by shifting their foraging emphasis away from hunting and increasing their use of plant resources, as evidenced by a marked increase in the presence of plant processing tools on archaeological sites dated to this time period. More manos and metates suggest that people had begun to rely on grinding hard seeds and grains for food. This, combined with a greater reliance on local tool stone sources suggests that groups largely abandoned the wide-ranging nomadism of the Pre-Archaic and began to concentrate their foraging efforts on smaller territories using a seasonal round, scheduled to coincide with the appearance of various resources as they became available. Though the lakes were shrinking, use of their many resources became an integral part of Early to Middle archaic subsistence strategies. It is also during this time period that people began a more intensive use of the coastal regions, taking advantage of the rich marine resources found there (Chartkoff and Chartkoff 1984).

LATE ARCHAIC PERIOD (4,000-2,000 B.C.)

Another major change in subsistence came in the Late Archaic Period with the discovery of a method to remove the tannins from acorns, allowing this nearly ubiquitous nut to become a staple food for the indigenous people of California. In addition to providing a rich and essentially inexhaustible source of nutrition, it allowed people to gather and store large surpluses of food to last through lean seasons. With this came an increase in group size and population densities. Sedentarism increased, and sophisticated cultures developed comparable to those found in farming areas in other parts of North America. It has been suggested that agriculture never took root in the Pacific region because the richness of the natural environment provided all that the people needed to survive. Trade also increased during this period, bringing in goods – and, presumably, ideas – from afar. The atlatl, or spear-thrower, is an example of technology that was most likely imported from another region. Hunting a variety of large and small game, fishing, and gathering numerous types of wild plants remained important elements of overall subsistence strategies (Chartkoff and Chartkoff 1984).

EARLY AND MIDDLE PACIFIC PERIODS (2,000 B.C.-A.D. 500)

By 2,000 B.C., acorn meal had become the most important food for California Indians, much as corn was for people elsewhere. An increase in the number of archaeological sites dating to this period suggests an increase in population that was probably the result of this reliable and widely available food resource. People moved into environmental zones that had previously been used only marginally, such as the middle and high sierras. In addition, societies began to become more complex, socially and politically (Chartkoff and Chartkoff 1984).

LATE PACIFIC PERIOD (A.D. 500-1400)

With the introduction of the bow and arrow in the Late Pacific Period, prehistoric weapons technology in California took a giant leap forward. Lighter, more accurate, and with a significantly longer range, the bow and arrow changed hunting and warfare

forever. Another major shift in technology at this time is the movement away from portable manos and metates and the increased use of bedrock mortars and milling stations (Moratto 1984). The increasing complexity of societies witnessed at the end of the Middle Pacific Period continues to be seen in archaeological sites dating to this period, as does the widening of trade networks, development of food storage and redistribution systems, the increasing intricacy of ceremonial and funerary patterns, and more marked territoriality. In addition, increased amounts and types of fishing equipment and fish and shellfish remains indicate greater use of riverine resources (Chartkoff and Chartkoff 1984).

FINAL PACIFIC PERIOD (A.D. 1400-1769)

Sedentism intensified during this period, with people becoming ever more reliant on resources, such as acorns and seeds, obtained within their territory and supplemented by resources obtained through trade and exchange. Societies, along with economies and political systems, continued to become more complex. During this period, visits from Europeans began, culminating with the establishment of Spanish mission and presidios along the coast in A.D. 1769 (Chartkoff and Chartkoff 1984).

LOCAL PREHISTORY CONTEXT

The earliest evidence of the prehistoric inhabitants of the region surrounding the Project area comes from a single, deeply buried site in the bank of Arcade Creek, north of Sacramento, containing grinding tools and large, stemmed projectile points. The points and grinding implements suggest an occupation date of some time between 6,000 and 3,000 B.C. (Wallace 1978). However, it was not until after about 3,500 B.C., in the late Archaic Period, that people began to move into the San Joaquin and Sacramento Valleys in any significant numbers (Chartkoff and Chartkoff 1984). This earliest permanent settlement of the Delta region of the Sacramento River is called the Windmill Tradition and is known primarily from burial sites containing relatively elaborate grave goods (Chartkoff and Chartkoff 1984, Ragir 1972, Wallace 1978). The Windmill Tradition reflects the amplification of cultural trends begun in the Middle Archaic, as seen in the proliferation of finished artifacts such as projectile points, shell beads and pendants, and highly polished charmstones. Stone mortars and pestles, milling stones, bone tools such as fishhooks, awls, and pins, are also present. It is probable that people during this time subsisted on deer and other game, salmon, and hard seeds. They also were apparently the first Californians to discover the process for leaching the tannins out of acorns thus making them edible by humans (Chartkoff and Chartkoff 1984). Based on linguistic evidence, it has been suggested that the Windmill culture was ancestral to several historic tribes in the Central Valley, including the Penutian-speaking Nisenan (Chartkoff and Chartkoff 1984, Elsasser 1978). The Windmill Tradition lasted until about 1000 B.C. (Chartkoff and Chartkoff 1984).

Around 1000 B.C., subsistence strategies in the Delta region became noticeably more “focal,” with a clear increase in the reliance on acorns and salmon (Chartkoff and Chartkoff 1984, Elsasser 1978). Culturally, this has been dubbed the Cosumnes Tradition (1700 B.C. to A.D. 500), and appears to be an outgrowth of the Windmill

Tradition (Ragir 1972). People in this time continued to occupy knolls or similar high spots above the floodplain of the Sacramento River and the terraces of tributaries such as the Cosumnes and American Rivers, flowing out of the foothills of the Sierra Nevada mountains located to the east. Populations increased and villages became more numerous than before, with more milling tools and specialized equipment for hunting and fishing. Trade appears to have increased, with burials containing larger amounts of seashell and obsidian. Burial styles, too, became more varied, with the addition of flexed internments along with the extended ones of the Windmill period. Projectile points found embedded in bones of excavated skeletons suggest that warfare was on the rise, possibly as a result of increased competition over available resources and trade (Beardsley 1954, Lillard et al. 1939, Ragir 1972).

The next and final, discrete prehistoric culture is the Hotchkiss Tradition (A.D. 500 to 1769) that persisted until the arrival of European settlers in central California (Beardsley 1954, Ragir 1972). During this period, use of acorns and salmon reached its peak, along with hunting of deer. Diet was supplemented with the addition of waterfowl, hard seeds, and other resources. Large sedentary villages along the lower Sacramento and San Joaquin Rivers, and their tributaries and delta were common. The size and density of these settlements suggest a further increase in population from Cosumnes times. Trade goods were plentiful, and burials exhibit a marked stratification of society with wide differences in the amount and variety of grave goods. Cremation of the dead appears, along with the flexed inhumations of the previous period (Chartkoff and Chartkoff 1984, Ragir 1972). While ornamental or ritual artifacts, such as large, fragile projectile points and trimmed bird bone increase during this period, milling tools are rare or absent. Shell beads are found in large numbers, and there are numerous utilitarian artifacts of bones such as awls, needles, and barbed harpoon points. Polished charmstones are rare during this time, but ground stone pipes become more abundant. In addition, fired and unfired clay objects begin to appear (Chartkoff and Chartkoff 1984).

ETHNOGRAPHIC CONTEXT

Ethnography is the written record of a culture. Archaeology can be combined with ethnography to identify groups more specifically. Ethnographic records (from missions and other documents) show that the groups that inhabited Sacramento County are the Nisenan, or Southern Maidu, and the Plains Miwok, a subgroup of the Eastern Miwok. The Plains Miwok traditional territory included the lower reaches of the Cosumnes and Mokelumne Rivers and extended west to the Sacramento River from Rio Vista north to Freeport (Levy 1978). Ethnographers generally agree that Nisenan territory included the drainages of the Bear, American, Yuba, and southern Feather Rivers and extended from the Sacramento River east to the crest of the Sierra Nevada (Beals 1933, Faye 1923, Gifford 1927, Kroeber 1925, Powers 1976, Wilson and Towne 1978). Thus, the proposed Project is located within the territory commonly attributed to the ethnographic Nisenan.

NISENAN

As shown, ethnographically, the Project area is in the southwestern portion of the territory occupied by the Penutian-speaking Nisenan. As a language, Nisenan (meaning “from among us” or “of our side”) has three main dialects – Northern Hill, Southern Hill, and Valley Nisenan, with three or four subdialects (Kroeber 1976, Shipley 1978, Wilson and Towne, 1978). The Valley Nisenan lived along the Sacramento River, primarily in large villages with populations of several hundred each. Between there and the foothills, the grassy plains were largely unsettled, used mainly as a foraging ground by both valley and hill groups. Individual and extended families “owned” hunting and gathering grounds, and trespassing was discouraged (Kroeber 1976, Wilson and Towne 1978). Residence was generally patrilocal, but couples actually had a choice in the matter (Wilson and Towne 1978).

Politically, the Nisenan were divided into “triblets”, made up of a primary village and a series of outlying hamlets, presided over by a more-or-less hereditary chief (Kroeber 1976, Wilson and Towne 1978). Villages typically included family dwellings, acorn granaries, a sweathouse, and a dance house, owned by the chief. The chief had little authority to act on his own or her own, but with the support of the shaman and the elders, the word of the chief became virtually the law (Wilson and Towne 1978).

Subsistence activities centered on the gathering of acorns (tan bark oak and black oak were preferred), seeds, and other plant resources, the hunting of animals such as deer and rabbits, and fishing. Large predators, such as mountain lions and wildcats were hunted for their meat and skins, and bears were hunted ceremonially. Although acorns were the staple of the Nisenan diet, they also harvested roots like wild onion and “Indian potato”, which were eaten raw, steamed, baked, or dried and processed into flour cakes to be stored for winter use (Wilson and Towne 1978). Wild garlic was used as soap/shampoo, and wild carrots were used medicinally (Littlejohn 1928). Seeds from grasses were parched, steam dried, or ground and made into a mush. Berries were collected, as were other native fruits and nuts. Game was prepared by roasting, baking, or drying. In addition, salt was obtained from a spring near modern-day Rocklin (Wilson and Towne 1978).

Hunting of deer often took the form of communal drives, involving several villages, with killing done by the best marksmen from each village. Snares, deadfalls, and decoys were used as well. Fish were caught by a variety of methods including use of hooks, harpoons, nets, weirs, traps, poisoning, and by hand (Wilson and Towne 1978).

Trade was important with goods traveling from the coast and valleys up into the Sierra Nevada mountains and beyond to the east, and vice versa. Coastal items like shell beads, salmon, salt, and digger pine nuts were traded for resources from the mountains and farther inland, such as bows and arrows, deer skins, and sugar pine nuts. In addition, obsidian was imported from the north (Wilson and Towne 1978).

The Spanish arrived on the central California coast in 1769 and by 1776 the Miwok territory bordering the Nisenan on the south had been explored by Jose Canizares. In 1808, Gabriel Moraga crossed Nisenan territory, and in 1813, a major battle was fought

between the Miwok and the Spaniards near the mouth of the Cosumnes River. Though the Nisenan appear to have escaped being removed to missions by the Spanish, they were not spared the ravages of European diseases. In 1833, an epidemic – probably malaria – raged through the Sacramento valley, killing an estimated 75 percent of the native population. When John Sutter erected his fort at the future site of Sacramento in 1839, he had no problem getting the few Nisenan survivors to settle nearby. The discovery of gold in 1848 at Sutter's Mill, near the Nisenan village of Colluma (now Coloma) on the south fork of the American River, drew thousands of miners to the area, and led to widespread killing and the virtual destruction of traditional Nisenan culture. By the Great Depression, no Nisenan remained who could remember the days before the arrival of the Euro-Americans (Wilson and Towne 1978).

HISTORICAL CONTEXT

Although the Spanish had made forays into the Central Valley since about 1769, it was not until 1808 that captain Gabriel Moraga explored and named the Sacramento area (Lawson 2002). The Spanish took little interest in the areas and did not establish any missions or settlements in the Central Valley. California became part of Mexico in 1821 when Mexico achieved its independence from Spain. In 1827, American trapper Jedediah Smith traveled along the Sacramento River and into the San Joaquin Valley to meet other trappers of his company who were camped there, but no permanent settlements were established by the fur trappers (Thompson & West 1880).

John Sutter, a European immigrant, built a fort at the confluence of the Sacramento and American Rivers in 1839 and petitioned the Mexican governor of Alta (upper) California for a land grant which he received in 1841. Sutter built a flour mill and grew wheat near the fort (Bidwell 1971). Gold was discovered in the flume of Sutter's lumber mill at Coloma on the south Fork of the American River in January 1848 (Marshall 1971). The town of Sacramento was laid out in the fall of 1848 and developed as a supply center for gold miners (Gudde 1969). Alta California was ceded to the United States by Mexico as a result of the Treaty of Guadalupe Hidalgo in 1848. California became a state in 1850 as a result of the major increase in population that resulted from the gold rush of 1849 (Old Sacramento Foundation, Inc. 2001, Lawson 2002).

The Project site is roughly two miles southeast of the Rancho Rio de los Americanos and is adjacent to the Omuchumnes land grant to the south. The Omuchumnes land grant was issued by the Mexican governor of Alta California to Jared (Joaquin) Sheldon in 1844 (Avina 1976). Sheldon built a hotel, stage stop, and grist mill at Sloughhouse on Deer Creek on his land grant in 1850. Sheldon was killed in a dispute with miners in 1851 (Roots Web 2007). The Rio de los Americanos land consisted of about 35,000 acres south of the American River and was issued by the Mexican governor of Alta California to William Leidesdorff in 1844 (Avina 1976). Leidesdorff was a San Francisco merchant who died in 1848. Joseph L. Folsom, a former U.S. Army captain who came to San Francisco during the gold rush, purchased the Rio de los Americanos land grant from Leidesdorff's estate. Folsom founded the town of Granite City on the land grant. It was renamed Folsom after his death in 1855 (Historic Folsom 2006). The Sacramento Valley Railroad (SVR) was completed from Sacramento to Folsom in 1856 (FEDSHRA

2007). It facilitated shipment of goods from Sacramento to the mining areas to the east. The SVR was acquired by the Southern Pacific Railroad which extended the line to Placerville in 1866 (Peal & Associates 1992). From the mid 1800s to the mid 1900s, the area surrounding the Project was used primarily for grazing and mining. Dredge mining by the Natomas Company occurred on about 5,100 acres a few miles north of the Project area in the first half of the 20th century. In the early 1950s the mined land was sold off in pieces to Aerojet General Corporation, a company which produced and tested missile and rocket engines. Aerojet quickly acquired over 18,000 acres of land north and west of the Project (Lindstrom & Wells 1989).

CULTURAL RESOURCES REGULATORY SETTING

FEDERAL REGULATIONS

Cultural resources are considered during federal undertakings chiefly under Section 106 of the National Historic Preservation Act (NHPA) of 1966 (as amended) through one of its implementing regulations, 36 CFR 800 (Protection of Historic Properties), as well as the National Environmental Policy Act (NEPA). Properties of traditional religious and cultural importance to Native Americans are considered under Section 101(d)(6)(A) of NHPA. Other federal laws pertinent to cultural resources include the Archaeological Data Preservation Act of 1974, the American Indian Religious Freedom Act (AIRFA) of 1978, the Archaeological Resources Protection Act (ARPA) of 1979, the Native American Graves Protection and Repatriation Act (NAGPRA) of 1989, among others. Below is a more detailed description of applicable federal regulations.

ANTIQUITIES ACT

The federal Antiquities Act of 1906 was created with the intent to protect cultural resources in the United States. The Act prohibits appropriation, excavation, injury, and destruction of “any historic or prehistoric ruin or monument, or any object of antiquity” located on lands owned or controlled by the federal government, without permission of the secretary of the federal department with jurisdiction. Accordingly, the Act provided early framework to protect cultural resources within the United States.

NATIONAL ENVIRONMENTAL POLICY ACT

NEPA requires that federal agencies assess whether federal actions would result in significant effects on the human environment. The Council on Environmental Quality’s (CEQ’s) NEPA regulations further stipulate that identification of significant effects should incorporate “the degree to which the action may adversely affect districts, sites, highways, structures, or objects listed in or eligible for listing in the National Register for Historic Places or may cause loss or destruction of significant scientific, cultural, or historic resources” (40 CFR 1508.27[b][8]).

NATIONAL HISTORIC PRESERVATION ACT

Section 106 of NHPA (16 USC 470f) requires federal agencies to take into account the effects of their undertakings on any district, site, building, structure or object that is included in or eligible for inclusion in the NRHP and to afford the Advisory Council on Historic Preservation (ACHP) a reasonable opportunity to comment on such undertakings (36 CFR 800.1). Under Section 106, the significance of any adversely affected cultural resource is assessed and mitigation measures are proposed to reduce any impacts to an acceptable level. Significant cultural resources are those resources that are listed, or are eligible for listing, on the NRHP per the criteria listed at 36 CFR 60.4 (Advisory Council on Historic Preservation 2000) below.

The quality of *significance* in American history, architecture, archaeology, engineering and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling and association and that:

- a. Are associated with events that have made a significant contribution to the broad patterns of our history; or
- b. Are associated with the lives of persons significant in our past; or
- c. Embody the distinctive characteristics of a type, period, or method of installation, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- d. Have yielded, or may be likely to yield, information important in prehistory or history.

STATE OF CALIFORNIA REGULATIONS

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires a lead agency to determine whether a project may have a significant effect on historical resources. If it can be demonstrated that a project will cause damage to a unique archaeological resource, the lead agency may require reasonable efforts to be made to permit any or all of these resources to be preserved in place or left in an undisturbed state. To the extent that they cannot be left undisturbed, mitigation measures are required (Section 21083.2 (a), (b), and (c)). Section 21083.2(g) describes a *unique archaeological resource* as an archaeological artifact, object, or site about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.

- (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
- (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

A *historical resource* is a resource listed, or determined to be eligible for listing, in the California Register of Historical Resources (CRHR) (Section 21084.1); a resource included in a local register of historical resources (Section 15064.5(a)(2)); or any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant (Section 15064.5 (a)(3)). Sacramento County does not currently have a local register.

Public Resources Code (PRC) Section 5024.1, Section 15064.5 of the Guidelines, and Sections 21083.2 and 21084.1 of the Statutes of CEQA were used as the basic guidelines for the cultural resources study. PRC Section 5024.1 requires evaluation of historical resources to determine their eligibility for listing on the CRHR. The purpose of the register is to maintain listings of the State's historical resources and to indicate which properties are to be protected from substantial adverse change. The criteria for listing resources on the California Register were expressly developed to be in accordance with previously established criteria developed for listing on the National Register of Historic Places (NRHP).

NATIVE AMERICAN BURIALS AND ACCIDENTAL DISCOVERIES

California law protects Native American burials, skeletal remains and associated grave goods regardless of their antiquity and provides for the sensitive treatment and disposition of those remains (Section 7050.5 of the Health and Safety Code and Public Resources Code 5097.9).

When human remains are discovered, the protocol to be followed is specified in California Health and Safety Code, which states:

In the event of discovery or recognition of any human remains in any location other than a dedicated cemetery, there shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent remains until the coroner of the county in which the human remains are discovered has determined, in accordance with Chapter 10 (commencing with Section 27460) of Part 3 of Division 2 of Title 3 of the Government Code, that the remains are not subject to the provisions of Section 27492 of the Government Code or any other related provisions of law concerning investigation of the circumstances, manner and cause of death, and the recommendations concerning treatment and disposition of the human remains have been made to the person responsible for the excavation, or to his or her authorized representative, in the manner provided in Section 5097.98 of the Public Resources Code.

State CEQA Guidelines Section 15064.5, subdivision (e), requires that excavation activities be stopped whenever human remains are uncovered and that the county coroner be called in to assess the remains. If the county coroner determines that the remains are those of Native Americans, the Native American Heritage Commission (NAHC) must be contacted within 24 hours. At that time, the lead agency must consult with the appropriate Native Americans, if any, as timely identified by the NAHC. Section 15064.5 directs the lead agency (or applicant), under certain circumstances, to develop an agreement with the Native Americans for the treatment and disposition of the remains.

In addition to the mitigation provisions pertaining to accidental discovery of human remains, the State CEQA Guidelines also require that a lead agency make provisions for the accidental discovery of historical or archaeological resources, generally. Pursuant to Section 15064.5, subdivision (f), these provisions should include “an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be an historical or unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation should be available. Work could continue on other parts of the building site while historical or unique archaeological resource mitigation takes place.”

LOCAL REGULATIONS

2030 SACRAMENTO COUNTY GENERAL PLAN

The Sacramento County General Plan Conservation Element, states under Section VI, Cultural Resources, the following goal and six objectives:

Promote the inventory, protection and interpretation of the cultural heritage of Sacramento County, including historical and archaeological settings, sites, buildings, features, artifacts and/or areas of ethnic historical, religious or socio-economical importance.

1. Comprehensive knowledge of archeological and historic site locations.
2. Attention and care during project review and construction to ensure that cultural resource sites, either previously known or discovered on the project site, are properly protected with sensitivity to Native American values.
3. Structures with architectural or historical importance preserved to maintain contributing design elements.
4. Known cultural resources protected from vandalism unauthorized excavation, or accidental destruction.
5. Properly stored and classified artifacts for ongoing study.

6. Public awareness and appreciation of both visible and intangible historic and cultural resources.

To implement the primary goal and the objectives, the Conservation Element contains the following policies:

- CO-150. Utilize local, state and national resources, such as the NCIC, to assist in determining the need for a cultural resources survey during project review.
- CO-151. Projects involving an adoption or amendment of a General Plan or Specific Plan or the designation of open space shall be noticed to all appropriate Native American tribes in order to aid in the protection of traditional tribal cultural places.
- CO-153. Refer projects with identified archeological and cultural resources to the Cultural Resources Committee to determine significance of resource and recommend appropriate means of protection and mitigation. The Committee shall coordinate with the Native American Heritage Commission in developing recommendations.
- CO-154. Protection of significant prehistoric, ethnohistoric and historic sites within open space easements to ensure that these resources are preserved in situ for perpetuity.
- CO-155. Native American burial sites encountered during preapproved survey or during construction shall, whenever possible, remain in situ. Excavation and reburial shall occur when in situ preservation is not possible or when the archeological significance of the site merits excavation and recording procedure. On-site reinterment shall have priority. The project developer shall provide the burden of proof that off site reinterment is the only feasible alternative. Reinterment shall be the responsibility of local tribal representatives.
- CO-157. Monitor projects during construction to ensure crews follow proper reporting, safeguards, and procedures.
- CO-158. As a condition of approval of discretionary permits, a procedure shall be included to cover the potential discovery of archaeological resources during development or construction.
- CO-159. Request a Native American Statement as part of the environmental review process on development projects with identified cultural resources.
- CO-161. As a condition of approval for discretionary projects, require appropriate mitigation to reduce potential impacts where development could adversely affect paleontological resources.

- CO-162. Projects located within areas known to be sensitive for paleontological resources, should be monitored to ensure proper treatment of resources and to ensure crews follow proper reporting, safeguards and procedures.
- CO-163. Require that a certified geologist or paleoresources consultant determine appropriate protection measures when resources are discovered during the course of development and land altering activities.
- CO-166. Development surrounding areas of historic significance shall have compatible design in order to protect and enhance the historic quality of the areas.
- CO-169. Restrict the circulation of cultural resource location information to prevent potential site vandalism. This information is exempt from the "Freedom of Information Act".

DISCLOSURE OF CULTURAL RESOURCES INFORMATION

Public disclosure of site specific cultural resources information is expressly exempt from the California Public Records Act, Government Code Sections 6250-6270.

Furthermore, information obtained during Native American consultation or through consultation with the local and state agencies, including the North Central Information Center (NCIC), should remain confidential and is exempt from public disclosure under Senate Bill 922. Additionally Sacramento County staff has signed an "Agreement to Confidentiality" with the NCIC that states that site specific information will not be distributed or released to the public or unauthorized individuals. An authorized individual is a professional archaeologist or historian that qualifies under the Secretary of Interior's standards to view confidential cultural resources materials.

METHODOLOGY

Archival research, Native American consultation, and fieldwork were conducted to establish what cultural resources may be present within the Cordova Hills Project area and, furthermore, may be impacted as a result of implementation of the proposed Project.

PRE-FIELD RESEARCH

INFORMATION CENTER RECORD SEARCH

An extensive search of data maintained by the North Central Information Center (NCIC) of the California Historical Resources Information System (CSU-Sacramento) including State and federal listings of significant cultural resources and associated data bases was conducted by ECORP Consulting, Inc. on multiple occasions (as the Project

description was developed and changed) including June 2005, November 2006, and September 2007. Standard references and lists consulted include the following:

- National Register of Historic Places (United States Department of the Interior [USDI] 1979, and computerized updates);
- California Register of Historic Resources (California Department of Parks and Recreation [DPR] 1998, and computerized updates);
- California Historical Landmarks (California DPR 1996, and computerized updates);
- California Inventory of Historic Resources (California DPR 1976, obsolete);
- Historic Properties Directory (California DPR, and computerized updates);
- California Points of Historical Interest (California DPR 1992, computerized updates through September 2009);
- Archaeological Site Records;
- NCIC, California Historic Resource Information System historic resource records and maps;
- Historic GLO plat maps and historic USGS Buffalo Creek Quadrangle maps;
- Gold Districts of California (1979);
- California Gold Camps (1975);
- California Place Names (1969);
- Survey of Surveys (Historic and Architectural Resources) (1989);
- Caltrans Local Bridge Survey (1989);
- Caltrans State Bridge Survey (1987), and;
- Historic Spots in California (1990).

The record searches at the NCIC identified eight previous cultural resources studies that include portions of the Project area or directly adjacent to the Project area.

As a result of the previous surveys conducted in the area, seven cultural resources have been recorded within the search radius. Only one of the sites was noted as being located within the Project site. The previously recorded site consists of a prehistoric archaeological site. Investigation of historic maps also revealed the presence of two structures that were historically located within the Project area.

NATIVE AMERICAN CONSULTATION

A letter was sent to the Native American Heritage Commission (NAHC) requesting a check of the Sacred Lands File in January 2006 and September 2007. Both checks failed to reveal any properties listed as Sacred Lands. The NAHC did provide a list of

individuals and groups to contact regarding the property. ECORP sent correspondence to all the individuals listed by NAHC requesting any information they may have regarding cultural resources on the Project site in February 2006 and September 2007. This initial consultation occurred prior and during Phase I (pedestrian survey and archival research) of the cultural investigation. During Phase I, follow-up phone calls were also made to ensure each group or individual had adequate opportunity to comment on the proposed Project.

In 2007, ECORP received comments from Randy Yonemura, who advised that there are cultural resources in the area, especially near waterways. Mr. Yonemura requested an additional day to view the Project area maps. On October 8, 2007, at the request of Mr. Yonemura, ECORP conducted a Project area tour with him. He expressed his belief that the wetlands and vernal pools on site constitute cultural resources, although no tangible archaeological data are directly associated with them. He also stated that he would send a letter regarding this issue, but no letter or other form of documentation has been received. He asked for copies of historical maps of the vicinity, and those maps were mailed to Mr. Yonemura on October 9, 2007. Mr. Yonemura also requested further consultation, which should occur directly with the Section 106 (of the National Historic Preservation Act) Lead Agency.

When the Testing and Evaluation program for the recorded cultural resources began, ECORP contacted each of the individuals on the original NAHC correspondence again, by letter and telephone. The consultation occurred in May and June of 2008. The results of this consultation is summarized by ECORP, as follows:

On June 3, 2008, Billie Blue Elliston telephoned ECORP to request that monitors Leland Daniels and Kenneth Counsil be afforded the opportunity to conduct an on-site visit with the lead agency. Ms. Elliston was advised that this request would be related to the USACE via the evaluation report, and that the USACE would direct consultation with these individuals, in accordance with its revised 2007 Guidelines.

On June 5, 2008, the remaining Native American contacts were contacted by telephone to ensure receipt of the letter. Leland Daniels and Jeri Scrambler indicated that they would review the letter and call back if they had any questions or concerns. Glen Villa, Jr. said that he is no longer the contact for the area, and requested that we contact Billie Blue Elliston. John Tayaba of the Shingle Springs Band of Miwok Indians said that Randy Yonemura would be calling ECORP to discuss the Project. On June 13, 2008, Mr. Yonemura contacted ECORP with a request for another copy of the Project information. On June 16, 2008, ECORP mailed him a duplicate copy. No correspondence from Mr. Yonemura has been received as of the date of this report. Cosme Valdez asked that the letter be resent to him, and ECORP faxed it to him on June 5, 2008. Mr. Valdez called back to say he received the faxed letter and that he would like the bedrock mortar sites to be protected. Dwight Dutschke, Jessica Tavares, Ernest Faircloth, Mary Daniels-Tarango, Nicolas Fonseca, and Pamela Baumgartner could not be reached for comment.

FIELD ASSESSMENT

AREA OF POTENTIAL EFFECT

The Area of Potential Effect (APE) for the Project has been tentatively defined as the boundaries of the Cordova Hills Project site. An APE is the area in which a Project could have potential impacts to cultural resources and is the area in which a cultural resources analysis should be undertaken. The APE for Cordova Hills is subject to concurrence by the Federal Lead Agency that will undertake and comply with the provisions of Section 106 of the National Historic Preservation Act.

PEDESTRIAN SURVEY

An intensive pedestrian survey of the Project area was conducted utilizing the transect approach. The pedestrian surveys of the Project area occurred during December 2006, January 2007, September 2007, and October 2007. Transects were walked with 15-meter intervals between each transect. During the transects, the ground surface was carefully inspected for evidence of historical use such as fragments of ceramics, metal, and glass, and for indications of prehistoric use such as chipped stone artifacts and debitage, ground stone artifacts, bone fragments, and soil color changes. Exposures of subsurface soil produced by animal burrowing, cattle grazing, and human disturbance were carefully examined and, where visibility was restricted for a distance of 50 meters along a transect, vegetation was removed with a shovel to expose the surface area. The survey was conducted to the standards set by the Secretary of Interior (National Park Service 1990, 1983).

When prehistoric or historic-era resources were encountered, they were documented on State of California Department of Parks and Recreation (DPR) Series 523 Primary, Archaeological Site, and other DPR forms as necessary. Each site, feature, or isolated artifact was photographed and mapped as a point, line, or polygon as appropriate on appropriate USGS topographic quadrangle maps.

PEDESTRIAN SURVEY RESULTS

The pedestrian survey and prior research resulted in identification of 9 cultural resources in the Cordova Hills APE. The 8 resources consist of the following:

- 4 historic-era resources
- 1 prehistoric resource
- 1 multi-component (historic and prehistoric) site
- 3 isolated artifacts (2 historic and 1 prehistoric)

Recommendations from the pedestrian survey report were to evaluate all recorded resources for eligibility on the National Register of Historic Places, with the exception of

the isolated artifact finds. Isolates (usually three or less resources found together), by definition, lack immediate cultural context and therefore lack the data potential that would be required to be considered eligible for NRHP or CRHR inclusion.

In order to evaluate the recorded resources a subsurface test program and more elaborate historical archival research program was recommended to evaluate significance.

ARCHIVAL RESEARCH

As part of the investigation, additional archival research was conducted by ECORP. Additional sources consulted include:

- Bureau of Land Management, Sacramento
- California Geological Survey Library
- Sacramento Room of the Sacramento Public Library
- Sacramento Archives and Museum Collections
- Sacramento County Recorder's Office

This additional work allowed ECORP to determine property ownership data and associated historical background of each owner. This work was utilized to determine if sites could be associated with individuals or organizations that are important historical figures. Results of the archival research are incorporated into the result of the testing program and evaluation discussed below, to determine resource significance.

TESTING AND EVALUATION PROGRAM

Historic properties or archaeological remains identified within the APE were evaluated according to the criteria of the NRHP and the CRHR. This was accomplished by employing a testing and evaluation program for the resources recorded in the Project area.

During the test program phase an additional 2 historic era isolated artifacts were discovered, bringing the total resource count in the Project APE up to 11 resources. As noted previously, only the sites, not isolates, required additional research and evaluation because isolates lack enough cultural context and data potential to be considered significant resources. Therefore, the testing and evaluation program centered on the 4 historic era resources, 1 prehistoric resource, and 1 multi-component site discovered in the Project area.

For historic/architectural resources, the testing process includes assessment of the historic information available for the structure(s)/resource, recordation employing standard California State Department of Parks and Recreation 523 (DPR 523) forms

and photography to document the structure/resource and significant architectural details. For archaeological resources, test excavations were conducted to sample the site area. The purpose of the test excavations was to acquire data regarding the range of artifacts found in the site and to estimate the physical integrity of the site, including site stratigraphy and spatial organization.

TESTING AND EVALUATION PROGRAM RESULTS

PREHISTORIC RESOURCES

CA SAC-334

CA-SAC-334 was the previously recorded resource located within the Project area. The site consists of a bedrock mortar site. The following results of testing at the site are from ECORP (2008):

Seven STPs [Shovel Test Pits] were excavated within site CA-SAC-334. The STPs were placed around the edge of the outcrop, approximately two to three meters from the outcrop. The soil within all seven STPs can be described as an andesitic soil, or dry volcanic tuff. Depths to 50 and 40 cm below surface were achieved; however, STPs 2, 5, and 6 fell short due to shallow bedrock. All STPs were negative for cultural material. No artifacts were apparent on the surface and none of the previously recorded surface artifacts could be relocated.

As a result of the testing program and archival research, it appears that this site represents acorn processing efforts conducted at one of the only locations of exposed bedrock in the area. The fact that no subsurface or surface artifacts remain suggest that the use of the site was limited to acorn processing. Habitation sites, such as village or camp sites, are located elsewhere. . .

The following evaluation of the site is from ECORP (2008):

Archival information, which could be used to identify any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B), does not exist in the historical record for prehistoric archaeological sites. In addition, bedrock mortars of this type are common features in the region, and are neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). The lack of artifacts indicates that this site does not have the necessary cultural material with which to address research questions. Unless further information on the intangible significance of this site is revealed through Native American consultation, CA-SAC-334 is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

MULTI-COMPONENT RESOURCES

CA-SAC-1033/H

CA-SAC-1033/H is a multi-component site consisting of a bedrock mortar station and historic mining shafts and tailings.

The following results of testing at the site are from ECORP (2008):

Eight STPs were excavated within site CA-SAC-1033/H. Four STPs were excavated in the cardinal directions surrounding the bedrock mortar station. Four additional STPs were excavated in a north/south row along the length of the site.

Soil within the STPs consisted of a light tan volcanic tuff mixed with gravels and small rocks. Hardpan resulted in termination of the STPs at shallow depths. All STPs were negative for cultural material.

The property contain site CA-SAC-1033/H was originally granted to John Hagan in February of 1875. It is believed that Hagan sold the land to James Caples, who owned the land from 1900 to 1912. According to the Sacramento County Assessor's books, the Glide Brothers owned the parcel from 1912 to sometime between 1925 and 1930, when Lizzie H and Sadie Glide became owners of the property. Records show that Lizzie H. and Sadie Glide owned the property to at least 1939. Records of ownership of the land could not be obtained for the years between 1939 and 1969. Records of title change were found at the Sacramento County Assessor's Office, revealing that, in December of 1969, Guadagno PB sold the land to Title Insurance/trust company.

As a result of the testing program and archival research, it appears that the historic component of this site represents lode mining activities during prospecting efforts conducted in one of the only locations of exposed bedrock in the area. The lack of temporally diagnostics artifacts makes dating the historic component very difficult, and, therefore, the site cannot be firmly associated with one of the previous owners. The mine pits, the result of the lode mining activities, are not likely the remnants of Cheska Minka #2, a placer mine. Likewise, the relative lack of bedrock outcrops in the area provided an attractive location for prehistoric inhabitants to utilize the outcrop during processing. The fact that no subsurface or surface artifacts remain for either component suggest that the gold prospecting effort was relatively brief and unsuccessful, and that the prehistoric use was limited to acorn processing. Habitation sites, such as village or camp sites, are located elsewhere...

The following evaluation of the site is from ECORP (2008):

Prehistoric Component

Archival information, which could be used to identify any association with any important persons or events in California or National history (CRHR 1, 2; NRHP

Criteria A, B), does not exist in the historical record for prehistoric archaeological sites. In addition, bedrock mortars of this type are common features in the region, and are neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). The lack of artifacts indicates that this site does not have the necessary cultural material with which to address research questions. Unless further information on the intangible significance of this site is revealed through Native American consultation, it is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

Historic Component

Archival research conducted for the site failed to reveal any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B). In addition, mining sites of this type are neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). The lack of historic artifacts indicates that this site does not have the necessary cultural material with which to address research questions. As a result, site CA-SAC-1033/H is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

HISTORIC-ERA RESOURCES

CA-SAC-1032-H

CA-SAC-1032-H consists of several shallow placer mining features. The following results of testing at the site are from ECORP (2008):

The test program originally called for the placement of six STPs in and around the surface boundaries of site CA-SAC-1032-h. The ground surface, however, was found to be impenetrable, even when shovels and picks were used. As a result, no STPs could be excavated. In addition, because no surface artifacts were observed on site, no data was collected.

In an effort to identify the individuals associated with the site, ECORP consulted property records on file at the Sacramento County assessor's office. The property containing site CA-SAC-1032-H was originally granted to John Hagan in February of 1875. It is believed that Hagan sold the land to James Caples, who owned the land from 1900 to 1912. According to the Sacramento County Assessor's books, the Glide Brothers owned the parcel from 1912 to sometime between 1925 and 1930, when Lizzie H and Sadie Glide became owners of the property. Records show that Lizzie H. and Sadie Glide owned the property to at least 1939. The Sacramento Assessor's Office records show that, in 1973, Sallie Glide Kendell was the owner, and she sold the property to Thornton Elsen Glide and Marion Glide Bunker. After 1973, the land had many changes in ownership.

As a result of the testing program and archival research, it appears that this site represents shallow placer mining activities during prospecting efforts conducted along the creek. The fact that subsurface or surface artifacts or other features remain suggest that this prospecting effort was unsuccessful, and the site represents only a brief period of use by miners. The miners may have been one of the previous property owners; however, a lack of temporally diagnostic artifacts makes dating the site difficult. The tailing piles loosely resemble those of shallow placer mining activities that were common in the 1850s and 1860s, which predates recorded ownership of the land.

The following evaluation of the site is from ECORP (2008):

Archival research conducted for this group of small mine tailings failed to reveal any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B). In addition, mining tailings of this type are common features in the region, and is neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). The lack of artifacts indicates that this site does not have the necessary cultural material with which to address research questions. As a result, site CA-SAC-1032-H is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

CA-SAC-1034-H

CA-SAC-1034-H consists of two loci: Locus 1 includes a concrete windmill foundation, the remaining pump shaft of the windmill and a concrete stem wall directly east of the windmill; Locus 2 includes a stem wall and concrete pad. The following results of testing at the site are from ECORP (2008):

Five trenches were excavated within site CA-SAC-1034-H. Trenches 1 and 2 were excavated north and south, parallel along the entire length of Features 1 and 2 in Locus A, with Trenches 3, 4, and 5 excavated directly east, north, and west of Feature 1 in Locus B. No surface artifacts were observed in the trench locations.

As a result of the testing program and archival research, it appears that this site represents a ranching site used to deliver water to free-range cattle. Locus 1 is the location of the windmill, used to generate electricity needed to pump water from below ground. Locus-2 appears to represent the former cattle trough; although any pipes that link the two loci have either been removed or were not detected by subsurface testing. The fact that little subsurface or surface artifacts remain, and that the artifacts that were recovered were largely structural, indicate that there was no human occupation of this site. The lack of historical residential sites in the vicinity also suggests that the property was used to graze cattle. The site would have likely been visited and maintained by ranch hands, who might have consumed beverages (as evidenced by bottle glass fragments); however, domestic refuse, typical of a residence and necessary to address research

questions, is notably absent from the site. In addition, due to the apparent dating of the site (circa 1954), it does not appear that this site is associated with either the Glide Brothers Ranch or Lizzie Glide of the Glide United Methodist Church in San Francisco. The lack of property ownership information between 1939 and 1969 prevents confirmation of any possible associations.

The following evaluation of the site is from ECORP (2008):

Archival research conducted for this ranching site failed to reveal any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B). In addition, windmills and cattle troughs are common features in the region, and is neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). Trenching at both loci resulted in an overall lack of substantial subsurface deposits. The artifacts recovered from all five trenches were largely composed of structural materials. There is not sufficient archaeological data to address research questions. Therefore, site CA-SAC-1034-H is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

CA-SAC-1045-H

CA-SAC-1045-H consists of a concentrated historic-age refuse scatter situated along an east-west running drainage. The following results of testing at the site are from ECORP (2008):

Six STPs were excavated within site CA-SAC-1045-H. Two STPS were placed northwest and southeast of Locus 1, with four additional STPs placed in the cardinal directions surrounding Locus 2. STPs were excavated to their maximum depth before hitting bedrock or impenetrable soil. The soil among all STPS was a compact silt with a high density of gravels and rocks creating a type of natural cement, common in intermittent drainages and waterways. In addition to subsurface excavations, a surface collection of representative diagnostic artifacts was conducted as well as bottle base sketches of additional artifacts that were not collected. STP 1 was the only STP that yielded subsurface cultural material.

The property containing site CA-SAC-1045-H may have been a portion of one of the parcels granted to Perry H. Morgan in July of 1872. Morgan owned the land to at least 1874, when the ownership was transferred to Mrs. J.E. Van Trees. The 1878 Assessor's Office books show a J.M. Van Trees as the landowner, and in 1882, the landowners were listed as I.H. Van Trees and F.D. Ryan. In 1892, the landowner was G.A. (George) Hanlon, until sometime between 1925 and 1930, when the land was sold to George Hanlon, Jr. Hanlon Jr. was the landowner until at least 1939.

As a result of the testing program and archival research, it appears that this site represents incidental dumping of residential refuse by local residents during the

1930s, 1940s, and 1950s. Such dump sites, which are often located in or along drainages, roads, or property boundaries, are common in the region. Based on the dates of the artifacts recovered during the evaluation, the refuse could be associated with the Hanlon family; however, there is nothing contained within the artifact assemblage that precludes the possibility that other local residents were the source. According to Melton (2003), George Hanlon was a post office employee in Routier, located near Sacramento. Melton also reports that he:

“lives four miles from that place and fifteen miles from Sacramento; was born in Ohio in 1823, and lived there until 1851, engaged in farming; in that year he removed to Iowa; but in 1852 he came to California and to Sacramento County; he subsequently went to El Dorado County, and engaged in mining and teaming there until 1860; since then he has lived on his present location; owns eleven hundred and fifty acres, worth, with improvements, about \$15 per acre. Mr. Hanlon was married in 1844 to Miss Mary Cable, also a native of Ohio; they have one son and three daughters.

The following evaluation of the site is from ECORP (2008):

Archival research conducted for this site failed to reveal any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B). In addition, refuse scatters are neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). The refuse scatter also lacks sufficient cultural material to address research questions. The site yielded a limited quantity of surface and subsurface material and only a few items were diagnostic. There is no evidence for subsurface deposits that would be sufficient to address research questions. Site CA-SAC-1045-H is evaluated as not eligible under any criteria for the NRHP or the CRHR and is not a Historical Resource as defined by CEQA.

P-34-2195

P-34-2195 consists of a one-mile segment of a PG&E transmission line that extends from Halsey Junction to the Newark Substation. This segment is composed of six metal towers (numbers 257 through 262) along the western side of Deep Creek. Since the towers are purely architectural there was no need to do a testing program for the transmission line. ECORP (2011) provided the following historic context and evaluation statements.

Historic Context:

The foundations of electric transmission go back thousands of years (see Adams 2010), but transmission as we know it today began in 1843, when Congress passed a bill for the construction of a telegraph line between Washington DC and Baltimore. The pole and wire infrastructure of telegraph technology was expanded after the invention of the incandescent light bulb in 1879 created an

even greater demand for electricity. The California Electric Light Company of San Francisco was the first to string long distance electric transmission lines in California, using low-voltage direct current (DC) starting in 1879. It was the development of alternating current (AC) a few years later, however, that led to wide-spread electrification of four California cities in 1890: Santa Barbara, Visalia, Pasadena, and Highgrove. The subsequent invention of the transformer allowed for a reduction in high distribution voltage to a level that was suitable for use in houses with interior wiring. These developments further spurred the construction of additional large voltage lines, primarily in Southern California (Adams 2010).

The first documented transmission line in Northern California was built in 1901 by the Bay Counties Power Company. It was a 142-mile long cedar pole and copper and aluminum wire transmission line built by John Debo Galloway, known as one of the pioneers in the design of electric transmission facilities in California. It stretched from the Colgate Powerhouse in the Sierra Nevada Mountains, through the Sacramento Valley, to Oakland (Adams 2010).

With the development of hydroelectric power around the turn of the century, electricity transmission technology expanded significantly. California's first hydroelectric plant, the Folsom Powerhouse on the American River in Sacramento County, began operating in 1895, and by 1902, the Bay Area, Stockton, Amador City, and Marysville had nearly complete electric coverage. One of the largest and most historic hydroelectric projects in California was the Central Valley Project, which began in the late 1920s. It was one of the largest water conveyance projects ever undertaken, and was initially composed of Shasta Dam, Delta-Mendota Canal, Friant Dam, Firant-Kern Dam, and the Contra Costa Canal. It continues to operate to this day, and produces enough electricity to power over 4 million homes (Adams 2010).

Evaluation of Significance:

Adams (2010) developed a framework for evaluating electric transmission structures for significance under NRHP criteria, arguing that in order for an electronic transmission structure or line to be eligible under NRHP Criterion A, it must be associated with a significant event or pattern of events, such as the first lattice electric transmission structure built in California, or the development of wood pole transmission structure technology over time, or the arrival of electricity to a community that was not previously powered (Adams 2010). For a structure or line to be eligible under NRHP Criterion B, it must be associated with a significant person, who is important for reasons associated with the electric transmission structure or system specifically. If the association is with a master craftsman or engineer, then that significance qualifies under NRHP Criterion C. Other examples of significance under Criterion C include those transmission structures that exemplify the best example of a period or method of construction. For example, a transmission structure must have all of the components that classify it as one of the first of a kind, or be a good representation of the evolution

of steel towers (Adams 2010). Finally, in order for an electric transmission structure to be eligible under NRHP Criterion D, it should possess the ability to provide information. Normally, this is applicable only to archaeological sites, which could include the ruins of historic transmission structures; however, early forms of transmission structures, for which engineering drawings are not available, could yield important information that is not represented in the archival record.

Site P-34-2195, the transmission lines within the Cordova Hills project area, was constructed in the early 1940s, well after electric transmission systems became established in California. It was associated with construction of the Newark Substation in 1942, which post-dates the earliest and most significant transmission systems in Northern California. It was constructed the same year as the death of John Debo Galloway (1869-1943), and there is no evidence to support the notion that he was involved in the design of the transmission lines. The towers are composed of steel lattice and have been modified and remodeled several times since construction, so there is no evidence to suggest that the lines were originally architecturally distinctive. In addition, the towers are in operation currently, being maintained by PG&E. There is no potential for information to be gained from these towers that is not better represented in the archival record.

Therefore, the transmission towers have no potential to yield important information (NRHP Criterion D), are not associated with the early development of electrical power transmission systems in the region (NRHP Criterion A), are not associated with important events or persons in the development of electrical power (NRHP Criterion B), and are not architecturally distinctive (NRHP Criterion C). In addition, the transmission line has been modified at least three times since its construction in the early 1940s – once in conjunction with the construction of the Gold Hill Substation in 1963, and again in 1975 and 1983 as part of system-wide improvements and upgrades. Although the line maintains its original alignment, and accordingly, retains integrity of location, the modifications to the line over the years resulted in a loss of integrity of design, materials, workmanship, and feeling.

Therefore, based on archival and field review of two discontinuous segments of site P-34-2195, the entire alignment is evaluated as not eligible as an individual resource, or as a contributing element to a district, for the NRHP or the CRHR. Accordingly, it is not a Historical Resource as defined by CEQA or an Historic Property defined by 36 CFR Part 800 and Section 106.

ISOLATES

Five isolates were recorded within the Cordova Hills APE. These include one prehistoric isolate (two chert core reduction flakes), and four historic era isolates (one brown glass beverage bottle, one car chassis, two pits, and one water tank). Isolated artifacts have no potential to yield important information (NRHP Criterion D), are not associated with important events or persons (NRHP Criteria A and B) and are not

architecturally distinctive (NRHP Criterion C). Therefore, none of the isolated artifacts discovered on the Project site are eligible for the NRHP or the CRHR and are not considered historical resources as defined by CEQA.

SIGNIFICANCE CRITERIA

In order for a cultural resource to be considered a “historic property” under NRHP criteria (i.e., eligible for inclusion on the NRHP), it must be demonstrated that the resource possesses *integrity* of location, design, setting, materials, workmanship, feeling and association, and must meet at least one of the following four criteria delineated by Section 106 (Advisory Council on Historic Preservation 2000), as listed in 36 CFR 60.4:

- (a) That are associated with events that have made a significant contribution to the broad patterns of our history; or
- (b) That are associated with the lives of persons significant in our past; or
- (c) That embody the distinctive characteristics of a type, period or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- (d) That have yielded, or may be likely to yield, information important in prehistory or history.

The criteria for listing resources on the CRHR were expressly developed to be in accordance with previously established criteria developed for listing on the NRHP, enumerated above, and require similar protection to what NHPA Section 106 mandates for historic properties. According to PRC Section 5024.1(c)(1-4), a resource is considered *historically significant* if it meets at least one of the following criteria:

- (1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
- (2) Is associated with the lives of persons important in our past;
- (3) Embodies the distinctive characteristics of a type, period, region or method of installation, or represents the work of an important creative individual, or possesses high artistic values; or
- (4) Has yielded, or may be likely to yield, information important in prehistory or history.

Under CEQA, if an archeological site is not a significant “historical resource” but meets the definition of a “unique archeological resource” as defined in PRC Section 21083.2,

then it should be treated in accordance with the provisions of that section. A unique archaeological resource is defined as follows:

An archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
- (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.
- (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Resources that neither meet any of these criteria for listing on the NRHP or CRHR nor qualify as a “unique archaeological resource” under CEQA PRC Section 21083.2 are viewed as not significant. Under CEQA, “A non-unique archaeological resource need be given no further consideration, other than the simple recording of its existence by the lead agency if it so elects” (PRC Section 21083.2(h)).

Impacts to *significant* cultural resources (“historic properties” under NHPA and “historical resources” under CEQA) that affect the characteristics of any resource that qualify it for the NRHP or adversely alter the significance of a resource listed on or eligible for listing on the CRHR are considered a significant effect on the environment (CEQA guidelines 15065(a)(1)). Impacts to *significant* cultural resources from a proposed Project are thus considered significant if a project physically destroys or damages all or part of a resource, changes the character of the use of the resource or physical feature within the setting of the resource which contribute to its significance or introduces visual, atmospheric, or audible elements that diminish the integrity of significant features of the resource.

IMPACTS AND ANALYSIS

IMPACT: HISTORICAL RESOURCES

The Project area contains four historic era sites, and a fifth historical site that is included in a multi-component site. As documented above, none of the historic sites are associated with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B). They are not considered to be unique and do not represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). In all cases, the historic sites lack sufficient cultural material to address research questions (CRHR Criterion 4; NRHP Criterion D). All of the historic sites were evaluated

as not eligible under any criteria for the NRHP or the CRHR and are not considered a historical resource or unique archeological resource as defined by CEQA, and thus any impacts to these resources are not significant.

As always, with implementation of the Cordova Hills Project, there remains a potential to encounter buried or as yet undiscovered resources during land clearing and construction work. Buried resources may consist of historic remains such as structural features (foundations, cellars, etc.) or buried trash deposits containing glass, ceramics and metal, or the resources may be of prehistoric origin containing chipped stone, shell, bone and other remains. If such subsurface resources are encountered, work should halt in the vicinity of the discovery until its significance can be evaluated by a professional archaeologist. If during land clearing further surface resources such as additional mining, historic trash scatters, or prehistoric resources are encountered, work should halt in the vicinity of the find until the discovery can be evaluated by a professional archaeologist. Mitigation is recommended below to reduce impacts to *less than significant* levels.

MITIGATION MEASURES

CR-1. If subsurface deposits believed to be cultural or human in origin are discovered during construction, then all work must halt within a 200-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for prehistoric and historic archaeology, shall be retained at the Applicant's expense to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native American Heritage Commission shall be followed, and the monitor shall be retained at the Applicant's expense.

Work cannot continue within the 200-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources.

If a potentially-eligible resource is encountered, then the archaeologist, DERA, and project proponent shall arrange for either 1) total avoidance of the resource, if possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to DERA as verification that the provisions of CEQA for managing unanticipated discoveries have been met.

In addition, pursuant to Section 5097.97 of the State Public Resources Code and Section 7050.5 of the State Health and Safety Code, in the event of the discovery of human remains, all work is to stop and the County Coroner shall be immediately notified. If the remains are determined to be Native American,

guidelines of the Native American Heritage Commission shall be adhered to in the treatment and disposition of the remains.

IMPACT: PREHISTORIC RESOURCES

One prehistoric bedrock mortar station site and one prehistoric component of a multi-component site were discovered in the Project area. As noted previously, archival information, which could be used to identify any association with any important persons or events in California or National history (CRHR 1, 2; NRHP Criteria A, B), does not exist in the historical record for prehistoric archaeological sites. In addition, bedrock mortars of this type are common features in the region, and are neither unique, nor do they represent the work of a master or possess high artistic values (CRHR Criterion 3; NRHP Criterion C). Both of the prehistoric sites lacked subsurface or surface artifacts, which indicate that they do not possess the necessary cultural material to address relevant research questions (CRHR Criterion 4; NRHP Criterion D). Both sites have been evaluated as not eligible under any criteria for the NRHP or the CRHR and are not considered historical resources or unique archeological resources as defined by CEQA; any impacts to these resources are not significant.

As always, there is the potential for the existence of buried prehistoric archaeological materials or previously undiscovered surface resources within the Project area. CEQA requires that lead agencies protect both known and unknown cultural resources; therefore, mitigation is recommended to ensure that in the event that cultural resources are discovered during implementation phases that all work shall be halted until a qualified archaeologist may evaluate the resource encountered. With mitigation (see Mitigation Measure CR-1, above), environmental impacts to potentially sensitive cultural resources are considered *less than significant*.

IMPACT: HUMAN REMAINS

Section 5097.94 of the Public Resources Code and Section 7050 of the California Health and Safety Code protect Native American burials, skeletal remains and grave goods, regardless of age and provide method and means for the appropriate handling of such remains. If human remains are encountered, work should halt in that vicinity and the County coroner should be notified immediately. At the same time, an archaeologist should be contacted to evaluate the situation. If the human remains are of Native American origin, the coroner must notify the Native American Heritage Commission within 24 hours of such identification. In the event that a burial is discovered during implementation of the Cordova Hills Project, strict adherence to mitigation as outlined in Mitigation Measure CR-1 (see above) would reduce this impact to *less than significant* levels.

9 GEOLOGY AND SOILS

INTRODUCTION

This chapter describes the geologic and soil setting of and around the Project area, including descriptions of potential geologic hazards and the presence of mineral resources. The impacts and analysis section of this chapter evaluates the effects of the proposed Project to geologic and soil resources as well as the effects of geologic and soil hazards to the Project.

ENVIRONMENTAL SETTING

REGIONAL GEOLOGY

The present-day landscape of Sacramento County has been shaped over time by the ongoing processes of erosion and deposition. Material eroded from the ancestral Sierra Nevada, formed over 100 million years ago, was deposited onto the Sacramento Valley floor. Approximately 10 to 15 million years ago tectonic uplifts altered the geomorphology of the Sierra Nevada. Glaciation, volcanism, and erosion followed the uplifting, adding layers of sediment to the valley floor. Under the present geologic conditions, the alteration of the local geomorphology continues through stream erosion of the valley sediments and subsequent deposition in adjacent floodplains.

A "geomorphic province" is comprised of an area of similar geologic origin and erosional/depositional history. Sacramento County is situated in portions of two geomorphic provinces. By far the largest portion of the County, and the Project, lies in the Great Valley province. A small area in the eastern part of the County is in the Sierra Nevada province. The Great Valley province is further divided into four geomorphic subunits, as described below:

The Delta - The Delta, characterized by Holocene deposits, includes the low-Delta is arbitrarily fixed at the zero-elevation contour, which coincides with the contact between the organic and inorganic soils. Prior to human intervention, this region was dominated by tidal marshes that were traversed by meandering sloughs. Over time, however, the sloughs were altered and the marshes drained. Numerous islands have been created by the construction of a system of artificial levees.

River Floodplain - The river floodplain subunit consists of unconsolidated inorganic soils which were formed by the deposition of sediment when flood waters overtopped the natural levees of the County's rivers and major streams.

Alluvial Plain - To the east of the Sacramento River floodplain is an extensive area of former floodplain that has been highly dissected by subsequent stream erosion. This geomorphic subunit is comprised of older, Quaternary, deposits. This area is underlain by soil which is characterized by layers of hardpan or dense, impervious clay.

Low Foothills - The low foothill area, located east of the alluvial plain, is typified by rolling, boulder-strewn topography and is underlain by moderately consolidated silts, sands, and clays of continental origin. The small area in the northeast part of the County within the Sierra Nevada geomorphic province consists of Pliocene and older deposits and is characterized by steep-sided hills and narrow, rocky stream channels. Stream patterns here are well established and are controlled principally by bedrock features

GEOLOGICAL HAZARDS

SEISMIC HAZARDS

Geological literature indicates that active faults are largely considered those which have had movement within the last 11,000 years (within the Holocene or Historic time periods) and indicates that no major active faults transect the County; however, there is one known subsurface inactive fault in northern Sacramento County, and several subsurface faults in the Delta, some of which may have had movement but when that movement occurred is speculative. Also, a number of other fault systems lie to the east and west of Sacramento County which can be considered active and subject to possible seismic events.

California Geological Survey (CGS) (formerly the California Division of Mines and Geology) staff (W. Bryant) was consulted to obtain the most current seismic information in and around the Sacramento County Region. The closest known faults to the Project area are the Willows Fault and the Bear Mountain Fault.

The Willows Fault is located in the vicinity of Citrus Heights near Antelope Road and is presumably inactive. According to CGS staff, generalized geologic maps show the Willows Fault to be concealed by Pleistocene deposits and Harwood and Haley (1987) show this fault as pre-Quaternary (active 1.6 million years ago or longer). To the east of Sacramento County, the Bear Mountain fault zone trends northwest-southeast through Amador and El Dorado Counties. Where the Bear Mountain Fault lies closest to the Project site it is noted as pre-Quaternary. This fault is associated with the Foothills Fault system.

According to CGS staff, faults in the Foothills Fault system are largely characterized by very slow slip rates (generally less than 0.01mm/yr) and have long recurrence intervals. CGS staff further indicated that the Foothills Fault system east of Sacramento County have evidence of late Pleistocene to Holocene displacement and have the potential to produce infrequent, moderate magnitude earthquakes.

The Midland fault, buried under alluvium, extends north of Bethel Island in the Delta to east of Lake Berryessa. Studies by Webber-Band (1998) suggest that the Midland Fault offsets Pleistocene strata (1.6 million to 10,000 years old) and possibly even deforms basal peat deposits thought to be of Holocene age (10,000 to 200 years old); however, according to CGS staff, Holocene activity is unconfirmed. This fault is noted on the C.W. Jennings, Fault Activity Map of 1994 to be a pre-Quaternary fault (active 1.6 million years ago or longer). Although the timeframe of its most recent activity is speculative, this fault is considered capable of generating a near 6.6 (Richter Scale) earthquake. This figure is an assumption based on an 1892 earthquake measuring 6.6 on the Richter Scale with an epicenter possibly in the Midland Fault vicinity or along blind-thrust faults in the Coast Range, although the source of this earthquake is uncertain according to CGS staff.

Another delta fault is located further west of the Midland Fault. This fault is currently unnamed. It is concealed where it passes beneath the westernmost tip of Sacramento County, and may have been active within the past 11,000 years according to the C.W. Jennings Activity Map although, again, exact times of displacement are unknown. Oil and gas companies exploring the Delta area's energy potential have identified several subsurface faults, none of which show any recent surface rupture.

While Sacramento County has experienced relatively little seismic activity, faulting in neighboring regions, especially the San Francisco Bay area and the Sierra Nevada, suggests that the County could be affected by future ground motion originating elsewhere.

The Richter Magnitude Scale is used to quantify the magnitude or strength of the seismic energy released by an earthquake. The Modified Mercalli Intensity Scale (MMI Scale) is used to measure the intensity of groundshaking at a given site in response to an earthquake. The MMI Scale is useful in planning for seismic safety, as it translates the intensity of earthquake shaking into possible damaging effects on structures. Table GS-1 below shows the relationship of an earthquake's magnitude and intensity as well as describes the related intensity.

Table GS-1: Relationships Between Earthquake Magnitude and Intensity

Magnitude	Intensity (MMI)	Description
1.0 – 2.9	I	I. Not felt except by a very few under conditions especially susceptible to seismic events.
3.0 – 3.9	II – III	II. Felt only by a few persons at rest, especially on upper floors of buildings. III. Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
4.0 – 4.9	IV – V	IV. Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably. V. Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
5.0 – 5.9	VI – VII	VI. Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight. VII. Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
6.0 – 6.9	VIII – IX	VIII. Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned. IX. Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
7.0 and higher	X and higher	X. Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent. XI. Few, if any (masonry) structures remain standing. Bridges destroyed. Rails bent greatly. XII. Damage total. Lines of sight and level are distorted. Objects thrown into the air.
Source: California Geological Survey http://earthquake.usgs.gov/learning/topics/mercalli.php .		

The intensity of ground shaking and its potential impact on structures is determined by the physical characteristics of the underlying soil and rock, building materials and workmanship; earthquake magnitude; location of the epicenter; and the character and duration of ground motion. Much of the County is located on alluvium which increases the amplitude of the earthquake wave. Ground motion lasts longer and waves are amplified on loose, water-saturated materials as compared with solid rock. As a result, structures located on alluvium typically suffer greater damage than those located on solid rock.

The CGS has prepared a map of the state which shows the earthquake shaking potential of areas throughout California based primarily on an area's distance from known active faults. The map shows the east and central portions of the County in a relatively low intensity groundshaking zone, while the westernmost portion of the County is in a relatively moderate groundshaking zone (See Plate GS-1). The Project is located in an area which is noted to have some of the lowest groundshaking potential in the State.

LIQUEFACTION

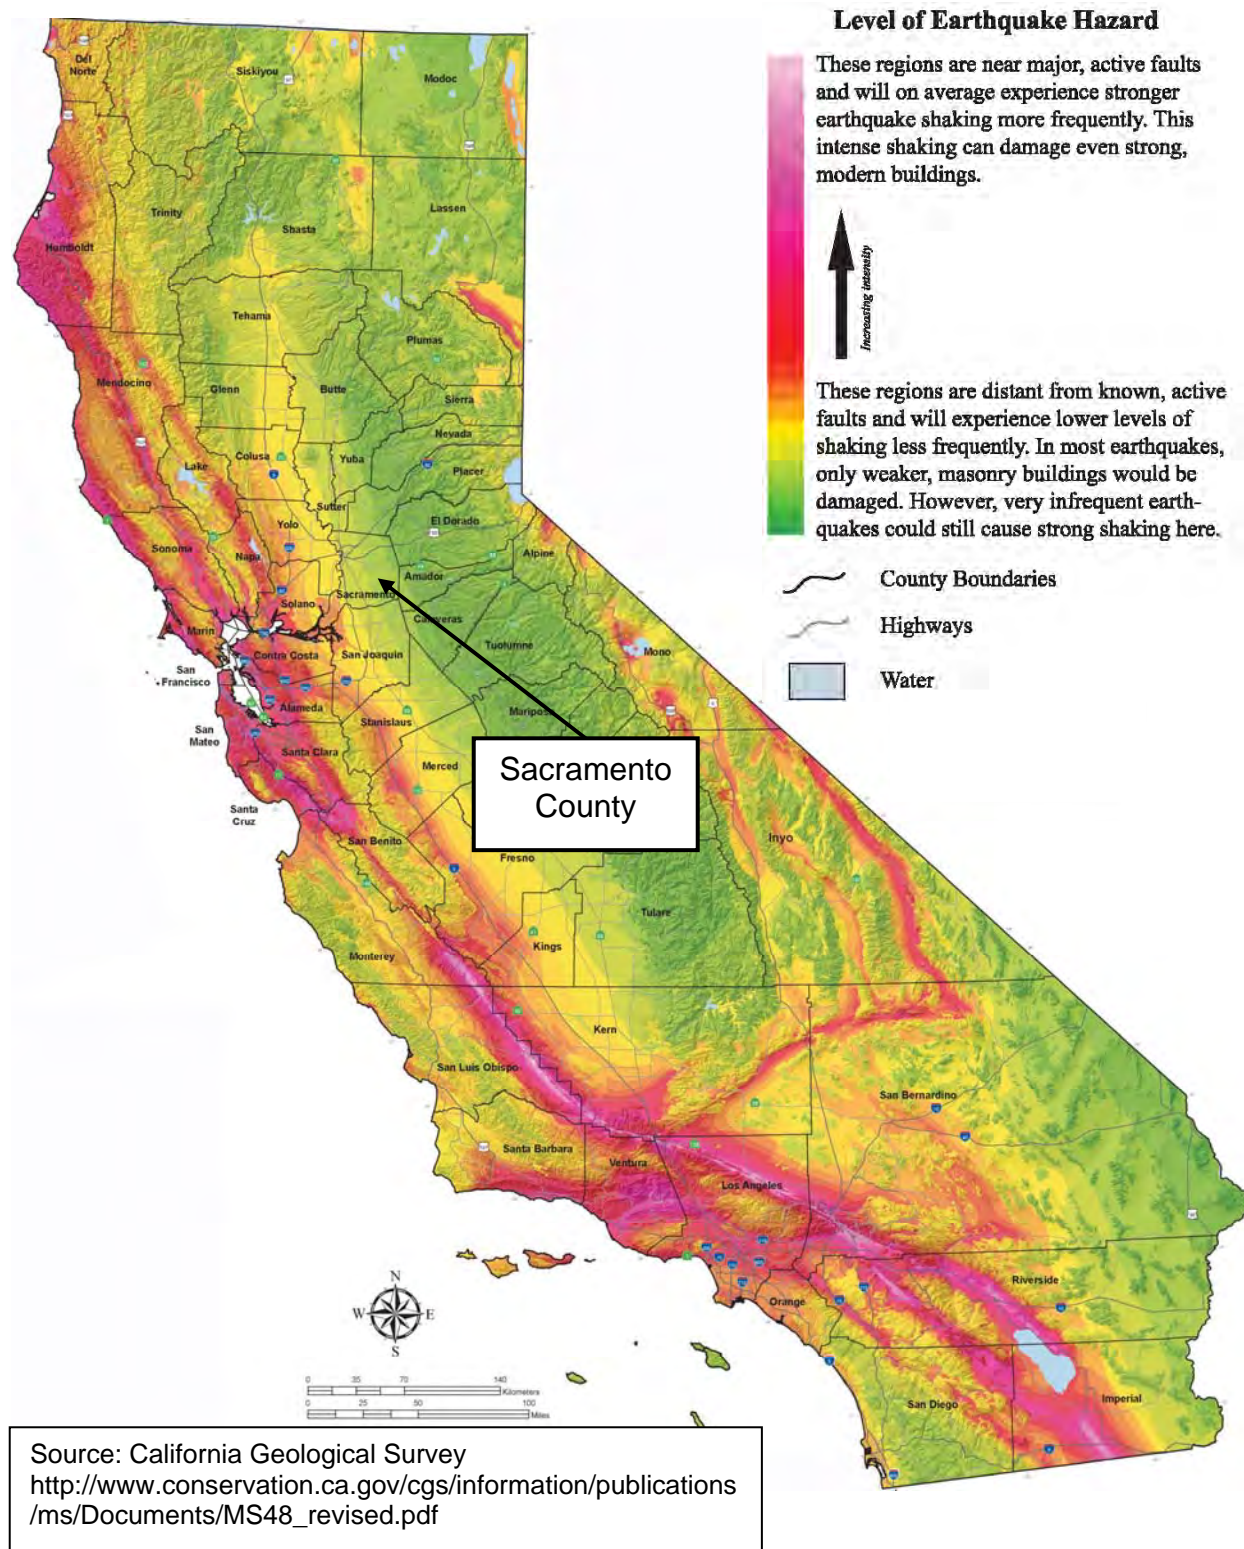

Sacramento County has two areas that have been suggested as posing potential liquefaction problems - the downtown area and the Delta. Liquefaction is a process whereby the strength and stiffness of a soil is reduced by earthquake shaking or rapid cyclic loading. Liquefaction occurs in saturated, typically cohesionless soils.

Earthquake shaking can cause the pore water pressure to increase to a point where the strength of the soil decreases and the ability of a soil deposit to support foundations for buildings and bridges is significantly reduced. A geological and seismological study in 1972 for a downtown building site concluded that potential liquefaction problems may exist throughout the downtown area where loose sands and silts are present below the groundwater table. Liquefaction may also pose a serious threat to levees in the Delta. Levee failure, depending on the extent, could have adverse effects on agriculture, natural gas supply, fisheries, and lead to salt water intrusion from the San Francisco Bay as well as property value declines and safety hazards.

SOILS AND HAZARDS

The soils of Sacramento County can be separated into three general classifications based on geographic factors: Delta soils, flood basin soils, and bench soils. The dark soils of the Delta area are primarily fertile peat comprised of slow-to-decay organic matter. The geologically recent flood basin soils, rich with organic and mineral compounds, are alluvium formed by historic and ancient flood deposits from swollen rivers overflowing into adjacent floodplains. Lastly, the bench soils, elevated above the spreading basins, are river terraces. Due to erosion and leaching, these soils lack the high percentage of organic material found in the Delta and flood basin soils, and are the soils prevalent on the Project site.

Plate GS-1: Earthquake Shaking Potential for California

Soils in Sacramento County can be divided into eight broad landscape classifications, or groups, (see Plate GS-2); the Project soils are within groups six and seven. These groups are further divided into 16 soil associations, which are landscapes that have distinctive patterns of soils, relief, and drainage; the Project soils are within associations 12 and 15. Normally a soil association consists of one or more major soils and at least one minor soil. Groups six and seven are described below.

Group 6: These soils are in the eastern portion of the County. They are very shallow to very deep and are moderately well drained or well drained. They are underlain by weakly consolidated sediments or have a cemented hardpan underlain by consolidated sediments. The moderately deep soils have a surface layer of gravelly loam or fine sandy loam and are underlain by a claypan. The very shallow or shallow soils are sandy loam or fine sandy loam.

Group 7: These soils are in the eastern portion of the County. In some areas they are on the highest terraces in the County. They are moderately deep or very deep and are well drained or moderately well drained. They have a subsoil of sandy clay loam or gravelly clay or have a claypan.

SUBSIDENCE

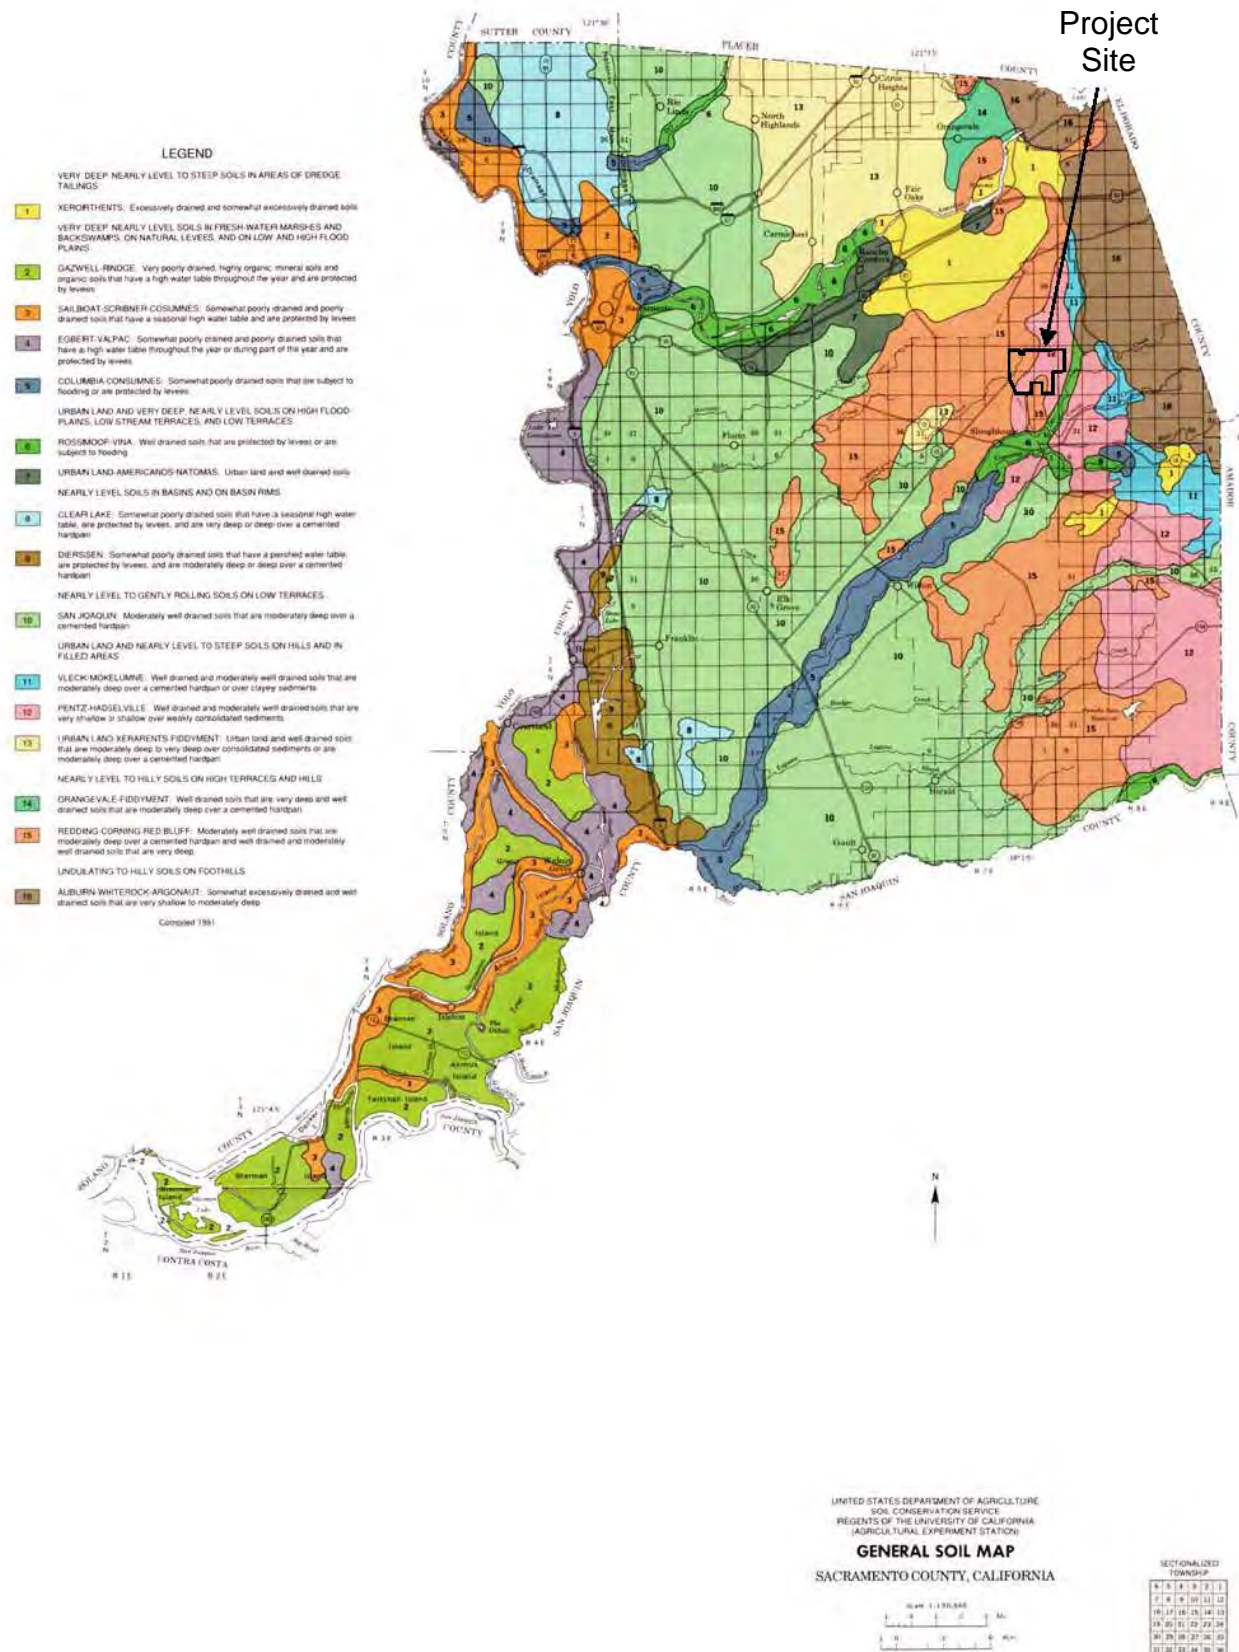

Subsidence is the gradual settling or sinking of the earth's surface with little or no horizontal motion. Sacramento County is affected by five types of subsidence. They are: compaction of unconsolidated soils by earthquake shaking, compaction by heavy structures, the erosion of peat soils, peat oxidation, and fluid withdrawal. The pumping of water for residential, commercial and agricultural uses from subsurface aquifers causes the greatest amount of subsidence in Sacramento County.

Subsidence has created major problems for flood control, particularly in the Delta. As levees sink under their own weight and are weakened by the erosive force of water, expensive periodic rebuilding is necessary. It is estimated that the Sacramento-San Joaquin Delta is subsiding at a rate of just over three inches per year. Many islands in the Delta that, at one time, were at or above sea level are now below sea level.

EXPANSIVE SOILS

Expansive soils represent approximately one third of all soil types in Sacramento County. These soils are largely comprised of clays, which greatly increase in volume when water is absorbed and shrink when dried. Expansive soils are of concern because building foundations may rise during the rainy season and fall during the dry season in response to the clay's action. If movement varies under different parts of the building, the result is that foundations crack, structural portions of the building are distorted, and doors and windows are warped so that they do not function properly.

Plate GS-2: General Soils Map

LANDSLIDES

Landslide is a general term used for a falling mass of soil and rock. The topography of the majority of Sacramento County is relatively flat and not subject to landslide. In Sacramento County, only a narrow strip along the eastern boundary, from the Placer County line to the Cosumnes River, is considered to have landslide potential. However, future slides on these slopes are expected to be minor in nature and do not pose a large scale threat to life or property. The American River Bluffs downstream from Folsom and in Fair Oaks and Carmichael are considered stable and are generally not subject to fracture or landslides.

EROSION

Erosion is a natural geological process by which landforms are worn down or reshaped by wind and water and the eroded material is deposited elsewhere. While natural erosion of undisturbed areas occurs in Sacramento County, it does not appear to pose a significant hazard to property. The principal area of erosion is along portions of the American River bluffs.

Erosion from agriculture seems to pose little problem in most of the County. The central and western portions of the County are fairly level and very little erosion takes place in these areas unless poor farming practices leave large areas of soil exposed and dry and subject to wind erosion.

There is a greater potential for erosion in the eastern foothills of the County, but extensive grass cover protects most of the vulnerable soils. Also, there is little agricultural activity, with the exception of grazing, in this area because the soils are generally of poor quality. The grasses, therefore, remain undisturbed unless a fire or some other event exposes the soil.

Perhaps the highest potential for erosion to occur is as a result of construction activity, where soils may be exposed for some length of time. However, Sacramento County, through Grading and Drainage Ordinances, provides measures to limit or restrict construction practices which might cause erosion, create a nuisance, constitute a hazard, or obstruct waterways. Permits issued under these ordinances ensure that Projects avoid potentially significant erosion hazards.

NATURALLY OCCURRING ASBESTOS

Asbestos is a naturally occurring, fibrous silicate mineral mined for its useful properties, such as thermal insulation, chemical and thermal stability, and high tensile strength (greater resistance to longitudinal stress before rupturing). The most common type of asbestos is chrysotile, but other types such as tremolite and actinolite are also found in California. Serpentine may contain chrysotile asbestos, especially near fault zones. Ultramafic rock, a rock closely related to serpentine, may also contain asbestos minerals. Asbestos can also be associated with other rock types in California, though much less frequently than serpentine and/or ultramafic rock. However, the information

available at this time is insufficient to allow such occurrences to be mapped on a statewide basis.

Asbestos is classified as a known human carcinogen by state, federal, and international agencies and was identified as a toxic air contaminant by the California Air Resources Board (CARB) in 1986. Asbestos poses a health risk only when it becomes friable, such as through disturbance or damage. Once airborne, asbestos fibers may be inhaled into the lungs where they can cause serious health problems (US EPA, 2008). All types of asbestos are hazardous and may cause lung disease and cancer.

Asbestos is commonly used as an acoustic insulator and in thermal insulation (fire proofing and other building materials). Serpentine and ultramafic rocks have been commonly used for unpaved gravel roads, landscaping, fill projects and other improvement projects in some localities.

US EPA issued a final rule banning most asbestos-containing products in July 1989; however, this regulation was overturned in 1991 by the Fifth Circuit Court of Appeals in New Orleans. The Courts ruled that the US EPA ban shall remain for specific asbestos-containing products. These banned products are flooring felt; rollboard; and corrugated, commercial, or specialty paper. The regulation continues to ban the use of asbestos in products that have not historically contained asbestos, otherwise referred to as "new uses" of asbestos.

Asbestos may be released to the atmosphere due to vehicular traffic on unpaved roads, during grading for development projects and at quarry operations (broken or crushed serpentinite and ultramafic rocks). All of these activities may have the effect of releasing potentially harmful asbestos into the air. Natural weathering and erosion processes can act on asbestos bearing rock and make it easier for asbestos fibers to become airborne if such rock is disturbed. At the point of release, the asbestos fibers may become airborne, causing air quality and human health hazards.

The Sacramento Metropolitan Air Quality Management District (SMAQMD) has determined that Naturally Occurring Asbestos (NOA) is present within areas of eastern Sacramento County. SMAQMD commissioned the California Department of Conservation Geologic Survey to test for and map all areas of potential NOA within Sacramento County. The map depicts areas within Sacramento County relative to their potential to contain NOA (see Plate GS-3, which shows the location of the Project site). The map is divided up into the following three classifications:

- **Areas Most Likely to Contain NOA:** These areas include ultramafic rock and serpentinite (serpentine rock), and associated soils, which are most likely to contain NOA. Such areas are not known to be present in eastern Sacramento County at this time, and thus do not appear on this map.
- **Areas Moderately Likely to Contain NOA:** These areas include those metamorphic and igneous rocks that are moderately likely to contain NOA.

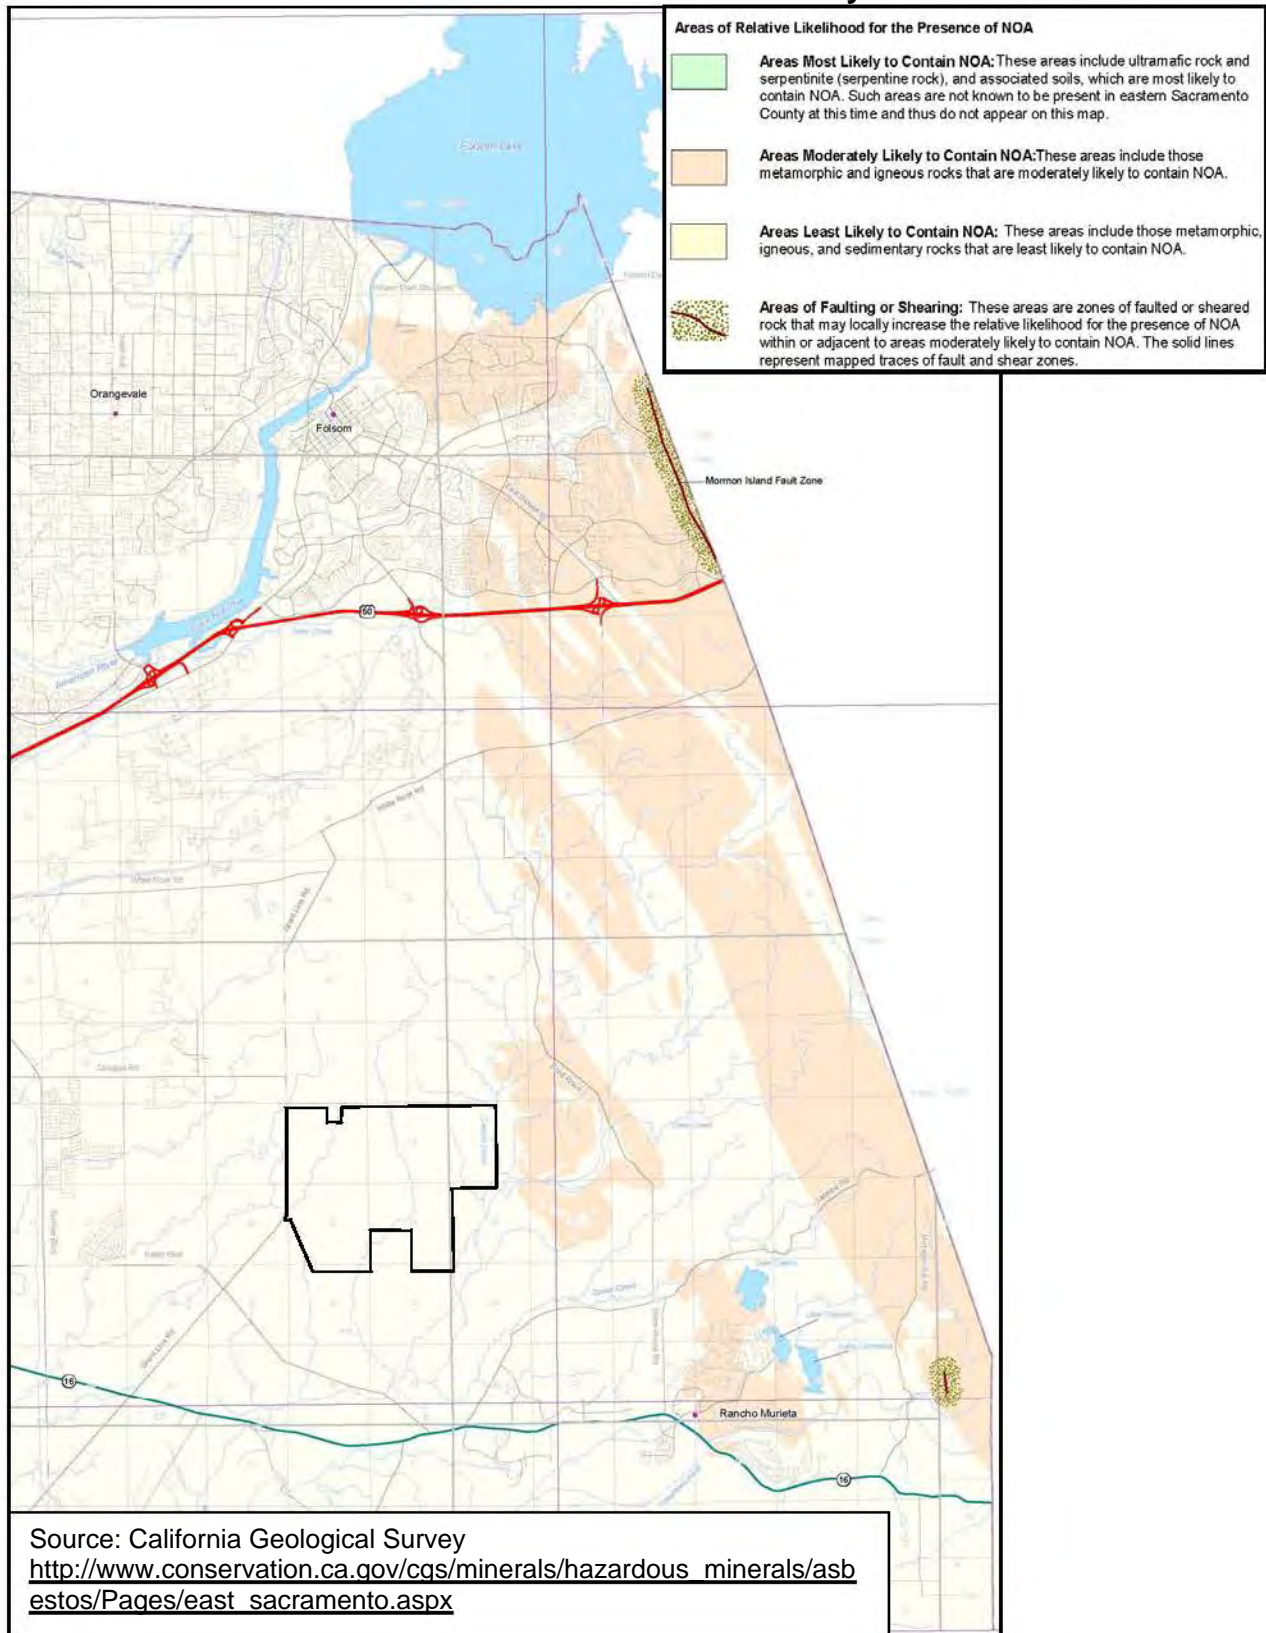

- Areas Least Likely to Contain NOA: These areas include those metamorphic, igneous, and sedimentary rocks that are least likely to contain NOA.

The other area shown on this map is areas of faulting or shearing. These areas are zones of faulted or sheared rock that may locally increase the relative likelihood for the presence of NOA within or adjacent to areas moderately likely to contain NOA. The solid lines represent mapped traces of fault and shear zones. The SMAQMD Air Pollution Control Officer (APCO) has determined that properties located partially or totally within the “Moderately Likely to Contain NOA” are subject to the requirements of Section 93105, *Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations* of the California Code of regulations (SMAQMD, 2006). Sacramento Air Quality Management District (SMAQMD) has regulatory authority of NOA.

In areas where NOA is located the ATCM establishes particular controls related to testing, engineering and notification prior to construction related activities. Projects located in these areas are required to submit a “Dust Mitigation Plan” which needs to be approved by SMAQMD prior to the start of the Project. A property may be exempt from the requirements of the ATCM if no asbestos is found in concentrations greater than or equal to 0.25% through a geologic evaluation performed by a registered geologist.

The unincorporated areas in eastern Sacramento County with a moderate likelihood for the presence of NOA include portions of Rancho Murieta and areas south of US 50 in the City of Folsom’s Sphere of Influence. The Project site is rated as least likely to contain NOA.

Plate GS-3: Relative Likelihood for the Presence of Naturally Occurring Asbestos in Eastern Sacramento County

MINERAL RESOURCES

Mineral resources in Sacramento County include sand, gravel, clay, gold, silver, peat, topsoil, lignite, natural gas and petroleum (Plate GS-4). The principal resources which are in production are aggregate (sand and gravel) and natural gas. Resource conservation issues associated with natural gas production and the lesser minerals are not currently considered vital within Sacramento County and conservation issues related to mineral resources focus primarily on aggregate production.

The Surface Mining and Reclamation Act (SMARA) of 1975 requires the State Geologist to classify land into Mineral Resource Zones (MRZ's) based on the known or inferred mineral resource potential of that land. The classification process is based solely on geology, without regard to existing land use or land ownership. The purpose is to help ensure that the mineral resource potential of lands is recognized and considered in the land use planning process. Plate GS-5 below depicts the MRZ's on the Project site (MRZ-1 and MRZ-2). SMARA also requires that Sacramento County incorporate that information and develop policies in the General Plan that are related to mineral resource preservation. A 1988 special report ("*Mineral Land Classification: Portland Cement Concrete-Grade Aggregate in the Sacramento-Fairfield Production Consumption Report*", Dupras 1988) was the source of much of the mineral resource information in the current General Plan.

Plate GS-4: Mineral Resources Map

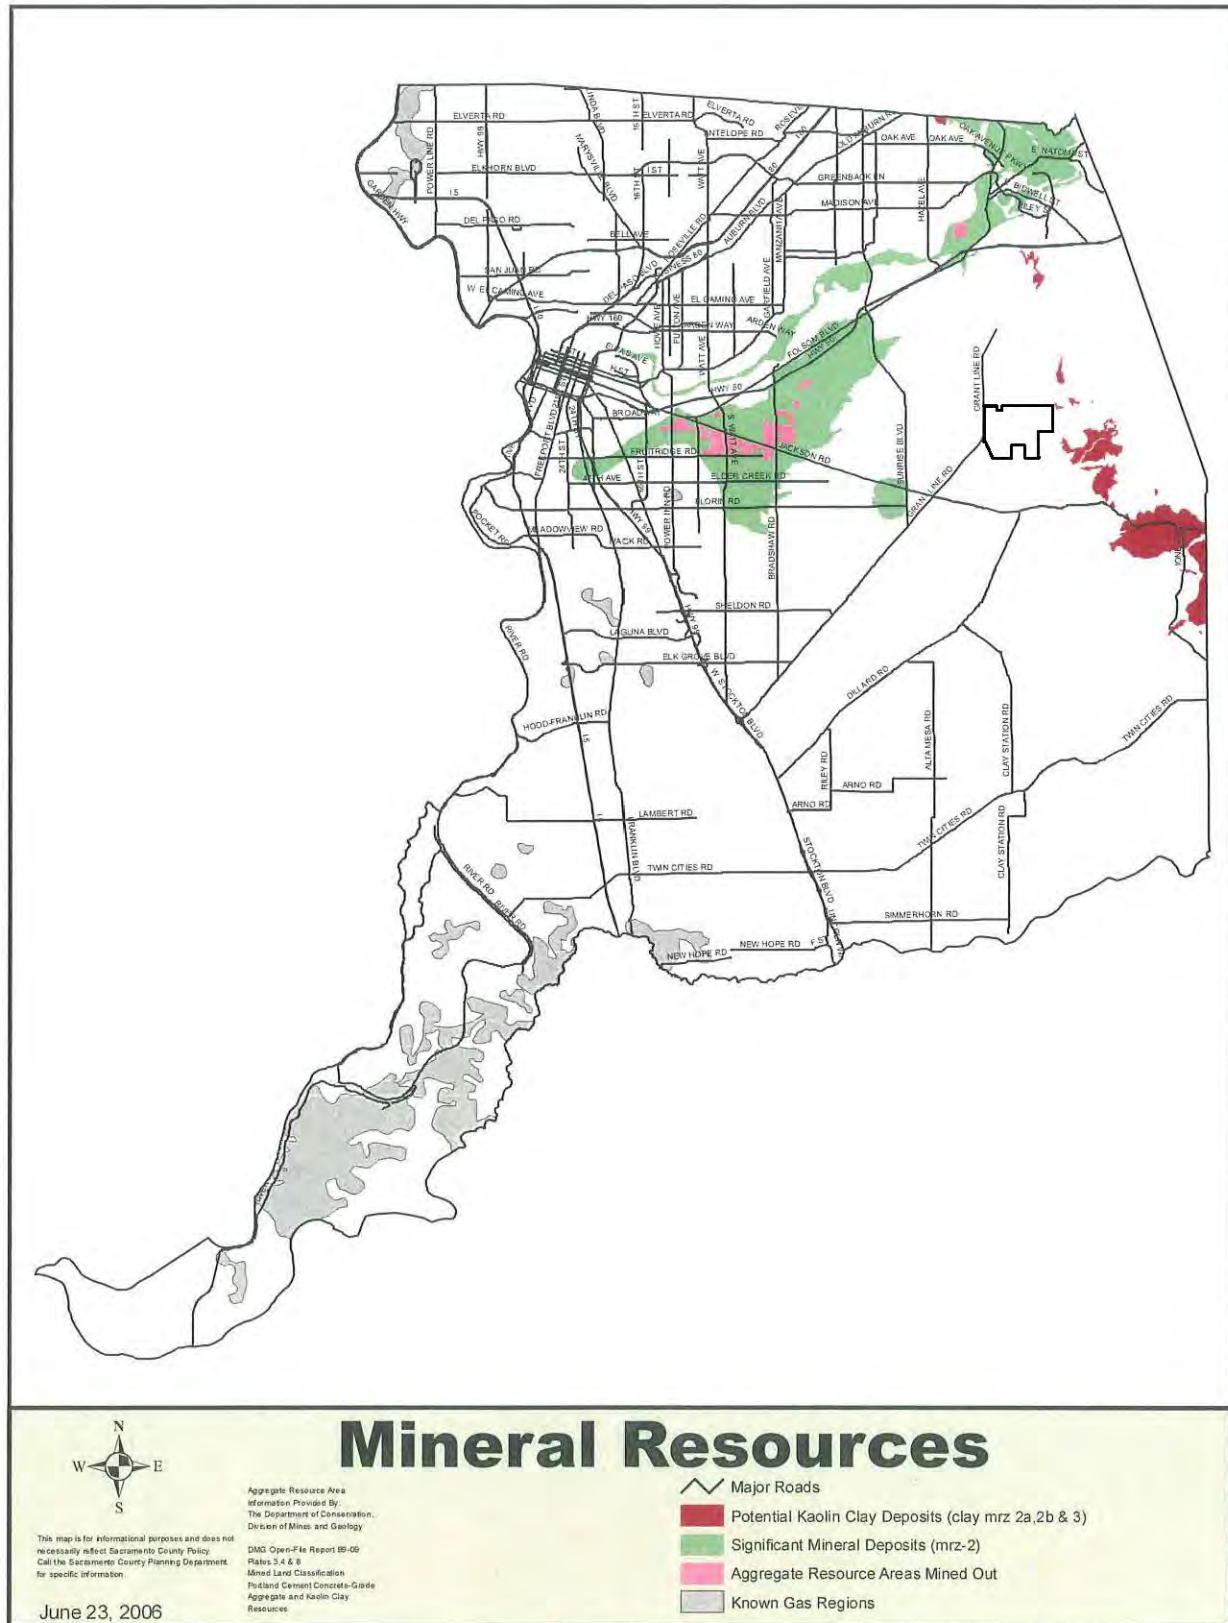

Plate GS-5: Project Area and Sacramento County MRZ Zones

MRZ's are divided into six categories. The categories for establishing MRZ's are as follows:

- MRZ-1: Areas where available geologic information indicates that little likelihood exists for the presence of significant mineral resources.
- MRZ-2a: Areas underlain by mineral deposits where geologic data indicate that significant measured or indicated resources are present. Areas classified MRZ-2a contain discovered mineral deposits that are either measured or indicated reserves as determined by such evidence as drilling records, sample analysis, surface exposure, and mine information. Land included in the MRZ-2a category is of prime importance because it contains known economic mineral deposits.
- MRZ-2b: Areas underlain by mineral deposits where geologic information indicates that significant inferred resources are present. Areas classified MRZ-2b contain discovered mineral deposits that are significant inferred resources as determined by their lateral extension from proven deposits or their similarity to proven deposits. Further exploration work could result in upgrading areas classified MRZ-2b to MRZ-2a.
- MRZ-3a: Areas containing known mineral occurrences of undetermined mineral resource significance. Further exploration work within these areas could result in the reclassification of specific localities into MRZ-2a or MRZ-2b categories. MRZ-3 is divided on the basis of knowledge of economic characteristics of the resource.
- MRZ-3b: Areas containing inferred mineral occurrences of undetermined mineral resource significance. Land classified MRZ-3b represents areas in geologic settings that appear to be favorable environments for the occurrence of specific mineral deposits. Further exploration work could result in the reclassification of all or part of these areas into the MRZ-2a or MRZ-2b categories.
- MRZ-4: Areas of no known mineral occurrences where geologic information does not rule out either the presence or absence of significant mineral resources.

As shown in the MRZ definitions above, MRZ-2a and MRZ-2b are the areas containing substantial aggregate resources. These areas contain geologic evidence which indicate that valuable resources are available and are of primary concern.

In 2001, the California Division of Mines and Geology submitted to the County of Sacramento Open File Report 99-09 titled "*Mineral Land Classification: Portland Cement Concrete-Grade Aggregate and Kaolin Clay Resources in Sacramento County*", which provides updated information on mineral resources in Sacramento County. This report presents updated maps of State-designated Aggregate Resource Areas (ARA) for the County to utilize for land use planning and conservation. In all, 22 ARAs are

designated as available land in Open File Report 99-09, none of which are in the Project area (they lie west of Grant Line Road).

The County subsequently adopted several amendments to the General Plan to incorporate the updated mineral resources information, though some changes were made to the State's ARAs through a County project entitled (*Mineral Resource-Related General Plan Amendments*, Control No. 2002-0104) in order to account for existing local land use conflicts. The County resource areas are known as Mineral Resource Areas (MRAs) which delineate the locations of high quality, available aggregate resources in Sacramento County, when considering land use conflicts. All of the areas are west of Grant Line Road, outside of the Project area.

Other recent changes include two separate petitions submitted to the State Mining and Geology Board for mineral lands reclassification, one by Angelo G. Tsakopoulos and one by Teichert, Inc.. Both petitions were granted, and the relevant lands (414 acres and 380 acres, respectively) were reclassified from MRZ-3 to MRZ-2 and should now be shown as ARA as well. These properties lie approximately 2.5 miles to the northeast of the Project site.

REGULATORY SETTING

FEDERAL

Development within the State of California is required to at least adhere to the provisions of the Uniform Building Code (UBC). The UBC sets forth minimum standards related to development, seismic design, building siting and grading. Local jurisdictions typically adopt standards that are as stringent, if not more stringent than those of the UBC. California has adopted the UBC but has amended it to better meet the need of the specific conditions of California.

STATE GUIDELINES

The 1972 Alquist-Priolo Earthquake Fault Zoning Act regulates development near active faults to mitigate the hazard of surface fault rupture. Under this Act, the State Geologist is required to delineate earthquake fault zones along known active faults in California. Cities and counties affected by these zones must regulate certain developments within these zones, and withhold development permits for sites until geologic investigations demonstrate that they are not threatened by surface displacements from future faulting. For the purposes of this act, an active fault is defined as a fault that has "had surface displacement within Holocene time" (about the last 11,000 years). Sacramento County is not affected by Earthquake Fault Zones.

The Seismic Hazards Mapping Act of 1990 requires the State Geologist to delineate liquefaction and earthquake-induced landslide hazard zones in the state. Cities and counties affected by these hazard zones must regulate certain developments within

these zones, and withhold development permits for sites until geologic investigations demonstrate they are not threatened by liquefaction, earthquake, or induced landsliding during future earthquakes. Sacramento County is located outside of the Seismic Hazard Mapping Zones, although according to the CGS, the county has not yet been evaluated for possible inclusion in a Seismic Hazard Zone.

The California Uniform Building Code (CBC) contains the minimum standards for design and construction in California. All development in California is subject to the regulations of the CBC. Local standards other than the code may be adopted if those standards more strict. Some design considerations associated with seismic hazards need to address the appropriate building codes for a particular site. The code adopts all the standards associated with seismic engineering detailed in the Uniform Building Code of 1997. The 2007 California Building Code is adopted and incorporated into Title 16 of the Sacramento County Code and all construction, alteration, moving, demolition, repair and use of any building or structure within Sacramento County shall be made in conformance with the CBC.

The California Air Resources Board (ARB) has adopted an Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mining Operations (17 CCR 93105). The Sacramento Metropolitan Air Quality Management District (SMAQMD) has mapped areas of serpentine and ultramafic rock in eastern Sacramento County and determined that these areas are subject to the ATCM (SMAQMD 2006b).

LOCAL GUIDELINES

LAND GRADING AND EROSION CONTROL

The Project will be required to comply with the Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44). The ordinance was established to minimize damage to surrounding properties and public rights-of-way; limit degradation to the water quality of watercourses; and curb the disruption of drainage system flow caused by the activities of clearing, grubbing, grading, filling, and excavating land. The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities.

2030 SACRAMENTO COUNTY GENERAL PLAN

The General Plan contains goals and policies related to seismic and geologic hazards, and to conservation of soils. Applicable goals and objectives include maintaining a high level of public health and safety for all residents of Sacramento County while minimizing the loss of life, injury, and property damage due to seismic and geological hazards. The following policies are applicable.

SA-1. The County shall require geotechnical reports and impose the appropriate mitigation measures for new development located in seismic and geologically sensitive areas.

~~AG-28. The County shall actively encourage conservation of soil resources.~~

SIGNIFICANCE CRITERIA

Sacramento County considers impacts to geology, soils, and seismic areas of concern to be significant if a project would:

1. Expose people or structures to potentially substantial adverse effects, including the risk of loss, injury, or death involving:
 - a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist of the area or based on other substantial evidence of a known fault
 - b. Strong seismic ground shaking
 - c. Seismic-related ground failure, including liquefaction
 - d. Landslides
 - e. Unsafe exposure to naturally occurring asbestos
2. Result in substantial soil erosion or the loss of topsoil.
3. Be located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.
4. Be located on expansive soil as defined in Table 18-1-B of the Uniform Building Code, creating substantial risks to life or property.
5. Result in obstruction of access to, and removal of, mineral resources. In particular for aggregate resources, removal or disruption of mineral resources delineated on a local general plan, specific plan, or other land use plan.

None of the soils present on the site, as described in *The Soil Survey of Sacramento County, California*, are listed as unstable; significance criteria 3 does not apply. Though there is topographical variation on the site, there are no major bluffs or other features that would make the Project susceptible to damage related to landslides; significance criteria 1d does not apply.

METHODOLOGY

In general, the geotechnical characteristics of the Project area determine the potential for structural and safety hazards as well as mineral resource impacts that could occur with development related to the proposed Project. Existing conditions data was summarized from the previously identified documents and resources as well as geotechnical reports prepared by Wallace Kuhl and Associates Inc. (Wallace Kuhl) which can be found in Appendix GS-1 of this EIR. The Project was analyzed in terms of its consistency with Sacramento County General Plan policies and potential for geologic or soils-related hazards to people and property in the Project area as well as potential for mineral resource impacts. It should be noted that soil resources generally pertain to the agricultural suitability of the soil; Project issues related to the agricultural suitability of the site are addressed in the Agricultural Resources chapter of this EIR.

IMPACTS AND ANALYSIS

The Cordova Hills Project is located on approximately 2,669 acres in southeastern Sacramento County, adjacent to the eastern city limits of Rancho Cordova. The Project includes a mix of residential uses from high density residential along the western edge of the Project to low density residential along the eastern boundary approaching the USB. The Project includes a Town Center commercial area adjacent to Grant Line Road. Just southeast of the Town Center is the proposed location of the University/College Campus Center. The Project includes mixed uses consisting of residential, office, retail, a university/college campus center, schools, parks, and a trail network.

IMPACT: SOIL EROSION

Erosion is a natural process that occurs when wind and water reshape or wear down landforms and the eroded materials are deposited in another location. The erosion of soil can be accelerated when existing groundcover is removed from the surface of the ground such as during grading or clearing activities which expose underlying soil to erosional forces. The most likely potential for erosion to occur is as a result of construction activity where soils may be exposed for some length of time.

According to the NCRS web soil survey, there are 16 different soil units within the Project area (refer to Plate GS-6). *The Soil Survey of Sacramento County, California*, (1993) issued by the USDA Soil Conservation Service indicates these soils range in depth from very deep to very shallow and that the hazard of erosion potential for these soils range from slight to severe. The soil unit noted to be a severe erosion hazard is unit 188 which is located on the eastern portion of the site where low and medium density development is proposed. Implementation of the proposed Project may allow for development that could result in increased soil erosion.

The Project will be required to comply with the Sacramento County Land Grading and Erosion Control Ordinance (Sacramento County Code Ch. 16.44). The ordinance was established to minimize damage to surrounding properties and public rights-of-way; limit degradation to the water quality of watercourses; and curb the disruption of drainage system flow caused by the activities of clearing, grubbing, grading, filling, and excavating land. The ordinance establishes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land grading activities. Also refer to the Hydrology and Water Quality chapter for further discussion.

Because development projects are already subject to the County Land Grading and Erosion Control Ordinance and the State Water Resources Control Board stormwater permitting requirements, any development related to the proposed Project will be subject to erosion and sediment control measures as a matter of course. As such, the Project will not result in substantial soil erosion or the loss of topsoil and impacts to soil resources are considered to be *less than significant*.

MITIGATION MEASURES:

None required.

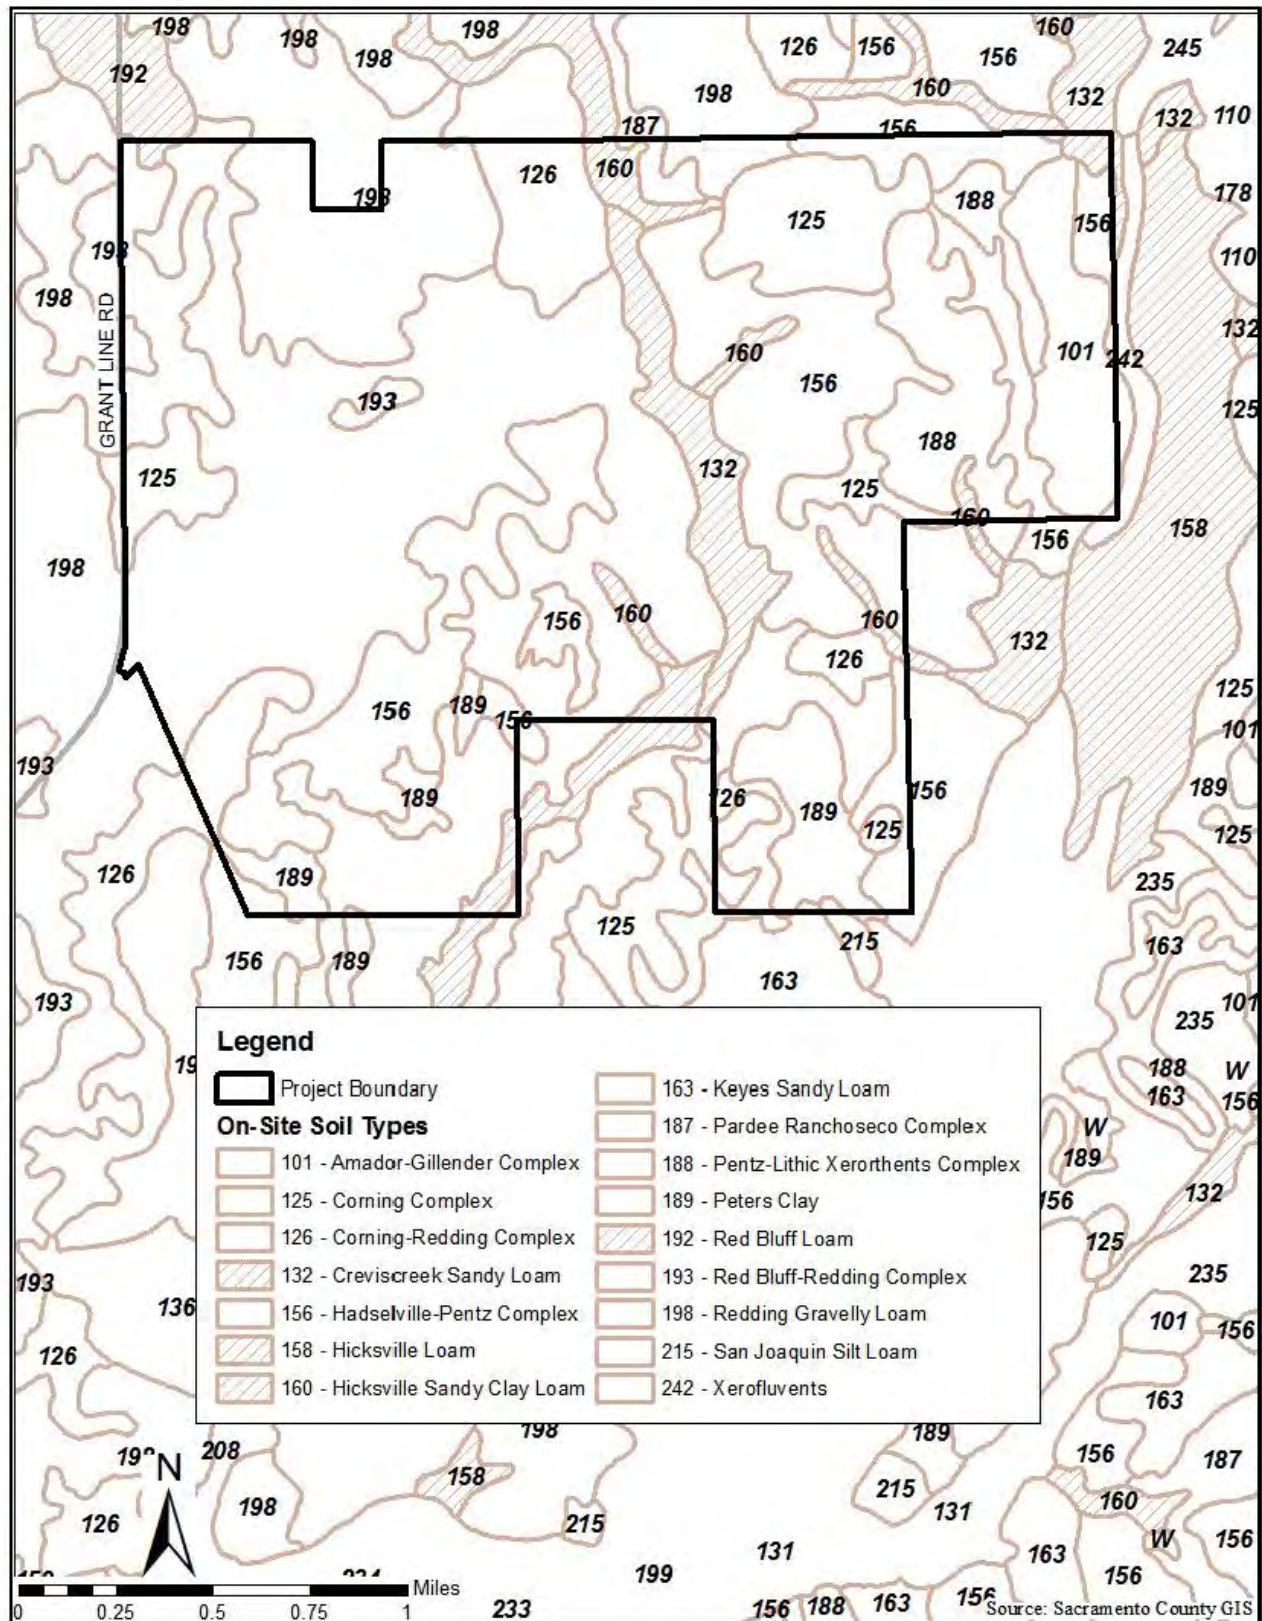

IMPACT: EXPOSURE TO EXPANSIVE SOILS

According to the geotechnical reports prepared by Wallace Kuhl, the Project site contains soils that have a high shrink-swell potential, including the Peters clay profile (unit 189 on Plate GS-6; note that the hatchmarking denotes prime soils). *The Soil Survey of Sacramento County, California* indicates that the majority of the soils in the Project area have either a moderate or high shrink-swell potential at various depths, depending on the soil.

Development related to the proposed Project may result in the addition of new structures and roadways located in areas containing expansive soils that have the ability to cause structural damage to both foundations and roads. To address this, the construction permitting process within Sacramento County requires completed geotechnical reports for development located within areas known to contain expansive soils; the purpose of this is to identify potential hazards that may impact a project as well as measures to eliminate the hazardous soil conditions. Measures related to eliminating potential hazards of expansive soils can include the excavation of silts and clays to a suitable depth, the replacement of these materials with engineered fill and compacted granular fill material, or the mixing of onsite soils to achieve a consistent soil composition. This effectively removes expansive soils from a project area, or ensures that any expansion and contraction under the foundation is evenly distributed. In addition, structural design must conform to the criteria detailed in the UBC and CBC (Chapters 16, 18, 33 and the Appendix to Chapter 33). Consistent with Policy SA-1, a geotechnical report was prepared for the site.. The codes and policies are part of the existing regulatory framework of the County and reliance on them is assumed for any new development related to the proposed Project.

Any Project-related development will need to adhere to the existing UBC and CBC, which will ensure the maximum necessary protection available for development within areas known to contain expansive soils, and will avoid substantial risk to life and property; impacts are *less than significant*.

Plate GS-6: Soils within the Project Area

MITIGATION MEASURES:

None required.

IMPACT: EXPOSURE TO NATURALLY OCCURRING ASBESTOS

The Project area is located approximately 2,000 feet west of locations known as “Areas Moderately Likely to Contain NOA” based on the data provided in Special Report 192- Relative Likelihood for the Presence of Naturally Occurring Asbestos in Sacramento County, published by the California Geologic Survey. According to Wallace Kuhl, soil testing performed for the Project revealed no ultramafic rocks, serpentine, or obvious evidence of NOA. Given that the Project site is not mapped for NOA presence and that soil testing found no obvious evidence of NOA on the site, Project impacts related to unsafe exposure to naturally occurring are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: OBSTRUCTION OF ACCESS TO MINERAL RESOURCES

As noted above, mineral resources in Sacramento County have been classified in a number of ways over the years, including as MRZs, ARAs, and MRAs. Although the MRZs (broad categories that take into account only geological factors) indicate that much of the County lies over mineral resources ranging from areas with “known mineral occurrences of undetermined mineral resource significance” to “areas underlain by mineral deposits where geologic data indicate that significant measured resources are present,” only a relatively small portion of the county lies over known high-quality mineral resources that are available for extraction. These areas, which reflect the most recent mineral resource classification for the County, are the ARA’s (MRZ-2z or 2b and available for extraction).

The ARA’s are primarily located south and southwest of Mather Airport, though there are newly designated areas to the northeast as well. The ARA located nearest to the Project site is located northeast of the site, in the newly-designated areas, approximately 2.5 miles from the site. As such, Project related development is unlikely to result in the obstruction of access to mineral resources within the County.

The aggregate resources of primary concern are located outside of the Project area. The subject property is shown to be on land with the MRZ-1 and MRZ-3 State mineral resource categories, which means that the site has either “little likelihood” of resources or resources of “undetermined mineral resource significance”. If suitable rock deposits are found within the proposed development areas, the applicant has indicated that the use of these deposits will be maximized for the production of aggregate for Project construction needs. Section 7.10 of the Cordova Hills SPA states that:

Screening, crushing and sizing of onsite aggregate-grade rock deposits encountered while conducting activities related to onsite excavation, earthmoving, construction of structures, landscaping, compaction, fills, road cuts and embankments shall be performed with the intent of utilizing to the fullest extent feasible the onsite aggregate-grade rock deposits while construction activity is ongoing. The operations of the processing and sorting of grading materials will only take place within the project and no exporting of the materials offsite will be permitted.

On-site rock deposits and the tools and machinery needed for aggregate processing will be utilized in areas already designated for developed uses, and will be incidental to already-planned grading activities. Due to the variable nature of site topography, deep cuts are already planned in order to facilitate construction of the proposed uses. Aggregate extraction that may occur on the site will *not* involve attempts to find resources through significant exploratory digging which goes beyond the grading needed for general Project construction. The relevant topical chapters of this EIR disclose the impacts of full development of the proposed Project, including the earthmoving activities that will take place which may yield rock deposits and the techniques utilized to process aggregate.

The Project will not result in the placement of urban structures over an area of significant known aggregate value, and thus will not result in the obstruction of access to or loss of mineral resources. Furthermore, any small amount of aggregate that is found on the site will be used as part of Project construction. Impacts to mineral resources are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: EXPOSURE TO GEOLOGICAL HAZARDS OR UNSTABLE SOILS

SEISMICITY AND GROUND SHAKING

Ground shaking occurs as a result of significant amounts of energy that are released due to seismic events. Sacramento County is less affected by seismic events than other portions of the State of California. Sacramento County does not lie within or adjacent to an Alquist-Priolo Earthquake Fault Zone nor are there any mapped seismic hazard zones within the County. Active faulting has not been mapped as occurring across or immediately adjacent to the County, and surface rupture due to faulting is not expected to occur unless some unknown fault is to rupture.

The majority of Sacramento County and the entire Project site have some of the lowest seismic potential in California. Nevertheless, some property damage has occurred in the County in the past due to seismic activity along faults in nearby counties. The damage that was experienced has largely been the result of major seismic events

occurring in adjacent areas, especially the San Francisco Bay area and, to a lesser extent, the foothills of the Sierra.

Tectonically, the Project area is situated in between faults in Northern California and Nevada. Although the Willows fault is the nearest fault to the Project area, this fault is not considered active or capable of rupturing to the ground surface, nor is it considered in current ground motion estimates. The next closest fault to the Project area is the Bear Mountain Fault Zone, which is located approximately seven miles east of the site. According to Wallace Kuhl, the Bear Mountain Fault Zone is considered a pre-Quaternary fault and has not been active in the last 1.6 million years, except for the "Rescue Lineament," which is located approximately 14 miles from the site and may have been active in late Quaternary time. The nearest known active fault that has been mapped on the C.W Jennings Fault Activity Map (see simplified version in Plate GS-7) is the Dunnigan Hills Fault located approximately 46 miles to the northwest of the site, although according to the CGS staff, evidence of Holocene displacement is questionable.

Although no active faults are known within Sacramento County, the region has undergone numerous instances of ground shaking caused by the surrounding faults. Peak horizontal ground acceleration values associated with characteristic earthquake events of faults can be used to assess probabilistic ground-shaking characteristics of a given region. The amount of shaking is often expressed in terms of "Peak Ground Acceleration," measured in percent of "g," the acceleration of gravity (approximately 9.80 meters per second per second). Although groundshaking may occur, a review of current information provided on the Department of Conservation website indicates that the peak horizontal ground acceleration within the Project area as well as the majority of Sacramento County, is estimated to be 10 to 20 percent of g or 0.10g to 0.20g, making the seismic ground-shaking hazard relatively low within the proposed Project area (see Plate GS-8).

Although seismic ground-shaking hazards are considered relatively low, ground shaking from earthquakes in the Sacramento region, contributed by the relatively close faults located primarily in the bay area, could cause light to moderate damage to structures depending on construction methods.

In Sacramento County, commercial, institutional and large residential buildings as well as all related infrastructure are required, in conformance with Chapter 16, *Structural Design Requirements*, Division IV, *Earthquake Design* of the CBC, to lessen the exposure to potentially damaging vibrations through seismic resistant design. In compliance with Sacramento County General Plan Safety Element policies and the UBC and CBC, all structures in the Project area would be well-built to withstand ground shaking from possible earthquakes in the region. Structures built to the requirements of these codes readily withstand the levels of ground shaking that could occur in the Project region.

Based on the existing regulatory framework that governs new development within Sacramento County which addresses safety issues and requires that development adhere to the CBC and other relevant policies, regulations, and design standards

related to seismic activity, seismically induced groundshaking effects are not expected to be substantial hazards. Therefore, development related to the proposed Project will not expose people or structures to substantial new adverse effects related to a rupture of a known fault or strong seismic ground shaking; impacts are *less than significant*.

LIQUEFACTION

Liquefaction occurs when ground shaking causes a sediment layer saturated with groundwater to lose strength and take on characteristics of fluids, therefore reducing the ability of the soil to support the load of structures. As a result, structures could be shifted off balance or even destroyed under sufficient liquefaction conditions. Two possible liquefaction areas exist within Sacramento County: Sacramento City's Downtown area and the Delta area. Because the known liquefaction areas are not located within the vicinity of the Project site, the proposed Project will not expose people or structures to substantial adverse effects related to liquefaction; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

Plate GS-7: Simplified Fault Activity Map

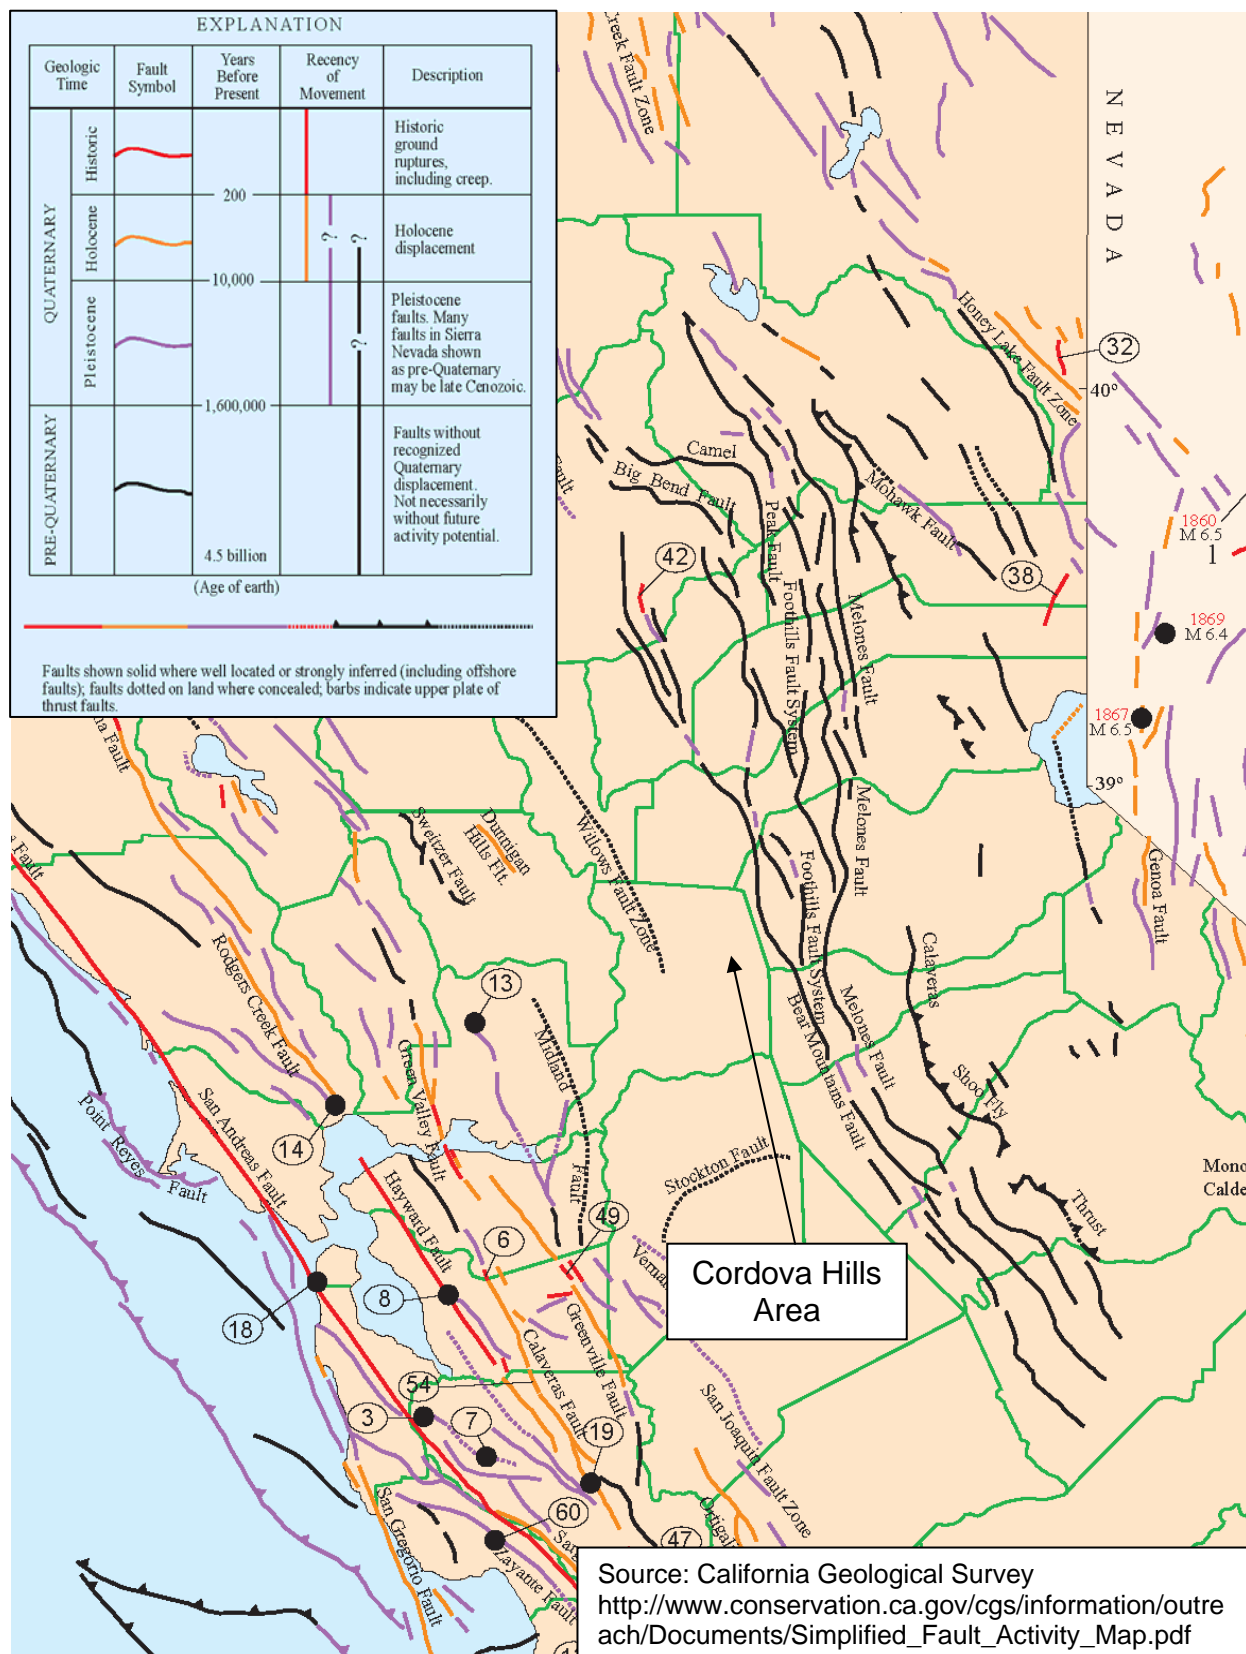

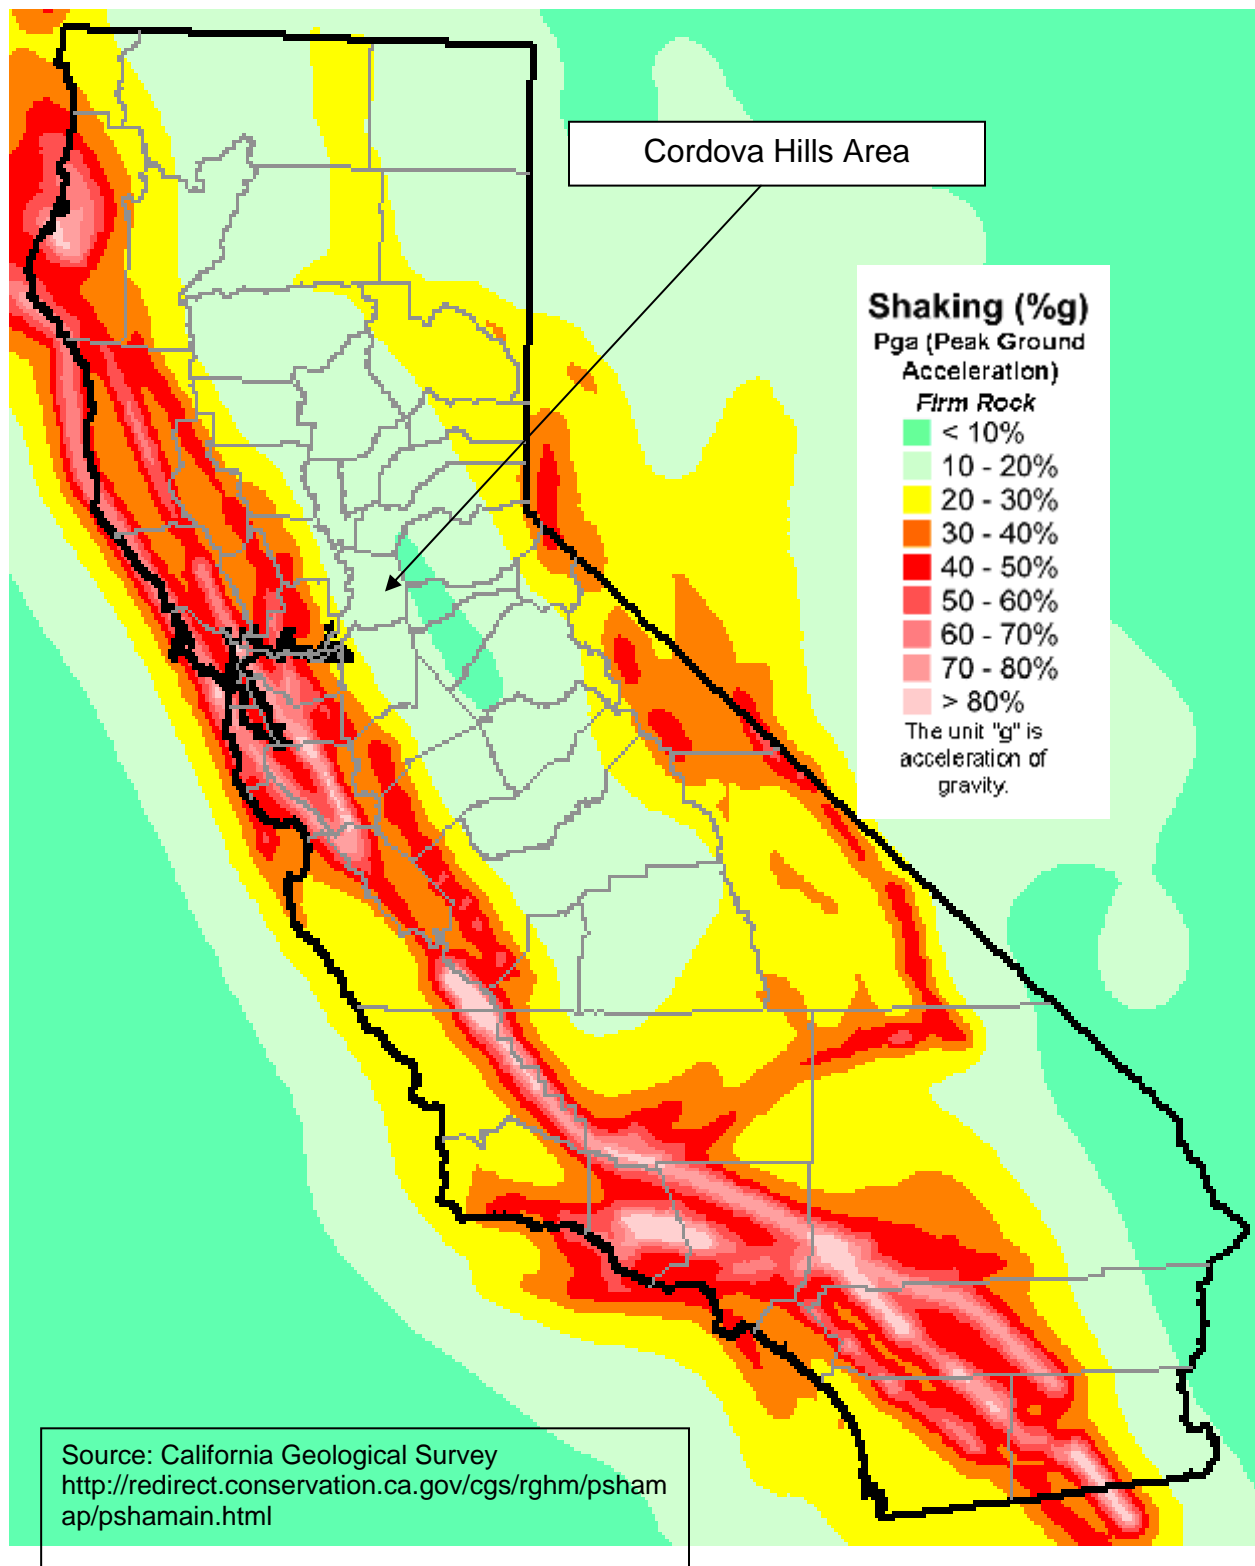

Plate GS-8: Seismic Shaking Hazards in California

10 HAZARDOUS MATERIALS

INTRODUCTION

This chapter addresses the effects of development consistent with the proposed Project related to hazardous substances in Sacramento County and the effectiveness of proposed policies to mitigate identified impacts. The term “hazardous substances” refers to both hazardous materials and hazardous wastes. A material is defined as hazardous if it appears on a list of hazardous materials prepared by a federal, state or local regulatory agency, or if it has characteristics defined as hazardous by such an agency.

Sacramento County uses the definition of “hazardous materials” in the California Health and Safety Code, Division 20, Chapter 6.95, Section 23301, which states:

(a) “Hazardous material” means any material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. “Hazardous materials” include, but are not limited to, hazardous substances, hazardous wastes, and any material which a handler or the administering agency has a reasonable basis for believing that would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

This definition is not limited to just those chemicals with long-term detrimental effects. It also includes materials that present a hazard because of their physical nature (explosive, corrosive, flammable).

This chapter will discuss hazardous materials and handlers of hazardous materials. Handlers consist of individuals or firms that manufacture, store, use, ship, recycle, or dispose of hazardous materials. Also, the health impacts that can result from exposure or long-term contact with hazardous materials will be assessed. Policies and mitigation measures to protect from exposure and reduce exposure levels in long-term contact conditions will be identified, as appropriate.

ENVIRONMENTAL SETTING

Sacramento County has a variety of hazardous substances associated with many uses. These include known contaminated properties; businesses that handle (use and/or collect) contaminants; household contaminants; landfills; lead-based paint; asbestos (in buildings predating 1970 – natural soil sources are discussed in the Geology and Soils

chapter); and pesticides, fertilizers, and petrochemicals associated with agriculture. These sources can contaminate soil, ground and/or surface water, and buildings.

Table HM-1 below lists the databases used to determine the presence or absence of known contaminated sites, a description of the information they contain, and the authority charged with maintenance of these databases. The setting sections below describe, in general, the known or potential hazardous materials and/or sites in the vicinity of the Project. The more specific descriptions of these hazards and their potential impacts to the Project are contained in the Impacts and Analysis section.

Table HM-1: Federal, State, and Local Databases & Lists for Hazardous Materials

Database	Description
Federal	
National Priorities List (NPL)	This list is maintained by the Environmental Protection Agency (EPA) and includes the most severe hazardous waste sites as identified by Superfund. Sites are put on the NPL after they have been scored using the Hazard Ranking System, as well as having been subjected to public comment. Any site on the NPL is eligible for cleanup using Superfund Trust money. The NPL is primarily an informational resource that identifies sites that may warrant cleanup.
State	
Geo Tracker	This database is maintained by the State Water Resources Control Board and tracks regulatory information about leaking underground fuel tanks (LUFTs), fuel pipelines, and public drinking water supplies.
Envirostor	This database is maintained by the State Department of Toxic Substances Control (DTSC) and holds information on investigation, cleanup, permitting, and corrective actions that are planned, are being conducted, or have been completed under the DTSCs oversight.
Local	
Master List of Facilities within Sacramento County with Potentially Hazardous Materials (Master List)	This list is maintained by the Sacramento County Environmental Management Department
Toxic Site Clean-Up Site Specific Report	This list is maintained by the Sacramento County Environmental Management Department and lists where unauthorized releases of potentially hazardous materials have occurred.

LEAD

Lead is commonly found in paint, dust, and soil. In 1978 the Federal government banned the use of lead-based paint in housing. Many homes built before 1978 have lead-based paint. If the paint is in good condition it is usually not a hazard. However, if lead-based paint is dry scrapped, dry sanded, or heated, lead dust can form. This lead dust can get on surfaces and objects that people touch and settled lead dust can re-enter the air when people vacuum, sweep, or walk through it. Lead can also settle in soil from flaking or chipped exterior lead-based paint. This can be tracked into a house by children playing in bare soil, causing a possible hazard. Lead poisoning, especially in children, can cause damage to the brain and nervous system, behavior and learning problems, hearing problems and headaches. Adults are also susceptible and can have difficulties during pregnancy, high blood pressure, nerve disorders, muscle and joint pain, and memory and concentration problems, to name a few (US EPA, 2007).

There are no structures on the Project site. Though there is a historic homestead site, none of this structure remains.

ASBESTOS

Asbestos is a naturally occurring, fibrous silicate mineral mined for its useful properties, such as thermal insulation, chemical and thermal stability, and high tensile strength (greater resistance to longitudinal stress before rupturing).

Asbestos is classified as a known human carcinogen by state, federal, and international agencies and was identified as a toxic air contaminant by the California Air Resources Board (ARB) in 1986. Asbestos poses a health risk only when it becomes friable, such as through disturbance or damage. Once airborne, asbestos fibers may be inhaled into the lungs where they can cause serious health problems (United States EPA, 2008). All types of asbestos are hazardous and may cause lung disease and cancer.

Asbestos was commonly used as an acoustic insulator and in thermal insulation (fire proofing and other building materials). The United States EPA issued a final rule banning most asbestos-containing products in July 1989; however, this regulation was overturned in 1991, by the Fifth Circuit Court of Appeals in New Orleans. The Courts ruled that the United States EPA ban shall remain for specific asbestos-containing products. These banned products are flooring felt; rollboard; and corrugated, commercial, or specialty paper. The regulation continues to ban the use of asbestos in products that have not historically contained asbestos, otherwise referred to as "new uses" of asbestos.

In ARB's Final Regulation Order for Asbestos Airborne Toxic Control Measure For Construction, Grading, Quarrying and Surface Mining Operations (California Code of Regulations Title 17, Section 93105), specific mitigation measures were developed for asbestos. ARB's staff has the data and expertise necessary to determine appropriate control measures, and is the regulatory agency responsible for establishing controls.

There are no structures on the Project site. Though there is a historic homestead site, none of this structure remains. As stated previously, discussions of naturally-occurring asbestos are within the Geology and Soils chapter.

KNOWN SMALL CONTAMINATED SITES

There are many types of businesses that handle hazardous wastes or materials, including automotive businesses, gas stations, buildings supplies (concrete, painting, lumber, etc), and dry cleaners. For many of these businesses, the contamination source is an above-ground or underground storage tank that has developed a leak. The contaminants may be contained solely within the surrounding soils, or they may pass into groundwater and cause a migrating contamination plume. The databases noted in Table HM-1 maintain lists of these known contamination sites, the source of contamination, and the status of cleanup efforts. Reviewing all of the lists for known contaminated sites within ½-mile of the Project disclosed only one small site: the Sacramento County Boys Ranch (Boys Ranch).

The Boys Ranch is a juvenile correction facility operated by the County – though as of the time of this writing budget reductions have resulted in the facility's closure. It is located just outside of the northeastern site boundary. The contamination on the site was associated with a leaking underground fuel storage tank.

KNOWN LARGE CONTAMINATED SITES

AEROJET CORPORATION

Aerojet was founded in 1942 with the development of the Jet Assist Take Off (JATO) rocket motor that provided extra boosting power for United States military planes during World War II. Aerojet developed, tested, and produced rocket engines and ordnances in the propulsion industry. The Aerojet headquarters are located near Highway 50 in Sacramento County, approximately five miles from the Project site; this facility is listed on the Sacramento County Environmental Management Department (County EMD) Toxic Site Clean Up list with 21 buildings. Of those buildings, 18 cases have been closed and of those, five received remedial action. Two of the three open cases are under the jurisdiction of the State Department of Toxic Substances Control (DTSC) and the third open case is under the jurisdiction of County EMD.

Of the three open cases, the types of contaminants at the Aerojet sites are petrochemicals (gasoline and diesel). The types of receiving bodies contaminated (case types) are listed as other aquifers (such as non-potable perched groundwater), soil only, and undetermined (which are areas where contamination has not be determined in soil or groundwater). Aerojet is listed as having sites on the Leaking Underground Fuel Tank (LUFT) list and sites listed in the Spills, Leaks, Investigation, and Cleanups (SLIC) list. Two wells (one inactive, the second with an unknown status) and a landfill (land disposal list) are noted on the Geo Tracker database as an open case. Aerojet is also listed on the Envirostor database as an open Federal Superfund site.

Contamination remaining at Aerojet today from past uses, which has generated the Superfund designation, includes petrochemical contamination of aquifers and soil from leaking underground storage tanks, spills (non-permitted discharges), the contamination of wells and groundwater due to volatile organic compounds and solvents (among other contaminants), and contamination from landfills on site. These cases remain open, as does the Federal Superfund listing.

LANDFILLS

Potential hazards to public health and safety can be associated with landfill operations. These hazards include spread of disease, risk of fire or explosion, exposure of humans to air-borne toxics, degradation of water quality, and human exposure to locally-confined hazardous or infectious wastes. Kiefer Landfill and other landfill sites within Sacramento County are fully permitted through California Department of Resources Recycling and Recovery (CalRecycle) and have plans in place to mitigate these dangers. Modern landfill design includes the placement of a several liners separating waste lifts (layers where any waste material having seeped through is pumped to the surface to treatment tanks). Also a flexible membrane liner is laid out beyond a drainage layer below the series of waste lifts (CIWMB, 2001).

There are ten landfills in Sacramento County, though not all of these are active. Plate HM-1 presents a map of the landfills in Sacramento County. Table HM-2 presents a status list of the landfills in closest proximity to the Project area (facilities 10, 11, and 25 on the map). In February 2008, County EMD staff (L. Todd) commented that the Aerojet Lagoon site on the map is gone and the Aerojet Plant 2 sites are part of the larger Aerojet site already mentioned (sites 5 – 7 on the map). The sites listed as “inspected closed site” (facilities 10 and 11 on the map) have been inspected by County EMD, and are no longer active. This leaves site 25, the Kiefer Landfill, as the only active site that warrants discussion. County-owned property associated with the landfill is adjacent to the southern project boundary, though the active landfill is several thousand feet away.

Plate HM-1: Solid Waste Landfill Sites in Sacramento County

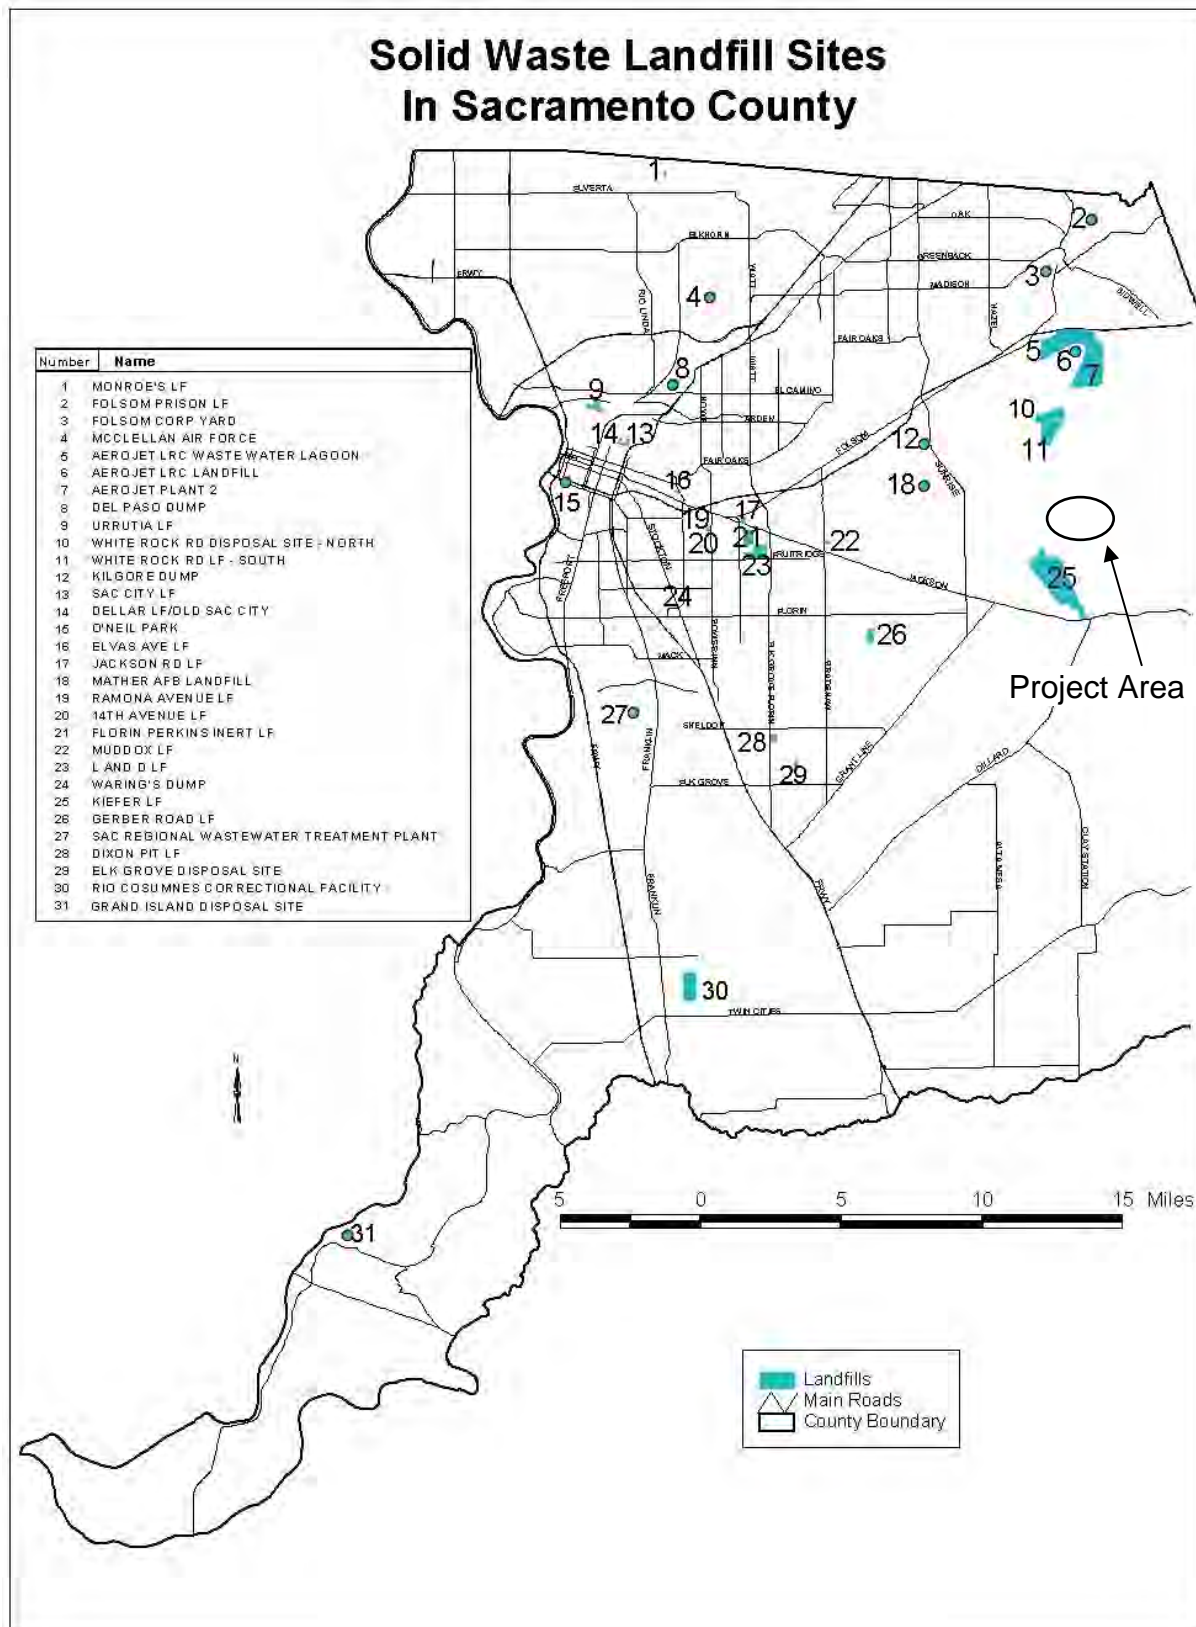

Table HM-2: Status of Landfills in the Project Vicinity

Landfill	Status
Kiefer Landfill	Open
White Rock – North	Inspected closed site
White Rock – South	Inspected closed site

SPILLS AND LEAKS

Spills and leaks can originate from aboveground and underground sources. Aboveground sources include aboveground storage tanks (ASTs) and pipelines. Aboveground spills and leaks are listed on the Regional Water Quality Control Board's (Regional Water Board) Geo Tracker as a SLIC site. As of late 2007, there are 172 SLIC sites listed within Sacramento County. This includes sites in the unincorporated county and cities. There are none listed within one mile of the site.

Spills and leaks originating from underground sources are from underground tanks, such as underground storage tanks (USTs) and underground fuel tanks (UFTs). USTs and UFTs are essentially the same since it is rare that underground tanks store something other than fuel. Geo Tracker groups leaking underground tanks with leaking underground fuel tanks in the Leaking Underground Fuel Tank category. As of late 2007, there are 1,389 LUFT sites listed within Sacramento County. There are none listed within one mile of the site.

REGULATORY SETTING

Throughout the United States including California, hazardous materials are regulated by a number of federal and state laws, most of which are promulgated by the United States Environmental Protection Agency (US EPA) and the California Environmental Protection Agency (Cal EPA). On the federal level, these regulations include the Resource Conservation and Recovery Act (RCRA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Clean Air and Clean Water acts, Safe Drinking Water Act, Hazardous Materials Transportation Act, and the Emergency Planning and Community Right-to-Know Act. Together, these regulations serve as guiding principles governing the storage, use, and transportation of hazardous and other regulated materials from their time of origin to their ultimate disposal. The cleanup and remediation of environmental contamination resulting from the accidental or unlawful release of these materials and substances are also governed by these regulations. Solid wastes that are not classifiable as hazardous are regulated under RCRA and pollution prevention is also regulated under the Clean Air, Clean Water, and Safe Drinking Water acts.

On the state level, Cal EPA's DTSC is responsible statewide for matters concerning the use, storage, transport, and disposal of hazardous materials. Cal EPA's Office of

Environmental Health Hazard Assessment (OEHHA) is involved in the evaluation of risks to public health and the environment posed by hazardous materials and environmental contamination. Cal EPA delegates much of the permitting, inspection, and enforcement responsibility for hazardous materials, hazardous waste, ASTs, USTs, and other related state programs to local governments under the Certified Unified Program Agency (CUPA) program.

County EMD is both the local Environmental Health regulatory agency and the County-wide Certified Unified Program Agency. County EMD is also the Local Oversight Program for UST site investigation, cleanup, and closure, and the Local Enforcement Agency (LEA) for landfills. The Central Valley Regional Water Quality Control Board (CVRWQCB) also has jurisdiction over the management of surface and groundwater contamination such as the cleanup of spill sites. Finally, the Sacramento Metropolitan Air Quality Management District (SMAQMD) is involved in the assessment of health and environmental hazards associated with both “criteria” and toxic (or hazardous) air pollutants.

2030 SACRAMENTO COUNTY GENERAL PLAN POLICIES

The Sacramento County General Plan Hazardous Materials Element provides a hazardous materials policy plan to manage hazardous materials and minimize their effects on humans and the environment. The General Plan policies include measures to educate and inform the public about hazardous waste management, implement public health and safety programs, and coordinate with other agencies to enforce hazardous materials regulations. The General Plan also provides details on emergency response plans for responding to hazardous material spills and other emergency actions.

The Sacramento County General Plan policies that are pertinent to Hazardous Materials are policies HM-1 through HM-15. These policies are intended to support the stated objectives of the Hazardous Materials Element of the General Plan. As presented in the element the objectives are as follows:

County-wide public awareness of all available hazardous material informational and disposal programs;

Protect the residents of Sacramento County from the effects of a hazardous material incident via the implementation of various public health and safety programs;

Coordinated efforts by the applicable regulatory agencies, thereby facilitating effective long-term hazardous materials management;

Enforce all federal, state, and local regulations and if necessary prosecute those cases involving the mismanagement of hazardous materials; and

The availability of reliable and solvent funding sources to augment hazardous materials management

The policies in the Hazardous Materials Element most applicable to the Project are as follows:

HM-4. The handling, storage, and transport of hazardous materials shall be conducted in a manner so as not to compromise public health and safety standards.

HM-8. Continue the effort to prevent ground water and soil contamination.

HM-9. Continue the effort to prevent surface water contamination.

SIGNIFICANCE CRITERIA

Pursuant to the CEQA Guidelines, the County of Sacramento considers impacts to hazards and hazardous materials to be significant if a project would:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment. Specific conditions include:
 - a. Location within 1,000 feet of a known contamination site
 - b. Location within 2,000 feet of a known "border zone property" (i.e., "Superfund" site) or a hazardous waste property subject to corrective action pursuant to applicable health and safety codes
 - c. Involve excavation at a Department of Toxic Substances Control closed site that could disturb contaminated soils
 - d. Location on or near an active or former landfill
 - e. Properties historically developed with industrial or commercial uses that involve dewatering in association with major excavation in an area of high groundwater
 - f. Emissions of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste within ¼ mile of an existing or proposed school
 - g. Location on a site that is included on a list of hazardous materials sites compiled pursuant to California Government Code Section 65962.5 and,

as a result, would create a significant hazard to the public or the environment

Significance criteria 1, 2c, 2e, and 2f are not applicable to the Project, because it does not involve the generation, transport, or emission of hazardous substances and was not historically developed with industrial or commercial uses. The analyses to follow focus on the proximity of proposed development areas to known hazardous sites or conditions.

METHODOLOGY

A review of two databases and two lists was conducted to assemble a list of hazardous materials storage and use, and known contaminated sites within the Project vicinity. Envirostor is a database maintained by the State DTSC and holds information on investigation, cleanup, permitting, and corrective actions that are planned, are being conducted, or have been completed under the DTSC's oversight. Envirostor was reviewed and a list of sites was generated. Geo Tracker is a second database that is maintained by the State Water Resources Control Board and tracks regulatory data about underground fuel tanks, fuel pipes, and public drinking water supplies. Toxic Site Clean-Up Site Specific Report (Toxic Site) is a County-generated and maintained list that shows a list of known contaminated sites. Finally, the County's Master List of Business Facilities identifies business in Sacramento County that store and use hazardous materials. Each of these databases lists sites with active, inactive, certified, de-listed, no further action, and refer to other agency statuses. A site that is listed as closed is one at which remediation and cleanup activities are complete.

In addition to the database review, an Environmental Site Assessment report and an All Appropriate Inquiries Report were prepared by Wallace Kuhl & Associates (WKA, dated April 14, 2005 and March 30, 2007, respectively). Between them, these reports cover the entire Project site, and are hereby incorporated by reference. These reports are available for review at

<http://www.dera.saccounty.net/PublicNotices/SQLView/ProjectDetails/tabid/71/Default.aspx?ProjectID=35697>. As part of the WKA report, databases administered by the following agencies were reviewed: United States EPA, California EPA, California Department of Toxic Substances Control, California Office of Environmental Health Hazard Assessment, Central Valley Regional Water Quality Control Board, Department of Resources Recycling and Recovery (formerly Integrated Waste Management Board), California State Water Resources Control Board, California Department of Health Services, California Office of Drinking Water, and Sacramento County Environmental Management Department.

IMPACTS AND ANALYSIS

IMPACT: ACCIDENTAL RELEASE DUE TO TRANSPORT, USE, OR DISPOSAL OF HAZARDOUS MATERIALS

Standard construction activities would require the use of hazardous materials such as fuels, oils, lubricants, glues, paints, paint thinners, soaps, bleach, and solvents. These are common household and commercial materials routinely used by both businesses and average members of the public alike. The materials would only pose a hazard if they are improperly used, stored, or transported either through upset conditions (e.g. an explosion) or mishandling. All persons involved in the handling of these hazardous materials are required to use, store, and transport hazardous materials in compliance with local, state, and federal regulations during project construction.

In addition to hazardous materials used during construction, the operational Project would result in the use, transport, and storage of materials that are considered hazardous. Increased transport would occur in response to commercial demand for the products within the Project development, and both residential and non-residential areas would use and store materials considered to be hazardous. Household hazardous materials include cleaners, pesticides, paints, lubricants, and similar items. Commercial uses would involve greater amounts and types of hazardous materials, including underground storage tanks associated with gas stations and automotive-related businesses. It is presumed that pharmacies and medical offices may also be developed, which would include the use of materials considered hazardous and the generation of medical wastes which are considered hazardous.

Regulations pertaining to transport of hazardous materials are codified in 49 CFR 171 – 180. These regulations provide definitions for hazardous materials, including a “hazard class” that requires the listing of each material type according to its major property (e.g. flammable solid). There are separate requirements for each stage of the transport process, including preparation of shipping paperwork, the appropriate labeling of shipping containers, the requirements specific to the shippers of the material, and the requirements specific to the carriers of the material. There are also categories of materials and packages that are prohibited from being shipped.

Hazardous materials transport regulations are enforced and monitored by the California Department of Transportation and the California Highway Patrol. All carriers and drivers involved in transportation of hazardous materials must apply for and obtain a hazardous materials transportation license from the California Highway Patrol. When transporting explosives and inhalation hazards, safe routing and safe stopping places are required, as described in 26 CCR Section 13 et seq. A route map must be carried in the vehicle. The purpose of these regulations is to reduce the likelihood of exposure to people and the environment.

Specifications for storage on a construction site are contained in various regulations and codes, including the California Code of Regulations, the Uniform Fire Code, and the California Health and Safety Code. Some of the relevant standards are:

- all reserve fuel supplies and hazardous materials must be stored within the confines of a designated construction area,
- equipment refueling and maintenance must take place only within the staging area,
- construction vehicles shall be inspected daily for leaks, and
- a Spill Prevention, Control, and Countermeasure plan shall be prepared and implemented.

In addition to the above regulations pertinent to storage and spill prevention requirements, workplace rules administered by the California Occupational Safety and Health Administration (enacted by the California Code of Regulations) ensure that the hazards of all chemicals are evaluated and that information concerning chemical hazards is transmitted to employees. This is accomplished by:

- container labeling and other warnings,
- Material Safety Data Sheets, and
- employee training.

All regulations and codes must be implemented, as appropriate, and are monitored by the agencies described above. Such compliance would reduce the potential for accidental release of hazardous materials during construction and operation of the proposed Project. As a result, it would lessen the risk of exposure of construction workers and employees to accidental release of hazardous materials, as well as the demand for incident emergency response.

The Environmental Compliance Division of EMD has been designated by the California Environmental Protection Agency as the Certified Unified Program Agency for Sacramento County. The role of the Certified Unified Program Agency is to implement six statewide environmental programs:

- underground storage of hazardous substances
- aboveground storage tanks (spill prevention and countermeasures)
- hazardous materials business plan requirements
- hazardous waste generator requirements
- California accidental release prevention program
- Uniform fire code hazardous materials management plan

Implementing the above includes the permitting and inspection of regulated facilities, providing educational guidance and notice of changing requirements, investigations of complaints regarding spills or unauthorized releases, and administrative enforcement actions levied against facilities that have violated applicable laws and regulations. Compliance with the above requirements, as monitored and enforced by EMD, lessens the risk of exposure of the general public to accidental release of hazardous materials.

Regulations pertinent to compounding, storing, and dispensing medicines and medical equipment such as needles are contained in the following: Title 16 of the California Code of Regulations section 1700 et. seq. and California Uniform Controlled Substances Act (Health and Safety Code 11000 et. seq.). These codes regulate how medicines may be legally supplied, compounded, stored, administered, and prescribed, as well as how to properly dispose of medicines and equipment such as needles.

For household materials use, all products offered for sale are required to be labeled appropriately to ensure safe use, storage, and disposal, and residents are required to use these materials consistent with labeling requirements. Laws regarding the safe disposal of hazardous materials apply to residents, just as they apply to businesses. The Sacramento County Department of Waste Management and Recycling operates multiple household hazardous waste drop-off locations, and also transports garbage collected from bins to the North Area Recovery Station, where household hazardous waste is separated for proper disposal.

Because construction and operation of the Project would implement and comply with federal, state, and local hazardous materials regulations and codes monitored by the state (e.g., California Occupational Safety and Health Administration, Department of Toxic Substances Control, California Highway Patrol, California Department of Transportation) and/or local jurisdictions (e.g., Sacramento Metropolitan Fire District and Sacramento County Environmental Management Department), impacts related to creation of significant hazards for construction workers, employees within the Project area, and the general public through routine transport, use, and disposal of hazardous materials would be unlikely; this impact is *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: PROXIMITY TO KNOWN CONTAMINATED SITES

There are three agency-listed contaminated sites within approximately one mile of the Project site. These include the Sacramento County Boys Ranch (a juvenile correction facility within 1,000 feet of the eastern Project boundary), Aerojet (located just over a mile to the northwest), and the Kiefer Landfill (located approximately 2,000 feet to the south). Each is discussed separately below.

SACRAMENTO COUNTY BOYS RANCH

The Boys Ranch is located adjacent to the eastern Project boundary. According to the WKA reports and review of the databases, the Boys Ranch experienced a hazardous material release from a leaking underground storage tank, but the tank was removed, the site was remediated, and the Boys Ranch received closure status from the Sacramento County Department of Environmental Management. Since the issue was remediated, Project approval would not result in the creation of a significant hazard to the public or the environment as it relates to the Boys Ranch property; impacts are *less than significant*.

AEROJET

This property is commonly called “Aerojet”, and will be described as such herein, but is also called the Boeing/McDonnell Douglas/Aerojet or the Inactive Rancho Cordova Test Site. The total Aerojet property extends from Highway 50 to a point approximately 1 ½ miles south of White Rock Road. Large portions of this property are no longer actively used as part of the company’s aerospace activities. Thus, although the Project site is just over one mile from the Aerojet property boundary, it is over three miles from the area of active use.

The Aerojet property is associated with potential and known contamination sites or conditions. This includes the former Administration Area near the intersection of Douglas Road and Grant Line Road (which contained a photographic laboratory, liquid oxygen laboratory and evaporation pond, manufacturing building, paint booth, vehicle checkout laboratory for flight simulations, and a drum storage area). The WKA report states that potential contaminants may include volatile organic compounds (VOCs), alcohols, metals, acids, bases, and possibly semi-volatile organic compounds. VOCs, kerosene, Freon-113, and several metals have been detected in the soils and groundwater beneath the Administration Area. Soil contamination is a hazard which is restricted to uses on the soil, so the analysis focuses on groundwater contamination.

The entire Aerojet Superfund site spans approximately 8,500 acres, and as a result spans multiple groundwater sheds which flow in different directions. None of the plumes are migrating in the direction of the Project¹. The WKA report indicates that the contaminated groundwater plumes located beneath the Administration Area have migrated southwesterly, away from the Project site. A Groundwater Extraction and Treatment Program (GET Program) **for the Administration Area** has been in place since 2002. **There are multiple GET wells throughout the Aerojet area, all of which are shown on the exhibit linked to footnote one, at the bottom of this page; the earliest of these became operational in 1982.** The purpose of the GET Program is to prevent further migration of the contaminated groundwater plume. Even if the GET

¹ US EPA Fact Sheet (2006)

[http://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/3dc283e6c5d6056f88257426007417a2/a87b19cbf8bd29738825784f0005767e/\\$FILE/Aerojet2006-09.pdf](http://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/3dc283e6c5d6056f88257426007417a2/a87b19cbf8bd29738825784f0005767e/$FILE/Aerojet2006-09.pdf)

Program were to cease functioning, the WKA report indicates that the Project site is not directly in the pathway of the plume **from the Administration Area**. Given that the plume migration path has been to the southwest of the contaminated site, away from the Project site, completion of the Project would not create a significant hazard to the public or the environment as it relates to the Aerojet property; impacts are *less than significant*.

KIEFER LANDFILL

IMPACTS TO THE PROJECT

Sacramento County owns and operates the Kiefer Landfill, which is the primary solid waste disposal facility in the County. Kiefer Landfill is a total of 1,084 acres in size, with a permitted disposal area of 660 acres. Kiefer Landfill is classified as a Class III municipal solid waste landfill facility and is permitted to accept general residential, commercial, and industrial refuse for disposal, including municipal solid waste, construction and demolition debris, green materials, agricultural debris, and other nonhazardous designated debris.

Sacramento County established a 2,000-foot buffer zone intended to prevent the encroachment of incompatible uses on the landfill. The proposed Project sports park is partially within this buffer, but the University/College Campus Center and all of the residential and commercial land uses are outside of the buffer.

The Kiefer landfill is not merely a single excavated pit that is gradually filled; it is operated in phases as a series of pits, or modules, that are each excavated, filled, and closed before moving on to the next module in the overall landfill plan. According to the WKA report, groundwater contamination from Kiefer landfill was first detected in 1987, and the source of this contamination is "Module M-1". Module M-1 is over 45 years old, and is unlined. As a result, the Sacramento County Department of Waste Management and Recycling indicates that Module M-1 has released VOCs into the groundwater and soils.

In 1995, the Sacramento County Department of Waste Management and Recycling installed a groundwater extraction system, including several extraction wells and a pump and treat system. Groundwater is currently extracted from 14 wells at a combined average rate of about 1,000 gallons per minute. The system includes two air stripper towers, a carbon absorption filter, and several extraction wells. Pump and treat remediation began in April 1995, with the objective of containing the spread of the plume and reducing volatile organic compound (VOC) levels in the source area. According to the monitoring reports submitted by the DWMR through 2006, groundwater extraction has removed over 700 pounds of VOCs from the groundwater since 1995, and resulted in an approximate 75 percent reduction in mass of VOCs in the groundwater. Treated groundwater is discharged to Deer Creek under National Pollutant Discharge Elimination System (NPDES) Permit No. CA0083681. (Source: Kiefer Bufferlands Land Use and Feasibility Analysis Final Report, March 2008, Environmental Stewardship and Planning)

Based on the above information, the groundwater contamination is being effectively contained, and even in absence of containment has been migrating in a southwesterly direction, away from the Project site. Furthermore, the potable water needs for the residential and commercial components of the Project will not be met through extraction of local groundwater, but will be served by the Sacramento County Water Agency. Completion of the Project would not expose Project residents or visitors to a significant hazard as it relates to contaminated groundwater; impacts to the Project are *less than significant*.

IMPACT: PROXIMITY TO KNOWN HAZARDOUS CONDITIONS

The Kiefer landfill is associated with known groundwater and soil contamination by VOCs migrating from Module M1. VOCs in soils and groundwater can collect underneath the ground surface and filter upward and become trapped within the airspace of enclosed areas, including buildings; this is also true of methane gas, which is another common byproduct of landfills. These gases are both potentially toxic and explosive, and therefore pose a hazard.

In 1997, the Sacramento County Department of Waste Management and Recycling installed a landfill gas (LFG) control system. The system includes a gas flaring facility and an LFG-to-energy plant with a combined extraction rate capability of 10,500 standard cubic feet per minute. Module M1 is connected to the system via vertical extraction wells. Limited landfill gas extraction is also performed to remediate pockets of gas that still exist in the subsurface outside of the landfill modules. (Source: Kiefer Bufferlands Land Use and Feasibility Analysis Final Report, March 2008, Environmental Stewardship and Planning)

Existing evidence from monitoring wells indicates that landfill gas is not present in the Project area (Erik Vanderbilt, Sacramento County Department of Environmental Management, phone call on September 22, 2010). This finding is supported by the lack of groundwater contamination north of the site. Although future landfill modules will be located to the north of the existing active landfill, which will bring buried waste closer to the Project site, these new modules will be lined to help prevent contaminant and gas migration. Furthermore, with the exception of the open-air sports park all of the Project uses will be outside of the 2,000-foot buffer around the landfill. The purpose of this buffer is to delineate a reasonable protective boundary around the landfill, outside of which appropriate development may occur. Nonetheless, given the existing gas migration Sacramento County Department of Environmental Management staff submitted a comment letter as part of the Notice of Preparation recommending the following:

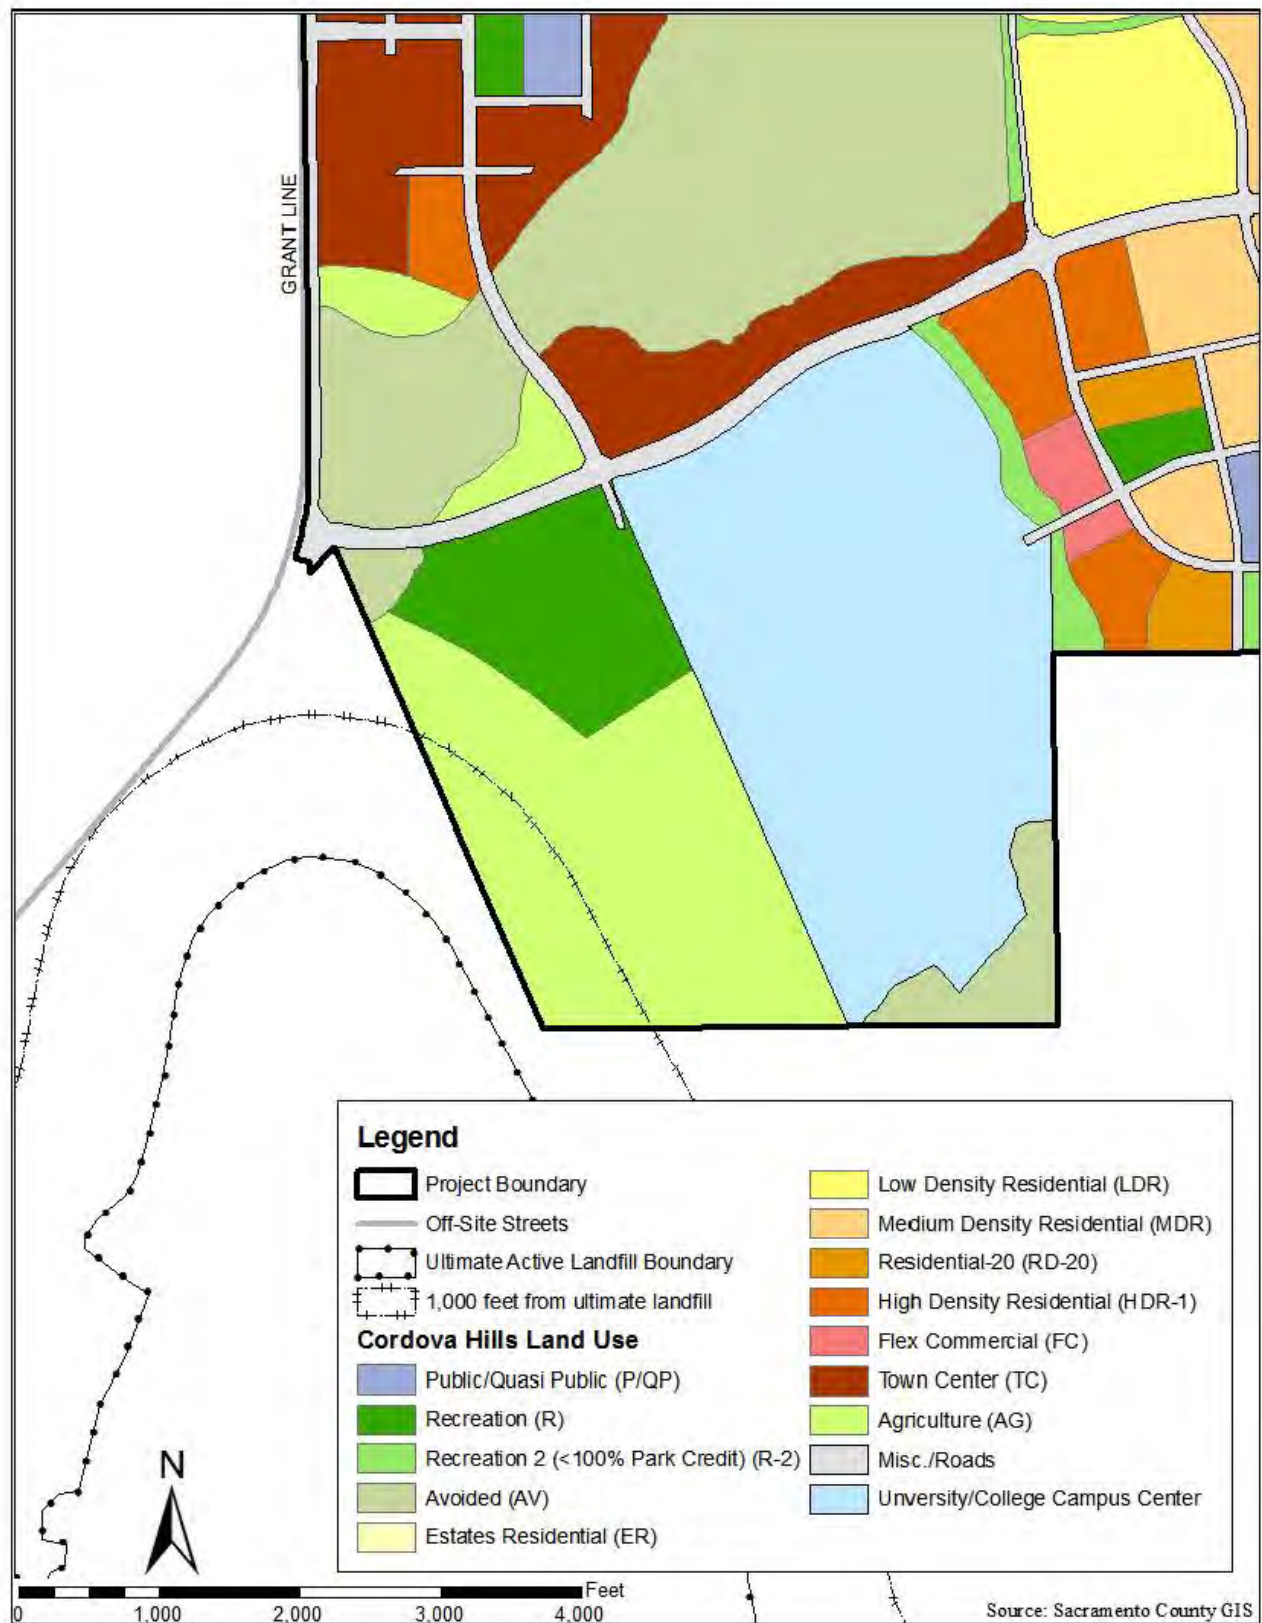

Any structure within the project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety or the environment) within 1000 feet of buried waste or proposed buried waste should be continuously monitored for landfill gas and adhere

to stricter construction standards to prevent landfill gas accumulation in those structures.

Only a small portion of the Project area is within 1,000 feet of the ultimate active landfill boundary (Plate HM-2), and this area is outside of the Urban Services Boundary and is designated Agriculture by the SPA. No residential structures or commercial structures are permitted within the Agriculture designation, so the Project is not expected to result in hazards affecting a substantial number of people. Nonetheless, the above is included as a recommended mitigation measure to ensure that residents and visitors to the Project site will not be exposed to a significant hazard as it relates to landfill gas migration; with mitigation, impacts are *less than significant*.

MITIGATION MEASURES:

- HM-1.** Any structure within the project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety or the environment) within 1000 feet of buried waste or proposed buried waste at Kiefer Landfill (refer to Plate HM-2 of the EIR) shall be continuously monitored **by the owner/operator of said structure** for landfill gas and be designed and constructed to prevent landfill gas accumulation in those structures.

Plate HM-2: Property Within 1,000 Feet of the Ultimate Landfill Boundary

IMPACT: PRESENCE OF ONSITE HAZARDOUS MATERIALS OR CONDITIONS

The Project area has historically been used for grazing and has not undergone any significant development. A search of the various contaminated site databases shows that there are no listed toxic sites either within or immediately adjacent to the area. Though the area has been used for agricultural purposes, it has been used as grazing land, not for crops. Unlike croplands, pesticides and fertilizers are not typically used on grazing lands, nor are petrochemicals or other toxic materials stored on the site. The WKA reports included a review of United States Geological Survey topographic maps of the area dating back to 1916. None of these maps show any large manufacturing facilities, industrial ponds, large above-ground storage tanks, airfields, mining-related features, or other features that could indicate potential contaminated conditions. Therefore, the potential for the area to contain undiscovered toxic materials either in the form of buried tanks or soil contamination is low.

According to the WKA report, the Project site contains seven cased water supply wells and possibly one hand-dug well identified as a collapsed circular depression on the central portion of the property. If there is no intent to use these wells, they must be properly destroyed in accordance with Sacramento County Code, Section 6.28.040.B. The property may also contain a private septic system or outhouse pit at the old homestead site, though the WKA report indicates that no such features were directly observed. If a septic system is present, it will need to be properly abandoned in accordance with Section 722 of the Uniform Plumbing Code. Lastly, there are two minor features of unknown origin on the site: two square pits. These could be prospect or mine related, but the features are small, healthy plants are growing over and within the pits, and there is no evidence of stained or odiferous soils. For these reasons, the potential for these features to involve contamination is minimal.

Based on the above analysis, there is no evidence of any recognized hazardous conditions that may have a significant adverse effect on the development of the Project site. Though there are existing wells, potentially a septic system, and two minor features on the site that are likely to require closure prior to development, the application of current laws and regulations will ensure that any of these features are identified and properly addressed prior to development. Existing regulations and programs will ensure that development in the Cordova Hills area does not expose people to a significant hazard associated with proximity to hazardous materials or contaminates sites. Impacts are *less than significant*.

MITIGATION MEASURES:

None recommended.

IMPACT: ASBESTOS OR LEAD EXPOSURE THROUGH RENOVATION OR
DEMOLITION OF EXISTING STRUCTURES

There are no existing buildings within the Project site, so there is no risk related to asbestos or lead exposure from changes to existing structures; impacts are *less than significant*.

MITIGATION MEASURES:

None recommended.

11 HYDROLOGY AND WATER QUALITY

INTRODUCTION

This chapter addresses the effects of development consistent with the Project relative to the hydrologic characteristics of the site and vicinity. There are many design standards, policies, and regulations that protect our water from pollution and our communities from flooding. An overview of pertinent regulations is important to include in this analysis; however, to prepare a concise report, the following documents are hereby incorporated by reference, and are available for review at 827 7th Street, Room 220, Sacramento:

- Stormwater Quality Design Manual for the Sacramento and South Placer Regions, May 2007.
- Sacramento County Improvement Standards
- Sacramento County Volume 2 Hydrology Standards
- Sacramento County Floodplain Management Ordinance
- Sacramento County Code 16.44 (Land Grading and Erosion Control)

HYDROLOGIC AND HYDRAULIC SETTING

The Project site is within the Laguna Creek, Deer Creek, and Carson Creek watersheds. Very little of the site is within mapped 100-year floodplain areas (Plate HY-1). There are three primary ephemeral drainages on the Project site that feed into Laguna Creek, Deer Creek, and Carson Creek. The intermittent drainage on the western side of the site connects to Upper Laguna Creek, which begins approximately 1.5 miles to the north of the site. Carson Creek lies along the eastern property boundary, and flows into Deer Creek approximately 1.5 miles south of the site. Deer Creek flows into the Cosumnes River, approximately 2.5 miles south of the site. There is an ephemeral drainage that extends through the approximate center of the site which flows into Deer Creek, and another ephemeral drainage on the eastern side of the site that flows into Carson Creek.

Plate HY-1: 100-Year Floodplain in Project Vicinity

REGULATORY FRAMEWORK

2030 SACRAMENTO COUNTY GENERAL PLAN

The General Plan includes multiple Elements containing policies relevant to flooding and water quality: the Agriculture Element, Circulation Element, Conservation Element, and Safety Element. There are many policies within each Element, but the policies of greatest relevance to the Project are included below.

AG-29. The County shall minimize flood risks to agricultural lands resulting from new urban developments by:

- Requiring that such developments incorporate adequate runoff control structures and/or
- Assisting implementing comprehensive drainage management plans to mitigate increased risks of farmland flooding resulting from such developments.

CI-65. Incorporate Low Impact Design (LID) techniques to the greatest extent feasible to improve water quality runoff and erosion control, infiltration, groundwater recharge, visual aesthetics, etc. LID techniques may include but are not limited to:

- Bioretention techniques, such as filtration strips, swales, and tree box filters
- Permeable Hardscape
- Green roofs
- Erosion and sediment controls
- Reduced street and lane widths where appropriate

CO-24. Comply with the Sacramento Areawide National Pollutant Discharge Elimination System Municipal Stormwater Permit (NPDES Municipal Permit) or subsequent permits, issued by the Central Valley Regional Water Quality Control Board (Regional Board) to the County, and the Cities of Sacramento, Elk Grove, Citrus Heights, Folsom, Rancho Cordova, and Galt (collectively known as the Sacramento Stormwater Quality Partnership [SSQP]).

CO-26. Protect areas susceptible to erosion, natural water bodies, and natural drainage systems.

CO-28. Comply with other water quality regulations and NPDES permits as they apply to County projects or activities, such as the State's Construction General Permit and Aquatic Pesticides Permit.

CO-30. Require development projects to comply with the County's stormwater development/design standards, including hydromodification management and low impact development standards, established pursuant to the NPDES Municipal Permit.

CO-31. Require property owners to maintain all required stormwater measures to ensure proper performance for the life of the project.

CO-93. Discourage fill in the 100-year floodplain (Please also refer to CO-117).

CO-94. Development within the 100-year floodplain and designated floodway of Sacramento streams, sloughs, creeks or rivers shall be:

- Consistent with policies to protect wetlands and riparian areas; and
- Limited to land uses that can support seasonal inundation.

CO-107. Maintain and protect natural function of channels in developed, newly developing, and rural areas.

CO-114. Protect stream corridors to enhance water quality, provide public amenities, maintain flood control objectives, preserve and enhance habitat, and offer recreational and educational opportunities.

CO-117. Public roads, parking, and associated fill slopes shall be located outside of the stream corridor, except at stream crossings and for purposes of extending or setting back levees. The construction of public roads and parking should utilize structural materials to facilitate permeability. Crossings shall be minimized and be aesthetically compatible with naturalistic values of the stream channel.

CO-118. Development adjacent to waterways should protect the water conveyance of the system, while preserving and enhancing the riparian habitat and its function.

CO-126. Prohibit obstruction or underground diversion of natural waterways.

SA-5. A comprehensive drainage plan for major planning efforts shall be prepared for streams and their tributaries prior to any development within the 100-year floodplain defined by full watershed development without channel modifications. The plan shall:

- a. Determine the future 100-year flood elevations associated with planned and full development of the watershed;
- b. Determine the future 100-year floodplain boundaries for both flood elevations (planned and full development) based on minimum 2-foot contour intervals;
- c. Assess the feasibility of gravity drainage into the existing flowline of the stream;

- d. Assess the feasibility of alternative means of drainage into the stream;
 - e. Identify potential locations for sedimentation ponds and other stormwater treatment facilities;
 - f. Determine practical channel improvements and/or detention basins to provide the flood control needs of the proposed development;
 - g. Determine the location and extent of marsh, vernal pool and riparian habitat;
 - h. Develop measures for protecting and mitigating natural habitat;
 - i. Develop measures for protecting and mitigating for federal and state listed endangered species;
 - j. Develop and ensure implementation of measures that would reduce vector larvae;
 - k. Identify appropriate plant species to be included as part of the natural features of the comprehensive drainage plan.
- SA-10. Fill within the 100-year floodplain of creeks outside of the Urban Service Boundary is permissible to accommodate structures (e.g., residential, commercial, accessory) and septic systems, and only when the Board of Supervisors finds that the fill will not impede water flows or storm runoff capacity. Such development shall not cause an increase in base flood elevation of the 100-year floodplain exceeding 0.10 feet, unless analysis clearly indicated that the physical and/or economic use of adjacent property within the floodplain will not be adversely affected. A permit is required if the fill is within the jurisdiction of the Central Valley Flood Protection Board.
- SA-14. The County shall require, when deemed to be physically or ecologically necessary, all new urban development and redevelopment projects to incorporate runoff control measures to minimize peak flows of runoff and/or assist in financing or otherwise implementing Comprehensive Drainage Plans.
- SA-16. Deny creation of parcels that do not have buildable areas outside the 100-year floodplain unless otherwise allowed in the Floodplain Management Ordinance.
- SA-17. For residential zoning, the area outside the 100-year floodplain must be contiguous or reasonably situated to provide buildable area for a residence and associated structures. Examples of structures include swimming pools, sheds, barns, detached garages, and other outbuildings that are normally associated with residential development. There may be exceptions (such as the Delta area) as allowed in the Floodplain Management Ordinance.
- SA-18. Vehicular access to the buildable area of newly created parcels must be at or above the 10-year flood elevation. Exceptions may be made when the existing

public street from which access is obtained is below the 10-year flood elevation. There may be exceptions (such as the Delta area) as allowed in the Floodplain Management Ordinance.

- SA-22. Areas within a 100-year floodplain shall not be upzoned to a more intensive use unless and until a Master Drainage Plan is prepared that identifies areas of the floodplain that may be developed.

FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA)

FEMA maintains and updates the National Flood Insurance Program maps, called the Federal Insurance Rate Maps (FIRM), that define areas of federal flood hazard. In Sacramento County and elsewhere the floodplains are identified based on U.S. Army Corps of Engineers (Army Corps) studies. FIRM maps denote the location of the federal 100-year flood area, 500-year flood area, and the Base Flood Elevation. In a 100-year floodplain, there is a 1% chance of flooding in a given year, and in a 500-year floodplain, there is a 0.2% chance of flooding in a given year. If an area is within a 100-year floodplain, flood insurance is required by most mortgage companies. FEMA is also responsible for the accreditation of levee systems (certification is by the Army Corps).

Not all 100-year floodplains are mapped by FEMA, because the focus of the FEMA FIRM maps is to provide information for insurance programs. Areas that have very little development that would be at risk from flooding, such as rural areas and wilderness areas, typically are not mapped (the proposed Project area is unmapped by FEMA for this reason). In Sacramento County, some of the rural areas of the eastern part of the County with watersheds that are generally less than 1 square mile in size have not been mapped by FEMA. Areas not mapped by FEMA, or areas where there are additional site-specific constraints that change the shape of the floodplain, are referred to as local floodplains in this EIR.

SACRAMENTO COUNTY DEPARTMENT OF WATER RESOURCES

As discussed in the Regulatory Setting section, not all floodplains are mapped by FEMA. Though not mapped by FEMA, many local 100-year floodplains have been identified by the Sacramento County Department of Water Resources (County DWR). Local floodplains in the County are typically mapped either in response to an area having flooding problems, or in response to a request by a property owner to make modifications to their parcel. In such circumstances, County DWR staff investigate the property and either decide if there is sufficient existing information to determine the floodplain elevation on the property or that a drainage study is required before a determination can be made. Floodplains, whether local or FEMA, are regulated by the provisions of the Sacramento County Floodplain Management Ordinance, Improvement Standards, and Local Floodplain Management Plan.

WATER QUALITY LEGISLATION

Government agencies regulate potential impacts to water quality in order to comply with legislative acts such as: the Clean Water Act (CWA), the Porter-Cologne Water Quality Act (Porter-Cologne), the Rivers and Harbors Act, and the California Environmental Quality Act (CEQA). The Clean Water Act contributes to the dramatic improvement of surface water bodies in the United States. The Rivers and Harbors Act prevents obstructions to navigation, including dumping of trash and sewage. CEQA prevents avoidable damage to water quality by requiring changes in projects through the use of alternatives or mitigation measures [15002(a)(3)]. Coordinated efforts by the following agencies protect water supplies from degradation:

- County of Sacramento
- Sacramento Area Flood Control Agency (SAFCA)
- California Department of Fish and Game (Fish and Game)
- State Water Resources Control Board (State Water Board)
- Regional Water Quality Control Board (Regional Water Board)
- State Lands Commission
- U.S. Coast Guard (Coast Guard)
- National Park Service (NPS)
- State Department of Water Resources Reclamation Board
- U.S. Army Corps of Engineers (Army Corps)

STREAMBED ALTERATION

Section 1603 of the Fish and Game Code requires applicants to notify Fish and Game before beginning a project if the project will substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake or use materials from a streambed. Notification is generally required for any project that will take place in the vicinity of a river, stream, or lake. The recommendations of Fish and Game may include steps to protect water quality.

PORTER-COLOGNE WATER QUALITY ACT

Porter-Cologne is enacted as part of the California Water Code, and is intended to protect the quality of waters within the State. Porter-Cologne covers many of the same issues as the Federal Clean Water Act (see below), but is specific to the needs and objectives of the State. Waters protected by the Clean Water Act must be navigable or hydrologically connected to navigable waters, whereas Porter-Cologne protects non-navigable, or “isolated”, waters. The State Water Resources Control Board (Water Board) and the Regional Water Quality Control Boards (Regional Water Board) are responsible for the coordination and control of water quality protection efforts related to Porter-Cologne. **Porter-Cologne requires each Regional Water Board to prepare and adopt a Basin Plan. According to Section 13050 of the California Water Code, Basin Plans consist of a designation or establishment for the waters within a**

specified area of beneficial uses to be protected, water quality objectives to protect those uses, and a program of implementation needed for achieving the objectives.

The Basin Plan for the Sacramento River and the San Joaquin River Basin (October 2011) identifies the following as the beneficial uses of waters within the basin (not all are applicable to every water body): municipal water supply, agricultural water supply, industrial water supply, recreation, freshwater habitat, fish migration, fish spawning, wildlife habitat, and navigation. The “Implementation” section of the Basin Plan describes the various mechanisms used by the Regional Water Board to ensure that Basin Plan standards and policies are achieved. Mechanisms which are most germane to the discussion of this Project’s impacts include: municipal and industrial National Pollutant Discharge Elimination System permits, construction National Pollutant Discharge Elimination System permits, and the 303(d) listing of impaired waters. All of these implementation mechanisms are described in sections which follow, and the Project’s impact related to these are analyzed.

CLEAN WATER ACT

The Clean Water Act (CWA) is the Federal regulation covering surface water quality – it does not address either groundwater or water quantity. Surface waters protected by the CWA must either be navigable or hydrologically connected to a navigable water. The provisions of the CWA are administered and regulated primarily by the Environmental Protection Agency (EPA), the California EPA (Cal EPA), the Army Corps, and the State and Regional Water Boards. Under the “umbrella” of Cal EPA, the State and Regional Water Boards are responsible for administration of the National Pollutant Discharge Elimination System program, which deals with stormwater pollution from construction, industrial areas, and municipal areas. The Army Corps is responsible for issuance of the CWA Section 404 permit, which deals with the discharge of dredged or fill material in a surface water, and the State and Regional Water Boards are responsible for issuance of the CWA Section 401 permit, which covers the same activity. Section 303(d) of the Clean Water Act (CWA) also requires States to identify waters that do not meet water quality standards, and to develop plans to address polluted water bodies on the 303(d) list (called Total Maximum Daily Load plans, or TMDLs).

STORMWATER POLLUTION AND EROSION CONTROL

Section 402 of the CWA established the National Pollutant Discharge Elimination System (NPDES) permit program to prohibit the unauthorized discharge of pollutants from a point source to U.S. waters. The County of Sacramento has obtained a Municipal Stormwater NPDES permit from the Central Valley Regional Water Quality Control Board under the requirements of the Clean Water Act, to reduce pollutants found in urban stormwater runoff to the maximum extent practicable. The County complies with this permit by developing and enforcing ordinances and requirements to

reduce the discharge of sediments and other pollutants in runoff from areas within the County.

Sacramento County must verify compliance with permit requirements by monitoring effluent, maintaining records, and filing periodic reports. A provision of the NPDES permit is the requirement that Sacramento County develop a Construction Site Management Program. The Construction Site Management Program is intended to help protect the water quality of surface waters by minimizing the amount of sediment runoff from a construction site. This is accomplished by enforcement of the existing County Land Grading and Erosion Control Ordinance.

The County has established a Stormwater Ordinance (Sacramento County Code 15.12). The Stormwater Ordinance prohibits the discharge of unauthorized non-stormwater to the County's stormwater conveyance system and local creeks. It applies to all private and public projects in the County, regardless of size or land use type. In addition, Sacramento County Code 16.44 (Land Grading and Erosion Control) requires private construction sites disturbing one or more acres or moving 350 cubic yards or more of earthen material to obtain a grading permit. To obtain a grading permit, project proponents must prepare and submit for approval an Erosion and Sediment Control (ESC) Plan describing erosion and sediment control best management practices (BMPs) that will be implemented during construction to prevent sediment from leaving the site and entering the County's storm drain system or local receiving waters. Construction projects not subject to SCC 16.44 are subject to the Stormwater Ordinance (SCC 15.12) described above.

In addition to complying with the County's ordinances and requirements, construction sites disturbing one or more acres are required to comply with the State's General Stormwater Permit for Construction Activities. The Construction General Permit is issued by the State Water Resources Control Board (<http://www.waterboards.ca.gov/stormwtr/construction.html>) and enforced by the Regional Board. Coverage is obtained by submitting a Notice of Intent (NOI) to the State Board prior to construction. The General Permit requires preparation and implementation of a site-specific Stormwater Pollution Prevention Plan (SWPPP) that must be kept on site at all times during construction for review.

Applicable projects applying for a County grading permit must show proof that a NOI has been filed and must submit a copy of the SWPPP. Although the County has no enforcement authority related to the Construction General Permit, the County is required by its Municipal Stormwater Permit (Order Number R5-2008-0142) to verify that the SWPPP program includes six minimum components (public education and outreach on storm water impacts, public involvement participation, illicit discharge detection and elimination, construction site storm water runoff control, post-construction storm water management in new development and redevelopment, and pollution prevention/good housekeeping for municipal operations).

In addition to the above construction controls, new development is required to include treatment of urban runoff using the BMPs required by the current standard defined in

the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions, 2007*. The BMPs include a number of options for treatment including simple grassy swales and rain gardens, to more complex systems that use cisterns, pumps, and sand filters. Updates and background on the County's requirements for post-construction stormwater quality treatment controls, along with several downloadable publications, can be found at the following websites:

<http://www.msa.saccounty.net/sactostormwater/SSQP/development.asp>

<http://www.sactostormwater.org/newdevelopment.asp>

SIGNIFICANCE CRITERIA

According to the CEQA Guidelines, impacts may be significant if the Project results in one of the following:

1. A violation of any water quality standard or waste discharge requirement.
2. A substantial alteration of the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion, siltation, and/or environmental harm on- or off-site (hydromodification).
3. Creation or contribution of runoff water that would provide substantial additional sources of polluted runoff. Changes in water quality would be considered substantial if the Project will not comply with the County NPDES Program, or there is a net increase in any other pollution source associated with an impaired waterway (under Section 303d of the Clean Water Act).
4. Substantial increase to the rate or amount of surface runoff in a manner that would result in flooding on- or off-site.
5. Creation or contribution of runoff water that would exceed the capacity of existing or planned stormwater drainage systems.
6. Placement of housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map, or other flood hazard delineation map.
7. Placement of structures within a 100-year flood hazard area that would impede or redirect flood flows.
8. Exposure of people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of a failure of a levee or dam.

STUDY AREA

The Project is within the Laguna Creek, Deer Creek, and Carson Creek watersheds. A watershed is an area of land in which all of the surface water drains to the same waterway. For the purposes of this analysis, the entire watershed of a given creek need not be studied. Sufficient watershed area upstream and downstream of the site must be captured in order to ensure that the analysis properly models flows coming through the site and to capture the limits of any upstream or downstream impacts the Project may cause. The study area for the Project included 4,495 acres of land within the affected watersheds, as shown in Plate HY-2. In the exhibit, the Laguna Creek watershed has been further divided into an upper and lower watershed, to reflect the two different tributaries in the study area.

METHODOLOGY

HYDROLOGY

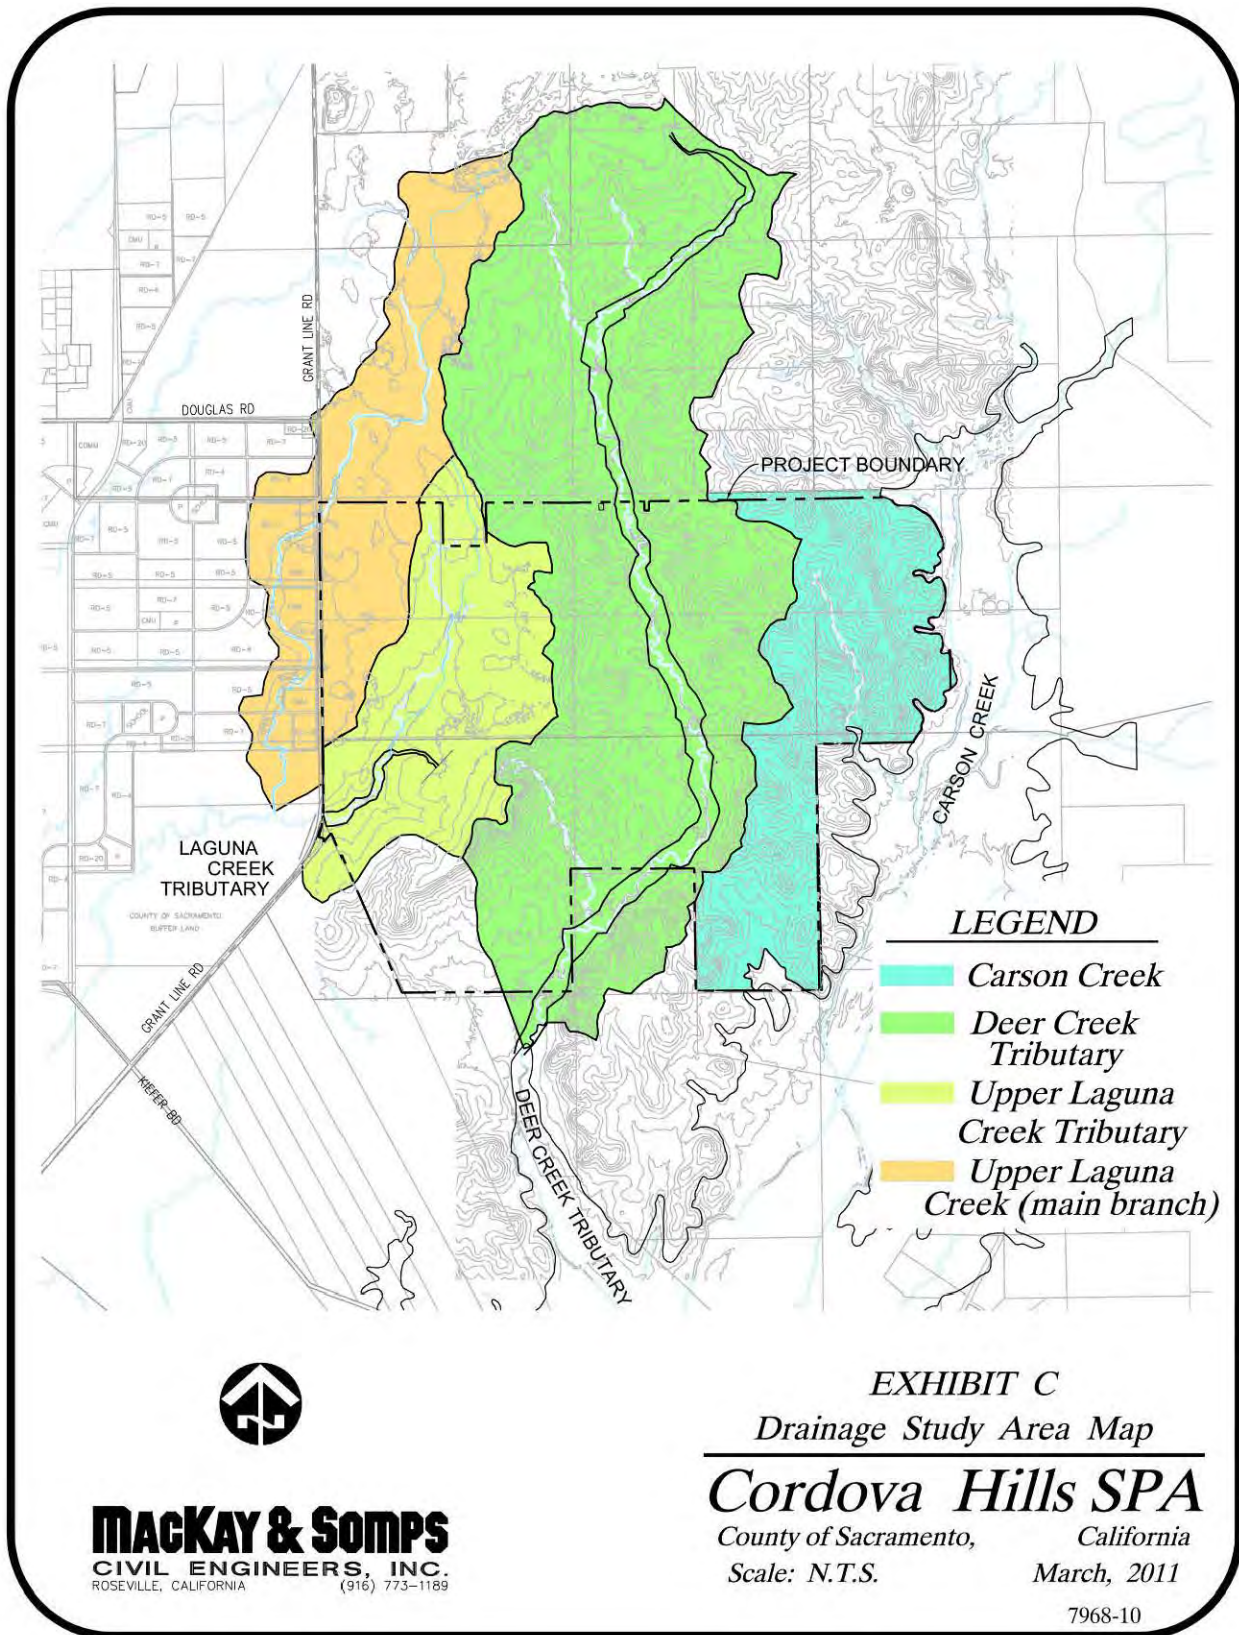

MacKay and Soms Civil Engineers, Inc. prepared a Drainage Master Plan (dated May 31, 2011 and included as Appendix HY-1. The Drainage Master Plan was prepared in accordance with the Sacramento County Improvement Standards, Hydrology Standards, and the Floodplain Management Ordinance, and was reviewed and approved as technically adequate by the Sacramento County Department of Water Resources. Runoff hydrographs for existing and developed conditions needed for input into the HEC-RAS model have been calculated using a Windows based application called the Sacramento Calculator (SacCalc) with what is commonly referred to as “the Sacramento Method”. Hydraulic analyses for water surface elevation assessment purposes have been performed using version 4.1 of the US Army Corps of Engineers HEC-RAS program, using the unsteady state routines.

The on-site sheds which are tributary to Carson Creek constitute only a very small portion of the much larger overall Carson Creek basin, so it was deemed impracticable to prepare detailed hydraulic models of Carson Creek. For these sheds, only SacCalc models for pre- and post-development conditions were run to establish peak runoff rates and associated detention and water quality volumes required for mitigation.

Also note that in the developed Project site analysis, the initial analysis of the Deer Creek tributary watershed resulted in lower peak flows leaving the site than the existing condition analysis. It was determined to be the result of hydrograph timing differences. To resolve the issue and to ensure that the proper Project detention requirements were included, a hypothetical buildout scenario was included in the model for the area north of the Project. Though this is speculative, it was determined to be appropriate under the circumstances in order to create a more conservative analysis. This assumption is consistent with ultimate long-term planning documents, such as the City of Rancho Cordova General Plan and the Draft 2030 Sacramento County General Plan. It was

assumed in the model that the Deer Creek Tributary watershed study area north of the site was 50% impermeable surfaces under post-development conditions, consistent with the requirements outlines in the Sacramento County Volume 2 Hydrology Standards.

Plate HY-2: Hydrologic Study Area

HYDROMODIFICATION

The Drainage Master Plan also includes a hydromodification assessment which examines the hydrologic and geomorphic impact of the Project relative to existing conditions of Laguna Creek, Deer Creek, and Carson Creek watersheds.

Hydromodification refers to changes in a watercourse's physical structure and/or pre-development function. Stream channels change over time, but ultimately reach a dynamic equilibrium, which essentially means that although individual characteristics of the stream change, these balance each other out so that no net change in character (profile and pattern) results. Hydromodification occurs when the variables which created the current stream function (precipitation and the character of the surrounding watershed) are changed. Changes to the watershed which occur as a result of development alter the rate and volume of runoff, which exerts new erosive forces on the channel.

As described in Appendix B of the Drainage Master Plan, there are various recognized stages of stream channel modification. When water discharge is increased, the channel begins to incise (deepen). Incision continues until hardpan is reached or the channel banks become too steep and collapse into the channel, which initiates the channel widening phase. During this time, discharge volumes that would normally overtop the banks and inundate the floodplain (the 2-year storm event, which has a 50% chance of occurring in any year) are retained in the channel, which helps erode the channel even further. Ultimately, the channel reaches a width and depth that causes flows to slow and erosive forces to reduce, and a new floodplain forms at a lower elevation than the original. Vegetation begins to establish as the floodplain becomes reconnected to the channel, and the stream begins to stabilize and reach dynamic equilibrium.

To assess the long-term hydrologic conditions in the watershed, a long-term, continuous simulation which used a 49-year precipitation record (with 1-hour interval precipitation) was used in the HEC-HMS model. To determine the total amount of erosive forces that existing and proposed conditions' runoff exert on the receiving waters, the annualized hydrograph (a plot of the variation of discharge with respect to time) was then processed using Mike11 modeling software and the geo-referenced cross sections out of the HEC-RAS model. The total erosive force resulting from post-development runoff hydrographs was then compared to that resulting from the existing conditions hydrographs in order to establish Project-related detention needs, consistent with policies CO-26 and CO-30.

WATER QUALITY

For water quality impacts resulting from the deposition of pollutants in the watersheds, the effects of the Project have been examined based on the known pollutant types that occur from completed projects of this kind; the existing pollutant loads within Laguna, Deer, and Carson Creeks (as determined from the 303d list of polluted waterways); and the available control mechanisms for pollutants. The Drainage Master Plan for the Project included an assessment of detention needs for water quality treatment, which involves proposals to construct wet water quality treatment basins.

EXISTING CONDITIONS

OVERALL SITE

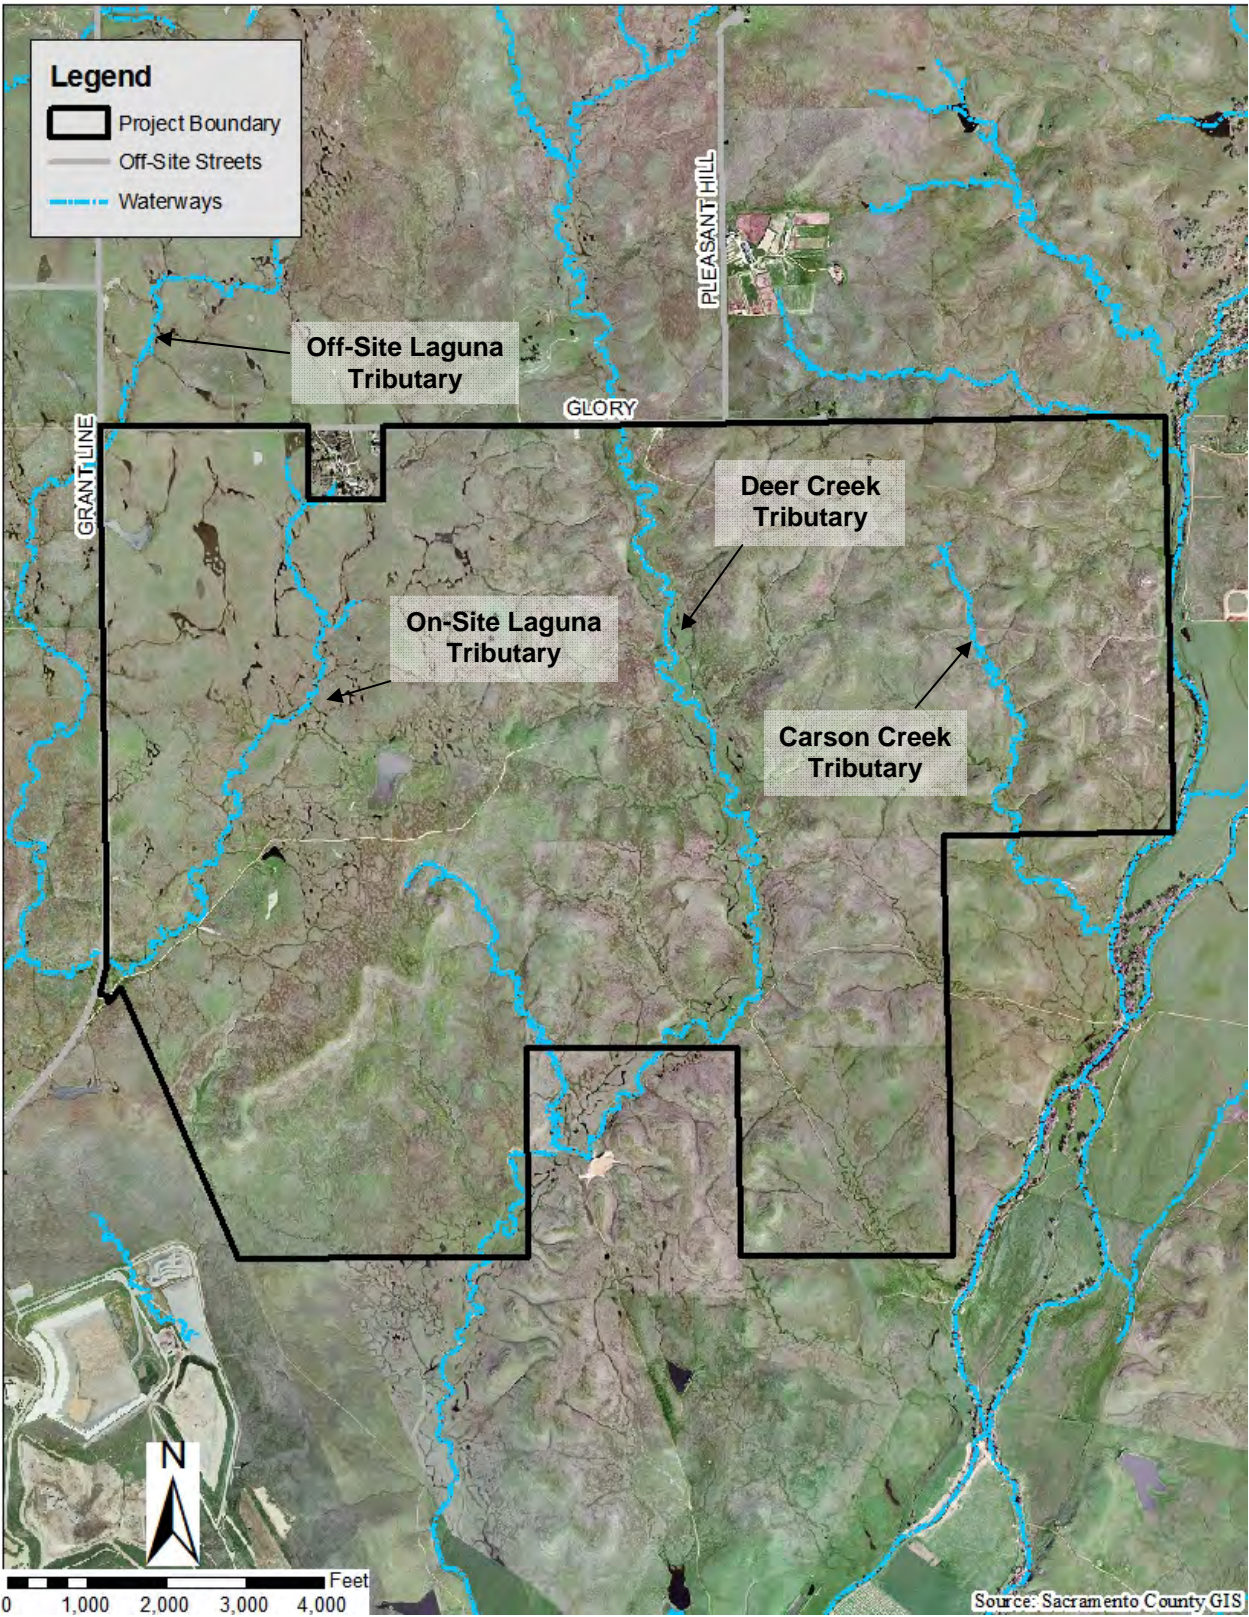

The existing condition descriptions are derived from the main body of the Drainage Master Plan, and from Appendix B of the Drainage Master Plan (the geomorphic assessment for Cordova Hills). The swales and drainages within the Project boundary are typically unstable, with deep incision, eroded banks, and little to no riparian zones. The two-year flood event is contained within many of the channels, leaving poorly connected floodplains. This lack of floodplain connection is part of the reason why a riparian zone has not been established for most channels. Plate HY-3 depicts the waterways both on- and off-site, as referenced in the discussions to follow.

The Project site is undeveloped grazing land, which ensures that common urban pollutants are not currently being discharged into local waterways. In addition, unlike other types of agricultural activities, grazing land does not require the application of pesticides or other potential pollutants. Grazing animals on the land does introduce nutrients from livestock manure, and sediment can also be introduced as a result of large livestock creating areas of bare or disturbed soil. Though there are existing sources of such pollution in this area, the sources are relatively minor.

The Regional Water Board maintains and periodically updates a listing of “impaired” waterways, called the 303(d) list. This list indicates the waterway or reach of waterway that is impaired, the pollutant for which it is impaired, the source of that pollutant (if known), and the date by which the TMDL will be completed. ~~The current 303(d) list is dated 2006, but an update to the list has been ongoing since 2008. A final version of the 2008 update ([Final 2008 Clean Water Act Section 303\(d\)/305\(b\) Integrated Report for the Central Valley Region](#)) has been published but must be approved by both the State Water Board and the US EPA prior to becoming effective. Though not finalized, the updated information has been used in this analysis. A review of the existing (2006) and proposed (2008)~~ **The current** 303d list¹ of impaired waterways indicates that Deer Creek and Carson Creek are listed as impaired, while Laguna Creek is not. Deer Creek and Carson Creek are listed for iron and aluminum, respectively.

¹ http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml

Plate HY-3: Existing Drainage Conditions

LAGUNA CREEK WATERSHED

Upper Laguna Creek begins approximately 1.5 miles to the north of the Project. The western portion of the site contains two tributaries to Laguna Creek: one which flows southward through the site and into Upper Laguna Creek and one which crosses only a small corner of the site and flows into Upper Laguna Creek. These drainages are referred to in the Drainage Master Plan as the on-site and off-site Laguna Creek tributaries, respectively. The off-site tributary crosses under Grant Line Road through corrugated metal culverts and flows into the future Sun Creek Specific Plan area in Rancho Cordova; during storm events, water ponds along the eastern side of Grant Line Road at a few of the culverts. The on-site tributary also flows under Grant Line Road through 62-inch corrugated metal culverts. The on-site tributary has a complex form, is well-connected to the Laguna Creek floodplain to the west, and is associated with local vernal pool habitats.

As shown in Plate HY-1, the 100-year floodplain associated with the on-site tributary is restricted to areas in close proximity to the channel. Where the floodplain appears to end just north of the Urban Services Boundary is the limit of the main channel of this tributary, beyond which the tributary fans out into multiple small swales within the Avoided Area; the floodplains in this area become very narrow, and thus will not impact Project development. Watersheds also include many smaller subsheds where localized drainage conditions direct flows into small channels and swales that ultimately connect to the main tributary. The three subsheds within the study area for Laguna Creek are shown on Plate HY-4.

DEER CREEK WATERSHED

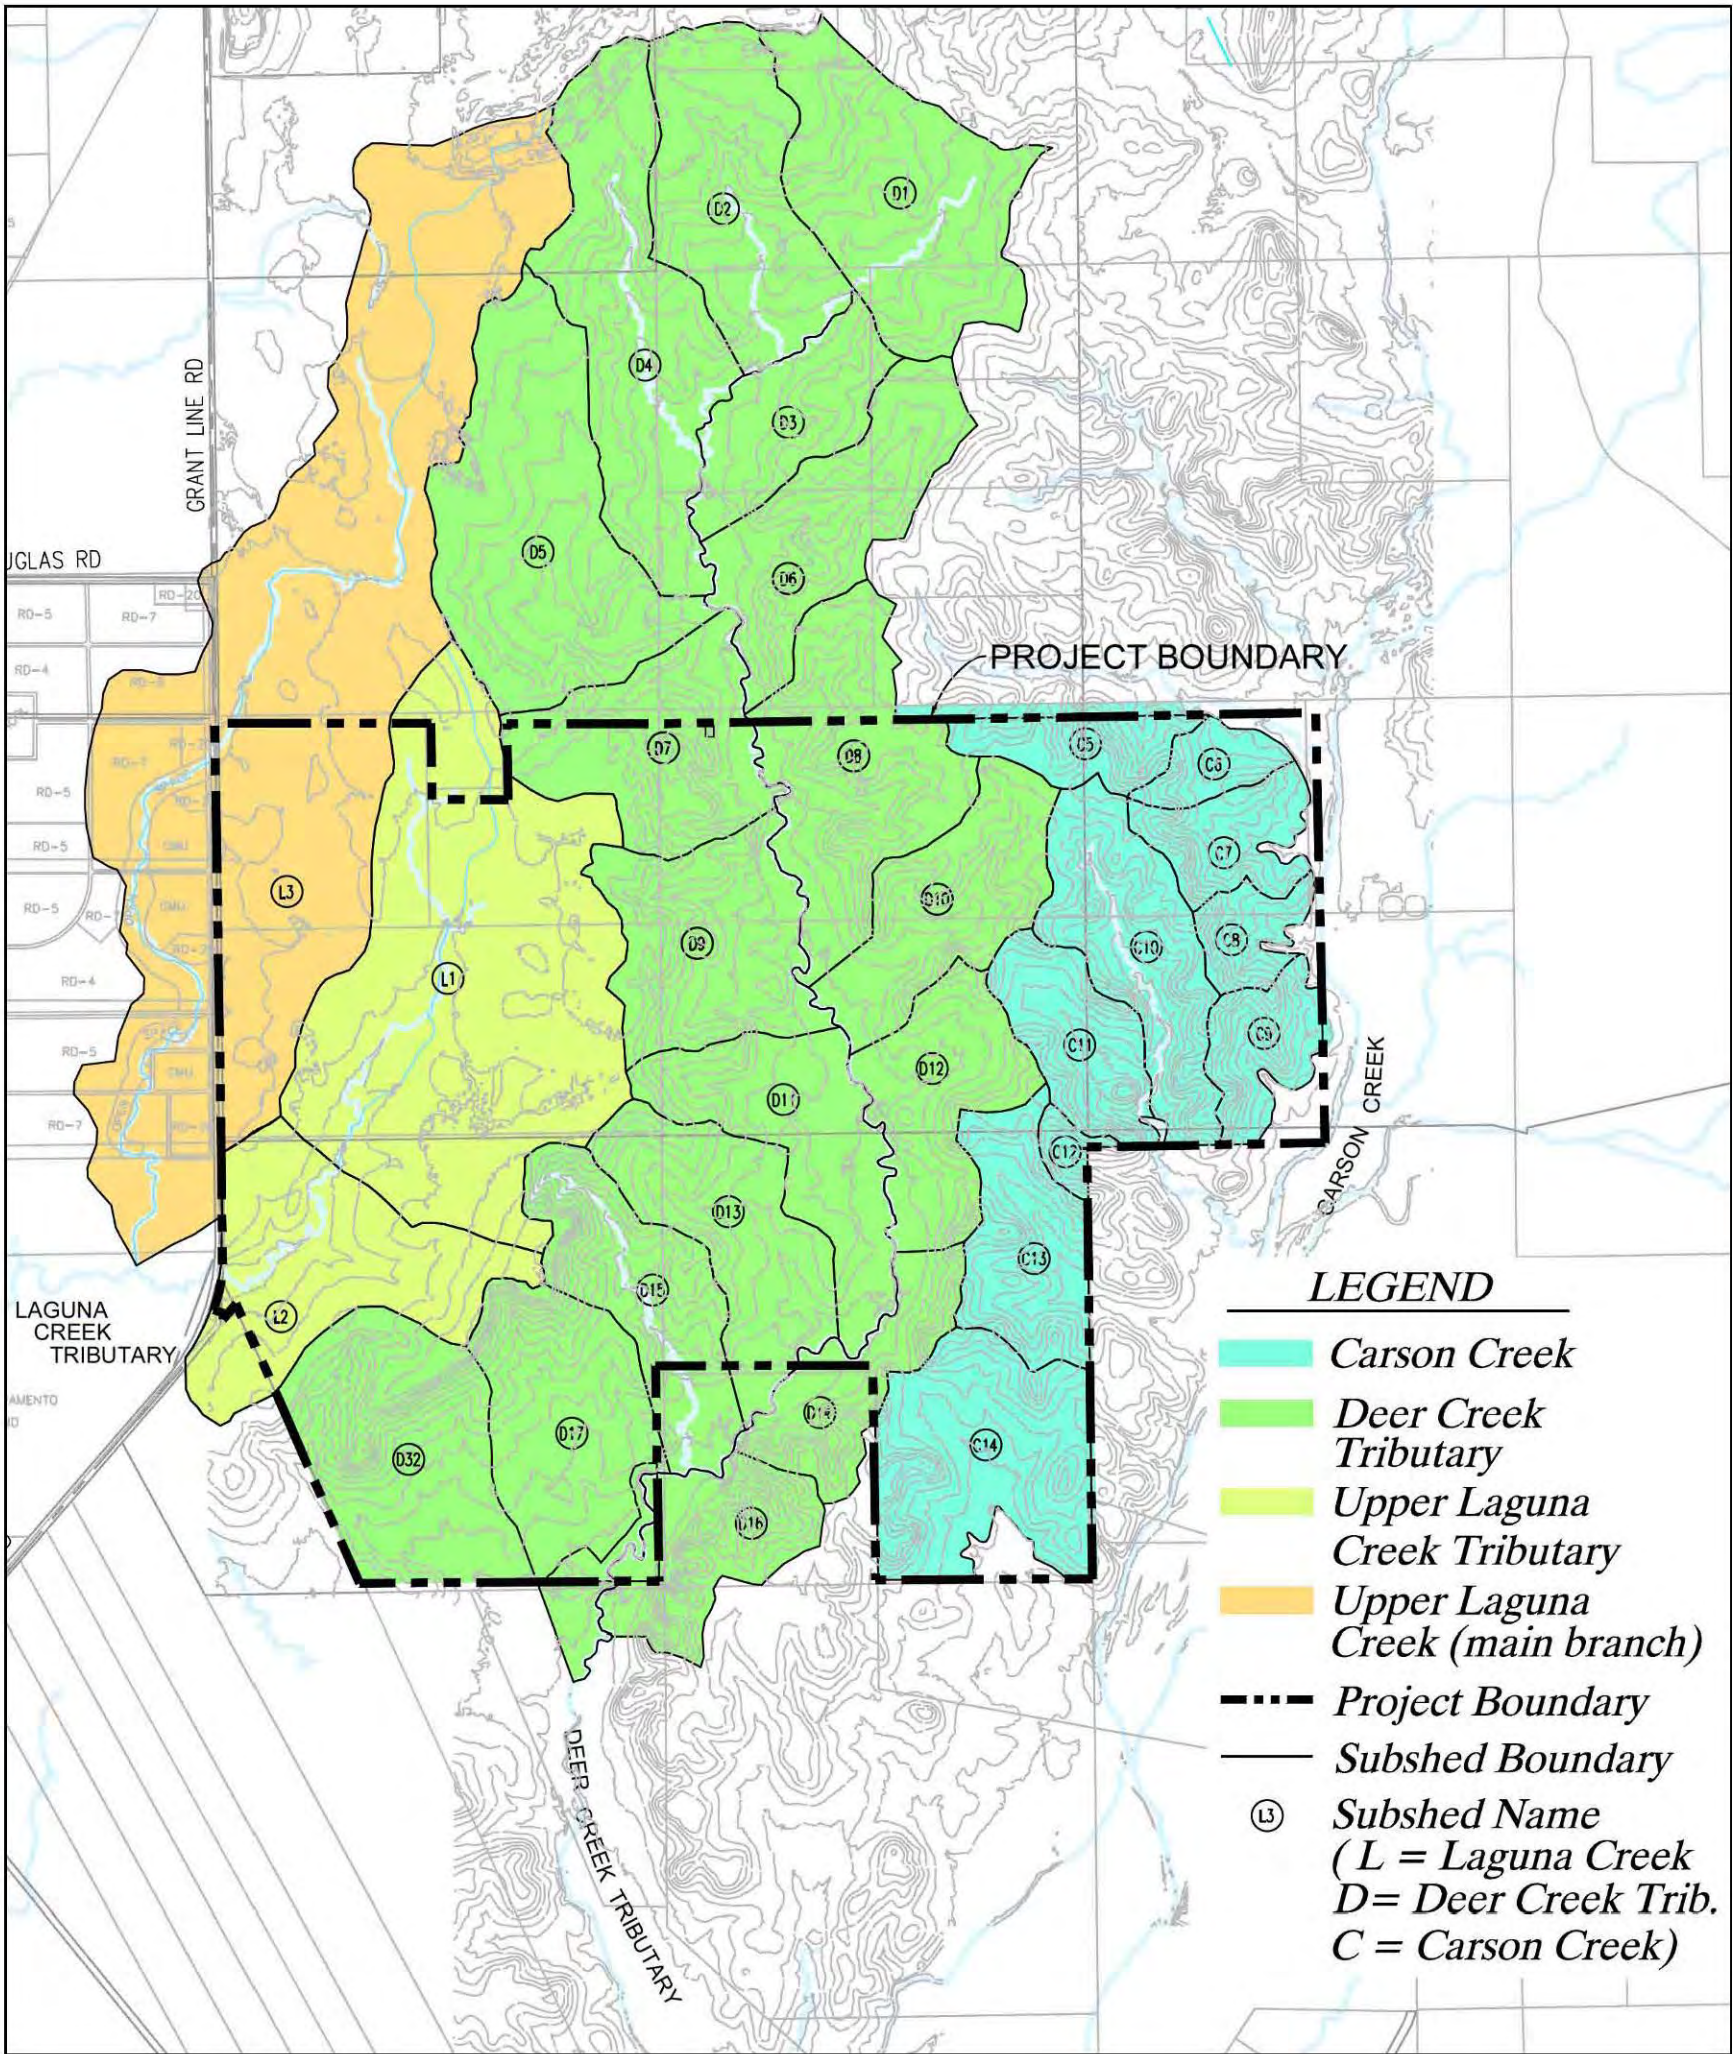

The intermittent drainage that flows to the south through the approximate center of the site is tributary to Deer Creek. This is an unmodified channel which flows for its entire length as an open waterway, running unobstructed into Deer Creek. The watershed affected by the proposed Project originates roughly 9,200 feet north of the Project. The tributary is a sharply incised cobble-strewn channel. The bed of the drainage is generally well armored by large grain sizes and cobbles and underlain by hardpan, which limits further incision. Further channel erosion would be likely to involve channel widening rather than deepening. Several locations along the creek show evidence that lateral channel migration may happen rapidly, perhaps in as little as one high-flow event. As shown in Plate HY-1, the 100-year floodplain associated with the on-site tributary is restricted to areas in close proximity to the channel. As shown in Plate HY-4, there are 18 different subsheds identified in the study area of Deer Creek.

Site observations indicate that smaller tributaries to the main tributary to Deer Creek are geomorphically unstable, meaning that degradation is continuing. The drainages are extremely incised relative to their size; the banks are typically vertical, tall, and eroding, which will continue in the future regardless of site development.

CARSON CREEK WATERSHED

The intermittent drainage that flows across the eastern side of the site is tributary to Carson Creek. As shown on Plate HY-4, there are ten subsheds identified within the study area of Carson Creek. Runoff from each of these subsheds is conveyed by sheetflow or through small intermittent tributaries. Like the Deer Creek tributary, the primary intermittent drainage is an unmodified channel which flows for its entire length as an open waterway, running unobstructed into Carson Creek. All of the channels within the Carson Creek watershed on the site are incised and unstable. There are multiple areas with older, abandoned channels left behind as the tributaries have eroded a new path and migrated laterally. Like the Deer Creek tributary, it appears that this channel migration can occur rapidly. This floodplain of this watershed was not studied, because the Project includes filling in the drainage.

Plate HY-4: Existing Condition Subsheds in the Project Vicinity

IMPACTS AND ANALYSIS

IMPACT: EXPOSURE OF PEOPLE OR STRUCTURES TO FLOOD HAZARDS

The Drainage Master Plan assumed full-buildout of the Project in order to model post-Project conditions, which includes significant grading to moderate the steep topographic changes on the site. Site grading will alter the localized drainage conditions that generated the existing condition subsheds within the larger watersheds. The new subshed boundaries that would result from Project construction are shown in Plate HY-5, along with basic detention basin locations. Plate HY-6 depicts the proposed Project grade changes, conceptual basin designs and locations, main underground trunk drainage infrastructure, and subshed identification numbers.

Proposed detention basin volumes are reported in Table 1 of the Drainage Master Plan, and the discharge rates from these basins are reported in Table 2 of the Drainage Master Plan. Each detention basin includes a flood control outlet structure designed to limit discharge rates to the existing-condition 10-year and 100-year rainfall event. Discharge is controlled by appropriate sizing of the orifice on the side of the concrete box structure. The discharge pipe outlet includes energy dissipation components which re-establish sheet flow.

The proposed detention basins have been sized to ensure that the flow rate within the tributaries post-Project does not exceed the existing condition flow rates. The necessary volumes are based on the largest predicted volume requirement resulting from modeling the 10-year and 100-year 24-hour storms, and the 100-year 10-day storm. The resulting 100-year floodplain boundaries are contained within non-urbanized open space (Plate HY-7). The Project will not expose people or structures to flood hazards; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

Plate HY-5: Developed Condition Subsheds and Detention Basins

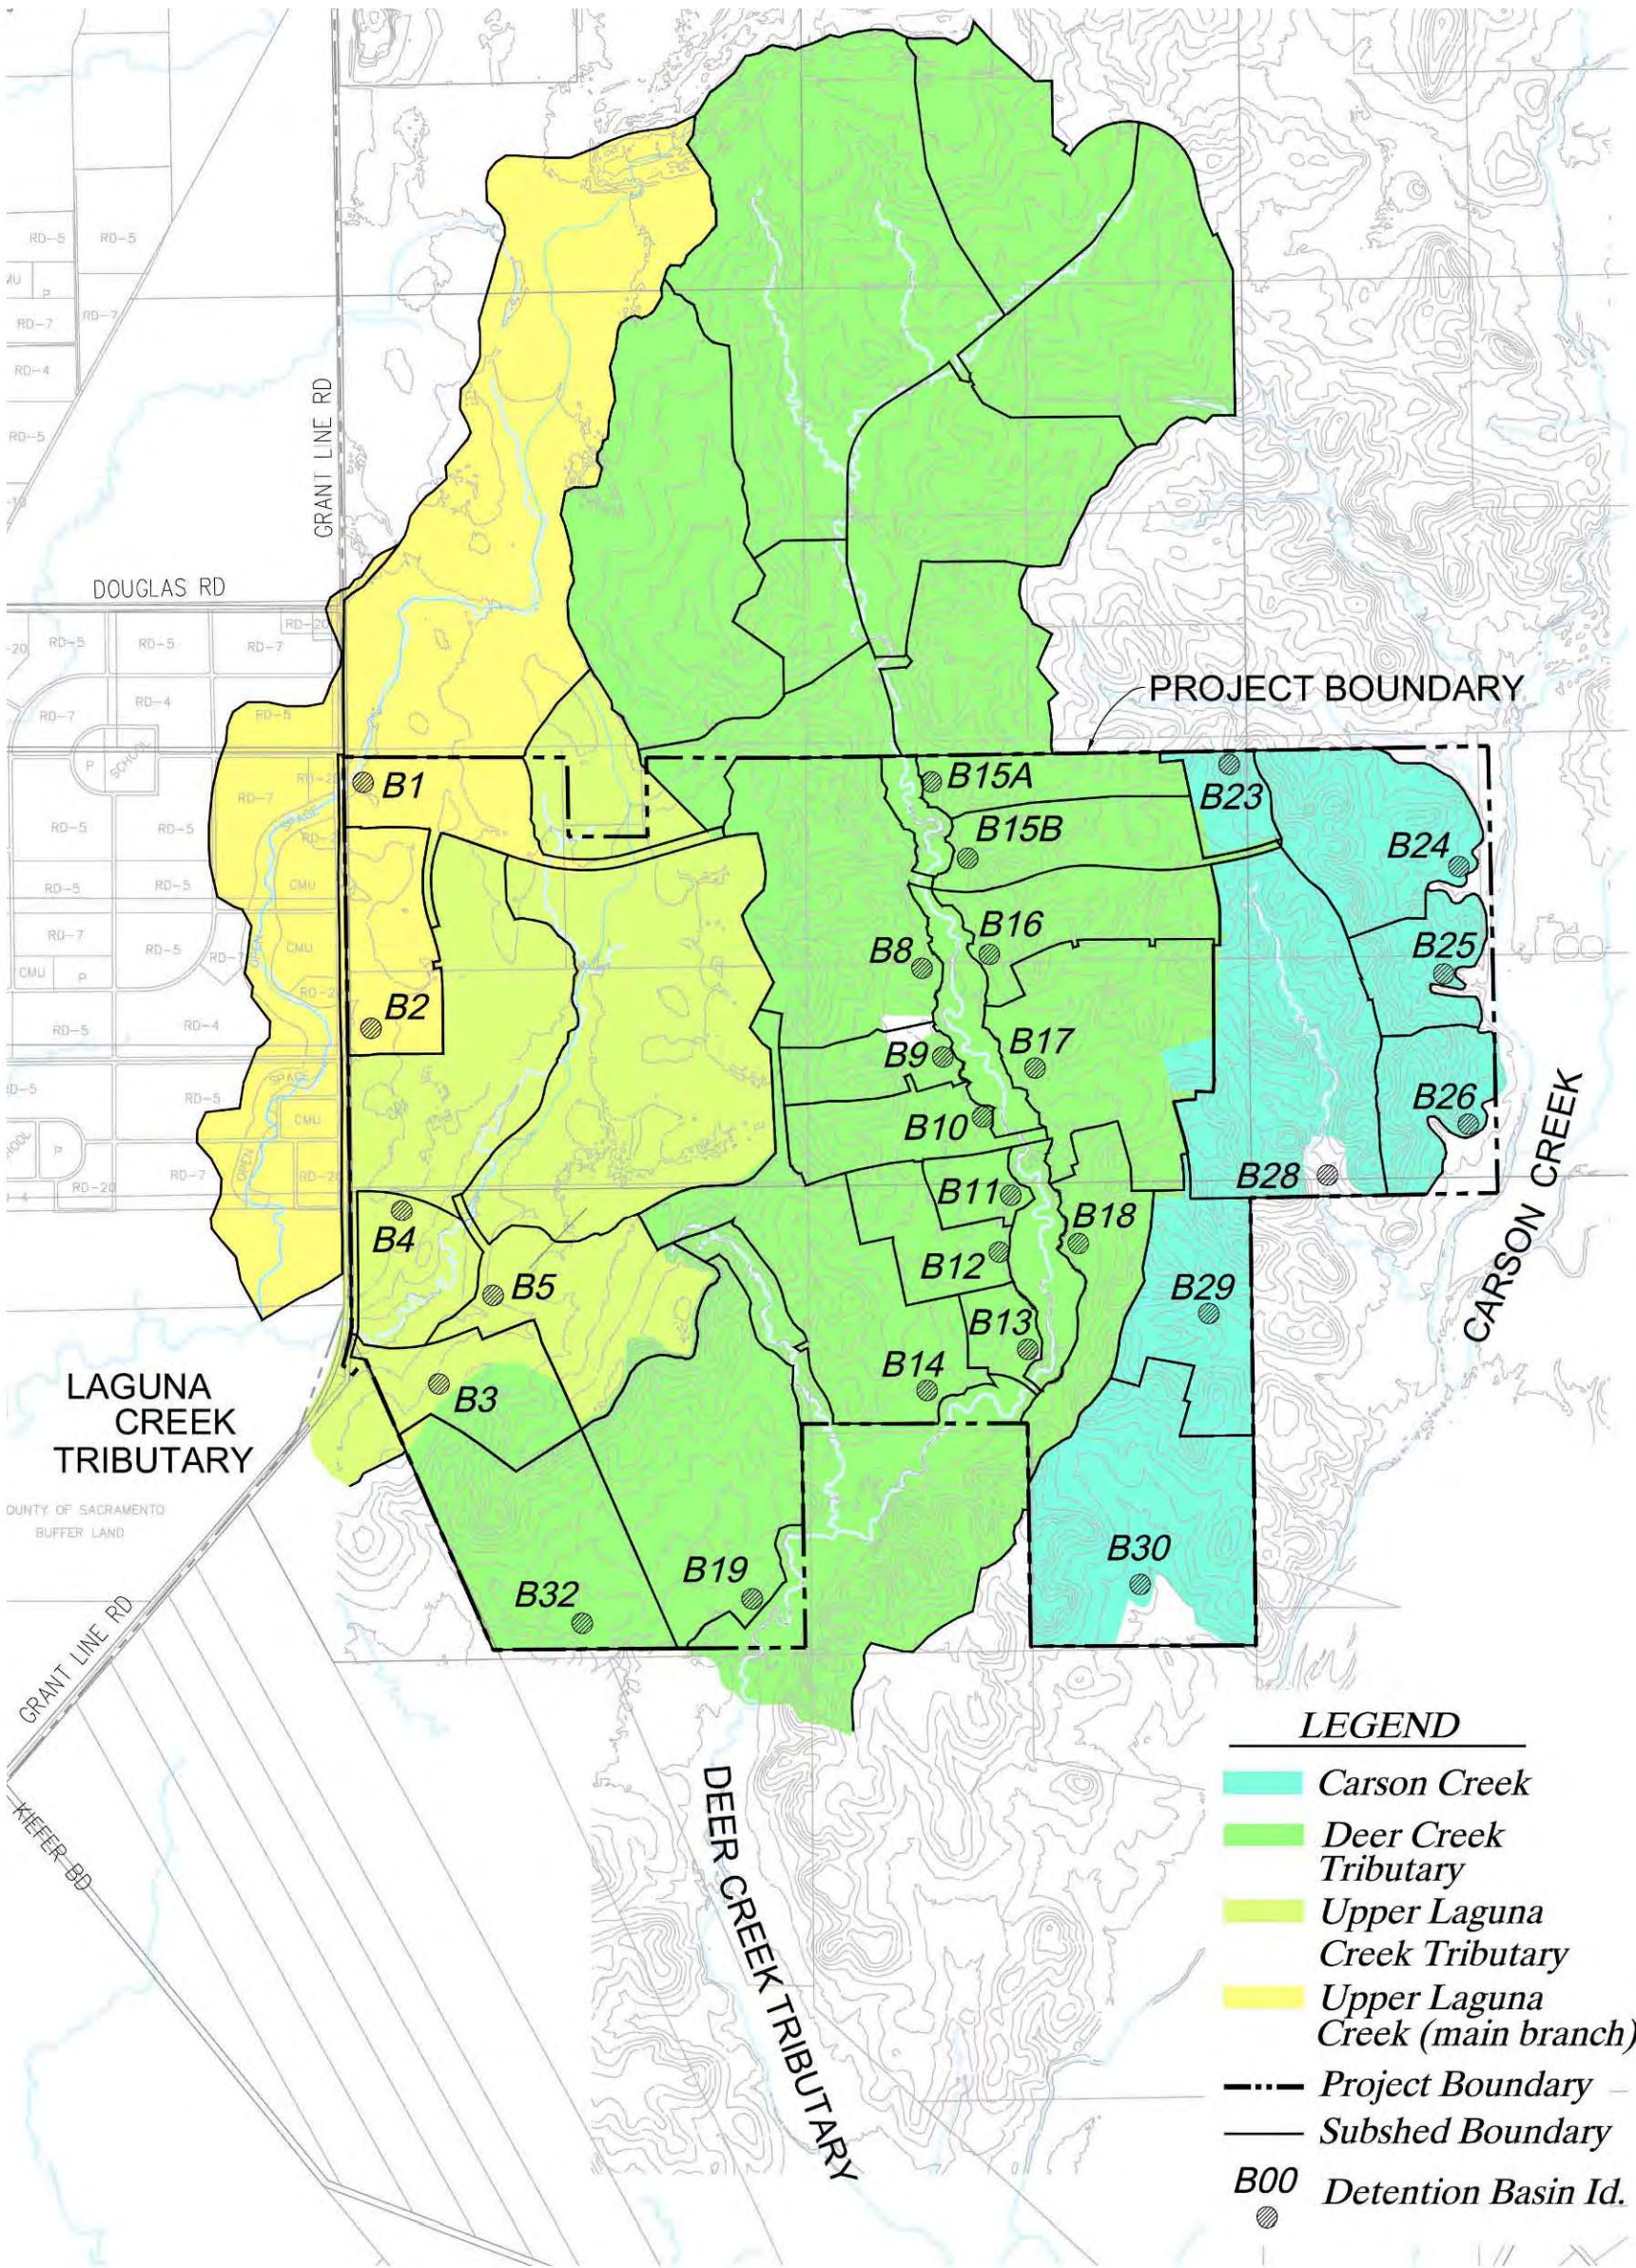

Plate HY-6: Developed Conditions Topography, Basin Design Concepts, Trunk Drainage Lines, and Subshed Identifications

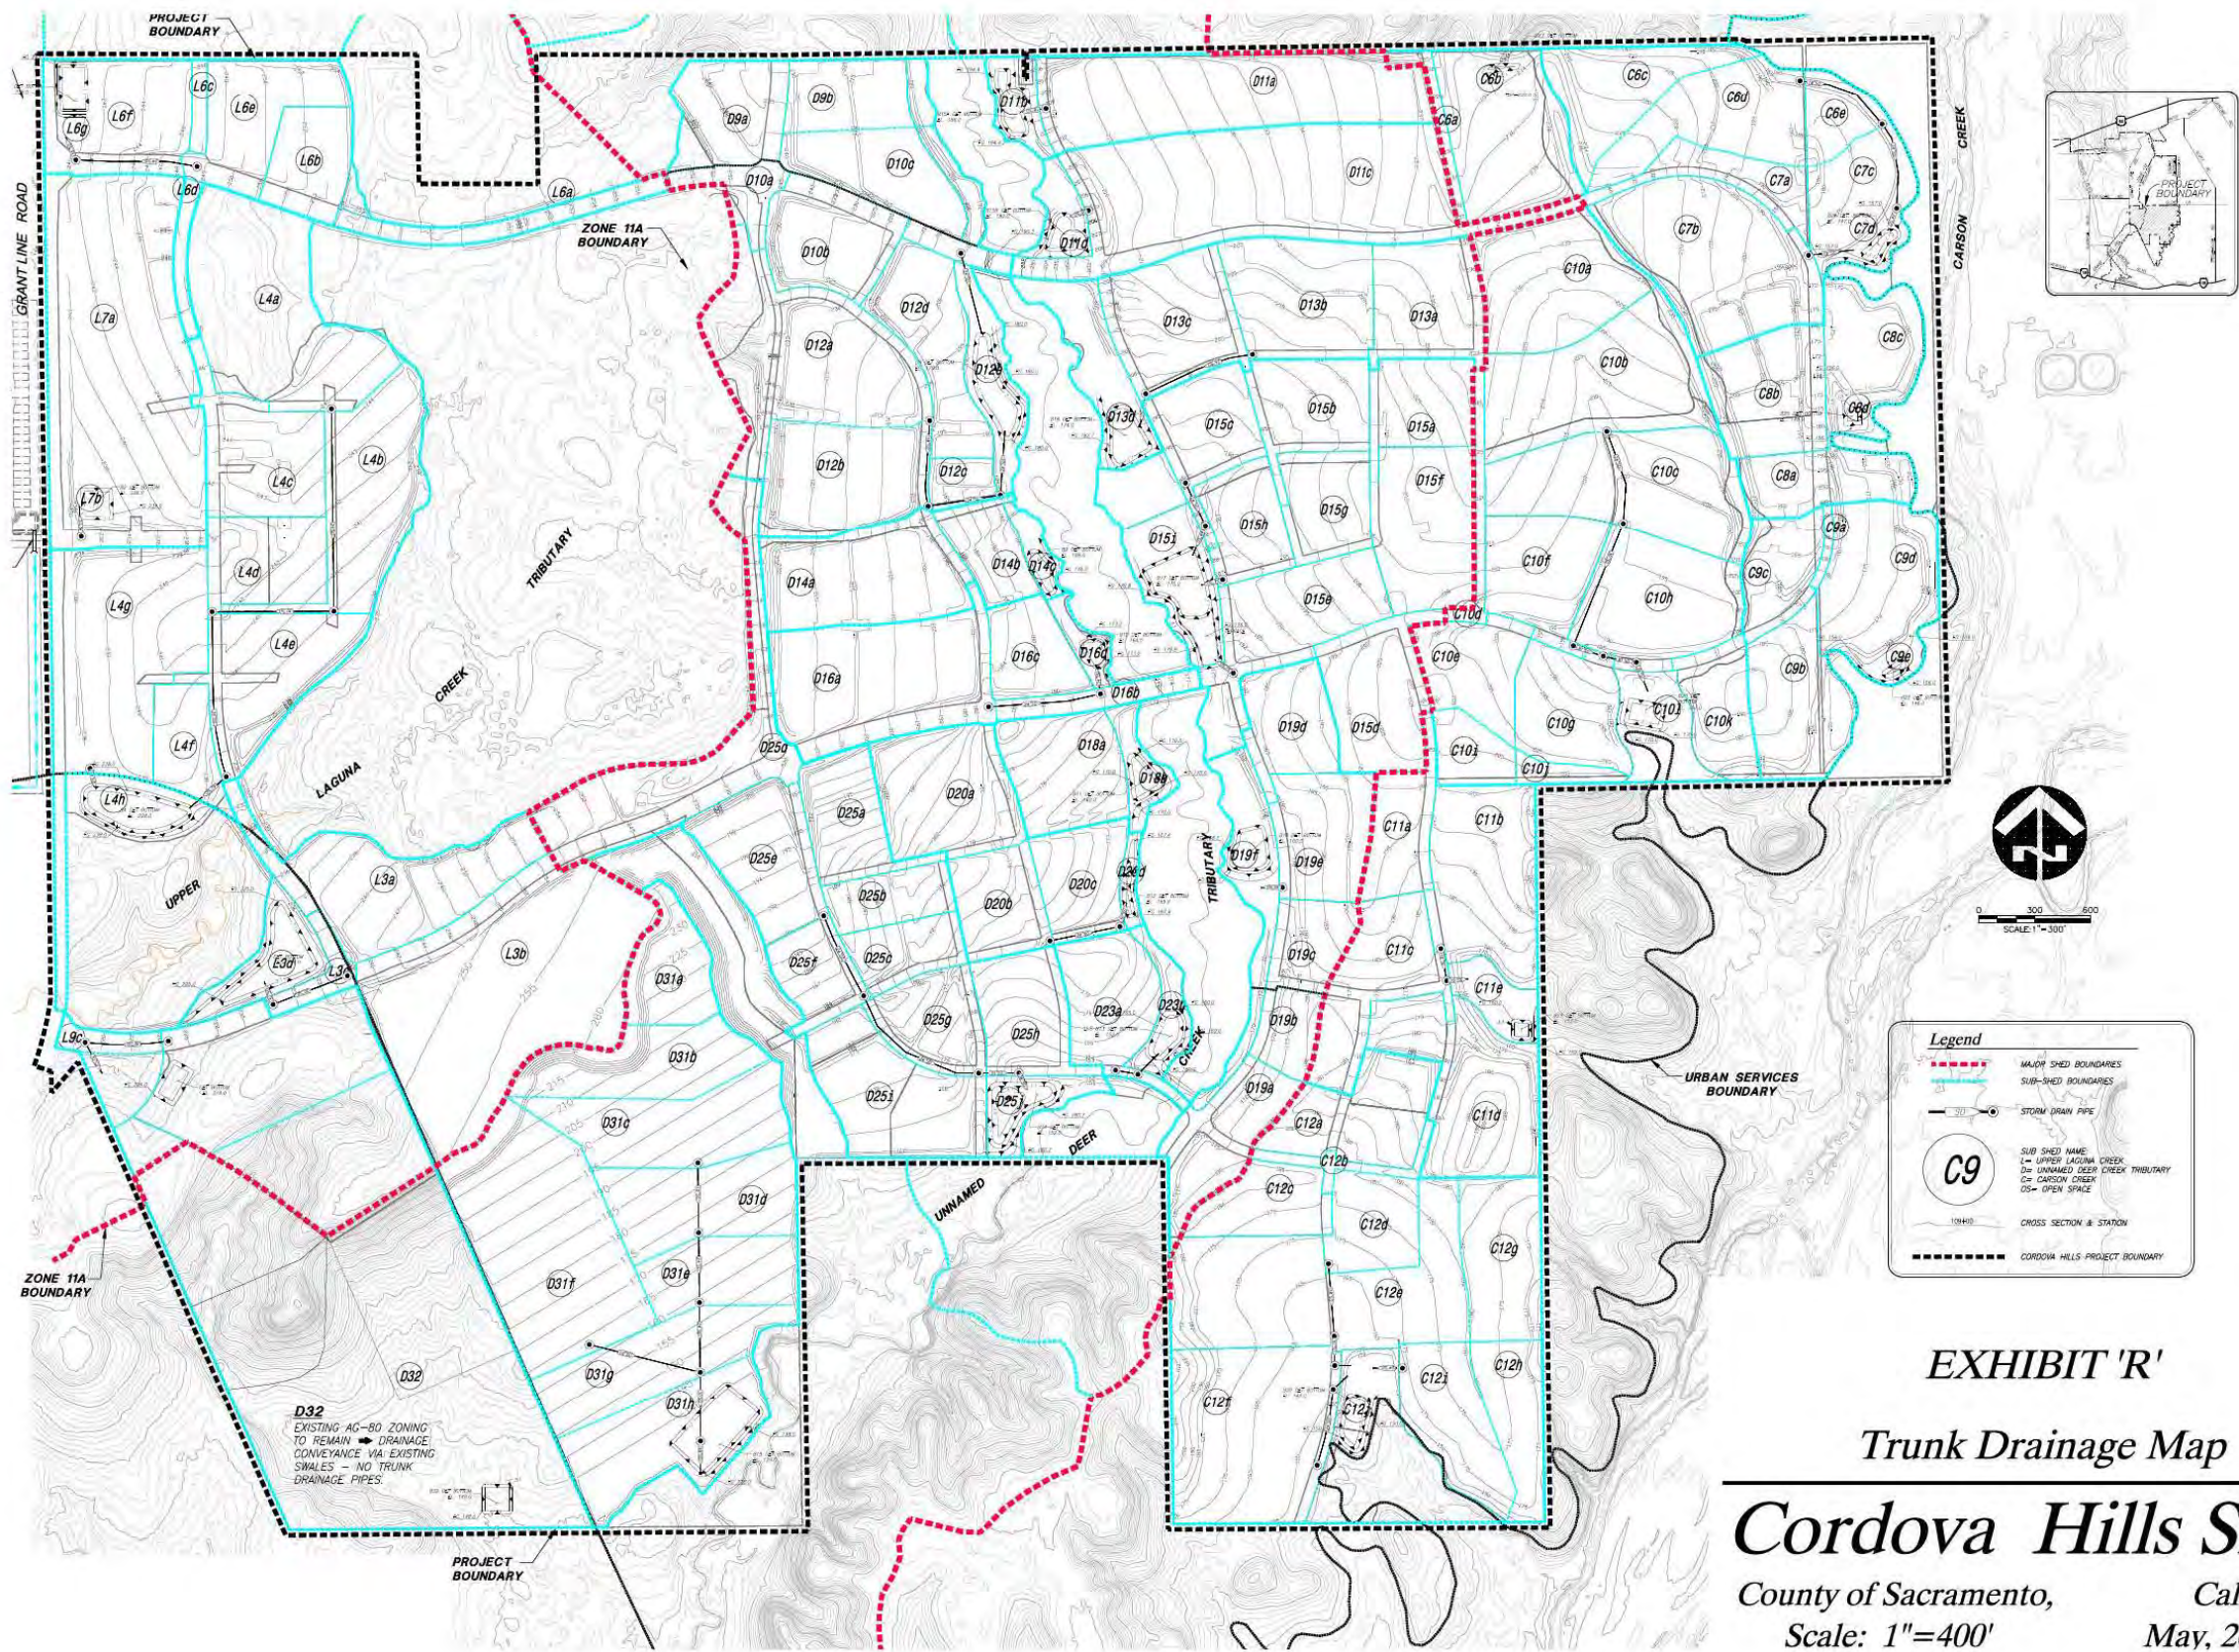

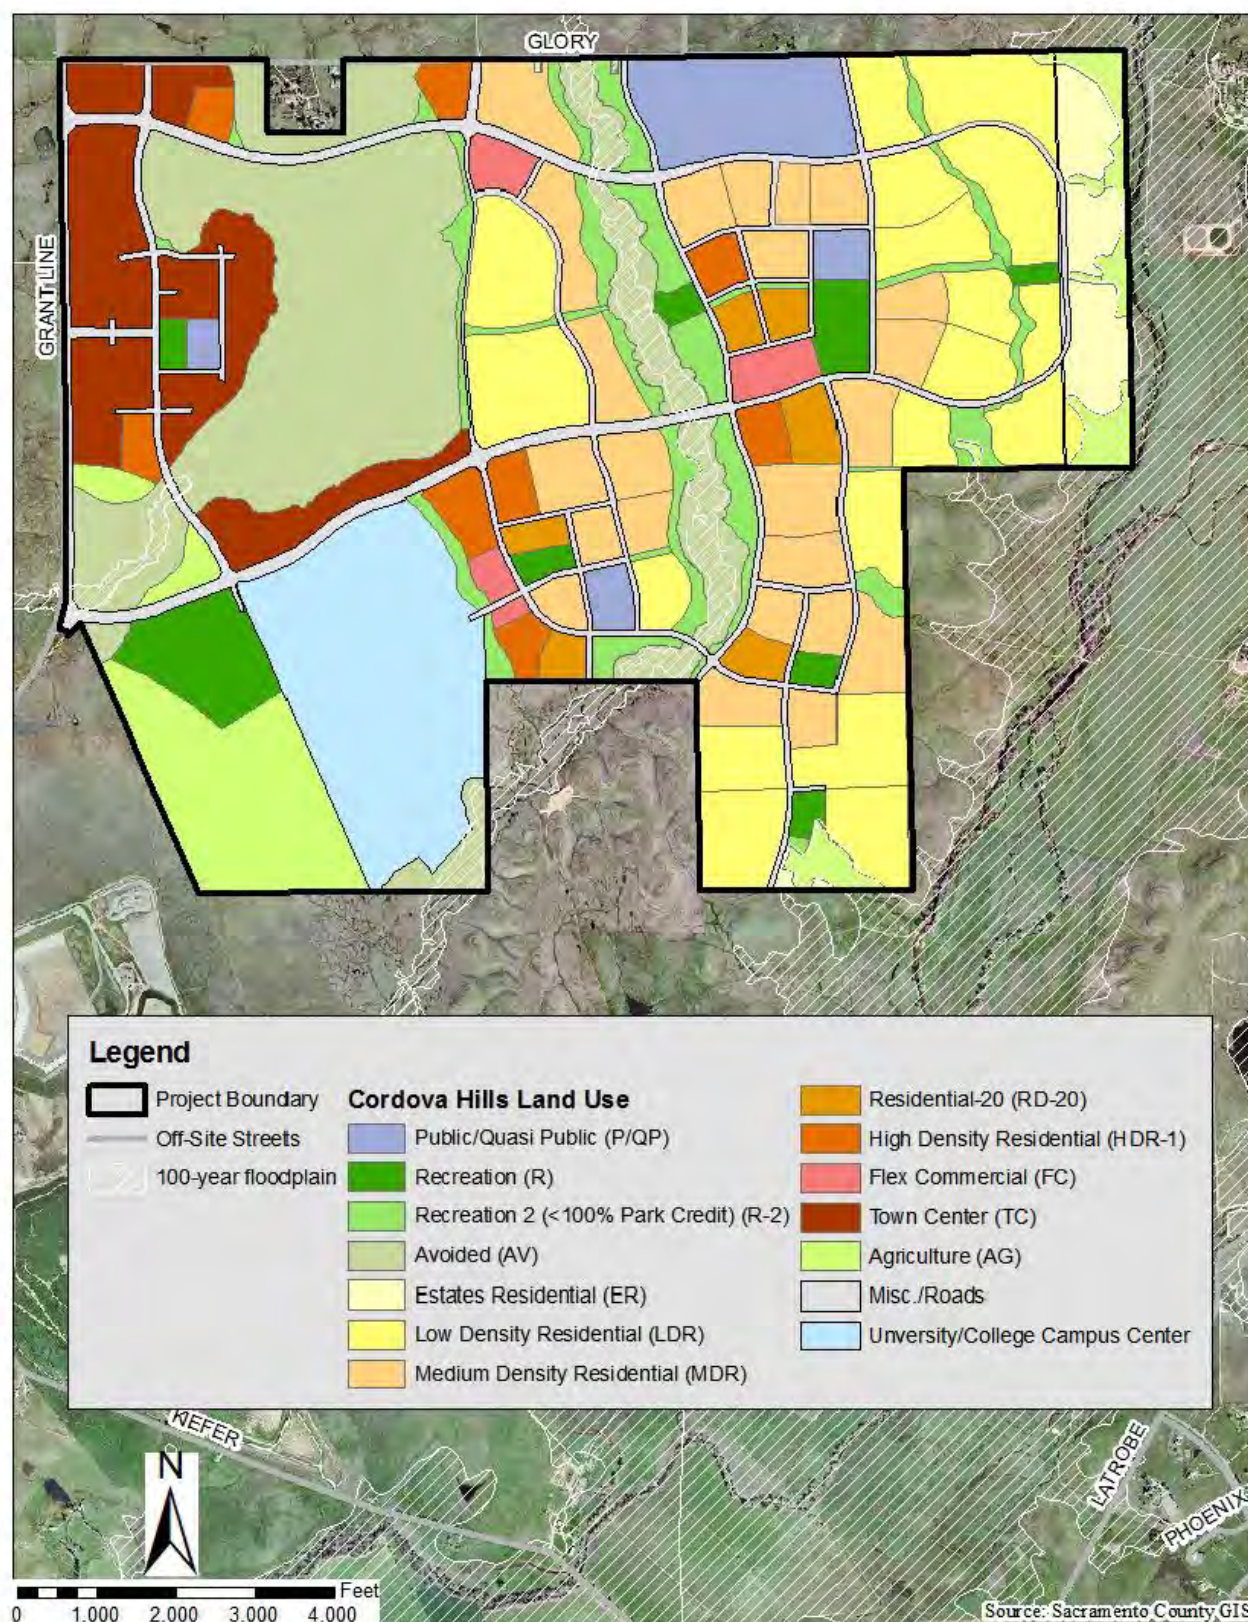

Plate HY-7: Post-Project 100-Year Floodplain and Project Uses

IMPACT: HYDROMODIFICATION

Appendix A and B of the Drainage Master Plan include the geomorphic assessment and hydromodification assessment prepared for the proposed Project. The hydromodification assessment included detailed performance criteria for the analysis (Section 1.2.2 of the Drainage Master Plan Appendix A), including that the Project peak flows (up through the 10-year storm event) should not exceed existing condition peak flows by more than 10% for the flow range specified². Put in general terms, the resulting design is a detention basin outlet control structure which retains all stormwater runoff generated up to a 10-year event and slowly releases the runoff through a very small outlet. Each detention basin includes a weir set above the basin bottom, and each weir has a V-notch opening and a 2-inch outlet pipe beneath the V-notch. The narrow outlet pipe causes water to back up within the basin, draining out slowly over an extended period of time. Overall, basin volumes were increased by approximately 20% in order to add hydromodification control to the detention basins designed for flood control. Modeling indicates that the detention basins will control flows so that substantial hydromodification impacts do not occur; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: EXCEED CAPACITY OF STORMWATER SYSTEMS

Virtually all stormwater flows overland on the site as sheet flow into swales and channels. The only existing stormwater facilities in the Project study area are two culverts under Grant Line Road: one which routes the off-site Upper Laguna Creek into Rancho Cordova and one which routes the on-site Upper Laguna Creek into Rancho Cordova (refer to Plate HY-3 for the creek locations). The culverts which route the on-site creek are functioning properly, but water often ponds on the upstream side of the off-site creek culverts. Since only a small portion of the off-site creek edges onto the site, the Project includes the diversion of the creek along the edge of, rather than through, the site. To address the capacity constraint at the existing culverts for this creek, the Project also includes installation of a four-foot by eight-foot reinforced concrete box culvert under Grant Line Road. This culvert will be able to convey the 100-year storm runoff from the off-site Upper Laguna Creek (main branch) watershed in

² The following is from page 4, note 5, of Appendix A of the Drainage Master Plan: For the flow range specified (25% of Q2 [2-year peak flow] through Q10 [10-year peak flow]), the proposed condition discharge rates and durations should not deviate above the existing condition discharge rates and durations by more than 10% over more than 10% of the length of the flow duration curve. The flow duration curve relates to the percentage of time of the total period of record that a particular flow is equaled or exceeded. It does not refer to the duration of that particular flow event. Thus, the flow duration technique gives an indication of how the average flows are hydromodified between a specific flow range (area under the curve). Flow duration curves are the most commonly accepted method of analyzing the response of watersheds to perturbations; hence, we recommend them for this application.

addition to the existing conditions runoff from the tributary shed; this water will continue to drain directly into Rancho Cordova. No changes would be made to the culvert which takes the on-site Upper Laguna Creek tributary under Grant Line Road.

The Project also includes installation of a new trunk drainage system to convey flows throughout the site to the various proposed detention basins and outfalls. The trunk system consists only of the major underground piping, which has all been proposed within the major streets of the proposed land use plan (refer to Plate HY-6). Subsequent project-level applications for subdivisions and commercial development will, pursuant to existing County ordinances and requirements, need to design small-diameter collection pipe systems that will connect to the proposed trunk system. The overall trunk system has been designed consistent with County requirements, and will include sufficient capacity to serve buildout of the Project. The Project will not exceed the capacity of existing or planned stormwater systems; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: CONTRIBUTION OF POLLUTED RUNOFF

Pollutants entering waterways are generally categorized by regulatory agencies as either point or nonpoint discharge. A point source discharge is one that comes from a specific location, such as a wastewater treatment plant outfall. A nonpoint source discharge is one that comes from multiple locations over a wide land area, and is the type of pollution that occurs as a result of land use activities. Rainwater or irrigation runoff flows over agricultural fields, streets, parking lots, backyards, and other areas, picking up sediment, pesticides, fertilizers, heavy metals, oils, and other pollutants before ultimately flowing into a waterway. It is nonpoint pollution that the proposed Project has the potential to generate. Nonpoint source pollution may be generated both during construction and after a site is operational; construction and operations are discussed separately below.

CONSTRUCTION IMPACTS

The Project would result in construction of residential and commercial buildings, along with associated streets and other paved areas. Water quality impacts could occur during construction from increased soil erosion and sedimentation due to clearing of vegetation, alteration of drainages, and grading. Construction also involves solvents, paints, concrete, and other materials that have the potential to contact and affect runoff from construction sites.

During the wet season (October 1 – April 30), development on the Project site must include an effective combination of erosion, sediment, and other pollution control BMPs in compliance with the Sacramento County Stormwater Ordinance, the Land Grading

and Erosion Control Ordinance, and the State's Construction General Permit. During the rest of the year erosion controls typically are not required, except in the case of predicted rain. Examples of erosion controls include: stabilized construction entrances, tackified mulch, 3-step hydroseeding, spray-on soil stabilizers, and anchored blankets. Sediment controls help to filter sediment out of runoff before it reaches the storm drains and local waterways. Examples include rock bags to protect storm drain inlets, staked or weighted straw wattles/fiber rolls, and silt fences. Erosion control plans are a requirement of the County grading permit, and would be developed and submitted for approval prior to the commencement of grading. Each plan would be tailored to address the constraints specific to the proposed grading area.

In addition to erosion and sediment controls, individual development projects that occur as a result of Project approval must have BMPs in place to keep other construction-related wastes and pollutants out of the storm drains. Such practices include, but are not limited to: filtering water from dewatering operations, providing proper washout areas for concrete trucks and stucco/paint contractors, containing wastes, managing portable toilets properly, and dry sweeping instead of washing down dirty pavement. Compliance with adopted Ordinances and standards will ensure that future development projects implemented as a result of Project approval will not cause violation of a water quality standard or waste discharge requirement, result in substantial erosion or siltation, and will not result in substantial increases to polluted runoff associated with construction; impacts are *less than significant*.

OPERATIONAL IMPACTS (POST-CONSTRUCTION IMPACTS)

New development proposed by the Project will result in the use of substances that could pollute waterways if not regulated. Vehicles deposit heavy metals, oils, and other substances onto roadways, parking lots, and driveways; residents wash their cars in streets and driveways, and the water picks up soaps, waxes, dirt, oils, and heavy metals from the cars; and people maintaining landscaping areas use pesticides and fertilizers. Water carries these and other pollutants into storm drains, where the water flows without treatment directly into the streams that provide drinking water, recreation, and wildlife habitat. This runoff could increase pollutant loads to such an extent that the waterway becomes impaired. Water temperatures can be increased, which affects the health of many organisms that live in the creeks. Even the nutrients in fertilizers can cause water quality problems, because they promote blooms of algae. Increases in discharge amounts or velocity have the potential to greatly accelerate downstream erosion and impair stream habitat in natural drainage systems. These impacts must be addressed by requiring appropriate runoff reduction and pollution prevention controls to minimize runoff and keep runoff clean for the life of the Project.

It is critical that stormwater runoff be treated, in particular for the first flush that carries the greatest concentration. Typically, the first flush is the first ½ inch of rain after an extended dry period; it carries the accumulation of many weeks or months of pollutants that have been deposited onto the soils, pavement, and plants. It is impractical to treat all stormwater run-off during large storm events, but the use of standard water quality

treatment methods can treat the first inch of run-off, which is highly beneficial and can avoid significant impacts to water quality.

The Drainage Master Plan for the Project includes an analysis of water quality basins, which function by retaining water long enough to let sediments, metals, and other heavy pollutants settle out of the water. The same basins which provide peak storm control have also been designed to function as water quality basins, consistent with the design requirements of the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions*. Table 3 of the Drainage Master Plan includes calculations for each basin indicating the amount of storage needed for water quality.

In addition to retention treatment of wintertime storm flows, the Project also includes designs to reduce summertime “nuisance flows” by allowing runoff to percolate on-site rather than discharge into waterways. Summer nuisance flows consist primarily of irrigation runoff, but can also include runoff from washing vehicles in driveways or water play equipment. These flows can cause formerly ephemeral streams to become somewhat perennial, and introduce pollution. The Drainage Master Plan includes four strategies intended to retain nuisance flows: installation of drainage facilities in areas that do not have high groundwater recharge potential, installation of percolation trenches in detention basins, installation of percolation chambers disbursed throughout the drainage collection system, and the use of Low Impact Development measures to capture and retain runoff. Table 4 of the Drainage Master Plan contains an evaluation of the number of percolation trenches that will be required, though a more detailed evaluation will be necessary at the individual project application phase.
