Most of the above discussion relates to the plan-level designs that will be incorporated to control pollution in the watershed and subsheds as a whole. Further measures will be required for the project-level development proposals that would follow approval of the SPA. The County requires that projects include source and/or treatment control measures on most new development projects. Using the BMPs required by the current standard defined in the *Stormwater Quality Design Manual for the Sacramento and South Placer Regions, 2007* and subsequent editions in the years to come, Low Impact Development components and other measures will be required. These may include simple grassy swales and rain gardens, to more complex systems that use cisterns, pumps, and sand filters. Basic source controls applicable to all projects include “No Dumping – Drains to Creek/River” stencils/stamps on storm drain inlets to educate the public, and providing roofs over areas likely to contain pollutants, so that rainfall does not contact the pollutants.

A review of the existing ~~(2006)~~ and proposed ~~(2008)~~ 303d list of impaired waterways indicates that Deer Creek and Carson Creek are listed as impaired, while Laguna Creek is not. Deer Creek and Carson Creek are listed for iron and aluminum, respectively. The listing states that the source of these pollutants is unknown, but neither of these pollutants are typically associated with urban runoff. Thus, although both waterways are listed as impaired, the development of the Project site will not cause a net increase of the pollutant for which the waterways are listed.

Compliance with the County Stormwater Ordinance, implementation of Low Impact Development Standards, and implementation of the Drainage Master Plan will ensure that development of the site will not alter the course of local waterways in a manner that results in substantial erosion or siltation, will not cause violation of a water quality standard or waste discharge requirement, and will not result in substantial increases to polluted runoff; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

12 LAND USE

INTRODUCTION

The following chapter addresses potential physical environmental impacts related to land use. Areas of analysis include Project compatibility and consistency with adopted land use plans of Sacramento County and the City of Rancho Cordova, consistency with adopted Sacramento County General Plan policies, division or disruption of an established neighborhood, and the displacement of housing. Though growth inducement is discussed in this chapter as it relates to General Plan policy consistency, the overall discussion of growth inducement is within the Cumulative Impacts chapter.

ENVIRONMENTAL SETTING

The project site is on the eastern side of Grant Line Road in the Cosumnes Community within Sacramento County. The Sacramento County General Plan designates this area as General Agriculture and the site is zoned AG-80 (agricultural lands of at least 80 acres). There are 485 acres in the southeastern portion of the site that are under Williamson Act contracts. Those contracts are in non-renewal and are expected to expire in 2016.

Grant Line Road is a two-lane thoroughfare that lies along the western project boundary, and Glory Lane is a gravel road that lies along the northern boundary (in a prescriptive right-of-way); there are no public roadways within the project site. The surrounding lands to the north, east, and south are agricultural or open space properties with few structures, but the land along the western property boundary is within the City of Rancho Cordova and is the subject of an approved Specific Plan – the Sunridge Specific Plan. A 120-kilovolt Pacific Gas & Electric transmission line traverses the eastern edge of the project in a north-south direction adjacent and parallel to Carson Creek. The City of Rancho Cordova General Plan designates this area as “General Plan Planning Boundary”.

The nearest public water and sewer lines are within Douglas Road, approximately ¾-mile to the northwest. The Kiefer Landfill is located to the southwest of the Project site; a portion of the Project (the sports park, solar facility, and similar uses) is within the 2,000-foot urban encroachment buffer that Sacramento County established around the landfill. Mather Airport is located over four miles to the northwest of the site, and the nearest airport noise or safety contour to the Project site is nearly four miles away.

REGULATORY SETTING

To analyze the potential land use effects of the Project, this EIR considers the policies and land use designations of the Sacramento County General Plan and Zoning designations currently guiding development in the project area. The project is also on the boundary of the City of Rancho Cordova, so the EIR examines the land use designations and development plans of the City.

SACRAMENTO COUNTY GENERAL PLAN

The General Plan Land Use Element provides land development guidance through the implementation of policies LU-1 through LU-128. The land use policies listed below are those that are both pertinent to the Project and are intended to avoid an environmental effect. Though all of the policies listed below are located within the land use element, many are intended to avoid impacts related to other topical impact areas, such as public services. A relevant policy from the Public Facilities Element is also concluded, as it relates to the Kiefer Landfill.

- LU-1. The County shall not provide urban services beyond the Urban Policy Area, except when the County determines the need for health and safety purposes.
- LU-2. The County shall maintain an Urban Service Boundary that defines the long-range plans (beyond twenty five years) for urbanization and extension of public infrastructure and services, and defines important areas for protecting as open space and agriculture.
- LU-12. The County will prohibit land use projects which are not contiguous to the existing UPA, city boundaries, or existing planned communities or master plan areas (i.e. leapfrog development).
- LU-13. A Public Facilities/Infrastructure Master Plan shall be prepared to identify the major facilities required to serve new development in urban growth areas. A Public Facilities Financing Plan shall be prepared and approved by the Board of Supervisors prior to or concurrent with the approval of any zoning for any urban uses in urban growth areas. The Financing Plan shall include a Public Facilities/Infrastructure Master Plan describing required major infrastructure improvements necessary to support proposed developments, and present a detailed plan for the phasing of capital improvements and identifies the extent, timing and estimated costs of all necessary infrastructure.
- LU-19. Incompatible urban land uses should be buffered from one another by methods that retain community character, and do not consume large land areas or create pedestrian barriers.
- LU-21. Promote a better balance of employment, neighborhood services, and different housing types by reviewing development projects and the surrounding

community and designing new projects wherever feasible so that they maintain or improve the mix of uses in the community.

LU-22. Specific Plans and Community Plans should provide a balance of employment, neighborhood services, and different housing types wherever feasible.

LU-23. Providing compact, mixed use developments shall be an integral part of all master planning efforts for new growth areas and commercial corridors.

LU-25. Depending on its emphasis, a mixed use development may include the following proportions of different uses, shown as percentages of the site area:

TABLE 6			
USE	EMPHASIS OF DEVELOPMENT		
	COMMERCIAL	OFFICE	RESIDENTIAL
Retail	50 – 70%	10 – 30%	10 – 30%
Office	0 – 20%	50 – 70%	0 – 30%
Residential	20 – 40%	0 – 30%	50 – 80%
Public	10 – 30%	10 – 30%	10 – 30%
NOTE: Commercial uses refer to the LC and SC zones. Office uses refer to the BP and MP zones. Residential uses refer to the RD-5 through RD-50 zones.			

LU-26. When planning for new development in new communities, the features below shall be incorporated for their public health benefits and ability to encourage more active lifestyles, unless environmental constraints make this infeasible. In existing communities, the features below shall be considered, as appropriate and feasible:

- Where appropriate, compact, mixed use development and a balance of land uses including schools, parks, jobs, retail and grocery stores, so that everyday needs are within walking distance of homes.
- Grid or modified-grid pattern streets, integrated pathways and public transportation that connect multiple destinations and provide for alternatives to the automobile.
- Wide sidewalks, shorter blocks, well-marked crosswalks, on-street parking, shaded streets and traffic-calming measures to encourage pedestrian activity.
- Walkable commercial areas with features that may include doors and windows fronting on the street, street furniture, pedestrian-scale lighting, and served by transit when feasible.

- Open space, including important habitat, wildlife corridors, and agricultural areas incorporated as community separators and appropriately accessible via non-vehicular pathways.

LU-34. Developments in the areas designated on the Land Use Diagram as Transit Oriented Development shall be designed in a manner that conforms to the concepts of transit-oriented development, including:

- High intensity, mixed-use development concentrated in a Core Area within an easy walk (one quarter mile) of a transit stop on the Trunk or Feeder Line Network.
- An emphasis on neighborhood support commercial services at street level in the Core Area that can serve the residents of the Core and surrounding Secondary Areas, with other employment encouraged in the TODs created along the Trunk Line Network.
- A pleasant walking environment created through good land use design, short distances, amenities, and streetscape features.
- Direct, multiple linkages, especially for bicycles and pedestrians, between the Core Area and the surrounding Secondary Area.

LU-35. The primary concepts in LU-34 should be employed wherever feasible in new urban development.

LU-36. Community Plans and Specific Plans shall employ the primary concepts in LU-34 in designating locations for higher intensity mixed use development and designing circulation and pedestrian networks.

LU-46. Assure that regionally-oriented commercial and office uses and employment concentrations have adequate road access, high frequency transit service and an adequate but efficient supply of parking.

LU-113. The County shall work with SACOG to support implementation of Blueprint's policies and land use objectives.

LU-120 The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside of the existing UPA if the Board finds that the proposed project is planned and will be built in a manner that¹:

- meets all of the requirements per PC-1 through PC-10, and;

¹ Some areas within a Master Plan may have existing uses that are not likely to change and are appropriate to remain. If the Master Plan designates such areas with a land use category that reflects that existing use, the Board may exclude these areas for purposes of determining consistency with these criteria.

- meets ONE of two alternative performance metrics:
 - *Alternative #1- Criteria-Based*
 - *Alternative #2 - VMT/ Greenhouse Gas Emissions Reduction Metric*

PC-1. Vision for connection to other adjacent existing and potential future development areas.

Required: Include a vision of how the development will connect to other adjacent existing and potential future development areas within the USB, including how roadways, transit, sewer, and water could occur within all adjacent areas.

PC-2. Housing choice.

Required: A variety of housing types and densities, including single-family homes, duplexes, triplexes, accessory dwelling units, townhomes, condominiums, apartments and similar multi-family units, in a variety of settings including both residential neighborhoods and mixed use nodes.

PC-3. Quality.

Required: Design guidelines, development standards and/or similar assurances that will require high-quality development consistent with the vision set forth in the Master Plan.

Discussion: The County's General Plan contains numerous policies that address quality of new development, but does not provide specific details regarding how a particular Master Plan will be planned and built to ensure that quality is achieved. Conversely, many of the County's tools used implement the General Plan (such as zoning) provide specific details about how land can be used and developed, but do not necessarily address quality. The Master Plan is the bridge between the broad-based General Plan and fine-grained implementation tools like zoning, making it the ideal context to address the quality of development expected within its boundaries.

Master Plans should provide specific details regarding the quality envisioned for the project and appropriate standards to ensure that it will be built out over time in a manner that achieves the stated vision. Detailed design guidelines and firm development standards can be excellent tools for creating certainty that quality will be achieved. Elements of quality to be addressed may include:

- Building form, including architectural styling, materials, articulation, orientation, size, massing, etc.

- “Theming” at the neighborhood or community level, including consistent signage, materials, landscaping, and other elements
- Amenities provided beyond those required by law
- The public realm
- Relationship between uses

PC-4. Accommodate the percentage of low and very low income residential units required by state law per the County’s current Housing Element based on the Regional Housing Needs Allocation (RHNA).

Required: Accommodate ≥ 90 percent of the obligation per RHNA (currently $\sim 33\%$ of units accommodated in RD-20 or higher).

Discussion: State law (California Government Code Section 65583) requires cities and counties to provide “adequate” sites with appropriate zoning, development standards, infrastructure, and public services to facilitate and encourage the development of a variety of types of housing for all income levels.

State law requires SACOG to periodically adopt a Regional Housing Needs Plan (RHNA) for the six-County region. The RHNA determines each jurisdiction’s “fair share” of the region’s housing needs per a methodology established by state law and approved by the California Department of Housing and Community Development (HCD). The purpose of this is to avoid over-concentration of low-income households in any one community.

As part of periodic Housing Element updates required by state law, the County must create a land inventory that identifies vacant and underutilized land available for residential development within the unincorporated area. This land inventory is used to demonstrate how the County can accommodate its “fair share” of the region’s housing needs as determined by the RHNA, including how it will provide adequate sites for low and very low households. Currently, 37 percent of the units allocated to the County per the RHNA are for low and very low households and must be accommodated on land zoned for 20 dwelling units per net acre (RD-20) or greater.

Requiring Master Plans to be consistent with this criterion ensures that they are contributing their “fair share” of adequate sites toward the County’s overall obligation per state law. It represents the “break even” point where the County’s ability to meet state law neither helped nor hurt by adoption of the Master Plan. If numerous Master Plans were adopted with a considerably lower percentage of its units accommodated on land

zoned RD-20 or greater, the County could fall short of adequate sites over time and be forced again to rezone properties in existing communities or planned growth areas, or face other negative consequences such as a moratorium on issuing building permits.

PC-5. Pedestrian- and transit-oriented design.

Required: Pedestrian- and transit-oriented design, including:

- Sidewalks and bike routes along interconnected streets with short block lengths and a high intersection density.
- Prominent pedestrian and bicycle network.
- Few if any cul-de-sacs.
- Pedestrian and bike connections at the ends of all cul-de-sacs unless infeasible due to topography or similar impediments inherent in the project site.

PC-6. Infrastructure Master Plan And Financing Plan

Required: Inclusion of an Infrastructure Master Plan and Financing Plan that include the following:

- The Infrastructure Master Plan shall identify required public facilities and infrastructure (including roads, transit, water, sewer, storm drainage, schools, fire, park, library, and other needed community facilities) and associated costs for the development of the proposed UPA expansion/Master Plan;
- The Financing Plan shall:
 - Include an infrastructure phasing analysis that examines development through buildout taking into consideration potential development activities, facilities requirements and constraints;
 - Identify the phase or timing for when the facilities are needed;
 - Identify the funding mechanisms proposed to pay for the identified infrastructure and facilities;
 - Demonstrate that infrastructure requirements and the associated costs are reasonably balanced throughout each development phase and outline solutions for any potential constraints and/or shortfalls for any given phase.

PC-7. Services Plan

Required: Inclusion of a Services Plan to demonstrate:

- that provision of services to the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers;
- that the operations and maintenance costs stemmed from the required public facilities and infrastructure for the development of the proposed UPA expansion/Master Plan are cost-neutral to the County's General Fund and existing ratepayers, and;
- that existing levels of municipal services will not be negatively impacted by approval and buildout of the proposed UPA expansion/Master Plan.

PC-8. Consistency with County-adopted plans.

Required: Consistency with all applicable County adopted plans not sought to be amended by the proposed project.

PC-9. Consideration of regional planning efforts.

Required: Inclusion of a discussion/analysis of how the proposed UPA expansion/Master Plan relates to broad-based and regional planning efforts, such as SACOG's adopted Blueprint Vision and Metropolitan Transportation Plan, Sacramento County's Visioning documents created for the Jackson Highway and Grant Line East Areas, any applicable Habitat Conservation Plan(s), the Sacramento Metropolitan Air Quality Management District's State Implementation Plan, and Regional Transit's Master Plan.

PC-10. Consideration of jobs-housing balance.

Required: Inclusion of a discussion/analysis of the proposed UPA expansion/Master Plan's jobs-housing balance. Master Plans should provide an internal jobs-housing balance and/or improve the jobs housing balance within the project's vicinity.

Alternative #1 – Criteria-Based

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that:

- meets all of the requirements per the criteria below, and;
- qualifies for a minimum of 18 points (out of a possible 24) per the criteria below

CB-1. Minimum net density.

Required: Minimum density of at least 7 dwelling units per net acre if using “double net” methodology or 9.3 dwelling units per acre if using “triple net” methodology.

Points:

1. ≥ 8 dwelling units per acre if using “double net” methodology, or ≥ 10.6 dwelling units per acre if using “triple net” methodology.	3 points
2. ≥ 9 dwelling units per net acre if using “double net” methodology, or ≥ 12 dwelling units per acre if using “triple net” methodology.	4 points
3. ≥ 10 dwelling units per net acre if using “double net” methodology, or ≥ 13.3 dwelling units per acre if using “triple net” methodology.	5 points

Discussion and definitions:

Double net density methodology: Double net density shall be calculated by considering land area dedicated exclusively to residential and mixed-use residential areas, **including** land for streets and alleys internal to the residential and mixed use residential areas. All other lands are excluded from this calculation, including streets not internal to the residential or mixed use areas, parks, schools, detention basins, other infrastructure, and services needed to support the development, and non-residential uses such as commercial areas, offices, and open space. This methodology shall be used if the Master Plan does not contain details regarding the location, size and extent of streets internal to residential and mixed use areas. A graphic representation of this methodology is provided below, with blue shading representing the residential and mixed use areas included in the calculation.

Triple net density methodology: Triple net density shall be calculated by considering land area dedicated exclusively to residential and mixed-use residential areas, **excluding** land for streets and alleys internal to the residential and mixed use residential areas. All other lands are excluded from this calculation, including streets not internal to the residential or mixed use areas, parks, schools, detention basins, other infrastructure, and services needed to support the development, and non-residential uses such as commercial areas, offices, and open space. This methodology may only be used if the Master Plan contains sufficient details regarding the location, size and extent of streets internal to residential and mixed use areas. A graphic representation of this methodology is provided below, with blue shading representing the residential and mixed use areas included in the calculation.

Allowable deviations from density calculations: Certain lands may be excluded from the density calculation to allow for larger lot residential development and/or a transitional zone between urban uses within the USB and rural uses beyond, including:

- Land within ¼ mile of the USB, OR;
- Up to 10 % of the net residential acreage.

Definition of “dwelling units”: Dwelling units shall include single family homes, duplex and triplex units, condominium units, townhomes, apartment and multiple-family units, and residential units in mixed use buildings. Residential units in congregate care facilities and in the residential portion of a university may be counted when calculating a master plan’s overall density if the County finds that the Master Plan includes assurances that these units will be built. Each planned accessory unit that is allowed “by right” per the Master Plan’s design guidelines, development standards and zoning will be counted as ½ a dwelling unit.. If the County finds that the Master Plan includes assurances that planned

accessory dwelling units will be built to habitable standards and rented or sold to people outside the family resident in the primary unit, they will be counted as one dwelling unit. Hotel rooms and other similar transient housing will not be considered as dwelling units.

CB-2. Proximity of residential units to amenities.

Required: ≥80 percent of all residential units located within one mile of at least three of the following existing or planned amenity categories:

- Public elementary, middle, or high school
- Park or recreational facility
- Grocery store, drug store or commercial center
- Office or industrial employment center
- Civic use (e.g. library, post office, community garden, urban farm)
- Preschool, childcare or senior care facility
- Medical offices or facilities

Points:

1. ≥85 percent of all units located within one mile of at least three of the amenity categories	2 points
2. ≥90 percent of all units located within one mile of at least three of the amenity categories	3 points
3. ≥90 percent of all units located within one mile of at least four of the amenity categories	4 points

CB-3. Mixed use.

Required: Include a mixed use designation, overlay, and/or zoning category that allows vertical mixed use by right, provides uninterrupted pedestrian connections, and prohibit barriers between different uses.

Points:

1. At least 5 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical).	2 points
2. At least 10 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical).	3 points
3. At least 15 percent of a Master Plan's developable land zoned for mixed use (horizontal or vertical) or assurances that at least 5 percent of the residential units will be located and built within vertically integrated mixed-use buildings.	4 points

Discussion: Mixed use shall be defined as “residential uses and at least one or more different use integrated vertically and/or horizontally in conformance with a coherent plan with significant functional, aesthetic, and physical integration of project components including, but not limited to, pedestrian and vehicle circulation, jointly accessible common areas and shared parking, and shared architectural, landscaping, lighting and signage themes.” Mixed use zoning shall allow vertical mixed use by right, provide uninterrupted pedestrian connections, and prohibit barriers between different uses.

CB-4. Transit.

Required: ≥65 percent of all residential units located within ½ mile of existing or planned transit service, which consists of light rail, streetcars, buses, vanpools and/or shuttles that connects with regional public transit service.

Points:**Proximity**

1. ≥ 70 percent of residential units located within $\frac{1}{2}$ mile of existing or planned transit service	2 points
2. ≥ 75 percent of residential units located within $\frac{1}{2}$ mile of existing or planned transit service	3 points
3. ≥ 80 percent of residential units located within $\frac{1}{2}$ mile of existing or planned transit service	4 points

Headways

1. Transit service with headways of 60 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	1 points
2. Transit service with headways of 30 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	2 points
3. Transit service with headways of 15 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	3 points

Discussion: “Planned transit service” shall be defined as service identified in SACOG’s Metropolitan Transportation Plan (MTP), Regional Transit’s (RT) Short Range Transit Plan (SRTP), and/or service to be provided as part of the Master Plan and funded via a secure financial mechanism (example: CSA 10; North Natomas TMA/developer fees). The MTP has a 20+ year planning horizon and is updated every four years; the SRTP has a 10-year planning horizon and is updated every year. Both the MTP and SRTP must be “financially constrained” in that only those transportation projects and programs for which funding is reasonably expected to be available may be included in the plan. Therefore, there is a high likelihood that transit service identified in these plans will ultimately be provided. Service to be provided as part of a Master Plan and funded via a secure financial mechanism would provide similar assurances that identified service will ultimately be provided.

In contrast, transit service envisioned in RT’s long-range TransitAction Plan cannot be implemented until a significant new revenue source is secured, making such service far more speculative. For example, a new $\frac{1}{2}$ cent sales tax increase would only partially fund transit service envisioned in the TransitAction Plan. Therefore, service(s) identified in the TransitAction Plan and similar visioning documents will not be considered

“planned transit service” for purposes of determining consistency with this criterion.

CB-5. Proximity to employment.

Required: Analysis of existing employment/jobs within a five mile radius of the proposed UPA expansion/Master Plan boundary.

Points:

1. <50,000 existing employees/jobs within a 5 mile radius of the proposed project	2 points
2. Between 50,000-100,000 existing employees/jobs within a 5 mile radius of the proposed project	3 points
3. >100,000 existing employees/jobs within a 5 mile radius of the proposed project	4 points

Alternative #2 – Vehicle Miles Travelled (VMT)/Greenhouse Gas (GHG) Emission Metrics

To satisfy this alternative, the Board must find that the proposed project is planned and will be built in a manner that results in:

- ≤14 vehicle miles travelled (VMT) per resident per day (or the equivalent VMT per household per day);

OR

- ≤Equivalent GHG per capita per day from cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight).

Discussion: While consistency with the criteria in Alternative #1 provides a level of certainty that a proposed project will achieve particular outcomes, *measuring* the actual projected outcome(s) of the project is a viable alternative. These projected outcomes can be compared against pre-defined metrics to determine the project’s “performance”. VMT and greenhouse gas (GHG) emissions are logical metrics because a project’s performance in these areas is directly correlated to the project’s ability to achieve the same goals and mandates (relative to air quality, transportation, land use, infrastructure, and GHG emissions) as the criteria in Alternative #1. Additionally, VMT and GHG are very closely related; the mix of vehicles that residents use for their daily travel has a relatively narrow range of GHG emissions per mile traveled. Given the direct correlation between improved VMT and associated reductions in GHG emissions, this alternative directly addresses goals and mandates relative to recent state laws aimed at reducing GHG emissions, including AB 32, SB 375 and SB 97.

VMT is easily measured using standard travel demand analysis methods. Multiple traffic models exist for conducting such analysis. Given the long-range nature of the General Plan and the ever-evolving nature of traffic models, it does not make sense to require use of a specific model to determine compliance with this alternative. However, to ensure that a credible model is employed, the project proponent and County staff (including Environmental Review, DOT, Planning, etc.) will discuss the merits of available models and determine which will be used to determine compliance with this alternative prior to starting the analysis.

The 14 VMT per capita can be translated into a 13 lbs. of GHG per capita by using the same assumptions that SACOG is required to use for calculating SB375 GHG targets. These assumptions are that this travel will use cars, light trucks, and medium trucks (less than 8,500 Gross Vehicle Weight), and that vehicle and fuel improvements are not included. If the technology improvements are included (fuel economy increases and a 10% reduction in the carbon content of gasoline), then the GHG metric would be 8 lbs. of GHG per capita.

LU-123. Before granting approval of an amendment to the Land Use Diagram, the Board of Supervisors shall find that:

- the request is consistent with the objectives and policies of the General Plan;
- the request is consistent with the goals and objectives of a Sacramento County-adopted Habitat Conservation Plan;
- approval of the proposal will not adversely affect the fiscal resources of the County;
- the project will be consistent with the performance standards in this Plan and, for urban uses in urban growth areas, the project complies with the requirements of LU-13.

PF-21. Property buffering the County landfill shall remain in agricultural, recreational or other open space uses and extend at least 2,000 feet in all directions, measured from the landfill's permitted boundary, unless the Department of Waste Management and Recycling determines that the use is compatible with landfill operations and the Board of Supervisors makes the finding that the uses are compatible with the existing or future operations of the landfill.

SACRAMENTO AREA COUNCIL OF GOVERNMENTS (SACOG) BLUEPRINT

The SACOG Board of Directors adopted the Preferred Blueprint Scenario (<http://www.sacregionblueprint.org/adopted/>) in December 2004, hereinafter referred to as the Blueprint. The Blueprint is a growth concept for the greater Sacramento region based on the seven principles listed below, with an ultimate horizon of the year 2050.

Consistent with General Plan Policy LU-113, the Blueprint is treated as an applicable land use policy document intended to avoid environmental impacts. General Plan policies LU-23 and LU-26 are also applicable in this context, as they require inclusion of many of the growth principles (mixed use, compact community design, walkable environments, and open space) unless determined to be infeasible.

1. Provide a variety of transportation choices, including walkable paths
2. Mix land uses
3. Take advantage of compact building and community design
4. Create a range of housing opportunities and choices
5. Strengthen and direct development toward existing communities
6. Foster distinctive, attractive communities with a strong sense of place
7. Preserve open space, farmland, natural beauty, and critical environmental areas

The ultimate purpose of the “smart growth” concept supported by the principles is sustainable communities, and is a reaction to the recognized health and safety impacts of urban sprawl and vehicle-centric development strategies. Various studies have demonstrated that smart growth development significantly reduces impacts to air quality, water quality, open space/biological resources, and public health. A 2000 study found that compact development in New Jersey would produce 40 percent less water pollution than more dispersed development patterns (Rutgers University). A 2005 Seattle study found that residents of neighborhoods where land uses were mixed and streets are better connected, making non-auto travel easier and more convenient, traveled 26 percent fewer vehicle miles than residents of neighborhoods that were more dispersed and less connected (Lawrence Frank and Company). Smart growth development also promotes the clean-up and redevelopment of contaminated lands (brownfields), supports maintenance of infrastructure by concentrating post-development revenue into smaller areas, and requires less extension of new infrastructure. It has also been demonstrated that the greenhouse gas emission reductions incorporated within California’s Executive Order S-3-05 are unlikely to be achieved just through vehicle efficiency and development of low-carbon fuels – significant vehicle trip reductions will also be required (Yang, et. al.) and can be fostered through smart growth land use policies.

The SACOG website for the blueprint (<http://www.sacregionblueprint.org/adopted/>) states that the Blueprint “should be interpreted and used as a concept-level illustration of the growth principles” and that it is “not intended to be applied or implemented in a literal, parcel-level manner”. The Blueprint can be considered an example of how the seven principles could be applied in the Sacramento region. This analysis includes the Blueprint map applicable to the Project area, but the analysis relies on analysis of the Project’s conformity to the principles and overall vision of the Blueprint, rather than conformity to the concept map. This analysis relies on a strict definition of smart growth

– a proposal must be consistent with all seven principles to be called smart growth. The following paragraphs expand on the seven principles, and describe both what does and does not satisfy each principle. The descriptions below were developed using information from the Blueprint, from the Environmental Protection Agency's Smart Growth program (www.epa.gov/dced), from Smart Growth Online (smartgrowth.org), and from Smart Growth America (www.smartgrowthamerica.org). Though these descriptions are provided, the analysis recognizes that the Blueprint principles are general policy statements, and there is no clearly empirical way to analyze a project's consistency. This analysis is somewhat subjective in nature.

TRANSPORTATION

The first principle recommends a mix of transportation options, including walkable paths. This does not merely imply that there must be sidewalks, a bus turnout, and roadways. Those design elements are normal infrastructure required by existing development standards. A project must go beyond these minimums to satisfy the principle. The following paragraphs include some of the design elements that typify pedestrian-, bicycle-, and mass transit-friendly development.

Pedestrian-supportive development includes placing commercial and retail buildings close to the road rather than separated by large parking lots, providing separated sidewalks with landscaping, avoiding cul-de-sacs and non-linear street design that lengthens the distance from one place to another, placing amenities within 5 – 10 minutes walking distance, and creating community trails.

Bicycle-supportive development includes bicycle lanes on roads carrying higher volumes and/or speeds, avoidance of cul-de-sacs and non-linear street design, placement of secure bicycle parking facilities at all amenities, provision of showering facilities at places of employment, and providing a cash buy-out program for employees that do not use a parking space.

Transit supportive development includes creation of exclusive Bus Rapid Transit lanes, provision of queue-jump processes for buses, creation of bus stops at key locations, providing subsidies for employees who choose mass transit, institution of maintenance fees to support ongoing operation of transit, provision of high residential density along all mass transit routes to provide adequate ridership, provision of medium density in many non-corridor areas to support mass transit, provision of a jobs-housing balance within each community rather than just in the region as a whole, and location of development near existing transit lines and job centers.

MIXED-USE

A development is often called mixed use if two or more uses are proposed adjacent to one another. However, this type of project would be better described as multiple use. A mixed use project would involve multiple uses in the same building (e.g. a building with retail on the first floor and apartments on the second floor) or would at a minimum

intersperse and blend multiple uses throughout a development rather than grouping most of the similar uses together. This involves the inclusion of neighborhood community retail centers, markets, and parks within a $\frac{1}{4}$ or $\frac{1}{2}$ mile radius, rather than clustering these amenities in regional centers several miles from the average home.

COMPACT DESIGN

Compact building and community design refers to higher density development, cluster development, including multiple-story buildings, and including smaller buildings. The typical subdivision in Sacramento County is less than 5 dwelling units to the acre, whereas compact community design would involve a minimum of 10 dwelling units to the acre. In many typical subdivisions, the greenspace is divided up amongst all of the residential and commercial lots and fenced off, while in a cluster development homes and businesses would be given smaller private yards and clustered together facing a common greenspace. Townhomes and other types of housing products can be included to provide home square-footage without taking up additional land, and homes can be built with less square footage in general to avoid taking up additional land.

RANGE OF CHOICES

Many subdivisions provide only a handful of floorplans and often only one type of product. A smart growth development would include a range of house sizes and product types to accommodate the range of residents in the community. The needs of young single individuals differ from the needs of a family of 5, and differ again from the needs of seniors. The purchasing power of the different resident groups also varies. Rather than building predominantly single-family homes of several thousand square feet, developments should include cottages of 700 – 1,000 square feet, townhomes, condominiums, apartments, and other housing choices.

DEVELOP IN EXISTING COMMUNITIES

Directing development toward existing communities is accomplished by building on infill land and urban brownfields before developing greenfields, building on greenfields only after the prime infill and brownfield land is developed, and developing greenfields in a logical and phased progression beginning in those areas nearest to existing urban lands.

SENSE OF PLACE

Creating a sense of place, and creating distinctive, attractive communities can be accomplished through a variety of means, and the existing landscape and community context will be a significant driver for that process. However, it can generally be stated that the inclusion of focal points, such as town centers and community main streets plays a role in creating a sense of place. Distinctiveness and attractiveness is a function of how the setbacks are implemented, the amount and location of landscaping, providing variation in building façades while maintaining cohesion, the placement of

garages at homes, and a multitude of other factors. To ensure that this principle is achieved, it is often important to include a comprehensive set of design guidelines for a community.

PRESERVE OPEN SPACE

Preservation of open space, be it for the benefit of agriculture, ecological function, or cultural resources, is an often-overlooked component of smart growth. A project may meet all of the smart growth principles listed above, but still be developed within prime open space. Clearly, it is inevitable that development will involve the destruction of some open space resources if a project is located on undeveloped land (as opposed to a reuse project). The purpose of this principle is not to entirely prevent loss of open space, but to ensure that a project preserves the most sensitive and prime resources within the area. This is partly accomplished through principle five, which directs development toward existing communities where the open space environment is already compromised by existing urbanization. This is also accomplished by identifying the prime ecological, agricultural, and cultural resources during project design, and avoiding those areas. These resources can then become recreational and visual amenities, sequestration areas for carbon dioxide, and natural preserves.

ZONING REGULATIONS

The proposed Project includes a Zoning Ordinance Amendment to create the Cordova Hills Special Planning Area (SPA) to incorporate a Master Plan including Design Guidelines and Development Standards. This would require a rezone from AG-80 (agricultural parcels of at least 80 acres) to the SPA zone. Title II, Article 6, §235-90 through 235-93 of the Sacramento County Zoning Code establishes the procedure and authority for establishing Special Planning Areas in the County. The SPA zoning category was designed to allow for the regulation of properties that have unique environmental, historical, architectural attributes, or other elements that require special conditions that the standard zone regulations do not accommodate. According to §235-90:

It is recognized that in certain circumstances it may be desirable to provide for a greater range or mixture of uses in an area than would be permitted in the standard land use zones of this Code.

The applicant has asserted that due to its location, environmental constraints, the presence of a proposed university/college campus center, and the desire to create a smart growth mixed-use project on the site the plan area requires special conditions in order to develop and revitalize it into a community asset. Section 235-93 of the Zoning Code states that the following items shall be addressed and included in an SPA Ordinance:

1. A list of permitted uses.

2. Performance and development requirements relating to yards, lot area, intensity of development on each lot, parking, landscaping, and signs.
3. Other design standards appropriate for the specific site and development.
4. Legal description of property covered by the ordinance.
5. Reasons for establishment of an SPA Land Use Zone on the particular property.

The draft SPA that has been prepared for the Project is available online through the Sacramento County Planning and Community Development Department at <http://www.planningdocuments.saccounty.net/ViewProjectDetails.aspx?ProjectID=784>.

SIGNIFICANCE CRITERIA

CEQA Guidelines defines “significant” as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.” (Section 15382)

Based on the CEQA Guidelines, a land use impact is significant if Project implementation results in any of the following:

1. Substantial conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including but not limited to a general plan, specific plan or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect.
2. Substantial physical disruption or division of an established community.
3. Displacement of substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere.
4. Creation of an airport safety hazard for people residing or working in the Project area.

Significance criteria four is not discussed below, because the Project lies nearly four miles outside of any of the identified safety contours of Mather Airport, and will not result in the creation of an airport safety hazard.

METHODOLOGY

An evaluation of the potential land use impacts associated with implementation of the Project was based on a review of planning documents, including the various components and policies of the Sacramento County General Plan, other County regulations affecting planning and implementation of the proposed General Plan, the City of Rancho Cordova General Plan, the Sunridge Specific Plan, field reviews of the County, and consultation with appropriate agencies.

IMPACTS AND ANALYSIS

IMPACT: CONFLICT WITH LAND USE PLANS

The Project site is zoned AG-80 and has a General Plan land use designation of General Agriculture 80 (see Plate LA-1 and Plate LA-2). Most of the land north, east, and south of the site is also zoned and designated for General Agriculture uses of at least 80 acres. There are a few single-family homes, but the land is mostly devoted to grazing or passive open space uses. There is a parcel to the north, surrounded on three sides by the Project, which is zoned AG-20 (agricultural parcels of at least 20 acres). This property contains a home, several accessory structures, and an olive grove. There are no current development proposals for the lands north or east of the site, though it should be noted that the property owners of the Project own several of the larger parcels to the north. Property to the east of the Project is outside of the Urban Services Boundary.

The Boy's Ranch, a juvenile correction facility which is operated by the Sacramento County Probation Department, is adjacent to the northeastern Project boundary. This property is zoned A-2 (agricultural-residential properties of at least two acres) and designated Public/Quasi-Public. As of the time of this writing, the facility has been closed due to budget deficits, but it should be assumed that it will resume operation once finances have improved (refer to the Sacramento County Boys Ranch section below). All chapters treat this as an operating facility, for the purposes of the analysis.

Plate LA-1: Zoning in Project Area

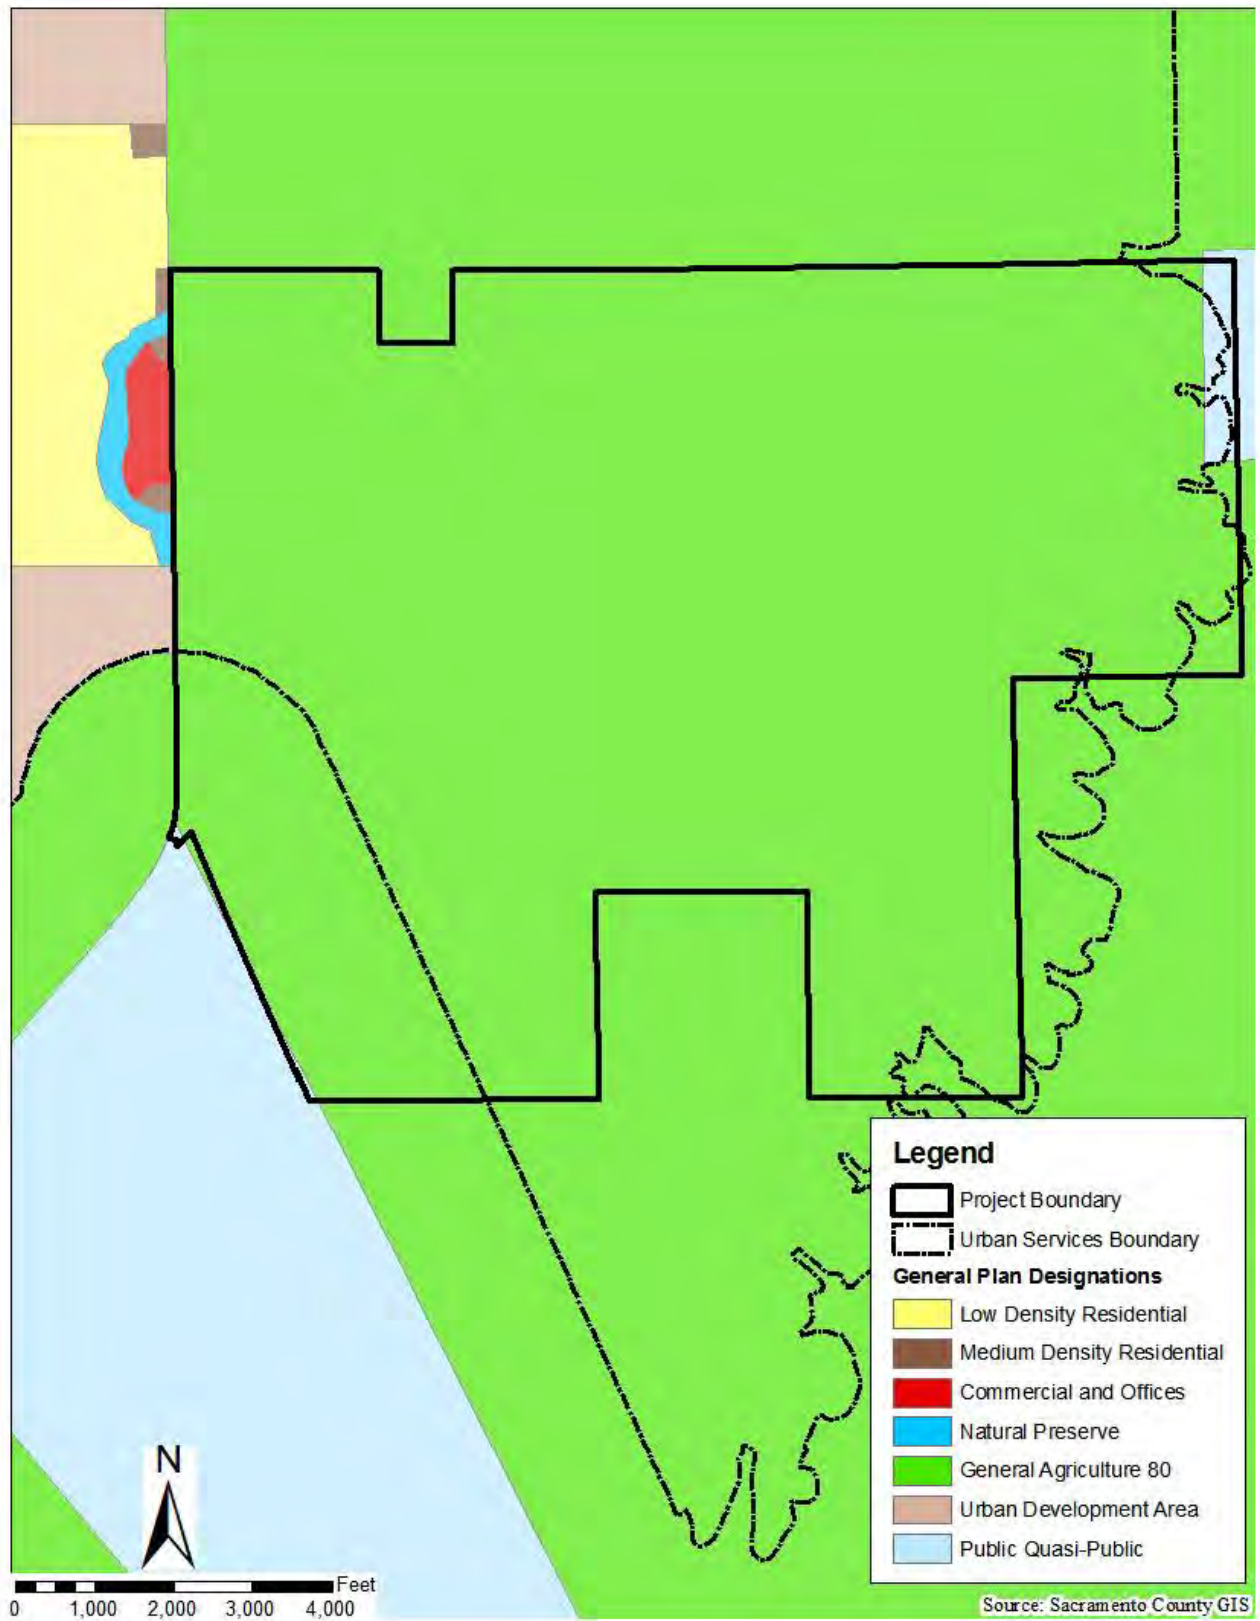

Plate LA-2: General Plan Designations in Project Area

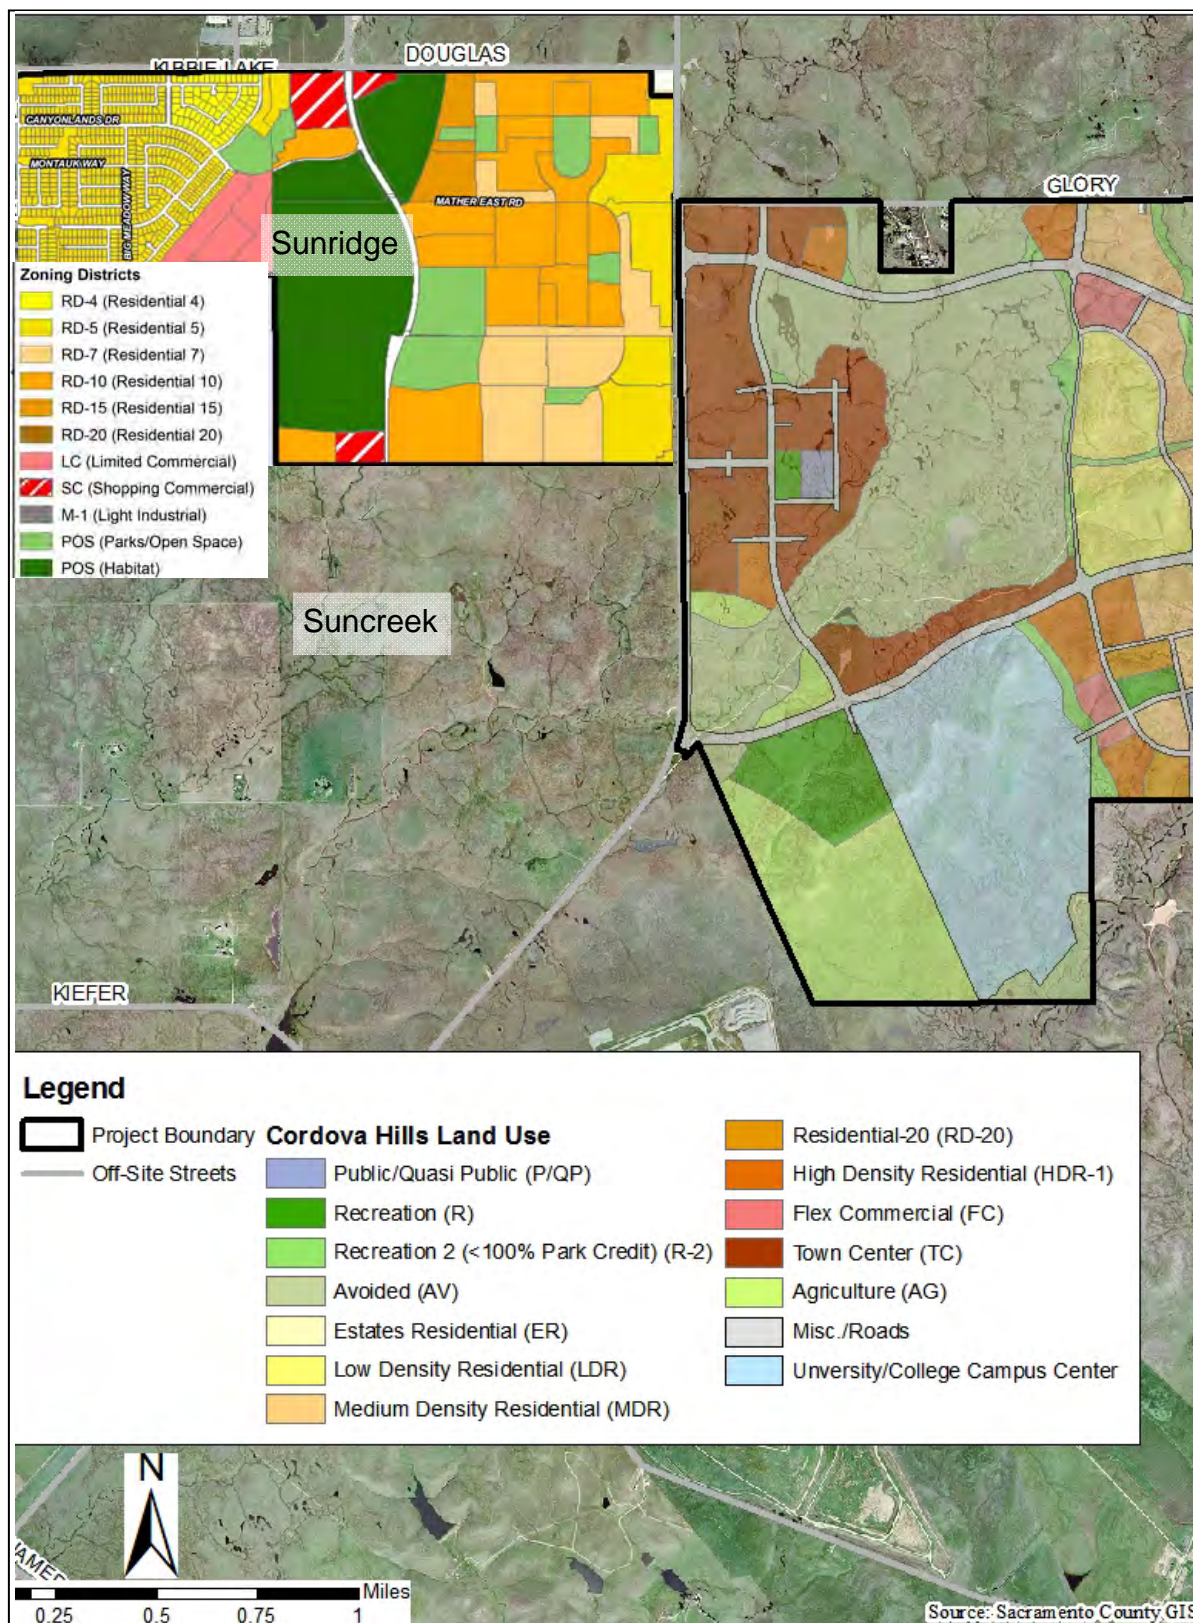

There is also an area to the southwest designated Public/Quasi-Public, which is zoned AG-20 (agricultural parcels of at least 20 acres); this is the Kiefer Landfill property. In the existing General Plan the land within 2,000 feet of the ultimate active landfill boundary has been designated as an urban use buffer which prohibits development that could be incompatible with landfill activities. Though there is currently no approved development plan for the area, the Sacramento County Board of Supervisors has initiated the Kiefer Landfill Special Planning Area project (refer to the Kiefer Landfill section below). These properties are outside of the Urban Services Boundary.

Land to the west is within the City of Rancho Cordova and is approved (tentative maps), designated (Sunridge Specific Plan), or proposed (Suncreek Specific Plan) for future urban development but is currently undeveloped. The City of Rancho Cordova General Plan covers not only the land within the City, but also a substantial amount of land that is within the unincorporated County. This further area outside the City limits is called the “General Plan Planning Boundary”, which the Rancho Cordova General Plan recognizes is outside of City jurisdiction and defines as lands where the City intends to enter into “cooperative agreements on land use and circulation planning” (Rancho Cordova General Plan, page 5). One of these Planning Areas includes the Project site. The presence of two different land use plans over the same land is an inconsistency. However, the City of Rancho Cordova does not have jurisdiction in this area, nor does the Rancho Cordova General Plan contain details about future development in this area, so this EIR does not contain a discussion about land use conflicts in this respect. The Project site is not within the City of Rancho Cordova Sphere of Influence.

The Project site shares a boundary with the City of Rancho Cordova at Grantline Road. The Rancho Cordova General Plan designates all of these City areas along Grantline Road for a range of low to high density residential with a node of commercial at the intersection of Grant Line Road and Douglas Road, north of the site. The approved Sunridge Specific Plan area lies across Grant Line Road from the Project, and includes infrastructure financing plans, approved subdivision maps, and other more detailed development approvals (Plate LA-3). The proposed Suncreek Specific Plan lies across Grant Line Road from the Project, in the area south of Chrysanthy Boulevard; this is shown on the exhibit but no uses are shown since the Draft EIR for the Specific Plan has not been published at this time. Although the land to the west of the Project is currently undeveloped open space, some of this area has land use entitlements and is likely to develop within the near-term. The proposed Project, the Sunridge Specific Plan, and the Suncreek Specific Plan are compatible projects, each containing residential, commercial, and institutional uses.

Plate LA-3: Project Uses and Adjacent Specific Planning

The potential conflicts between Project lands which will be designated for urban uses and lands designated for agricultural uses are discussed in the Agriculture Resources chapter. To summarize that chapter, substantial conflicts between the Project and agricultural lands will not arise because these lands are used for grazing, which does not generate the levels of dust, pesticide drift, fertilizer drift, and noise which are the usual source of conflict; nonetheless, a mitigation measure requiring disclosure of agricultural uses to prospective property owners is included. The proposed Project is compatible with the other adjacent land use plan, the Sunridge Specific Plan. Both projects include a similar mix of uses, and are separated by Grant Line Road. The Project will not result in a significant conflict with a land use plan adopted for the purpose of avoiding or mitigating an environmental effect; impacts are *less than significant*.

IMPACT: CONFLICT WITH LAND USE POLICIES AND REGULATIONS

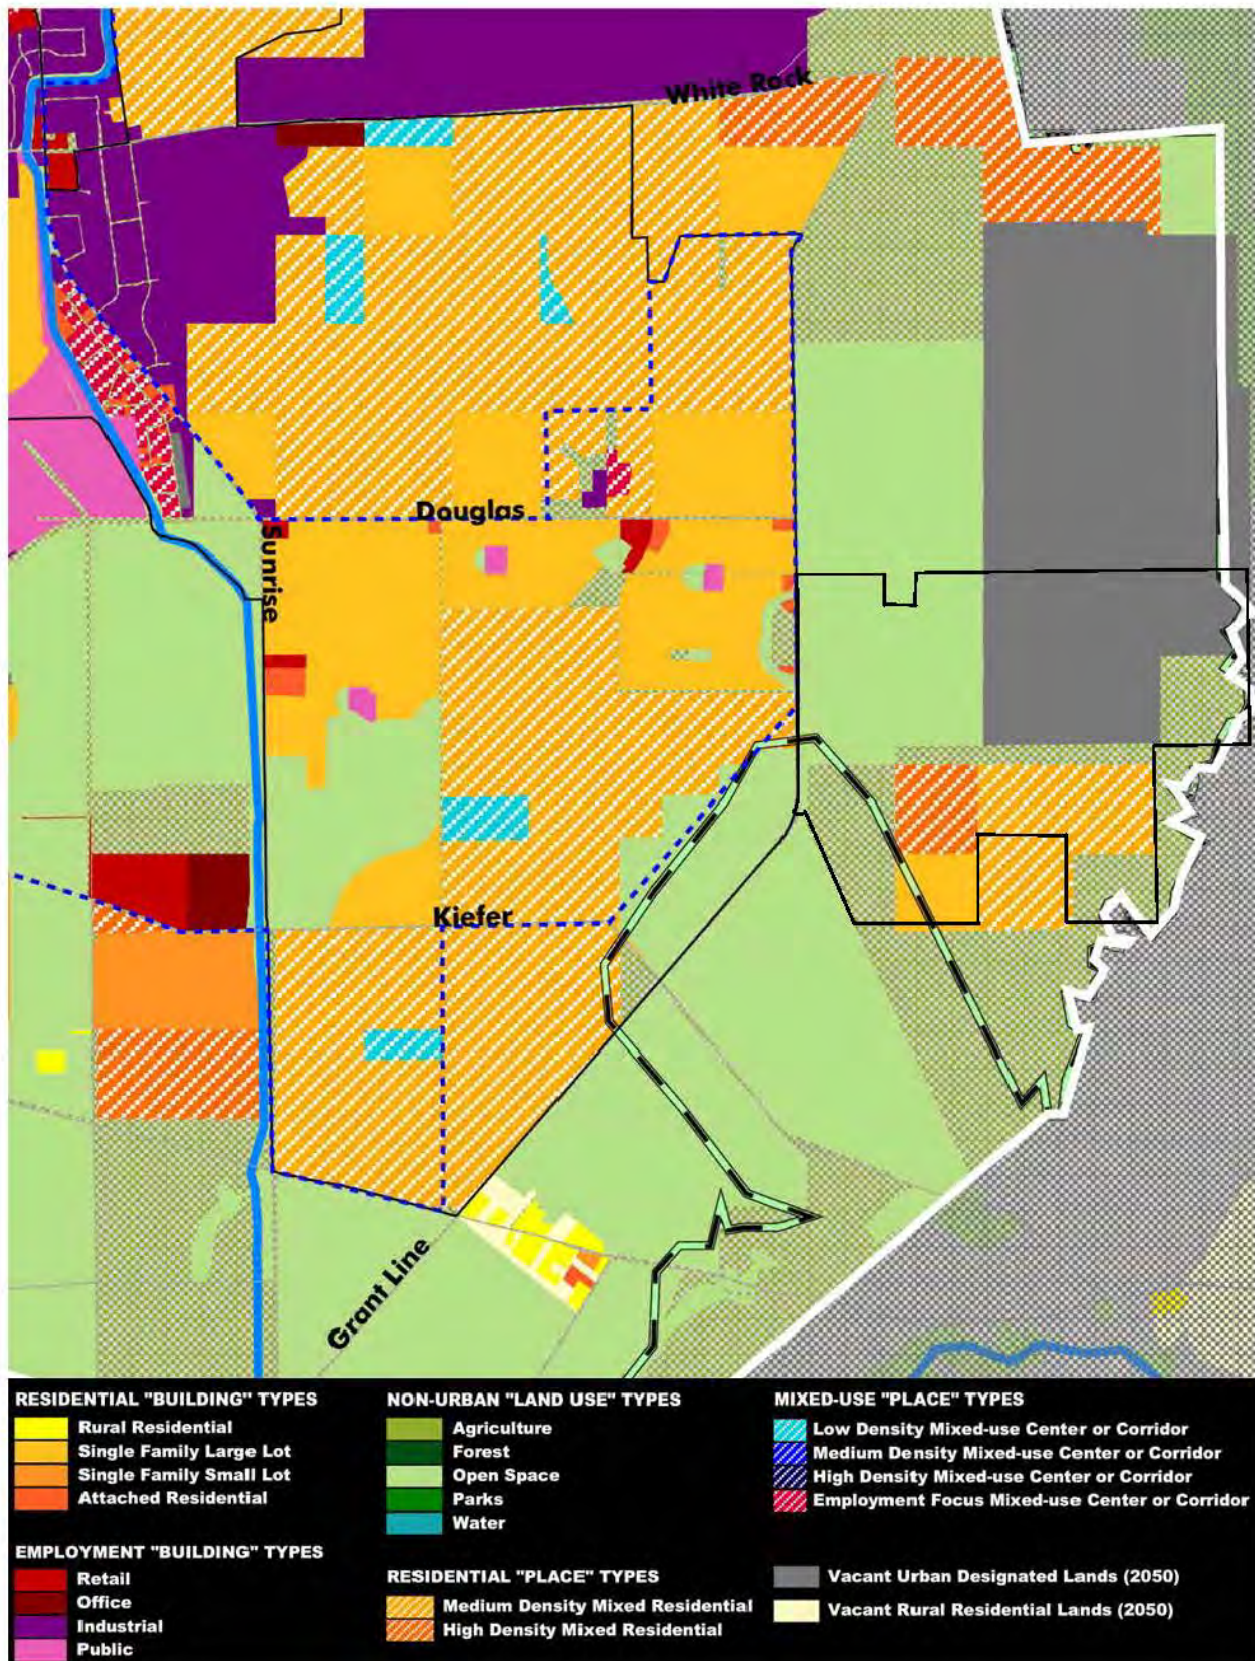

SACOG BLUEPRINT, LU-23, LU-26, AND LU-113

The Blueprint concept plan for the Project area is provided in Plate LA-4. The concept plan depicts conceptual buildout in the year 2050, and depicts buildout of the City of Rancho Cordova planning areas west of Grant Line Road, but shows a relatively minor amount of development east of Grant Line Road by that time – albeit, with a note indicating that some of the land is designated for urban uses but is vacant up to the year 2050. As this map is not intended for parcel-level interpretation, it should not be construed as depicting specific, preferred development locations but should instead be interpreted as displaying preferred overall patterns. In this context, the Blueprint indicates that development should be city-centric, focusing growth within the confines of incorporated city boundaries as a logical buildout from existing urban areas. On this basis, though some development is assumed within the Project area, the Project goes beyond the level of development assumed outside of the city areas by the year 2050 – or put another way, the Project takes a portion of the Blueprint development assumed for beyond the year 2050 and brings it within the 2050 time horizon. The sections below discuss the Project's conformity with the seven blueprint principles, which are also captured by several General Plan policies.

VARIETY OF TRANSPORTATION CHOICES

The Project includes a wide array of transportation choices, including residential collectors and arterials for vehicles, a network designed to accept Neighborhood Electric Vehicles on nearly all of the interior roadways, a mass transit system operated by the Cordova Hills Community Services District, approximately 28 miles of on-street bicycle lanes, approximately 22 miles of off-street multi-use trails, approximately 5 miles of trails within the conceptual university/college campus center, pedestrian bridges and underpasses, and approximately 20 miles of paseos (multi-use pathways which connect vehicular pathways – see the next paragraph).

Plate LA-4: Preferred Blueprint Scenario in Project Area

The only aspect of the Project which is not in strict conformity with this principle is that the overall street network deviates from the grid pattern; however, upon examination of the SPA it becomes clear that this deviation is deliberate and is intended to promote decreased reliance upon automobiles for internal travel. Section 6.11.3 of the SPA describes pedestrian and bicycle paseos, and indicates that streets will deliberately end in cul-de-sacs and other features, from which will extend bicycle and pedestrian paths called paseos (the standard is for 90% of all cul-de-sacs to include paseos). This design will make non-automotive routes the most direct line of travel in many cases. General Plan Policy LU-26 does allow for a modified grid pattern. The Project provides a variety of transportation choices, and is consistent with this principle and with General Plan policy.

COMPACT BUILDING AND COMMUNITY DESIGN

The Project Description chapter includes a table of residential unit totals, which is also included as Table LA-1 below. Including the conceptual university/college campus center dorms, the total Project net density is ten units per acre, and excluding the university/college campus center, the net density is nine units per acre. The Project is twice as dense as the County average of five units per acre, and is consistent with this principle and with General Plan policy.

Table LA-1: Residential Unit Totals

Village	Number of Units	Net Residential Acres	Net Density
Town Center Village	1,750	194.6	9
Ridgeline Village	995	107.2	9
University Village	1,475	96.3	15
Estates Village	500	125.8	4
East Valley Village	1,740	188.6	9
Creekside Village	1,540	192.4	8
University/College Campus Center	1,010	39.7	25
<i>Project Total</i>	<i>9,010</i>	<i>938.3</i>	<i>10</i>

RANGE OF HOUSING

Residential types in the Project range from estate lots of one to four units per acre, to dense multi-family areas of 30 to 40 dwelling units per acre. Based on Table 3.1 of the SPA, the percentage of housing types is approximately as follows: 2% HDR 2 (30 – 40 units per acre), 20% HDR 1 (20 – 30 units per acre), 11% RD 20 (20 units per acre), 39% MDR (7 – 15 units per acre), 24% LDR (4 – 7 units per acre), 2% ER (1 – 7 units per acre), and 2% FC (units integrated into commercial buildings). From these totals it is apparent that the Project includes a reasonable range of housing densities. In terms of product types, details would not be known until tentative map stage, but the SPA does include design guidelines for basic product types that show a variety of parcel

layouts (including alleys for product access instead of driveways), cluster development, and townhomes (beginning with Section 4.4). The SPA also includes a section on design themes for those products (beginning with Section 4.8). From these details it can be concluded that the Project includes an array of housing choices, and is consistent with this principle and with General Plan policy.

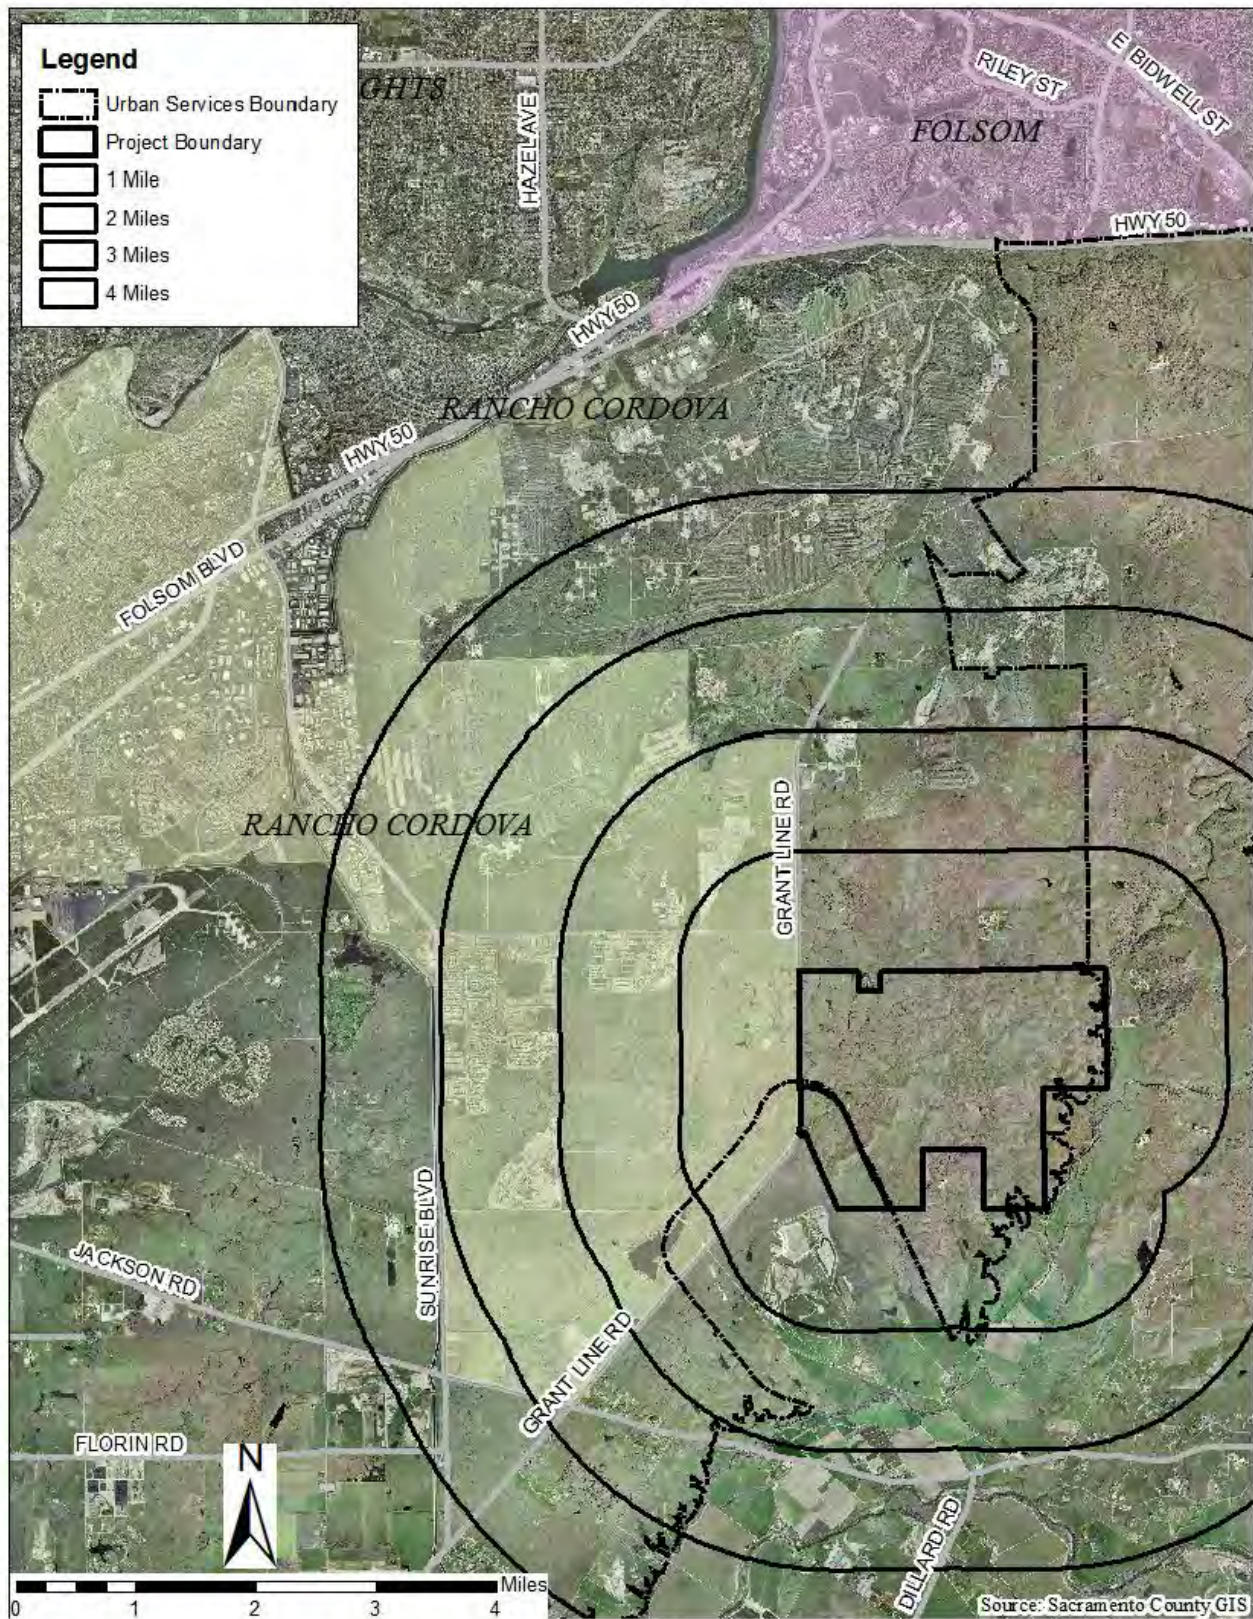

DIRECT DEVELOPMENT TOWARD EXISTING COMMUNITIES

Based on the language contained within the Blueprint, an existing community is defined for this analysis as one that is physically constructed in the existing condition, rather than one that is planned for development at a future time. The City of Rancho Cordova has several either approved or pending Specific Plans within the eastern portion of the City boundaries, but most of these properties are undeveloped, with some small areas where development had been initiated. The nearest incomplete development area is a finger of residential and commercial construction within the Sunridge Specific Plan, approximately one mile from the Project boundary. The nearest complete, built-out community area within the City of Rancho Cordova (the area at the northern end of Sunrise Boulevard) is approximately four miles from the Project boundary. The City of Folsom's Sphere of Influence boundary is approximately four miles from the Project boundary, while the existing urban boundaries are approximately six miles from the Project boundary. Plate LA-5 illustrates this discussion. The Project conflicts with this principle, thus with General Plan policy.

FOSTER A SENSE OF PLACE

The Project includes design guidelines in Chapter 4 which are intended to create a variety of building façades and treatments which nonetheless retain a unified theme. Standards address setbacks, garage locations and treatments, architectural massing, roof forms, streetscape massing, plans and styles, colors and materials, and architectural principles such as: A variety of compatible architectural styles will ensure a degree of individuality in all Villages and neighborhoods. The overall Project layout also includes a variety of open space types integrated with the residential and commercial areas, and includes a Town Center and a university/college campus center. The SPA delineates criteria that will foster a sense of place.

Plate LA-5: Proximity of the Project to Existing Communities (Year 2009)

PRESERVE OPEN SPACE

It is recognized that loss of open space resources is an inherent part of development within greenfield areas, and is not meant to suggest that greenfield development should be prohibited or avoided altogether. The key of the principle is to preserve the most sensitive and prime resources, but on this basis the principle is somewhat subjective, as there is no set definition of what is “most sensitive” or of how much preserved land is sufficient to meet the intent of the principle. One relevant planning document for this analysis is the United States Fish and Wildlife “Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon” (Recovery Plan). This document identifies vernal pool habitats in the Project area as a high priority (Rank 1) vernal pool recovery area. On this basis, the analysis focuses on wetland resources as being the “most sensitive”.

The Project involves the avoidance of 493 acres of land within the 2,669-acre Project boundary, which is approximately 18% of the total site area. The largest of these avoided areas contains the largest assemblage of vernal pool features on the site, and is 298 acres. The boundaries of the 298-acre avoided area were defined through a watershed analysis to determine the upland area that would be necessary to maintain adequate functioning of the wetlands within the open space. On this basis it can be stated that the applicants have made an effort to identify the most sensitive areas and preserve them, so the issue then revolves around the determination of sufficiency regarding the land area.

Though the Project does preserve large areas which were based on sensitivity analysis, the Project will nonetheless result in the loss of 44% of the wetlands on the Project site, which includes 33% of the vernal pool acreage. If the Project were not within an area identified as vital to the preservation and recovery of vernal pools (refer to the Biological Resources chapter), the analysis would likely conclude that the preserved area was sufficient; however, under the circumstances it is concluded that the land area preserved is insufficient to meet the intent of the principle, and thus with General Plan policy.

Though this analysis concludes that the amount of area preserved is not considered sufficient for the purposes of consistency with the principle, it is acknowledged that this determination is somewhat subjective, and that disagreement will exist. It is further acknowledged that although the Project is considered inconsistent based on the amount of land preserved, the Project is consistent inasmuch as the open space areas were designed to avoid the largest concentrations of the most sensitive vernal pool resources on the site.

SUMMARY OF SACOG BLUEPRINT ANALYSIS

The Project includes a wide variety of transportation choices, an array of housing choices, a mix of uses, compact community design, and fosters a sense of place. While acknowledging that in terms of internal community design, the Project appears to be an excellent example of “smart growth” development, it must also be acknowledged that the Project conflicts with the principles with respect to the preservation of open space

and the proximity to existing developed communities. As stated, in terms of open space preservation, the analysis is somewhat subjective, and the Project has directed preservation toward the most sensitive vernal pool areas of the site. In terms of directing development toward existing communities, the conflict is more clear. Note that this is not precisely an issue of location – the Blueprint, the Sacramento County General Plan, and the City of Rancho Cordova have all identified the Project area for future urbanization – it is an issue of timing. Though projected for future development, the Blueprint envisions growth occurring from the existing city centers outward rather than the reverse. This is a fundamental underpinning to the Blueprint, and as a result, the Project's inconsistency with this principle is considered a substantial conflict with the Blueprint and with General Plan policy which supports the Blueprint. Avoidance of this impact would require substantial Project redesign and relocation. Though Alternatives have been considered which would reduce this impact, there is no mitigation available and impacts are *significant and unavoidable*.

GENERAL PLAN GROWTH MANAGEMENT POLICY

General Plan Policy LU-120 is intended to reduce impacts of many different types – such as growth inducement, unacceptable operating conditions on roadways, poor air quality, and lack of appropriate infrastructure – by establishing design criteria for all amendments to the Urban Policy Area. A project must be consistent with the policy before it may be considered for approval. The Planning Division has reviewed the Project for consistency with LU-120 and has found in the affirmative. The Project has been deemed consistent with criteria PC-1 through PC-10, and has achieved a total of 21 points in the criteria-based standards (CB-1 through CB-5). A total of 18 points is required and 24 points are possible. The tables below (Table LA-2 and Table LA-3) summarize the reasoning for the affirmative finding for the performance criteria (PC-1 through PC-10) and for the points achieved in the criteria-based standards. Given that the Project has been deemed consistent, Project impacts related to conflict with growth management policy are *less than significant*.

Table LA-2: Cordova Hills Performance Criteria Determination

CRITERIA		CORDOVA HILLS RESPONSE
PC-1	Vision for connection to other adjacent existing and potential future development areas.	Cordova Hills is integrally linked to existing and future development of adjacent areas in terms of land use compatibility, streets, transit, bike and pedestrian paths, regional recreation opportunities, institutional amenities, resource protection, and public utilities and services.
PC-2	Housing choice.	The Cordova Hills Master Plan provides a range of housing choices that will meet the needs of a diverse range of households, lifestyles, and income levels.
PC-3	Quality.	The Cordova Hills Master Plan provides extensive design guidelines and development standards that ensure an exceptionally high quality of design throughout the Project.
PC-4	Accommodate the percentage of low and very low income residential units required by state law per the County's current Housing Element based on the Regional Housing Needs Allocation (RHNA).	Thirty-three percent (33.2%) of all units in Cordova Hills are designated for a minimum density of 20 dwelling units per acre. The plan exceeds the requirement for high-density housing.
PC-5	Pedestrian- and transit-oriented design.	Cordova Hills is designed to implement and combine several forms of circulation that will provide significant alternatives to conventional vehicle use for common, every day travel and provides an extensive pedestrian and bike trail network linked to schools, parks, employment, and shopping.
PC-6	Infrastructure Master Plan And Financing Plan.	The County Infrastructure Finance Service is reviewing the comprehensive Cordova Hills Financing Plan that addresses all of the requirements of November 6, 2011.
PC-7	Services Plan	The Urban Services and Governance Plan provides a description of the urban services that will be required to serve the Cordova Hills Community along with how and by whom these services will be provided, and how they will be funded over time.
PC-8	Consistency with County-adopted plans.	Cordova Hills is consistent with all County adopted plans that affect the project area. The project incorporates policies, smart growth principles, guiding principles and design guidelines and integrates project infrastructure plans with the County agency's master plans.
PC-9	Consideration of regional planning efforts.	The Cordova Hills Master Plan was prepared with consideration of regional planning and incorporates the Blueprint principles in the land use and circulation plan. The plan is coordinated with regional plans for transportation, transit, sewer, water, and air quality.
PC-10	Consideration of jobs-housing balance.	Cordova Hills includes a substantial employment base (6,548 jobs). The core of Cordova Hills and the adjacent development planned in Rancho Cordova will grow into a significant employment hub along Grantline Road that will contribute to a balance of jobs/housing within five miles of the project.

Table LA-3: Cordova Hills Criteria-Based Standards Determination

CRITERIA			POINTS ACHIEVED BY CORDOVA HILLS
CB-1	Minimum density	≥10 dwelling units per net acre if using “double net” methodology, or ≥13.3 dwelling units per acre if using “triple net” methodology.	5 points
CB-2	Proximity to Amenity	≥90 percent of all units located within one mile of at least four of the amenity categories	4 points
CB-3	Mixed Use	At least 10 percent of a Master Plan’s developable land zoned for mixed use (horizontal or vertical).	3 points
CB-4a	Transit Proximity	≥80 percent of residential units located within ½ mile of existing or planned transit service	4 points
CB-4b	Transit Headway	Transit service with headways of 15 minutes or less during peak hours (Monday through Friday from 7-9 a.m. and 4-6 p.m.)	3 points
CB-5	Employment Proximity	<50,000 existing employees/jobs within a 5 mile radius of the proposed project	2 points
TOTAL POINTS			21 points

GENERAL PLAN POLICIES RELATED TO GROWTH INDUCEMENT

Compliance with General Plan Policies LU-1, LU-2, and LU-12 can avoid the negative physical impacts that result from growth inducement. The need to extend new service lines or improve existing infrastructure is often a financial or physical barrier to new growth. Extending services from an existing developed area to reach a non-contiguous development area, either because of a proposed land use or existing land use, can remove these barriers for the in-between lands. As a direct result, the area may be developed and cause an increase in impacts such as vehicle congestion, pollutant emissions associated with those vehicles, and loss of biological and other physical resources. Growth inducement is discussed in broader terms in the Cumulative and Growth Inducing Impacts chapter of the EIR, and that analysis concludes differently than this analysis. The reason is that this analysis is quite narrowly confined to discussing the ramifications of the policy language, not to the overall effect of the Project on growth inducement.

The Project includes an expansion of the Urban Policy Area to include all of the Project area that is within the Urban Services Boundary. The Urban Policy Area expansion will not include the southwestern portion of the site which is outside of the Urban Services Boundary, but the applicant has nonetheless requested that the Sacramento County Water Agency supply public water for the uses in this area (the sport’s park, corporation yard, etc.). This makes the Project inconsistent with Policy LU-1, and thus the Project

also includes a General Plan Amendment which would add policy language to the General Plan allowing water to 251 acres of the Project outside the USB. The proposed policy language specifically notes that proposed uses so served should help strengthen and preserve the current location of the Urban Services Boundary, consistent with Policy LU-2. According to the Sacramento County Planning Division this language is expressly intended to prevent this policy being used to allow growth inducement, either through use of the policy itself or through statements that the policy sets a precedent of allowing water outside of the Urban Services Boundary and Urban Services Area. The Project is adjacent to existing planned communities (the Sunridge Specific Plan) and is therefore consistent with policy LU-12. The Project will not result in any substantial negative environmental impacts related to conflict with policies LU-12 or LU-1; impacts are *less than significant*.

GENERAL PLAN POLICIES RELATED TO PUBLIC SERVICES AND UTILITIES

Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The policies address a variety of issues, including the need to ensure that adequate facilities will be constructed and that funding is secured for construction and that service providers are contacted to ensure that service planning is adequate. These issues are discussed in detail in the Public Services and Public Utilities chapters of this EIR, but a brief summary is provided here. The Project includes a facilities financing plan which was submitted to all of the applicable service entities for review and approval. Long-term funding sources have been identified for the maintenance of public services. The Project will not result in any substantial environmental impacts related to conflict with General Plan policies which pertain to public services or utilities; impacts are *less than significant*.

GENERAL PLAN POLICIES RELATED TO TRANSPORTATION AND AIR QUALITY

Compliance with General Plan Policies LU-21, LU-22, LU-25, LU-34, LU-35, LU-36, LU-38, LU-46, and LU-71 can reduce the impacts of a project related to transportation and air quality. These policies address provision of a mix of uses, adequate pedestrian circulation, access to non-vehicular transportation, and reduction in energy demand. Providing a mix of uses and access to non-vehicular travel modes can reduce traffic congestion and reduce total trip lengths, which in turn reduces pollutant emissions. Reducing energy demand reduces pollutant emissions generated by the provision of energy. These issues are discussed in more detail in the Air Quality and Transportation and Circulation chapters of the EIR, but a summary is provided here.

The proposed Project includes a mix of uses and a multi-modal transportation system which includes pedestrian paths, bicycle paths, a transit system, and a Neighborhood Electric Vehicle system. The Project has included a Town Center to act as the “Core Area” of the Project, which is directly along the major transportation facility, Grant Line Road. The Project also includes an Air Quality Mitigation Plan and a Greenhouse Gases Reduction Plan which include measures to reduce energy usage.

It is difficult to assess the proposed Project against Policy LU-25, because it is an SPA and does not fall into the zoning categories assumed for this policy. The Project includes areas designated for commercial uses which do not separate retail from office uses. Moreover, the Town Center portion of the Project will include some multi-story, mixed-use buildings, and thus analyzing the percent of the site footprint does not fully assess the Project mix. In addition, several of the land use categories allow both residential and commercial development. Nonetheless, including only commercial, public, and residential acreage in the Project (which excludes the university/college campus center) the Project mix is 60% residential, 16% commercial, and 24% public. This places the Project within the ranges specified by LU-25 for projects with a residential emphasis.

Though the Project does result in substantial impacts related to transportation and air quality, it is not due to conflicts with policies of the General Plan; impacts are *less than significant*.

GENERAL PLAN POLICIES: LAND USE COMPATIBILITY

Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development. The following sections discuss existing adjacent developments and their potential conflicts with the Project proposal.

SACRAMENTO COUNTY BOYS RANCH

The Boys Ranch property abuts the Project boundary, though the main facility is located approximately ¼-mile to the east, on the other side of Carson Creek from the Project site. The facility is closed at this time due to County budget constraints, but for the purposes of this analysis it is assumed that it will reopen once the budget allows. There are various potential issues of land use incompatibility when siting residential development near the Boys Ranch, which include nuisance noise from outdoor recreation areas, odor impacts from the onsite sewage treatment facility, and aesthetic impacts. Most of these issues are discussed in detail in the appropriate topical chapters of this Environmental Impact Report, but the conclusions of those discussions are described here.

The Project proposal designates the lands on the eastern boundary for agricultural uses. Adjacent to these agricultural lands, the Project proposal designates the land for estate residential (1 – 4 units per-acre properties). The estate residential area is on a bluff, which drops down significantly in elevation until reaching Carson Creek. This will place the edge of Project residential properties at least 1,200 feet from Boys Ranch, and 20 – 50 feet higher. This distance will be sufficient to buffer Project uses from nuisance noise and from incidental odors. Future residences can be placed in such a way that the facility is either not visible, due to the bluff edge blocking the view below, or through the use of screening plants. Though nuisance impacts will be *less than significant*, the nature of the facility itself may cause the perception of nuisance or discomfort, leading to potential complaints against the facility. Furthermore, additional

perceived conflict could result if people purchase property within the Project before being fully aware of the facility. For this reason, mitigation recommends including disclosures for prospective buyers of properties within the estate residential area of the Project.

KIEFER LANDFILL

Sacramento County owns and operates the Kiefer Landfill, and the landfill is the primary solid waste disposal facility in the County. Kiefer Landfill is a total of 1,084 acres in size, with a permitted disposal area of 660 acres. It is classified as a Class III municipal solid waste landfill facility and is permitted to accept general residential, commercial, and industrial refuse for disposal, including municipal solid waste, construction and demolition debris, green materials, agricultural debris, and other nonhazardous designated debris.

Kiefer Landfill is permitted to accept a maximum of 10,815 tons per day (tpd) of solid waste, but the average **current** intake is approximately **5,598** ~~6,000~~ tpd. **The annual maximum tonnage for the current fiscal year is 1,202,000 tons per year under its Solid Waste Facility Permit.** Kiefer Landfill receives over 700,000 tons of waste per year. The landfill currently has a permitted capacity of approximately 117 million cubic yards and a remaining capacity of 108 million cubic yards. Currently, the landfill is operating below permitted capacity, and according to CalRecycle the closure date of the Kiefer Landfill is anticipated to be approximately 2064. Based on this closure date, the landfill will still be operational when the Cordova Hills project reaches full build-out.

In addition to the existing Kiefer Landfill, the Board of Supervisors has also initiated the Kiefer Landfill Special Planning Area project. A Notice of Preparation for the project was released on April 19, 2010. This reasonably foreseeable project would designate landfill property for General Agriculture and Public/Quasi-Public, with the former designation for preserve areas and the latter for the landfill and for “waste stream industry” uses. The purpose of the waste stream industry uses is to provide an area for waste recycling, renewable energy projects, and other waste diversion uses. The areas nearest to the Project site would be preserve areas, while the waste stream industry uses would be located south and west of the existing landfill.

There are various potential issues of land use incompatibility when siting residential development near an active landfill, including odor, dust, nuisance pests, litter, noise, aesthetics, and nighttime lighting. Odor, noise, and nighttime lighting are discussed in the appropriate topical chapters of this EIR (Air Quality, Noise, and Aesthetics, respectively), but the conclusions of those discussions are described here. Neither odor, noise, nor aesthetics were deemed significant with respect to the Project, though mitigation is included for odor impacts. Most of the more sensitive project uses are located more than a mile from the ultimate landfill boundary. This distance ensures that the lighting and noise impacts are insubstantial, and allows time for any odors to be dispersed and diffused. The landfill itself operates a gas recapture program; natural gas emissions from landfills is one of the major sources of odor, so this is an effective means of control. Mitigation is included to recommend dense tree and shrub plantings

along the sports park and university/college campus center, to help filter, mix, and disperse any odors.

In terms of dust, nuisance pests, and litter, these are not likely to have any substantial impact on the Project. As stated, the nearest uses are nearly 2,000 feet from the ultimate active landfill boundary, which was deemed by the County to be a reasonable buffer for the purposes of preventing most land use conflicts related to the landfill (consistent with General Plan Policy PF-21). Over that buffer distance, the dust generated by vehicle traveling on unpaved roads and via waste grinding and other processes has sufficient time to be dispersed. Nuisance pests and vectors are typically experienced only in close proximity to the source condition. Any litter which escapes the site is likely to become caught within the intervening landscape; substantial litter is highly unlikely to be blown a distance of nearly ½- mile or more. Litter from the landfill was not observed on any of the site visits to the Project. In addition, there are existing regulations and permits in effect for the landfill which reduce the potential for conflicts.

Pursuant to 14 Cal. Code Regs. § 17200 et seq. 27 Cal. Code Regs. § **20760** ~~21685(b)(8)~~, **the County Environmental Management Department acts as the Local Enforcement Agency in Sacramento County and is certified by CalRecycle (formerly the California Integrated Waste Management Board) to regulate the Kiefer Landfill and oversee its compliance with the State Minimum Standards** CalRecycle (formerly the California Integrated Waste Management Board) must verify ~~that a proposed facility complies with the State Minimum Standards~~. The minimum standards require that facilities be operated and maintained so as not to create a nuisance (14 ~~27~~ Cal. Code Regs. § **20760** ~~17867(a)(2)~~). A "nuisance" at a solid waste facility is defined by CalRecycle as a storage, removal, transport, processing or disposal activity which "is injurious to human health or is indecent or offensive to the senses and interferes with the comfortable enjoyment of life or property," and "affects at the same time an entire community, neighborhood or any considerable number of persons." (14 Cal. Code Regs. §17402(a)(12); 27 Cal. Code Regs. § 20164). To this end, the Solid Waste Facilities Permit in effect for Kiefer Landfill includes an array of measures intended to control nuisance conditions. These existing regulations and permit mechanisms are sufficient to ensure that the landfill will not result in the creation of a significant nuisance condition at the Project location, and impacts are *less than significant*.

Though nuisance impacts will be less than significant, the nature of the facility itself may cause the perception of nuisance or discomfort, leading to potential complaints against the facility. Furthermore, additional perceived conflict could result if people purchase property within the Project before being fully aware of the facility. Increased complaints against the facility may have negative consequences for the landfill, as it could result in the imposition of new permit conditions that impact existing operations. For this reason, mitigation recommends including disclosures for prospective buyers of properties within one mile of the ultimate active landfill boundary.

MITIGATION MEASURES:

- LU-1.** The location and nature of the Sacramento County Boys Ranch facility shall be disclosed to all prospective buyers of estate-residential properties.
- LU-2.** The location and nature of the Kiefer Landfill facility shall be disclosed to all prospective buyers of properties within one mile of the ultimate active landfill boundary. **The disclosure notice shall include:**
- A. **A statement substantially consistent with the following: “The landfill will expand in height and land area over time, and thus the visibility and proximity of the landfill from the property at the time of purchase does not reflect how visible or proximate the landfill will be in the future.” This statement shall be supplemented with relevant facts about ultimate landfill design, including the distance of the property to the ultimate planned edge of the landfill waste disposal area to the nearest 100 feet and the ultimate planned height of the landfill (as set forth in the Solid Waste Facilities Permit).**
 - B. **Notification that the landfill operates under a Solid Waste Facilities Permit and is required to control pests, vectors, litter, and odor to the extent practicable, but that it is not possible to eliminate all of these nuisances. For this reason, property owners may experience some of these nuisance conditions.**
 - C. **Notification that the active landfill area is lighted at night.**

IMPACT: DIVISION OR DISRUPTION OF ESTABLISHED COMMUNITY

The division or disruption of an established community is an impact considered by CEQA. Case law has established that a project must create physical barriers within the established community in order to be considered under this impact category. There is no existing development on the project site, nor are there developments north, south, or east of the site that could be divided or disrupted by the project. Furthermore, the Project includes stub streets so that if there is development north or south of the site in the future, those uses could connect into the Project. The project will not disrupt or divide an established community; impacts are *less than significant*.

MITIGATION MEASURES:

None recommended.

IMPACT: DISPLACEMENT OF HOUSING

There is no existing housing on the Project site that could be displaced by the project, nor would the project uses cause the displacement of nearby housing. The site is not included in the affordable housing inventory as part of implementation of the

Sacramento County General Plan Housing Element. The Project does include an affordable housing plan. Impacts are *less than significant*.

MITIGATION MEASURES:

None recommended.

13 NOISE

INTRODUCTION

This chapter describes the regulatory and environmental settings for noise in the project area and vicinity of the project site, identifies and analyzes the noise impacts of traffic, aircraft, and stationary sources to components of the Project, analyzes the Project's contribution to off-site traffic noise and recommends mitigation measures to reduce or eliminate significant impacts.

NOISE FUNDAMENTALS AND TERMINOLOGY

Noise is often described as unwanted sound, and thus is a subjective reaction to the physical phenomenon of sound. Sound is variations in air pressure that the ear can detect. Sound levels are measured and expressed in decibels (dB), which is the unit for describing the amplitude of sound¹. Because sound pressure levels are defined as logarithmic numbers, the values cannot be directly added or subtracted. For example, two sound sources, each producing 50 dB, will produce 53 dB when combined, not 100 dB. This is because two sources have two times the energy (not volume) of one source, which results in a 3 dB increase in noise levels.

Most environmental sounds consist of several frequencies, with each frequency differing in sound level. The intensities of each frequency combine to generate sound. Acoustical professionals quantify sounds by “weighting” frequencies based on how sensitive humans are to that particular frequency. Using this method, low and extremely high frequency sounds are given less weight, or importance, while mid-range frequencies are given more weight, because humans can hear mid-range frequencies much better than low and very high frequencies. This method is called “A” weighting, and the units of measurement are called dBA (A-weighted decibel level). In practice, noise is usually measured with a meter that includes an electrical “filter” that converts the sound to dBA. The threshold at which one hears sounds is considered to be zero (0) dBA. The range of sound in normal human experience is 0 to 140 dBA. Decibels and other technical terms are defined in Table NO-1.

The ambient noise level is defined as the noise from all sources near and far, and refers to the noise levels that are present before a noise source being studied is introduced. A synonymous term is pre-project noise level.

¹ Equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals.

Table NO-1: Acoustical Terminology

TERM	DEFINITION
Ambient Noise Level:	The composite of noise from all sources near and far. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location.
Intrusive Noise:	That noise which intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of a sound depends upon its amplitude, duration, frequency, and time of occurrence and tonal or informational content as well as the prevailing ambient noise level.
Decibel, dB:	A unit for describing the amplitude of sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micropascals (20 micronewtons per square meter).
Frequency, Hz	The number of complete pressure fluctuations per second above and below atmospheric pressure.
Community Noise Equivalent Level, CNEL*:	The average equivalent sound level during a 24-hour day, obtained after addition of approximately five decibels to sound levels in the evening from 7:00 p.m. to 10:00 p.m. And ten decibels to sound levels in the night before 7:00 a.m. and after 10:00 p.m.
Day/Night Noise Level, L_{dn}^*:	The average equivalent sound level during a 24-hour day, obtained after addition of ten decibels to sound levels in the night after 10:00 p.m. And before 7:00 a.m.
Equivalent Noise Level, L_{eq}:	The average noise level during the measurement or sample period. L_{eq} is typically computed over 1, 8 and 24-hour sample periods.
L_{max}, L_{min}:	The maximum or minimum sound level recorded during a noise event.
L_n :	The sound level exceeded “n” per percent of the time during a sample interval. L_{10} equals the level exceeded 10 percent of the time (L_{90} , L_{50} , etc.)
Noise Exposure Contours:	Lines drawn about a noise source indicating constant levels of noise exposure. CNEL and L_{dn} contours are frequently utilized to describe community exposure to noise.
Sound Exposure Level, SEL; or Single Event Noise Exposure Level, SENEL:	The level of noise accumulated during a single noise event, such as an aircraft overflight, with reference to a duration of one second. More specifically, it is the time integrated A-weighted squared sound pressure level for a stated time interval or event, based on a reference pressure of 20 micropascals and a reference duration of one second.
Sound Level, dBA:	The sound pressure level in decibels as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the response of the human ear and gives good correlation with subjective reactions to noise.

NOISE SETTING

The project site is located on the east side of Grant Line Road and south of Glory Road. Glory Road is a gravel private road serving only a few properties, and thus carries minimal traffic. Grant Line Road is a two-lane thoroughfare which carries approximately 6,500 daily trips in the Project vicinity (refer to the Traffic and Circulation chapter). Plate NO-1 depicts the location of the project site. The project site is zoned agricultural and there are a few houses just north of the project site. There is one residential structure located adjacent to the northern property boundary.

Existing potential noise sources in the Project vicinity include traffic on Grant Line Road, Kiefer Landfill, and Mather Airport. Mather Airport is located approximately 4 miles to the west. At the nearest point, the Project site is located approximately 2.25 miles outside the 60 CNEL contour for Mather Airport. Kiefer Landfill is located to the south/southwest of the project site. The nearest sensitive Project use to the landfill will be the university/college campus center, which is approximately 0.5 mile from the northern portion of the landfill.

The boundaries of the City of Rancho Cordova lie to the west of the project site, across Grant Line Road. The Rancho Cordova General Plan Land Use Policy Map (adopted June 26, 2006) designates the area along Grant Line Road, between Chrysanthy Boulevard and Douglas Road, as low density residential, with a node of commercial at the intersection of Grant Line Road and Douglas Road, north of the site. The development to take place along Grant Line Road is part of the Sunridge Specific Plan, which encompasses 2,606 acres. The project is primarily residential, consisting of mostly single-family residential units, some multi-family garden apartments, townhomes and condominiums. There is also a proposed project, the Suncreek Specific Plan, which lies south of the approved Sunridge Specific Plan and will contain similar uses.

Plate NO-1: Location Map

REGULATORY SETTING

In order to limit population exposure to physically and/or psychologically damaging noise levels, the State of California and Sacramento County have established standards and ordinances to control noise.

STATE OF CALIFORNIA

The California Department of Health Services (DHS) office of Noise Control has studied the relationship between noise levels and different land uses. As a result, the DHS has established four categories for judging the severity of noise intrusion on specified land use. Noise in the “normally acceptable” category places no undue burden on affected receptors and would need no mitigation. As noise rises into the “conditionally acceptable” range, some mitigation of exposure (as established by an acoustical study) would be warranted. At the next level, noise intrusion is so severe that it is classified “normally unacceptable” and would require extraordinary noise reduction measures to avoid disruption. Finally, noise in the “clearly unacceptable” category is so severe that it cannot be mitigated.

Title 24 of the California Administrative Code establishes standards governing interior noise levels that apply to all new multifamily residential units in California. The standards require that acoustical studies be performed prior to construction at building locations where the existing L_{dn} exceeds 60 dBA. Such acoustical studies are required to establish mitigation measures that will limit maximum L_{dn} noise levels to 45 dBA in any inhabitable room. The U.S. Department of Housing and Urban Development (HUD) has set an L_{dn} of 45 as its goal for interior noise in residential units built with HUD funding.

2030 COUNTY GENERAL PLAN NOISE ELEMENT

The goals of the Sacramento County General Plan Noise Element are to: (1) protect the citizens of Sacramento County from exposure to excess noise and (2) protect the economic base of Sacramento County by preventing incompatible land uses from encroaching upon existing planned noise-producing uses. The General Plan defines a noise sensitive outdoor area as the primary activity area associated with any given land use at which noise sensitivity exists. Noise sensitivity generally occurs in locations where there is an expectation of relative quiet, or where noise could interfere with the activity which takes place in the outdoor area. An example is a backyard, where loud noise could interfere with the ability to engage in normal conversation.

The Noise Element of the Sacramento County General Plan establishes noise exposure criteria to aid in determining land use compatibility by defining the limits of noise exposure for sensitive land uses. There are policies for noise receptors or sources, transportation or non-transportation noise, and interior and exterior noise.

NO-1. The noise level standards for noise-sensitive areas of *new* uses affected by traffic or railroad noise sources in Sacramento County are shown by Table 1. Where

the noise level standards of Table 1 are predicted to be exceeded at new uses proposed within Sacramento County which are affected by traffic or railroad noise, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 1 standards.

**Table NO-2: Noise Element Table 1
Noise Standards for New Uses Affected by Traffic and Railroad Noise**

New Land Use	Sensitive Outdoor Area – L_{dn}	Sensitive Interior Area – L_{dn}
All Residential ⁵	65	45
Transient lodging ^{3,5}	65	45
Hospitals and nursing homes ^{3,4,5}	65	45
Theaters and auditoriums ³	None	35
Churches, meeting halls, schools, libraries, etc. ³	65	40
Office buildings ³	65	45
Commercial buildings ³	None	50
Playgrounds, parks, etc	70	None
Industry ³	65	50
<ol style="list-style-type: none"> 1. Sensitive areas are defined in acoustical terminology section. 2. Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions. 3. Where there are no sensitive exterior spaces proposed for these uses, only the interior noise level standard shall apply. 4. Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation either by hospital staff or patients. 5. If this use is affected by railroad noise, a maximum (L_{max}) noise level standard of 70 dB shall be applied to all sleeping rooms to reduce the potential for sleep disturbance during nighttime train passages. 		

NO-4. New residential development within adopted Airport Policy Area boundaries, but outside the 60 CNEL, shall be subject to the following conditions:

- A. Provide minimum noise insulation to 45 dB CNEL within new residential dwellings, including detached single family dwellings, with windows closed in any habitable room.

- B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within an Airport Policy Area.
- C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento, recorded with the Sacramento County Recorder, and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within an Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the subject Airport.

Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural and between the 60 and 65 CNEL contours, shall be permitted within adopted Airport Policy Area boundaries, but would be subject to the conditions listed above.

- NO-5. The interior and exterior noise level standards for noise-sensitive areas of new uses affected by existing non-transportation noise sources in Sacramento County are shown by Table 2. Where the noise level standards of Table 2 are predicted to be exceeded at a proposed noise-sensitive area due to existing non-transportation noise sources, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 2 standards within sensitive areas.

Table NO-3: Noise Element Table 2
Non-Transportation Noise Standards Median (L_{50})/Maximum (L_{max})

New Land Use	Outdoor Area		Interior
	Daytime	Nighttime	Day and Night
All Residential	55 / 75	50 / 70	35 / 55
Transient lodging ⁴	55 / 75	---	35 / 55
Hospitals and nursing homes ^{5,6}	55 / 75	---	35 / 55
Theaters and auditoriums ⁶	---	---	30 / 50
Churches, meeting halls, schools, libraries, etc. ⁶	55 / 75	---	35 / 60
Office buildings ⁶	60 / 75	---	45 / 65
Commercial buildings ⁶	---	---	45 / 65
Playgrounds, parks, etc ⁶	65 / 75	---	---
Industry ⁶	60 / 80	---	50 / 70
<ol style="list-style-type: none"> 1. The Table 2 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 2, then the noise level standards shall be increased at 5 dB increments to encompass the ambient. 2. Sensitive areas are defined in the acoustic terminology section. 3. Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions. 4. Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours. 5. Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients. 6. The outdoor activity areas of these uses (if any), are not typically utilized during nighttime hours. 7. Where median (L_{50}) noise level data is not available for a particular noise source, average (L_{eq}) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply. 			

- NO-6. Where a project would consist of or include non-transportation noise sources, the noise generation of those sources shall be mitigated so as not exceed the interior and exterior noise level standards of Table 2 at existing noise-sensitive areas in the project vicinity.
- NO-7. The “last use there” shall be responsible for noise mitigation. However, if a noise-generating use is proposed adjacent to lands zoned for uses which may have sensitivity to noise, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the Table 2 standards at the property line of the generating use in anticipation of the future neighboring development.
- NO-8. Noise associated with construction activities shall adhere to the County Code requirements. Specifically, Section 6.68.090(e) addresses construction noise within the County.
- NO-9. For capacity enhancing roadway or rail projects, or the construction of new roadways or railways, a noise analysis shall be prepared in accordance with the Table 3 requirements. If projected post-project traffic noise levels at existing uses exceed the noise standards of Table 1, then feasible methods of reducing noise to levels consistent with the Table 1 standards shall be analyzed as part of the noise analysis. In the case of existing residential uses, sensitive outdoor areas shall be mitigated to 60 dB, when possible, through the application of feasible methods to reduce noise. If 60 dB cannot be achieved after the application of all feasible methods of reducing noise, then noise levels up to 65 dB are allowed.

If pre-project traffic noise levels for existing uses already exceed the noise standards of Table 1 and the increase is significant as defined below, feasible methods of reducing noise to levels consistent with the Table 1 standards should be applied. In no case shall the long-term noise exposure for non-industrial uses be greater than 75 dB; long-term noise exposure above this level has the potential to result in hearing loss.

A significant increase is defined as follows:

<u>Pre-Project Noise Environment (Ldn)</u>	<u>Significant Increase</u>
Less than 60 dB	5+ dB
60 – 65 dB	3+ dB
Greater than 65 dB	1.5+ dB

- NO-12. All noise analyses prepared to determine compliance with the noise level standards contained within this Noise Element shall be prepared in accordance with Table 3.

The requirements as listed in Table 3 of the Noise Element are that an acoustical analysis shall:

1. Be the responsibility of the applicant.
2. Be prepared by qualified persons experienced in the fields of environmental noise assessment and architectural acoustics.
3. Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.
4. Estimate projected future (20 year) noise levels in terms of the Standards of Tables 1 and 2, and compare those levels to the adopted policies of the Noise Element.
5. Recommend appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element.
6. Estimate interior and exterior noise exposure after the prescribed mitigation measures have been implemented.

NO-13. Where noise mitigation measures are required to satisfy the noise level standards of this Noise Element, emphasis shall be placed on the use of setbacks and site design to the extent feasible, prior to consideration of the use of noise barriers.

SACRAMENTO COUNTY NOISE CONTROL ORDINANCE

The County's Noise Control Ordinance sets limits for exterior noise levels on some designated agricultural-residential and all residential properties. The Noise Ordinance does not apply to noise levels at agriculturally zoned properties. Most of the properties surrounding the Project site are zoned agricultural; however, portions of Grant Line Road, Douglas Road and White Rock Road are zoned for future residential land uses. The portions of these roadway segments that are within the County would be subject to the Noise Ordinance.

The residential land uses along Grant Line Road and Douglas Road are located within the City of Rancho Cordova. Rancho Cordova's Noise Ordinance is based on the County's Noise Ordinance.

The standards found in the County's Noise Control Ordinance are based on the duration of noise on private property over one-hour periods. The ordinance is primarily concerned with regulating noise other than noise generated by transportation noise sources (e.g., passing cars or aircraft flyovers). The ordinance limits the duration of noise based on many factors, including the type of source, tonal characteristics of the source, ambient noise levels, time of day, etc., by utilizing a system of noise criteria not to be exceeded based on the duration of noise over any given hour. Table NO-4 summarizes the Noise Ordinance standards.

In recognition of ambient noise, the ordinance allows the standards set forth in Table NO-4 to be adjusted in 5 dBA increments to encompass the ambient noise level. For

example, if the ambient noise level for a given hour was 57 dBA, the daytime L50 noise standard would be increased to 60 dBA. The Noise Control Ordinance also states that each of the standards identified in Table NO-4 should be reduced by 5 dBA for impulsive or simple tone noises², or for noises consisting of speech or music.

Table NO-4: Sacramento County Noise Ordinance

Cumulative Duration of the Intrusive Sound	Descriptor	Exterior Noise Standard, dB	
		Daytime (7am – 10pm)	Nighttime (10pm – 7am)
30 – 60 minutes per hour	L ₅₀	55	50
15 – 30 minutes per hour	L ₂₅	60	55
5 – 15 minutes per hour	L ₀₈	65	60
1 – 5 minutes per hour	L ₀₂	70	65
Level not to be exceeded at any time	L _{max}	75	70

MATHER COMPREHENSIVE LAND USE PLAN

The State of California regulates airports under the authority of the Airport Land Use Commission Law, Chapter 4, Article 3.5, California Public Utilities Code. The purpose of the Airport Land Use Commission Law is to:

1. Protect public health, safety and welfare through the adoption of land use standards that minimize the public's exposure to safety hazards and excessive levels of noise; and
2. Prevent the encroachment of incompatible land uses around public-use airports, thereby preserving the utility of these airports into the future.

The Sacramento Area Council of Governments (SACOG) has been designated the Airport Land Use Commission (ALUC) for Sacramento, Sutter, Yolo and Yuba counties. The ALUC is an autonomous agency and does not have jurisdiction over the operation of any airport. Under the provisions of the law, the ALUC is required to prepare a Comprehensive Land Use Plan (CLUP) for each public airport within its jurisdiction.

² "Impulsive noise" means a noise characterized by brief excursions of sound pressures whose peak levels are very much greater than the ambient noise level, such as might be produced by the impact of a pile driver, punch press or a drop hammer, typically with duration of one second or less. "Simple tone noise" or "pure tone noise" means a noise characterized by the presence of a predominant frequency or frequencies such as might be produced by a whistle or hum.

A CLUP designates planning boundaries (zones) around the airport and provides guidelines that define compatible types and patterns of future land use. These guidelines fall into three categories: (1) provide height restrictions that aim to protect the navigable airspace around airports for aircraft safety, (2) provide noise compatibility by minimizing the number of people exposed to noise from aircraft operations, and (3) provide for the safety of people on the ground by minimizing the number of people exposed to hazards related to aircraft operations and accidents.

In May 1996, the ALUC prepared a draft Mather Airport CLUP Update to establish new height, noise and safety zones for Mather Airport based on its projected buildout use as a County-operated aviation facility (and not a military airfield). An amended version of the CLUP was adopted by the ALUC Board on May 15, 1997. The Sacramento County Board of Supervisors approved a package of amendments to the General Plan that included this amended version of the Mather Field CLUP.

Land uses are restricted within airport safety zones to minimize the number of people exposed to aircraft crash hazards. The safety zones established by the CLUP consist of the clear zone, the approach-departure zone and the overflight zone. The clear zone is the area located immediately at the end of the runway and is the most restrictive safety area. The approach-departure zone is located beyond the clear zone and the end of each runway along the primary flight paths and is less restrictive. The least restrictive of the three safety areas is the overflight zone, which generally coincides with the area overflown by local traffic patterns.

The following information is from the noise section of the 1997 Mather CLUP. Airport noise is of concern since most complaints are related to noises generated by aircraft operations. The noise exposure has the potential to interfere with sleep, conversation, school, business, and recreational activities. The effect of noise interference on normal activities is most often described in terms of annoyance. Annoyance is a measure of the general adverse reaction people have to noise that causes interference to their normal lives. Currently, the best measure of this response to noise is the percentage of the affected population that can be characterized as “highly annoyed” by long term exposure to noise at a specified level. Community response is a term used to describe annoyance of groups of people exposed to noise sources in residential settings.

There is variability in the way individuals react to noise that makes it impossible to accurately predict how an individual will react to a given noise. However, when an impacted area is considered as a whole, trends start to emerge that relate noise to annoyance on a community level. The studies of community reaction to noise have shown that the community response to aircraft noise is affected not only by how loud the noise is, but also how often the noise occurs. It is noted in the Mather CLUP that complaints are not an accurate measure of impact. Annoyance can exist without complaints and complaints can occur without annoyance; thus, complaints are an inadequate indicator of the full extent of noise effects on a community or group of people.

The CLUP makes the finding that based on studies of noise the State of California has established noise standards in the California Code of Regulations, Title 21, Subchapter 6. These standards designate the Community Noise Equivalency Level (CNEL) as the noise rating method to be used at airports in California. Most commercial, industrial, and recreational uses are compatible with noise levels up to 70 dB CNEL. The State has deemed the following land uses to be incompatible in the 65 dB CNEL:

- residential dwellings
- public and private schools
- hospitals and convalescent homes
- churches, synagogues, temples and other places of worship

The project site is located outside the 60 dB CNEL (refer to Plate NO-2); therefore development of the proposed project is not considered an incompatible use per the California Code of Regulations. However, the project site is located within the Mather Airport Planning Policy Area (APPA) as shown on Plate NO-3.

MATHER AIRFIELD AIRPORT PLANNING POLICY AREA (APPA)

The Mather Airfield Airport Planning Policy Area (APPA), was adopted on April 19, 2006 by the Sacramento County Board of Supervisors by resolution 2006-1378. The APPA boundary is the area around Mather Airport that contains the 55 CNEL aircraft noise contour and most of the lower altitude portions of flight tracks for large aircraft flying below 3,000 feet above ground level. Within this area, residential development would be allowed, but a disclosure notice to potential homebuyers that addresses aircraft overflight and related noise beyond the normally mapped noise exposure contours would be required. This disclosure notice includes: seller's real estate disclosure statement, subdivision white paper disclosure, recorded deed notices, and grant of avigation easement. Thus, development within the APPA is not restricted, but there would be conditions that residential development would be contingent upon the requirement of a disclosure notice to prospective buyers. The disclosure would identify the property as located within the APPA and that aircraft can be expected to regularly fly at varying altitudes below 3,000 feet above ground level in that area. A granting of an Avigation Easement would also be required to further ensure that all future home buyers are aware of potential aircraft overflights.

Plate NO-2: Mather CNEL Contour Map

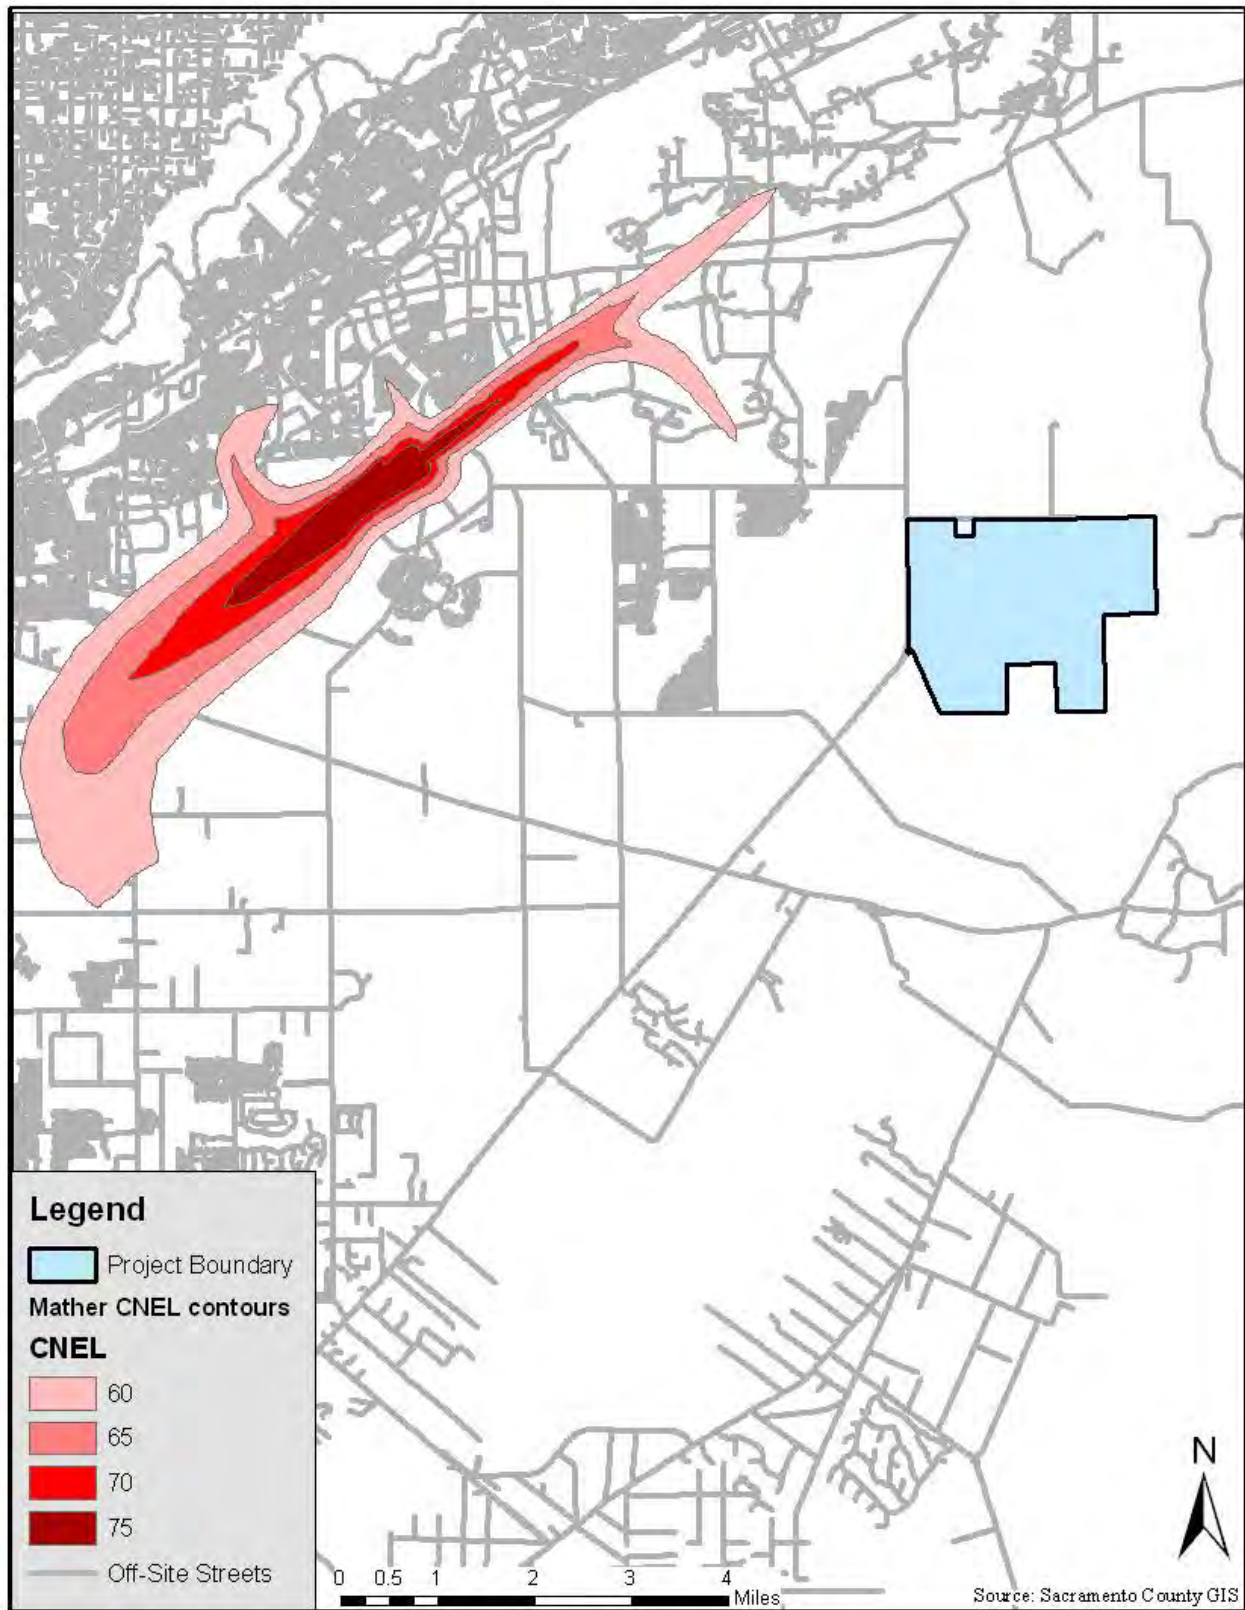

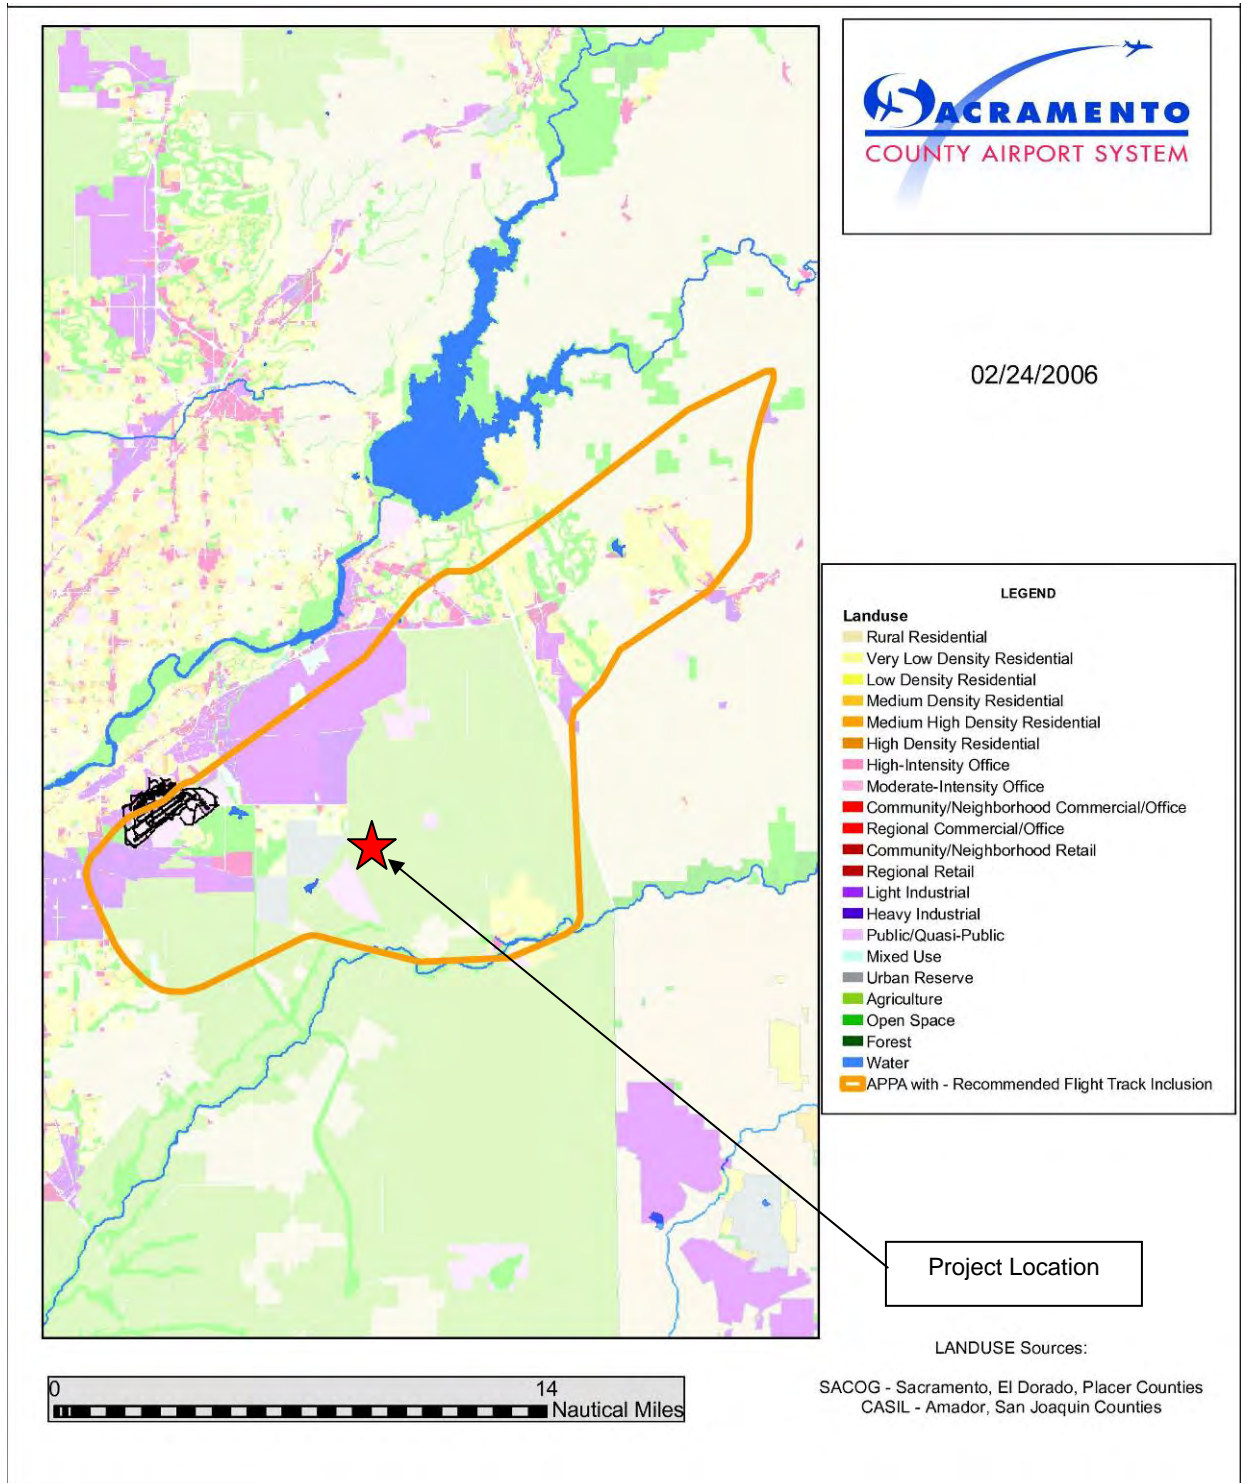

Plate NO-3: Mather Airport Planning Policy Area

CITY OF RANCHO CORDOVA GENERAL PLAN NOISE ELEMENT

There are roadway segments located within the City of Rancho Cordova that were studied in the Traffic Impact Study (TIS) and traffic associated with the proposed Project has the potential to increase noise levels to sensitive receptors.

The following Policies of the City of Rancho Cordova's Noise Element apply:

Policy N.1.2 Ensure that the indoor and outdoor areas of new projects will be located, constructed, and/or shielded from noise sources in compliance with the City's noise standards to the maximum extent feasible.

Policy N.2.3 Emphasize mitigation methods other than soundwall installation to reduce noise acceptable levels in residential areas originally constructed without soundwalls.

Table N-2 of the Rancho Cordova Noise Element outlines the maximum transportation noise exposure for various land uses. According to Table N-2, residential land uses shall not have an outdoor activity area (where the location of the outdoor activity area is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use) greater than 60 dB and interior noise levels shall not exceed 45 dB. However, a footnote to the table indicates that where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn} /CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn} /CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

Also note that the Noise Element contains interior noise limitations for several classes of non-residential uses, such as churches and offices, but there are no standards for industrial, retail, or other non-residential uses. The interior noise standard for churches is listed as 40 dB L_{eq} , for offices is 45 dB L_{eq} , and for transient lodging is 45 dB L_{dn} .

CITY OF FOLSOM NOISE ORDINANCE

There are some roadway segments that were studied in the TIS that are located within the jurisdiction of the City of Folsom. The Folsom General Plan Noise Element Policy 30.4 considers areas as "noise-impacted" if they are exposed to existing or projected exterior noise levels exceeding 60 dBA L_{dn} /CNEL, or to non-transportation noise exceeding the performance standards summarized of Noise Element Table 26-3 (the table is not included in this EIR, as the Project will not contribute non-transportation noise to the City of Folsom). The General Plan does not identify "noise-impacted" to mean that noise is significant, but rather that a noise analysis to determine consistency with General Plan policy would be required. Significant noise is defined by later policies, including the policy most relevant to potential Project impacts:

Policy 30.5: New development of residential or other noise sensitive land uses will not be permitted in noise impacted areas unless effective mitigation measures are incorporated into the project design to reduce noise levels to:

1. For noise due to traffic on public roadways, railroad operations, and aircraft: 60 dB L_{dn} /CNEL or less. Where it is not possible to reduce exterior noise due to these sources to 60 dB L_{dn} /CNEL or less by incorporating a practical application of the best available noise-reduction technology, an exterior noise level of up to 65 dB L_{dn} /CNEL will be allowed. Under no circumstances will interior noise levels be permitted to exceed 45 dB L_{dn} /CNEL with the windows and doors closed.
2. For nontransportation related noise sources: achieve compliance with the performance standards contained within Table 26-3.
3. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a statement of overriding considerations for the project must be provided.

NON-REGULATORY SETTING

SUBJECTIVE REACTIONS TO CHANGES IN NOISE LEVELS

Another means of assessing noise impacts is to estimate public reaction to the change in noise levels which result from a given project; this is, in fact, how the General Plan has established significance for roadway projects (refer to Policy NO-9). Expected human reactions to changes in ambient noise levels have been quantified by metrics that define short-term exposure (e.g., hourly L_{eq} , L_{max} and L_n). These metrics are usually used to describe noise impacts due to industrial operations, machinery and other sources that are not associated with transportation. An increase of at least 3 dB is usually required before most people will perceive a change in noise levels, and an increase of 5 dB is required before the change will be clearly noticeable.

Table NO-5 is used to show expected public reaction to changes in environmental noise levels. This table was developed on the basis of test subjects' reactions to changes in the levels of steady-state pure tones or broad-band noise and to changes in levels of a given noise source.

Some additional guidance as to the significance of changes in ambient noise levels is provided by the 1992 findings of the Federal Interagency Committee of Noise (FICON), which assessed the annoyance effects of changes in ambient noise levels resulting from aircraft operations. The FICON findings are based upon studies that relate aircraft and traffic noise levels to the percentage of persons highly annoyed by the noise. Annoyance is a summary measure of the general adverse reaction of people to noise that generates speech interference, sleep disturbance, or interference with the desire for a tranquil environment.

The rationale for the FICON findings is that it is possible to consistently describe the annoyance of people exposed to transportation noise in terms of L_{dn} or CNEL. The

changes in noise exposure that are shown in Table NO-6 are expected to result in equal changes in annoyance at sensitive land uses. The rationale for the criteria shown in Table NO-6 is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause significant annoyance. Although the FICON findings were specifically developed to address aircraft noise impacts, they are considered as measures of potential noise impacts in the analysis of traffic noise.

Table NO-5: Subjective Reaction to Changes in Noise Levels

Change in Level	Subjective Reaction	Factor Change in Acoustical Energy
1 dB	Imperceptible (Except for tones)	1.3
3 dB	Just Barely Perceptible	2.0
5 dB	Clearly Noticeable	3.2
10 dB	About Twice (or Half) as loud	10.0
<i>Source: Architectural Acoustics, M David Egan, 1988.</i>		

Table NO-6: Significance of Changes in Noise Exposure

Ambient Noise Level Without the Project, L_{dn}	Significant Impact
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more
<i>Source: Federal Interagency Committee on Noise (FICON)</i>	

METHODOLOGY

The Federal Highway Administration Traffic Noise Prediction Model (FHWA-RD-77-108) was used to model roadway noise. The roadways analyzed were the same as those analyzed in the Traffic and Circulation chapter. The average daily traffic (ADT) volumes were provided by DKS Transportation Solutions. Results are reported as the distance from the centerline of the roadway to the 75 dB L_{dn} , 70 dB L_{dn} , 65 dB L_{dn} , and 60 dB L_{dn} noise contours. The model does not include the noise shielding effects of any existing sound walls or other noise barriers along roadways outside the proposed project area. Within the project area, noise levels were determined and then analyzed based on the land use plan.

To analyze the impact of aircraft overflights from Mather Airport, a flight track analysis was requested from the Sacramento County Airport System. The flight track analysis gathers overflight data by placing a “penetration gate” over the center of the project site (in this case, the penetration gate spans 2 ¼ miles over the center of the project site) and reports the number, type and altitude of the aircraft that passed through the gate

during a specified one month time period. The analysis also reports the number and type of aircraft that flew within a 1 ½ mile radius of the penetration gate.

The Federal Aviation Administration (FAA) Order 1050.1E, Section 311 provides a list of categorical exclusions for FAA actions involving establishment, modification, or application of airspace and air traffic procedures. Section 311i addresses changes over noise sensitive land uses and states that new or revised air traffic control procedures conducted at 3,000 feet or more above ground level would be categorically excluded. In addition, overflights for general aviation and most U.S. airspace in general, may be as low as 3,000 feet. The minimum 3,000 feet altitude is used by most pilots of general aviation aircraft since the federal requirement establishes general aviation's minimum cruise elevation to be 3,000 feet. Based on this information, it would be reasonable to generally assume that aircraft over altitudes of 3,000 feet above ground level are not increasing noise and creating an annoyance to people below the flight path. Therefore, the analysis of the flight track data focused on aircraft passing over the site at or below 3,000 feet above ground level.

SIGNIFICANCE CRITERIA

According to the CEQA Guidelines, an impact may be significant if the project results in any one of the following:

1. Exposure of persons to or generation of noise levels in excess of standards established in the Sacramento County General Plan, Zoning Code and Noise Ordinance, or applicable standards of other agencies;
2. Expose people residing or working in the project area to excessive airport noise levels;
3. Expose people to a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project; or
4. Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The definition of what is "excessive" or "substantial" noise is generally defined in the General Plan and Noise Ordinance, as described in the Regulatory Setting section. For airports, significance is based on the Comprehensive Land Use Plan (or similar). The existing Sacramento County General Plan includes policies that establish compatibility-related noise thresholds but does not include any policies that deal with the significant changes in ambient noise described in criterion three. In this case, the thresholds described in the Non-Regulatory Setting regarding subjective responses to changes in noise are used (Table NO-6).

EXISTING NOISE LEVELS

EXISTING TRAFFIC NOISE LEVELS

Existing traffic noise levels were determined using the existing average daily traffic (ADT) from the traffic impact study (TIS) prepared by DKS Associates Transportation Solutions. The existing ADT was entered into the Federal Highway Administration (FHWA) Noise Model. Based on the ADT, the 75 dB, 70 dB, 65 dB and 60 dB noise contours were generated along the various roadway segments. The results have been included in tables Table NO-7 and Table NO-9.

The only existing residential properties along the studied roadway segments are along Douglas Road, from Sunrise Boulevard to Grant Line Road. The residential property boundaries are 73 feet from the centerline of Douglas Road (the existing paved roadway width in this location is approximately 48 feet, with a 25-foot wide landscape corridor). The existing traffic noise level at this distance is 63 dB between Sunrise Boulevard and Rancho Cordova Parkway and 60 dB between Rancho Cordova Parkway to Grant Line Road.

There are commercial and institutional land uses, ranging from offices to warehouses, along White Rock Road from Kilgore Road to Grant Line Road; along Sunrise Boulevard from US Highway 50 to Douglas Road; and along Douglas Road from Eagles Nest to Sunrise Boulevard. The buildings along these roadways are located outside of the 70 dB contour (into the 65 or 60 dB contours). Major uses include Aerojet properties and the Prairie City State Vehicle Recreation Area (SVRA).

The properties along the remainder of the studied roadway segments are large agricultural parcels, zoned AG-20, AG-80 or AG-120. In Figure II-1 of the Noise Element, agricultural and industrial land uses are acceptable up to 70 dB $L_{dn}/CNEL$ and conditionally acceptable between 70 and 80 dB $L_{dn}/CNEL$. The homes on these agricultural properties are located within the 65 dB contour.

KIEFER LANDFILL

The Sacramento County Landfill is located at Kiefer Road, near Grant Line Road, southwest of the project site. As described in the Land Use chapter, a 2,000-foot buffer was established around the landfill as a means to prevent the encroachment of incompatible urban uses; this buffer is measured from the ultimate active landfill boundary. Ongoing activities within the landfill that generate noise include bulldozers, back up warning devices, garbage trucks and private and commercial traffic utilizing the landfill.

EXISTING AIRCRAFT NOISE LEVELS

The nearest airport to the project site is Mather Airport, which is located 4 miles to the west of the site. As shown in Plate NO-2, the Project site is located outside the 60 CNEL contour of Mather Airport; however, the project site is located within the flight

path of aircraft that regularly fly at varying altitudes below 3,000 feet above ground level.

FUTURE NO PROJECT NOISE LEVELS

FUTURE TRAFFIC NOISE LEVELS

Future off-site traffic noise will be generated from various reasonably foreseeable projects. This includes traffic generated by projects in the City of Rancho Cordova (such as the Sunridge Specific Plan) and development of the proposed City of Folsom Sphere of Influence.

Aggregate haul trucks associated with hard rock quarries in the east county will also contribute to future traffic noise levels in the project vicinity. There are three hard rock quarries proposed along Scott Road, south of White Rock Road. The Teichert Quarry Project was certified by the Sacramento County Board of Supervisors on November 31, 2010 (County Control # 2002-0636). A Final EIR was released in October 2011 for the Stoneridge Quarry Project (County Control # 2010-00264). The Milgate Quarry Project is currently on hold as an incomplete application (County Control # 2010-00237). The average daily traffic calculated for the cumulative condition includes the traffic associated with the three mining projects, as all three mining projects are assumed to be in full operation in the cumulative condition analyzed by the TIS.

Another project that may contribute traffic noise in the project vicinity is the Capital Southeast Connector Joint Powers Authority Project. The Capital Southeast Connector is a proposed 35-mile roadway that will link communities in El Dorado and Sacramento Counties and the cities of Elk Grove, Folsom, and Rancho Cordova. This project may widen Grant Line Road from Calvine Road to White Rock Road from a four-lane roadway to six-lane expressway with a total right-of-way of 220 feet.

Future No Project ADT was entered into the FHWA Noise Model. Based on the ADT, the 75 dB, 70 dB, 65 dB and 60 dB noise contours were generated along the various roadway segments. The results have been included in tables Table NO-8 and Table NO-10.

NOISE REDUCING DESIGNS

There are a variety of site designs which may be used to reduce noise volumes that are applicable to most of the impact topics described later in this chapter. For ease of reference these designs are described rather than embedded throughout the later discussions.

USE OF SETBACKS

Noise exposure may be reduced by increasing the distance between the noise source and receiving use. Setback areas can take the form of open space, frontage roads, recreational areas, storage yards, etc. The available noise attenuation from this technique is limited by the characteristics of the noise source, but is generally about 4 to 6 dB per doubling of distance from the source.

USE OF BARRIERS

Shielding from noise can be achieved by placing walls, berms, or other structures, such as buildings, between the noise source and the receiver. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increasing the distance the sound must travel to pass over the barrier as compared to a straight line from source to receiver. In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path length difference for a given increase in barrier height than does a location closer to either source or receiver.

For maximum effectiveness, barriers must be continuous and relatively airtight along their length and height. To ensure that sound transmission through the barrier is insignificant, barrier mass should be about 4 pounds per square foot, although a lesser mass may be acceptable if the barrier material provides sufficient transmission loss in the frequency range of concern. Satisfaction of the above criteria requires substantial and well-fitted barrier materials, placed to intercept line of sight to all significant noise sources. Masonry walls make an effective barrier, whereas wood materials typically do not. Earth, in the form of berms or the face of a depressed area, is also an effective barrier material.

Note that noise barrier walls have fallen into disfavor in the neighborhood planning and public health communities, because they create barriers to walkability and may decrease the desire of people to walk and bike by making the streetscape less attractive. They may also create the impression of walling off segments of the community.

SITE DESIGN

Buildings can be placed on a project site to shield other structures housing more noise sensitive uses, or to prevent an increase in noise level caused by reflections. The use of one building to shield another can significantly reduce overall project noise control costs, particularly if the shielding structure is insensitive to noise. As an example, carports or garages can be used to form or complement a barrier shielding adjacent dwellings or an outdoor activity area. Similarly, one residential unit can be placed to shield another so that noise reduction measures are needed for only the building closest to the noise source. Placement of outdoor activity areas within the shielded portion of a building complex, such as a central courtyard, can be an effective method of providing a quiet retreat in an otherwise noisy environment; this method is often used in multiple-family developments. Patios or balconies can be placed on the side of a building

opposite the noise source, and "wing walls" can be added to buildings or patios to help shield noise sensitive areas.

Another option in site design is the placement of relatively less sensitive land uses, such as commercial or storage areas, between the noise source and a more sensitive portion of the project. Examples include developing a commercial strip along a busy arterial to block noise affecting a residential area, or parking areas along the noise-impacted edge of a multifamily residential complex. Sensitive structures or activity areas may then be placed behind these buildings to reduce noise control costs.

BUILDING CONSTRUCTION TECHNIQUES

When structures have been located to provide maximum noise reduction by implementing barriers or through site design, noise reduction measures may still be required to achieve acceptable interior noise levels. One option is to place sensitive portions of a dwelling, such as bedrooms, living rooms, or family rooms on the side of the unit farthest from the noise source. Bathrooms, closets, stairwells and kitchens are relatively insensitive to exterior noise sources and can be placed on the noisy side of a dwelling unit. When such techniques are employed, noise reduction requirements for the building façade can be significantly reduced, although the architect must take care to isolate the noise impacted areas by the use of partitions or doors.

Interior noise reduction may be obtained through acoustical design of building facades. Standard residential construction practices provide 10 – 15 dB noise reduction for building facades with open windows, and approximately a 25 dB noise reduction when windows are closed. Thus, a 25 dB exterior-to-interior noise reduction can be obtained by the inclusion of adequate ventilation systems, allowing windows on a noise-impacted façade to remain closed under any weather condition.

Where greater noise reduction is required, acoustical treatment of the building façade is necessary. Reduction of relative window area is the most effective control technique, followed by providing acoustical glazing (thicker glass or increased air space between panes) in low air infiltration rate frames, use of fixed (non-movable) acoustical glazing or the elimination of windows. Noise transmitted through walls can be reduced by increasing wall mass (using stucco or brick in lieu of wood siding), isolating wall members by the use of double- or staggered-stud walls, or mounting interior walls on resilient channels. Noise control for exterior doorways is provided by reducing door area, using solid-core doors, and by acoustically sealing door perimeters with suitable gaskets. Roof treatments may include the use of plywood sheathing under roofing materials.

Whichever noise control techniques are employed, it is essential that attention be given to installation of weatherstripping and caulking of joints. Openings for attic or subfloor ventilation may also require acoustical treatment.

Design of acoustical treatment for building facades should be based upon analysis of the level and frequency content of the noise source. The transmission loss of each

building component should be defined, and the composite noise reduction for the complete façade calculated, accounting for absorption in the receiving room. A one-third octave band analysis is a definitive method of calculating the A-weighted noise reduction of a façade. A common measure of transmission loss is the Sound Transmission Class (STC). STC ratings are not directly comparable to A-weighted noise reduction, and must be corrected for the spectral content of the noise source. Requirements for transmission loss analyses are outlined by Title 24 of the California Code of Regulations.

USE OF VEGETATION

Trees and other vegetation are often thought to provide significant noise attenuation. However, approximately 100 feet of dense foliage (so that no visual path extends through the foliage) is required to achieve a 5 dB attenuation of traffic noise. Thus, the use of vegetation as a noise barrier should not be considered a practical method of noise control unless large tracts of dense foliage are part of the existing landscape.

Vegetation can be used to acoustically “soften” intervening ground between a noise source and receiver, increasing ground absorption of sound and thus increasing the attenuation of sound with distance. Planting of trees and shrubs is also of aesthetic and psychological value, and may reduce adverse public reaction to a noise source by removing the source from view, even though noise levels will be largely unaffected. However, it should be noted that trees planted on the top of a noise control berm can actually slightly degrade the acoustical performance of the barrier. This effect can occur when high frequency sounds are diffracted (bent) by foliage and directed downward over a barrier.

IMPACTS AND ANALYSIS

IMPACT: CONSTRUCTION WOULD TEMPORARILY INCREASE NOISE LEVELS

Initial site grading and road development would occur prior to occupancy. There is one residential dwelling located adjacent to the northern boundary of the project site and there are two additional residential structures located further north. Once development starts to occur, construction over the course of the project would temporarily increase noise levels in the vicinity of various construction sites. Noise sensitive land uses located in the vicinity of construction could be subjected to noise from construction activities.

In addition, the Applicant has indicated that during site preparation/grading and road development, processing of aggregate will occur to maximize the use of onsite rock deposits for construction needs. Activities will include screening, crushing and sizing of onsite aggregate-grade rock deposits encountered during onsite excavation, earthmoving, construction of structures, landscaping, compaction, fills, road cuts and embankments.

The rock aggregate processing site will be located within the areas of intended development. The processing site will separate the excavated rock materials from the soil, crush the rock, and separate the resulting aggregate into sizes and stockpiles appropriate for use during construction. The operations of the processing and sorting of grading materials will only take place within the project and no exporting of the materials offsite will be permitted. The expected types of equipment include: portable crushing device, conveyor belts, excavator, front-end loader, water truck and tanker, and power generators. This equipment generates noise volumes consistent with general construction noise volumes.

The Sacramento County Noise Ordinance specifically exempts construction-related noise from meeting noise limitations, subject to the following provisions:

Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of eight p.m. through six a.m. on weekdays and Friday commencing at eight p.m. through and including seven a.m. on Saturday; Saturdays commencing at eight p.m. through and including seven a.m. on the next following Sunday and on each Sunday after the hour of eight p.m. Provided however, when an unforeseen or unavoidable condition occurs during a construction project, and the nature of the project necessitates that work in process be continued until a specific phase is completed, the constructor or owner shall be allowed to continue work after eight p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner. [Sacramento County Code, Section 6.68.090 (e)]

Construction noise impacts associated with buildout of the proposed project fall under this exemption. It is acknowledged that construction related noise could be a nuisance to sensitive receptors; however, this increase in noise is short-term, and noise standards within the General Plan are generally intended to address long-term sources of noise. Construction-related noise would not result in a permanent increase in ambient noise. Though noise volumes would undergo short-term increases, the existing construction ordinance is designed to avoid significant community effects through the restriction of nighttime and weekend disturbance, and thus impacts are *less than significant*.

IMPACT: ON-SITE TRAFFIC NOISE WOULD EXCEED NOISE STANDARDS

EXISTING PLUS PROJECT

The existing plus project noise contours for onsite roadway segments were determined using the FHWA model by entering the average daily traffic information from the Traffic Impact Study (Appendix TR-1). Detailed street sections have been provided by the applicant for the 20 internal roadway segments. The type of road, the distance from the road centerline to the right-of-way, and landscape and public utility easements were

provided for each type of roadway proposed. The type of land use proposed along the roadway segments were then compared to the noise contours.

RESIDENTIAL

As shown on Table NO-7 the distance from the roadway centerline to the road right-of-way, plus landscape and public utility easements, would result in placement of residential property lines between the 65 and 70 dB contours (note that the Town Center includes single-family dwellings, though locations are not specified). Given that the discussion references street names, an exhibit showing the roadways is also included (Plate NO-4). If outdoor activity areas (i.e. backyards and play areas) are placed along the roadway frontage without any shielding, the noise volumes will exceed the 65 dB standard. The Project is a land use master plan which does not include the detailed small-lot layouts and subdivision maps that would be needed in order to analyze noise volumes relative to individual lot design. These small-lot subdivision maps would be proposed as subsequent projects, also subject to the California Environmental Quality Act, and it would be at this time that the lot-level analysis would occur. This analysis focuses on community design issues.

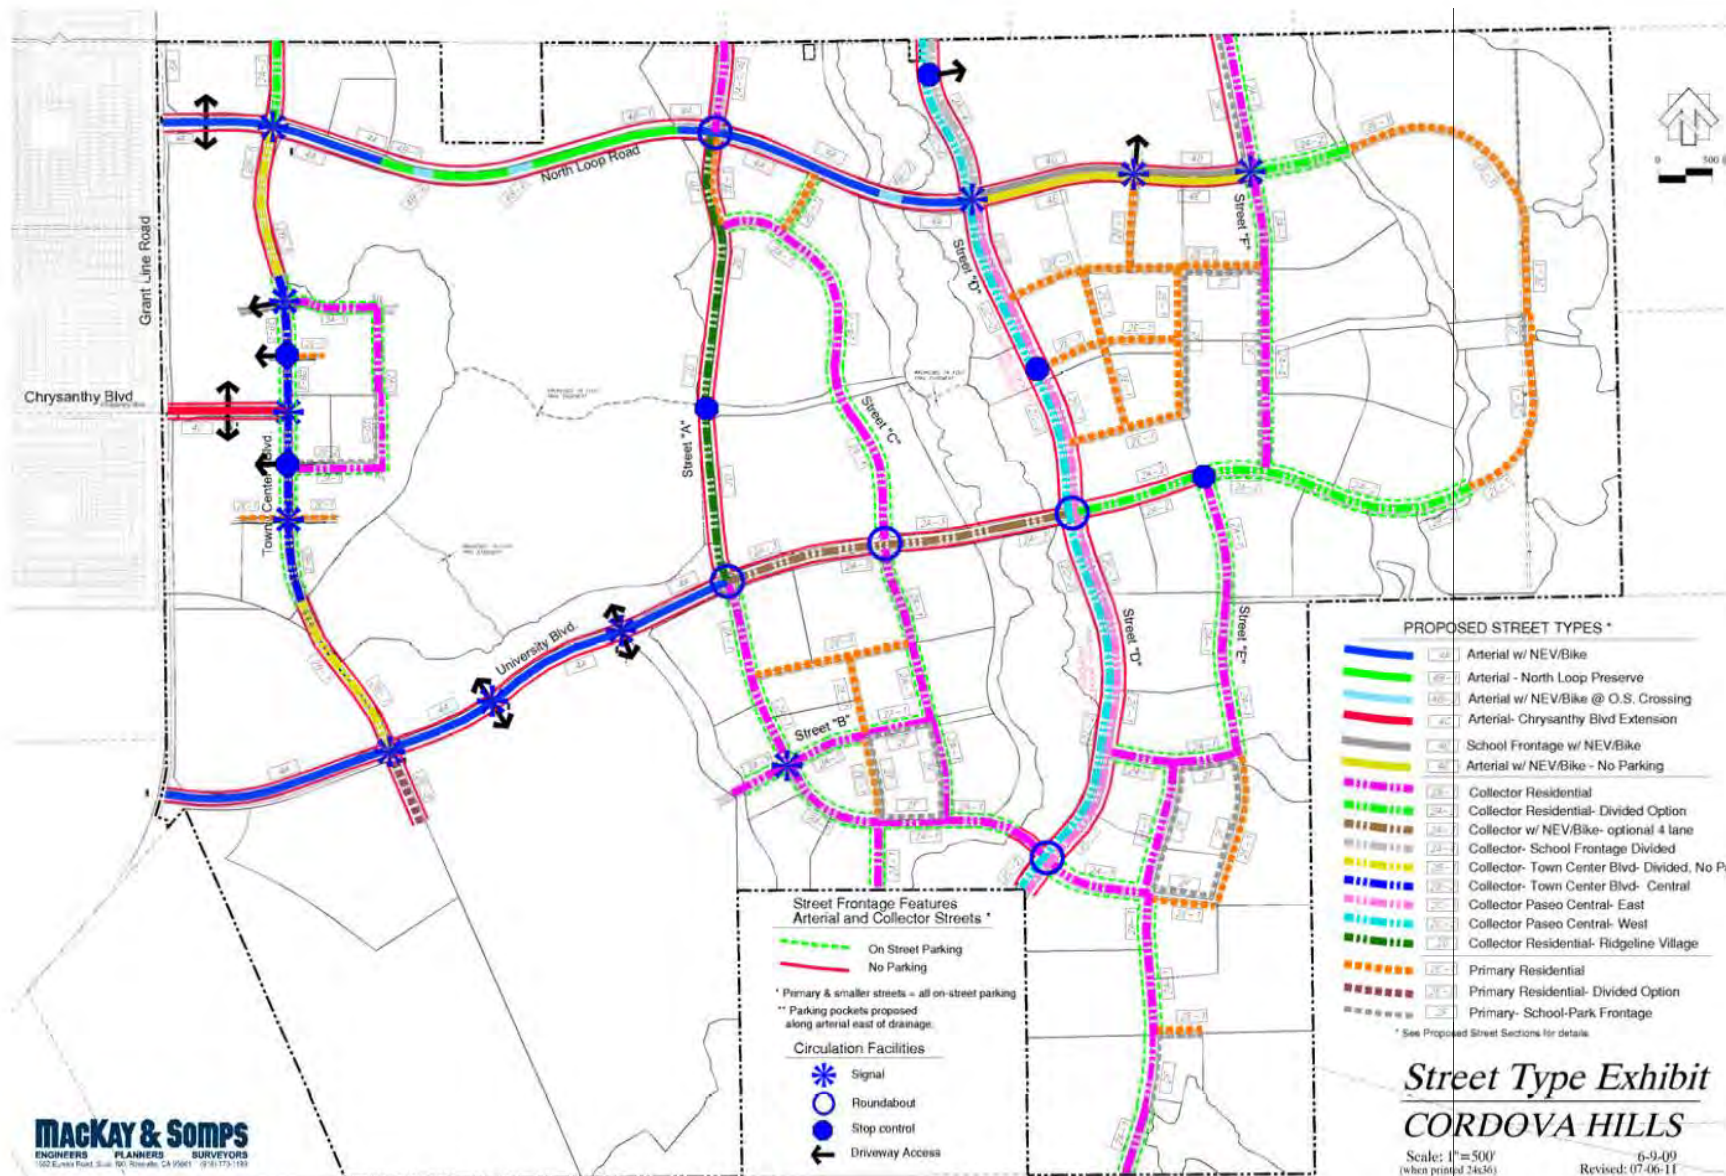

Chapter Four of the SPA includes design guidelines for residential development. These design guidelines establish minimum setbacks, lot sizes, building sizes, and other standards. In addition to the standards, the SPA includes various “typical plotting diagrams” which provide example layouts for future lots. All of these examples indicate that the homes would front onto the streets, which would place the backyards in a shielded position behind the house. Provision is also made for alternative cluster designs that would provide noise shielding, with alley-loaded garage access and cluster developments where the outdoor activity areas would be between side yards and in a shared front greencourt onto which all the homes would face. In sum, the SPA has clearly included both requirements for and flexibility to use alternative designs that would allow for appropriate noise reduction without the use of soundwalls. Lot layouts are not included for apartment-style multiple-family developments (though townhomes are shown), but outdoor common areas are usually placed within the residential complex where the buildings provide noise attenuation.

Table NO-7: Existing Plus Project Condition for On-Site Roadways

Roadway	Segment		ADT	Roadway Width ¹ (in feet)	Adjacent Land Uses ²	Noise level at property line ³	70 dB contour (in feet)	65 dB contour (in feet)

Plate NO-4: Circulation Diagram

With appropriate inclusion of features such as those described in the Noise Reduction Designs section, noise volumes could easily be reduced to acceptable levels. If preferred, noise barriers could also be used. Although precise barrier heights cannot be determined until small-lot map stage, approximate barrier heights can be determined using typical setbacks and roadway cross-sections provided as part of the Project. Barrier analyses using the FHWA model were performed to determine the minimum barrier heights that would be necessary, assuming minimal setbacks from the roadway were used (based on the minimum setbacks described in the SPA). The results of this analysis indicate that when the receiver is located ten feet from the barrier, a six-foot sound barrier located at the property line (when backyards front roadways) would attenuate noise levels by one dB and an eight-foot sound barrier could reduce noise levels by four dB. The loudest roadway segment where low to medium density residential land uses are proposed adjacent to the roadway will have traffic noise levels as high as 69 dB at the residential property line. A six-foot soundwall will not attenuate the outdoor activity area to within the 65 dB standard. An eight-foot soundwall would be required to reduce the noise level to an acceptable 65 dB.

Though subsequent residential projects will be subject to the California Environmental Quality Act, mitigation is nonetheless recommended to stipulate that all residential exterior activity areas exposed to noise environments of greater than 65 dB must incorporate noise-reducing designs.

The maximum interior noise level for residential uses is 45 dB. Standard residential construction generally provides interior noise reduction of 25 dB, which means that exterior noise volumes must exceed 70 dB before interior volumes will exceed the 45 dB standard. Most of the roadway segments that will have adjacent residential land uses will not expose residential properties to traffic noise levels in excess of 70 dB, and thus standard construction will result in acceptable interior noise levels. Roadway segments that will have property lines located within the 75 dB and 70 dB contours are:

- North Loop Road, from Grant Line Road to Town Center Drive (71 dB at property line),
- North Loop Road, from Town Center Drive to Street A (71 dB at property line);
- University Boulevard, from Grant Line Road to Town Center Drive (70 dB at property line), ‘
- Street D, from North Loop Road to University Boulevard (70 dB at property line); and
- Street D, from University Boulevard to Street A (71 dB at property line)

Along North Loop Road, from Town Center Drive to Street A, the majority of the land use is designated as Avoided; however there are two small segments where high

density residential land uses are proposed. High density residential land uses are generally built where the activity area is located within a courtyard shielded from traffic noise by the dwelling units. At a noise level of 71 dB at the property line, if the building is set back from the roadway, interior noise levels of 45 dB could be attained, or increased construction could be utilized to achieve greater than 25 dB attenuation in order to attain an interior noise level of 45 dB. Both single-family residential dwellings and multiple-family dwellings will be within the Town Center area, as well. Street D from University Boulevard to Street A will include high density residential uses on the eastern side of the street, and open space uses on the western side. These uses will be exposed to the same noise level as the uses along North Loop Road, and the same discussion applies.

Additional noise-reducing construction methods would need to be applied for residences exposed to exterior noise levels above 70 dB, including window coatings and additional noise insulation on exterior walls. Mitigation is included to require such designs. With the application of mitigation, the Project will not expose residents to noise levels in excess of standards, and impacts are *less than significant*.

NON-RESIDENTIAL

The compatibility standards for non-residential land uses affected by transportation noise sources are provided on Table NO-2. Town Center land uses are proposed for North Loop Road, from Grant Line Road to Town Center Drive and along a small portion of North Loop Road from Town Center Drive to Street A. Uses in this area would include office buildings, business commercial and professional buildings. There are no exterior noise standards for commercial areas and theaters, but all other non-residential areas have a standard of 65 dB. The noise level along this roadway segment is expected to be about 71 dB at the property line, but the threshold should apply at the “noise sensitive” area. For offices and other non-residential uses, outdoor gathering spaces are located in a shielded location which is not directly along the street frontage, because such spaces are intended to provide a degree of privacy and quiet which is not available when located right alongside the main street. Analysis indicates that a 10-foot soundwall would reduce noise to within standards, and thus it can easily be concluded that any outdoor area which is shielded by the building itself will be within acceptable noise standards.

There are interior noise standards outlined in the Noise Element for non-residential rooms affected by transportation noise (refer to Table NO-2). Uses that could be possible within the Town Centers similar to the rooms outlined in the table include conference rooms, small offices, large public offices, retail businesses, and libraries. The most restrictive interior noise level for these types of uses is 40 dB, and this is the standard applied to schools, churches, and libraries – places where there is an expectation of quiet throughout the building. For offices the standard is 45 dB, and for commercial businesses it is 50 dB. Standard construction affords up to a 25 dB reduction; therefore, an exterior noise environment greater than 65 dB would exceed the 40 dB interior standard, exterior noise greater than 70 dB would exceed the interior

45 dB standard, and exterior noise greater than 75 dB would exceed the interior 50 dB standard.

There are no cases where the exterior noise environment at a non-residential property line (excluding open space uses) exceeds 75 dB, and thus all commercial uses will be within thresholds in the existing plus Project condition. North Loop Road from Grant Line Road to Street A will be 71 dB, which means that additional noise attenuation may be needed for any offices or other more sensitive uses such as churches, depending on the amount by which the building is set back from the roadway. Most of the main roadways exceed 65 dB, which means that all of the most sensitive non-residential uses such as school and libraries located along these roadways will either need large setbacks, additional noise attenuation measures, or a combination thereof.

In cases where standards are exceeded, additional noise attenuation measures must be incorporated. This can be accomplished by use of other buildings to shield these rooms, placing conference rooms interior to a building, and use of building construction techniques to reduce the interior noise level. Mitigation is included which stipulates that all non-residential construction – excluding commercial uses – must be designed to adhere to the General Plan noise standards.

The only Project area adjacent to a major off-site roadway is the Town Center, which will be adjacent to Grant Line Road. All of the Town Center development on the Grant Line Road frontage is likely to be commercial, though it is planned that residential uses will exist in more interior locations of the Town Center. Based on noise volumes of more than 70 dB along Grant Line Road (refer to Table NO-9), which lists noise for off-site roadways), these uses could be exposed to substantial interior noise volumes depending on ultimate location and design. The same mitigation applied for the purpose of mitigating noise from on-site roadways would apply and would reduce noise to acceptable levels.

The land uses adjacent to University Boulevard, from Grant Line Road to Town Center Drive would consist of Avoided, Agricultural, and Recreational uses. Recreational uses are proposed adjacent to Street D, from North Loop Road to Street A. Proposed recreational land uses would be similar to the playgrounds and neighborhood parks category shown in Table NO-2, in which noise levels up to 70 dB are acceptable. The noise levels along these roadways will be 71 dB, except that the segment of Street D from North Loop Road to University Boulevard will be 78 dB. Incorporation of noise reducing design strategies (such as increased distance of play structures and seating areas from the roadway) would reduce the expected noise to within acceptable levels. Even for the segment which is 78 dB at the property line, the setback would only need to be 48 feet in order to reduce noise to 70 dB. Mitigation is recommended that stipulates that all playgrounds and neighborhood parks exposed to noise environments greater than 70 dB must incorporate noise-reducing designs to ensure that community noise levels are not exceeded.

With mitigation, traffic on internal roadways will not cause exposure of persons to noise levels in excess of standards established in the Sacramento County General Plan. This impact is *less than significant*.

CUMULATIVE PLUS PROJECT

The cumulative plus Project noise contours for onsite roadway segments were determined using the FHWA model by entering the average daily traffic (ADT) information from the Traffic Impact Study (Appendix TR-1).

Similar to the analysis for the existing plus Project condition, the expected noise level contours were compared to the street sections provided by the Applicant for the 20 studied internal roadway segments. The type of adjacent land use proposed along the roadway segments were compared to the noise contours from the FHWA model. Refer to Table NO-8.

The noise contours in the cumulative plus project condition are very similar to the existing plus project condition. The slight change in the cumulative condition noise environment does not change the conclusions of the analysis or require mitigation beyond that already proposed for existing plus project conditions. As concluded in the existing plus project analysis, mitigation will ensure that the Project does not expose people to noise levels in excess of existing standards; impacts are *less than significant*.

Table NO-8: Cumulative Plus Project Condition for On-site Roadways

Roadway	Segment		ADT	Roadway Width ¹ (in feet)	Adjacent Land Uses ²	75 dB contour (in feet)	70 dB contour (in feet)	65 dB contour (in feet)

MITIGATION MEASURES:

- NO-1.** All residential development projects exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels to within General Plan Noise Element standards for exterior activity areas. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.
- NO-2.** All residential development projects exposed to greater than 70 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to achieve an interior noise level of 45 dB L_{dn} or less. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the site.
- NO-3.** Non-residential development projects such as churches, libraries, meeting halls, and schools exposed to greater than 60 dB L_{dn} , and all non-residential development projects such as transient lodging, hospitals and nursing homes, and office buildings exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall demonstrate that interior noise volumes will not exceed General Plan Noise Element standards for non-residential uses exposed to traffic noise. This may be accomplished by providing documentation that the type of use is within acceptable limits based on the location of the identified noise contours and assuming standard exterior-to-interior attenuation of 25 dB. If this cannot be demonstrated, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. The measure does not apply to commercial uses.
- NO-4.** All parks exposed to noise volumes in excess of 70 dB (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels within park activity areas (benches, play structures, etc) to within General Plan Noise Element standards for parks. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. For barrier and other structural options, an acoustical analysis substantiating the

required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.

IMPACT: RESULT IN ON-SITE COMMUNITY AND STATIONARY NOISE SOURCES THAT WILL EXCEED GENERAL PLAN NOISE STANDARDS

The university/college campus center has the potential to create noise, specifically from athletic fields or stadiums. The Project also includes other parks that could include playing fields, as well as schools which will have outdoor play areas. The Noise Element of the Sacramento County General Plan provides examples of the noise level of existing fixed noise sources. Softball games were found to produce noise levels up to 70 dBA at 350 feet from the bleachers, and it should be assumed that similar noise volumes could be generated by university/college campus center playing fields, as well as playing areas found in other Project parks.

Though parks and schools have the potential to generate noise in excess of standards, it is customary for parks and schools to be placed near or within residential subdivisions. Noise is typically addressed by locating the most noise-producing uses in the interior of the park, while placing more passive use areas on the boundaries. This results in an increased setback, reducing noise to nuisance levels. Furthermore, the Sacramento County Noise Ordinance exempts parks and schools from compliance with the Noise Ordinance (Sacramento County Code 6.68.090).

There are many non-residential uses which could be constructed within the Project area subsequent to SPA approval that would not require any further CEQA review or discretionary entitlements. Though CEQA would not apply, all such developments would be required to comply with the Sacramento County Noise Ordinance. Uses with the potential to generate noise include retail stores (e.g. loading docks), auto repair services, and fire stations (to list a few). Additional noise sources include the District Energy Plant, sewage pump station, and corporation yard. Development of these uses must comply with the Sacramento County Noise Ordinance Section 6.68.120 Machinery, Equipment, Fans and Air Conditioning which states:

It is unlawful for any person to operate any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof installed after July 1, 1976 in any manner so as to create any noise which would cause the maximum noise level to exceed

- 1) Sixty dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

The above requirement will ensure that noise from machinery would not exceed acceptable levels. In addition, it is common for wells or pumps to be enclosed or blocked from view, which would further reduce the noise level.

A District Energy Plant would have noise generating equipment; however, the equipment would be interior to the facility, thus noise associated with the operation of the District Energy Plant would not exceed acceptable levels. In addition, Sections 301-10 through 301-13 of the Sacramento County Zoning Code outlines development standards for transmission facilities. An energy plant would be similar to a substation and, under Section 301-11(b)(3), substation location preferences would be first within an area designated for industrial or commercial land uses in an adopted plan or within areas designated agricultural-urban reserve in an adopted plan. The development of a District Energy Plant in the lands outside the USB would not result in sensitive receptors exposed to noise levels in excess of standards.

The corporation yard on the Project site would be used by the Cordova Hills Community Services District. Chapter 4 of the Master Plan provides design guidelines for the corporation yard. A specific condition for the development of the corporation yard as it relates to noise control is included in the SPA and is provided below.

- Auto and truck access doors to service bays, tire shops, machine shops or other areas where machinery is operated shall not be orientated toward a residential use unless noise levels at the adjacent residential use property line would not exceed the County noise level standard. Noise levels may be mitigated through various methods including, but not limited to, sound baffles around equipment and sound walls.

As a worst-case example of the potential noise that could be generated, a large corporation yard project was recently proposed and analyzed called the Sacramento Municipal Utility District (SMUD) East Campus-Operations Center Project (SMUD Corporation Yard) located within unincorporated Sacramento County. Information from the Final Environmental Impact Report (FEIR) prepared for that project indicates that the operational noise environment of the Corporation Yard would consist of off- and on-loading operations, maintenance of vehicles and equipment, servicing of equipment, fueling and washing of vehicles, and movement of trucks and equipment within the project site. The main on-site operational noise would be associated with movement of equipment, servicing and maintenance of vehicles, and operation of other miscellaneous equipment within the site. Noise calculations were performed for on-site noise levels assuming an average noise level of 86 dBA at 50 feet for equipment operating onsite. The SMUD Corporation Yard FEIR found that the noise level 500 feet (the distance to the nearest residential property line) from the SMUD Corporation Yard would be 66 dB. However, it is not expected that the Cordova Hills Corporation Yard will be located adjacent to any residential land uses, as it will be located in the southwest portion of the project site, west/southwest of the university/college campus center, and outside of the USB. The Cordova Hills corporation yard can easily be located and designed to avoid noise impacts, consistent with language already incorporated into the SPA.

Though it is likely that standard design practices and compliance with the Sacramento County Noise Ordinance will locate most of these uses in such a way that significant noise exposure is avoided, mitigation has been included to ensure this result. Mitigation

will ensure that stationary Project uses will not expose people to noise in excess of standards; impacts are *less than significant*.

MITIGATION MEASURES:

NO-5. All non-residential development projects located adjacent to residentially designated properties shall be designed and constructed to ensure that noise levels generated by the uses do not result in General Plan Noise Element standards being exceeded on adjacent properties. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the non-residential projects with the potential to generate substantial noise (e.g. car wash, auto repair, or buildings with heavy-duty truck loading docks) if those uses are adjacent to residentially designated properties. The acoustical analysis shall include, but not be limited to, consideration of potential noise conflicts due to operation of the following items:

- Mechanical building equipment, including HVAC systems;
- Loading docks and associated truck routes;
- Refuse pick up locations; and
- Refuse or recycling compactor units.

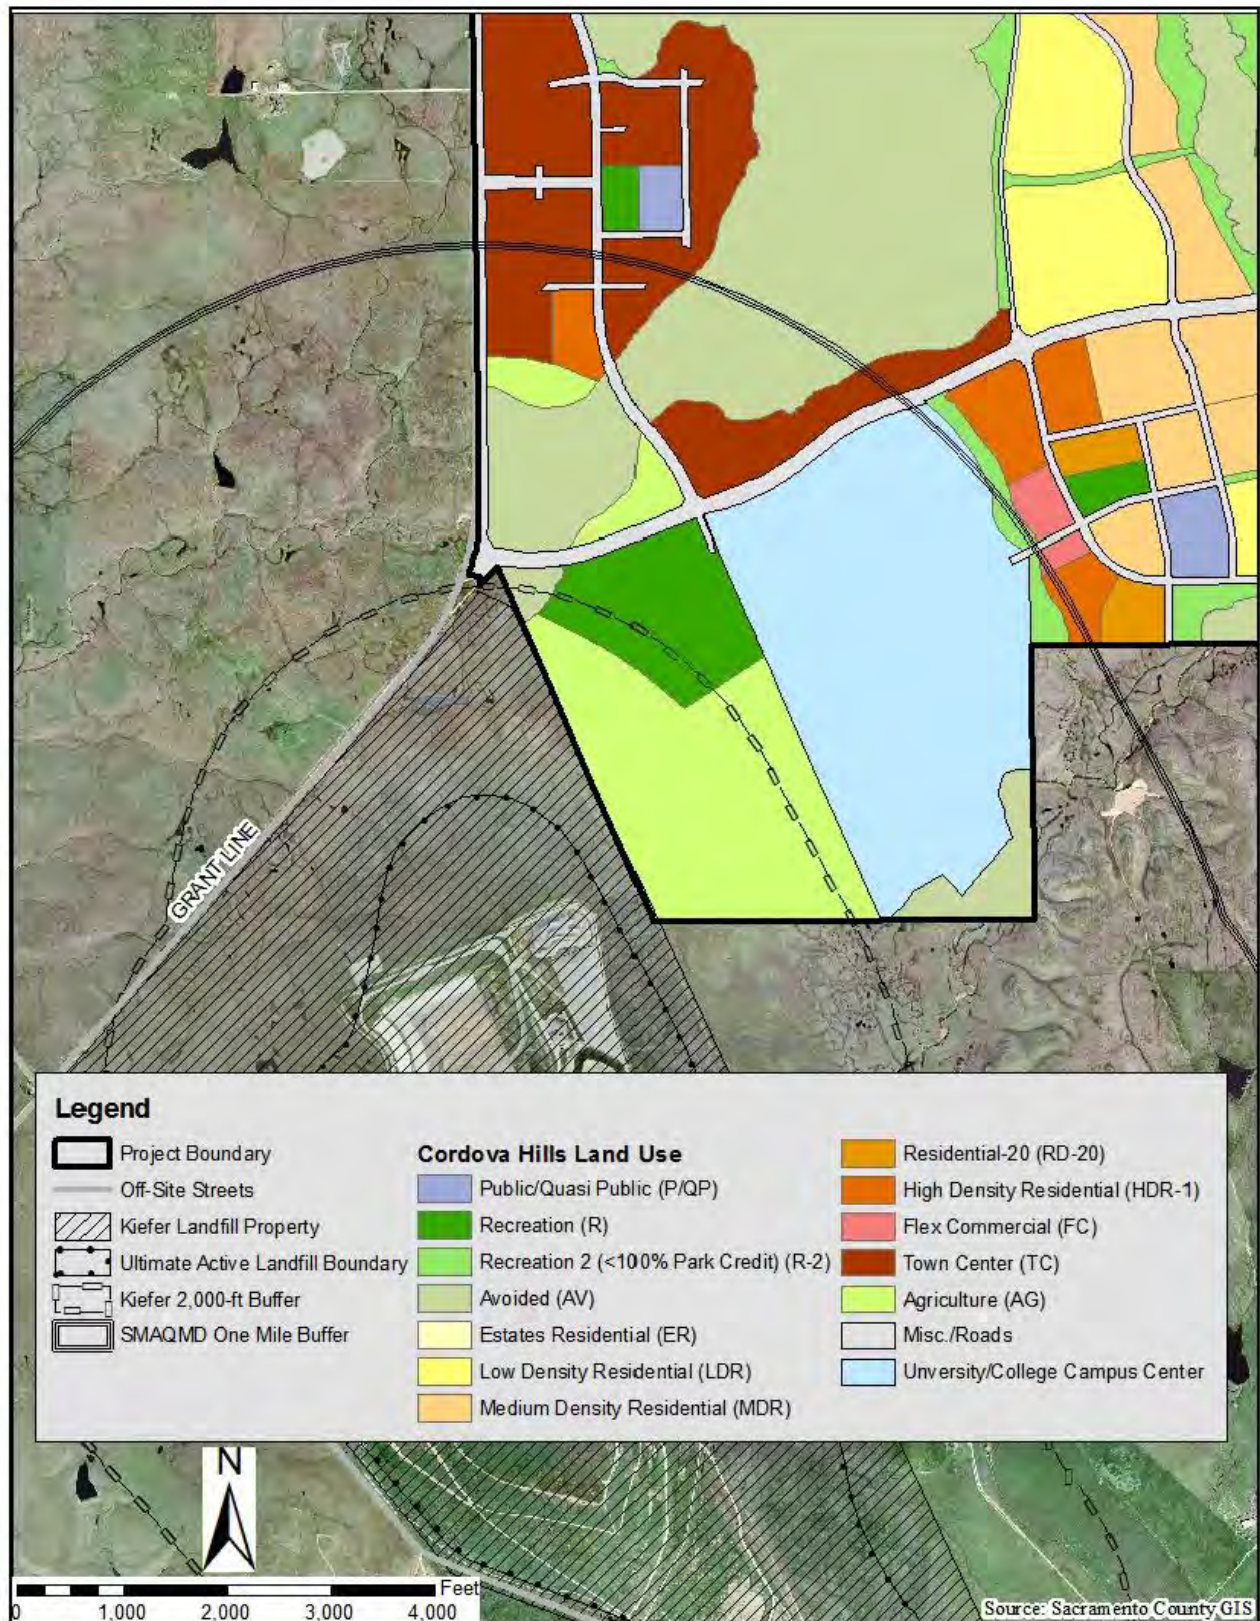

IMPACT: NOISE DUE TO ACTIVITIES AT KIEFER LANDFILL

Kiefer Landfill is located southwest of the project site. The Kiefer Landfill includes a buffer which extends 2,000 feet beyond the active landfill boundary which limits urban uses (refer to Plate NO-5). There is approximately 2,330 feet between the active landfill boundary and the nearest residential uses, which would be located on the university/college campus center. The only active use area within the buffer is a portion of the sports park.

Kiefer Landfill operations currently produce noise levels in the form of traffic noise along Kiefer Road and Grant Line Road (which is included in the traffic study) and on-site noise created by heavy equipment (e.g., bulldozers, garbage trucks, and backup warning devices) associated with the operation of the landfill. Noise measurements conducted at the landfill in 1989 yielded an average noise level of 71 dBA at a distance of 100 feet from the main dump activity area (General Plan Noise Element). All of the proposed Project uses are more than 15 times this distance away from the landfill boundary.

The following equation can be used to determine the change in the noise level of stationary sources: $20 (\log_{10}(d_1/d_2))$, where d_1 is the known distance and d_2 is distance of the sensitive receptor. In general, this equates to a 6 dB attenuation per doubling of distance. An average noise level of 71 dBA at 100 feet means that at 2,300 feet, the noise level would be about 44 dB (a reduction of 27 dB). On this basis, activities at Kiefer Landfill will not cause exposure of persons to noise levels in excess of standards established in the Sacramento County General Plan; impacts are *less than significant*.

Plate NO-5: Kiefer 2,000-foot Buffer

IMPACT: SUBSTANTIAL INCREASE IN THE EXISTING AMBIENT NOISE LEVEL

While there are General Plan noise standards applicable to *new* development affected by transportation noise, and for existing development affected by *new* transportation projects (new roadways, or roadway widening), there are no General Plan standards which apply to existing development affected by increases in traffic associated with new land uses. That impact is assessed not through General Plan standards, but the general CEQA guidelines criteria that an increase in noise which is substantial is significant. For this analysis, a substantial increase in noise is defined by the FICON noise study – which is the same basis on which new roadway project impacts are assessed according to NO-9.

According to the FICON noise study (refer to Table NO-5), an increase in the ambient noise level by 5 dB or more is substantial when existing ambient noise levels are less than 60 dB, a change in 3 dB or more is substantial when existing noise levels are between 61 and 64 dB, and a change of 1.5 dB or more is substantial when existing ambient noise levels are above 65 dB. Table NO-9 shows the roadways that would experience a substantial increase in the existing ambient noise levels as a result of project traffic. Most of these segments are located adjacent to agricultural or industrial properties where there are no residences or other occupied buildings near the roadway.

Table NO-10 is also included to disclose probable future conditions, but note that the threshold only applies to development subject to substantial increases in *existing* ambient noise. In any case, the table shows that in the majority of cases the Project contribution to cumulative noise is negligible.

Note that some of the roadways would appear to generate noise which will exceed standards as well, but even if the standards applied in this case, there would still be no impact to residential uses. The Sunridge Specific Plan requires a minimum 6-foot sound wall along Douglas Road and Chrysanthy Boulevard – which has been constructed where there are existing homes – and this wall reduces noise to below standards even in cumulative conditions. Any future uses constructed will be required by CEQA to consider and provide shielding for the cumulative noise environment. After examining the affected roadways, non-residential uses are those primarily affected, and the majority of non-residential uses along the studied roadways are retail businesses and industrial facilities; if these were new uses, they would be permissible as the County interior noise standard is 50 dB for commercial uses and “industry” (which is 75 dB exterior). The City of Rancho Cordova does not have interior noise standards for commercial or industrial uses. Any outdoor congregation spaces for non-residential uses would be behind the buildings or in a courtyard, which would provide noise shielding.

There are sections of Grant Line Road, White Rock Road, and Jackson Road, all of which are subject to substantial noise increases, which are adjacent to businesses, but these businesses generate noise themselves. When two different noise levels combine, the formula for their additive effect is $10\log(10^{(L1/10)} + 10^{(L2/10)})$. What this means is that when noise volumes differ by at least 9 dB, there is no additive effect. When noise volumes differ by between 4 – 8 dB, the higher noise volume is only increased by

approximately 1 dB. Any area subject to existing noise volumes substantially greater than the Project traffic noise volumes will not experience a substantial increase in ambient noise. The Prairie City SVRA is adjacent to Grant Line Road and White Rock Road, but people at the Prairie City SVRA are subject to noise from off-road vehicles, which can be as loud as 96 dB according to off-highway vehicle noise regulations (source http://ohp.parks.ca.gov/?page_id=23037). Users of this facility will not perceive changes in roadway noise. Business uses along Jackson Road are associated with aggregate mining or supply, with substantial truck and processing equipment noise. These areas will not be affected by increases in roadway noise.

Sections of Sunrise Boulevard have office uses and other noise-sensitive uses (such as the California Northstate College). Classrooms would be areas where the change in noise would be perceptible. Though a soundwall could be constructed, this would be incompatible with businesses which rely on roadway visibility for customers; mitigation is deemed infeasible.

Douglas Road includes existing residential areas, which are already protected by a soundwall, and this soundwall ensures that noise will not exceed standards. Nonetheless, the Project will cause a significant increase in ambient noise volumes (noise increases by 7 to 10 dB). The height of this existing barrier could be increased in order to reduce the increase in noise, but this would require disruption of a built community and is moreover not planned by the City of Rancho Cordova because the existing soundwall is sufficient to prevent exceedance of noise standards. For these reasons, mitigation is deemed infeasible.

Lastly, there are agricultural-residential properties with homes along affected segments of Jackson Road. These homes are set much farther back from the roadway than other existing uses – a minimum of 150 feet rather than the modeled distance of 70 feet. At a distance of 150 feet from the centerline, ambient existing noise levels are 64 dB, which requires a 3 dB increase to be perceptible. The Project increases noise levels by 2 dB, and thus the Project does not cause a substantial increase in ambient noise.

As described, mitigation cannot be included to reduce the substantial noise increases on Sunrise Boulevard and Douglas Road. The Project will expose people to a substantial increase in noise, and impacts are *significant and unavoidable*.

MITIGATION MEASURES:

None available.

IMPACT: MATHER AIRPORT

The project site is located approximately four miles east of Mather Airport. Although the project site is located outside the 60 dB CNEL contour (as shown on Plate NO-2) of Mather Airport, the project site is located within the overflight path of approaching and departing aircraft that fly below 3,000 feet above ground level. A flight track analysis was provided by the Sacramento County Airports System for the month of April 2011. A penetration gate was orientated over the center of the project site and spanned 2 ¼ miles. The flight track data provides the altitude of flights through the penetration gate in feet above mean sea level; however it does not provide the type of aircraft at specified altitudes, nor does the data specify the time of day for the various flights. Mather Airport is an economic resource for the County thus there are air cargo night operations occurring. Cargo jets tend to be louder and during the quieter evening hours it is more likely that aircraft noise could interfere with sleeping patterns. The flight track report also classifies the flight patterns as arriving, departing, and touch-and-go flights.

The project site ranges in elevation from 140 feet to 250 feet above mean sea level. The average elevation is about 200 feet above mean sea level. Flights passing over the site 3,000 feet above ground level would range in altitude of 3,140 feet to 3,250 feet above mean sea level.

Plate NO-6 shows the arrival flights recorded for Mather Airport. As shown on Plate NO-6, the majority of the flights arriving at Mather Airport are not passing over the project site, due to the orientation of the runway at Mather being in a

southwest/northeast direction and that the site is located southeast of the runway. There were 1,080 arrival flight tracks recorded for Mather Airport, of which 94 flew within 1 1/8 -mile radius of the project site and 67 penetrated the gate spanning the project site. Only eight percent of the total arrivals flew over the project site. The flights ranged in altitude from 500 to 5,000 feet above mean sea level. There were 63 flights (5 percent of total arrival flights) below 3,500 feet above mean sea level. The report does not indicate the type of aircraft at the various elevations, but does provide the overall number and type of aircraft for the studied time frame. Of the arrivals that flew within 1 1/8 -mile radius of the project site, two were military aircraft and one was cargo aircraft.

Plate NO-7 shows the departure flights recorded for Mather Airport. As shown on Plate NO-7, the majority of the flights departing Mather Airport are not passing over the project site. There were 1,082 departure flight tracks recorded at Mather Airport, of which 24 flew within a 1 1/8 -mile radius of the project site and 19 penetrated the gate spanning the site. Only two percent of the total departure flights for Mather Airport are passing over the project site. These departure flights ranged in altitudes from 1,000 to 12,000 feet above mean sea level. Of the aircraft departing Mather Airport that flew within a 1 1/8 -mile radius of the project site, there were four military and four cargo aircraft.

Plate NO-8 shows the touch-and-go flights recorded for Mather Airport. As shown on the exhibit, touch-and-go flights were a little more erratic than arrivals or departures, but most are concentrated in a ring around Mather Airport, outside a one-mile radius of the project site. It should be noted that the number of flight tracks over the site may consist of one touch-and-go flight track with multiple operations. Of the total 322 touch-and-go flights, 46 were recorded within a one-mile radius of the project site, which is 14 percent of the total touch-and-go flights. There was one jet and nine military aircraft recorded within the one-mile radius.

During an average one-month time period, a very small percentage of total departure (two percent) and arrival (eight percent) flights are passing over the project site and there is less than 15 percent of the total touch-and-go flights passing over the project site. These flights do not represent a large number of flights from Mather Airport.

It should be noted that Mather Airport receives funding from the FAA and is therefore required to allow the military to use the airport; thus the nature of military operations at Mather Airport can change in the future. Furthermore, Mather Airport has been designated to be a substitute airport in the event that the Sacramento International Airport (SMF) is flooded due to levee failure. This would result in an increase in the number of overflights over the Project area, potentially creating a greater, albeit temporary, noise nuisance.

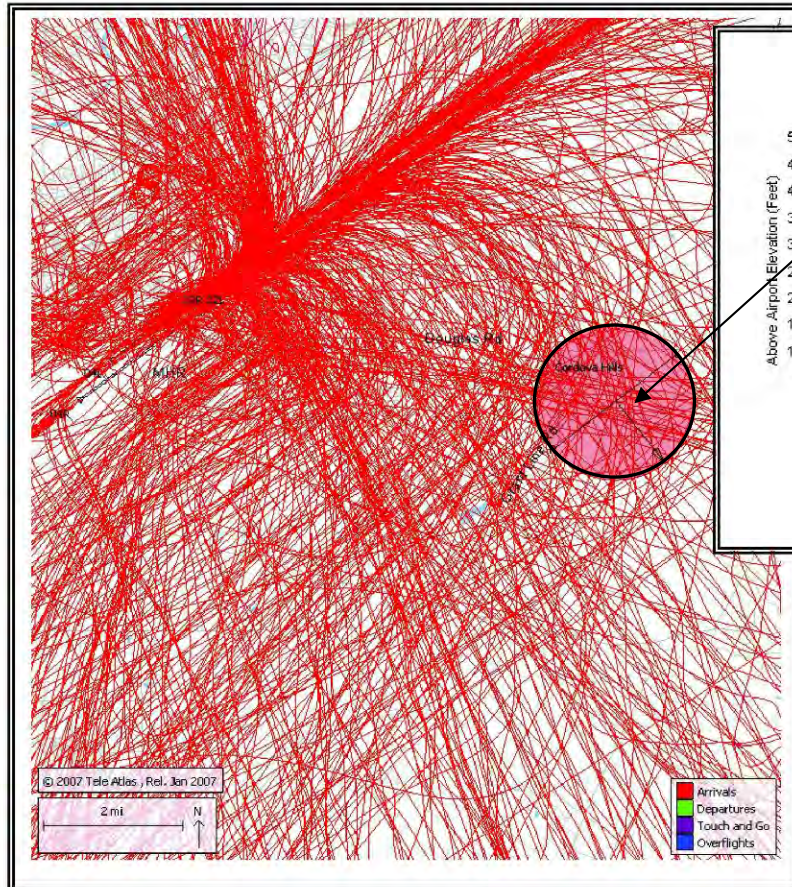

Plate NO-6: Arrival Flight Tracks for Mather Airport

**Sacramento County Airport System
Aircraft Noise Information Office**
Mather Airport Flight Altitudes Near Cordova Hills Project Location
Flight Track Analysis

Arrival Analysis

Project Penetration Gate

During April of 2011, 1,080 arrival flight tracks were recorded at Mather Airport. Of these, 94 flew within a 1 1/8-mile radius of the parcel; 67 penetrated the gate spanning the location. As indicated by the graphic above, these flights passed over the site at a wide range of altitudes from 500 to 5,000 ft MSL. The Operator Category for the total number of arrivals that flew within a 1 1/8-mile radius includes 1 Cargo, 37 Commercial, 29 General Aviation, 2 Military and 25 Unknown. The Aircraft Category includes 17 Business Jets, 1 Jet, 2 Military, 6 Propeller, 33 Regional Jets, 10 Turbo-prop and 25 Unknown.

The center of the proposed project location is approximately 5.0 miles from the end of Runway 22L at MHR.

Plate NO-7: Departure Flight Tracks for Mather Airport

Sacramento County Airport System
Aircraft Noise Information Office
 Mather Airport Flight Altitudes Near Cordova Hills Project Location
Flight Track Analysis

Departure Analysis

Project Penetration Gate

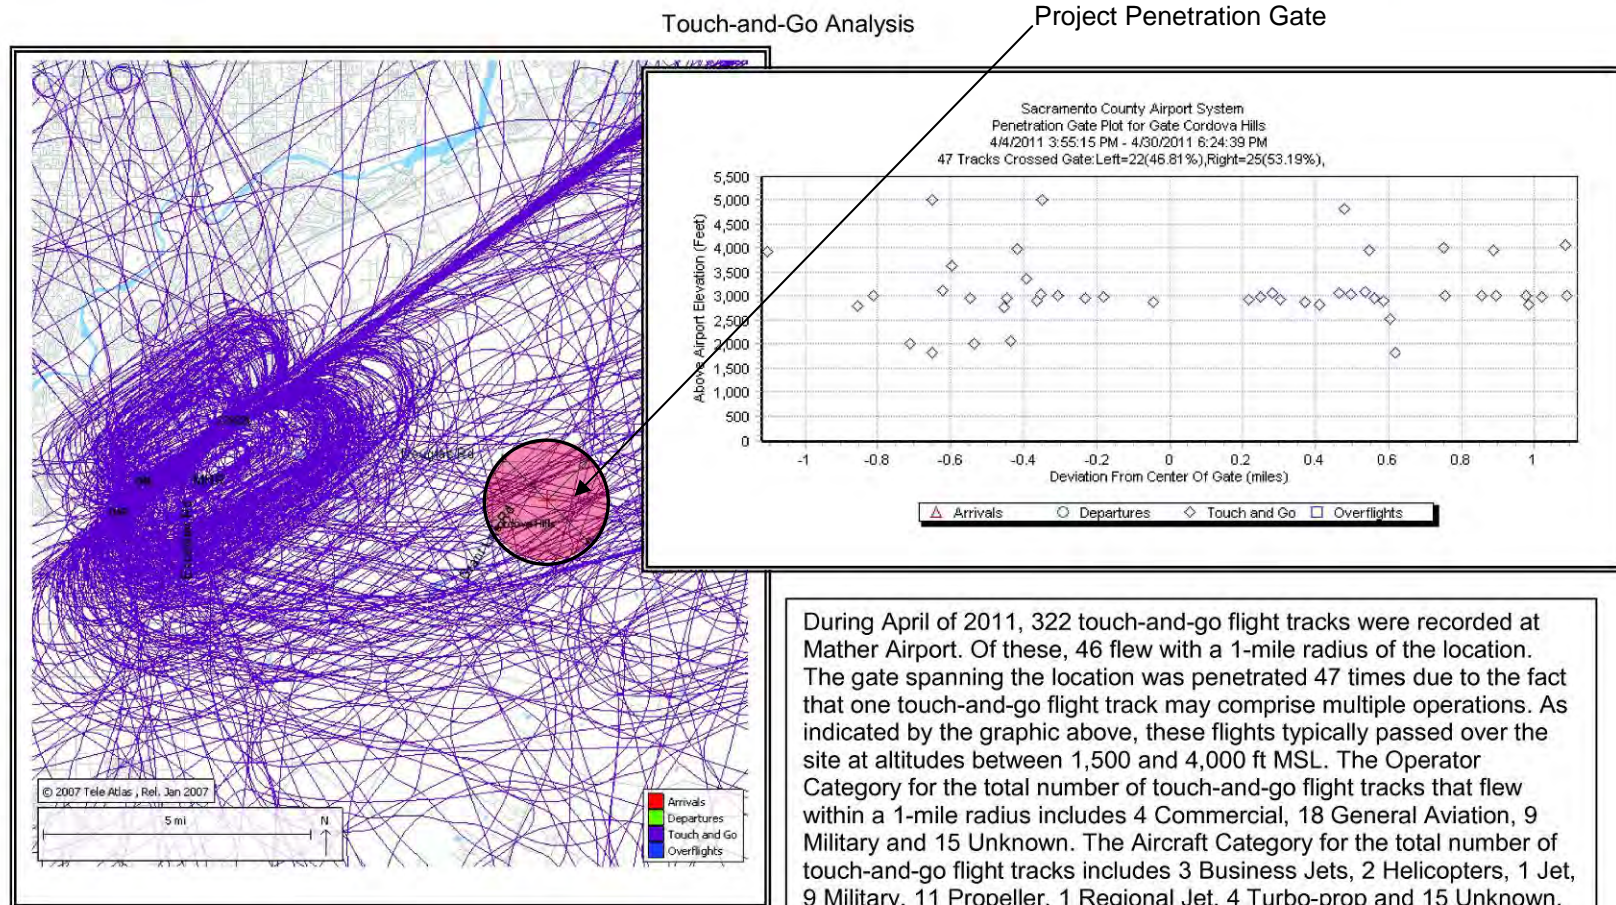

During April of 2011, 1,082 departure flight tracks were recorded at Mather Airport. Of these, 24 flew with a 1 1/8-mile radius of the parcel; 19 penetrated the gate spanning the location. As indicated by the graphic above, these flights passed over the site at a wider range of altitudes from 1,000 to 12,000 ft MSL. The Operator Category for the total number of departures that flew within a 1 1/8-mile radius includes 4 Cargo, 2 Commercial, 7 General Aviation, 4 Military and 7 Unknown. The Aircraft Category includes 8 Business Jets, 4 Jets, 4 Military, 2 Regional Jets, 3 Turbo-prop and 7 Unknown.

In order to capture the relative proximity of the flight tracks to the location center, the basic penetration gate direction was re-oriented.

Plate NO-8: Touch-and-Go Flight Tracks for Mather Airport

Sacramento County Airport System
Aircraft Noise Information Office
 Mather Airport Flight Altitudes Near Cordova Hills Project Location
Flight Track Analysis

In order to capture the relative proximity of the flight tracks to the location center, the basic penetration gate direction was again re-oriented.

During April of 2011, 322 touch-and-go flight tracks were recorded at Mather Airport. Of these, 46 flew with a 1-mile radius of the location. The gate spanning the location was penetrated 47 times due to the fact that one touch-and-go flight track may comprise multiple operations. As indicated by the graphic above, these flights typically passed over the site at altitudes between 1,500 and 4,000 ft MSL. The Operator Category for the total number of touch-and-go flight tracks that flew within a 1-mile radius includes 4 Commercial, 18 General Aviation, 9 Military and 15 Unknown. The Aircraft Category for the total number of touch-and-go flight tracks includes 3 Business Jets, 2 Helicopters, 1 Jet, 9 Military, 11 Propeller, 1 Regional Jet, 4 Turbo-prop and 15 Unknown.

Staff of the Sacramento County Airport System (B. Taylor) reviewed the proposed Project and submitted conditions of approval consistent with the Mather Airfield Airport Planning Policy Area (APPA) requiring that new properties within the APPA boundary be subject to the following condition:

Execution and recordation with the Sacramento County Recorder of an Avigation Easement to Sacramento County and compliance with all other conditions as required by the Sacramento County Board of Supervisors adoption of the APPA for Mather Airfield.

The aircraft noise associated with Mather Airport within the project area will not exceed any federal or State thresholds of significance since the site is located well outside the 60 dB CNEL contour. However, it is reasonable to conclude that although aircraft overflight noise is below thresholds of significance, aircraft noise as a result of the continued and future use of Mather Airport has the potential to be a nuisance and generate objections by residents and other sensitive receptors (such as schools, churches, theaters, etc.) throughout the Project area. For this reason, all residential units planned in the proposed Project area will be conditioned with all Mather Airfield APPA conditions in order to facilitate home buyer awareness and thereby minimize the impact of aircraft overflights which may be experienced by residents within the Project area.

Consistent with General Plan Policy NO-4, the following conditions outlined in the Mather Airfield APPA will be applicable for all planned residential units in the proposed Project area:

1. Minimum noise insulation to protect persons from excessive noise within new residential dwellings, including single family dwellings, that limits noise to 45 dB CNEL, with windows closed, in any habitable room.
2. Notification in the Public Report prepared by the California Department of Real Estate disclosing to prospective buyers that the parcel is located within the applicable airport planning policy area and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level
3. Execution and recordation with the Sacramento County Recorder of an Avigation Easement prepared by the Sacramento County Counsel's Office on each individual residential parcel contemplated in the development in favor of the County of Sacramento. All Avigation Easements recorded pursuant to this policy shall, once recorded, be copied to the director of Airports and shall acknowledge the property location within the appropriate Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the appropriate airport.

Note that item one does not apply, as standard building design would result in interior noise volumes below 45 CNEL for any building constructed outside of the 60 CNEL

contour. Sacramento County Airport System staff have indicated that Mather Airport is an economic resource to the region whose operations can increase or decrease as operations continue, and that objections by future residents could affect future operations at Mather Airport. An Avigation Easement to inform future potential residential buyers will be required to help reduce the impact to Mather Airport from new complaints by future residents or other sensitive receptors of the proposed Project; these various conditions are included as mitigation. The Project will not expose people to excessive aircraft noise which exceeds standards, and for this reason impacts are *less than significant*, but it is acknowledged that people may experience nuisance conditions related to airport operations.

MITIGATION MEASURES:

NO-6. The following conditions will be required to ensure adequate disclosure of Mather Airport operations:

1. Notification in the Public Report prepared by the California Department of Real Estate shall be provided disclosing to prospective buyers that the parcel is located within the applicable Airport Planning Policy Area and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level.
2. Avigation Easements prepared by the Sacramento County Counsel's Office shall be executed and recorded with the Sacramento County Recorder on each individual residential parcel contemplated in the development in favor of the County of Sacramento. All Avigation Easements recorded pursuant to this policy shall, once recorded, be copied to the director of Airports and shall acknowledge the property location within the appropriate Airport Planning Policy Area and shall grant the right of flight and obstructed passage of all aircraft into and out of the appropriate airport.

14 PUBLIC SERVICES

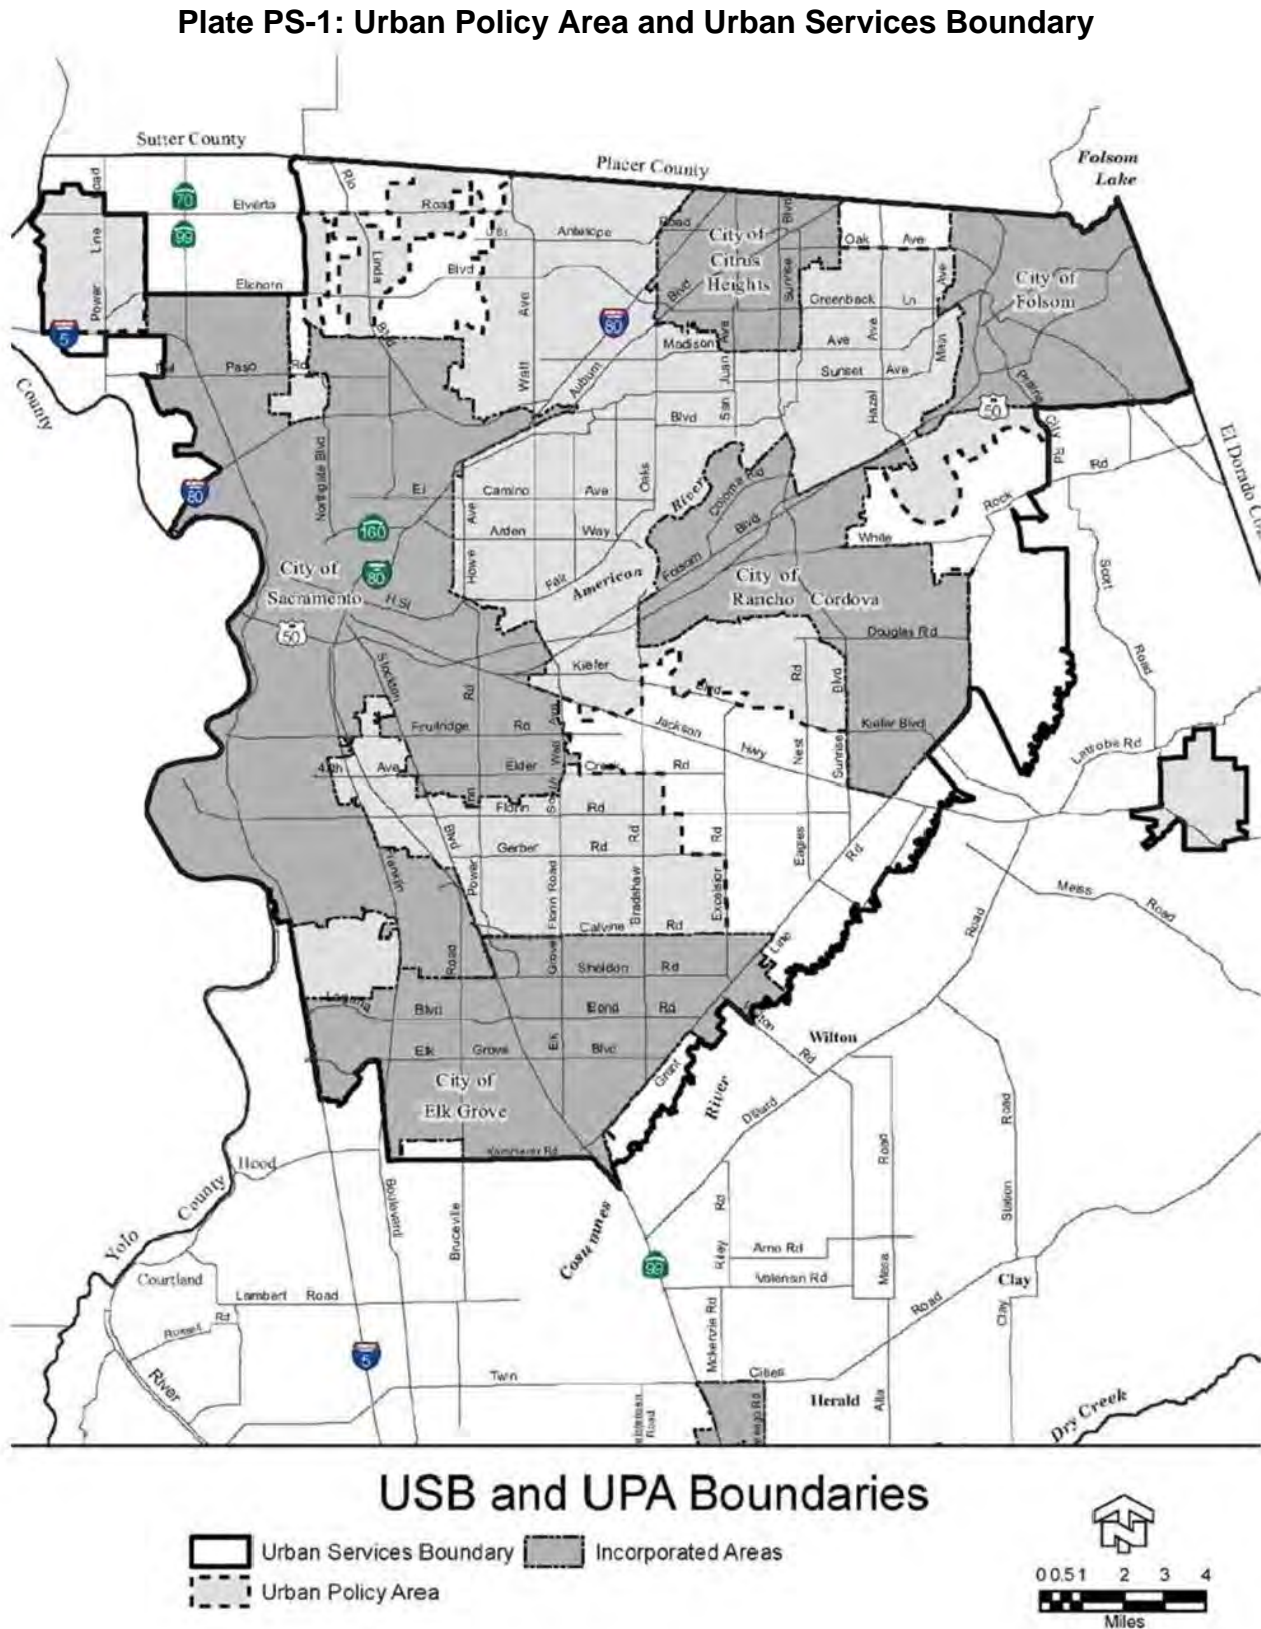

SETTING

The majority of the Project is located within the Urban Services Boundary (USB), as defined in the Land Use Element of the County of Sacramento General Plan (Plate PS-1). The USB indicates the ultimate boundary of the urban area in the unincorporated County. The portion of the Project outside the USB does not include any residential or retail uses, but does include uses such as a sports park and a corporation yard. Although mostly within the USB, none of the Project area is within the Urban Policy Area (UPA). The Urban Policy Area defines the area expected to receive urban levels of public infrastructure and services within the 20-year planning period. In order to receive urban public services, the Project must be within both the UPA and USB. To this end, the Project includes a General Plan Amendment to move the UPA to include approximately 2,366 acres of the Project site.

The Project is located within the following public service districts:

Fire Protection:	Sacramento Metropolitan Fire District California Department of Forestry and Fire Protection
Law Enforcement:	Sacramento County Sheriff's Department
Solid Waste:	County Waste Management and Recycling Division
School District:	Elk Grove Unified School District
Park District:	Sacramento County Regional Parks Department County Service Area 4B
Libraries:	Sacramento Public Library System

This chapter analyzes the Project's potential impacts on service providers due to future development of this site in accordance with the land use designations proposed. Wastewater (sewer), water supply, and energy services are addressed in the Public Utilities chapter of this EIR, while transit services are addressed in the Traffic and Circulation chapter.

PROJECT CHARACTERISTICS

According to the Cordova Hills Master Plan Special Planning Area (SPA), the Project will allow for 8,000 new households and 21,379 new residents within the Project area, a university/college campus center of 6,000 students and 2,036 employees, as well as approximately 1.4 million square feet of commercial and office uses. The SPA estimates that 90% of the undergraduate students and 10% of graduate students will live within the Project area, for a total student resident population of 4,040. In order to provide public services to support the proposed uses in the Cordova Hills Area, the Project includes the development of a new Community Services District (CSD). The Cordova Hills Community Services District (CHCSD) will be a multi-purpose special district with broad power and authority to provide services within the Project area.

CSDs can gather a number of municipal-type services under one government umbrella, granting local autonomy and a framework that can be adapted to local conditions, circumstances, and resources. According to the applicant, the CHCSD is desired in order to more effectively address the broad range of interconnected community needs. CSD's are authorized by California Government Code Section 61000 (Section 61000). According to Section 61000, CSD's can provide services in order to promote public peace, health, safety and welfare. The proposed CHCSD will provide transportation services, greenscape and surface water management, open space management, domestic water management, recreation and park services, community communication services, and landscape and streetscape maintenance services.

Currently the Project area is located within County Service Area 4b (CSA 4b), which is a parks and recreation Service Area governed by the Board of Supervisors. CSA 4b is staffed by the Sacramento County Regional Parks Department which provides park and recreation services to the eastern portion of the County where the Project site is located. According to the Project proposal, the Project area will be detached from CSA 4b, and will be provided park and recreation services under the proposed CHCSD. In order for areas to be detached from existing districts and to create CSDs, discretionary action by the Sacramento Local Agency Formation Commission (LAFCo) is required for approval. To this extent, LAFCo, which intends to use this EIR in considering public service detachment, CHCSD creation, and annexation to various public utilities (refer to the Public Utilities chapter of this EIR) related to the approval of this Project, is considered a responsible agency under CEQA.

The Project area is currently vacant and is not in close proximity to any existing public services, and as a result some extensive, costly improvements related to infrastructure and public facilities – discussed in the Public Utilities chapter – will be required to adequately support the Project. As part of the Project proposal, a Draft Cordova Hills Special Planning Area Public Facilities Financing Plan (Financing Plan, dated November 18, 2010) was submitted identifying a strategy to finance new infrastructure and other public facilities and improvements required to serve the proposed land uses within the Cordova Hills area. The Financing Plan provides the estimated costs and timing of needed facilities as well as a strategy to match the timing and costs with the availability of probable funding sources. The Financing Plan is required to be approved

concurrent with the Project. At this time the Financing Plan is a draft, so reviewers should note that the total costs stated herein are subject to change. Various public service providers were consulted during the development of the initial draft of the Financing Plan, and will continue to be consulted in order to prepare the final draft, to determine needs generated by the Project and the funding required to meet those needs.

Infrastructure improvements detailed in the Financing Plan include roadways, sanitary sewer facilities, water facilities, and storm drain facilities. Public facility improvements detailed in the Financing Plan include fire facilities, landscape corridors, parks, open space and trails, habitat and wetlands, library facilities, transit facilities, corporation yard facilities and schools. It is estimated that infrastructure and facility costs will be approximately 453 million dollars.

According to the Financing Plan, in order to fund the needed infrastructure and facilities a combination of funding sources will be utilized including:

- existing County and other public agency fee programs
- a new Cordova Hills Special Financing District (SFD), which could include the following funding mechanisms:
 - a Project area development fee program
 - bond funding through a Mello-Roos Community Facilities District (CFD)
 - developer advancements and reimbursements
- Elk Grove Unified School District CFD funding
- state, federal and other funding
- developer funding

The Cordova Hills SFD will partially fund the construction of backbone infrastructure and public facilities. The Financing Plan includes a cost allocation of the projected SFD costs to estimate the build out costs for each proposed land use type. The Financing Plan has estimated costs per unit for residential uses, per building square foot for commercial uses, and in total for the university/college campus center. The development and population estimates used in the Financing Plan are lower than those in the SPA in order to provide a conservative cost estimate to ensure that construction costs per unit or square foot are not understated if actual development occurs at levels below the maximum authorized with Project approval. Total residential development (excluding the university/college campus center) is listed as 7,500 homes with 20,110 people and approximately 850,000 square feet of non-residential uses. The Financing Plan has been developed in coordination with affected service providers in order to ensure that adequate funding is available for facilities and infrastructure needed to serve Project development. The financing plan is based on 7,500 homes rather than

the 8,000 homes assumed throughout the SPA in order to ensure that the full development cost is provided in the event that the full development of 8,000 homes is not achieved.

Aside from the capital improvement costs detailed in the Financing Plan, the Project proposal includes an Urban Services Plan (Appendix PS-1) which describes the service levels and financing strategy to fund an urban level of public services that will be provided to future residents, businesses and employees in the Project area. The services provided by independent agencies and the County will be funded from the County general fund, user fees, and existing property tax allocations. The services provided and administered by the CHCSD will ultimately be funded through user fees and special taxes or assessments of those utilizing the services. Like the Financing Plan, cost allocations are based on development and population estimates that are lower than what would be allowed to ensure adequate funding for operations and maintenance.

REGULATORY SETTING

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

Local Agency Formation Commissions (LAFCoS) are countywide commissions, required in each California county. LAFCoS govern the formation of new agencies, incorporation of new cities and districts, consolidation or reorganization of special districts and/or cities, as well as municipal service reviews and sphere of influence updates, and annexations of cities and special districts. The broad goals of the Sacramento LAFCo's directive are to ensure the orderly formation of local governmental agencies, to preserve agricultural and open space lands, and to discourage urban sprawl. LAFCoS must, by law, create Municipal Service Reviews and update Spheres of Influence for each independent local governmental jurisdiction within their countywide jurisdiction.

2030 SACRAMENTO COUNTY GENERAL PLAN

In order to assure adequate service levels and adequate funding for those services, the Sacramento County General Plan includes the following policies:

- LU-65. Levels of service shall be consistent with policies in this Plan, or where none are applicable, shall use Federal and State environmental standards and commonly accepted industry norms and standards as guidelines.
- LU-66. Assure service availability, adequacy, and funding at each stage of the development process for all public services for the life of the project consistent with the intent of the adopted Public Facilities Financing Plan and accompanying Phasing Plan.

LU-69. Supplemental mitigation fees may be established by the Board of Supervisors provided they find that supplemental fees are critical and necessary to meet the facility funding needs of a service provider and that traditional methods are inadequate.

FIRE PROTECTION AND EMERGENCY SERVICES

CALIFORNIA OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

In accordance with CCR Title 8 Sections 1270, "Fire Prevention" and Section 6773 "Fire Protection and Fire Equipment", the California Occupational Safety and Health Administration (Cal/OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials; fire hose sizing requirements; restrictions on the use of compressed air; access roads; and the testing, maintenance, and use of all fire fighting and emergency medical equipment.

EMERGENCY RESPONSE/ EVACUATION PLANS

The State of California passed legislation authorizing the Office of Emergency Services (OES) to prepare a Standard Emergency Management System (SEMS) program, which sets forth measures by which a jurisdiction should handle emergency disasters. Non-compliance with SEMS could result in the State withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster.

FIRE CODES AND GUIDELINES

The availability of sufficient water flows and pressure are a basic requirement of the fire districts. Fire District requirements are determined for specific development projects at the design stage and are based on the Uniform Building Code (UBC). In addition to meeting minimum fire flow requirements, all development projects within the unincorporated area are required to meet other various fire protection requirements identified in the plan check and review process. The Fire District specifications require that fire sprinklers be installed in all new commercial construction that exceeds 3,600 square feet and some residential properties exceeding 2,999 square feet. Also, for structures exceeding 3,600 square feet, the district requires water pressure of at least 20 pounds per square inch residual pressure at 1,000 gallons per minute flow. The district also requires that all traffic signals installed on a site include traffic control devices that allow the Fire District to activate the light and therefore control the flow of traffic in order to maintain adequate response times.

FIRE DISTRICT MASTER PLANS

Fire District Master Plans provide policy guidance, objectives, and activities in an effort to improve emergency response to the districts' citizens, use existing resources more efficiently, and improve district facilities. These plans address deficiencies with existing

fire stations, including age and condition issues; noncompliance with building codes; the ability to respond to emergencies following an earthquake; and lack of apparatus rooms of sufficient size to store present-day emergency-response equipment. SMFD has defined a 20-year plan to deal with new infrastructure needs and augment/replace equipment.

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

Sacramento County General Plan Policies PF-54 through PF-64 are pertinent to fire protection and emergency services. These policies are intended to support the stated goal of the Fire Protection and Emergency Services Section of the General Plan which is to have “efficient and effective fire protection and emergency response serving existing and new development.”

The policies in the Public Facilities Element that support the County’s emergency services strategies and are relevant to the Project are as follows:

- PF-54. Require new development to install fire hydrants and associated water supply systems which meet the fire flow requirements of the appropriate fire district.
- PF-55. New development shall provide access arrangements pursuant to the requirements of the California Fire Code.
- PF-56. Infill development shall be provided adequate off-site improvements to meet on-site fire flow requirements.
- PF-57. New development, redevelopment or traffic signal replacement shall require the installation of emergency signal activation systems in all street improvements requiring signalization when requested by a fire district.
- PF-58. Traffic calming measures should be used wherever possible in a manner that does not delay emergency vehicle responses.
- PF-59. Alternative methods of fire protection and access must be instituted if access is reduced to emergency vehicles.
- PF-60. Require that structures of four stories or more in height provide on-site equipment and facilities to the satisfaction of the appropriate fire district, consistent with industry norms and standards.
- PF-61. Mitigation fees may be established by the Board of Supervisors or Fire Districts for the purpose of funding adequate fire protection and emergency medical response facilities provided they find that such fees are critical and necessary to meet the facility funding needs of the fire district and that existing methods of financing are inadequate.

- PF-63. Mitigation fees established by County ordinance or Fire District shall, together with other reasonably assured sources of funding identified in the fire district's financing plan, be sufficient to implement the adopted financing plan.
- PF-64. No building permit for new residential or commercial construction shall be issued when there is a Board of Supervisors certified fire district financing plan for any applicable fire district, which provides for mitigation fees, until the applicant has contributed all required mitigation fees.

LAW ENFORCEMENT SERVICES

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

Sacramento County General Plan Policies PF-50 through PF-53 are pertinent to Law Enforcement services. These policies are intended to support the stated goal of the Sheriff Section of the General Plan which is to have “adequate Sheriff Services and Facilities for the Unincorporated Areas of Sacramento County.” The law enforcement policy relevant to the Project is as follows:

- PF-53. Design neighborhoods and buildings in a manner that prevents crime and provides security and safety for people and property; when feasible.

SOLID WASTE SERVICES

RESOURCE CONSERVATION AND RECOVERY ACT (RCRA)

The Resource Conservation and Recovery Act (RCRA) was enacted in 1976 to protect human health and the environment from potential hazards of waste disposal, to conserve energy and natural resources, to reduce the amount of waste generated, and to ensure that wastes are managed in an environmentally sound manner (EHSO, 2009).

Under RCRA, the United States Environmental Protection Agency (US EPA) has the authority to control hazardous wastes from the “cradle to grave”. This includes the generation, transportation, treatment, storage and disposal of hazardous wastes (US EPA, 2009). RCRA also sets a framework for the management of non-hazardous solid wastes. In 1986, amendments to RCRA enabled the US EPA to address underground storage tanks storing petroleum and other hazardous substances.

RCRA authorizes states to develop and enforce their own waste management programs. State programs must be approved and authorized by the US EPA.

CALIFORNIA INTEGRATED WASTE MANAGEMENT ACT AND CALRECYCLE (FORMERLY THE CALIFORNIA INTEGRATED WASTE MANAGEMENT BOARD)

Regulations for solid waste disposal in California began with the enactment of the Solid Waste Management and Resource Recovery Act of 1972. This statute created the

Solid Waste Management Board, giving it authority related to solid waste handling, disposal and reclamation.

The Integrated Waste Management Act of 1989 is the result of two pieces of legislation, AB 939 and SB 1322, which created the California Integrated Waste Management Board (which has been renamed CalRecycle). The Integrated Waste Management Act mandated a goal of 25 percent diversion of each city's and county's waste from disposal by 1995 and 50 percent diversion in 2000, with a process to ensure environmentally safe disposal of waste that could not be diverted. CalRecycle plays a central role of promoting achievement of the waste diversion as mandated by the Act (Cal EPA, 2009).

CalRecycle is the State agency designated to oversee, manage, and track California's 92 million tons of waste generated each year. They provide grants and loans to help California cities, counties, businesses and organizations meet the State's waste reduction, reuse and recycling goals. CalRecycle promotes a sustainable environment where these resources are not wasted, but can be reused or recycled. In addition to many programs and incentives, the Board promotes the use of new technologies for the practice of diverting California's resources away from landfills (CalRecycle, 2009). The Board is responsible for ensuring that State waste management programs are primarily carried out through local enforcement agencies (LEAs). The California Water Resources Control Board and the Central Valley Regional Water Quality Control Board also regulate waste disposal (the latter actually regulated solid waste prior to CalRecycle).

As reported in the CalRecycle 2008 Annual Report, California has exceeded the goals mandated by the Integrated Waste Management Act of 1989 by diverting 58 percent of its waste stream. This accomplishment is in part due to successful partnership between State government, local government, and the solid waste industry in California.

SACRAMENTO COUNTY DEPARTMENT OF WASTE MANAGEMENT AND RECYCLING (DWMR)

The Sacramento County Department of Waste Management and Recycling (DWMR) is responsible for maintaining a waste management system for residents and businesses in the unincorporated areas of the County. The DWMR has responsibility for garbage recycling and collection services, garbage disposal and recycling facilities, and recycling programs. The DWMR oversees the waste management collection and disposal services for approximately 155,500 residential customers every week. The DWMR collects and disposes/processes 150,000 tons of trash, 75,000 tons of green waste, and 45,000 tons of recyclables each year.

SOLID WASTE ADVISORY COMMITTEE

The Solid Waste Advisory Committee (SWAC) is an advisory panel consisting of appointed representative from each jurisdiction in Sacramento County. The SWAC is the State-mandated Local Task Force (as mandated by the California Public Resources Code Section 40950), which coordinates waste management and recycling efforts throughout the County. The SWAC advises the County Board of Supervisors, the city

councils of the cities within the County, and the Sacramento Regional County Solid Waste Authority (SWA) on all matters relating to the County of Sacramento Integrated Waste Management Plan and all matters relating to integrated waste management, including public education; source reduction; recycling; composting; transformation; materials recovery/resource recovery and marketing; and the collection, transfer, processing, and disposal of refuse and recycling.

SACRAMENTO COUNTY INTEGRATED WASTE MANAGEMENT PLAN

The County of Sacramento adopted the Sacramento County Integrated Waste Management Plan in March 1996, and it was approved by CalRecycle in May 1998. The plan was re-approved as part of the mandatory 5-year review process in March of 2009. This plan consists of the following:

- Siting Element (entire county: cities and unincorporated areas)
- Summary Plan (entire county: cities and unincorporated areas)
- Source Reduction & Recycling Elements (by City, County, or Regional Agency)
- Household Hazardous Waste Elements (by City, County, or Regional Agency)
- Non-disposal Facility Elements (by City, County, or Regional Agency)

These documents are the main sources and references for solid waste facility planning in Sacramento County. The Siting Element and Summary Plan are prepared and administered by the County of Sacramento, Department of Waste Management & Recycling. The remaining documents are prepared and administered by each individual jurisdiction or regional agency.

SACRAMENTO REGIONAL SOLID WASTE AUTHORITY (SWA)

The Sacramento Regional Solid Waste Authority is a joint powers authority of Sacramento County and the City of Sacramento. SWA was formed in December 1992 to assume the responsibility for solid waste, recycling, and disposal needs for businesses and apartment complexes in the Sacramento area. The SWA regulates commercial solid waste collection by franchised haulers and offers recycling services to multi-family dwelling units. SWA is governed by a Board of Directors consisting of elected officials from the City of Sacramento and the unincorporated area of Sacramento County. The following SWA recycling ordinances apply to the unincorporated areas of the County.

SWA ORDINANCES

The SWA has adopted three recycling ordinances that target three distinct waste streams: (1) The Business Recycling Ordinance, adopted in 2007 for commercial generators who subscribe to 4 cubic yards or more of refuse service per week; (2) The Certification of C&D [Construction and Demolition] Debris Sorting Facilities Ordinance, adopted in 2008, that creates a program for mixed C&D facilities that dovetails with both City and County C&D Ordinances for builders; and (3) The Multifamily Recycling

Ordinance, adopted in 2009, that requires owners of multifamily properties with over 5 units to subscribe to a recycling service for their tenants.

LOCAL ENFORCEMENT AGENCY

Local enforcement agencies (LEAs) have the primary responsibility for ensuring the correct operation and closure of solid waste facilities in the state. They also have responsibilities for guaranteeing the proper storage and transportation of solid wastes. The Sacramento County Environmental Management Department (EMD) is authorized as the LEA under Division 30 of the Public Resources Code and Title 14 of the California Code of Regulations (CCR).

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

Sacramento County General Plan Policies PF-20 through PF-26 are pertinent to solid waste. These policies are intended to support the stated goal of the Solid Waste Services and Facilities Section of the General Plan which is to have a “safe, efficient and environmentally sound operation of solid waste facilities in Sacramento County.”

The majority of the policies in the General Plan pertain to service providers and not to development projects. The policies in the Public Facilities Element that support the County’s Solid Waste Services strategies and are relevant to the Project relate to fees to support adequate waste facilities and are as follows:

- PF-23. Solid waste collection, handling, recycling, composting, recovery, transfer and disposal fees shall recover all capital, operating, facility closure and maintenance costs.
- PF-24. Solid waste disposal fees and rate structures shall reflect current market rates and provide incentives for recovery.

SCHOOL SERVICES

LEROY F. GREENE SCHOOL FACILITIES ACT OF 1998

The “Leroy F. Greene School Facilities Act of 1998”, also known as Senate Bill No. 50 (SB 50) established a State program to provide per-pupil funding for new construction and modernization of existing school facilities. (OPSC, 2009). The passage of Proposition 1A in 1998 allowed SB50 to be fully implemented.

SB 50 limited the power of cities and counties to require mitigation of school facilities as a condition of approving new development and authorized school districts to assess fees (at various levels) to directly offset the costs associated with increased capacity as a result of new development.

OFFICE OF PUBLIC SCHOOL CONSTRUCTION AND THE STATE ALLOCATION BOARD

The State Allocation Board (SAB) is responsible for determining the allocation of state resources used for the new construction and modernization of local public school facilities. The SAB is also responsible for the administration of the State School Facility Program, the State Relocatable Classroom Program and the Deferred Maintenance Program. The SAB is the policy-level body for the programs administered by the Office of Public School Construction (OPSC) (OPSC, 2009). The OPSC, as staff to the SAB, implements and administers the School Facility Program and other programs of the SAB. The OPSC also has the responsibility of verifying that all applicant school districts meet specific criteria based on the type of funding which is being requested. (OPSC, 2009)

There have been four Kindergarten – University Public Education Facilities Bond Acts passed by voters (Proposition 1A, 47, 44 and 1D) that allocated billions of dollars in general obligation bonds for K – 12 facilities through the School Facility Program. These funds help assist school districts with overcrowding, accommodating future enrollment growth and repairing and modernization of older facilities.

CALIFORNIA EDUCATION CODE

The California Education Code authorizes the California Department of Education to develop site selection standards for school districts. The California Department of Education School Facilities Planning Division has prepared a School Site Selection and Approval Guide that provides criteria for location appropriate school sites in the State of California.

Site selection is determined based on a screening and ranking procedure. The criteria, in order of importance are listed below:

1. Safety
2. Location
3. Environment
4. Soils
5. Topography
6. Size and Shape
7. Accessibility
8. Public Services
9. Utilities
10. Cost
11. Availability
12. Public Acceptance

SACRAMENTO COUNTY OFFICE OF EDUCATION

The Sacramento County Office of Education (SCOE) is responsible for delivering quality education to more than 238,000 K – 12 public school students in Sacramento County. The SCOE provides technical assistance, curriculum and instructional support, staff

development, legal and financial advice and oversight to 13 school districts. SCOE also directly educates more than 30,000 children and adults.

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

The Sacramento County General Plan policies that are pertinent to public school facilities are policies PF-27 through PF-39. These policies are intended to support the stated goal of the Public School Facilities Section of the General Plan which is to have “new public schools which serve as a neighborhood focus and maintain a quality learning environment for Sacramento County’s residents as the County population increases.”

The General Plan policies related to public schools generally pertain to developing schools that are functionally and physically integrated within their surrounding neighborhoods; that are developed through a coordinated planning effort between school districts; and that are at levels equal to state standards for school enrolment and school site size for all Sacramento schools. School related policies in the General Plan focus on how schools will be sited and developed rather than on how development may affect schools. School facilities mitigation is covered under California Government Codes noted above. Applicable General Plan policies are:

- PF-27. Community plans shall identify all existing and planned school sites and shall include guidelines and conceptual examples for incorporating new schools into overall neighborhood design.
- PF-28. Community and Specific Plans shall consider the needs of community colleges and address the feasibility and appropriateness of off-campus facilities, particularly in TODs.
- PF-29. Schools shall be planned as a focal point of neighborhood activity and interrelated with neighborhood retail uses, churches, neighborhood and community parks, greenways and off-street paths whenever possible.
- PF-30. New elementary schools in the urban area should be planned whenever possible so that almost all residences will be within walking distance of the school (one mile or less) and all residences are within two miles of a school.
- PF-31. Schools shall be planned adjacent to neighborhood parks whenever possible and designed to promote joint use of appropriate facilities. The interface between the school and park shall be planned with an open design and offer unobstructed views to promote safety.
- PF-32. Elementary schools shall not be located along arterials and thoroughfares. Junior high and high schools should be located near roadways with adequate capacity and should provide adequate parking to facilitate the transport of students.

- PF-33. New community college campuses and high schools within the urban service boundary shall be located along arterial or thoroughfare streets, with high priority to location adjacent to transportation corridors identified on the Transportation Plan Map.
- PF-34 All school site plans shall be designed to minimize traffic speed and maximize traffic flow around the school, allowing for several access points to and from the site.
- PF-35. New schools should link with planned bikeways and pedestrian paths wherever possible.
- PF-38. Land dedications or reservations for schools should meet state guidelines for school parcel size. Where more than one owner or development project is involved, there shall be appropriate assurances and conditions to assure that requisite acreage can and will be assembled to meet facility site requirements.
- PF-39. Specific Plans shall show the location of future school sites based upon adopted school district master plans and criteria in the General Plan.

PARK AND RECREATION SERVICES

CALIFORNIA GOVERNMENT CODE SECTION 66477

California Government Code Section 66477 (Quimby Act) allows local governments to exact land dedications or fees in lieu for park purposes from new subdivisions. The law prescribes a standard consistent with the circumstances of each park district based on a minimum of 3 acres and a maximum of 5 acres per 1,000 residents. Sacramento County's Planning Division and Municipal Services Agency oversee these requirements in the unincorporated area.

TITLE 22

Title 22 of the Sacramento County Code provides direction on calculating park acreage requirements for residential developments. Depending on the jurisdiction, residential developments are required to provide dedicated land for park construction or pay in-lieu fees.

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

The Sacramento County General Plan policies that are pertinent to park facilities are policies PF-120 through PF-131. These policies are intended to support the stated goal of the Local Park Acquisition and Maintenance Section of the General Plan which is to have “adequate and well funded local park facilities for existing and new developments.”

The policies in the Public Facilities Element that support the County's park services strategies and are relevant to the Project are as follows:

- PF-122. To help assure that local recreation and park district Master Plan standards for levels of service may be achieved and maintained, the County may require new development to dedicate land, pay in-lieu fees, development impact fees, or otherwise contribute a fair share to the acquisition and development of parks and recreation facilities. For development in infill areas where land dedication may not be practical, the County in cooperation with the affected park district may explore creative alternatives for providing park and recreation facilities.
- PF-123. At a minimum, new residential developments approved by the County shall provide sites for local parks for their prospective residents consistent with the Quimby Act and the land dedication standards for each local recreation and park district adopted by Sacramento County in Chapter 22.40 of the Sacramento County Code. These requirements may be satisfied by land dedication, payment of fees in lieu of dedication, or on-site improvements per the provisions of Chapter 22.40, which will be regularly updated to reflect changing demography. These include the baseline standard of three acres of land for parks per 1,000 residents or in cases where existing parklands within a park district exceed three acres per 1,000 population, that higher ratio shall be the standard for new developments up to a maximum of five acres of land for parks per 1,000 residents based on calculations specified in SCC Chapter 22.40.
- PF-125. The County shall promote the provision of on-site recreational amenities and gathering places that are available to the public by large scale development projects and may consider providing incentives such as density bonuses or increases in building coverage for that purpose.
- PF-127. Require new residential developments to participate in park O & M financing mechanisms where established by local park districts or the County.
- PF-128. Encourage park development adjacent to school sites and the formation of joint use agreements between school and park districts.
- OS-10. Sacramento County shall seek to attain the County Regional Park System standard of 20 acres of regional parkland per 1,000 population.

LIBRARIES

SACRAMENTO COUNTY GENERAL PLAN PUBLIC FACILITIES ELEMENT

The Sacramento County General Plan policies that are pertinent to library facilities are policies PF-40 through PF-49. These policies are intended to support the stated goal of the Library Facilities and Service Section of the General Plan which is to provide for “satisfactorily designed, safe, and well-maintained library facilities using current and future technologies in Sacramento County.”

The policies in the Public Facilities Element that support the County’s library services strategies and are relevant to the Project are as follows

- PF-40. New and remodeled library facilities shall meet adopted standards for square footage and parcel size; materials and equipment; and services programs and staffing commensurate with the population served.
- PF-42. Share capital costs of library construction and renovation for existing residents through bond financing or other appropriate measures and by new residents and workers through fees on new development.
- PF-43. Include community library needs among facilities to be financed by financing districts created in new urban areas.
- PF-45. New commercial development in financing districts shall contribute to library financing such that fees based on projected employment are approximately equivalent to the fees for an equivalent number of new residents.
- PF-46. Incorporate planned libraries into community and specific plans for new development.
- PF-48. Locate future library sites to be accessible by car, bicycle, foot, public transportation, and have sufficient off-street parking.
- PF-49. Locate future library sites so as to be visible to people passing by and be accessible to children unaccompanied by adults.

LIBRARY FACILITY MASTER PLAN 2007 – 2025

The Library Facility Master Plan (FMP) for the Sacramento Public Library System sets forth general standards and criteria for the renovation and construction of all new libraries. Existing and future library needs are largely population driven, e.g., for every 30,000 residents in a community, at least one full service library is required. Ideally, new libraries would have 0.4 to 0.6 square feet per capita with some basic minimum and maximum sizes. The FMP also establishes preferred sizing and footprint and desirable components such as volumes and collection, meeting rooms, study areas, computer terminals and so on. Each of these items is standards driven. One of the most critical items for future library development is location. A new library in a poor location is an under-utilized library, and conversely, an older, under-sized library in a good location is a highly used library. Important location criteria include: land availability, cost, quality of the site, size, accessibility (parking, pedestrian access, public transportation), and synergy/location with other public and private uses. For example, a new library is often better positioned in a new town square, rather than in a residential neighborhood.

SIGNIFICANCE CRITERIA

The criteria used to evaluate the significance of public services impacts resulting from the proposed Project were developed based on CEQA Guidelines and on professional standards. Impacts of the proposed Project on public services were considered significant if implementing the Project would:

1. Result in substantial adverse physical impacts associated with the provision of emergency services;
2. Result in substantial adverse physical impacts associated with the provision of law enforcement services;
3. Result in service by a landfill with insufficient permitted capacity to accommodate the Project's solid waste disposal needs;
4. Result in non-compliance with federal, state, and local statutes and regulations related to solid waste.
5. Result in substantial adverse physical impacts associated with the provision of public school services;
6. Result in substantial adverse physical impacts associated with the provision of park and recreation services, or result in substantial physical deterioration of an existing facility due to increased use;
7. Result in substantial adverse physical impacts associated with the provision of library services.
8. Result in a service demand that cannot be met by existing or reasonably foreseeable future service capacity.

IMPACTS AND ANALYSIS

IMPACT: CONSTRUCTION OF FACILITIES

The funding of new facilities, land acquisition, and other issues are discussed within the impact sections to follow, which are specific to the type of facility (schools, parks, etc). This section discusses the overall impacts that can be expected to result from constructing new facilities, which will generally include schools, libraries, Sheriff's facilities, fire stations, and parks. The proposed Project will increase the demand on a number of services, as described in the sections that follow, to support development within the Project area. In most cases the demands will require the construction of new facilities which will result in physical impacts. These construction activities will take place within the Project boundaries in areas designated for developed uses, consistent

with the provisions of the SPA. The relevant topical chapters of this EIR disclose the physical impacts of full development of the proposed Project, which includes areas where fire stations and other public facilities would be constructed, and provide mitigation as appropriate.

Public service facilities construction will not result in any substantial physical impacts specific to public services that are not already an inherent part of overall Project impacts; impacts specific to public facility construction related to fire services, law enforcement services, solid waste services, school services, park services, and library services are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: FIRE PROTECTION AND EMERGENCY SERVICES

The Project site is located within an area of Sacramento County designated as a State Responsibility Area (SRA) by the California Department of Forestry and Fire Protection (CAL FIRE) (see Plate PS-2). CAL FIRE has assigned the area a moderate fire hazard severity risk rating. This is the lowest fire hazard rating applied to SRAs; nonetheless there is a risk of wildland fires in the area. Inclusion in the SRA means that the property will be subject to building codes that reduce the risk of burning embers pushed by wind-blown wildfires from igniting buildings.

Roofing standards vary by the fire hazard zone rating of a site but the codes for siding, decking, windows, and vents apply throughout all SRAs regardless of the fire hazard severity ranking. New buildings located in any Fire Hazard Severity Zone within SRAs must comply with all sections of Chapter 7 of the California Building Code.

The Project site is also within the service area of the Sacramento Metropolitan Fire District (SMFD). The Fire District does not have any adopted performance standards, but it strives to maintain minimum response times of five minutes in 90% of all cases, which is a national voluntary standard set by the National Fire Protection Association. The proposed Project will increase the demand for SMFD protection and emergency services. This increase in demand will require additional staff and fire facilities in order to maintain service levels and to ensure that adequate fire protection is provided.

In order to provide sufficient fire and emergency response services to the Project area the Cordova Hills Project proposes development regulations that will accommodate fire stations in the following land use zones: public/quasi public; low, medium, and high density residential; flex residential; flex commercial; flex office; commercial mixed use; and town center. New fire stations will be built within the Project area as development plans come forward and the need for them arises, as determined and implemented by SMFD. According to the proposed financing plan, funding for the construction and operation of the fire facilities will be provided by the District-wide Capital Fire Facilities fee.

Plate PS-2: CAL FIRE State Responsibility Area Moderate Fire Hazard Zone for Eastern Sacramento County

CAL FIRE Source Data: http://www.fire.ca.gov/fire_prevention/fhsz_maps/fhsz_maps_sacramento.php

SMFD has indicated (letter dated June 22, 2011) that the Project plan includes adequate opportunities for fire station sites throughout the Project, and that one or two fire stations will be needed to serve the Project and adjacent development. Citygate Associates LLC conducted a “standards level of coverage model” (dated September 2011 and included as Appendix PS-2) which has been approved by SMFD, indicating that a single fire station located along University Boulevard at the intersection of Street D would be sufficient. Based on the Project site, it is anticipated that the station will require a truck company, an engine company, and a medic company. With adherence to existing regulations and the construction of new fire facilities on site, impacts associated with fire protection services will be *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: LAW ENFORCEMENT SERVICES

The Project is within the service area of the Sacramento County Sheriff's Department (SSD) and includes a substantial number of housing units as well as associated non-residential uses, which will increase the demand of SSD services. The proposed Project includes a maximum of 8,000 residential units which will provide housing for a residential population of approximately 21,379 residents (excluding the university/college campus center students).

Safety and law enforcement issues are addressed within the Cordova Hills SPA as well as both the Financing Plan and the Urban Services Plan. The SPA indicates that law enforcement services will continue to be provided by SSD and that a flexibility in the land plan has been provided to accommodate a Sheriff's Department substation in the proposed Town Center Zone. Additionally, according to the SPA, police facilities will be allowed in the following land use zones: low, medium, and medium/high density residential; flex residential; flex commercial; flex office; commercial mixed use; and town center.

According to the Financing Plan, which has been reviewed by SSD, the development of the Project will “not likely necessitate the construction of additional police facilities”; however, the Urban Services Plan indicates that SSD plans to operate a substation in the Town Center Village through a lease with Cordova Hills. SSD staff (C. Burdette) was given the opportunity to review and comment on the Project and submitted recommendations/ requirements for the Project dated January 16, 2011.

SSD submitted standard recommendations related to landscaping, fencing and access control, lighting, and the addressing of buildings in order to increase visibility to public and private areas while making those areas less attractive to loiterers and potential offenders while aiding emergency service responders. These recommendations are based on the concepts and strategies of Crime Prevention Through Environmental Design (CPTED) which promotes the idea of proper design and effective use of the built environment and can lead to the reduction of crime and increase the feeling and reality

of safety (the CPTED strategies are included in Section 4.15.5.2 of the SPA). The provided comments also include staffing ratio requirements of the SSD and indicate that SSD will require an increase in staffing based on the staffing ratio of 0.75 deputies per 1,000 citizens. To meet the Sheriff Department's 0.75 officers per 1,000 persons staffing goal, approximately 16 staff members would need to be added to the department to account for the increased demand generated by the Project.

Funding for the expected increase in law enforcement services is detailed in the Cordova Hills Financing Plan. According to the Urban Services Plan, law enforcement services will be funded through the County General Fund and through County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax. Taxes will be levied on each new residential unit developed within the Cordova Hills area in accordance with the provisions of CFD 2005-1 which is estimated to generate approximately 2.3 million dollars for law enforcement services at full buildout.

In addition to the funding mechanisms already in place to help provide for adequate law enforcement services generated by new development, the General Plan contains policies for the planning and development of law enforcement facilities, such as law enforcement programs (educational and crime preventative programs), design of neighborhoods and regulating security measures through the Zoning Code, Uniform Building Code and Land Development Ordinances. These funding mechanisms, policies and regulations will ensure that the Sheriff's Department can adequately serve the new growth. Impacts to law enforcement services are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: SOLID WASTE SERVICES

The Project area is provided with solid waste collection service by the Sacramento County Department of Waste Management and Recycling. The Kiefer Landfill is the primary municipal solid waste disposal facility in Sacramento County. The proposed Project will allow for the construction of 8,000 residential units, approximately 1.4 million square feet of commercial and office uses and well as a university/college campus center which is expected to accommodate 6,000 students. Development of the proposed Project will result in an increased demand for solid waste services.

The landfill facility area is 660 acres in size and, according to DWMR staff (D. Ghirardelli), is permitted to accept 10,815 tons of waste per day (at buildout in 2035). **The facility's current maximum daily tonnage is 5,598 tpd and the projected annual tonnage for the 2011/2012 fiscal year is 1,202,000 tons per its Solid Waste Facility Permit.** ~~and currently receives approximately 700,000 tons per year.~~ CalRecycle's website indicates that the landfill's permitted capacity is approximately 117 million cubic yards. According to CalRecycle staff (N. Yeates), as of April 30, 2010, the landfill's remaining capacity is approximately 108 million cubic yards. Based on current disposal rates, Kiefer landfill's anticipated "ceased operations date" (the estimated date

when the facility will reach its permitted capacity) is 2064 according to the CalRecycle website.

DWMR staff has calculated the expected annual waste generation of the Cordova Hills Project based on the current waste characterization patterns within the unincorporated portion of Sacramento County and the commercial and residential land uses proposed within the Project site. According to DWMR, the total annual waste generation expected from the Project is 61,753 tons but with a 70% current diversion rate (amount that will be recycled, composted, or otherwise not be put in the landfill) only 18,592 tons of waste will require landfill disposal.

DWMR has also calculated the expected amount of construction debris that will be generated thorough the buildout of the proposed Project. A total of 50,483 tons of construction debris is expected to be generated at full buildout of the proposed Project. However, according to DWMR staff, due to recent green building code requirements, 50% of construction debris from new structures is to be recycled and only 25,241 tons of the resultant debris will need to be disposed of in the landfill.

DWMR has indicated that landfill capacity is adequate to support the waste disposal needs generated by the Project. Additionally, DWMR staff has indicated that currently the local recyclable marketplace is adequate to support the traditional and construction recycling needs of the Project.

The proposed Project will not be served by a landfill with insufficient permitted capacity to accommodate the Project's solid waste disposal needs nor will the Project be in non-compliance with federal, state, and local statutes and regulations related to solid waste. The impacts of the proposed SPA on solid waste service are considered *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: SCHOOL SERVICES

The Project site is within the service area of the Elk Grove Unified School District (EGUSD). Development of the proposed Project would result in increases to the localized student population. The Financing Plan projects that student enrollment resulting from the Project will be approximately 4,686 total students, with approximately 2,553 of these in grades K – 6 (elementary school), 748 in grades 7 – 8 (middle school), and 1,384 in grades 9 – 12 (high school). These figures are lower than those cited in the SPA, so that the Financing Plan will be fiscally conservative in the assessment of expected future funding. According to the Financing Plan, the Project will generate the need for three elementary schools but only about 62% of a middle/high school, which is accurate even using the slightly higher figures for student generation reported in Table 8.2 of the SPA. The students and funding for the portion of the high school not attributable to the Project will come from areas outside of Cordova Hills.

School services are addressed in the Cordova Hills SPA as well as the Financing Plan. The elementary schools will be located near the centers of the Town Center Village, University Village and East Valley Village. The middle/high school will be located on an 80-acre site along the northern property line of the Project site, north of the East Valley Village. According to the Financing Plan, the construction costs of the elementary schools are expected to be approximately \$55.5 million while the middle/high school is expected to cost approximately \$97.2 million with the Project's portion of the costs totaling approximately \$60.8 million. The Financing Plan also indicates that funding for the schools will come from three different sources: existing fee programs, state funding, and the EGUSD Mello-Roos CFD No.1.

EGUSD Facilities and Planning Department staff (K. Williams) has indicated that EGUSD has been working with the Project proponents to be sure that adequate school facilities can be accommodated within the Project area and is satisfied with the proposed development and financing plans for the needed schools. EGUSD staff also indicated that EGUSD will monitor the development of the Project as well as development patterns in the EGUSD to anticipate when new schools will be required and will initiate the school development process prior to the anticipated need in order to be sure that adequate school facilities are available to support the student population of the EGUSD (pers. com. March 22, 2011).

Financial impacts to school districts for facilities are addressed under California Government Code Sections 65995(h) and 65996(b). Section 65995(h) states that the payment or satisfaction of a fee, charge, or other requirement levied or imposed pursuant to Section 17620 of the Education Code is deemed to be full and complete mitigation of the impacts for the planning, use, development, or the provisions of adequate school facilities. Section 65996(b) finds that these provisions provide full and complete school facilities mitigation. Since the Project will comply with Government Code Sections 65995(h) and 65996(b), impacts related to the provision of school services are considered *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: PARK AND RECREATION SERVICES

The Project area is located within CSA 4b which is staffed by the Sacramento County Regional Parks Department (Parks Department). The Parks Department provides park and recreation services to the eastern portion of the County where the Project site is located. According to the Project proposal, the Project area will be detached from the CSA 4b, and will be provided park and recreation services under the proposed Cordova Hills **Local Services District (CHLSD)** CSD. As stated above, in order for the Project area to be detached from CSA 4b and for park services to be provided by the proposed **CHLSD** CSD, discretionary action by LAFCo is required.

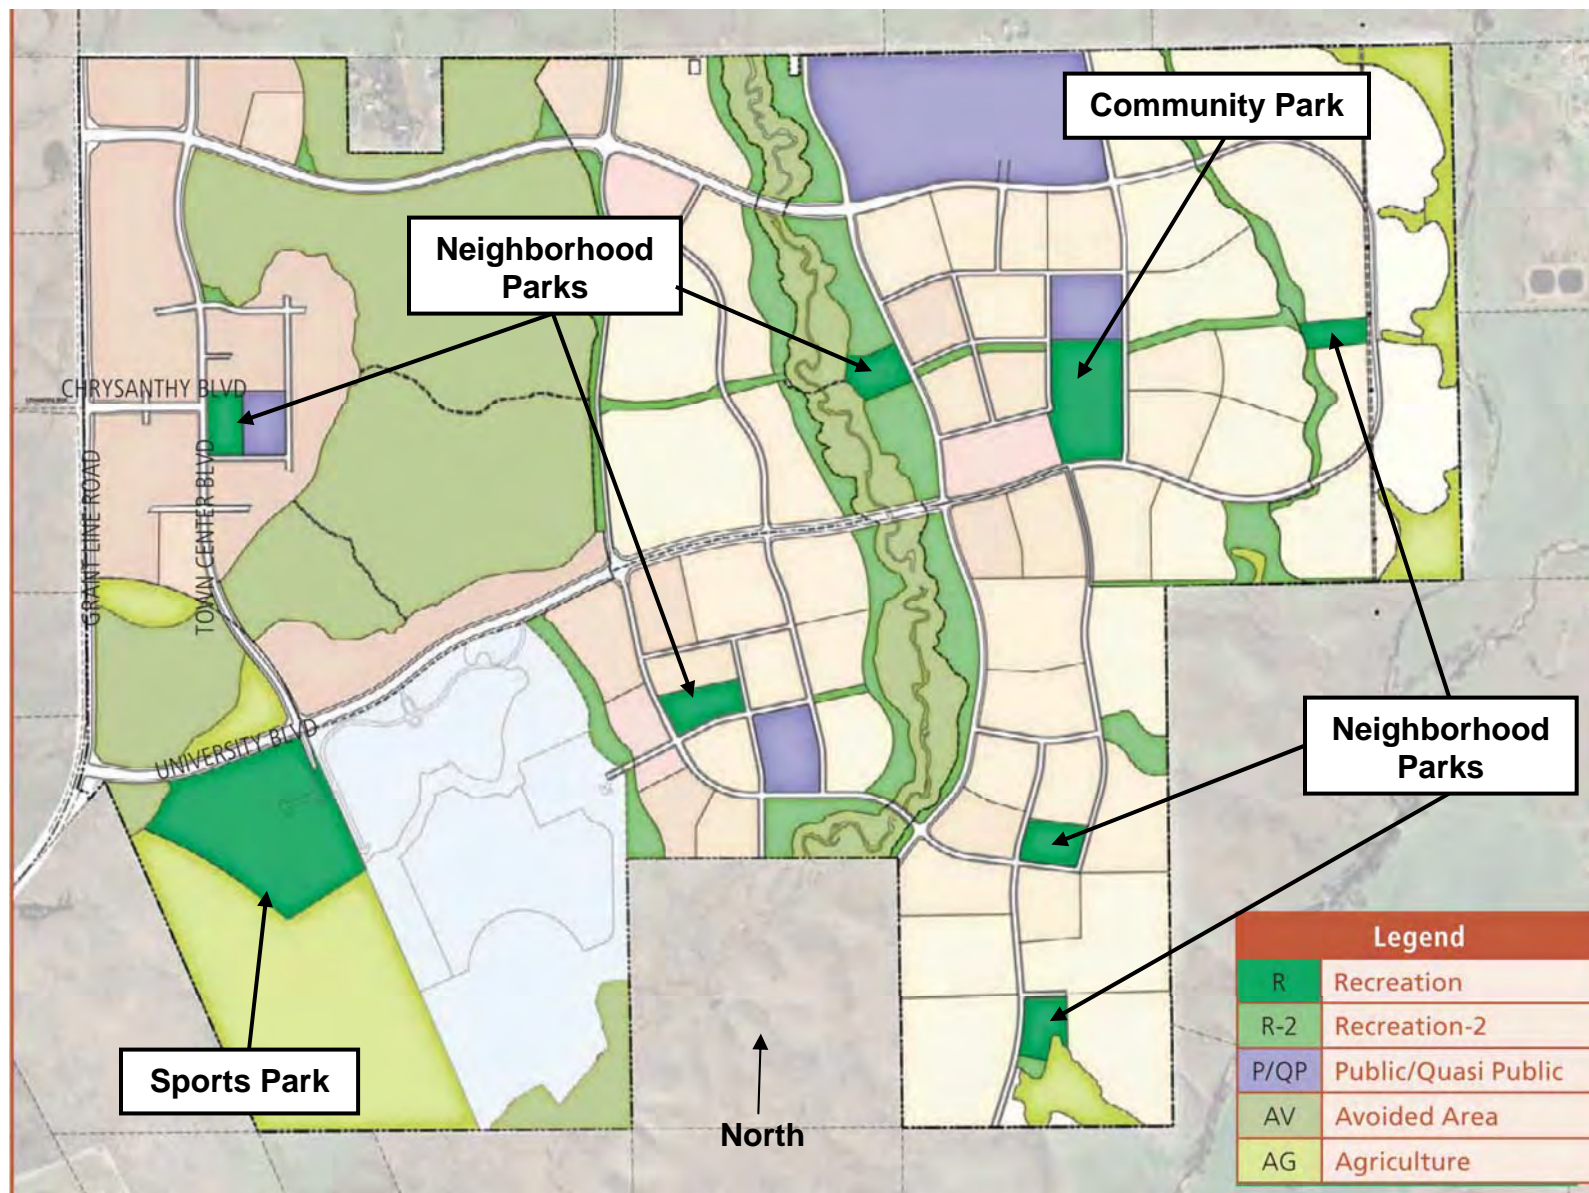

The Cordova Hills SPA describes proposed Project parks in Section 3.8, and indicates that six neighborhood parks will be distributed throughout the Project area with some adjacent to the new school sites. One community park will be located south of a school site within the East Valley Village and one sports park will be located at the southwest portion of the site. In total, 99.1 acres of designated parks are proposed as part of the Project (refer to Plate PS-3). The neighborhood parks range in size from 3.7 to 6.1 acres in size and will provide a variety of facilities that will accommodate local recreational needs. The park facilities will include soccer and softball fields, hardcourts, restrooms, playgrounds, tot lots, picnic areas and a community center that can be used as a neighborhood meeting space. Table 3.6 of the SPA provides a description of services and programming that will be available at the proposed parks.

The community park is described on page 3-31 of the SPA. This park will be 18.5 acres in size, located near an elementary school, and is intended to provide joint use opportunities. Facilities that may be provided include active play fields for organized sports such as baseball and soccer, sports courts, pedestrian and bicycle trails, an outdoor group gathering facility, and picnic areas. The sports park is also described on page 3-31 of the SPA. The sports park will be 50 acres in size and will be located west of the university/college campus center. The sports park will include baseball fields, a concession area, regulation soccer fields, basketball courts, picnic and playground areas and parking lots associated with these uses. The SPA also provides some descriptions for the town center park, pocket parks, linear parks, and open space areas. Conceptual diagrams of some of these parks are also provided in the SPA.

The Quimby Act and the Sacramento County General Plan requires a minimum of three and a maximum of five acres of parkland per 1,000 residents. The General Plan also indicates that park districts can require a greater minimum in park land dedication up to five acres per 1,000 people. The Parks Department has indicated that a five acre per 1,000 people land dedication is the standard for CSA 4b and is requesting that this standard be met. Cordova Hills will generate an estimated population of approximately 21,379 residents (excluding the university/college campus center). This population will create a minimum park dedication requirement of 106.9 acres within the Cordova Hills community. Between the sports park, neighborhood parks and the community park 99.1 acres of formal parkland will be developed.

In addition to the formal parks above, the Project also includes approximately 151 acres of land designated R-2. These R-2 areas will include trails, informal play areas, picnic areas, and paseos. The informality of these areas combined with the site characteristics (slopes, the presence of detention basins, and other factors) preclude full park credit for these areas, but partial Quimby credit may be given. If 5% of the R-2 areas received Quimby credit, that would be sufficient to achieve the full requirement of 106.9 acres of credited parkland.

Plate PS-3: Parks Plan

The proposed ~~Cordova Hills CSD~~ **CHLSD** will provide park maintenance, and recreation services and programs. The programs will include traditional sports activities such as youth and adult basketball, soccer, and coordination with other sports organizations, such as little league. Programs will also include traditional special interest activities such as dance, music training, crafts, youth summer day camp and others typically associated with a park district or department. The recreation services may also include classes on nutrition, gardening, wellness, nature studies and others and may evolve depending on the needs and interests of the community.

The Financing Plan details the proposed park development costs as well as the costs of the aquatic and events center. The general park development cost is estimated to be \$33.4 million based on an average cost of \$350,000 per acre. The aquatic center construction cost is estimated at \$7.4 million and the events center, which is planned to include meeting rooms, a gymnasium, youth center and senior center, is estimated to cost \$16.0 million. All of the park acres are proposed to be dedicated as part of the large-lot map, though it is possible that modifications will be made as part of later small-lot Tentative Subdivision Maps. The County Land Development Ordinance (Title 22 of Sacramento County Code) requires that Tentative Subdivision Maps and Tentative Parcel Maps be conditioned to dedicate land, pay a fee in lieu thereof, or provide a combination of dedication and in-lieu fees for park facilities consistent with Quimby requirements. Any changes would be required to maintain Quimby conformity.

According to the Financing Plan, the development of new parks is to be fully funded through the Cordova Hills **Special Financing District (CHSFD)** which could include funding through developer funding and reimbursements, bond-funding, or funding through a fee program. The **CHSFD** will also be used to help pay for the proposed aquatic and senior centers. The Financing Plan also details the cost allocation factors for new residential development within the Project area based on the land uses' (Estates Residential, Low Density Residential, Medium Density residential, Residential 20 and High Density residential) relative park usage. Approximately \$39.24 million will be generated through fees and funding required to provide adequate parkland will be available based on the financing strategy detailed in the Financing Plan.

The Urban Services Plan details the estimated annual cost for park maintenance services for the new parks proposed for the Project. The annual cost for park maintenance is estimated to be approximately \$1.3 million. The cost of park maintenance is proposed to be fully covered by the proposed **CHLSD** ~~CSD~~ services special tax/ assessment which will be allocated to benefiting residents.

The Urban Services Plan also details the estimated annual costs for the recreation services proposed for the Project. The annual cost of the proposed general recreation programs and the aquatics center is estimated to be approximately \$2 million. A 65% cost recovery from aquatic center user fees and a 50% cost recovery from general recreation program revenues is assumed based on similar recovery estimates in other jurisdictions in the region. The remaining costs, approximately \$853,000, are proposed to be covered by the proposed **CHLSD** ~~CSD~~ services special tax/ assessment. These costs will be allocated to the benefiting residents.

Parks Department staff (G. Kolling) reviewed the proposed Project and has indicated that the Parks Department has been working closely with the Project proponents to be sure that adequate park facilities are provided to meet the demand generated by the Project. Parks Department staff has indicated that the proposed park acreage and Financing Plan are adequate.

The Project is consistent with the requirements of the Quimby Act and the General Plan and Project residents will use the proposed parks within the Project area; therefore, the Project will not increase the demand for existing park services such that a substantial physical deterioration of existing facilities will result. Impacts to park and recreation services will be *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: LIBRARIES

The Sacramento Public Library System provides library services to the residents of Sacramento County. The library system is comprised of interdependent branches providing services to all residents. Branches are grouped by services, geography, and usage patterns to provide efficient and economical services to the residents of the County. The Sacramento Public Library is a joint powers agency between the County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Galt, Isleton, and Rancho Cordova (Sacramento Public Library website, 2011).

The Project residents would increase the demand for library services provided by the Sacramento Public Library System and nearby libraries such as the Rancho Cordova Library system. The Cordova Hills SPA indicates that a new full service, 15,000 square foot branch library is planned within the proposed Town Center to serve the Cordova Hills community as well as residents in the surrounding area.

According to the Sacramento Public Library Authority Facility Master Plan 2007 – 2025 (Library Master Plan), a full service library provides for a full range of services to customers in one building and is sized appropriately for each community. The Library Master Plan indicates that a 15,000 square foot library can serve between 25,000 and 37,000 people. Based on the population allowances of the Cordova Hills Project, the proposed library size is adequate to serve the demands generated by the Project at buildout.

According to the Cordova Hills Financing Plan, a financing strategy to fund the construction of a new library in the Project area has been developed in coordination with the Sacramento Public Library System. The Financing Plan details that a development fee of \$800.00 will be required of new single family, low density residential units and a fee of \$640.00 will be required for higher density residential units to pay for the construction costs attributable to the Project. It is estimated that, at buildout, the Project will generate approximately \$5.6 million in fee revenue.

The Library Master Plan indicates that the cost of a new 15,000 square foot library (not including library materials) is approximately \$11.08 million dollars. This library would serve an area that includes, but is not limited to, the Project area. The \$5.6 million of Project funding represents the Cordova Hills fair share for the facility. The Library Master Plan states that funding for capital improvements involve a variety of sources such as City and County funds, statewide library bond funds, federal funds, general obligation bonds and Mello-Roos Special tax Bonds.

The Cordova Hills Urban Services Plan states that library operating costs will be fully funded through property tax revenue. The Library Master Plan includes an operating costs section which notes that funding sources for operational purposes are an assessment district within the City of Sacramento, the City of Sacramento General Fund, and the County Library Fund (Fund 11). Fund 11 is based on a portion of the property tax collected in all areas of the County except the cities of Sacramento and Folsom.

The Project includes a funding mechanism for a new library that is of sufficient size to accommodate the expected population of the Project, which has been developed in coordination with the Sacramento Public Library System; therefore, the Project will not result in substantial adverse physical impacts associated with the provision of library services. Impacts related to library services are *less than significant*.

15 PUBLIC UTILITIES

INTRODUCTION

The following analysis addresses the ability of existing water service providers, sewer service providers, and energy service providers to supply utility services to the Project. The analysis describes any relevant master planning of the utility services and whether the infrastructure and demands of the Project are consistent with the utility master plans. The potential physical impacts of constructing facilities is described, as are the potential physical impacts of water demands, sewer demands, and energy demands.

ENVIRONMENTAL SETTING

WATER SUPPLY

Twenty-eight water purveyors supply water to customers within Sacramento County. The Project is within the service area of the Sacramento County Water Agency (SCWA). SCWA currently provides service to portions of the City of Rancho Cordova, all of the City of Elk Grove, and a significant portion of unincorporated Sacramento County beginning near the current Urban Policy Area boundary and ending at the Urban Services Boundary; this service area is called Zone 40. The amount of water available to supply SCWA's customers is defined by individual water rights, surface water contracts, groundwater pumping limitations, and the infrastructure necessary to treat, pump, and deliver water.

SACRAMENTO COUNTY WATER AGENCY (ZONE 40)

Zone 40 serves an area of approximately 86,000 acres. The current water supply is obtained from a mix of groundwater, surface water, recycled water, and remediated water. SCWA manages its supplies conjunctively; that is, in wet years when there is abundant surface water available SCWA will divert the maximum amount of surface water allowed, while minimizing groundwater usage. The aquifer can replenish during these wet years, so that in dry years when surface water becomes less abundant SCWA can pump groundwater to meet needs.

Zone 40 groundwater is provided from the Central Groundwater Basin by the Sacramento County Water Agency using commercial wells and treatment plants located throughout its service area. The Central Groundwater Basin underwent significant pumping that resulted in an unacceptable groundwater elevation decline. As a result of this unacceptable groundwater decline, the basin is currently being managed by the Sacramento Groundwater Authority, which has adopted a groundwater management plan for the purpose of maintaining and protecting the basin's long term sustainable yield and quality consistent with the Sacramento Water Forum's objectives; the Water Forum Agreement, adopted via a Memorandum of Understanding between the County and other stakeholders, was designed to define a reliable and safe water supply through

2030 while protecting environmental resources. These documents can be accessed at the following web addresses: www.sgah2o.org and <http://www.waterforum.org/>.

Water supply analyses supporting the Water Forum Agreement allocate up to 40,900 acre-feet of groundwater annually on a long-term basis for Zone 40. Remediated water supplies are based on yields from the various groundwater extraction and treatment plants that Aerojet and Boeing operate to clean up contaminated water in the vicinity of their historical operations. This water is pumped from the Central Groundwater Basin, and amounts to 14,532 acre-feet of yield per year. Recycled water is tertiary treated wastewater from Sacramento Regional County Sanitation District (SRCSD) sold to SCWA for non-potable uses. Currently, recycled water is not used for residential landscaping.

The SCWA conjunctive use program includes the delivery of surface water within the Zone 40 boundaries as part of a comprehensive program to maintain the long-term, regional balance of the groundwater basin. SCWA has three sources of surface water supplies totaling up to 61,251 acre-feet per year (AFY) available on a long-term average:

- SCWA has entered into a contract with the U.S. Bureau of Reclamation (USBR) for 22,000 AFY of Central Valley Project (CVP) supplies from the American River pursuant to Public Law (PL) 101-514 (often referred to as “Fazio water”). Of this 22,000 AFY, 7,000 AFY has been subcontracted to the City of Folsom for diversion from Folsom Lake. The remaining 15,000 AFY will be diverted by SCWA from the Sacramento River. The long-term average availability of this supply is 13,551 AFY.
- SMUD has assigned 30,000 AFY of its CVP contract to SCWA under the terms of a three-party agreement with the City of Sacramento. The long-term average availability of this supply is 26,000 AFY.
- State Water Resources Control Board Permit 21209 allows for excess flows on the American River and Sacramento River to be diverted by SCWA from the Sacramento River. These flows, which would be available on an intermittent basis, could range up to 71,000 AFY. The long-term average availability of this supply is 21,700 AFY.

The following supply information (Table PU-1) was taken from the *Water Supply Assessment for Cordova Hills* prepared by the Sacramento County Water Agency, October 2011 (Appendix PU-1).

Table PU-1: Zone 40 Water Supply in Five-Year Increments

Water Year	Water Supply Sources	Zone 40 Water Supply (AFY)				
		2015	2020	2025	2030	2035
Normal Year	Surface Water	41,781	37,802	53,763	63,624	67,521
	Groundwater	7,204	21,584	21,028	22,043	24,276
	Recycled Water	4,400	4,400	4,400	4,400	4,400
	<i>TOTAL</i>	<i>53,385</i>	<i>63,786</i>	<i>79,191</i>	<i>90,067</i>	<i>96,197</i>
Single Dry Year	Surface Water	24,217	30,546	33,092	34,057	34,536
	Groundwater	17,421	19,932	30,479	38,760	43,492
	Recycled Water	4,400	4,400	4,400	4,400	4,400
	<i>TOTAL</i>	<i>46,038</i>	<i>54,878</i>	<i>67,971</i>	<i>77,217</i>	<i>82,428</i>
Multiple Dry Year (1)	Surface Water	29,199	37,590	40,774	42,165	42,850
	Groundwater	14,887	15,857	26,537	34,936	39,767
	Recycled Water	4,400	4,400	4,400	4,400	4,400
	<i>TOTAL</i>	<i>48,486</i>	<i>57,847</i>	<i>71,711</i>	<i>81,501</i>	<i>87,017</i>
Multiple Dry Year (2)	Surface Water	24,217	30,546	33,092	34,057	34,536
	Groundwater	17,421	19,932	30,479	38,760	43,492
	Recycled Water	4,400	4,400	4,400	4,400	4,400
	<i>TOTAL</i>	<i>46,038</i>	<i>54,878</i>	<i>67,971</i>	<i>77,217</i>	<i>82,428</i>
Multiple Dry Year (3)	Surface Water	24,217	30,546	33,092	34,057	34,536
	Groundwater	17,421	19,932	30,479	38,760	43,492
	Recycled Water	4,400	4,400	4,400	4,400	4,400
	<i>TOTAL</i>	<i>46,038</i>	<i>54,878</i>	<i>67,971</i>	<i>77,217</i>	<i>82,428</i>

SEWER SERVICE

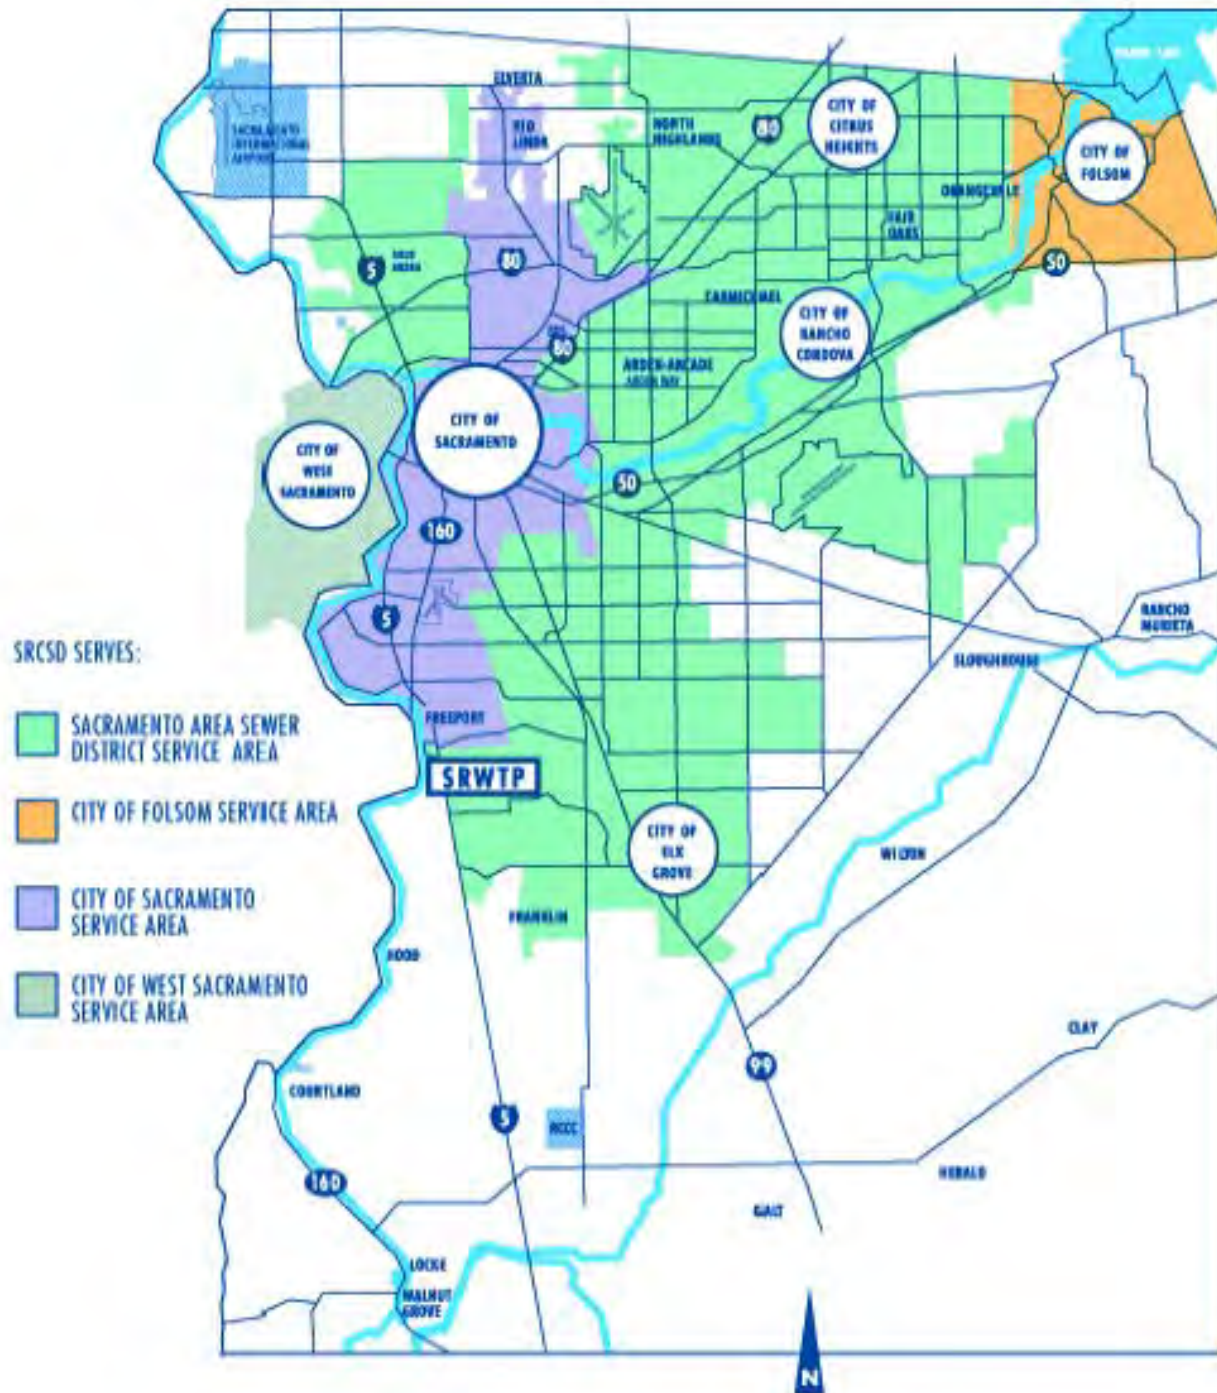

Sewer service within the Project area is provided by Sacramento Regional County Sanitation District (SRCSD), which builds and operates the interceptor lines and regional wastewater treatment plant, and Sacramento Area Sewer District (SASD), which builds and maintains trunk lines. SRCSD was formed to provide a regional wastewater conveyance, treatment, and disposal system for the entire urbanized area of the County of Sacramento. SASD is responsible for day-to-day operations and maintenance of the lower lateral and mainline pumps within its district. SRCSD and SASD are governed by a Board of Directors, whose members include the County of Sacramento Board of Supervisors and the mayors or designees of the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Rancho Cordova, West Sacramento (SRCSD only) and Yolo County (SRCSD only). SRCSD provides wastewater treatment for more than one million residents in a 435-square mile area within Sacramento and Yolo Counties, while SASD is responsible for the local collection system and maintenance in unincorporated Sacramento County as well as many of the incorporated cities (Plate PU-1).

SRCSD's and SASD's approved Sphere of Influence (SOI) in Sacramento County is the area officially designated for its future service planning effort. This area corresponds to the General Plan's Urban Services Boundary (USB), with the exception of the areas served by the Cities of Sacramento (portions), the Folsom sewer system and Rancho Murieta, Rio Cosumnes Correctional Center, the City of West Sacramento, and the Delta communities of Courtland and Walnut Grove.

Sewage is routed to the Sacramento Regional Wastewater Treatment Plant (SRWTP) by the collections systems owned by SRCSD, the City of Sacramento, and the City of Folsom. The SRWTP is a high-purity oxygen-activated sludge facility. **Incoming wastewater is screened to allow most of the heavy organic solids to settle to the bottom of tanks and be delivered to digesters. Next, oxygen is added to the wastewater to grow naturally-occurring microscopic organisms, which consume the lighter organic particles in the wastewater and then settle on the bottom of the secondary clarifiers. Clean water decants off the top of the clarifiers and is then chlorinated to remove any pathogens or other harmful organisms. Chlorine contact time occurs while the wastewater travels through a two-mile outfall pipeline to the Sacramento River, near the town of Freeport. Sulfur dioxide is added to neutralize the chlorine before the water discharges to the river, in order to neutralize the chlorine. The solids are anaerobically digested and are suitable for recycling (biosolids).**¹ After secondary treatment and disinfection, a portion of the effluent from the plant is further treated in SRCSD's Water Reclamation Facility and then used for non-potable purposes, such as landscape irrigation within select areas of Elk Grove and the SRWTP. ~~The majority of the treated wastewater is dechlorinated and discharged into the Sacramento River.~~

¹ <http://www.srcsd.com/pdf/infosheets2009.pdf>

Plate PU-1: SRCSD Service Area

The main SASD collection system includes over 2,800 miles of sewer pipelines ranging in size from four to 75 inches in diameter that deliver sewage to the interceptor system operated and maintained by SRCSD. SRCSD interceptors are a very large system of pipes (up to 10 feet in diameter), which carry wastewater directly to the SRWTP. At times of peak use, the interceptor system carries as much as 400 million gallons of wastewater per day. SRCSD currently has 123 miles of interceptor pipe including 30 miles of force mains and 9 major pumping stations. This does not include proposed interceptors or interceptors currently in construction. The SRWTP receives and treats approximately 141 mgd average dry weather flow (Seyfried, 2008). Previously, the wastewater flow at the SRWTP was about 150 mgd average dry weather flow, but appears to have been reduced due to water conservation efforts, dry weather and other factors. The SRWTP has a permitted average dry weather flow design capacity of 181 mgd and wet weather flow of 392 mgd. Wet water flows include groundwater infiltration and rainfall-dependent infiltration/inflow and are, therefore, greater than dry weather flows.

A new NPDES Discharge Permit was issued to the SRCSD by the Central Valley Regional Water Quality Control Board (Regional Water Board) in December 2010. When issuing the new Discharge Permit, the Regional Water Board required SRCSD to meet significantly more elevated treatment levels over its pre-existing levels. SRCSD believes that many of the new Permit conditions go beyond what is reasonable and necessary to protect the environment, and has appealed the permit decision to the State Water Resources Control Board. A decision on that appeal has not yet occurred. In the meantime, SRCSD is required to begin the necessary activities, studies and projects to meet the new permit conditions. All new treatment facilities must be completed by 2020. The SRWTP NPDES Permit issued in December 2010 provides for a permitted capacity of 181 mgd ADWF.

These systems are master planned for growth within the Urban Policy Area (UPA); however, the facilities are generally sized to accommodate the expected growth within the USB. The master plans discussed below are relevant to Project sewer service. The master plans described below are hereby incorporated by reference and can be viewed at County of Sacramento, Division of Environmental Review and Assessment, 827 7th Street, Room 220, Sacramento, CA 95814; or the Sacramento Regional County Sanitation District, 10545 Armstrong Avenue, Suite 101, Mather, CA 95655.

SACRAMENTO REGIONAL WASTEWATER TREATMENT PLANT MASTER PLAN 2020

The purpose of the SRWTP Master Plan is to identify wastewater treatment and facility needs for a 20-year planning period, which lasts through the year 2020. The SRWTP master plan's goal is to provide a phased program of recommended facilities to accommodate planned growth while at the same time maintaining treatment reliability, meeting future regulatory requirements, and optimizing costs. To meet this goal, a 2020 Master Plan was prepared that integrated overall strategies for wastewater treatment, effluent management, and biosolids disposal into an effective wastewater treatment management program. The 2020 Master Plan proposed that treatment facility expansion occur in stages or phases as the sewage generated by the population

increases. The capacity of the plant would increase under this plan from 181 mgd to 218 mgd (dry weather). The treatment plant is not designed to accommodate wet weather flows. During wet weather events (2-year, 10-year, and 100-year storm events), effluent must be stored (either in emergency storage basins or within the interceptors) because SRWTP cannot discharge effluent into the river. The storage basins and interceptors are designed to provide adequate capacity to accommodate wet weather flows.

The SRCSD Board of Directors approved the SRWTP Master Plan 2020 in summer of 2004. In November 2007, the Superior Court of California invalidated portions of the Environmental Impact Report that was certified for the 2020 Master Plan. Both the SRCSD and the plaintiffs have appealed the judge's ruling. Expansion of the SRWTP beyond the permitted capacity will not occur until after a Master Plan has been approved consistent with the result of the appellant decision.

INTERCEPTOR MASTER PLAN 2000

The purpose of the Interceptor Master Plan 2000 is an update of the 1993 – 1994 Sacramento Sewerage Expansion Study (SSES) to more accurately predict existing and future capacity needs in the regional interceptor system and provide a strategic approach to plan for these capacity needs. To update and refine the regional conveyance facilities, the master plan updates the service area, growth projections, existing system response to rainfall, provides dynamic modeling, estimates the cost of facilities, identifies right-of-way acquisition needs, and identifies near and long-term improvements required for regional wastewater conveyance. A master plan for the interceptor system accommodates approved developments and avoids interruption of service to developing areas. The Master Plan 2000 identifies land use and population projections based on SACOG Blueprint Criteria, and the land use plans of the member jurisdictions. The Plan also includes wastewater flow estimates, information on hydraulic modeling, interceptor design criteria, and identifies conveyance systems and policies to accommodate planned growth. The SRCSD Board of Directors approved the Interceptor Master Plan 2000 in March 2003.

The SRCSD is currently evaluating whether to update the Interceptor Master Plan 2000. District staff (S. Deeble) stated the following regarding an update to the Interceptor Master Plan 2000:

SRCSD is currently working on an Interceptor Sequencing Study to evaluate the Interceptor Master Plan 2000 (MP 2000) and determine when the next master planning document will be developed. Ideally, SRCSD will complete a Master plan on a 5-year cycle one year after CSD-1 (now SASD) master planning efforts.

The SASD Master Plan 2006 Update was approved by the Board of Directors in October 2008 (see discussion below).

SACRAMENTO AREA SEWER DISTRICT SEWERAGE FACILITIES EXPANSION MASTER PLAN

In order to effectively plan and budget for capital improvement needs, SASD adopted and periodically updates a facilities master plan. The master plan is broad based and addresses policy issues, improvements to the existing sewer system to alleviate deficiencies, and sewer trunk expansions to accommodate new development areas. This Master Plan was approved by the Board of Directors in May of 2004.

SASD SEWERAGE FACILITIES EXPANSION MASTER PLAN 2006 UPDATE

The 2006 SASD Sewerage Facilities Expansion Master Plan Update was approved by the Board of Directors in October, 2008. The Master Plan Update is a companion document to the previously approved Sewerage Facilities Expansion Master Plan. The master plan update evaluates future areas of expansion and revises relief projects approved in the previous master plan. Many of the facilities previously approved in the SASD Sewerage Facilities Expansion Master Plan Update have been constructed. In addition, the Master Plan Update incorporates the Upper Deer Creek, Lower Deer Creek, and Upper Laguna Creek sewer sheds, which were not evaluated in the previous master plan. The service area is proposed to expand from 268 square miles to 281 square miles with the update. Consequently, the number of miles of pipeline and the number of customers served is anticipated to increase.

Projected unit wastewater flow rates for future development are based on land use categories and their respective densities. The Master Plan Update used 13 land use categories for developing wastewater flow estimates for potential build-out conditions. The land use categories were developed during stakeholder sessions with the County, various cities, developers, and interested parties. The wastewater generation estimate was expressed in the equivalent of single-family dwelling units (ESDs) per acre, where one ESD represents the wastewater generation equivalent of one single-family residence. Flow estimates for an ESD are 310 gallons per day. The ESD's for each of the 13 land uses are found below (Table PU-2).

Table PU-2: Land Use Categories, Design ESD Densities, and Flow Estimates

Land Use Code	Description	ESDs per acre	Flow Estimates (gpd)
AG	Agricultural	6	1,860
VLSRI	Agricultural Residential	6	1,860
VLDR2	Very Low Density Residential	6	1,860
LDR1	Low Density Residential	6	1,860
LDR2	Medium Low Density Residential	10	3,100
MDR1	Medium Density Residential	15	4,650
MDR2	Medium High Density Residential	22	6,820
HDR	High Density Residential	30	9,300
COM	Commercial/Office	6	1,860
IND	Industrial	6	1,860
PQP	Public/Quasi-Public/Schools	6	1,860
Mixed	Mixed/Special Planning Areas/Urban Reserve	6	1,860
Open	Open Space, Recreation, Parks, Cemeteries	6	1,860

Source: CSD-1 Sewerage Facilities Expansion Master Plan 2006 Update, pages 2-9 and 2-10 and SASD Design Standards (dated February 13, 2008, page 22, section 3.1.7.

WATER RECYCLING PROGRAM

The SRCSD has a Water Reclamation Facility (“WRF”) that has been in operation since 2003 and is located in Elk Grove with a capacity for 5 MGD of Title 22 tertiary recycled water. It is located within the SRWTP property. A portion of the recycled water is used by SRCSD at the SRWTP and the rest is wholesaled to the Sacramento County Water agency (SCWA). The SCWA retails the recycled water primarily for landscape irrigation use to select customers in the City of Elk Grove.

~~SRCSD, in partnership with SCWA, has a small-scale non-potable water recycling program. SRCSD is responsible for producing and wholesaling recycled water to SCWA, while the SCWA is responsible for retailing the recycled water to selected customers. SRCSD’s small-scale water recycling program began to serve communities in the City of Elk grove in 2003. Recycled water is also used at the SRWTP. The existing Water reclamation Facility (WRF) Phase 1 at the wastewater treatment plant has a design capacity of 5 mgd of recycled water, which is used in lieu of potable water for non-potable purposes such as landscape irrigation. This facility was constructed to be expanded as demand increased.~~

In January 2004, the SRCSD Board of Directors approved a Water Recycling Program that includes the following goals:

- Increase water recycling throughout the Sacramento region on the scale of 30 – 40 mgd over the next 20 years.
- Increase utilization of recycled water to expand SRCSD's effluent management options beyond continued discharge to the Sacramento River.
- Increase utilization of recycled water to meet growing non-potable demands, allowing Sacramento area water purveyors to reduce demands on their existing high quality water supplies and reduce the need for additional water supplies in the future.

To evaluate the feasibility of implementing a large-scale water recycling program, SRCSD began preparation of its Water Recycling Opportunities Study (WROS) in November 2004 and completed the WROS in February 2007. The WROS does the following:

- Studies areas throughout the Sacramento Region and SRCSD service area to identify potential water recycling opportunities,
- Engages potential water recycling partners and stakeholders,
- Develops, assesses, and prioritizes potential water recycling projects, and
- Provides a strategy to further develop and implement the projects selected to move forward in achieving the stated goals of the large-scale Water Recycling Program.

The WROS identifies goals and objectives, and evaluates potential water recycling opportunities at a high planning level. The actual implementation of any of these opportunities is yet to be determined and depends on many factors, such as participation of all key stakeholders, permitting requirements, and financial feasibility.

GAS AND ELECTRIC

Electric service within the Project area is provided by the Sacramento Municipal Utility District (SMUD) and natural gas service in the County is provided by the Pacific Gas and Electric Company (PG&E). SMUD generates, transmits, and distributes electric power to a 900-square mile service area that includes Sacramento County and a small portion of Placer County. SMUD gets its electricity from diverse and competitively priced resources, including: hydro generation; cogeneration plants; advanced and renewable technologies such as wind, solar, and biomass/landfill gas power; and power purchased on the wholesale market. PG&E is one of the largest combination natural gas and electric utilities in the United States. PG&E delivers natural gas from three major sources – California, the southwestern U.S., and Canada.

REGULATORY SETTING

SEWER SERVICE

FEDERAL REGULATIONS

CLEAN WATER ACT

Construction of wastewater infrastructure and facilities may have impacts (erosion and sedimentation) that would be regulated by the Clean Water Act. The 1972 amendments to the federal Clean Water Act prohibit the discharge of pollutants to navigable waters from a point source unless the discharge is authorized by a National Pollutant Discharge Elimination System (NPDES) permit. The Clean Water Act requires NPDES permits for stormwater discharges caused by general construction activity. The purpose of the NPDES program is to establish a comprehensive stormwater quality program to manage urban stormwater, reducing pollution of the environment as much as possible. The NPDES program involves characterizing the quality of receiving water, identifying harmful constituents, targeting potential sources of pollutants, and implementing a comprehensive stormwater management program. NPDES permits are issued by the Regional Water Quality Control Board.

SAFE DRINKING WATER ACT

The federal Safe Drinking Water Act established a national program to protect the quality of drinking water available from municipal and industrial water suppliers. The act establishes a program requiring compliance with national drinking water standards for contaminants that may have an adverse effect on human health. It also establishes programs to protect potable groundwater from contamination.

STATE REGULATIONS

PORTER-COLOGNE WATER QUALITY CONTROL ACT

The Porter-Cologne Act requires the California State Water Resources Control Board (State Water Resources) to adopt water quality control plans and set waste discharge requirements (WDRs) for dischargers into surface and groundwater. The Central Valley Regional Water Quality Control Board (Regional Water Board) is responsible for administering and enforcing WRDs, permits, and water quality control plans.

WATER QUALITY CONTROL PLANS

NPDES permits and Erosion Control Programs are required for the construction of infrastructure and pumping facilities. The Clean Water Act requires that water resources be protected from degradation caused by waste discharges and requires that identified beneficial uses be maintained. The Regional Water Board's Water Quality Control Plan for the Central Valley Region identifies the designated beneficial uses of groundwater and surface water bodies and contains water quality objectives and standards established to protect those uses.

The County of Sacramento received a municipal NPDES permit for stormwater discharges from the Central Valley Regional Water Quality Control Board. Under this permit, permittees are required to develop, administer, implement, and enforce a Comprehensive Stormwater Management Program (CSWMP) in order to reduce pollutants in urban runoff to the maximum extent practicable. The CSWMP implemented by the county is a multi-faceted, dynamic program which is designed to reduce stormwater pollution to the maximum extent practicable. The CSWMP emphasizes all aspects of pollution control including but not limited to public awareness and participation, source control, regulatory restrictions, water quality monitoring, and treatment control.

The Sacramento Stormwater Management Program has developed the January 2000 Guidance Manual for On-Site Storm Water Quality Control Measures. The Guidance Manual contains the 2000/2001 Progress Report that provides general conditional language used to require development projects to incorporate erosion and sediment controls and on-site stormwater quality control measures. For public and quasi-public projects, mitigation requiring the Project to comply with the County's Land Grading and Erosion Control Ordinance is required.

In addition to construction/stormwater impacts, the Water Quality Control Plan for the basin contains specific numeric water quality objectives for bacteria, dissolved oxygen, pH, pesticides, electrical conductivity, total dissolved solids, temperature, turbidity, and trace elements, as well as numerous narrative water quality objectives, that are applicable to certain water bodies or portions of water bodies (Sacramento River). In 2002, the Regional Water Board completed review of their basin plan that resulted in amendments that: 1) update bacteria objectives for water contact recreation; 2) clearly state that a basin planning process will be used to designate or change designated beneficial uses; and 3) update language in the basin plan. The districts that move and treat wastewater effluent for Sacramento County (SRCSD and SASD) are responsible for compliance with Regional Water Board's Water Quality Control Plan's discharge requirements.

STATE WATER RESOURCES RESOLUTION NO. 68-16

The goal of State Water Resources Resolution No. 68-16 (Statement of Policy With Respect to Maintaining High Quality Waters in California") is to maintain high quality waters where they exist in the State. State Board Resolution No. 68-16 States, in part:

- "Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies.
- Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which

will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.”

The State Water Resources has interpreted Resolution No. 68-16 to incorporate the federal anti-degradation policy, which is applicable if a discharge that began after November 28, 1975 will lower existing surface water quality.

WATER RECLAMATION REGULATIONS

Wastewater reclamation in California is regulated under Title 22, Division 4, of the California Code of Regulations. The intent of these regulations is to ensure protection of public health associated with the use of reclaimed water. The regulations establish acceptable levels of constituents in reclaimed water for a range of uses and prescribe means for assurance of reliability in the production of reclaimed water. The California Department of Health Services (DHS) has jurisdiction over the distribution of reclaimed wastewater and the enforcement of Title 22 regulations. The Regional Water Board is responsible for issuing waste discharge requirements (including discharge prohibitions, monitoring, and reporting programs).

LOCAL REGULATIONS

The 2030 Sacramento County General Plan contains policies and implementation measures which pertain to the provision of wastewater collection and treatment. The Public Facilities Element policies PF-6 through PF-19 pertain to sewer services, but not all of these are applicable to the Project. There is also one policy from the Land Use Element which is applicable to the Project.

LU-73. Sewer and water treatment and delivery systems shall not provide for greater capacity than that authorized by the General Plan.

PF-6. Interceptor, trunk lines, and flow attenuation facilities shall operate within their capacity limits without overflowing.

PF-7. Although sewer infrastructure will be planned for full urbanization consistent with the Land Use Element, an actual commitment of additional sewer system capacity will be made only when the land use jurisdiction approves development to connect and use the system.

PF-8. Do not permit development which would cause sewage flows into the trunk or interceptor system to exceed their capacity.

PF-9. Design trunk and interceptor systems to accommodate flows generated by full urban development at urban densities within the ultimate service area. System design may take into consideration land that cannot be developed for urban uses due to long-term circumstances including but not limited to conservation easements, floodplains, public recreation areas etc. This could include phased construction where deferred capital costs are appropriate.

- PF-10. Development along corridors identified by the Sanitation Districts in their Master Plans as locations of future sewerage conveyance facilities shall incorporate appropriate easements as a condition of approval.
- PF-11. The County shall not support extension of the regional interceptor system to areas within the County which are beyond the Urban Service Boundary. This shall not prohibit the County from supporting the extension of the regional interceptor system to areas outside the USB which are being proposed for annexation to a city.
- PF-13. Public sewer systems shall not extend service into agricultural-residential areas outside the urban policy area unless the Environmental Health Department determines that there exists significant environmental or health risks created by private disposal systems serving existing development and no feasible alternatives exist to public sewer service.
- PF-14. Independent community sewer systems shall not be established for new development.
- PF-15. Support CSD-1 and SRCSD policies to fund new trunk and interceptor capital costs through connection fees for new development.
- PF-16. Support SRCSD policy to fully fund treatment plant operation through monthly service charges to system users. Fund treatment plant expansion and upgrades and existing trunk and interceptor replacements or improvements through connection fees or other revenue sources.
- PF-18. New development projects which require extension or modification of the trunk or interceptor sewer systems shall be consistent with sewer facility plans and shall participate in established funding mechanisms. The County should discourage development projects that are not consistent with sewer master plans or that rely upon interim sewer facilities, particularly if the costs of those interim facilities may fall on ratepayers. Prior to approval of a specific Commercial Corridor redevelopment project which requires extension or modification of the trunk or interceptor sewer systems, a sewer study and financing mechanism shall be prepared and considered along with the proposed Corridor redevelopment project, in consultation with the Sacramento Area Sewer District.
- PF-19. Extension or modification of trunk or interceptor sewer systems that are required for new developments shall be consistent with sewer facility plans and shall participate in an established funding mechanism. New development that will generate wastewater for treatment at the SRWTP shall not be approved if treatment capacity at the SRWTP is not sufficient to allow treatment and disposal of wastewater in compliance with the SRWTP's NPDES Permit.

WATER SUPPLY

FEDERAL REGULATIONS

UNITED STATES BUREAU OF RECLAMATION

The Bureau of Reclamation is part of the United States Department of the Interior and is responsible for the development and conservation of much of the water resources in the western United States. The Bureau operates Folsom Dam, Nimbus Dam, and the Folsom South Canal. While the original purpose of the Bureau was to provide for the reclamation of arid and semiarid lands in the west, the agency's current mission covers a wider range of interrelated functions. These functions include providing municipal and industrial water supplies through the Central Valley Project; generating hydroelectric power; providing irrigation water for agriculture; improving water quality, flood control, and river navigation; providing river regulation and control and fish/wildlife enhancement; offering water-based recreation opportunities; and conducting research on a variety of water-related topics.

UNITED STATES GEOLOGICAL SURVEY

The United States Geological Survey (USGS) National Water Use Information Program is responsible for compiling and disseminating the nation's water use data. The USGS works in cooperation with federal, state, and local environmental agencies to collect water use information at the local level.

STATE REGULATIONS

DEPARTMENT OF WATER RESOURCES

The Department of Water Resources (DWR) is responsible for the preparation of the California Water Plan, management of the State Water Project, protection, and restoration of the Sacramento-San Joaquin River Delta, regulation of dams, provision of flood protection, and other functions related to surface water and groundwater resources. Other functions include helping water agencies prepare their Urban Water Management Plans and reviewing such plans to ensure that they comply with the related Urban Water Management Planning Act.

WATER RESOURCES CONTROL BOARD

The Water Resources Control Board (State Water Resources) was established in 1967 to administer state water rights and water quality functions. State Water Resources and its nine regional water quality control boards administer water rights and enforce pollution control standards. State Water Resources is responsible for the granting of water right permits and licenses through an appropriation process following public hearings and appropriate environmental review by applicants and responsible agencies. In granting water right permits and licenses, the WRCB must consider all beneficial uses, including water for downstream human and environmental uses.

CENTRAL VALLEY REGIONAL WATER QUALITY CONTROL BOARD

The Central Valley Regional Water Quality Control Board (Regional Water Board) is responsible for the preparation and implementation of basin water quality plans consistent with the Clean Water Act and enforcement of those plans to ensure that local water quality is protected. The Regional Water Board may become involved in water supply programs as a responsible agency with respect to Project impacts on downstream beneficial uses.

CALIFORNIA DEPARTMENT OF FISH AND GAME

The California Department of Fish and Game (Fish and Game) is a responsible agency with respect to the review of water right applications and is responsible for issuing lake and streambed alteration permits for new water supply projects. Fish and Game often helps establish in stream flows to maintain habitat below a project.

LOCAL REGULATIONS

The 2030 Sacramento County General Plan contains policies and implementation measures which pertain to the provision of water supply. The following policies are applicable to the proposed Project.

- AG-27. The County shall actively encourage groundwater recharge, water conservation and water recycling by both agricultural and urban water users.
- CO-1. Support conjunctive use water supply for development.
- CO-7. Support the Water Forum Agreement Groundwater Management Element. Prior to approving any new development water supply plan shall be approved that demonstrates consistency with an adopted groundwater management plan.
- CO-8. Applicants proposing developments in areas with significant groundwater recharge characteristics shall evaluate the impact of said development on groundwater recharge and quality. This evaluation should recognize criteria defined in any broader County-wide determination and/or evaluation of groundwater recharge areas.
- CO-9. Developments in areas with significant contamination shall utilize remediated groundwater as part of their water supply when feasible.
- CO-13. Support the WFA Conservation Element and the California Urban Water Conservation Council Best Management Practices for Water Conservation.
- CO-14. Support the use of recycled wastewater to meet non-potable water demands where financially feasible.
- CO-16. Ensure developments are consistent with the County Water Efficient Landscape Ordinance, which shall be updated as needed to conform to state law.

- CO-22. Support water management practices that are responsive to the impacts of Global Climate Change such as groundwater banking and other water storage projects.
- CO-23 Development approval shall be subject to a finding regarding its impact on valuable water-supported ecosystems.
- CO-34. Development applications shall be subject to compliance with applicable sections of the California Water Code and Government Code to determine the availability of an adequate and reliable water supply through the Water Supply Assessment and Written Verification processes.
- CO-35. New development that will generate additional water demand shall not be approved and building permits shall not be issued if sufficient water supply is not available, as demonstrated by Water Supply Assessment and Written Verification processes.
- CO-36. Water supply entitlements will be granted on a first come first serve basis to optimize the use of available water supplies.
- LU-73. Sewer and water treatment and delivery systems shall not provide for greater capacity than that authorized by the General Plan.
- PF-2. Municipal and industrial development within the Urban Service Boundary but outside of existing water purveyors' service areas shall be served by either annexation to an existing public agency providing water service or by creation or extension of a benefit zone of the SCWA.
- PF-4. Connector fees for new development shall cover the fair share of costs to acquire and distribute surface water to the urban area.
- PF-5. New treatment facilities and all facility operations shall be funded by beneficiaries.

LEGISLATION

URBAN WATER MANAGEMENT PLANNING ACT

Pursuant to California Water Code Sections 10610-10657, as last amended by Senate Bill 318 in 2004, the Urban Water Management Planning Act requires all urban water suppliers with more than 3,000 service connections or water use of more than 3,000 AFA to submit an Urban Water Management Plan (UWMP) to the California Department of Water Resources every 5 years and update the plan on or before December 31 in years ending in 5 and 0. SB 318 is the 18th amendment to the original bill requiring a UWMP, which was initially enacted in 1983. Amendments to SB 318 have focused on ensuring that the UWMP emphasizes and addresses drought contingency planning, water demand management, reclamation, and groundwater resources.

SENATE BILL 610

SB 610 became effective January 1, 2002. The purpose of SB 610 is to strengthen the process by which local agencies determine the adequacy and sufficiency of current and future water supplies to meet current and future demands. SB 610 amended the California Public Resources Code to incorporate Water Code requirements within the CEQA process for certain types of projects (described below). SB 610 also amended the water code to broaden the types of information included in a UWMP. SB 610 consists of two primary components, the UWMP and the Water Supply Assessment (WSA) (Water Code Sections 10910-10915).

WATER CODE PART SECTION 10910

Water Code Section 10910 et seq. defines the projects for which the preparation of a Water Supply Assessment (WSA) is required as well as the lead agency's responsibilities related to the WSA. The Water Code also clarifies the roles and responsibilities of the lead agency under CEQA and of the water supplier with respect to describing current and future supplies compared to current and future demands. A WSA is required for:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A proposed hotel or motel, or both, having more than 500 rooms;
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area;
- A mixed use development that includes one or more of the uses described above;
- A development that would demand a volume of water equivalent to or greater than the volume of water required by a 500-dwelling unit project; and
- For lead agencies with fewer than 5,000 water service connections, any new development that would increase the number of water service connections in the service area by 10% or more.

Under Section 10910 of the Water Code, the lead agency must identify the affected water supplier and ask the supplier whether the new demands associated with the project are included in the suppliers UWMP. If the UWMP includes the demands, it may be incorporated by reference in the WSA. If there is no public water system to serve the project, the lead agency must prepare the WSA.

SENATE BILL 221

SB 221 requires a city or county to include as a condition of approval of any tentative map, parcel map, or development agreement for certain residential subdivisions a requirement that a “sufficient water supply” be available. Proof of a sufficient water supply must be based on a written verification from the public water system that would serve the development.

CALIFORNIA SAFE DRINKING WATER ACT

The California Safe Drinking Water Act (CA SOWA; California Health and Safety Code 4010 – 4039.6) authorizes the California Department of Public Health (CDPH) to establish maximum contaminants levels (MCLs) that are at least as stringent as those required by the US EPA under the SDWA. The CDPH has established MCLs for contaminants that may occur in public water systems, including all the substances for which federal MCLs exist, and may have adverse health effects. Operators of public water systems in California are required to meet federal and state drinking water standards.

ENERGY SERVICES*FEDERAL REGULATIONS***FEDERAL ENERGY REGULATORY COMMISSION**

The Federal Energy Regulatory Commission is an independent agency that regulates the transmission and sale of electricity, natural gas, and oil; licenses and inspects hydropower projects; reviews proposals to build liquefied natural gas (LNG) terminals; and oversees related environmental matters (FERC, 2009).

*STATE REGULATIONS***CALIFORNIA PUBLIC UTILITIES COMMISSION**

The California Public Utilities Commission (CPUC) regulates the design, installation, and management of California's public utilities, including electric, natural gas, water, transportation, and telecommunications. The CPUC also provides consumer programs and information, such as energy efficiency, low income programs, demand response, and California solar initiative for California's energy consumers.

CALIFORNIA CODE OF REGULATIONS

New buildings constructed in California must comply with the standards contained in Title 20, Energy Building Regulations, and Title 24, California Building Standards Code. Part 6 of Title 24 contains California's Energy Efficiency Standards for Residential and Nonresidential Buildings. These regulations were established in 1978 in response to legislative mandate to reduce California's energy consumption. The standards are updated periodically to incorporate new energy efficiency technologies and methods (CEC, 2009).

WARREN-ALQUIST STATE ENERGY RESOURCES CONSERVATION AND DEVELOPMENT ACT

The Warren-Alquist Act of the Public Resources Code gives statutory authority to the California Energy Commission. Under the Warren-Alquist Act, there will be state policies for responsibility for energy resources, reduction in uses of energy, conservation of energy, and establishment of statewide goals for energy conservation. (Warren-Alquist Energy Resources Conservation and Development Act, Government Code Section 25000 *et seq.*).

LOCAL REGULATIONS

The 2030 County General Plan Public Facilities Element contains numerous policies (PF-67 through PF-119), including policies related to energy facilities include the location of facilities to minimize visual intrusion, biological impacts, and land use incompatibilities for cogeneration and solar facilities as well as conventional electric facilities, policies for the identification of non-potable water availability, and the policies related to the location of transmission infrastructure.

PF-67. Cooperate with the serving utility in the location and design of production and distribution facilities so as to minimize visual intrusion problems in urban areas and areas of scenic and/or cultural value including the following:

- Recreation and historic areas.
- Scenic highways.
- Landscape corridors.
- State or federal designated wild and scenic rivers.
- Visually prominent locations such as ridges, designated scenic corridors, and open viewsheds.
- Native American sacred sites

PF-68. Cooperate with the serving utility in the location and design of energy production and distribution facilities in a manner that is compatible with surrounding land uses by employing the following methods when appropriate to the site:

- Visually screen facilities with topography and existing vegetation and install landscaping consistent with surrounding land use zone development standards where appropriate, except where it would adversely affect photovoltaic performance or interfere with power generating capability.
- Provide site-compatible landscaping.
- Minimize glare through siting, facility design, nonreflective coatings, etc.
- Site facilities in a manner to equitably distribute their visual impacts in the immediate vicinity.

- PF-69. Cooperate with the serving utility to minimize the potential adverse impacts of energy production and distribution facilities to environmentally sensitive areas by, when possible, avoiding siting in the following areas:
- Wetlands
 - Permanent marshes
 - Riparian habitat
 - Vernal pools
 - Oak woodlands
 - Historic and/or archaeological sites and/or districts
- PF-70. Cooperate with the serving utility so that energy production and distribution facilities shall be designed and sited in a manner so as to protect the residents of Sacramento County from the effects of a hazardous materials incident.
- PF-71. Cogeneration facilities may be located in commercially zoned areas provided that the thermal host associated with the cogeneration facility is a conforming commercial use and the cogeneration facility does not adversely affect other commercial uses in the area.
- PF-726. Locate and screen cogeneration facilities in a manner that minimizes visual impacts on adjoining residential and/or commercial uses. These facilities shall also comply with noise ordinance requirements otherwise applicable in the area, or in adjacent zones that are potentially affected by facility noise.
- PF-73. Cogeneration facilities are prohibited outside the Urban Service Boundary, except as part of an existing processing operation.
- PF-74. The design and scale of a cogeneration project should be consistent with the existing design and scale of the host plant. All on-site landscaping should comply with the landscaping development standards of the surrounding land use zone.
- PE-75. Conduct an analysis of non-potable water availability prior to the development of any new cogeneration facility. The results of such an analysis shall be submitted to the State Water Resources Control Board for review and approval.
- PF-76. The County supports the generation and use of energy produced from renewable resources.
- PF- 77. The County supports a variety of solar and other renewable energy sources, including:
- A dispersed system that feeds into the electric delivery system,
 - On-site facilities that primarily supply energy for on-site uses, and
 - Properly sited large, centralized facilities consistent with Policy PF-78.

PF-78. Large multi-megawatt solar and other renewable energy facilities should be sited at locations that will minimize impacts. The following guidelines should be considered, though it is recognized that each project is different and must be analyzed individually, and that other factors may affect the suitability of a site. Locational criteria for wind turbines should be determined on a case-by-case basis and referred to the Sacramento County Airport System and the FAA for review and comment.

- Desirable sites are those which will minimize impacts to county resources and will feed into the electrical grid efficiently, including:
 - Lands with existing appropriate land use designations, e.g. industrial.
 - Brownfield or other disturbed properties (e.g. former mining areas, mine tailings) or land that has been developed previously and has lost its natural values as open space, habitat or agricultural land.
 - Sites close to existing facilities necessary for connection to the electrical grid to minimize the need for additional facilities and their impacts, and to improve system efficiency.
- Other sites may be used for siting renewable energy facilities after consideration of important natural and historic values of the land, including:
 - Farmlands. Site on farmlands of the lowest quality, e.g. land classified by the Department of Conservation as “other land” or “grazing land”, then consider farmlands of local, unique or statewide importance. Avoid high quality farmlands, especially land classified by the Department of Conservation as prime and lands under active Williamson Act contracts.
 - Habitat and Other Open Space Lands. Site on lands with the lowest habitat and open space values, and consider how a site will affect conservation planning, e.g. the Conservation Strategy in the South Sacramento Habitat Conservation Plan. Avoid areas containing vernal pool complexes and associated uplands.
 - Scenic Values. Site in areas of lowest scenic values and avoid visually prominent locations e.g. ridges, designated scenic corridors and designated historic sites.
 - Cultural Resources. Site in areas that are known to have limited potential for containing cultural resources. Otherwise, avoid sites with known cultural resources.

PF-79. New solar and other renewable energy facilities should be designed and developed so as to minimize impacts to sensitive biological resources such as oak woodlands and vernal pools, cultural resources (including designated

historic landscapes), or farmlands as defined by the California Department of Conservation. Nearby farm operations shall not be negatively affected by renewable energy facilities, per the policies of the Right-to-Farm Ordinance and the Agricultural Element.

- PF-80. Locate solar facilities, and design and orient solar panels in a manner that addresses potential problems of glare consistent with optimum energy and capacity production.
- PF-81. The County supports renewable energy facilities that convert and mitigate problem waste streams and residues that adversely impact environmental quality.
- PF-82. The County supports the placement of large multi-megawatt solar facilities on rooftops and over parking lots to minimize land use impacts associated with these systems.
- PF-83. New transmission corridors should be identified in all master plans created for new growth areas.
- PF-99. Minimize overhead wire congestion using techniques such as combining lines on poles or undergrounding.
- PF-101. Route new overhead subtransmission lines within existing transmission line corridors, along railroad tracks, or major roadways. In an effort to reduce the visual impact of new lines combine circuits on existing 69 kV power poles, wherever feasible.
- PF-102. The preferred route when installing overhead subtransmission lines through residential neighborhoods should be the landscape corridors located within arterial roadways. The County will include a map in all master plan documents that identifies the location of transmission, sub-transmission and substation facilities necessary to serve the new development.
- PF-104. Subtransmission lines within landscape corridors shall be situated street-side of the corridor's center line to minimize the visual impact to adjacent residences, but at a distance that will not affect traffic safety.
- PF-105. Landscaping shall be included in corridor design which meets the standards of the surrounding land use zone and is compatible with the overhead line design.
- PF-106. To help reduce visual intrusion landscape corridors with planned power lines along major streets in residential areas should be no less than 30 feet in width.
- PF-107. New sub-transmission lines should be routed along road rights-of-way in dedicated private or public utility easements. When necessary, sub-transmission lines can be routed along rear property lines in dedicated easements that provide adequate access for maintenance by the utility provider. Easements shall be granted as a condition of project approval. Lines near schools shall comply with California Codes and Regulations. Disclosure of future substations, transmission,

and sub-transmission lines by developers is required before property sales are made.

PF-108. To the maximum extent possible locate distribution substations serving residential areas in adjacent commercial properties. When not feasible, these facilities should be designed in a manner to harmonize visually with the surrounding development, including the use of landscaped buffers.

PF-111. It is the policy of Sacramento County not to locate public schools or grant entitlements for private schools within, or directly adjacent to power line corridors as specified below:

Power Line Capacity	Setback from the Corridor (measured from edge of easement)
○ 100 – 133kV	100 feet
○ 220 – 230 kV	150 feet
○ 500 – 550 kV	350 feet

The construction of transmission lines proximate to *an* existing and/or planned public or private school site and subject to the County Siting Process (100 kV or greater) should also comply with the distance criteria listed above unless compliance with these setbacks would result in a greater EMF impact on other adjacent uses.

PF-113. Route new high pressure gas mains within railway and electric transmission corridors, along collector roads, and wherever possible, within existing easements. If not feasible these gas mains shall be placed as close to the easement as possible.

PF-116. Community Plan land use designations and policies should be consistent with the policies of this Energy Facilities Siting section of the Public Facilities Element.

PF-117. All Community Plans shall include an Energy Facility Siting Element which indicates the location of existing and planned energy facilities. Community Plan Siting Elements and SMUD's Electric Study Plans for the corresponding area shall be consistent.

PF-118. All tentative subdivision maps should identify the location of all utility easements sufficient to accommodate existing and future needs as determined by SMUD and PG&E.

There are also multiple general plan policies which are relevant to the efficient use of energy:

EN-16. Promote the use of passive and active solar systems in new and existing residential, commercial, and institutional buildings as well as the installation of solar swimming pool heaters and solar water and space heating systems.

LU-28. Encourage the development of energy-efficient buildings and communities.

- LU-29. Promote voluntary participation in incentive programs to increase the use of solar photovoltaic systems in new and existing residential, commercial, institutional, and public buildings.
- LU-30. Whenever feasible, incorporate energy-efficient site design, such as proper orientation to benefit from passive solar heating and cooling, into master planning efforts.
- LU-70. Enact cost effective energy conservation performance standards consistent with USEPA Energy Star standards for new construction.
- LU-71. Reduce the energy impacts from new residential and commercial projects through investigation and implementation of energy efficiency measures during all phases of design and development.

SIGNIFICANCE CRITERIA

1. Require the construction of new or the expansion of existing utility facilities that could potentially cause significant construction-related environmental effects.
2. Result in a project water demand from proposed land uses that cannot be met by water purveyors' existing or future projected normal, single dry, and multiple dry year supplies.
3. Result in a service demand that cannot be met by existing or reasonably foreseeable future service capacity.
4. Contribute to groundwater pumping to serve project growth such that the average annual sustainable yield of 131,000 acre-feet for the Sacramento North Area Groundwater Basin is exceeded.
5. Contribute to groundwater pumping to serve project growth such that the average annual sustainable yield of 273,000 acre-feet for the Sacramento Central Groundwater Basin is exceeded.
6. Interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level.
7. Result in inefficient, wasteful, and unnecessary consumption of energy.

IMPACTS AND ANALYSIS

IMPACT: CONSTRUCTION OF INFRASTRUCTURE COULD RESULT IN ADVERSE PHYSICAL EFFECTS

In order to deliver utility service to the Project site, regional, local off-site, and on-site infrastructure improvements will be required. Most of this construction has either

already been contemplated as part of other infrastructure projects, or is within the boundaries of the Project site, and thus will not cause any new, previously unstudied impacts. There are a few facilities, however, which may involve construction in off-site locations that were not previously considered, or which involve construction of “interim” facilities within the alignments of previously studied projects. The sections below describe the infrastructure improvements, and describe the probable impacts. Note that as it relates to significance criteria one, an impact is only considered attributable to project-related infrastructure if infrastructure construction is the primary cause of the impact. As an example, utility lines constructed on-site that will be within Project roadway alignments do not cause utility-specific impacts; the impacts are due to the Project as a whole.

NON-POTABLE WATER

During the preparation of this Final EIR, the County determined that there were no plans to provide future non-potable water to the Cordova Hills Project area and no funding for the County or the water and sewer agencies to maintain a recycled water distribution system at Cordova Hills until non-potable water could be supplied. Consequently, in conformance with the County’s current plans, it was decided that that the Cordova Hills Project will not be installing a separate recycled water distribution system. Since the water demands that would have been satisfied by the originally proposed recycled water distribution system were included in the potable water supply analysis, there is no new environmental impact arising from this change; impacts are less than significant.

A Non-Potable Water Supply Master Plan was prepared for the Project to determine the non-potable water demands of the Project and to determine the infrastructure necessary for Project development (*Non-Potable Water Master Plan for Cordova Hills, March 2011* and *Supplemental Report Non-Potable Water Master Plan for Cordova Hills, July 2011*) these reports are included as Appendix PU-3.

Ultimately the non-potable system will be supplied by the County’s future Reclaimed Water transmission system to be located in Grant Line Road. Until this reclaimed source is available, the above mentioned demands will be met through an interim connection of the on-site non-potable system to the potable system. When a non-potable water source becomes available to the Project, the interim connection will be terminated and the reclaimed water will be distributed through a separate non-potable pipe network, independent from the potable water system. The non-potable water demands are included in the potable water supply analysis.

It is anticipated that the irrigation needs of public right-of-ways, landscape corridors, parks, other public land uses, and large commercial sites will ultimately be met by the reclaimed water system. The estimated annual irrigation demand for these uses within the Project is 2,167.8 AFY. The reclaimed water system is laid out within the major arterial and collector streets within the Project area (Plate PU-2). The distribution system consists of 8 to 18 inch diameter reclaimed water lines, which connect to all major irrigated land uses within the Project area.

~~Construction activities associated with the non-potable pipe network will take place within the Project boundaries in areas designated for developed uses, consistent with the provisions of the SPA. The relevant topical chapters of this EIR disclose the physical impacts of full development of the proposed Project and provide mitigation as appropriate. Construction of the non-potable water system will not result in substantial physical adverse effects; impacts are less than significant.~~

MITIGATION MEASURES:

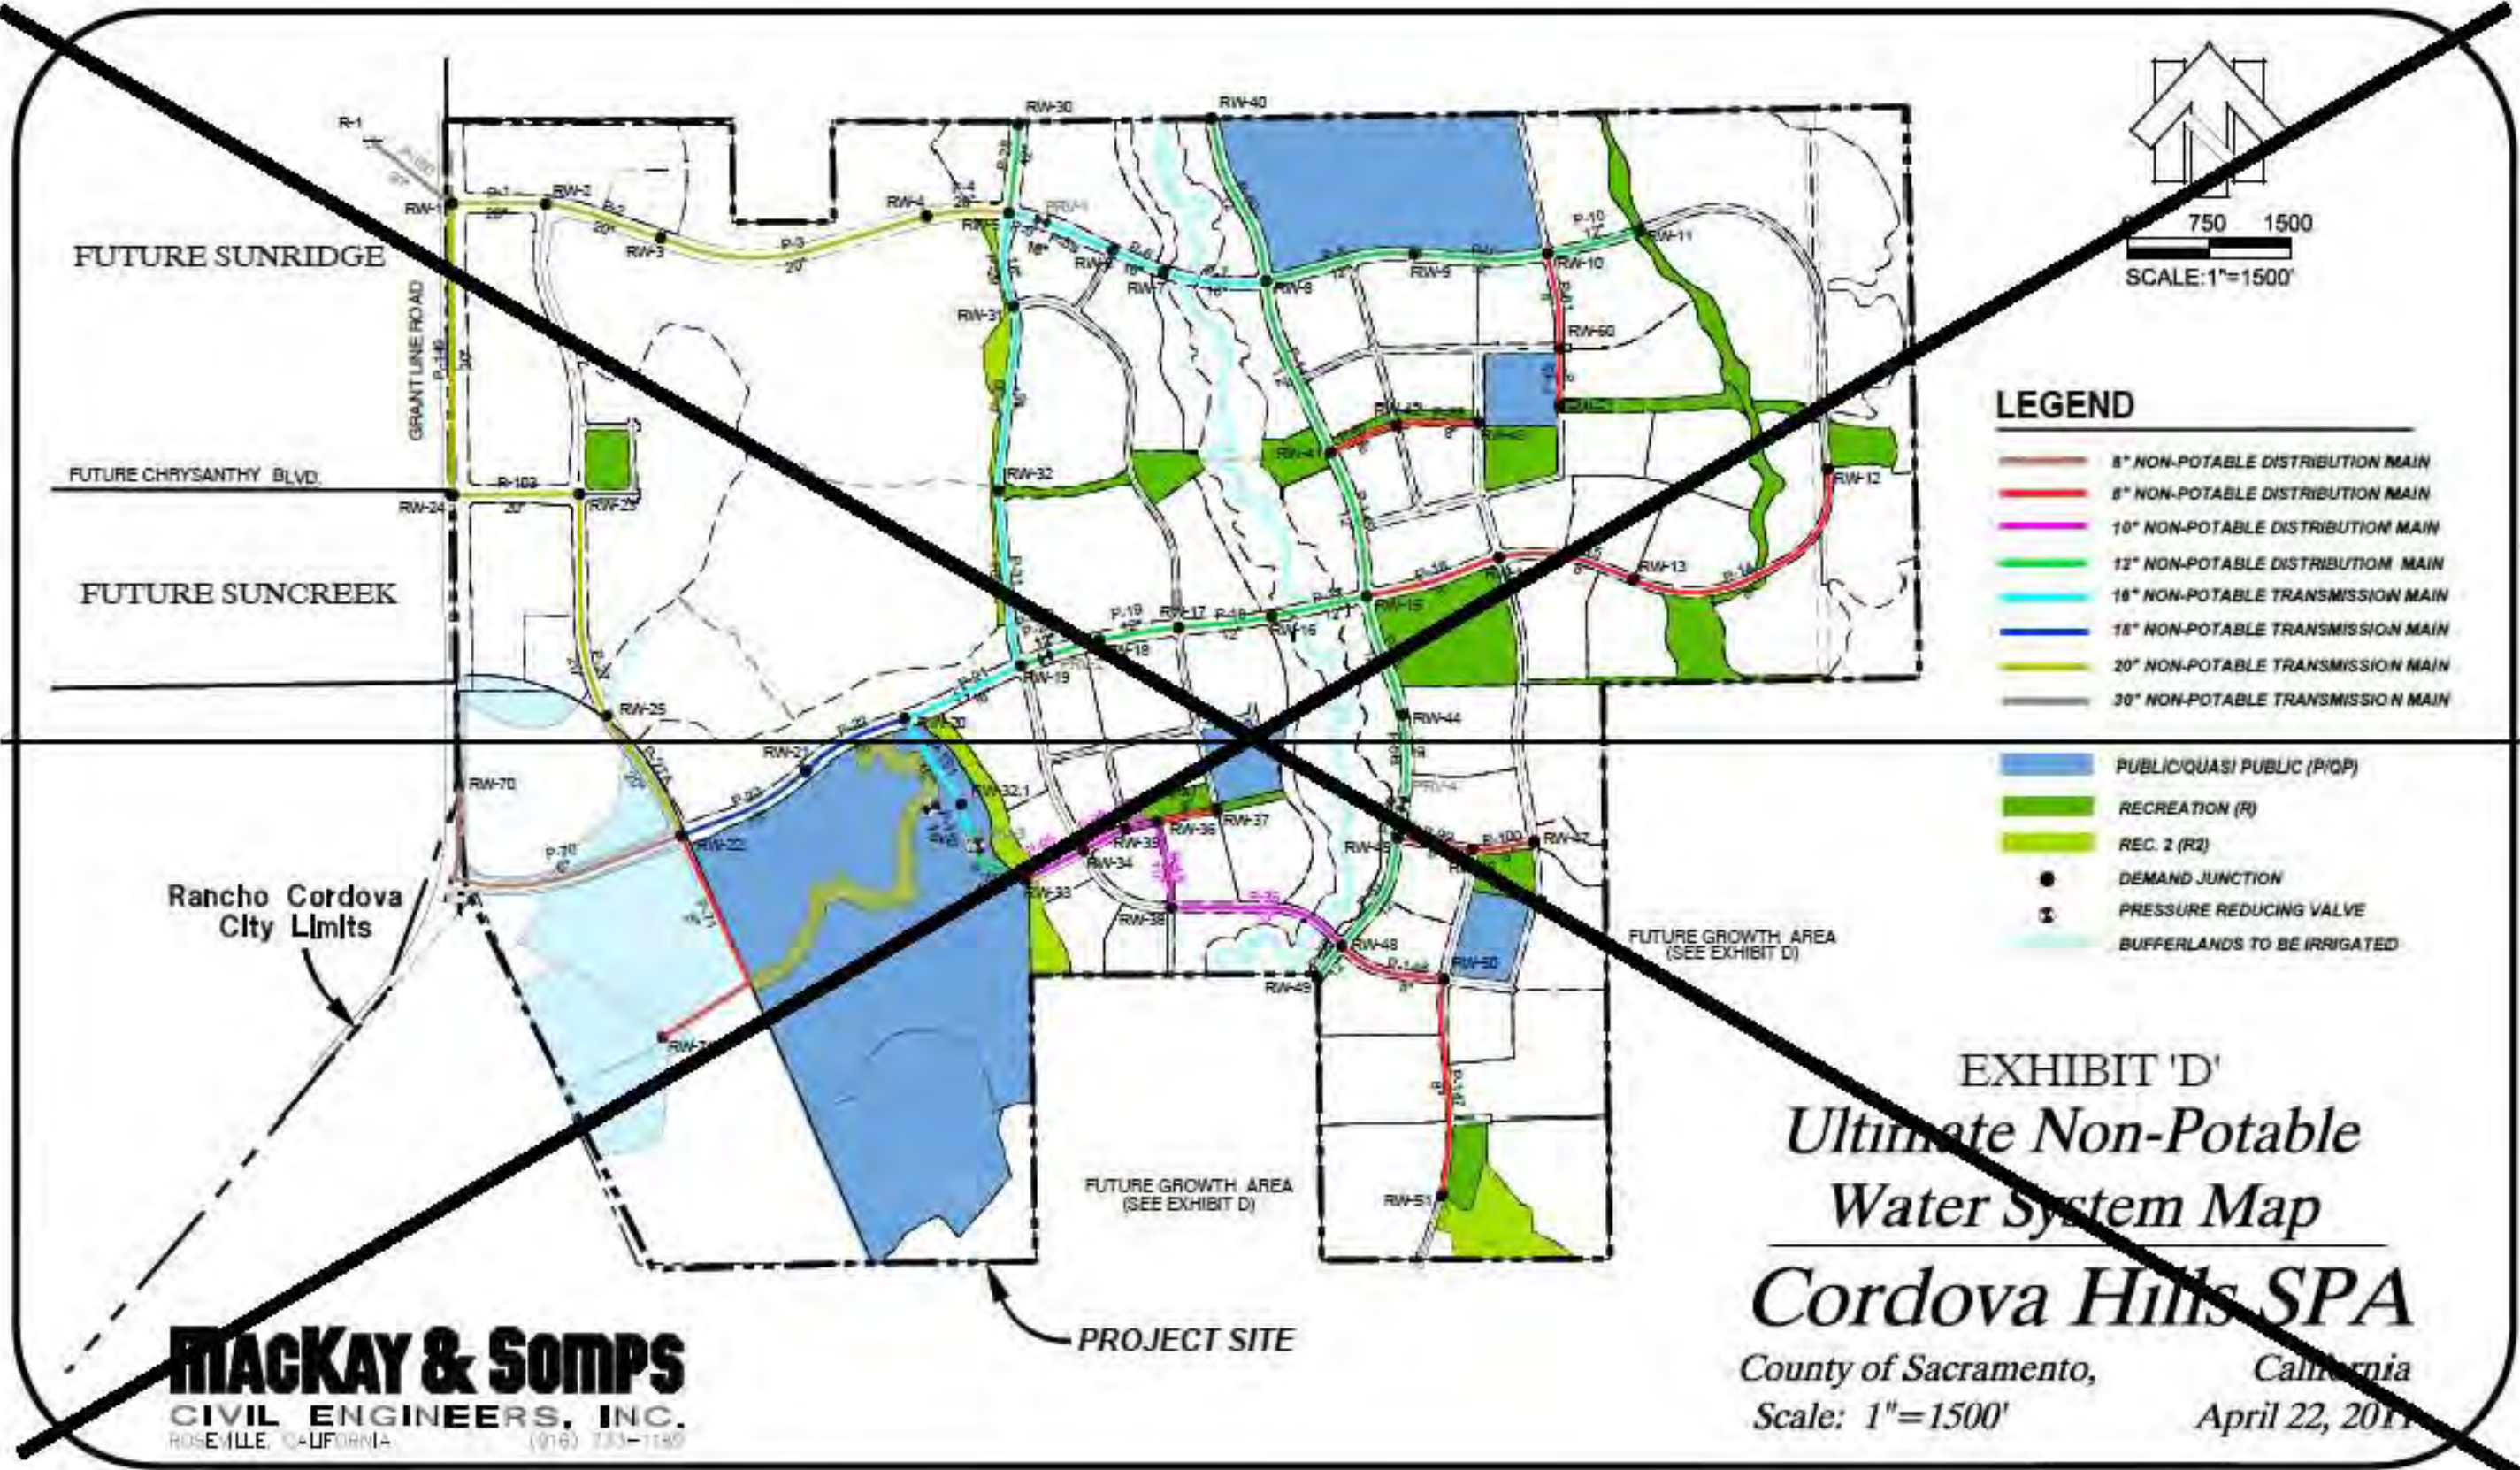

None required.

POTABLE WATER SUPPLY

There are two major projects relevant to the below discussions which have already been contemplated: the Vineyard Surface Water Treatment Plant and the North Service Area Pipeline. Construction of the Vineyard Surface Water Treatment Plant (WTP) and associated water supply facilities has recently been completed and the facilities are undergoing start-up testing. The WTP will provide potable water to existing and approved future development within the SCWA Zone 40 service area. The Vineyard Surface WTP will have capacity to treat 100 mgd of raw surface water. The raw river water will be diverted from the Sacramento River via the Freeport Regional Water Project facilities and conveyed to the Vineyard Surface WTP for treatment and delivery to the SCWA Zone 40 service area via the North Service Area Pipeline Project (NSAPP).

The NSAPP includes construction of a transmission main and booster tank station that will serve the Mather Specific Plan area and SCWA's North Service Area (NSA). The North Service Area Pipeline (NSAP) will begin at the Vineyard Surface WTP and convey water to an existing transmission main located at Douglas Road and Sunrise Boulevard.

Plate PU-2: Ultimate Non-Potable Water System Map

A Water Supply Master Plan was prepared for the Project to determine the water demands of the Project and to determine the on-site and off-site infrastructure necessary for Project development (*Potable Water Master Plan for Cordova Hills, March 2011* and *Supplemental Report-Potable Water Master Plan for Cordova Hills, July 2011*); these reports are included as Appendix PU-4. In order to determine infrastructure sizing requirements the water supply analysis also includes an evaluation of off-site areas adjacent to the Project to the east and south. Given their location (between the Project site and the USB), it is assumed that water for future development in these areas would come through the Project site. Therefore, their estimated water demands are included in the analysis in order to assure that the infrastructure that will be built with the Project is adequate to serve these areas.

The Project proposes a mix of uses which include low to high-density single-family residential units, multi-family residential units, retail, mixed-use, schools, parks, open spaces, community facilities, and a regional sports park. The SCWA preferred methodology for determining water demand is to apply a water demand factor to each proposed land use category. The unit water demand factors as defined in the *Zone 40 Water Supply Master Plan Table 2-2, February 2005* were applied to the Project land uses in order to estimate the water demands for the Project.

The TC (Town Center) designation will include a mix of residential and commercial development. In order to determine the approximate quantity of water required to serve this designation, given the uncertainty of the ratio of residential to commercial, the gross water demand was estimated under two different scenarios. One scenario assumes a high residential mix in the TC zone and the other assumes a high commercial mix in the TC zone. The two scenarios consist of the following mix of uses:

- Maximum Residential = 188.3 ac @ 9.3 DU/ac(net) + 8.8 ac Roads
- Maximum Commercial = 64 ac @ 0.35 FAR + 110.3 ac @ 9.3 DU/ca + 22.8 ac Roads

Once calculated, the water demand of 35.7 AFY for the portion of the Project outside of the USB was added to each of the scenarios. The land use scenario that yields the highest total annual potable water demand is the Maximum Residential scenario with 4,543.0 AFY. The total annual demand of the Maximum Commercial scenario is 4,347.6 AFY. The water demand of 4,543.0 AFY (Maximum Residential scenario) is used in the master plan to represent the annual potable water demand of the Project because it represents the worst case scenario.

REGIONAL INFRASTRUCTURE

SCWA has existing and planned facilities that will support the delivery of water to the Project site. The existing and planned facilities are detailed on ~~Plate PU-3~~. There are existing water lines extending to existing water storage tanks north of Douglas Road, called the North Douglas Storage Tanks. The point of connection will be at the intersection of Americanos Boulevard and Douglas Road. During the initial phases of the Project, the interconnection will be to the line which transmits water from the North Douglas Storage Tanks. Ultimately, the Project will require its own water tanks. When

demands reach the point where new storage is required, the transmission line will connect to the line which transmits water to the North Douglas Storage Tanks. The necessary water pressurization would then occur as water left the Cordova Hills storage tanks.

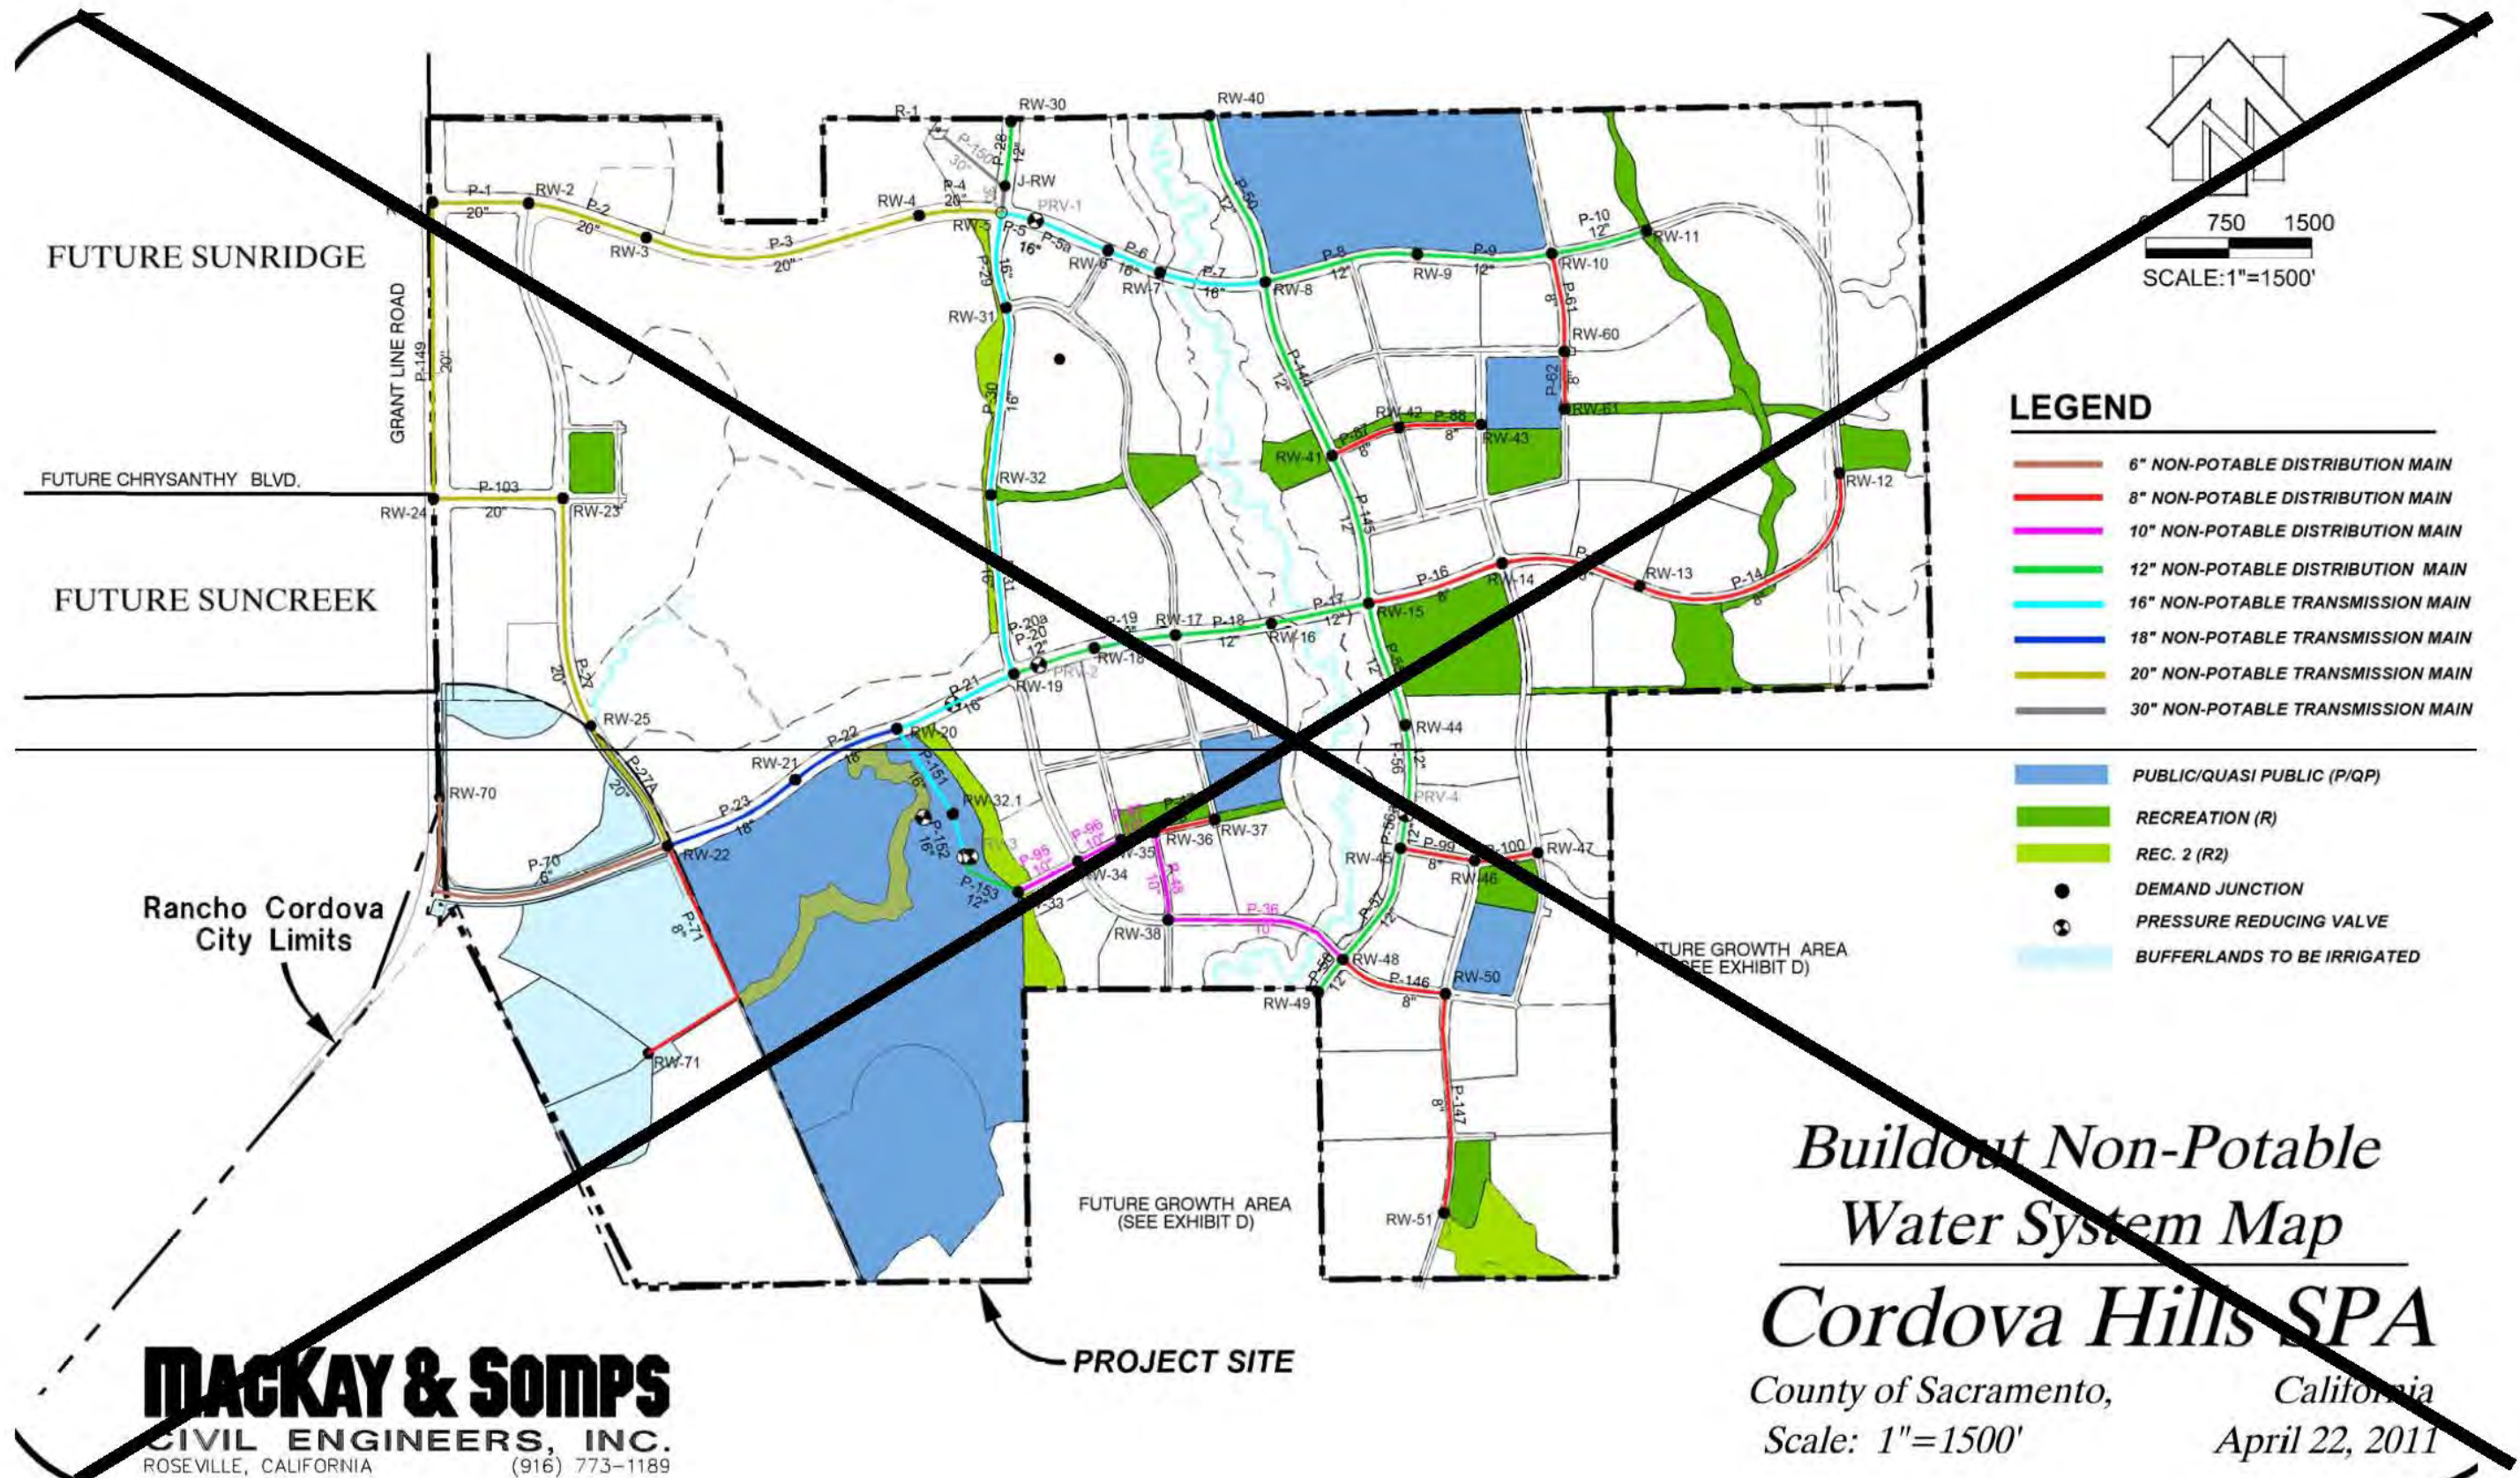

Project water demands will ultimately be met by a combination of groundwater and surface water delivered by SCWA through their water system; however, currently the North Douglas Storage Tanks are fed by the existing North Vineyard Well Field, which is intended to be expanded over time as demand increases. In addition to this existing design, there are two other regional infrastructure options which could convey water to the North Service Area of Zone 40. These are the North Service Area (NSA) Pipeline and the Anatolia Raw Water Pipeline Conversion. All three options, the existing design and the two other options, are described below.

NORTH VINEYARD WELL FIELD

Under this option, initial water demands in the NSA and Project area will be met by groundwater from the North Vineyard Well Field (NVWF) and possibly the Mather Housing wells located at Mather Field. Currently, the NVWF consists of three operational groundwater wells. As demand increases in the NSA additional well and treatment capacity will be developed to meet these demands. Ultimately, groundwater development in the NVWF will consist of seven wells. Aside from the already-anticipated well-field expansion, there are no regional off-site infrastructure improvements required for this option as facilities are currently in operation, which are capable of delivering water to the NSA.

Groundwater from the NVWF is conveyed to the Anatolia Groundwater Water Treatment Plant (AGWTP) through the Anatolia Raw Water Pipeline. Once treated, groundwater is then distributed throughout the existing NSA system. For Phase 1 of the Project, groundwater will be conveyed through the NSA system to the existing North Douglas Storage Tanks and then on to the Project site via a high pressure line connecting the tanks with the proposed on-site transmission main. Ultimately, the proposed transmission main will be connected to the existing low-head transmission main at the intersection of Americanos Boulevard and Douglas Road for conveyance to the future Cordova Hills Storage Tanks. Once this connection is made the line will be disconnected from the North Douglas Storage Tanks, and pressurization would occur at the Cordova Hills Storage Tanks.

Plate PU-3: SCWA Water Facility Plan

NORTH SERVICE AREA PIPELINE

SCWA, in cooperation with East Bay Municipal Utility District (EBMUD), has completed construction of the Freeport Regional Water Project (FRWP). SCWA's portion of the Project consists of 85 million gallons per day of diversion and conveyance capacity. Surface water from the FRWP facility will be treated at SCWA's Vineyard Surface Water Treatment Plant (VSWTP), located at the northeast corner of the intersection of Florin Road and Knox Road, prior to delivery to SCWA's customers.

The VSWTP is currently undergoing start-up testing and is expected to be fully operational in late 2011. In order to deliver treated surface water to the Project instead of water from the North Vineyard Well Field, SCWA will need to construct the NSA Pipeline project, which will provide a link between the VSWTP and the North Service Area (Plate PU-4). SCWA completed and approved an initial study/mitigated negative declaration (*NSA Pipeline Project*, Sacramento County Control Number 2007-70373) for construction of this pipeline in September 2010. The timing of construction of the NSA pipeline cannot be precisely predicted at this time, as it is dependent on demand growth in the NSA. Sacramento County Department of Water Resources staff (D. Eck and K. Schmitz) have indicated in meetings that there are no immediate plans to construct this facility, given that there is significant remaining capacity in the North Vineyard Well Field.

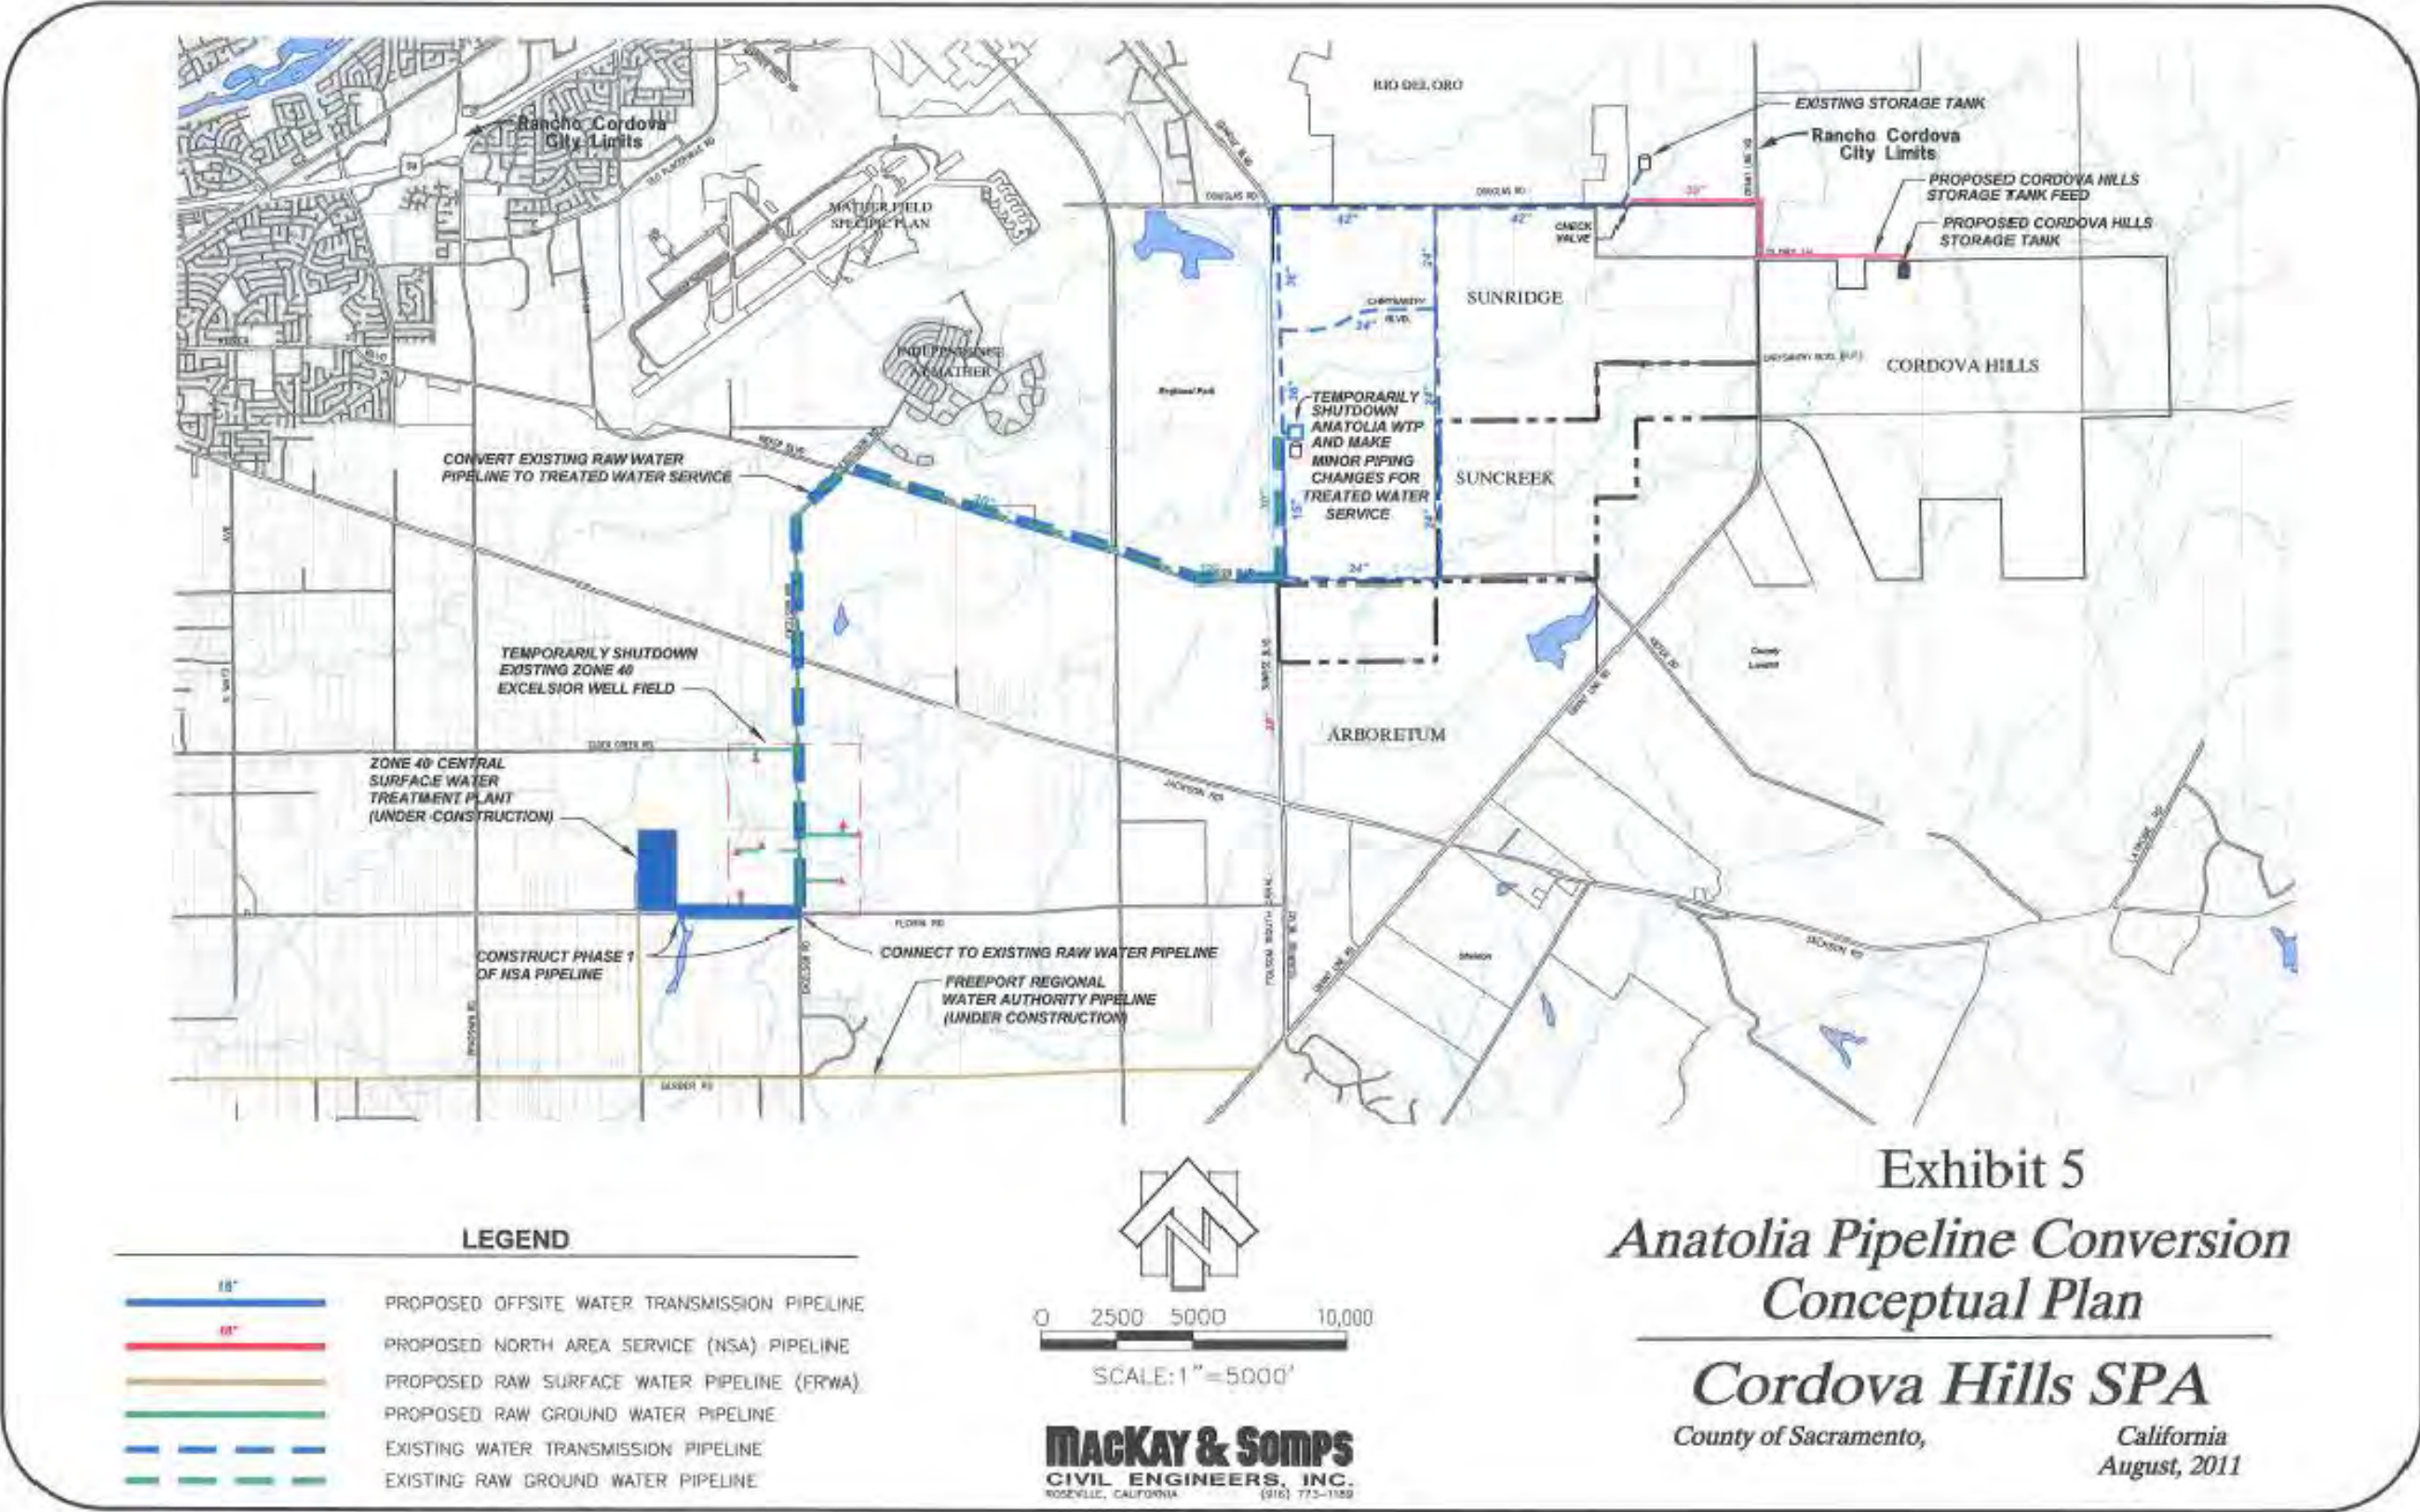

If the NSA Pipeline were constructed, the point of interconnection for the Project would be the same as under the North Vineyard Well Field option.

ANATOLIA PIPELINE CONVERSION

Due to applicant concerns about the ability to continue expanding the North Vineyard Well Field such that infrastructure remains ahead of housing demand, the applicant has proposed an interim surface water solution which would provide surface water until the NSA Pipeline is completed. Under this option surface water from the VSWTP would be conveyed to the NSA through a combination of existing, planned, and interim pipelines. Implementation of this option is detailed below, and is shown on Plate PU-5:

1. Construct "Phase 1" of the NSA pipeline, which extends from the VSWTP easterly within the Florin Road right-of-way to the intersection of Excelsior Road.
2. Construct a temporary 30-inch diameter transmission main northerly within the Excelsior Road right-of-way and connect to the existing raw water pipeline that extends from the Excelsior Well Field to the AGWTP.
3. Temporarily shut down the wells in the Excelsior Well Field until they are needed to meet future conjunctive use water demands.
4. Temporarily shut down the AGWTP until it is needed to meet future conjunctive use water demands.
5. Connect the converted raw groundwater transmission pipeline directly to the treated water side of the AGWTP. This will require minor piping modifications at the AGWTP site.

Plate PU-5: Anatolia Pipeline Conversion

This alternative requires construction of 4,600 feet of the approved NSA pipeline project located within Florin Road between the VSWTP and Excelsior Road and 2,500 feet of temporary pipeline within Excelsior Road, and converting the Anatolia Raw Water Pipeline to a treated surface water pipeline. The converted pipeline will convey treated surface water from the VSWTP to the AGWTP. Minor onsite conversions at the AGWTP would be necessary to convey surface water instead of groundwater. For Phase 1 of the Project, surface water would be conveyed through the NSA system to the existing North Douglas Storage Tanks and then on to the Project site via a high pressure line connecting the tanks with the proposed transmission main. The point of connection would be the same as for the North Vineyard Well Field option.

This alternative is intended to be temporary; once the NSA Pipeline is constructed the Anatolia Raw Water Pipeline and the AGWTP will be converted back to groundwater conveyance. Construction of "Phase 1" of the NSA Pipeline is planned and has been approved. Piping modifications at the AGWTP and the temporary 30" transmission main that will connect the raw water pipeline to the AGWTP are specific to this option and will require infrastructure project approval before implementation. These facilities are unplanned in terms of use and sizing, but they are located within existing facilities or along the same alignments as already approved and planned facilities. The piping modifications necessary to connect the converted raw groundwater transmission pipeline to the treated water side of the AGWTP are minor and will occur at the AGWTP site where habitat or other resources are not present. Construction of the temporary pipeline will occur within the alignment of the NSA Pipeline, the impacts of which were already studied and approved. Thus, any impacts resulting from construction of this line would occur regardless of the implementation of this option.

CONCLUSION

As described above, none of the regional infrastructure options would result in new, significant adverse impacts, because all of the infrastructure would be located in areas where pipelines and facilities already exist or have already been approved (and thus any impacts are not attributable to the Project); impacts are *less than significant*.

It should be noted that the Sacramento County Water Agency would need to approve the Anatolia Pipeline Conversion option, and at this time staff (D. Eck and K. Schmitz) have indicated a lack of support. Citing financial considerations and a desire to avoid interim/temporary facilities, staff indicated a preference to use the existing North Vineyard Well Field.

LOCAL OFF-SITE INFRASTRUCTURE

As previously discussed, in order to convey water to the Project site during Phase 1, a high pressure connection will be made connecting the Project to an existing pipeline leaving the North Douglas Storage Tanks. The connection will be made by constructing and connecting a new 30" transmission pipeline to the existing line in Douglas Road, which will then extend east along Douglas Road and south along Grant Line Road before finally connecting to a new 24" water line on the Project site. Once the Project's water demand begins to reach the capacity of the North Douglas Storage Tanks the Project will be disconnected from the line leaving the North Douglas Storage Tanks and

reconnected to the low-pressure line which enters the storage tanks. The 30" Project transmission line which was constructed along Grant Line Road will then be disconnected from the on-site 24" line and routed down Glory Lane to the new Cordova Hills Water Tanks. The current conceptual location of the Cordova Hills Storage Tanks is approximately 5,400 feet east of the intersection of Glory Lane and Grant Line Road, on property north of the Project site which is owned by the applicant.

The Cordova Hill Storage Tanks will consist of tanks and a booster station with the capacity to provide 5.5 million gallons of storage. Given that this water project will not go through engineering design until the facility need arises, the construction footprint and outline for the tanks are conceptual at this time. It is anticipated that the construction footprint would be a minimum of four acres and perhaps as much as 11 acres. The topography on the property is highly variable, which will influence the design and layout of the system. For example, the system could be constructed with several large tanks, which may require larger and deeper cut and fill areas but a smaller overall footprint, or with a larger number of smaller tanks, which would require less cut and fill but a larger overall footprint. The analysis of physical impacts focuses on the general area, and assumes the largest footprint in order to be conservative.

Construction of the first phase of the 30" transmission pipeline from the North Douglas Storage Tanks to the intersection of Grant Line Road and Glory Lane will occur within existing right-of-ways within existing roadways. Construction of the 30" transmission pipeline from Grant Line Road to the Cordova Hills Storage Tanks is proposed off-site on a private road where there is no existing right-of-way. The portion of the pipeline along Glory Lane is located on a private unpaved roadway in an area that is known to contain biological resources. The pipeline will be required to be constructed within a public right-of-way, general utility easement of at least 20 feet unencumbered width, or a dedicated water line easement of at least a 20-foot width. If the applicant is unable to acquire an easement then the pipeline may be located entirely within the proposed North Loop Road right-of-way. This alternative would add approximately 1,700 feet of additional pipeline to the overall pipe length. Similarly, construction of pipelines, storage tanks, and related infrastructure on the currently undeveloped, off-site Cordova Hills Storage Tank site will impact biological resources including wetlands and protected species habitat. The relevant topical chapters of this EIR disclose the physical impacts of full development of the proposed Project and provide mitigation as appropriate.

Though discussed in detail in the appropriate topical chapters, in the case of the local water line and the Cordova Hills storage tanks, the construction of infrastructure is part of an overall *significant and unavoidable* impact related to wetland resources and species supported by those wetlands.

ON-SITE INFRASTRUCTURE

On-site infrastructure consists of a combination of a variety of pipe sizes traversing the Project site as shown in (Plate PU-6). In the ultimate condition, in order to connect the Project site to the off-site Cordova Hills Water Storage Tanks a 42" waterline will extend from the storage tanks and connect to a 36" waterline, which will connect to a 30" waterline onsite and within the central portion of the site. The remaining on-site pipes

will extend from the on-site 30" waterline and traverse the Project site within the proposed roadways. The waterlines range in size from 24" to 12" and are sized to support the adjacent land uses.

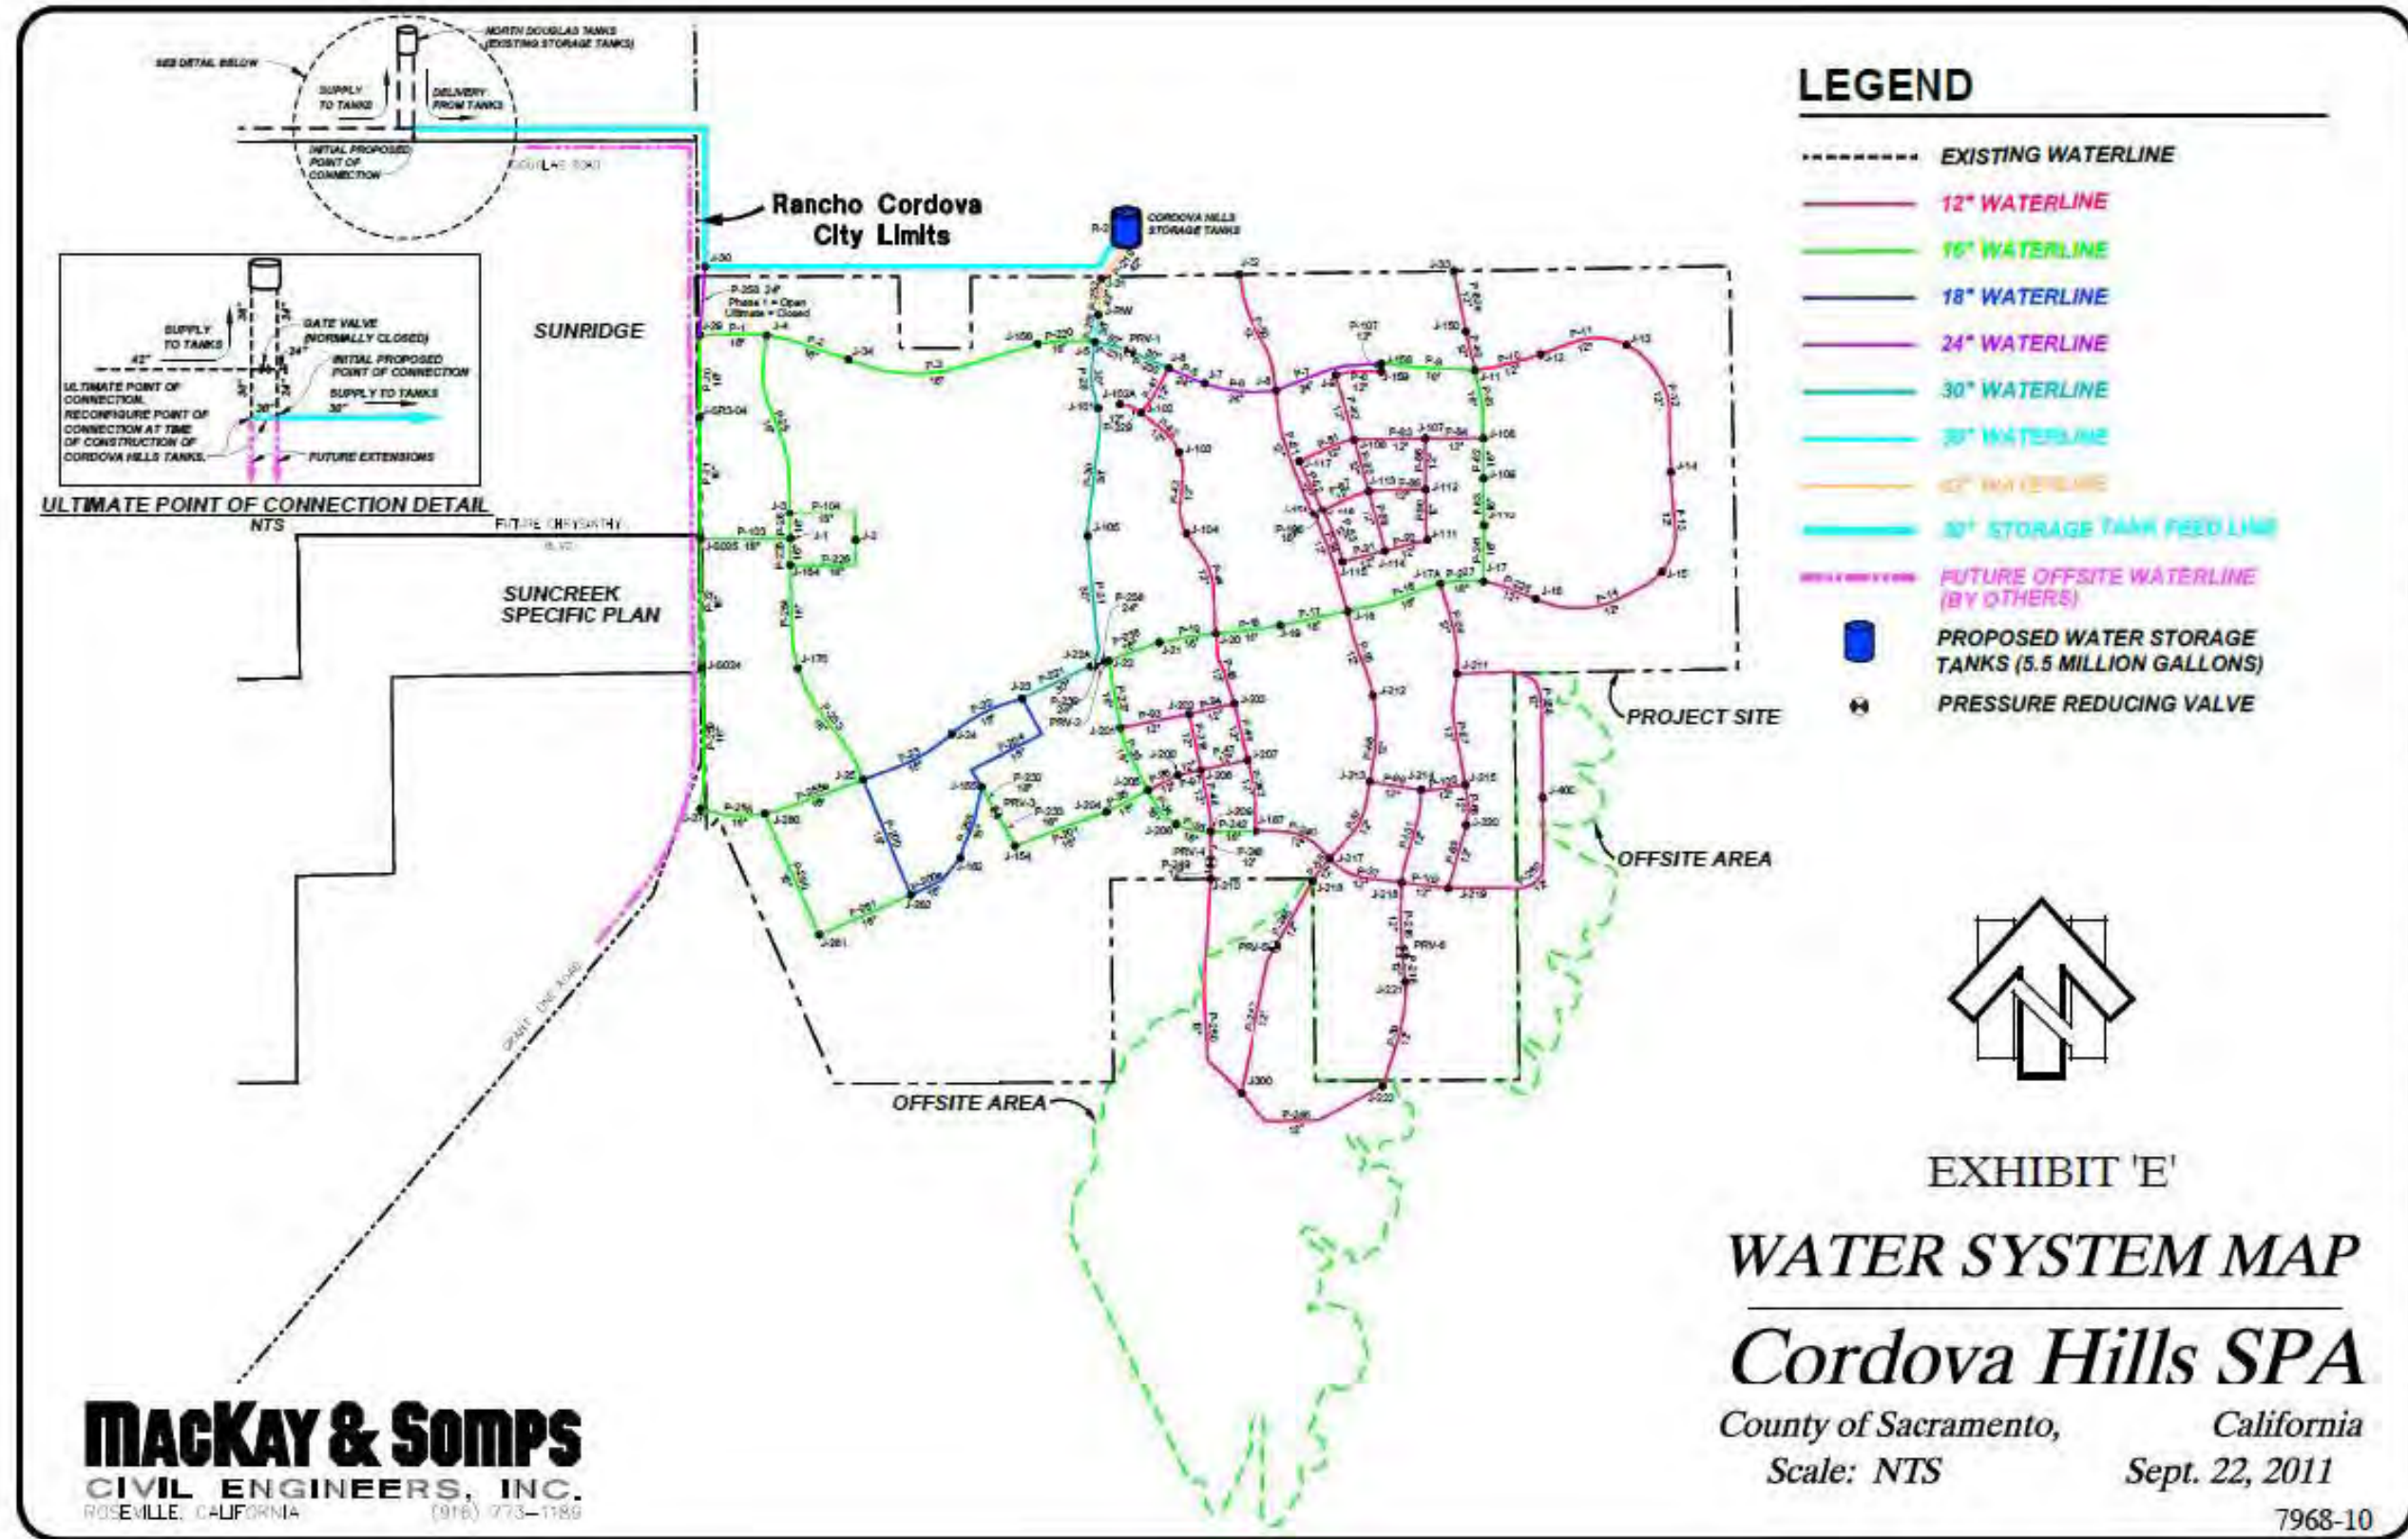

Note that the various water infrastructure exhibits within the technical studies show water lines extending off-site to the south of the Project site. These lines were included for modeling purposes only, in order to demonstrate to the Sacramento County Water Agency that the system was designed in a manner that would allow this land-locked portion within the Urban Services Boundary to connect to the Cordova Hills system if the property owner should ever choose to develop the property. The Cordova Hills applicant has an obligation, in terms of infrastructure planning, to ensure that they do not "harm" this southern property owner by creating a system that would preclude or inhibit the southern property from connecting to the overall system. Development of the Project does not require the construction of these water lines extending off-site to the south of the Project.

On-site construction activities will take place within the Project boundaries in areas designated for developed uses, consistent with the provisions of the SPA. The relevant topical chapters of this EIR disclose the physical impacts of full development of the proposed Project and provide mitigation as appropriate. Construction of on-site lines will not result in any utility-specific adverse impacts; impacts are *less than significant*.

MITIGATION MEASURES:

Mitigation for physical impacts has already been included in the various topical chapters. Relevant measures include AQ-1, BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1.

Plate PU-6: Cordova Hills Water System Map

SEWER SYSTEM

A Sewer Master Plan was prepared for the Project (*Sewer Master Plan for Cordova Hills*, December, 2010, MacKay and Soms Civil Engineers, Inc, Appendix PU-5) in order to satisfy the Sacramento County Sewer District's (SASD) Level Two Minimum Sewer Study Requirements and determine if sufficient sewer service is available for the Project. The Project proposes construction of 8,000 residential units, 1.4 million square feet of commercial and office uses, and a university/college campus center.

REGIONAL INFRASTRUCTURE

The SRWTP system is master planned for the anticipated growth within the UPA. Based on analysis of the SRCSD 2000 Master Plan, the 2006 CSD-1 Sewerage Facilities Expansion Master Plan, and implementation of the SASD/SRCSD strategic plan to utilize capacity in existing facilities, service to Cordova Hills is not constrained. There is sufficient treatment capacity to accommodate sewerage from the Project without the need for facility expansion.

The SRCSD 2000 Master Plan planned a 20 mgd regional interceptor pump station (RIPS) to collect flows from the Upper Deer Creek (DCU) shed, which includes the Cordova Hills area. To avoid overbuild of a regional pump station should SRCSD and/or SASD re-route future DCU trunk sewers, a 2.02 mgd pump station is proposed to serve Phase 1. This pump station is sited at the location of the future RIPS in the southwestern portion of the Project site (Plate PU-7 shows pump station locations and on-site sheds). This pump station will be located in an area already considered impacted by Project development, and thus no adverse utility-specific impacts would result.

The Project will follow the SASD/SRCSD regional strategic plan to utilize, on an interim basis, available capacity in nearby trunk and interceptor sewers. Phase 1 service requires SASD approval of an interim shed shift with pump station and force main facilities to transport wastewater from the Laguna Creek shed to the Bradshaw Interceptor shed. Sewer service to Cordova Hills will be phased as follows (Plate PU-8):

Phase 1: The recommended point of connection (POC) for initial service is the 18-inch Aerojet-Sunrise-Douglas trunk sewer stub at Douglas Road. If POC 1 is not available, POCs 2 and 3, which can connect to the Bradshaw Interceptor, are backup Phase 1 options.

Phases 2 and 3: Five alternative POCs, 2 through 6, are considered for Phases 2 and 3. The selected POC will be determined by SASD in the future, and is dependent on construction of the downstream Laguna Creek and Mather Interceptor (MI). If neither LCI-5 nor the MI is constructed, the POC will require approval by SRCSD as the POC will ultimately connect to the interceptor system.

All of the regional off-site infrastructure shown is already contemplated in SASD or SRCSD master planning documents, and thus are not impacts of the Project. All but

one of the on-site regional lines are located within areas designated for developed uses, consistent with the provisions of the SPA, and would not cause utility-specific physical impacts. As shown on the exhibit, POC-4 is shown being routed through an off-site area to the south, which is consistent with the trunk line alignments shown in SRCSD master planning. Wetland delineations, cultural resources surveys, and other resource studies have not been conducted for these areas because construction-level plans have not been prepared, and impacts will vary depending upon the precise alignment chosen. It is reasonable to assume that construction of this facility would result in wetland impacts and in impacts to species dependent on those wetland resources. Known cultural resources can typically be avoided. Construction of regional sewer infrastructure would contribute to *significant and unavoidable* biological resources impacts identified in the Biological Resources chapter.

LOCAL ON-SITE INFRASTRUCTURE

The Project will include the construction of several pump stations as well as lines throughout the site. All of these facilities will be located within the Project boundary within areas already proposed for development of roads and urban uses. Construction of on-site local infrastructure will not result in utility-specific adverse physical impacts; impacts are *less than significant*.

MITIGATION MEASURES:

Mitigation for physical impacts has already been included in the various topical chapters. Relevant measures include AQ-1, BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1.

Plate PU-7: On-site Sheds and Pump Stations

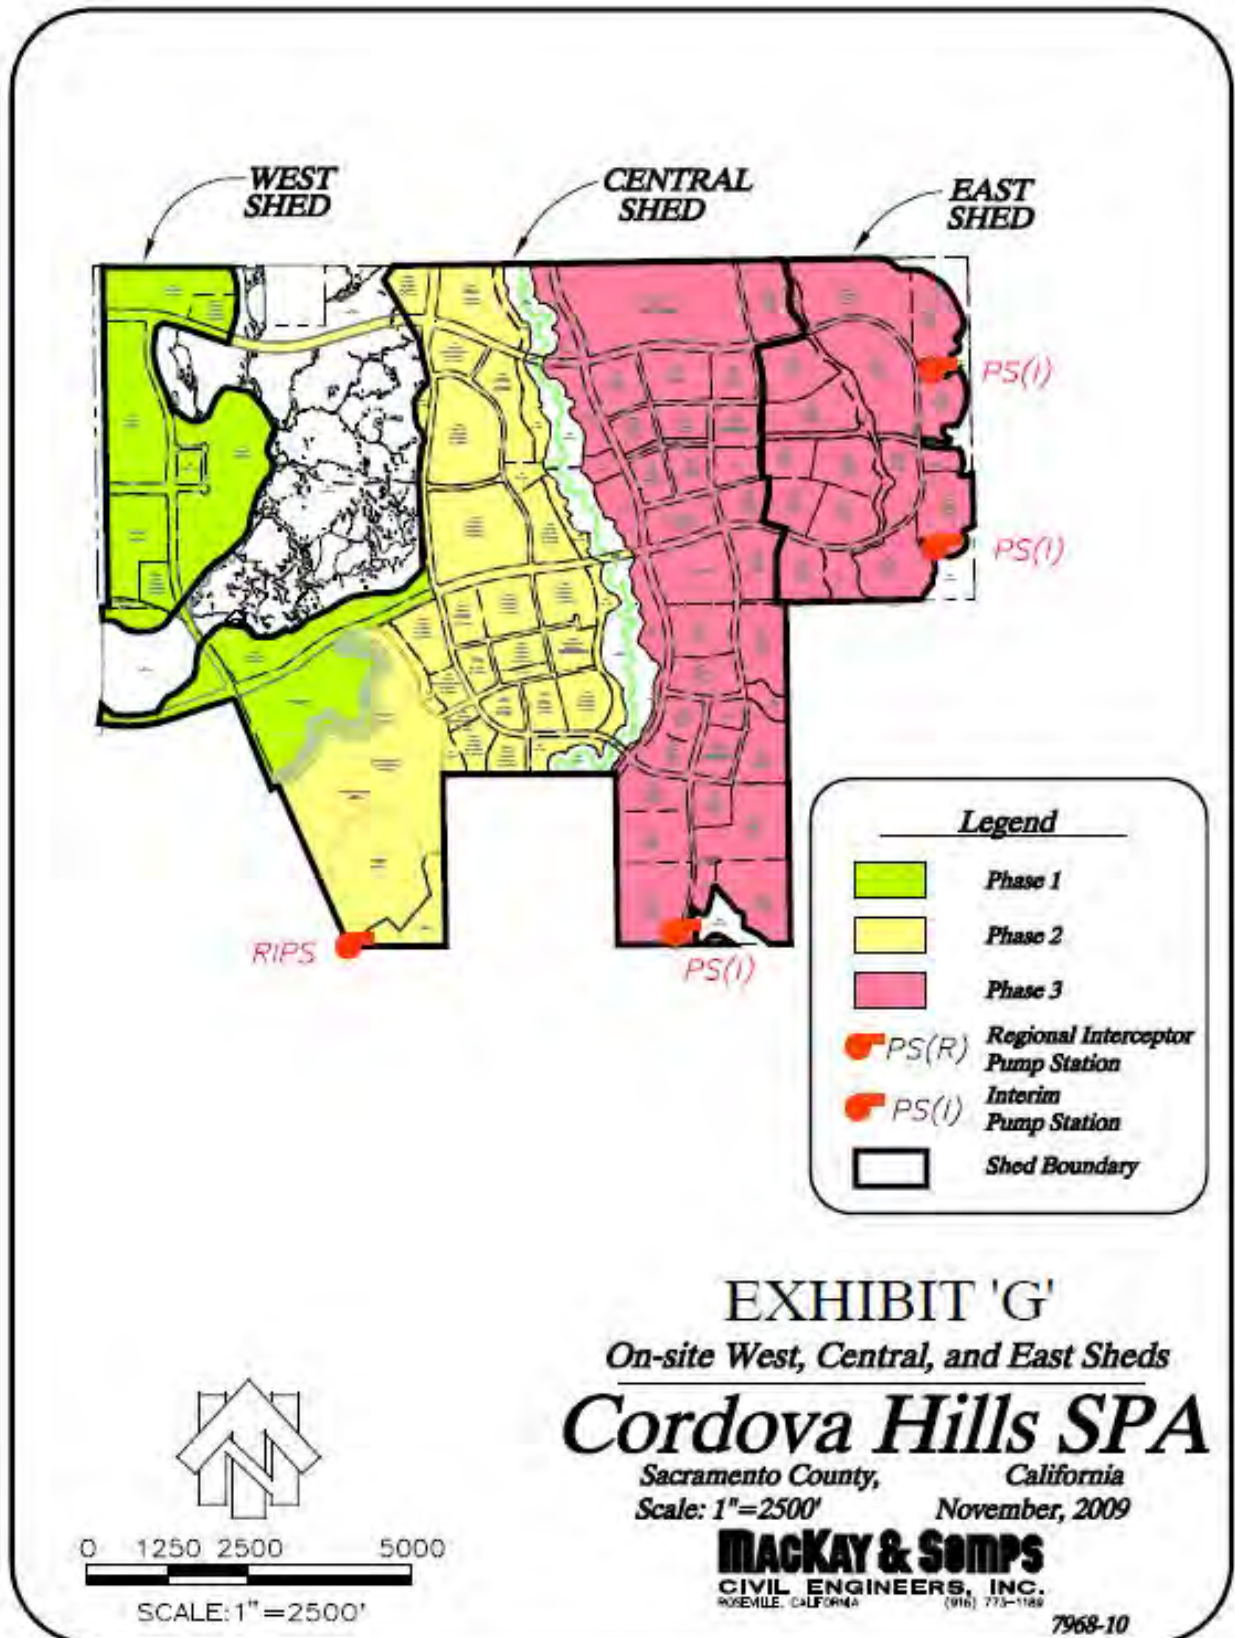

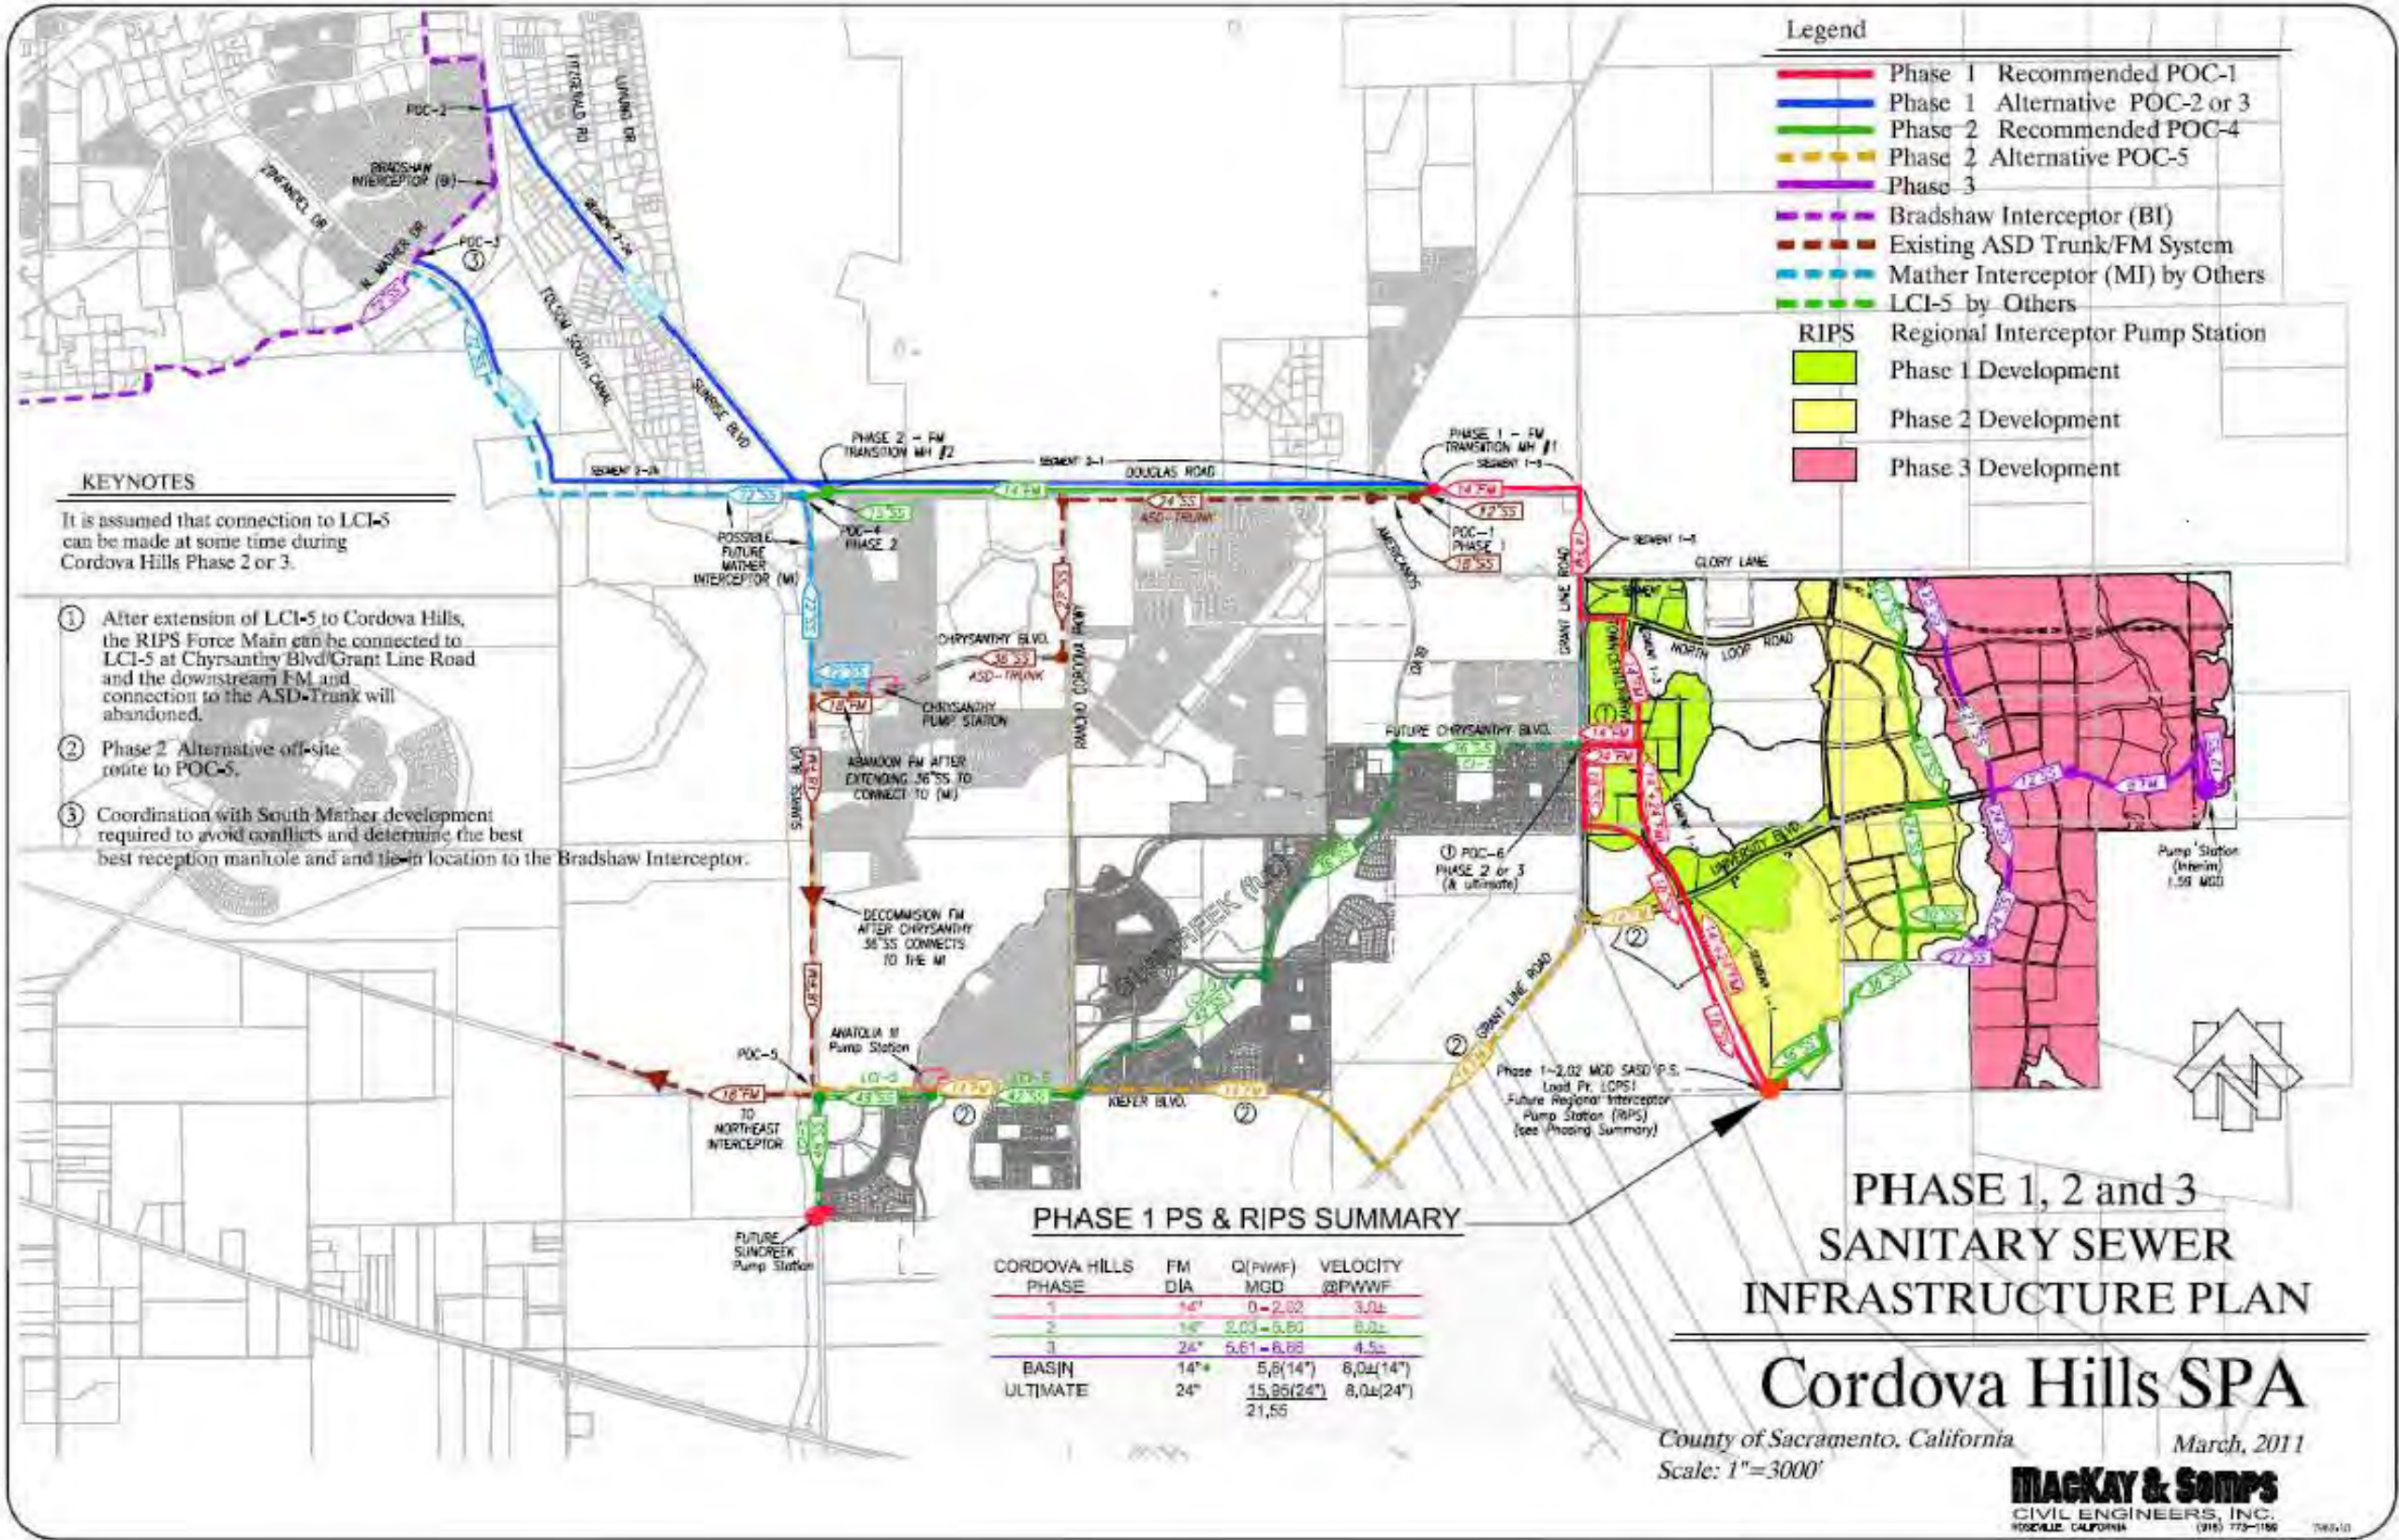

Plate PU-8: Sewer Infrastructure Plan

ENERGY SERVICES AND DRY UTILITIES

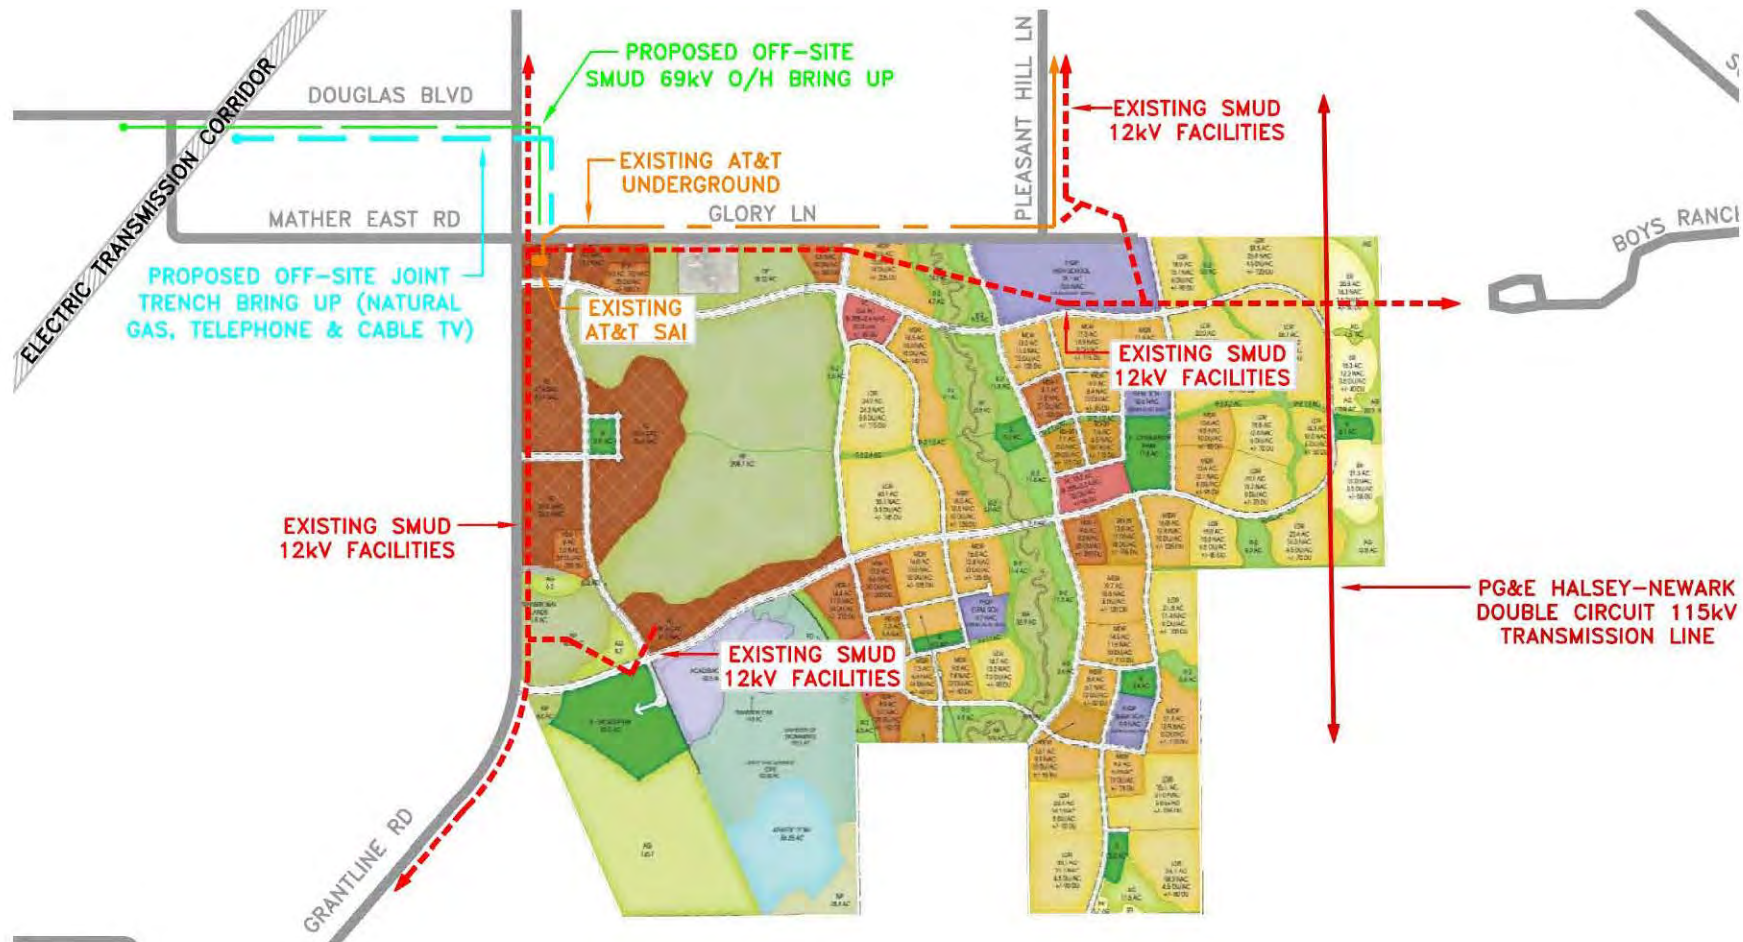

Sacramento Municipal Utility District (SMUD) and Pacific Gas & Electric Company (PG&E) will serve the electricity and natural gas needs of the Project. The natural gas and electric lines to the site will be within joint trenches along major roads. The joint trenches will be placed in franchise or public utility easements (PUEs) adjacent to the road right-of-ways. All the new distribution facilities will be underground, with the exception of transformers, switches, telephone cabinets, and other pedestals and pad-mounted equipment. With the exception of electrical lines and AT&T Cable lines, existing dry utility connections terminate approximately 0.8 miles west of Grant Line Road. Overhead electrical power line and underground television, phone, and gas lines from the existing point of connection on Douglas Road to the Project boundary and across the entire Project frontage will be required. This analysis focuses on electrical and natural gas infrastructure, as the other dry utilities are usually parallel to these facilities (either strung along the electrical poles or in a joint trench with gas lines). The following discussions are based on the Technical Dry Utilities Study dated April 2010; Appendix PU-6).

SACRAMENTO MUNICIPAL UTILITY DISTRICT

The locations of existing and proposed dry utilities are shown on Plate PU-9. There are existing 12 kilovolt (kV) overhead electrical distribution lines along Grant Line Road and internal to the Project site. In order to serve the electricity needs of the Project, SMUD will need to upgrade the existing distribution lines along Grant Line Road to 69 kV subtransmission lines with 12 kV underbuilt lines. SMUD will then continue this line past the Project frontage and loop back to the existing facilities near the intersection of Grant Line Road and the Kiefer Landfill to the south. In order to reduce the voltage from the 69 kV subtransmission lines to the 12 kV distribution lines, SMUD will need to construct three substations within the Project site.

The substations will be served from the 1.2 mile 69 kV line extended to the site south along Douglas Road and Grant Line Road. The 69 kV overhead line will continue south adjacent to the Project on Grant Line Road, with a single-circuit 69 kV line planned into the Project, then south into the substations, then west and back out to Grant Line Road, forming a loop. The line will continue south on Grant Line Road to a proposed 40 megavolt ampere (MVA) substation (2 – 20 MVA banks) near the intersection of Kiefer Boulevard and Grant Line Road. Each of the on-site substations will have two 25-MVA banks (50 MVA total) and 8 underground 12 kV mainline circuits. The substation sites will occupy from 0.5 acre to 0.75 acre sites. Transformers will be located in residential neighborhoods and at commercial sites to serve individual users. Though by preference the substations will be placed in areas of “open space”, for the purposes of this Project this would refer to R-2 areas, which are already considered impacted by development, not within Avoided Areas.

Plate PU-9: Existing and Proposed Dry Utilities

Though anticipated as aboveground lines to serve the initial Project phases, the subtransmission lines along Grant Line Road may be installed underground when Grant Line Road is widened. Existing overhead lines at Glory Lane will be converted to underground lines and routed underground through the new streets as the Project develops. All of the on-site electrical line construction would be within areas already assumed to be impacted by the overall Project; impacts are not utility-specific. Off-site impacts may occur, and have not already been studied as part of SMUD master planning proposals.

Active site disturbance will not be required along most of the off-site electrical line route, because no activity is necessary in between the utility poles. Construction activities will be focused at the location of the existing poles. Pole replacement generally uses the same hole or an adjacent location. To remove each existing pole, two holes no larger than 4 feet by 3 feet and 6 feet deep would be dug on opposite sides of the poles. Since this work will all take place along the roadway shoulder, there is little in the way of sensitive resources that could be affected. Nonetheless, there are dense wetlands all along the eastern side of Grant Line Road, and it is possible that some impacts will occur as part of line upgrades. A detailed analysis cannot be provided at this time, as construction-level designs have not been developed at this time. SMUD would act as lead agency on the utility upgrades, and would prepare an environmental analysis consistent with CEQA for the process. It should be assumed that off-site electrical line construction could result in some small amount of additional biological resources impacts, and would thus contribute to the *significant and unavoidable* impacts described in the Biological Resources chapter.

PACIFIC GAS AND ELECTRIC COMPANY

Pacific Gas & Electric Company (PG&E) will supply natural gas service to the Project in accordance with the rules and tariffs on file with the California Public Utilities Commission (CPUC). PG&E has no existing natural gas facilities adjacent to the site, but it maintains an 8-inch gas main (60 psig Maximum Operating Pressure) on Douglas Road approximately 0.8 miles west of Grant Line Road and has plans to install a 12-inch transmission pressure main extension (720 psig MOP) to the intersection of Douglas Road and Sunrise Boulevard.

Service will be extended to the Project area from the existing plastic 8" gas main (pressures range up to 60 psig) stubbed approximately 0.8 miles west of Grant Line Road on Douglas Road. The gas main will be fed from a proposed gas regulator station at Douglas Road and Sunrise Boulevard. The 8" plastic gas main will be extended east on Douglas Road then south on Grant Line Road to the Project in a joint trench. The gas main will be located within an existing right-of-way. If a second natural gas regulator station is required for the Project, it will be located at the intersection of Douglas Road and Grant Line Road and it will be fed from a distribution feeder main (DFM) extension from the regulator station planned at Sunrise and Douglas.

Eight-inch, six-inch, and four-inch plastic distribution mains will distribute natural gas throughout the Project area via the major internal roads. Distribution lines and services

will extend off the mains and will be sized based on anticipated gas loads to the various parcels. Residential neighborhoods will have two-inch plastic mains and one-inch services.

Impacts related to natural gas service are not expected to be significant, as trenched utility lines would be placed either within the paved margins of the roadway or directly adjacent to paved areas, where there are gravel shoulders and little to no biological or other resources; natural gas construction impacts are *less than significant*.

ENERGY EFFICIENCY

CEQA Guidelines Section 21100(b)(3)) indicates that an EIR should consider whether mitigation is needed due to “wasteful, inefficient, and unnecessary consumption of energy”. The Climate Change chapter describes the potential energy usage of the Project and compares this to a “business as usual” scenario. As described, the Project residential uses will consume approximately 19,500 MWh less electricity annually than a “business as usual” project, through exceedance of Title 24 standards, installation of Energy Star rated appliances, and the usage of renewable energy to supply 20% of residential energy. The Project will likewise result in more efficient usage of non-residential electricity, and of both residential and non-residential natural gas. The Project will not result in the wasteful, inefficient, and unnecessary consumption of energy, and impacts are *less than significant*.

MITIGATION MEASURES:

None required for onsite impacts; off-site impacts would be analyzed and appropriate mitigation would need to be provided by the lead agency (SMUD or PG&E) when the specific utility project is proposed. Sacramento County cannot impose mitigation requirements on SMUD or PG&E.

IMPACT: RESULT IN A PROJECT WATER DEMAND THAT CANNOT BE MET BY SUPPLY

The Project encompasses approximately 2,669 acres, which is largely within the Urban Services Boundary but also includes areas outside of the Urban Services Boundary. Initial technical studies determined that uses within the Cordova Hills “bufferlands” – the southwestern portion of the Project which is outside of the Urban Services Boundary – would need public water service as they are currently proposed, because groundwater supplies would not be sufficient and reliable for the uses. As a result, the Project includes a request to amend General Plan Policy LU-57 and add Policy LU-XX (which would be numbered upon approval) as follows:

“The County shall not provide urban services beyond the Urban Policy Area, except when the County determines the need for such services for health and safety purposes or where provision of such services is permitted pursuant to Policy LU-XX (below).”

“Limited public water service and facilities can be extended beyond the Urban Policy Area/Urban Services Boundary to serve the 251 acre area located in proximity to Kiefer Landfill, as shown in Exhibit “A”. Permitted uses within this area include agriculture, sports park, solar farm, district energy plant, corporation yard, park and ride lot, transit parking facility, fueling station, roads, storm water and storm water quality basins, community gardens, avoided areas, sewer pump station and lines, water tanks and similar utilities. Water facilities shall be sized adequately to only serve these permitted uses. Furthermore, proposed uses must be consistent with these permitted uses, act as a buffer between urban and open space uses, and help strengthen and preserve the current location of the Urban Services Boundary.”

If this policy is approved, SCWA would provide public water to serve the Cordova Hills uses in the area referenced. The Water Supply Assessment was prepared on this basis. The projected annual water demand for the entire Project is 6,549.9 acre feet per year (AFY), including system losses. The Project’s projected water demand by land use is detailed in Table PU-3. The Project’s water demand projection over the next 20 years in five-year increments is shown in Table PU-4.

The water demands associated with implementation of the Project were included in the *Cordova Hills Water Supply Master Plan Amendment* (WSMP Amendment, Appendix PU-2). An amendment is necessary because the water demand associated with the Project was not included and addressed in the Urban Water Management Plan (UWMP). The WSMP Amendment was prepared in order to add the water demand associated with the Project to the broader Zone 40 service area. The adjusted Zone 40 demands for normal, single-dry, and multiple-dry years in 5-year increments over a 20-year projection (2015 to 2035) are shown in Table PU-5.

SCWA has appropriate rights to the underlying groundwater in the Central Basin in the amount of 40,900 AFY and three sources of surface water totaling up to 61,251 AFY. The total maximum water supply to Zone 40 is 102,151 AFY. At build out the Project is expected to add 6,549.9 AFY to the overall Zone 40 water demand. This demand has been accounted for in the WSMP Amendment as shown in Table PU-5 above. The Project will add to the overall demand for water within the Zone 40 service area, but not beyond the service area’s projected supplies which were analyzed as part of the original Zone 40 Water Supply Master Plan. The Project will not contribute any previously-unanalyzed or undisclosed impacts to river flows, which is the issue at the heart of General Plan Policy CO-23. Zone 40 has sufficient supply to provide water service to the Project; therefore, impacts are *less than significant*.

MITIGATION MEASURES:

None required.

Table PU-3: Proposed Cordova Hills Land Use and Projected Water Demands

Land Use Category ¹	Proposed Water Demands ³		
	Maximum Residential Land Use Scenario (Acres)	Unit Demands ² (AFY/acre)	Annual Demands (AFY)
<i>Within USB</i>			
Estate Residential (ER)	64.7	1.33	86.1

Multiple Dry Year (3)	46,037	54,878	67,972	77,218	82,428

IMPACT: RESULT IN A PROJECT SEWER DISPOSAL DEMAND THAT CANNOT BE MET BY DISPOSAL OR CONVEYANCE CAPACITY

Flow estimates and ultimate buildout wastewater demands for conveyance facilities are calculated using ESDs, with one ESD representing the effluent generated by one single family residence. The ESD projections are based on gross acreage and used to determine the location and capacity of future wastewater conveyance facilities and trunk sheds. The Sewer Master Plan prepared for the Project (*Sewer Master Plan for Cordova Hills*, December, 2010, MacKay and Soms Civil Engineers, Inc) indicates that buildout of Phase 1 of the Project will result in 349.7 sewered acres resulting in 2,879 ESDs and an ADWF of 0.89 mgd, while ultimate buildout of the Project will result in 1,912.6 sewered acres resulting in 16,094 ESDs and an ADWF of 4.99 mgd. The peak wet weather flow for Project buildout is 10.41 mgd based on 16,094 ESDs.

The SRWTP has a permitted average dry weather flow (ADWF) design capacity of 181 mgd and wet weather flow (AWWF) of 392 mgd. The plant receives and treats approximately 141 mgd ADWF (Seyfried, 2008). The Project disposal demand can be met by this existing capacity. SASD and SRCSD have indicated that adequate interim capacity is available to serve development of Phase 1 of the Project, and that long-term options for providing service to Phase 2 and Phase 3 have been identified in master plans. SASD and SRCSD did not identify any facility constraints to service. Connection to the system is dependent on available capacity at the time of connection and is on a first come first served basis.

The Project will follow the SASD/SRCSD regional strategic plan to utilize, on an interim basis, available capacity in nearby trunk and interceptor sewers. Pipes are sized to accommodate dry weather base wastewater flow, rain-dependent inflow/infiltration, and gravity flow requirements. The SRCSD and SASD design criteria for pipe size is intended to guide design specifications for future construction. The size of the SRCSD interceptors is based on full buildout of the USB and is not related to any specific land use or designation. The actual size of the trunk lines is determined by the specific proposed land use.

Sacramento County Code regulates public sewage systems within the County. The Code includes requirements related to connection, design, and operation in order to ensure public safety and to lessen environmental impacts. Wastewater service for proposed development is subject to regulatory review and compliance with applicable wastewater Master Plans. The proposed extension of service is consistent with the SRCSD and SASD Master Plans, and thus conveyance facilities will be adequately sized for Project development. The Project will not exceed existing or planned disposal and conveyance capacity; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

IMPACT: RESULT IN AN ENERGY DEMAND THAT CANNOT BE MET BY ENERGY SERVICE PROVIDERS

Energy usage data for the Project, derived from the *Cordova Hills Greenhouse Gas Plan*, May 2011, indicates that the estimated annual residential and commercial electricity demand for the Project will be 122,903,000 kilowatt hours and that the estimated annual residential and commercial natural gas demand for the Project will be 4,201,494 therms². Peak electric demand at buildout is estimated at approximately 63.2 MVA (Table PU-6). The estimated peak natural gas demand at buildout is 582.6 thousand cubic feet per hour (MCFH), which equates to 4,755,560 therms (Table PU-6). The California Energy Commission's Energy Consumption Data Management System reports that 10,691.67 million kilowatt hours of energy and 315.57 million therms were consumed within Sacramento County in the year 2010. The estimated energy usage of the Project is substantially less than the annual energy production for either SMUD or PG&E. Energy service providers have sufficient capacity to serve the Project; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

Table PU-6: Estimated Electric Demand at Buildout (MVA)

Land Use	Residential	Commercial Mixed Use	Business Professional	Schools	University/ College Campus Center	Total Demand
Average Demand	20.3	2.9	0.7	0.5	5.5	29.9
Peak Demand	41.1	6.6	1.9	2.4	11.2	63.2

Table PU-7: Estimated Natural Gas Peak Demand at Buildout (MCFH)

Land Use	Residential	Commercial Mixed Use	Business Professional	Schools	University/ College Campus Center	Total Peak Demand
Peak Demand	400.0	51.9	15.9	21.3	93.5	582.6

² From Table 5a (77,955 megawatt hours), Table 9 (144 therms per capita by Project population of 25,419), Table 12 (44,948 megawatt hours), and Table 13 (401.03 therms per 1,000 square feet by Project total of 1,349,419 square feet).

IMPACT: EXCEED THE SUSTAINABLE YIELD OF THE SACRAMENTO NORTH AREA GROUNDWATER BASIN

The Project will not draw groundwater from the Sacramento North Area Groundwater Basin, and thus will not impact the basin; impacts are *less than significant*.

MITIGATION MEASURE

None required.

IMPACT: EXCEED THE SUSTAINABLE YIELD OF THE SACRAMENTO CENTRAL GROUNDWATER BASIN

The ultimate water demands associated with the Project will be met by a combination of groundwater and surface water provided by SCWA. According to SCWA the initial Project demands will be met with groundwater from the North Vineyard Well Field (NVWF) and possibly the Mather Housing wells located at Mather Field. Groundwater from the NVWF will be conveyed to the Anatolia Groundwater Water Treatment Plant (AGWTP) through the Anatolia Raw Water Pipeline.

SCWA currently exercises, and will continue to exercise, its rights as a groundwater appropriator to extract groundwater from the Central Groundwater Basin underlying Zone 40 for delivery to its customers. A long-term average annual yield of 40,900 AFY of groundwater has been identified in both the Water Forum Agreement (WFA) and WSMP for SCWA in the Central Basin. Additionally, as a signatory to the WFA and a member of the Sacramento Central Groundwater Authority (Groundwater Authority), SCWA recognizes the Water Forum-defined long-term sustainable average annual yield of the underlying groundwater basin of 273,000 AFY.

The additional groundwater draw caused from implementation of the proposed Project will not result in exceedance of the agreed-upon sustainable yield of 273,000 AFY. Impacts are *less than significant*.

MITIGATION MEASURE

None required.

IMPACT: ADVERSELY AFFECT GROUNDWATER RECHARGE

The majority of the County is considered a poor area for groundwater recharge due to clay or hardpan soils, which hinders infiltration. Areas of high groundwater recharge are typically found along stream channels, with the larger rivers (the American River, Sacramento River, and the Cosumnes River) containing the broadest recharge areas. There are some areas not associated with stream systems that also have good groundwater recharge capability, such as in some areas just south of the American River, where mining has been conducted. Areas of groundwater recharge capability have been mapped within Sacramento County, and given a rating of either high,

medium, or low based on the presence of porous soils that allow surface water to infiltrate to recharge the groundwater body. Development introduces impervious surfaces that prevent or hinder groundwater recharge. In areas of hardpan soils where infiltration is already very low, development has negligible effect on recharge. In areas of porous soils with good groundwater recharge potential, the placement of impervious surfaces can have measureable negative effects on that recharge ability.

The ability to replenish our groundwater supplies is very important to the availability of water, especially during dry years. Since the majority of the County has poor groundwater recharge capability due to clay or hardpan soils, it is imperative that the areas of high, medium, or even low groundwater recharge capabilities be maintained. Figure 4 of the Conservation Element of the General Plan shows that the main central waterway on the Project site has high groundwater recharge capability, and should be maintained. The Project already includes this area of high recharge within open space. Since this recharge area will not be covered with impervious surfaces and the Drainage Master Plan is designed to prevent substantial hydromodification, it is concluded that the Project will not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level; impacts are *less than significant*.

MITIGATION MEASURES:

None required.

16 TRAFFIC AND CIRCULATION

Mitigation Measures have been amended to reflect alternative mitigation proposed and found acceptable, and to reflect roadway improvements which were constructed in the interval between scoping of the traffic study roadway system and publication of this FEIR. All changes have been recommended or approved by the Sacramento County Department of Transportation (County DOT). Specifically:

TR-1.B has been deleted because a traffic signal at Douglas Road/Zinfandel Drive was constructed, and additional analysis shows that another signal consistent with TR-1.B is no longer needed. Refer to Appendices TR-1.A and TR-1.B.

TR-1.E has been amended to reflect language changes recommended by County DOT.

TR-1.F has been deleted because the improvement is in the process of being completed through a County DOT project.

TR-2.D has been modified to clarify the language to show all the lanes for the eastbound and westbound approaches, because that will make it easier for future staff to correctly verify the number of lanes required on the improvement plans.

TR-5.H has been deleted because this improvement was constructed.

TR-5.I has been modified to recognize that a portion of the specified improvement is already being constructed.

TR-5.I and TR-7 have been modified to recognize that a standard curb, gutter, and sidewalk cannot be installed at the ultimate location, because the facility will be four lanes at the time that the pedestrian facilities are needed, but will ultimately be six lanes. The measures now recognize that interim pedestrian improvements would be constructed.

INTRODUCTION

The chapter summarizes the key analysis points of the Cordova Hills Traffic Analysis Technical Report (October 2011) prepared by DKS Associates Transportation Solutions, hereinafter called the Traffic Study. The Traffic Study is included as Appendix TR-1.

TRANSPORTATION SETTING

Information on the existing transportation system was assembled from field observations, surveys (including traffic counts), previous environmental impact reports, and available information from the Sacramento County Department of Transportation (SacDOT), California Department of Transportation (Caltrans), the Sacramento Area Council of Governments (SACOG), and Regional Transit.

STUDY AREA

The study area was defined through cooperative work with SacDOT and Caltrans. The existing condition study area intersections and roadways are illustrated in Plate TC-1 and Plate TC-2. In the existing condition the study area includes 45 intersections, 54 roadway segments and portions of the US 50 freeway system between Howe Avenue and Hazel Avenue. By the cumulative condition the study area includes 66 intersections, 80 roadway segments, and portions of the US 50 freeway system between Howe Avenue and Scott Road. The roadways, transit systems, and pedestrian/bicycle networks within the study area are described in sections that follow.

TRANSPORTATION SOLUTIONS

FIGURE 6
EXISTING STUDY ROADWAY SEGMENTS

EXISTING ROADWAY SYSTEM

U.S. Highway 50 (US 50) is an east-west freeway that extends from the Interstate 80 (I-80) junction in West Sacramento to Canal Street in the City of Placerville, where it continues as a highway across the Sierra Nevada to South Lake Tahoe and Nevada. West of Sunrise Boulevard it is an eight-lane freeway. Between Sunrise Boulevard and Folsom Boulevard, it has six mixed flow lanes and two High Occupancy Vehicle (HOV) lanes (carpool lanes). Between Folsom Boulevard and El Dorado Hills Boulevard U.S. 50 has four mixed flow lanes and two HOV lanes. East of El Dorado Hills Boulevard, it has four mixed flow lanes.

Douglas Road is a two-lane, east-west road that extends from Mather Boulevard to Grant Line Road. It is generally a two-lane rural road with widening to five through-lanes in developed areas near Sunrise Boulevard.

Eagles Nest Road is a rural north-south road that extends from Douglas Road on Mather Field to Grant Line Road. Eagles Nest Road is closed to public traffic immediately north of Kiefer Boulevard.

Grant Line Road is a two-lane north-south rural roadway that forms the western Project boundary. It extends from White Rock Road to Highway 99 south of Elk Grove.

Jackson Road (State Route 16) is an east-west facility that extends from Folsom Boulevard to the west into Amador County to the east. It is a two-lane highway with additional turning lanes at some intersections.

Kiefer Boulevard is an east-west roadway that extends from Florin Perkins Road to the west to Jackson Road to the south. Kiefer Boulevard is not maintained and is not open to public traffic adjacent to Mather Airport, between Happy Lane and Eagles Nest Road. Portions of the roadway are also not maintained midway between Sunrise Boulevard and Grant Line Road.

Prairie City Road begins at White Rock Road and extends to the north across US 50 into the City of Folsom where it becomes Sibley Street. Prairie City Road is two lanes wide north of White Rock Road and its intersection with White Rock Road is controlled by stops signs on all three approaches.

Scott Road is a north-south facility that has two major segments called Scott Road (West) and Scott Road (East) in this traffic study. Scott Road (West) terminates at White Rock Road. To the south, it extends to Latrobe Road. Scott Road (West) is two lanes wide and is stop sign controlled at its intersection with White Rock Road. It is a rural road of limited width and substandard horizontal and vertical alignment. This road is also known as Old Scott Road. Scott Road (East) terminates at White Rock Road about one and a half miles east of Scott Road (West). To the north, the roadway continues across US 50, at an interchange, into the City of Folsom where it becomes East Bidwell Street. Scott Road (East) is two lanes wide north of White Rock Road. The roadway has an all way stop intersection at White Rock Road.

Sunrise Boulevard is a north-south roadway designated as a thoroughfare within the unincorporated County. It has six lanes between U.S. 50 and White Rock Road, four to six lanes between White Rock Road and Douglas Road, five lanes between Douglas Road and Kiefer Boulevard, and two lanes between Kiefer Boulevard and Grant Line Road.

White Rock Road is a two to six lane east-west roadway that provides access to the office parks/light industrial uses near Sunrise Boulevard. It begins at International Drive to the west and continues easterly into El Dorado County.

EXISTING TRANSIT SYSTEM

No transit service is currently provided in the Project area. Transit service is provided near the Project area by the Sacramento Regional Transit District (RT), Folsom Stage Line, and El Dorado County Transit. All of these transit services operate along routes located a considerable distance from the Project site.

EXISTING PEDESTRIAN AND BICYCLE FACILITIES

No pedestrian or bike facilities exist in the Project area. The nearest pedestrian and bicycle facilities are located in the City of Rancho Cordova to the west.

REGULATORY SETTING

STATE PLANS, POLICIES, REGULATIONS AND LAWS

The *Guide for the Preparation of Traffic Impact Studies* published by Caltrans (2002) identifies circumstances under which Caltrans believes that a traffic impact study would be required, information that Caltrans believes should be included in the study, analysis, scenarios, and guidance on acceptable analysis methodologies. The Traffic Impact Study prepared for the Project complies with Caltrans guidelines.

The standards for Caltrans' facilities in the study area are detailed in the U.S. 50 Corridor System Management Plan (CSMP). The 20-Year Concept Level of Service (LOS) for U.S. 50 in the study area is LOS F, because improvements necessary to improve the LOS to E are not feasible due to environmental, right-of-way, financial, and other constraints. For SR 16, the minimum acceptable operating condition is based on the local jurisdictional thresholds (i.e. City of Rancho Cordova or Sacramento County).

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS AND LAWS

METROPOLITAN TRANSPORTATION PLAN FOR 2035 (MTP)

The MTP 2035 is a long range planning document for identifying and programming roadway improvements throughout the Sacramento region, which was adopted in 2008.

The MTP has a history of being able to fund and deliver identified Tier 1 projects through State and local funding. The Sacramento Area Council of Governments periodically updates the MTP, and published an updated Draft MTP in November 2011. A review of this draft indicates that there are no changes to the list of funded facilities which would impact the traffic analysis for this Project.

SACRAMENTO COUNTY DEPARTMENT OF TRANSPORTATION

The Sacramento County Department of Transportation's (SacDOT) Traffic Impact Guidelines (July 2004) defines the methodologies to use in determining significant impacts, while the Sacramento County General Plan defines acceptable operating conditions. Sacramento County defines the minimum acceptable operation level for its roadways and intersections to be LOS D for rural areas and LOS E for urban areas. The urban areas are those areas within the Urban Service Boundary (USB) as shown in the Land Use Element of the County General Plan. The areas outside the USB are considered rural.

2030 SACRAMENTO COUNTY GENERAL PLAN

The Sacramento County General Plan Circulation Element focuses on providing roadways for growing automobile demands and alternative modes of transportation. This requires improving those alternatives through regional coordination, improved funding, better land use and design, and fair pricing. The overarching goals of the element seeks a balanced transportation system that moves people and goods in a safe and efficient way that minimizes environmental impacts, supports urban land uses, and serves rural needs. Supporting General Plan policies include conducting planning for roads, parking, clean alternative fuel and low emission vehicles, and other methods consistent with achieving air quality goals; conducting land use and transportation planning with a regional perspective; and mitigating new development traffic impacts.

Included within the Circulation Element is the Transportation Plan, which emphasizes four major themes: air quality, balance, transportation-land use coordination, and transportation funding. Air quality is an important aspect of this element because the major air quality problems in the County are related to automobile traffic. As a result, transportation planning in the County is to be conducted in a manner that promotes air quality. A balance of opportunities offers an efficient transportation system to citizens of the County by increasing the emphasis on transit, walking, and bicycling.

Goals and policies of the Sacramento County General Plan relating to traffic, circulation and transportation applicable to the Project are listed below:

- CI-1. Provide complete streets to provide safe and efficient access to a diversity of travel modes for all urban, suburban and rural land uses within Sacramento County except within certain established neighborhoods where particular amenities (such as sidewalks) are not desired. Within rural areas of the County, a complete street may be accommodated through roadway shoulders of sufficient width or other means to accommodate all modes of travel.

- CI-3. Travel modes shall be interconnected to form an integrated, coordinated and balanced multi-modal transportation system, planned and developed consistent with the land uses to be served.
- CI-4. Provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services.
- CI-5. Land use and transportation planning and development should be cohesive, mutually supportive, and complement the objective of reducing per capita vehicle miles travelled (VMT).
- CI-9. Plan and design the roadway system in a manner that meets Level of Service (LOS) D on rural roadways and LOS E on urban roadways, unless it is infeasible to implement project alternatives or mitigation measures that would achieve LOS D on rural roadways or LOS E on urban roadways. The urban areas are those areas within the Urban Service Boundary as shown in the Land Use Element of the Sacramento County General Plan. The areas outside the Urban Service Boundary are considered rural.
- CI-10. Land development projects shall be responsible to mitigate the project's adverse impacts to local and regional roadways.
- CI-12. To preserve public safety and local quality of life on collector and local roadways, land development projects shall incorporate appropriate treatments of the Neighborhood Traffic Management Program.
- CI-16. The County supports creating communities that promote access and mobility for all modes of travel through the development of roadway networks based on a grid or modified grid layout.
- CI-27. Public Facilities Financing Plans shall incorporate capital costs for transit. Infrastructure Master Plans shall include transit planning.
- CI-29. The County shall work with transit service providers to establish and implement development guidelines to maximize the ability of new development and redevelopment to support planned transit services. New development and redevelopment shall have an orientation to travel patterns that are conducive to transit service. This will include concentration of development in centers and along linear corridors such that trip origins and destinations are concentrated near transit services.
- CI-35. The applicant/developer of land development projects shall be responsible to install bicycle and pedestrian facilities in accordance with Sacramento County Improvement Standards and may be responsible to participate in the fair share funding of regional multi-use trails identified in the Sacramento County Bicycle Master Plan.

- CI-37. Pursue all available sources of funding for the development, improvement, and maintenance of bikeways, pedestrian facilities and multi-use trails, and to support bicycle and pedestrian safety, education, encouragement and enforcement programs.
- LU-37. Provide and support development of pedestrian and bicycle connections between transit stations and nearby residential, commercial, employment or civic uses by eliminating physical barriers and providing linking facilities, such as pedestrian overcrossings, trails, wide sidewalks and safe street crossings.
- LU-39. Support implementation of the ADA Transitional Plan and the Pedestrian Master Plan to create a network of safe, accessible and appealing pedestrian facilities and environments.
- LU-40. Employ appropriate traffic calming measures in areas where pedestrian travel is desirable but made unsafe by a high volume or excessive speed of automobile traffic. Preference shall be given to measures that slow traffic and improve pedestrian safety while creating the least amount of conflict with emergency responders.
- LU-42. Master planning efforts for new growth areas shall provide for separated sidewalks along all arterials and thoroughfares to make walking a safer and more attractive transportation option.

CITY OF RANCHO CORDOVA GENERAL PLAN

Goals and policies of the City of Rancho Cordova General Plan relating to traffic and transportation found applicable to the Project are listed below:

- C.1.2 Seek to maintain operations on all roadways and intersections at Level of Service D or better at all times, including peak travel times, unless maintaining this Level of Service would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. Congestion in excess of Level of Service D may be accepted in these cases, provided that provisions are made to improve traffic flow and/or promote non-vehicular transportation as part of a development project or a City-initiated project.
- C.1.11 As part of major individual roadway enhancement project (e.g., intersection redesign, signalization of previously un-signalized intersection), enhance and upgrade pedestrian and bicycle facilities within one-quarter mile of the project.
- C.2.6 Provide on-street bike lanes along all connector roadways and on local and major roadways when necessary to provide for interconnected routes. On-street bike routes maybe provided on local, connector, and major roadways as deemed necessary by the City.

Because the City of Rancho Cordova formally adopted the County's traffic-impact study guidelines upon incorporation, plans and policies from the County Guidelines were used in this analysis, except where the Circulation Element/Plan of the City of Rancho Cordova General Plan supersedes County thresholds and requirements. The City of Rancho Cordova has adopted a Level of Service D policy.

CITY OF FOLSOM GENERAL PLAN

Goals and policies of the City General Plan relating to traffic and transportation applicable to the Project are listed below:

Goal 17 To develop a comprehensive transportation / circulation system which includes as a minimum:

1. Freeways, highways, and/or expressways designed to route through-traffic away from Folsom's neighborhoods.
2. Arterial roads which provide access among Folsom's neighborhoods, major cross-town links, and links between Folsom and adjacent communities.
3. Additional crossing(s) over the American River.
4. Pathways and designated route for bicycle and pedestrian traffic.
5. Designated routes for commercial vehicles.
6. The protection of residential neighborhoods from through-traffic.
7. Public transportation routes.

Policy 17.1 The City shall plan for an integrated circulation system which provides for travel by private vehicles, commercial vehicle routes, a public transportation system, and for pedestrian and bicycle routes.

Policy 17.2 The City should establish a hierarchy of roads consisting of the following:

1. Freeways or limited access highways. Such roads shall be grade separated at each intersection with another road. The major purpose of such roads is to route traffic around Folsom, with as few interruptions to the surface street system as possible. U.S. Highway 50 currently meets the definition of a freeway. The City has made a firm commitment that a new freeway would not bisect the city.
2. Expressways. Allow for moderate- to high-speed travel within the City. The purpose of an expressway is to carry cross-town traffic from other communities or between neighborhoods within the City. An expressway may contain some grade-separated intersections, but this type of road would be mainly a surface street. Expressways

should be located to allow for controlled intersections spaced at one-half mile intervals or more. Only arterial and collector roads should intersect with an expressway.

3. Arterial roads (or major streets). Serve to connect neighborhoods within the City and the City with surrounding communities. Arterials would normally define the boundaries of neighborhoods, not provide internal access to a neighborhood.
4. Collector (or secondary) roads. Serve to route traffic from local streets within a neighborhood to an arterial road. Collector streets would not normally serve as “through” roads for more than one area, but would circulate throughout a neighborhood.
5. Local (or tertiary) roads. Serve a portion of a neighborhood only and route traffic to a collector street.
6. Street-ends (cul-de-sacs, dead end streets, etc.). Limited in length and serve only a few residences.

Policy 17.3 Arterial roads serving new developments shall be aligned with arterial roads whenever possible.

Policy 17.9 The City should plan for the expansion of future public transit routes (bus and fixed rail service).

1. Transit routes should coincide with major destinations for employment and shopping, the location of major institutions, concentrations of multifamily housing, and other land uses likely to attract public transit ridership.
2. The City should preserve existing railroad rights-of-way for their potential future use as public transit routes.
3. Bus routes should follow major roads with service to residential neighborhoods via collector streets.

Policy 17.10 The City should develop and maintain a bikeway and pedestrian master plan that links residential developments with sources of employment, public open space, parks, schools, neighborhood shopping areas, the central commercial district, other major recreational destinations, and adjoining communities.

1. The City should ensure that new residential developments incorporate pedestrian and bicycle paths or routes when there are nearby schools, parks, public open spaces, sources of employment or other destinations for such travel. Such paths or routes should be designed so that schools and parks accessible to area

residents. Pedestrian / bicycle over- and under-crossings may be provided when necessary to cross arterial roads or expressways.

2. The City should establish and maintain an internal pathway system that links parks sources of employment and public open spaces using right-of-way and parkways.
3. Where on-street bikeways are not feasible, the City should provide for Class I off-street bikeways.
4. The City should endeavor to provide routes for recreational travel, providing access to important recreational areas of the City, including Folsom Lake.

Policy 17.16 The City shall designate locations for park and ride lots and adopt standards for their development. Several such lots are designated on the Plan Map and dedication of land for each site shall be required as part of the approval process for developing of adjoining parcels.

Policy 17.17 The City should strive to achieve at least a traffic Level of Service “C” throughout the City. During the course of the Plan buildout it may occur that temporary higher Level of Service results where roadway improvements have not been adequately phased as development proceeds. However, this situation will be minimized based on annual traffic studies as approved by the City of Folsom and Monitoring programs. Resolution No. 3798.

Policy 17.18 The City will work with the California Department of Transportation in planning for and funding freeway interchange improvements and additional interchanges along U.S. Highway 50. A specific study should be prepared by the City to determine the required phasing of construction of freeway and interchange improvements based upon buildout of land uses designated on the Plan Map.

Policy 17.19 Because the Traffic Studies upon which this Circulation Element are based shows various intersections which will not achieve Level of Service “C”, the City should adopt a mandatory TSM program that applies to existing as well as future development and will ensure the assumed reduction in peak hour trips. Prior to adoption of the Program by the City, all discretionary development permits issued by the City should require the applicants to participate in the TSM program when enacted. Specific Studies should be conducted to determine the most desirable methods for achieving the required level of trip reduction.

Policy 17.22 The City shall require at a minimum two lane arterial roads be installed adjacent to or in the vicinity of new subdivision.

CITY OF ELK GROVE GENERAL PLAN

Goals and policies of the City of Elk Grove General Plan relating to traffic and transportation found applicable to the Project are listed below:

CI-10 The City shall implement the roadway master plan shown in Figure CI-2 of the General Plan. The following policies apply to selected roadways: The City shall use the latest version of Caltrans' Transportation Concept Report for I-5 and Hwy 99 to determine the planned width of these freeways. Expanded right-of-way indicates roadways on which sufficient width is provided for a middle two-way turn lane and/or expanded turn pockets at roadway intersections. The City will widen Grant Line Road north of Bradshaw Road only as needed to accommodate traffic, and strongly supports efforts to locate a future regional connector to provide traffic relief for this roadway. Grant Line Road north of Bradshaw Road should be widened in phases as needed, and should be widened to six lanes only if no alternative route for a future regional connector (see Policy CI-12) has been located and traffic conditions warrant the widening.

CI-10-Action 1: Require the dedication of right of way and the installation of roadway improvements as part of the review and approval of development projects. The City shall require the dedication of major road rights of way (generally, arterials and thoroughfares) at the earliest opportunity in the development process in order to implement this policy.

CI-11 The City shall assist Caltrans in implementing improvements to I-5 and Hwy 99 within the city.

CI-11-Action 1: Require the reservation of right of way for projects adjacent to I-5 and Hwy 99 sufficient to accommodate the freeway facilities outlined in the most recent Caltrans Transportation Concept Report.

CI-11 Action 2: A new Whitelock Parkway interchange, as shown on Figure CI-2 of the General Plan, may be considered by the City Council in the future. Any interchange in this general location shall be designed to minimize impacts to the Elk Grove Regional Park as well as other assets to the fullest extent possible. Consultation with Caltrans, the Cosumnes Community Services District, and other stakeholder groups shall be conducted prior to approval of any interchange design.

CI-12 The City supports efforts to locate an alternative route for a future regional roadway connecting Hwy 99 and Hwy 50 in order to reduce the need for widening of Grant Line Road, particularly in the Sheldon town area.

CI-12-Action 1: Participate in regional efforts to locate and implement an alternative route for a future Hwy 99-Hwy 50 connector.

- CI-13 The City shall require that all roadways and intersections in Elk Grove operate at a minimum Level of Service D at all times.
- CI-14 The City recognizes that Level of Service D may not be achieved on some roadway segments, and may also not be achieved at some intersections. Roadways on which LOS D is projected to be exceeded are shown in the General Plan Background Report, based on the latest traffic modeling conducted by the City. On these roadways, the City shall ensure that improvements to construct the ultimate roadway system as shown in this Circulation Element are completed, with the recognition that maintenance of the desired level of service may not be achievable.
- CI-14-Action 1: The City shall develop criteria to determine which roadway segments and intersections will not achieve the desired level of service standard.
- CI-15 Development projects shall be required to provide funding or to construct roadway/intersection improvements to implement the City's Circulation Master Plan. The payment of established traffic impact or similar fees shall be considered to provide compliance with the requirements of this policy with regard to those facilities included in the fee program, provided that the City finds that the fee adequately funds all required roadway and intersection improvements. If payment of established fees is used to provide compliance with this policy, the City may also require the payment of additional fees if necessary to cover the fair share cost of facilities not included in the fee program.
- CI-15-Action 1: Update the City's traffic analysis guidelines to implement the policies of this General Plan. Items to be addresses should include: Guidelines for determining when traffic analysis is required, Guidelines for the preparation of traffic analysis, Significance criteria for use in CEQA analysis of proposed projects. The guidelines and significance criteria referenced above shall be reviewed by the Elk Grove Planning Commission within six months of adoption of this General Plan.
- CI-16 Where a development project is required to perform new roadway construction or road widening, the entire roadway shall be completed to its planned width from curb to-curb prior to the operation of the project for which the improvements were constructed, unless otherwise approved by the City Engineer. Such roadway construction shall also provide facilities adequate to ensure pedestrian safety as determined by the City Engineer.
- CI-17 The City shall regulate truck travel as appropriate for the transport of goods, consistent with circulation, air quality, congestion management, and land use goals.

- CI-17-Action 1: The City shall on an as needed basis review existing truck routes within Elk Grove and designate routes consistent with the need to reduce traffic, noise and other impacts, and negative effects on residential areas.
- CI-18 To the extent possible, major traffic routes for residential areas should be separate from those used by the city's industrial areas, with the purpose of avoiding traffic conflicts and potential safety problems.
- CI-19 The circulation system serving the city's industrial areas should be designed to safely accommodate heavy truck traffic.
- CI-20 The City shall discourage the creation of private roadways unless the roadways are: 1) Constructed to public roadway standards, or 2) Are used in an affordable residential development.
- CI-21 The City shall require the installation of traffic pre-emption devices for emergency vehicles (police and fire) at all newly constructed intersections, and shall seek to retrofit all existing intersections to incorporate these features.
- CI-22 Where traffic calming devices or techniques are employed, the City shall coordinate design and implementation with the Elk Grove Police Department and the Elk Grove CSD to ensure adequate access for police and fire vehicles.
- CI-23 All public streets should have sufficient width to provide for parking on both sides of the street and enough remaining pavement width to provide for fire emergency vehicle access.

The City of Elk Grove has adopted a Level of Service D policy.

METHODOLOGY

LEVEL OF SERVICE METHODOLOGY

Determination of roadway operating conditions is based upon comparison of traffic volumes to roadway capacity. "Levels of service" describe roadway operating conditions. Level of service is a qualitative measure of the effect of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs. Levels of service are designated "A" through "F" from best to worst, which cover the entire range of traffic operations that might occur. Levels of Service (LOS) "A" through "E" generally represent traffic volumes at less than roadway capacity, while LOS "F" represents over capacity and/or forced conditions. Table TC-1 presents the Level of Service definitions.

Table TC-1: Level of Service (LOS) Definitions

LOS A	LOS A describes primarily free-flow operations at average travel speeds, usually 90 percent of the free-flow speed for the given street class. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal.
LOS B	LOS B describes reasonably free-flow operations at average travel speeds, usually 70 percent of the free-flow speed for the given street class. The ability to maneuver within the traffic stream is only slightly restricted and control delay at signalized intersections are not significant.
LOS C	LOS C describes stable operations; however, ability to maneuver and change lanes in midblock locations may be more restricted than at LOS B and longer queues, adverse signal coordination, or both may contribute to lower average travel speeds of about 50 percent of the free-flow speed for the street class.
LOS D	LOS D borders on a range in which small increases in flow may cause substantial increases in delay and decreases in travel speed. LOS D may be due to adverse signal progression, inappropriate signal timing, high volumes, or a combination of these factors. Average travel speeds are about 40 percent of the free-flow speed.
LOS E	LOS E is characterized by significant delays and average travel speeds of 33 percent or less of the free-flow speed. Such operations are caused by a combination of adverse progression, high signal delay, high volumes, extensive delays at critical intersections and inappropriate signal timing.
LOS F	LOS F is characterized by urban street flow at extremely low speeds, typically one-third to one-fourth of the free-flow speed. Intersection congestion is likely at critical signalized locations, with high delays, high volumes and extensive queuing.

Source: *Highway Capacity Manual*, Transportation Research Board, Special Report No. 209, Washington, D.C., 2000.

Sacramento County utilizes a LOS “E” standard for urban areas, and a LOS “D” standard for rural areas. The cities of Elk Grove and Rancho Cordova utilize a LOS “D” standard for their roadways. The city of Folsom utilizes a LOS “C” standard for their intersections. In Sacramento County, Caltrans has a route concept LOS “F” for US 50. In this report, we use a LOS “E” standard for all Caltrans facilities along US 50 to be conservative. For SR 16, we used LOS “D” standard for segments within City of Rancho Cordova and LOS “E” standard for segments within Sacramento County.

In this traffic assessment, capacity analyses were conducted for intersections and roadway segments in accordance with Sacramento County, City of Rancho Cordova, City of Folsom, City of Elk Grove, and Caltrans practice. The following summarizes the analysis types:

- Intersection-based capacity analyses are conducted utilizing a.m. and p.m. peak commuter hour traffic volumes. These analyses evaluate the ability of intersections to accommodate traffic volumes during peak travel periods.
- Roadway segment-based capacity analyses are conducted utilizing daily traffic volumes for Sacramento County and the cities of Elk Grove and Rancho Cordova. These analyses evaluate the adequacy of the number of roadway lanes between major intersections.
- Freeway segment-based capacity analyses are conducted utilizing a.m. and p.m. peak hour volumes for Caltrans facilities. These analyses evaluate the adequacy of the number of freeway lanes between interchanges.
- Freeway merge, diverge, and weave analyses are conducted utilizing a.m. and p.m. peak hour volumes for Caltrans facilities. These analyses evaluate the adequacy of the freeway system to accommodate entering and exiting traffic volumes.

INTERSECTION ANALYSIS

For intersection-based capacity analyses, different analysis methodologies are utilized depending upon whether an intersection is controlled by a traffic signal, two-way stop sign control, or all-way stop sign control.

UNSIGNALIZED INTERSECTIONS

For unsignalized intersections, LOS is based upon average control delay calculated, based upon *Highway Capacity Manual, 2000* methods. For two-way stop locations, delay is calculated for each lane group, and the worst delay/ level of service is reported. For all-way stop locations, average delay for all movements is reported. Table TC-2 presents the LOS definitions for unsignalized intersections, both two-way and all-way stop control.

The Project and alternatives include roundabouts within the Project site. These intersections were evaluated in accordance with techniques described in the Federal Highway Administration publication "Roundabouts: An Informational Guide," publication number FHWA-RD-00-067. Level of service at roundabouts is based upon delay in accordance with the criteria shown in Table TC-2 for other unsignalized intersections.

SIGNALIZED INTERSECTIONS

For signalized intersections, different methodologies are used depending on jurisdiction. Sacramento County and the City of Rancho Cordova use an updated version of the *Circular 212 (Interim Materials on Highway Capacity)* methodology. The level of service definitions based on the Circular 212 methodology are shown in Table TC-3. For the City of Elk Grove, City of Folsom, and Caltrans, the *Highway Capacity Manual, 2000* methodology is used. The level of service definitions based upon this methodology are shown in Table TC-4. For signalized intersections, level of service reflects average intersection conditions. Some movements may experience better or worse levels of service.

Table TC-2: Level of Service Criteria for Unsignalized Intersections

Level of Service (LOS)	Description	Total Delay per Vehicle (seconds)
A	Little or no delay	≤ 10
B	Short traffic delays	> 10 and ≤ 15
C	Average traffic delays	> 15 and ≤ 25
D	Long traffic delays	> 25 and ≤ 35
E	Very long traffic delays	> 35 and ≤ 50
F	Stop-and-go conditions	> 50

Source: Highway Capacity Manual, Transportation Research Board, Washington, D.C., 2000

Table TC-3: LOS for Signalized Intersections – Circular 212 Method

LOS	Sum of Critical Lane Volumes by Signal Phasing (Vehicles/critical lane/hour)		
	2-Phase	3-Phase	4 or more Phases
A	0 – 990	0 – 930	0 – 990
B	991 – 1,155	931 – 1,085	901 – 1,050
C	1,156 – 1,320	1,086 – 1,240	1,051 – 1,200
D	1,321 – 1,485	1,241 – 1,395	1,201 – 1,350
E	1,486 – 1,650	1,396 – 1,550	1,351 – 1,500
F	$> 1,650$	$> 1,550$	$> 1,500$

Source: Interim Materials on Highway Capacity (Circular 212, Transportation Research Board, 1980); and Traffic Impact Guidelines, County of Sacramento, Public Works Agency, 2004

Table TC-4: LOS for Signalized Intersections – Highway Capacity Manual Method

LOS	Description	Total Delay per Vehicle (seconds)
A	Uncongested operations; all queues clear in a single cycle	≤ 10
B	Very light congestion; an occasional phase is fully utilized	> 10 and ≤ 20
C	Light congestion; occasional queues on approaches	> 20 and ≤ 35
D	Significant congestion on critical approaches, but intersection is functional. Cars required to wait through more than one cycle during short peaks. No long-standing queues formed.	> 35 and ≤ 55
E	Severe congestion with some long-standing queues on critical approaches. Traffic queue may block nearby intersection(s) upstream of critical approach(es).	> 55 and ≤ 80
F	Total breakdown, stop-and-go conditions.	> 80

ROADWAY SEGMENT ANALYSIS

Level of service analyses were conducted for Sacramento County, City of Elk Grove, and City of Rancho Cordova roadway segments in the study area based upon daily traffic volumes, number of traffic lanes between intersections, and roadway characteristics (the City of Folsom does not have a roadway segment LOS criteria). These analyses were conducted utilizing the methodology employed in the analysis of the Sacramento County General Plan. In this methodology, the major roadway network is divided into “capacity class” categories for level of service determination, as shown in Table TC-5.

The capacity class categories are based upon the nature of traffic flow along the facility, including number of interruptions due to intersection control and “side-friction” due to driveways and local streets. For each capacity class shown in Table TC-5, relationships were developed between daily traffic volumes and roadway level of service. Table TC-6 summarizes the maximum daily traffic volumes for each capacity class/level of service combination. The segment-based level of service represents peak hour conditions, although it is calculated based upon daily traffic volumes and capacity estimates.

FREEWAY SEGMENT ANALYSIS

Level of service analyses were conducted for freeway segments in the study area based upon peak hour traffic volumes, and number of both mixed flow and full auxiliary lanes. The methodology is outlined in the Transportation Research Board’s Special Report 209, *Highway Capacity Manual*, 2000. Table TC-7 presents the level of service criteria for the freeway mainline.

FREEWAY RAMP MERGE/DIVERGE ANALYSIS

Freeway ramp junctions (merge/diverge) analyses were conducted at study area interchanges using the 2000 Highway Capacity Manual methodology. This methodology correlates the LOS to the expected density of vehicles in passenger cars per mile per lane. Table TC-8 summarizes the relationship between density and LOS for freeway ramp junctions and weaving areas.

Table TC-5: Roadway Capacity Class

Capacity Class	General Criteria			
	Stops per Mile	Driveways	Speed Range	Lanes
Urban Roadways				
Arterial – High Access Control	1 – 2	None	45 – 55	4 +
Arterial – Moderate Access Control	2 – 4	Limited	35 – 45	2 +
Arterial – Low Access Control	4 +	High	25 – 35	2 +
Rural Roadways				
Two-lane Highway	< 0.5	Limited	45 – 55	2

SIGNAL WARRANTS

At each unsignalized intersection, the potential need for a traffic signal was evaluated. Traffic signal warrants are a series of standards that provide guidelines for determining if a traffic signal is appropriate. If one or more of the signal warrants are met, signalization of the intersection may be appropriate. However, a signal likely should not be installed if none or few of the warrants are met since the installation of signals may increase delays on the previously uncontrolled major street and may contribute to an increase in accidents. The California Manual on Uniform Traffic Control Devices (CMUTCD) presents various warrant analyses to assist in evaluating the need for traffic signals at an intersection. The peak hour delay and/or the peak hour volume warrant were utilized to evaluate the possibility that traffic signals may be warranted at study intersections in this report.

SIGNIFICANCE CRITERIA

ROADWAYS AND INTERSECTIONS

This analysis was conducted using a combination of policies and guidelines based on whether the impacted facility is a state, county, or city facility. Each roadway facility was analyzed in accordance with the policies and guidelines of its jurisdiction. Sacramento County identifies LOS "E" as the minimum acceptable standard for intersection and roadway operations within the Urban Service Boundary, and LOS "D" outside. The Cities of Elk Grove and Rancho Cordova identify LOS "D" as its minimum standard for intersection and roadway operations. The City of Folsom identifies LOS "C" as its minimum standard for intersection operations. For state-controlled facilities, thresholds presented in the State's Corridor System Management Plan or Route Concept Report were applied. (The concept service level for U.S. 50 is LOS "F." For this study, LOS "E" is applied to U.S. 50 as a conservative approach for identifying impacts). For SR 16, we used LOS "D" standard for segments within City of Rancho Cordova and LOS "E" standard for segments within Sacramento County.

Table TC-9 presents the roadway standards of significance for each facility type in each jurisdiction. For each facility type in each jurisdiction, an impact is deemed significant if:

1. The facility is operating at an acceptable level of service (better than or equal to the standard) without the Project, and the addition of traffic associated with the Project degrades the level of service to worse than the standard.
2. The facility is operating at an unacceptable level of service (worse than the standard) without the Project, and the addition of traffic associated with the Project causes operations to exceed the stated impact threshold.

Table TC-9: Roadway Thresholds of Significance

Jurisdiction	LOS Standard	Facility Type	Impact Threshold if Already Deficient
Unincorporated Sacramento County	E or better inside Urban Service Boundary, D or better outside Urban Service Boundary	Unsignalized Intersection	Delay increase > 5 seconds (also must meet signal warrant)
		Signalized Intersection	v/c ratio increase > 0.05
		Segment	
City of Rancho Cordova	D or better	Unsignalized Intersection	Delay increase > 5 seconds (also must meet signal warrant)
		Signalized Intersection	v/c ratio increase > 0.05
		Segment	
City of Elk Grove	D or better	Signalized and Unsignalized Intersections	Delay increase \geq 5 seconds
		Segment	v/c ratio increase > 0.05
City of Folsom	C or better	Intersections	Delay increase \geq 5 seconds
Caltrans	E or better	Ramps and Freeways	Any volume increase
<p>Sources:</p> <p><i>Traffic Impact Guidelines</i>, County of Sacramento, Public Works Agency, Transportation Division, July 2004</p> <p><i>City of Rancho Cordova General Plan EIR</i>, 2006.</p> <p><i>City of Elk Grove General Plan</i>, 2009.</p> <p><i>US 50 Corridor Systems Management Plan</i>, Caltrans, 2009.</p>			

BICYCLE AND PEDESTRIAN FACILITIES

Bicycle facilities include Class I (off-street facilities), Class II (on-street bicycle lanes identified with signage and markings), and Class III (on-street bicycle routes identified by signage). Pedestrian facilities are composed of paths, sidewalks, and pedestrian crossings. A bicycle or pedestrian impact is considered significant if the proposed Project would:

- Eliminate or adversely affect an existing bikeway or pedestrian facility in a way that would discourage its use;
- Interfere with the implementation of a planned bikeway as shown in the Bicycle Master Plan, or be in conflict with the Pedestrian Master Plan; or
- Result in unsafe conditions for bicyclists or pedestrians, including unsafe bicycle/ pedestrian, bicycle/ motor vehicle or pedestrian / motor vehicle conflict.

TRANSIT FACILITIES

Transit facilities include shuttle services, bus service, bus rapid transit (BRT), and light-rail facilities. A project is considered to have a significant impact on the public transit system if the project would generate ridership which, when added to existing or future ridership, exceeds available or planned system capacity. An impact may also be significant if a project would conflict with or obstruct implementation of a transit plan.

EXISTING CONDITIONS

Existing a.m. and p.m. peak hour traffic volumes and lane geometry at the study area intersections are illustrated in Figure 7 of Appendix TR-1. Existing count data was obtained between 2007 and 2010. Intersection peak hour turning movement counts were collected by the Walltown Quarry Traffic Study (2008 and 2009), Mather Airport Traffic Study (2008), Folsom South of US 50 Annexation Environmental Impact Report (2007), Teichert Quarry Traffic Study (2006 and 2007), and this Project (2010). Peak hour freeway directional volumes were from the Caltrans Performance Measurement System (2008 and 2009). Daily Roadway Segment Volumes were collected by Sacramento County Department of Transportation (2007 – 2009), Caltrans (2008), Walltown Quarry Traffic Study (2008 and 2009), and this Project (2010).

Table TC-10 summarizes a.m. and p.m. peak hour operating conditions and peak-hour traffic signal warrants at the study area intersections. Table TC-11 summarizes roadway segment operating conditions based upon daily traffic volumes. Table TC-12 and Table TC-13 report freeway conditions.

INTERSECTION ANALYSIS

SACRAMENTO COUNTY

During the a.m. and p.m. peak hours, all of the Sacramento County intersections meet the LOS E standard within the Urban Service Boundary and the LOS D standard outside the boundary with the exception of the following intersections:

- *Grant Line Road and White Rock Road* – LOS F in p.m. peak hour
- *Prairie City Road and White Rock Road* – LOS E in a.m. peak hour and LOS F in p.m. peak hour

CITY OF ELK GROVE

During the a.m. and p.m. peak hours, the intersection of Grant Line Road and Calvine Road operates acceptably at the LOS D standard.

CITY OF RANCHO CORDOVA

During the a.m. and p.m. peak hours, all of the City of Rancho Cordova intersections meet the LOS D standard with the exception of the following intersections:

- *Zinfandel Drive and White Rock Road* – LOS E in p.m. peak hour
- *Sunrise Boulevard and Jackson Road* – LOS E in a.m. peak hour
- *Grant Line Road and Jackson Road* – LOS F in a.m. and p.m. peak hours

CALTRANS STATE HIGHWAY

During the a.m. and p.m. peak hours, all of the Caltrans State Highway intersections meet the Level of Service (LOS) E standard with the exception of the Zinfandel Drive and US 50 Eastbound Ramps, which is LOS F in the p.m. peak hour.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY

All of the Sacramento County roadway segments meet the LOS E standard within the Urban Service Boundary and the LOS D standard outside the boundary.

CITY OF ELK GROVE

The segment of Grant Line Road between Excelsior Road and Calvine Road operates at LOS E, exceeding the City of Elk Grove's LOS D standard.

CITY OF RANCHO CORDOVA

All of the City of Rancho Cordova roadway segments meet the LOS D standard with the following exceptions:

- *Sunrise Boulevard* – US 50 to Folsom Boulevard – LOS F

- *Sunrise Boulevard* – Folsom Boulevard to White Rock Road – LOS E

CALTRANS FREEWAYS

MAINLINE

Level of service analyses were also conducted for the study area freeway segments. Table 13 summarizes the freeway levels of service. All of the Caltrans freeway segments meet the LOS E standard with the following exceptions:

- *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – LOS F in a.m. peak hour
- *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – LOS F in p.m. peak hour

RAMP JUNCTIONS

Level of service analyses were also conducted for the study area freeway merge/diverge areas. Table 14 summarizes the freeway levels of service. All of the Caltrans freeway ramp junctions meet the LOS E standard.

BICYCLE AND PEDESTRIAN FACILITIES

The following two-lane roadway segments near the Project site are deficient for bicycles and pedestrians because there are no sidewalks or bike lanes:

- *Grant Line Road from Douglas Road to White Rock Road*
- *Douglas Road from Rancho Cordova Parkway to Grant Line Road*

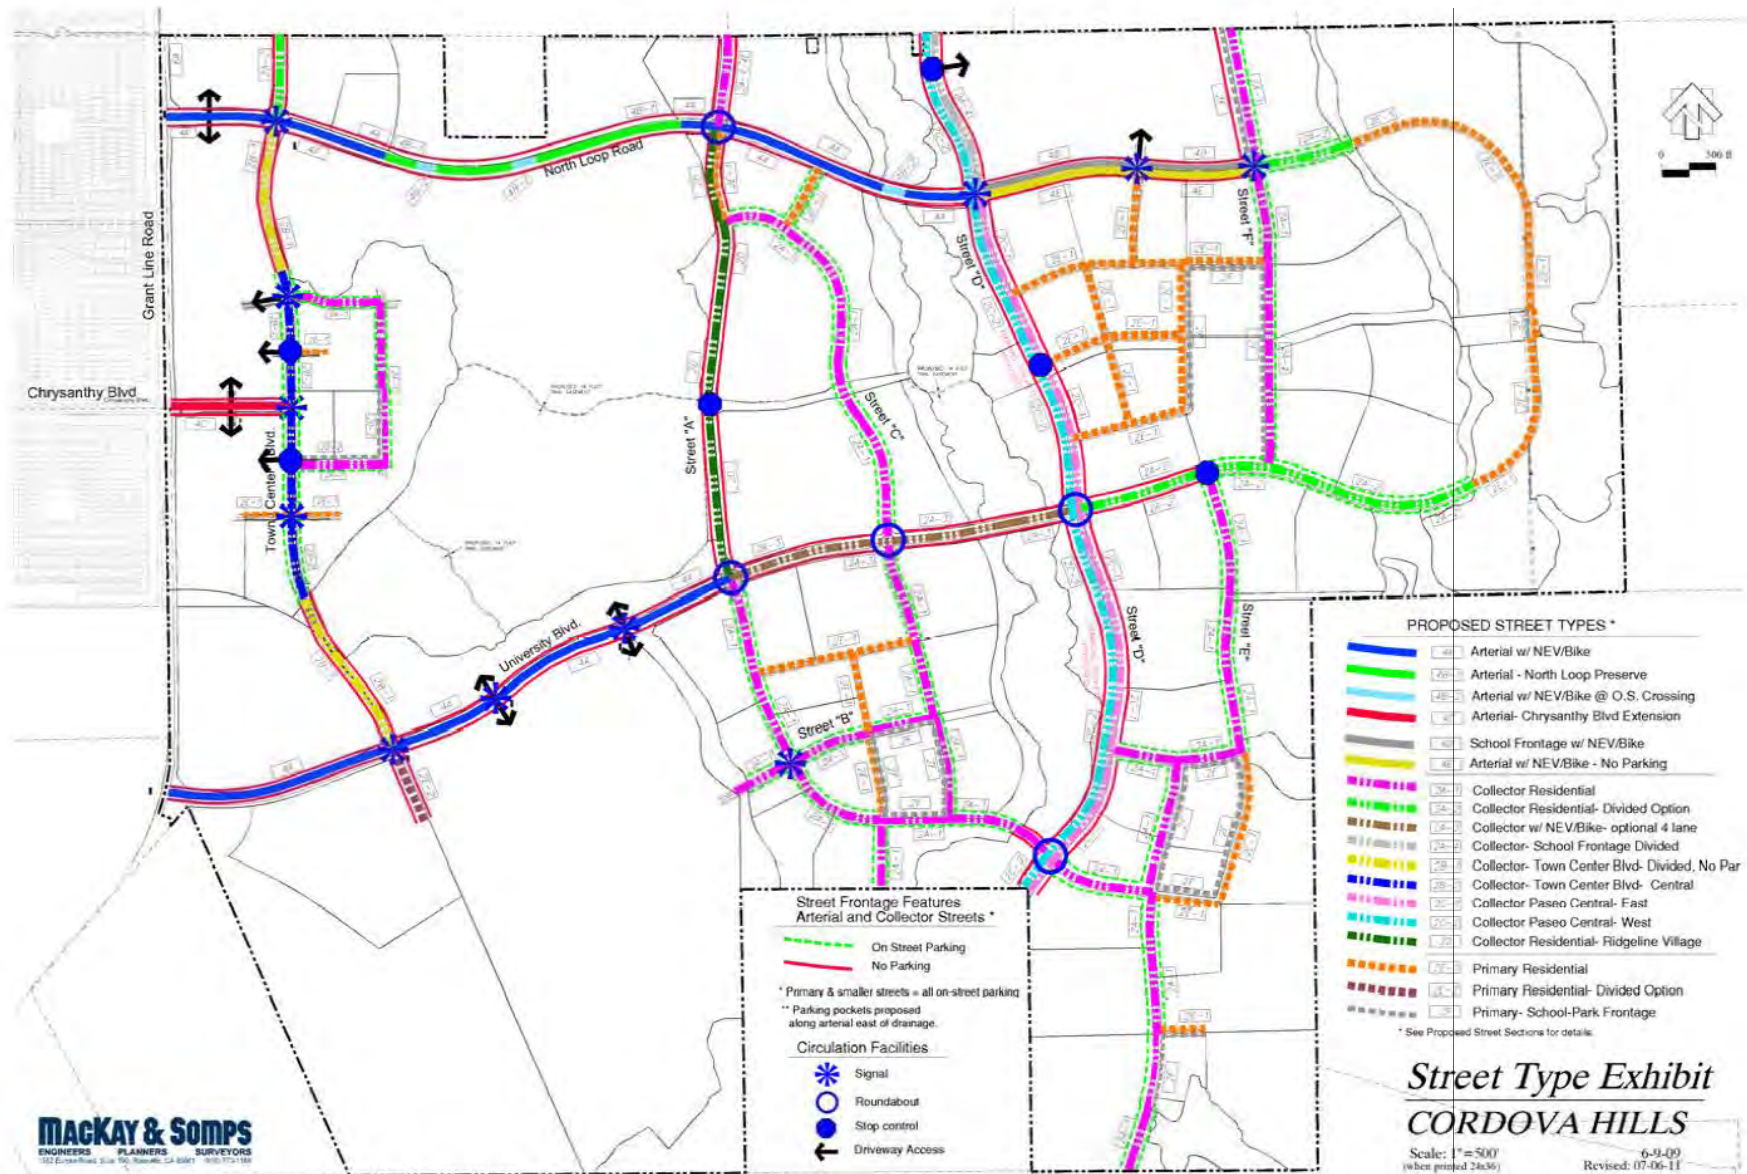

IMPACTS AND MITIGATION MEASURES

EXISTING PLUS PROJECT CONDITIONS

PROJECT TRIP GENERATION

The Project includes access via three east-west roadways: University Boulevard, North Loop Road, and Chrysanthy Boulevard. The proposed University Boulevard provides access to the southern portion of the site and the proposed North Loop Road provides access to the northern portion. The future Chrysanthy Boulevard would be extended across Grant Line Road into the Project site as the third access point. The Cordova Hills street exhibit, Plate TC-3, shows the three access points into the Project as four-lane arterials. North Loop Road decreases to a two-lane collector east of Street D and University Boulevard decreases to a two-lane collector east of Street A.

Plate TC-3: Project Access and Circulation

The Cordova Hills Urban Service Plan includes funding for operating a transit system. The Project will operate a local transit system consisting of two routes: an internal and external route. The internal route will service the Cordova Hills plan area. The external route will provide a connection to the Mather Field/Mills LRT station through the City of Rancho Cordova. The internal route will service 15 minute headways in the peak periods and 30 minute headways in the off peak period. The external route will service 15 minute headways in the peak periods and 60 minute headways in the off peak period. The Project also includes a pedestrian and bicycle system consisting of approximately: 26.2 miles of on-street class-2 bicycle paths and 22.0 miles of off-street community/multi-use/university trails.

Table TC-14 summarizes the vehicular trip generation of the Cordova Hills Project and alternatives. The estimation of trip generation focused on the unique characteristics of the Project elements, the portion of trips made by non-automobile modes (e.g., bike, walk, transit), and the number of vehicle trips that remain internal to the Project. Trip generation for the University/College Campus Center is based on conceptual designs provided by the applicant, as well as its relationship to the other land use elements of the Cordova Hills Project. Important characteristics include:

- 4,040 students (of a total of 6,000 students) will reside on campus (67 percent)
- 90 percent of underclass students will reside on campus
- Freshman will not be allowed to have cars on campus
- 100 housing units on campus for faculty on temporary assignment
- Good pedestrian and bicycle circulation
- Ample transit services both within and near the campus
- Limited parking on campus

As trip generation rates for colleges and universities vary widely based upon school characteristics, the Project applicant's consultant conducted a survey of universities to find similar campuses and provided a summary memorandum. This information was reviewed by the traffic study preparers and by County staff and was found to be appropriate for use in the transportation analysis. The conceptual university element of the Project results in approximately 8,807 daily external vehicle trips, as shown in Table TC-14. It should be noted that this estimate is based upon the favorable transportation characteristics listed previously; deviation from these characteristics could result in higher vehicle trip generation, and potentially greater impacts.

Trip generation of other land use elements (residential, retail, office, etc.) is based upon SACOG's Sacramento Regional Travel Demand Model (SACMET). The travel model estimates the number of person trips for each land use, the mode of travel for each trip, and the origin and destination of each trip. As shown in Table TC-14, these land uses result in about 91,970 daily vehicle trips. Combined with the University/College Campus Center, the total daily vehicle trip generation is estimated to be approximately 100,777 trips, of which about 69,343 trips travel outside the Cordova Hills boundary.

Table TC-14: Trip Generation

Land Use	Units	Vehicle Trip End Rates ¹			Daily Vehicle Trip Rates ^{1,2}			Vehicle Trips Ends			Vehicle Trips		
		AM	PM	Daily	AM	PM	Daily	AM	PM	Daily	AM	PM	Daily

<i>SubTotal</i>								<i>10,350</i>	<i>11,003</i>	<i>121,404</i>	<i>7,925</i>	<i>8,306</i>	<i>91,970</i>
University Students	6,000	0.1	0.2	1.8	0.1	0.1	1.5	755	973	10,808	631	792	8,807
<i>Total</i>								<i>11,105</i>	<i>11,975</i>	<i>132,211</i>	<i>8,555</i>	<i>9,098</i>	<i>100,777</i>
<i>External Trips³</i>											<i>6,005</i>	<i>6,221</i>	<i>69,343</i>
NOTES: 1. Rates in the table may not compute exactly due to rounding. 2. Vehicle trip rates reflect internalization reduction. For trips internal to the Cordova Hills Project, half the trip is attributed to the origin and half to the destination. 3. Approximate of vehicle trips traveling outside the Cordova Hills specific plan Vehicle trip summary based on modified version of the SACMET travel demand forecasting (TDF) model. Source: DKS Associates, 2011													

TRIP DISTRIBUTION AND MODE SHARE

The SACMET travel model predicts the travel mode of each person trip, including walk, bike, transit, and carpool. These modes vary by trip purpose, time of day, and whether the trip is internal to the Cordova Hills site or external (i.e. one trip end is outside of Cordova Hills). For the non-university/college campus center land uses, about 34 percent of person trips are internal to the non-university/college campus center uses, 11 percent travel to and from the university/college campus center, and about 55 percent are external trips. Non-automobile modes account for about 11 percent of the trips.

For the university/college campus center land use, about 67 percent of the total trips (not including trips entirely internal to the university/college campus center) are expected to remain internal to the Cordova Hills site. About 43 percent of these trips are expected to use non-automobile modes.

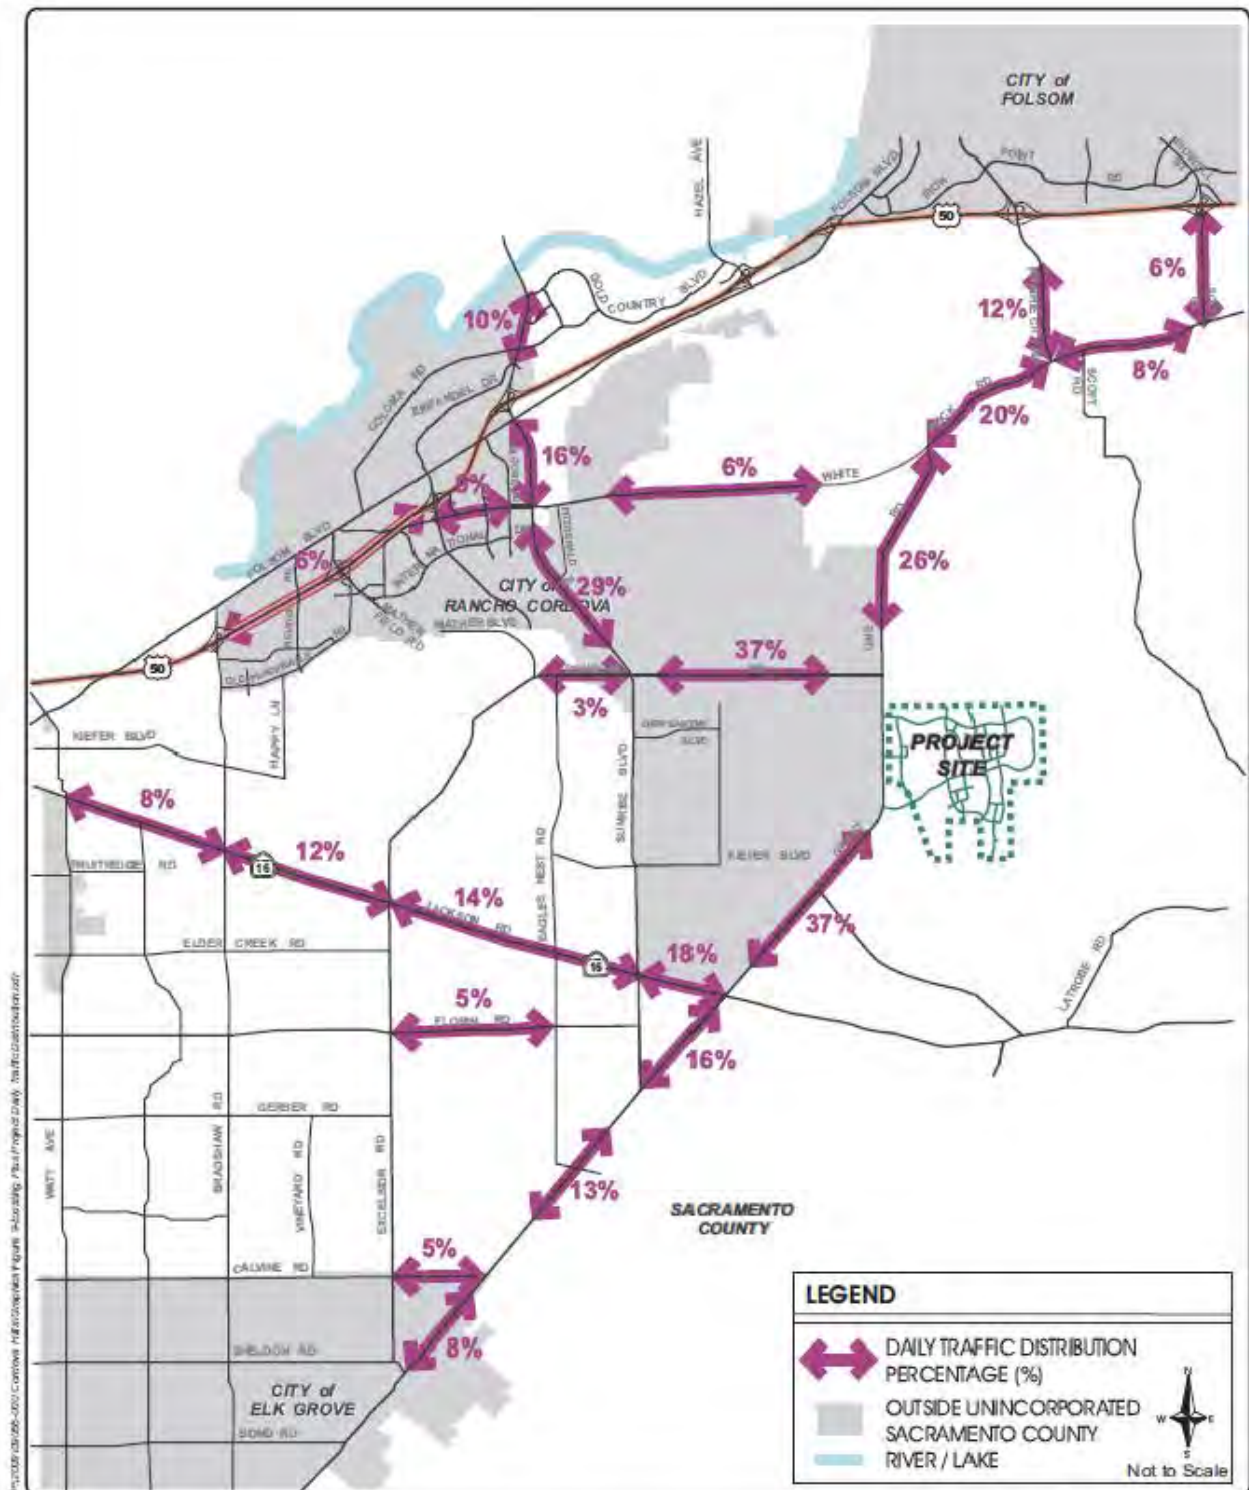

Overall, the analysis estimates that about 36 percent of all vehicle trips will remain internal to the Cordova Hills site, and that about 12 percent of all person trips (excluding on-campus trips) will be by non-automobile modes. The analysis estimates that about 43 percent of all person trips (excluding on-campus trips) will remain internal to the Cordova Hills site.

Plate TC-4 illustrates the external traffic trip distribution based upon daily traffic volumes (the distribution varies by time of day due to changing trip purposes and destinations). About 37 percent of traffic would use Douglas Road to the west, about 26 percent would use Grant Line Road to the north, and about 37 percent would use Grant Line Road to the south.

EXISTING PLUS PROJECT IMPACTS

The existing plus Project scenario assumes full construction of the Project roadway system, including frontage improvements along Grant Line Road adjacent to the Project site. Operating conditions for studied intersections, roadways, and freeways (ramps and segments) are provided in Table TC-15 through Table TC-18.

INTERSECTION ANALYSIS

SACRAMENTO COUNTY

The Project causes significant impacts to seven intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on mitigation, refer to Table 22 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-1 would improve all operating conditions from unacceptable to acceptable levels, and impacts would be *less than significant*.

- *Bradshaw Road and Jackson Road* – Operating conditions deteriorate from an acceptable LOS E to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS D to LOS F in the p.m. peak hour. Mitigation would improve operating conditions to an acceptable LOS E.
- *Mather Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS "E" to LOS "F" in the a.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Project traffic. Mitigation would improve operating conditions to LOS E.
- *Eagles Nest Road and Jackson Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the p.m. peak hour. This intersection meets peak hour traffic signal warrants with the addition of Project traffic. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road and Sunrise Boulevard* – Operating conditions deteriorate from an acceptable LOS D to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Grant Line Road and White Rock Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This intersection meets peak hour signal warrants without and with the addition of Project traffic. Mitigation would improve operating conditions to LOS C.
- *Prairie City Road and White Rock Road* – Operating conditions already at an unacceptable LOS E degrade to LOS F in the a.m. peak hour, with an increase in delay of more than five seconds. Operating conditions remain at LOS F in the p.m. peak hour, with an increase in delay of more than five seconds. This intersection meets peak hour signal warrants without and with the addition of Project traffic. Mitigation would improve operating conditions to LOS D.
- *School Access and North Loop Road* – This new intersection operates at LOS F during the a.m. peak hour. Mitigation would improve operating conditions to LOS D.

CITY OF ELK GROVE

The intersection of Grant Line Road and Calvine Road will continue to operate at an acceptable LOS B in the a.m. peak hour. The intersection level of service will change from A to an acceptable B in the p.m. peak hour. Impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Project causes significant impacts to ten intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on LOS calculations pertinent to the mitigation, refer to Table 22 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-2 would improve all operating conditions from unacceptable to acceptable levels, but the implementation of some of the below measures cannot be guaranteed because the facility lies wholly outside of the jurisdiction of Sacramento County. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included, the impact is considered potentially *significant and unavoidable*. Note that some of the facilities below are within both the City of Rancho Cordova and Sacramento County, and they have been included in this section simply to reflect the fact that they have been analyzed using the more conservative City of Rancho Cordova LOS standards.

- *Grant Line Road and Chrysanthy Boulevard* – This new intersection operates at LOS "F" during the a.m. and p.m. peak hours. This intersection meets peak hour signal warrants with the addition of Project traffic. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road and Douglas Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS B to LOS F in the p.m. peak hour. This intersection meets peak hour signal warrants with the addition of Project traffic. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road and Jackson Road* – During the a.m. and p.m. peak hours, operating conditions remain at an unacceptable LOS F, with an increase in V/C ratio of more than 0.05. Mitigation would not improve the LOS, but the change in the V/C ratio would be less than 0.05.
- *Grant Line Road and Kiefer Boulevard* – During the a.m. and p.m. peak hours, operation conditions deteriorate from an acceptable LOS B to LOS F. This intersection meets peak hour signal warrants without and with the addition of Project traffic. Mitigation would improve operating conditions to LOS C.
- *Grant Line Road and North Loop Road* – This new intersection operates at LOS F during the a.m. and p.m. peak hours. Mitigation would improve operating conditions to LOS C.

- *Grant Line Road and University Boulevard* – This new intersection operates at LOS "F" during the a.m. and p.m. peak hours. This intersection meets peak hour signal warrants with the addition of Project traffic. This would improve operating conditions to LOS B.
- *Sunrise Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS A to LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Sunrise Boulevard and Jackson Road* – Operating conditions deteriorate from an unacceptable LOS E to LOS F in the a.m. peak hour, with an increase in V/C ratio of more than 0.05. Operating conditions deteriorate from an acceptable LOS D to LOS E in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Sunrise Boulevard and White Rock Road* – Operating conditions deteriorate from an acceptable LOS C to LOS F in the a.m. peak hour. Operating conditions deteriorate from an acceptable LOS D to LOS F in the p.m. peak hour. Mitigation would improve operating conditions to LOS D.
- *Zinfandel Drive and White Rock Road* – During the p.m. peak hour, operating conditions remain at an unacceptable LOS E, with an increase in V/C ratio of more than 0.05. Mitigation would improve p.m. peak hour operating conditions to LOS E and the change in the V/C ratio would be less than 0.05.

CALTRANS

The Zinfandel Drive and US 50 Eastbound ramp intersection remains at an unacceptable LOS F during the p.m. peak hour, with the Project causing a 1.8-second increase in delay. Caltrans has no plans to expand the eastbound ramps beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect money to fund such improvements. No feasible mitigation measures exist to offset this impact; impacts are *significant and unavoidable*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY

Project traffic causes operations degrade from an acceptable LOS C to LOS E on the segment of Prairie City Road from US 50 to White Rock Road. Mitigation Measure TR-3 would improve operating conditions to LOS D (for more detailed data on LOS calculations pertinent to the mitigation, refer to Table 23 of Appendix TR-1), which would reduce impacts to this facility to *less than significant* levels. Note that the traffic study indicates an impact to an internal roadway. This impact is not described here because the applicant already incorporated the recommended mitigation to designate the roadway as four lanes.

CITY OF ELK GROVE

Project traffic will result in a v/c ratio increase of more than 0.05 on the segment of Grant Line Road from Excelsior Road to Calvine Road, which already operates at an unacceptable LOS E in the existing condition. Mitigation Measure TR-4 would improve operating conditions to LOS A, which would reduce impacts to this facility to *less than significant* levels.

CITY OF RANCHO CORDOVA

The Project causes significant impacts to eleven roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on LOS calculations pertinent to the mitigation, refer to Table 23 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-5 would improve most operating conditions from unacceptable to acceptable levels.

- *Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation would improve operating conditions to LOS B.
- *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road from Jackson Road to Kiefer Boulevard* – Operations deteriorate from an acceptable LOS D to LOS F. Mitigation would improve operating conditions to LOS C.
- *Grant Line Road from Kiefer Boulevard to University Boulevard* – Operations deteriorate from an acceptable LOS C to LOS F. Mitigation would improve operating conditions to LOS C.
- *Grant Line Road from University Boulevard to Chrysanthy Boulevard* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road from Chrysanthy Boulevard to North Loop* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation would improve operating conditions to LOS A.
- *Grant Line Road from North Loop to Douglas Road* – Operations deteriorate from an acceptable LOS C to LOS F. Mitigation would improve operating conditions to LOS C.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an acceptable LOS D to LOS F. Mitigation would improve operating conditions to LOS A.

- *Jackson Road from Sunrise Boulevard to Grant Line Road* – Operations deteriorate from an acceptable LOS D to LOS E. Mitigation would improve operating conditions to LOS B.
- *Sunrise Boulevard from US 50 to Folsom Boulevard* – Operations remain at an unacceptable LOS F, with an increase in V/C ratio of more than 0.05. No mitigation is available (see below discussion).
- *Sunrise Boulevard from Folsom Boulevard to White Rock Road* – Operations deteriorate from an unacceptable LOS E to LOS F, with an increase in V/C ratio of more than 0.05. No mitigation is available (see below discussion).

The same discussion provided for the intersection analysis applies here. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for most facilities, the impact is considered potentially *significant and unavoidable*. In addition, the only mitigation available for Sunrise Boulevard would be to widen the roadway, but this roadway is at full build-out according to the City of Rancho Cordova General Plan. Widening would require a General Plan Amendment, as well as significant acquisition of right-of-way which would involve property losses and the loss of improvements on what is currently private property. This being the case, the mitigation is considered infeasible, and impacts to these two facilities are *significant and unavoidable*.

CALTRANS FREEWAYS

MAINLINE

The Project causes significant impacts to two freeway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation. The facility improvements listed in Mitigation Measure TR-6 would improve all operating conditions from unacceptable to acceptable levels. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for most facilities, the impact is considered potentially *significant and unavoidable*.

- *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – There is an increase in traffic volume on this freeway segment already operating at LOS F in the a.m. peak hour. Mitigation would improve operating conditions to LOS E.
- *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – There is an increase in traffic volume on this freeway segment already operating at LOS F. Mitigation would improve operating conditions to LOS D.

RAMP JUNCTIONS

Project traffic does not cause a level of service standard to be exceeded, nor does it significantly contribute to an existing unacceptable operating condition; impacts are *less than significant*.

BICYCLE AND PEDESTRIAN ANALYSIS

Many miles of trails, pedestrian paths, and bicycle paths will be provided within the Project boundaries; on an internal level, the Project provides benefits, rather than negative impacts. The Sacramento County Bicycle Master Plan indicates that Grant Line Road is planned for bicycle lanes. The Sacramento County Pedestrian Master Plan does not identify Grant Line Road for pedestrian improvements. Project implementation will not result in substantial new adverse offsite physical impacts to existing bikeways or pedestrian facilities, nor will it interfere with the implementation of future facilities. No new pedestrian or bicycle conflicts will be created, but the Project will contribute to existing impacts.

There are two-lane rural roadway segments that currently do not have shoulders or other dedicated bicycle or pedestrian facilities (see below). These are potentially unsafe conditions for existing pedestrians and bicyclists who use the facilities, particularly since speed limits are relatively high (all are 55 mph). The Project will result in substantial increases in traffic along these roadway segments, increasing the potential for conflict. The Project will significantly increase existing impacts along the following roadway segments:

- Grant Line Road from Douglas Road to White Rock Road
- Douglas Road from Rancho Cordova Parkway to Grant Line Road

Mitigation is included which requires that the applicant contribute a fair share toward the construction of bicycle lanes and pedestrian facilities along these roadways. This mitigation will reduce impacts to *less than significant* levels.

TRANSIT ANALYSIS

The Project will create a demand for transit services both on-site and off-site, with an expected non-automotive usage of approximately 12% of all trips. Though the Project will introduce this demand, there is no existing transit service available to the Project. The nearest existing services are operated by Sacramento Regional Transit District north of Mather Airport, which is over five miles (when driving) from the Project boundary. There are no transit plans within the Project area with which the Project could conflict; note that this is primarily a cumulative condition issue, and is discussed in more detail in the Cumulative Plus Project section. The Project Urban Services Plan includes a transit system to meet this demand, which has sufficient frequency and capacity to serve the Project. This transit system is also designed to link riders to existing transit systems. The Project would not conflict with any adopted transit plans, nor would it exceed the available capacity of a transit system; impacts are *less than significant*.

MITIGATION MEASURES:

SACRAMENTO COUNTY INTERSECTIONS

- TR-1.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.
- A. *Bradshaw Road and Jackson Road* – Provide a second westbound through lane.
 - B. ~~*Mather Boulevard and Douglas Road* – Construct a new traffic signal. Provide a shared through-right turn lane on the northbound approach; provide a separate left turn lane and a through lane on the southbound approach; and provide separate left turn lane and a separate right turn lane on the westbound approach.~~
 - C. *Eagles Nest Road and Jackson Road* – Construct a new traffic signal. Provide a left turn lane and a through-right turn shared lane on the northbound and southbound approaches.
 - D. *Grant Line Road and Sunrise Boulevard* – Provide a separate southbound right turn lane so the southbound approach has one left turn lane, one through lane and one right turn lane.
 - E. *Grant Line Road and White Rock Road* – ~~Construct a new~~ **Modify the intersection and** traffic signal **to provide** dual left turn lanes and **a separate two** through lanes on the northbound approach; provide a **two** through lanes and a separate right turn lane on the southbound approach; and provide separate **two** left turn lanes and a separate right turn lane on the eastbound approach. Also an extra westbound departure lane is needed for the dual northbound left movement. **On the western leg of the intersection, two westbound departure lanes are required.**
 - F. ~~*Prairie City Road and White Rock Road* – The applicant shall be responsible for a fair share of this measure. Construct a new traffic signal. Provide a separate left turn lane and a separate right turn lane on the southbound approach; provide a separate left turn lane and a through lane on the eastbound approach; and provide a through lane and a separate right turn lane on the westbound approach. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.~~

- G. *School Access and North Loop Road* – Provide dual eastbound left turn lanes. The applicant shall be responsible for a focused access study addressing the internal circulation of the Cordova Hills project to finalize the design of intersection geometries and length of left turn pockets. The scope of work for the analysis shall be submitted to the Sacramento County DOT staff. Upon completion, the analysis shall be submitted to the Sacramento County DOT for approval and recommendations.

CITY OF RANCHO CORDOVA INTERSECTIONS

- TR-2.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.
- A. *Zinfandel Drive and White Rock Road* – The applicant shall be responsible for a fair share of this measure. Provide separate dual right turns on the westbound approach so the westbound approach has two left turn lanes, two through lanes and two right turn lanes. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- B. *Sunrise Boulevard and White Rock Road* – Provide overlap phasing on the eastbound and westbound approaches.
- C. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the westbound approach.
- D. *Sunrise Boulevard and Jackson Road* – ~~Provide dual through lanes on the eastbound and westbound approaches.~~ **Provide an eastbound through lane, and eastbound through-right turn shared lane, and an eastbound left turn lane; a northbound left turn lane and a northbound through-right turn shared lane; two westbound through lanes, a westbound right turn lane, and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane.**
- E. *Grant Line Road and Jackson Road* – The applicant shall be responsible for a fair share of this measure. Provide a left turn lane and a through-right shared turn lane on the eastbound and westbound approaches. Provide a separate left turn lane, a through lane and a separate right turn lane on the northbound and southbound approaches. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- F. *Grant Line Road and Kiefer Boulevard* – Construct a new traffic signal. Provide a left turn lane, a through lane and a through-right turn shared lane on the northbound and southbound approaches; provide a left turn lane and a through-right turn shared lane on the eastbound and westbound approaches.
- G. *Grant Line Road and Douglas Road* – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound, a through lane and a through-right turn shared lane on the southbound approach, and a separate left turn lane and a free-right turn lane on the eastbound approach. Also an extra southbound departure lane is needed for the eastbound free-right movement. To be consistent with the segment mitigations a second northbound through lane is included.
- H. *Grant Line Road and North Loop Road* – Construct a new traffic signal. Provide two through lanes and a separate right turn lane on the northbound approach, dual left turn lanes and one through on the southbound approach, and one left turn lane and one free-right turn lane on the westbound approach. Also an extra northbound departure lane is needed for the westbound free-right movement. To be consistent with the segment mitigations a second southbound through lane is included.
- I. *Grant Line Road and Chrysanthy Boulevard* – Construct a new traffic signal. Provide a through lane and a separate right turn lane on the northbound approach, dual left turn lanes and a through lane on the southbound approach, and dual left turn lanes and one right turn lane on the westbound approach. To be consistent with the segment mitigations a second northbound and southbound through lane is included. Also provide two westbound through lanes for when Chrysanthy Boulevard is connected through Rancho Cordova.
- J. *Grant Line Road and University Boulevard* – Construct a new traffic signal. Provide a through lane and a separate free-right turn lane on the northbound approach, dual left turn lanes and one through lanes on the southbound approach, and dual left turn lanes and a right turn lane on the westbound approach. Also an extra eastbound departure lane is needed for the northbound free-right movement. To be consistent with the segment mitigations a second northbound and southbound through lane is included.

SACRAMENTO COUNTY ROADWAY SEGMENTS

- TR-3.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

- A. *Prairie City Road from US 50 to White Rock Road* – Increase roadway capacity by upgrading the capacity class for this segment from a rural highway without shoulders to a rural highway with shoulders.

CITY OF ELK GROVE ROADWAY SEGMENT

TR-4. The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Elk Grove, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Grant Line Road from Sheldon Road to Calvine Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.

CITY OF RANCHO CORDOVA ROADWAY SEGMENTS

TR-5. The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Grant Line Road from Jackson Road to Kiefer Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- C. *Grant Line Road from University Boulevard to Chrysanthy Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- D. *Grant Line Road from Chrysanthy Boulevard to North Loop* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- E. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to 6 lanes and upgrading the capacity class to an arterial with moderate access control.

- F. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- G. *Jackson Road from Sunrise Boulevard to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- ~~H. *Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.~~
- I. *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control **between Americanos Boulevard and Grant Line Road, and by adding two westbound travel lanes to Douglas between Rancho Cordova Parkway to Americanos Boulevard. Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes.**

CALTRANS FREEWAY MAINLINE

- TR-6.** The applicant shall be responsible for funding a fair share of the construction costs of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with Caltrans.
- A. *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – Add an auxiliary lane.
 - B. *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – Add an auxiliary lane.

BICYCLE AND PEDESTRIAN FACILITIES

- TR-7.** The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- A. Construct **interim sidewalk improvements (typically a detached asphaltic concrete path)** and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road, **to the satisfaction of the Sacramento County Department of Transportation.**

CUMULATIVE CONDITIONS (WITHOUT THE PROJECT)

The primary travel forecasting tool used for future year travel forecasts is the Sacramento Metropolitan Travel Demand Model (SACMET) model. This model has provided the basis for other recent regional studies, corridor analyses, and environmental documents. SACOG maintains SACMET over time, updating base year and forecast year demographic data and networks, and working with a technical advisory committee to periodically update and enhance the model. Also, many local jurisdictions use the model as the basis for general plans and environmental studies. For all of these reasons, this model provides the best starting point for travel forecasts for the Cordova Hills Project.

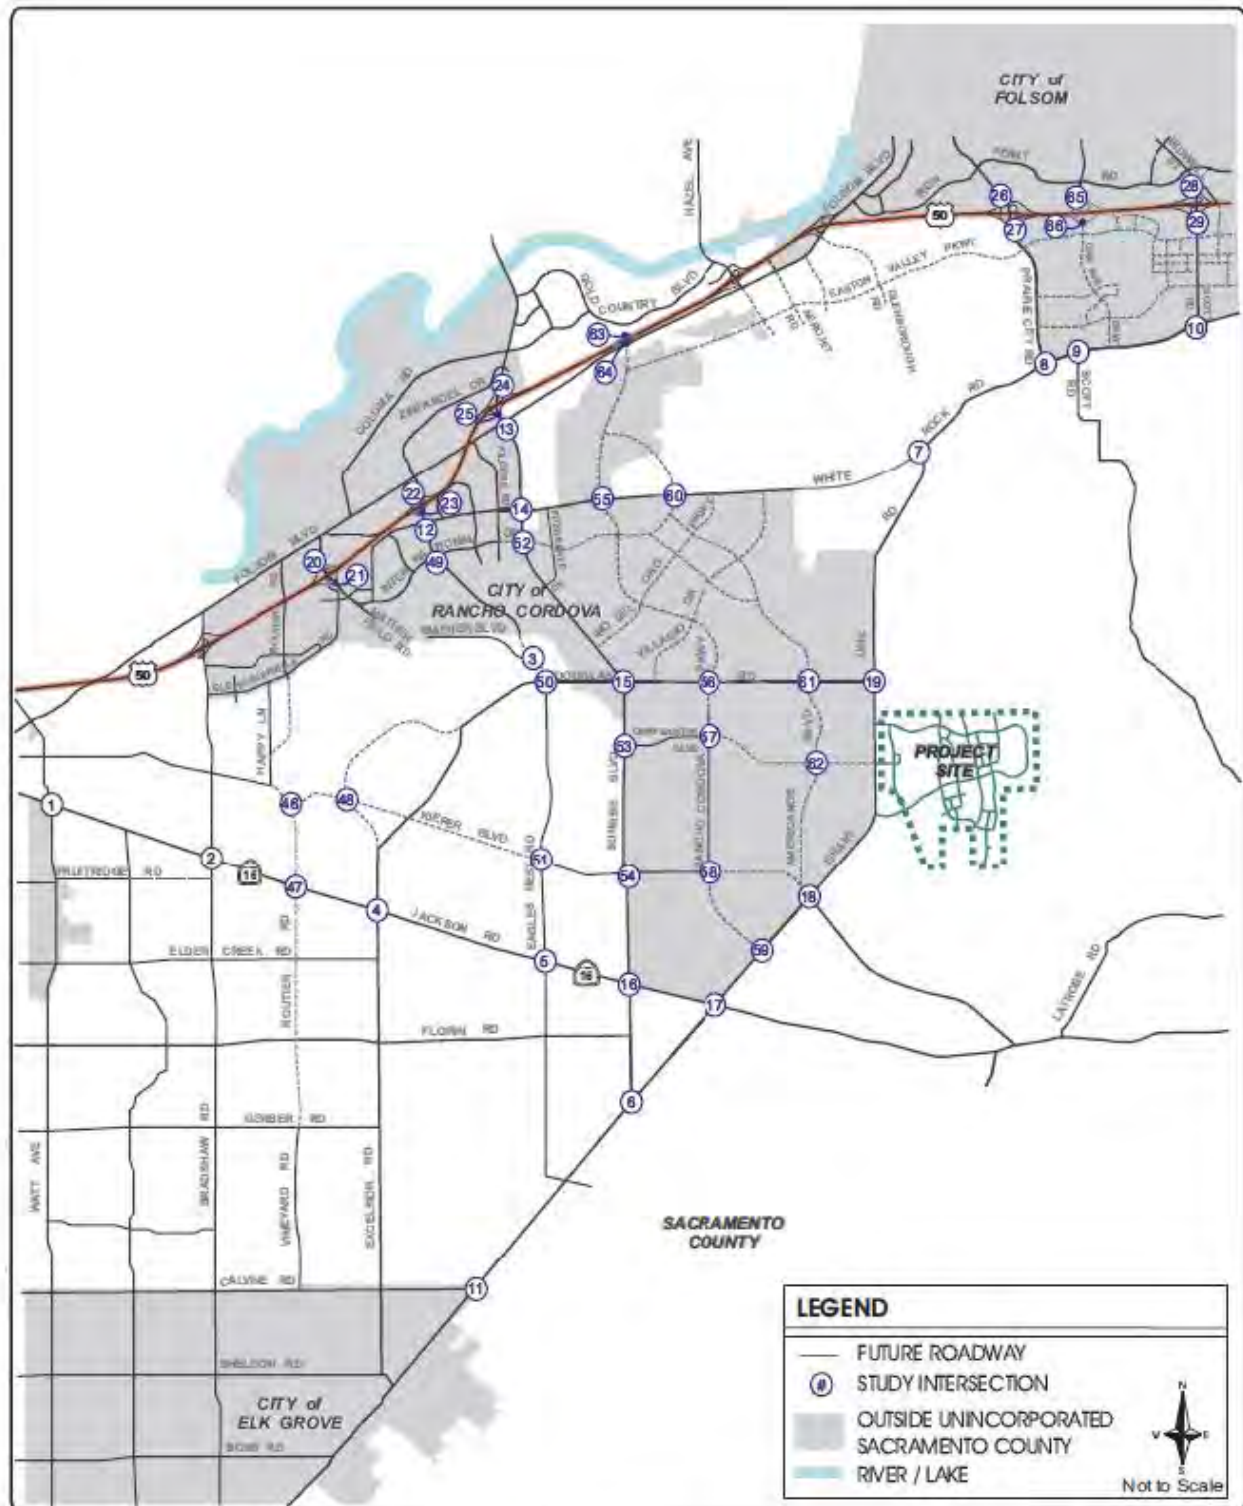

To evaluate the transportation impacts of the proposed Project adequately, a few modifications to SACMET roadway and development inputs were needed. Modifying a regional model roadway network and traffic analysis zone (TAZ) system to provide additional detail in the Project area and neighboring areas is a common practice for a transportation impact analysis. Regional cumulative conditions are based upon year 2035 projections. The development forecast used for the cumulative year scenarios are consistent with SACOG's currently adopted 2035 MTP development forecast. SACOG's development forecast include reasonable and foreseeable projects neighboring the Cordova Hills site such as Sun Ridge, Suncreek, Arboretum, Rio Del Oro, Westborough, Easton/Glenborough, and Folsom SOI. In addition to SACOG's 2035 development forecasts, truck trips from the proposed quarries in eastern Sacramento County are included in cumulative conditions. Quarry truck volumes were estimated using "average day" trip generation rates and distribution from the East Sacramento County Truck Study for the three proposed quarries (Teichert, Stoneridge, and Milgate). The development forecasts do not include any adjacent growth north or south of the Project. The future year roadway and transit networks are also consistent with the region's currently adopted 2035 MTP. However, based on input from recent transportation studies, the following MTP roadway improvements were changed:

- The number of lanes on White Rock Road from the El Dorado County line to Scott Road (E) was reduced from 6 to 4 to be consistent with the maximum number of lanes allowed on that segment in the proposed Sacramento County General Plan.
- The extension of Hazel Avenue from the future Easton Valley Parkway south to White Rock Road was not assumed.
- The number of lanes on Rancho Cordova Boulevard from the Chrysanthy Boulevard to Grant Line Road was reduced from 6 to 4 to be consistent with the maximum number of lanes allowed on that segment in the City of Rancho Cordova General Plan.
- The number of lanes on Prairie City Road from U.S. 50 to Easton Valley Parkway was increased from 4 to 6 to be consistent with the Folsom SOI.

- The number of lanes on Scott Road from Easton Valley Parkway to White Rock Road was reduced from 6 to 4 to be consistent with the Folsom SOI.

The study area includes 66 intersections, 80 roadway segments, and portions of the US 50 freeway system between Howe Avenue and Scott Road (refer to Plate TC-5 and Plate TC-6). Tables showing the cumulative condition operating conditions for all studied facilities are included in the Cumulative Plus Project analysis section, so that reviewers can see the No Project and Project impacts side by side (refer to tables Table TC-20 through Table TC-23). Note that the interface between the Project and the proposed Capitol Southeast Connector project is discussed in the Cumulative and Growth Inducing Impacts chapter.

DKS Associates
TRANSPORTATION SOLUTIONS

FIGURE 18
CUMULATIVE STUDY ROADWAY SEGMENTS

*INTERSECTION ANALYSIS***SACRAMENTO COUNTY**

During the a.m. and p.m. peak hours, the following Sacramento County intersections do not meet the Level of Service (LOS) E standard within the Urban Service Boundary or the Level of Service (LOS) D standard outside the boundary:

- *Bradshaw Road and Jackson Road* – LOS F in the p.m. peak hour
- *Excelsior Road and Jackson Road* – LOS F in the p.m. peak hour
- *Grant Line Road and Sunrise Boulevard* – LOS E in the p.m. peak hour
- *South Watt Avenue and Jackson Road* – LOS F in the a.m. and p.m. peak hours

CITY OF FOLSOM

During the a.m. and p.m. peak hours, all of the City of Folsom intersections meet the LOS C standard.

CITY OF ELK GROVE

During the a.m. and p.m. peak hours, the intersection of Grant Line Road and Calvine Road meets the LOS D standard.

CITY OF RANCHO CORDOVA

During the a.m. and p.m. peak hours the following City of Rancho Cordova intersections do not meet the Level of Service (LOS) D standard:

- *Zinfandel Drive and White Rock Road* – LOS F in the p.m. peak hour
- *Sunrise Boulevard and Folsom Boulevard* – LOS F in the a.m. peak hour
- *Sunrise Boulevard and Douglas Road* – LOS E in the a.m. peak hour
- *Sunrise Boulevard and Jackson Road* – LOS E in a.m. peak hour
- *Zinfandel Drive and International Drive* – LOS E in the a.m. peak hour and LOS F in the p.m. peak hour
- *Rancho Cordova Parkway and Douglas Road* – LOS F in the p.m. peak hour

CALTRANS

During the a.m. and p.m. peak hours, all but the Zinfandel Drive and US 50 Eastbound Ramps meet the Caltrans State Highway LOS E standard. In this location, intersection is at LOS F in the p.m. peak hour.

*ROADWAY SEGMENT ANALYSIS***SACRAMENTO COUNTY**

The following Sacramento County roadway segments do not meet the Level of Service (LOS) E standard within the Urban Service Boundary or the Level of Service (LOS) D standard outside the boundary:

- *Jackson Road from Watt Avenue to Bradshaw Road – LOS F*
- *Jackson Road from Bradshaw Road to Vineyard Road – LOS F*

CITY OF ELK GROVE

The segment of Grant Line Road between Excelsior Road and Calvine Road operates at LOS C, which meets the City of Elk Grove's LOS D standard.

CITY OF RANCHO CORDOVA

The following City of Rancho Cordova roadway segments do not meet the Level of Service (LOS) D standard:

- *Grant Line Road from Douglas Road to White Rock Road – LOS E*
- *Sunrise Boulevard from US 50 to Folsom Boulevard – LOS F*
- *Sunrise Boulevard from Folsom Boulevard to White Rock Road – LOS F*
- *Zinfandel Drive from US 50 to White Rock Road – LOS F*
- *Zinfandel Drive from White Rock Road to International Drive – LOS F*

CALTRANS FREEWAYS**MAINLINE**

The following Caltrans freeway segments do not meet the LOS E standard:

- *Eastbound US 50 from Watt Avenue to Bradshaw Road – LOS F in a.m. and p.m. peak hours*
- *Eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue – LOS F in a.m. and p.m. peak hours*

- *Westbound US 50 from Hazel Avenue to Rancho Cordova Parkway* – LOS F in the a.m. peak hour
- *Westbound US 50 from Bradshaw Road to Watt Avenue* – LOS F in a.m. and p.m. peak hours

RAMP JUNCTIONS

The following Caltrans freeway ramp junctions do not meet the LOS E standard:

- *Eastbound US 50 Exit Ramp to Watt Avenue* – LOS F in p.m. peak hour
- *Eastbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. and p.m. peak hours
- *Westbound US 50 Exit Ramp to Watt Avenue* – LOS F in a.m. and p.m. peak hours
- *Westbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. peak hour

CUMULATIVE PLUS PROJECT CONDITIONS

TRIP GENERATION, DISTRIBUTION, AND MODE SHARE

Project trip generation and distribution would differ from the Existing Plus Project scenario due to the buildout of facilities and land uses in proximity to the Project, such as within the City of Rancho Cordova. The Cumulative Plus Project trip generation is shown in Table TC-19. Overall, the analysis estimates that 36% of all drive-person trips will remain internal to the Cordova Hills site and that about 12% of all person trips will be by non-automobile modes.

Plate TC-7 illustrates the external Project trip distribution based upon daily traffic volumes (the distribution varies by time of day due to changing trip purposes and destinations). Approximately 70,019 daily vehicle trips travel outside the Cordova Hills specific area. About 28 percent of traffic would use Douglas Road to the west, about 22 percent would use Chrysanthy Boulevard to the west, about 18 percent would use Grant Line Road to the north, and about 32 percent would use Grant Line Road to the south.

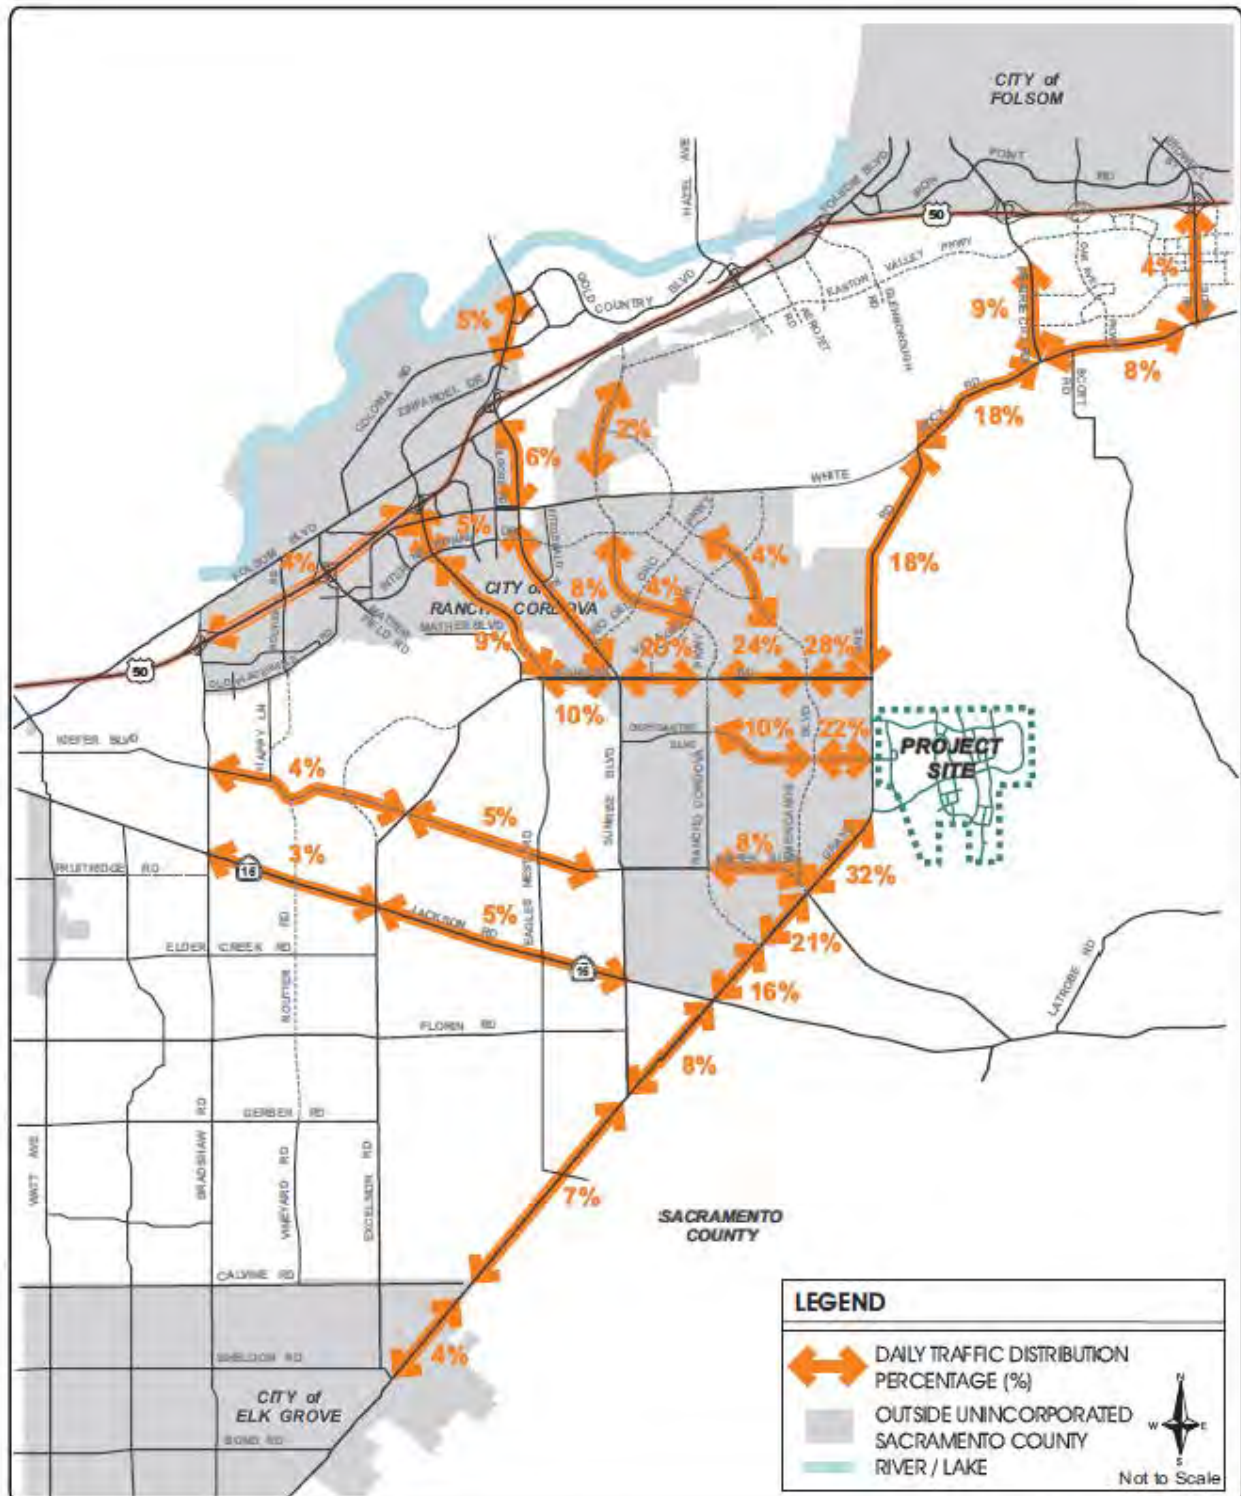

CUMULATIVE PLUS PROJECT IMPACTS

Impacts are defined by comparing the proposed Project to the cumulative without Project (No Project) conditions. Table TC-20 through Table TC-23 describe the operating conditions for the studied facilities in both the cumulative No Project and Cumulative Plus Project conditions.

Table TC-19: Cumulative Trip Generation

Land Use	Units	Vehicle Trip End Rates ¹			Daily Vehicle Trip Rates ^{1,2}			Vehicle Trips Ends			Vehicle Trips		
		AM	PM	Daily	AM	PM	Daily	AM	PM	Daily	AM	PM	Daily
Single-family DU	5,340	0.7	0.8	9.2	0.5	0.6	6.9	3,775	4,300	49,295	2,848	3,214	36,956
Multi-family DU	2,660	0.5	0.6	6.3	0.4	0.4	4.8	1,244	1,467	16,872	955	1,106	12,750
Retail Employee	1,897	1.0	1.7	17.8	0.8	1.3	13.7	1,912	3,230	33,778	1,515	2,471	26,048
Other Employee	2,166	0.3	0.4	3.9	0.3	0.3	3.3	657	764	8,432	555	635	7,067
K12 Students	7,140	0.4	0.2	1.8	0.3	0.1	1.3	2,745	1,207	12,820	2,052	880	9,337
<i>SubTotal</i>								10,350	11,003	121,404	7,925	8,306	91,970
University Students	6,000	0.1	0.2	1.8	0.1	0.1	1.5	760	978	10,862	637	798	8,880
<i>Total</i>								11,093	11,946	132,059	8,562	9,104	101,039
<i>External Trips³</i>											6,031	6,262	70,019
NOTES: 1. Rates in the table may not compute exactly due to rounding. 2. Vehicle trip rates reflect internalization reduction. For trips internal to the Cordova Hills Project, half the trip is attributed to the origin and half to the destination. 3. Approximate of vehicle trips traveling outside the Cordova Hills specific plan Vehicle trip summary based on modified version of the SACMET travel demand forecasting (TDF) model. INTERSECTION ANALYSIS

SACRAMENTO COUNTY

The Project causes significant impacts to the intersection of School Access and North Loop Road. This new intersection operates at LOS F during the a.m. peak hour. Mitigation Measure TR-8 would improve operating conditions to LOS D (for more detailed data on LOS calculations pertinent to mitigation, refer to Table 31 of Appendix TR-1), which would reduce impacts to this facility to *less than significant* levels.

CITY OF FOLSOM

The Project does not cause a level of service standard to be exceeded, nor does the Project cause a significant increase in delay at a facility already operating at unacceptable levels; impacts are *less than significant*.

CITY OF ELK GROVE

The Project does not cause a level of service standard to be exceeded, nor does the Project cause a significant increase in delay at a facility already operating at unacceptable levels; impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Project causes significant impacts to five intersections, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on LOS calculations pertinent to mitigation, refer to Table 31 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-9 would improve four of the intersection operating conditions from unacceptable to acceptable levels. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for most facilities, the impact is considered potentially *significant and unavoidable*. Furthermore, the intersection at Sunrise Boulevard and International Drive would remain at unacceptable operating conditions, as feasible mitigation is not available; impacts are *significant and unavoidable*.

- *Sunrise Boulevard and Douglas Road* – Operating conditions deteriorate from an acceptable LOS E to LOS F in the a.m. peak hour, with an increase in v/c ratio of greater than 0.05. Operating conditions deteriorate from an acceptable LOS D to LOS E in the p.m. peak hour. Mitigation will improve the a.m. peak hour operating conditions to LOS E and the change in the V/C ratio would be less than 0.05. Mitigation will improve the p.m. peak hour operating conditions to LOS D.

- *Grant Line Road and Douglas Road* – Operating conditions deteriorate from an acceptable LOS A to LOS F in the a.m. and p.m. peak hour. Mitigation will improve operating conditions to LOS D.
- *Grant Line Road and North Loop Road* – This new intersection operates at LOS F during the a.m. and p.m. peak hours. Mitigation will improve operating conditions to LOS D.
- *Grant Line Road and University Boulevard* – This new intersection operates at LOS E during the a.m. and p.m. peak hours. Mitigation will improve operating conditions to LOS B.
- *Sunrise Boulevard and International Drive* – Operating conditions deteriorate from an acceptable LOS D to LOS E in the a.m. peak hour. No feasible mitigation is available for the reasons described in the Existing Plus Project analysis. Widening of the roadway would be required, and is infeasible.

CALTRANS

The Project will increase traffic and delay at the Zinfandel Drive and US 50 eastbound ramp intersection during the p.m. peak hour, and this facility is operating at an unacceptable LOS F. No feasible mitigation measures are available, for the same reasons described in the Existing Plus Project section. Impacts to this Caltrans facility are *significant and unavoidable*.

ROADWAY SEGMENT ANALYSIS

SACRAMENTO COUNTY

The Project does not cause a level of service standard to be exceeded, nor does the Project cause a significant increase in delay at a facility already operating at unacceptable levels; impacts are *less than significant*.

CITY OF ELK GROVE

The Project does not cause a level of service standard to be exceeded, nor does the Project cause a significant increase in delay at a facility already operating at unacceptable levels; impacts are *less than significant*.

CITY OF RANCHO CORDOVA

The Project causes significant impacts to four roadway segments, which are listed below. The list includes both the facility impact, as well as the operating conditions that would result after the implementation of mitigation (for more detailed data on LOS calculations pertinent to mitigation, refer to Table 31 of Appendix TR-1). The facility improvements listed in Mitigation Measure TR-10 would improve three of the roadway operating conditions from unacceptable to acceptable levels. While the mitigation identified would reduce those facility impacts to less than significant levels, Sacramento

County does not have the land use authority to ensure that facilities outside of its jurisdiction are constructed. Thus, although adequate mitigation is included for three of the facilities, the impact is considered potentially *significant and unavoidable*.

- *Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard* – Operations deteriorate from an acceptable LOS C to LOS E. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road from Kiefer Boulevard to University Boulevard* – Operations deteriorate from an acceptable LOS A to LOS F. Mitigation would improve operating conditions to LOS B.
- *Grant Line Road from North Loop to Douglas Road* – Operations deteriorate from an acceptable LOS B to LOS F. Mitigation would improve operating conditions to LOS E, which is still unacceptable. No further mitigation beyond that described is feasible. Refer to the below discussion.
- *Grant Line Road from Douglas Road to White Rock Road* – Operations deteriorate from an unacceptable LOS E to LOS F, with an increase in v/c ratio of greater than 0.05. Mitigation would improve operating conditions to LOS C.

Grant Line Road from North Loop to Douglas Road was already modeled at maximum capacity, and a General Plan Amendment would be required to further increase capacity. Since neither right-of-way nor funding for this further expansion have been identified or acquired, the mitigation is considered infeasible. Realignment of the north Project access with Douglas Boulevard would potentially eliminate this impact; this was studied in one of the Alternatives to the Project. Despite application of feasible mitigation, Grant Line Road between North Loop Road and Douglas Road will operate at unacceptable levels; impacts are *significant and unavoidable*.

CALTRANS FREEWAYS

MAINLINE

The Project causes significant impacts to six freeway segments, which are listed below. Further widening of these freeway segments would be required in order to reduce Project impacts, but Caltrans currently has no plans to expand the segments beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect money to fund such improvements. No feasible mitigation exists to offset impacts to freeway segments; Project impacts are *significant and unavoidable*.

- *Eastbound US 50 from Watt Avenue to Bradshaw Road* – LOS F in a.m. and p.m. peak hours.
- *Eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue* – LOS F in a.m. and p.m. peak hours.

- *Westbound US 50 from Hazel Avenue to Rancho Cordova Parkway* – LOS F in the a.m. peak hour.
- *Westbound US 50 from Mather Field Road to Bradshaw Road* – LOS F in a.m. peak hour.
- *Westbound US 50 from Bradshaw Road to Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 from Watt Avenue to Power Inn/Howe Avenue* – LOS F in a.m. peak hour.

RAMP JUNCTIONS

The Project causes significant impacts to four freeway ramps, which are listed below. Caltrans currently has no plans to expand the following ramp junctions beyond the build-out capacities assumed in this analysis, nor are any funding mechanisms established to collect monies to fund such improvements. No feasible mitigation exists to offset impacts to freeway ramps; Project impacts are *significant and unavoidable*.

- *Eastbound US 50 Exit Ramp to Watt Avenue* – LOS F in p.m. peak hour.
- *Eastbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 Exit Ramp to Watt Avenue* – LOS F in a.m. and p.m. peak hours.
- *Westbound US 50 Slip Ramp Entrance from Watt Avenue* – LOS F in a.m. peak hour.

BICYCLE AND PEDESTRIAN ANALYSIS

The Project includes the provision of internal bicycle and pedestrian facilities, as has been described previously. Mitigation has already been required in the existing condition to address Project contribution to an existing pedestrian and bicycle system potential deficiency on two off-site roadways (Grant Line Road and Douglas Road). By the cumulative time horizon, these improvements will have been installed as part of buildout within Rancho Cordova, and as part of other improvements to Grant Line Road consistent with the Sacramento County General Plan, the Sacramento County Bicycle Master Plan, and the City of Rancho Cordova General Plan. The Project will not eliminate or adversely affect bicycle or pedestrian facilities, result in unsafe conditions, or interfere with implementation of planned bicycle or pedestrian facilities; impacts are *less than significant*.

TRANSIT ANALYSIS

The nearest existing transit services are operated by the Sacramento Regional Transit District north of Mather Airport, which is over five miles (when driving) from the Project

boundary. The Sacramento Regional Transit Master Plan identifies three scenarios for future buildout of the system by 2035. In the first two scenarios (A and B), transit will be no nearer to the Project than it is presently. In the final scenario (C), a streetcar line would be extended through Rancho Cordova, with the nearest point of that line (when driving) located approximately 1.5 miles from the Project boundary. There are no cumulative transit plans for service along Grant Line Road, where the Project lies.

There are existing commuter services that operate along Highway 16 (Amador Transit) and along the Highway 50 corridor (El Dorado Transit). It is possible that a commuter bus service will operate on the Grant Line Road corridor in the future as development within Rancho Cordova, the City of Folsom SOI, and within the Project increase demand for service along the corridor; however, this is entirely speculative. The nearest existing stops for either of the services mentioned, which both have destinations in downtown Sacramento, are a little more than three miles to the south (Sloughhouse stop, Amador Transit) and nearly eight miles to the north in Folsom (Iron Point Light Rail Station stop, El Dorado Transit).

Since there are no plans to expand services to the Project site, it must be assumed that extension of existing transit to the Project area will not occur in the cumulative scenario. Cordova Hills residents will need to rely on the transit services provided through the Cordova Hills Urban Services Plan, which as discussed previously is sufficient to meet demand; impacts are *less than significant*.

MITIGATION MEASURES:

SACRAMENTO COUNTY INTERSECTIONS

TR-8. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *School Access and North Loop Road* – Provide dual eastbound left turn lanes.

CITY OF RANCHO CORDOVA INTERSECTIONS

TR-9. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the eastbound and westbound right turns.
- B. *Grant Line Road and Douglas Road* – Provide a third southbound through lane and overlap phasing on the eastbound right turn lane. To be consistent with the segment mitigations a third northbound through lane is included.

- C. *Grant Line Road and North Loop Road* – Provide a westbound free-right turn lane. Also an extra northbound departure lane is needed for the westbound free-right movement.
- D. *Grant Line Road and University Boulevard* – Provide a northbound free-right turn lane. Also an extra eastbound departure lane is needed for the northbound free-right movement.

SACRAMENTO COUNTY ROADWAY SEGMENTS

TR-10. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *North Loop Road from Street D to Street F* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with low access control.

CITY OF RANCHO CORDOVA ROADWAY SEGMENTS

TR-11. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- C. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- D. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.

17 SUMMARY OF IMPACTS AND THEIR DISPOSITION

SIGNIFICANT EFFECTS WHICH CANNOT BE AVOIDED

AESTHETICS: DEGRADATION OF EXISTING VIEWS AND VISUAL QUALITY

The Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada significantly and negatively impacts the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed. No mitigation is available.

AESTHETICS: NEW SOURCES OF LIGHT OR GLARE

Project lighting will not result in sleep disruption or significant wildlife impacts, but will nonetheless introduce a substantial new source of light. This impact is not due to any individual feature or features, but due to the result of introducing a large urban development within a rural landscape. Though the impact cannot be made less than significant, usage of lighting fixtures that minimize glare and light trespass can reduce the impact to some degree. Mitigation is included requiring the use of fixtures approved by the International Dark Sky Association, but this will not reduce impacts to less than significant levels.

AIR QUALITY: OPERATIONAL EMISSIONS OF OZONE PRECURSORS (NO_x OR ROG)

The Project will result in worst-case NO_x and ROG emissions of 415.22 pounds per day and 857.40 pounds per day, respectively, which is significantly above the threshold of 65 pounds per day. A mitigation plan is included to reduce emissions by 35%, but emissions will still exceed the threshold.

AIR QUALITY: CONSTRUCTION ACTIVITIES WOULD INCREASE PARTICULATE MATTER EMISSIONS

Modeling conducted by SMAQMD has indicated that applying basic construction rules will ensure that impacts will not be significant provided that construction is limited to no

more than 15 acres of active grading. On a project of this size, it is unreasonable to assume that construction will be limited to such a small area. The Project will generate particulate matter emissions which exceed thresholds.

AIR QUALITY: IMPLEMENTATION OF THE PROJECT COULD CONFLICT WITH OR OBSTRUCT IMPLEMENTATION OF AIR QUALITY PLANS

The Project will result in significant emissions of ozone precursors, which SMAQMD has indicated can obstruct successful implementation of the State Implementation Plan (SIP). The current SIP did not assume that the land east of Grant Line Road would develop, and thus even if the Project's emissions of ozone precursors were not significant, the Project would still conflict with implementation of the SIP.

BIOLOGICAL RESOURCES: WETLANDS

In total, there are approximately 89.1 acres of wetland resources on the Project site. The Project will result in the fill or dredge of 41.37 acres of wetlands, which includes approximately 16 acres of vernal pool; three acres of seasonal wetland; 15 acres of seasonal wetland swale; six acres of intermittent drainage; and less than one acre of seep, stock pond, and creek. Mitigation is required to offset these direct impacts, but given the extent of wetland loss (46% of the wetlands on the site) and the fact that this is in a Rank 1 Vernal Pool Recovery Plan area the mitigation is not sufficient to reduce impacts.

Future development within the SPA could include amendments to the SPA which would modify the Avoided Area boundaries. This could result in additional incremental losses of needed uplands and/or wetlands, increasing the severity of what is already a significant impact in an area noted as vital to the recovery of vernal pool resources. For this reason, mitigation is also included which would require the establishment of a permanent conservation easement over all areas designed as Avoided.

BIOLOGICAL RESOURCES: INVERTEBRATES

The site contains wetlands suitable for the California linderella, midvalley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Published protocols for the vernal pool fairy shrimp and vernal pool tadpole shrimp contain survey requirements for determining absence, and mitigation to be applied in case of presence or if presence is being assumed. These same measures are applied to the Species of Concern, California linderella and midvalley fairy shrimp as well. Mitigation being required for these species will also serve to provide mitigation for the Ricksecker's water scavenger beetle, which uses the same habitats. Though in-kind mitigation will be required for the loss of habitat on the site, the loss of 46% of the wetlands on the site within an area identified as vital to the recovery for vernal pool habitats and their dependent species is significant even with mitigation.

CLIMATE CHANGE: GREENHOUSE GAS EMISSIONS AND CONFLICT WITH PLANS INTENDED TO AVOID SUBSTANTIAL CLIMATE CHANGE

In concert with state and federal activities, the design features of the SPA are intended to offset the Project climate change impact. Ideally, this mitigation would reduce the Project emissions and climate change impacts to levels that are not cumulatively significant, but there are many unknown variables and implementation challenges. Refinements to the County baseline modeling have already resulted in a change to the significance thresholds – a change which takes the Project from a conclusion of less than significant to a conclusion of significant. Furthermore, it is possible that the 15% emissions reduction estimated by the state will be revised upward. Aside from changes to the targets, the quantification of Project emissions has used the best available evidence, but there is a lack of research on the accuracy of such modeling compared to the actual emissions which result from the constructed master planning area. Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling this analysis concludes that Project impacts may remain significant. The analysis likewise concludes that due to uncertainties the Project may hamper attainment of AB 32 and SB 375 goals.

CLIMATE CHANGE: IMPACTS TO THE PROJECT

The effects of climatic changes on the Sacramento region are potentially significant, and can only be mitigated through both adaptation and reduction strategies.

Sacramento County is requiring that this Project, as well as other projects in the County, mitigate for their emissions. Adaptation strategies related to climate change may involve new water supply reservoirs or other storage options, changes to dam release schedules, changes to medical and social service programs, and other broad-level actions. Most of these strategies are within the auspices of the State of California, not local government. This is recognized within the AB 32 Scoping Plan that has been adopted by the State, as well as publications by agencies such as the California Department of Water Resources. Therefore, by requiring mitigation of projects that may result in significant greenhouse gas emissions, and by adopting County programs and changes in government operations, the County is implementing all feasible strategies to reduce the effects of climate change on the region. Nonetheless, it is probable that these strategies will not be sufficient to offset all of the impacts of climate change, and that some of these impacts will be significant.

LAND USE: CONFLICT WITH THE SACOG BLUEPRINT

The Project includes a wide variety of transportation choices, an array of housing choices, a mix of uses, compact community design, and fosters a sense of place. While acknowledging that in terms of internal community design the Project appears to be an excellent example of “smart growth” development, it must also be acknowledged that the Project conflicts with the principles with respect to the preservation of open space and the proximity to existing developed communities. In terms of open space preservation, the analysis is somewhat subjective, and the Project has directed

preservation toward the most sensitive vernal pool areas of the site. In terms of directing development toward existing communities, the conflict is more clear. Though projected for future development, the Blueprint envisions growth occurring from the existing city centers outward rather than the reverse. This is a fundamental underpinning to the Blueprint, and as a result, the Project's inconsistency with this principle is considered substantial.

NOISE: SUBSTANTIAL INCREASE IN EXISTING AMBIENT VOLUMES

The Project would result in a substantial increase in existing ambient noise for multiple roadway segments, but only two of these include receptors which would be impacted: Sunrise Boulevard and Douglas Boulevard. Noise volumes would be increased by 2 dB on Sunrise Boulevard and by 7 dB and 10 dB along Douglas Boulevard. Based on the existing noise environments, these are substantial increases. On Sunrise Boulevard, a noise barrier is not appropriate because businesses rely on visibility to attract customers, and on Douglas Road a barrier is already present. Thus, no further improvements can be made to reduce impacts.

PUBLIC UTILITIES: INFRASTRUCTURE CONSTRUCTION

Water, sewer, and dry utility lines constructed within the Project boundaries would not cause any additional utility-specific construction impacts, as utility construction will occur within areas that will already urbanize as part of the Project. Most of the off-site utility lines are shown within areas already proposed for utility construction as part of service provider master planning documents. There are some improvement areas which have not already been studied or approved, and which are likely to contribute to wetland impacts and impacts to associated species, which have been determined to be substantial.

TRAFFIC AND CIRCULATION: FACILITY IMPACTS

The Project results in significant impacts to the Zinfandel and US 50 freeway ramp intersection and to the Sunrise Boulevard from US 50 to White Rock Road roadway segment in the existing condition. Neither facility can be expanded sufficiently to offset the impact, as neither Caltrans nor the City of Rancho Cordova have identified any plans or secured any funding for such a project. In the case of the roadway facility, a General Plan Amendment would be required to increase the allowed facility size, and significant right-of-way would need to be acquired. For these reasons, no feasible mitigation exists to offset the impacts.

The Project results in significant impacts to the following facilities in the cumulative condition:

- *Intersections:* Zinfandel and US 50 freeway ramp intersection and Sunrise Boulevard and International Drive.

- *Roadway/Freeway Segments:* Grant Line Road from North Loop Road to Douglas Road, eastbound US 50 from Watt Avenue to Bradshaw Road, eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue, westbound US 50 from Hazel Avenue to Rancho Cordova Parkway, westbound US 50 from Mather Field Road to Power Inn/Howe Avenue.
- *Freeway Ramps:* eastbound US 50 Exit Ramp to Watt Avenue, eastbound US 50 Slip Ramp Entrance from Watt Avenue, westbound US 50 Exit Ramp to Watt Avenue, and westbound US 50 Slip Ramp Entrance from Watt Avenue.

For the same reasons discussed for existing condition impacts, feasible mitigation does not exist to improve operations to acceptable levels.

In addition, the Project will result in significant impacts to intersections and roadway/freeway segments which do not lie wholly within the jurisdiction of Sacramento County. While in most cases mitigation has been identified which would reduce impacts to less than significant levels, Sacramento County does not have the land use authority to assure that non-County facilities will be constructed.

SIGNIFICANT EFFECTS WHICH COULD BE AVOIDED WITH IMPLEMENTATION OF MITIGATION MEASURES

AGRICULTURAL RESOURCES

The proposed uses are permitted with approval of the Zoning Ordinance Amendment to adopt the Cordova Hills SPA, there are no lands designated as Prime Farmland, and the land does not support intensive agricultural investment. Though there are soils that are considered prime when irrigated, the site is not irrigated. The Project will result in the loss of 8.6 acres of Unique Farmland and 242.4 acres of Grazing Land, which exceeds the 50-acre threshold established by the County; mitigation is required. The Project will not result in substantial conflicts with existing agricultural use of adjacent lands, though mitigation requiring deed notices is recommended.

There is one existing Williamson Act Contract (72-AP-109) within the Project limits. The landowner initiated the non-renewal process for this contract in February 2007. Under the nonrenewal process the contract will expire in the year 2016, and the land will no longer be subject to Williamson Act contract restrictions. The Project proposal includes a large-lot subdivision map which would create parcels that range from less than an acre in size to approximately 35 acres, and also includes a rezone from an agricultural to an urban designation. In order to approve the subdivision map, the approval action would either need to be deferred until February 2013 (within three years of nonrenewal) or the Board of Supervisors would need to be make findings that the parcels can maintain agricultural use. In order to approve the rezoning, the approval action would need to stipulate that the zoning agreement will not become effective until 2016.

Provided these actions take place, the Project would be consistent with the provisions of the Williamson Act.

AIR QUALITY: CONSTRUCTION ACTIVITIES WOULD INCREASE NO_x EMISSIONS

The Project has the potential to result in significant impacts throughout most of the life of the Project, even after implementation of the Basic Construction Emission Control Practices and Enhanced Construction Emission Control Practices which are required by rule through the Sacramento Metropolitan Air Quality District (SMAQMD). Mitigation is included (which is in addition to the rules) to ensure that all subsequent projects which occur within the Project area conform to the SMAQMD mitigation and abatement requirements which are in effect at the time. This will offset Project emissions.

AIR QUALITY: PROJECT OPERATION WOULD RESULT IN TAC EMISSIONS

Using the published California Air Resources Board siting criteria for sources of toxic air contaminants (TAC) and sensitive receptors, there are no off-site TAC sources proximate to the sensitive receptors of the Project, and the Project will not generate TAC that would impact off-site sensitive receptors. The Project could result in exposure of proposed on-site uses to proposed on-site stationary source TAC, but mitigation is included to ensure that the siting of new uses conforms to ARB recommendations.

AIR QUALITY: PROJECT OPERATION MAY RESULT IN EXPOSURE TO OBJECTIONABLE ODORS

The Project is proximate to both the Boys Ranch and the Kiefer Landfill. The former facility includes wastewater treatment ponds. The facility is specifically prohibited from causing a nuisance odor condition, and nuisance odor is fully controllable through maintenance of aerated conditions in the ponds. Though based on historic operation of wastewater facilities in general and of this facility in specific it can be expected that there will be events when aeration fails (a pump malfunctions, for instance), it can also be expected that these will be infrequent events of short duration.

Only considering the meteorological conditions and the proximity of the Project to the landfill, it would be likely that some significant odor impacts to the Project could occur; however, the SMAQMD Guide does provide further information regarding factors that can reduce odor impacts, if present. Kiefer Landfill has established an active gas-to-energy system that employs active gas extraction from the landfill for use in electrical generation. As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given the foregoing and the mitigation incorporated below, odor impacts are not expected to be substantial.

BIOLOGICAL RESOURCES: BIRD SPECIES

The following special status bird species are identified as having potential to occur on or near the Project site: burrowing owl, Cooper's hawk, ferruginous hawk, golden eagle, grasshopper sparrow, northern harrier, Swainson's hawk, tricolored blackbird, and white-tailed kite. Excluding the large avoided area and two adjacent smaller avoided areas on the western side of the site, the Project will result in the conversion of 2,120 acres of grassland habitat to urban uses (note that the central linear avoided area is not considered preserved for the purposes of Swainson's hawk habitat, which is why the mitigation total for that species is 2,231 acres). Except the tricolored blackbird, all of the species listed above use grasslands for foraging and/or nesting and will be impacted by Project development. The Swainson's hawk is the only Threatened species, and mitigation is included requiring 1:1 habitat mitigation. Mitigation of habitat for the benefit of the Swainson's hawk will also provide habitat compensation for other bird species.

The Project site does not contain any trees for nesting, but there are offsite trees nearby; pre-construction nesting surveys have been included for tree-nesting raptors. Pre-construction nesting surveys are also included for burrowing owl (which is ground-nesting), and are also included for tricolored blackbird (for those areas which are within 300 feet of suitable habitat, such as cattail or blackberry).

BIOLOGICAL RESOURCES: PLANT SPECIES

The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc. The special status plant surveys revealed two special status species present on the Project site: legumere and Sacramento Orcutt grass. The wetlands containing these plants are located within Avoided Areas, but given the proximity of these wetlands to development areas, mitigation requires additional measures be implemented to control invasive species and to avoid pollution runoff from urban activities.

CULTURAL RESOURCES

The Project area contains three historic era sites, and a fourth historical site that is included in a multi-component site. One prehistoric bedrock mortar station site and one prehistoric component of a multi-component site were discovered in the project area. None of the sites are associated with any important persons or events in California or national history. They are not considered to be unique and do not represent the work of a master or possess high artistic values. In all cases, the historic sites lack sufficient cultural material to address research questions. All of the historic sites were evaluated as not eligible under any criteria for the National Register of Historic Places or the California Register of Historical Resources and are not considered a historical resource or unique archeological resource as defined by CEQA. There always remains a potential to encounter buried or as yet undiscovered resources during land clearing and construction work. Mitigation is included to ensure that such resources are treated appropriately if discovered.

HAZARDS AND HAZARDOUS MATERIALS

The site was assessed for on-site hazardous conditions, and this assessment concluded that there is no evidence of any recognized hazardous conditions that may have a significant adverse effect on the development of the project site. There are three agency-listed contaminated sites within approximately one mile of the project site. These include the Sacramento County Boys Ranch (a juvenile correction facility within 1,000 feet of the eastern Project boundary), Aerojet (located just over a mile to the northwest), and the Kiefer Landfill (located approximately 2,000 feet to the south). The Boys Ranch hazardous condition was remediated and the case closed. Aerojet remediation activities are ongoing. Contaminated soils from Aerojet would not affect the Project, as these are off-site, while the groundwater contamination plumes are migrating away from the Project area. Groundwater contamination at Kiefer Landfill is likewise migrating away from the Project site. The Project will also be using public water provided through the Sacramento County Water Agency, not groundwater. Landfill gas migration from Kiefer Landfill also appears not to affect the site, but a mitigation measure is nonetheless included for the small portion of the site outside of the Urban Services Boundary that is within the 2,000 foot buffer established around the Kiefer Landfill.

NOISE: ON-SITE NOISE SOURCES (TRAFFIC AND STATIONARY)

Traffic on the internal Project roadways will generate noise that has the potential to exceed General Plan noise standards related to both residential and non-residential uses. Mitigation is included to ensure that future subdivisions and non-residential developments are constructed in a manner that achieves compliance with General Plan standards. The Project also includes uses which include noise-generating sources such as playing fields, loading docks, a corporation yard, and other uses. Mitigation is included to require that all such uses located adjacent to residential lands be designed so as not to cause the General Plan standards to be exceeded.

TRAFFIC AND CIRCULATION: FACILITY IMPACTS

The Project results in significant existing condition impacts to six County intersections, ten City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, two County roadway segments, one City of Elk Grove roadway segment, eleven City of Rancho Cordova roadway segments, two US 50 freeway segments, and bicycle and pedestrian facilities. The Project results in significant cumulative condition impacts to five City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, one new Project roadway segment, four City of Rancho Cordova roadway segments, six Caltrans freeway segments, and four Caltrans freeway ramps. For all of the facilities within Sacramento County, mitigation has been provided which would reduce impacts to less than significant. Mitigation is also available and has been described for most of the facilities not within County jurisdiction, which would reduce impacts to less than significant if their construction could be assured (refer to the Significant Effects Which Cannot Be Avoided section).

EFFECTS FOUND NOT TO BE SIGNIFICANT

AIR QUALITY: PROJECT OPERATION WOULD GENERATE CO EMISSIONS

Eighteen intersections would either be subject to degradation of LOS to a level of service E or worse, or add vehicles to an intersection already operating at an LOS of E or worse. Examining these facilities as compared to the SMAQMD screening methodology for CO impacts: none of the affected intersections would result in an hourly traffic volume of more than 31,000 vehicles, a review of area topography indicates that these intersections are located in open areas (not in locations where vertical or horizontal mixing would be limited), and the Project would not substantially change the mix of vehicle fleets typical to Sacramento County at these intersections. Project traffic would not cause threshold exceedance.

BIOLOGICAL RESOURCES: AMPHIBIANS

The Project site contains suitable breeding habitat and suitable upland habitat for the western spadefoot toad. The Project will result in loss of approximately 19 acres of seasonal wetlands and vernal pools which are potential breeding habitat for the species. Western spadefoot, a Species of Concern, has been observed in several counties across the state, and a number of sites with suitable habitat for western spadefoot are already being protected. Additionally, 23 vernal pool species are federally protected; preservation efforts for those species and associated habitats will contribute to the conservation of the western spadefoot. While a localized population of the toad may be reduced through development of the Project site, the regional population will not be reduced significantly for the reasons stated above.

GEOLOGY AND SOILS

Multiple topics were examined: soil erosion, expansive soils, naturally occurring asbestos, mineral resources, and geologic hazards. The Project has the potential to increase soil erosion due to disturbance of onsite soils, and some of the soils in the Project area have a high shrink-swell potential. There are existing regulations in place to address both of these issues, including the Sacramento County Land Grading and Erosion Control Ordinance, the Uniform Building Code, and the California Building Code. The Project site is not considered likely to include asbestos-containing soils, and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site, and furthermore, the Project includes a plan to use whatever suitable rock deposits are found on the site to serve Project construction needs; the Project will not obstruct access to mineral resources. Seismic ground-shaking hazards are low in Sacramento County, and existing building codes require adherence to seismic design standards.

HYDROLOGY AND WATER QUALITY

The Project included a Drainage Master Plan which evaluated the on- and off-site floodplains, the potential for hydromodification of stream channels, and the adequacy of existing and planned stormwater infrastructure. The existing floodplains on the site will be within the Avoided Areas where no development will occur, and detention basins have been included to ensure that the post-Project flow rates do not exceed pre-Project rates. Put in general terms, the design to prevent hydromodification is a detention basin outlet control structure which retains all stormwater runoff generated up to a 10-year event and slowly releases the runoff through a very small outlet. The Project also includes stormwater infrastructure which is sufficient to handle flows.

Compliance with adopted Ordinances and standards will ensure that future development projects implemented as a result of Project approval will not cause violation of a water quality standard or waste discharge requirement, result in substantial erosion or siltation, and will not result in substantial increases to polluted runoff associated with construction. Compliance with the County Stormwater Ordinance, implementation of Low Impact Development Standards, and implementation of the Drainage Master Plan will ensure that development of the site will not alter the course of local waterways in a manner that results in substantial erosion or siltation, will not cause violation of a water quality standard or waste discharge requirement, and will not result in substantial increases to polluted runoff.

LAND USE: CONFLICT WITH ADOPTED LAND USE PLANS

The Project uses are compatible with surrounding existing and proposed land use plans, and would not result in substantial conflicts with land use plans designed to avoid environmental effects.

LAND USE: CONFLICT WITH GENERAL PLAN POLICIES RELATED TO GROWTH INDUCEMENT

The Project is inconsistent with Policy LU-1, and includes a General Plan Amendment to address this inconsistency. The General Plan Amendment includes language specifically intended to avoid growth-inducing impacts.

LAND USE: CONFLICT WITH GENERAL PLAN POLICIES RELATED TO PUBLIC SERVICES AND UTILITIES

Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The Project includes a facilities financing plan which was submitted to all of the applicable service entities for review and approval. Long-term funding sources have been identified for the maintenance of public services. The Project will not result in any substantial environmental impacts related to conflict with General Plan policies which pertain to public services or utilities.

LAND USE: CONFLICT WITH GENERAL PLAN POLICIES RELATED TO AIR QUALITY AND TRANSPORTATION

The Project results in significant impacts related to both transportation and air quality, but these impacts are not due to General Plan Policy inconsistency. The Project is consistent with policies intended to alleviate air quality and transportation impacts.

LAND USE: CONFLICT WITH GENERAL PLAN POLICIES RELATED TO LAND USE COMPATIBILITY

Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development. The Project is adjacent to two existing uses, the Boys Ranch and Kiefer Landfill, with the potential to result in conflicts. For the Boys Ranch, the distance from the majority of the site and the topographical changes between the site and the Boys Ranch act as a natural barrier. For the Kiefer Landfill, distance from the site combined with existing regulations for landfills will prevent substantial impacts. For both facilities, there remains the potential for nuisance impacts. For this reason, mitigation is included requiring disclosure of the facilities to prospective buyers.

LAND USE: DIVISION/DISRUPTION OF AN ESTABLISHED COMMUNITY

The division or disruption of an established community is an impact considered by CEQA. Case law has established that a project must create physical barriers within the established community in order to be considered under this impact category. There is no existing development on the project site, nor are there developments north, south, or east of the site that could be divided or disrupted by the project. Furthermore, the Project includes stub streets so that if there is development north or south of the site in the future, those uses could connect into the Project. The project will not disrupt or divide an established community.

LAND USE: DISPLACEMENT OF HOUSING

There is no existing housing on the Project site that could be displaced by the project, nor would the project uses cause the displacement of nearby housing. The site is not included in the affordable housing inventory as part of implementation of the Sacramento County General Plan Housing Element.

NOISE: KIEFER LANDFILL

All sensitive uses are located a sufficient distance from the landfill to avoid substantial noise exposure. Noise at the university/college campus center (the nearest area where residences would be located) would be 44 dB, which is well within standards.

NOISE: MATHER AIRPORT

The project site is located approximately four miles east of Mather Airport. Although the project site is located outside the 60 dB CNEL contour of Mather Airport, the project site is located within the overflight path of approaching and departing aircraft that fly below 3,000 feet above ground level. During an average one-month time period, a very small percentage of total departure (two percent) and arrival (eight percent) flights are passing over the project site and there is less than 15 percent of the total touch-and-go flights passing over the project site. Though the Project will not expose people to excessive aircraft noise, continued and future use of Mather Airport has the potential to be a nuisance and generate objections by residents and other sensitive receptors. An Avigation Easement to inform future potential residential buyers will be required to help reduce the impact to Mather Airport from new complaints by future residents or other sensitive receptors of the proposed Project; these various conditions are included as mitigation.

PUBLIC SERVICES

The public services analysis concludes that the Project provides for adequate public services and will not result in substantial adverse physical impacts associated with the construction of facilities, or result in a service demand that cannot be met by existing or reasonably foreseeable service capacity. In summary, service needs are as follows:

- Up to two fire stations, each of which will require a truck company, an engine company, and a medic company.
- A total of 16 new Sacramento County Sheriff's Department staff.
- 18,592 tons of waste of annual landfill disposal and 25,241 tons of construction debris disposed of in the landfill.
- Three elementary schools but only about 62% of a middle/high school, with student generation of 2,553 in grades K – 6 (elementary school), 748 in grades 7 – 8 (middle school), and 1,384 in grades 9 – 12 (high school).
- Approximately 107 acres of parkland required, with the Project providing approximately 99 acres of formal parkland and 151 acres of recreational open space which will receive partial credit.
- The Cordova Hills SPA indicates that a new full service, 15,000 square foot branch library is planned within the proposed Town Center to serve the Cordova Hills community as well as residents in the surrounding area.

PUBLIC UTILITIES

There is adequate water supply, sewage disposal capacity, and energy supply to serve the Project, nor will provision of these utilities result in substantial impacts to the

sustainability of groundwater resources or to groundwater recharge. The projected annual demands and system capacities are as follows:

- Water demand is 6,549.9 acre feet per year (AFY), while Zone 40 supply is 102,151 AFY.
- Sewage disposal demand is 4.99 million gallons per day (mgd) average dry weather flow and the peak wet weather flow is 10.41 mgd while the Sacramento Regional Wastewater Treatment Plant has remaining capacity of approximately 40 mgd average dry weather flow.
- Electricity demand is 527,434,520 kilowatt hours annually, which is a fraction of the total 10,691.67 million kilowatt hours delivered in Sacramento County in 2010.
- Natural gas demand is 4,215,491 therms annually, which is a fraction of the 315.57 million therms delivered in Sacramento County in 2010.

As a signatory to the WFA and a member of the Sacramento Central Groundwater Authority (Groundwater Authority), SCWA recognizes the Water Forum-defined long-term sustainable average annual yield of the underlying groundwater basin of 273,000 AFY. The additional groundwater draw caused from implementation of the proposed Project will not result in exceedance of the agreed-upon sustainable yield of 273,000 AFY. Furthermore, the central intermittent drainage on the site – which is mapped as an area of high groundwater recharge potential – is being retained within open space in the Project, and will not be subject to direct impacts.

TRAFFIC AND CIRCULATION: FACILITY IMPACTS AND CONFLICT WITH PLANS

Existing condition Project impacts will not be substantial for 28 of the 45 studied intersections, 40 of the 54 studied roadway segments, eight of the ten studied freeway segments, and all six of the studied freeway ramps. Cumulative condition Project impacts will not be substantial for 60 of the 66 studied intersections, 75 of the 80 studied roadway segments, four of the ten studied freeway segments, and two of the six studied freeway ramps.

IRREVERSIBLE ENVIRONMENTAL CHANGES

CEQA Guidelines Section 15126.2 requires the evaluation of significant irreversible environmental changes, stating that “uses of nonrenewable resources during the initial and continued phases of a proposed project may be irreversible since a large commitment of these resources makes removal or nonuse thereafter unlikely.” This section of the EIR evaluates whether the project would result in the irretrievable commitment of resources, or would cause irreversible changes in the environment.

Construction of various Project elements will require irretrievable commitments of a variety of finite natural resources, including aggregates, petrochemicals, and metals. These commitments will occur both as direct and indirect impacts of the Project. Direct impacts include the consumption of fuel by the construction fleet and equipment, the consumption of fuel as part of vehicle usage originating from and entering the completed Project, the use of metals in the constructed buildings, and the use of aggregates in the constructed buildings and paved surfaces. Indirect impacts include the consumption of fuel and other resources to produce the materials used in construction. The Project will also require the commitment of potentially renewable, but limited natural resources such as lumber, other forest products, and water.

The Project includes design features whose purpose is to reduce the usage of energy, water, and construction materials (see the Project Description chapter). CEQA Guidelines Appendix F focuses particularly on the “inefficient, wasteful and unnecessary consumption of energy.” As discussed in the Climate Change chapter, the Project includes a commitment to achieve building design which is 20% more efficient than 2008 Title 24 standards, water-efficient landscapes, water efficient irrigation, and the use of reclaimed water (when available). As described in the Public Services chapter, it is anticipated that 50% of the construction debris and 70% of all household/commercial waste will be diverted from the landfill for recycling. For these reasons, the investment of additional resources in the project would be less than the level of investment historically required for projects of this scale and type.

18 CUMULATIVE AND GROWTH INDUCING IMPACTS

INTRODUCTION

The CEQA Guidelines section 15355 defines a cumulative impact as “two or more individual effects which, when considered together, are considerable”. An individual effect need not itself be significant to result in significant cumulative effects; the impact is the result of the incremental effects of the Project combined with the effects of “other closely related past, present, and reasonably foreseeable probable future projects.” CEQA does not define “closely related”, but the Code of Federal Regulations (40 CFR 1508.25) indicates that a “closely related” project is one which is automatically triggered by the Project; one which cannot proceed without the Project first proceeding (mutual dependency); one which requires the Project for justification or is an interdependent part of the same action; or one which is a similar action with common timing, geography, and other features.

The requirements for a cumulative analysis are described in CEQA Guidelines Section 15130. A cumulative analysis “need not provide as great detail as is provided for the effects attributable to the project alone.” The analysis should focus on analyzing the effects of the Project to which other projects contribute, to the extent practical and reasonable. These other projects may be identified either through the provision of a list of cumulative projects, or via a summary of projections contained in an adopted General Plan or an adopted EIR. This EIR uses a combination of the two methods, using projections contained in adopted General Plans and related planning documents, as well as known major reasonably foreseeable other projects.

The significance criteria used for analysis are the same as those used throughout the topical chapters of the EIR. Section 15130(a)(3) states that a Project’s contribution to an impact is “less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures”.

GROWTH INDUCING IMPACTS

GROWTH INDUCEMENT

The CEQA Guidelines identify several ways in which a project could have growth-inducing impacts (CEQA Guidelines Section 15126.2). Growth inducement is when a project fosters economic or population growth in the surrounding environment, which may be directly or indirectly caused. For instance, a project may generate significant additional employment opportunities, which in turn generates the construction of additional housing to bring additional residents near this employment center. Indirect

growth inducement is also possible, if a project removes obstacles to population growth, or encourages and facilitates other activities that are beyond those proposed as part of the project. For instance, a project may upgrade and increase the capacity of a major water pipeline, which then allows additional development in the area that had previously been constrained by lack of additional infrastructure capacity. Aside from infrastructure, other indirect examples include altering the availability of developable land and precedent-setting actions related to local government growth policies.

Growth inducement may not be considered necessarily detrimental, beneficial, or of significance under CEQA. Induced growth is considered a significant impact only if it directly or indirectly affects the ability of agencies to provide needed public services or if it can be demonstrated that the potential growth, in some other way, significantly affects the environment. The paragraphs below analyze the Project's potential to induce growth by removing a barrier to growth, by setting a land use precedent, or by fostering additional development.

REMOVING BARRIERS TO GROWTH

The Project includes the extension of public infrastructure, including water lines and sewer lines. There are several possibilities outlined in the Public Utilities chapter for the routing of existing service lines, but all involve extending existing lines more than ½-mile from their current locations, and through areas west of the Project which are currently undeveloped. The costs for this extension are estimated to be \$6.5 million for off-site sewer construction alone. The construction of this backbone infrastructure could remove or reduce financial and infrastructure constraints in the undeveloped areas. The extension of infrastructure through the site itself could also remove such barriers for development of land within the USB immediately north or south of the Project. The public utilities studies have, in fact, included analyses which demonstrate that it would be possible for the property south of the Project to connect to the proposed sewer and water system within the Project boundaries. Conceptual water and sewer lines are shown extending through the property south of the site. The Project also includes roads that end in stubs at the northern and southern Project boundaries. The parcels south of the site currently have no public roadway frontage, but would be able to connect to the Project roadway system.

Extension of infrastructure through undeveloped areas west of the site does have the potential to reduce some constraints to growth; however, all of these areas have already been considered for growth even in absence of the Project. The entire area east of Sunrise Boulevard and south of Douglas Road, where the extensions would take place, are the subject of proposed or approved master plans. These are the Sunridge Specific Plan, the Suncreek Specific Plan, and the Arboretum development. The Project will not cause substantial growth inducement west of the site; growth in these areas is already contemplated. The sections below do not further discuss areas west of the site.

Areas north and south of the Project have physical constraints very similar to those of the Project: wetland resources, variable topography, and no proximate existing utilities. The Project would remove the latter barrier by extending water and sewer lines through

the Project. Neither the Sacramento Area Council of Governments MTP nor Blueprint anticipate growth in the areas north or south of the Project until after the Project reaches buildout. The City of Rancho Cordova General Plan included the Project area and areas north and south of the site within the planning boundary of the “East Planning Area”. Although the City of Rancho Cordova has no jurisdictional authority in these areas, it is worthy of note that the “Timing” section for the East Planning Area indicates that although development is currently not assumed during the life of the General Plan, development may occur within the General Plan time horizon if “necessary conditions are met (e.g. **infrastructure is provided**, annexation is approved)”. [emphasis added]

Although existing planning documents indicate that there is some minimal existing development pressure north and south of the site, there is no expectation of development until well after Project buildout is completed. The extension of service lines and roadways into the site could cause development north and south of the site to occur during the construction life of the Project, because a major barrier to growth would be removed or alleviated.

LAND USE PRECEDENT AND FOSTERING DEVELOPMENT

There are two primary elements of the Project which could set a land use precedent or otherwise foster development: expansion of the UPA to include the Project area and a General Plan Amendment to allow the extension of public water outside of the Urban Services Boundary.

Currently, the areas east of Grant Line Road and within the USB are designated for agricultural use, and are predominantly used as grazing land. The Project will extend the UPA two miles into these undeveloped grazing lands east of Grant Line Road, while leaving areas north and south of the property outside of the UPA. The property to the north of the site is already adjacent to property designated for urban uses (in Rancho Cordova, across Grant Line Road), but after Project approval it would be adjacent on two sides. The property to the south is currently landlocked, without access to public roads or other infrastructure, or proximity to existing designated urban uses. The Project would change those circumstances, and would also make urbanization of the property more logical because of the adjacency of the new urban sphere. Though the Project would bring areas into closer proximity with urbanized areas, it is not this land use decision which will drive the growth, but rather the extension of infrastructure discussed in the prior section. General Plan Policy LU-120 sets the standards for UPA expansion, and the Planning Division has determined that the Project meets these standards. Implementing a policy in the manner it was intended to be applied is not precedent-setting.

The Project also includes a General Plan Amendment which would change the existing General Plan policy prohibiting the provision of public water outside of the Urban Services Boundary (USB). The Amended Policy would read:

Policy LU-XX (numbering would be added after approval). Limited public water service and facilities can be extended beyond the Urban Policy

Area/Urban Services Boundary to serve the 251 acre area located in proximity to Kiefer Landfill, as shown in Exhibit "A". Permitted uses within this area include agriculture, sports park, solar farm, district energy plant, corporation yard, park and ride lot, transit parking facility, fueling station, roads, storm water and storm water quality basins, community gardens, avoided areas, sewer pump station and lines, water tanks and similar utilities. Water facilities shall be sized adequately to only serve these permitted uses. Furthermore, proposed uses must be consistent with these permitted uses, act as a buffer between urban and open space uses, and help strengthen and preserve the current location of the Urban Services Boundary.

The Sacramento County Board of Supervisors voted to initiate this policy amendment on September 28, 2011. The staff report prepared for this action indicated that the uses proposed for this area are conditionally permissible within the AG-80 zoning of the site, but that groundwater to serve the uses would be insufficient in drought conditions. It was also noted that groundwater extraction could impact groundwater remediation efforts at Kiefer Landfill. According to correspondence with the Sacramento County Department of Waste Management and Recycling and the Sacramento County Department of Water Resources, the likelihood of impacts could be studied and subsequently mitigated through changes to the remediation system, but that this would be costly. Under the circumstances, the Sacramento County Planning Division recommended initiation of the policy amendment.

This action sets a precedent, as Zone 40 water has never been provided outside of the Urban Services Boundary to serve *proposed* uses, though it has been extended to serve *existing* uses due to a public health and safety hazard (e.g. contaminated groundwater jeopardizing the water supply of existing communities). That said, it is unlikely to be common that a proposal is constrained both by supply and by contribution toward a hazardous condition, as it is in this case. Also, the uses being served are those which would be conditionally allowed within the AG-80 zoning in any case, so approval would not set a precedent for allowing uses which are not ordinarily permissible. For these reasons, it is concluded that although the policy change sets a precedent, that this change will not result in substantial additional growth.

CONCLUSION

The Project will not induce growth west of Grant Line Road, but will induce growth both north and south of the Project. The land to the north and south includes several thousand acres of large parcels. Review of aerial photography indicates that these properties have similar physical resources as the Project site, including wetlands and other special status species habitat. Growth in these areas is also likely to cause additional transportation system impacts and a commensurate increase in pollutant emissions. Project impacts in these topical areas are significant, and the conversion of adjacent lands to urban uses will contribute to this impact; the Project will result in *significant* environmental impacts associated with growth inducement.

CUMULATIVE ENVIRONMENTAL SETTING

The cumulative setting is based largely upon the development forecasts of the adopted Sacramento Area Council of Governments' 2035 Metropolitan Transportation Plan (MTP) development forecast. The MTP was approved with a certified FEIR on March 20, 2008. The MTP included development projections for Sacramento County and its incorporated cities, as well as for adjacent counties and cities, based on adopted and in-development General Plans, Specific Plans, and Community Plans in each jurisdiction. Reasonably foreseeable development areas already considered in the MTP include the proposed 2030 Sacramento County General Plan, the areas within the Vineyard community of Sacramento County, Rio Del Oro, Easton, the proposed City of Folsom SOI, and the City of Rancho Cordova Sunridge and Suncreek Specific Plans.

The above baseline cumulative setting was then augmented with current data on approved and proposed projects in Sacramento County. These include several major quarry proposals (Teichert Quarry, FEIR certified November 2010; Stoneridge Quarry formerly known as Walldown, FEIR dated October 2011; and Milgate Quarry, formerly known as DeSilva Gates, NOP dated January 2008) a greenwaste composting facility known as Greencycle (approved March 2010), and the Kiefer Landfill Special Planning Area (NOP dated April 19, 2010). In addition to these land use projects, the cumulative analysis also considers the Capitol Southeast Connector roadway project (Draft Program EIR dated March 2011). The analyses below also consider the growth which could occur north and south of the Project as a result of Project approval.

CUMULATIVE IMPACTS AND ANALYSIS

Cumulative impacts are assessed below, organized by EIR chapter. Mitigation measures are not included at the end of each subtopic below, but are instead included at the end of the Cumulative Impacts and Analysis section.

AESTHETICS

Singular project aesthetics analyses focus on a specific project site and its immediate environment, but for the purposes of this cumulative discussion the viewshed is defined more broadly. Most of the County includes relatively flat topography which is either urbanized or dominated by crop farming interspersed with rural communities and open space areas. The eastern portion of the County that is east of Grant Line Road, north of the Cosumnes River, and west of Carson Creek is non-urban, but is also of low cropland potential. For these reasons, this landscape tends to be dominated by unmodified grasslands which are used for grazing. The character of these lands are very similar to the visual character described for the site in the Aesthetics chapter.

The viewing groups for this larger viewshed area are mostly composed of people traveling along roadways which border the viewshed, such as Grant Line Road,

Jackson Highway, White Rock Road, and Scott Road. Scott Road is designated as a scenic road by the Sacramento County General Plan. Most of this viewshed is within the Urban Services Boundary of the existing Sacramento County General Plan, and can ultimately be expected to develop. As discussed, the Project is likely to induce growth within this area earlier than had been anticipated. As the Project results in significant visual impacts to the views of the site, it is also reasonable to conclude that additional development north and south of the site would have similar impacts. These impacts are related to the conversion of open space to urban uses, and cannot be mitigated, and thus the Project will contribute to *significant and unavoidable* cumulative aesthetic impacts.

AGRICULTURAL RESOURCES

The Project site includes approximately 2,660 acres of land designated as Grazing Land and approximately 9 acres of Unique Farmland. Grazing Land is not a farmland designation specifically protected within the CEQA Guidelines or within County Policy, but loss of this farmland type can be considered under the broader significance criteria which asks whether a project may result in substantial conversion of farmland to non-agricultural use. This analysis is restricted to the cumulative analysis because grazing impacts must be very large-scale in order to result in substantial impacts; grazing is not agriculturally intensive, and thus the loss of even one thousand acres may only represent the loss of 70 cattle (the Project site supports one head of cattle for every 15 acres). When considered cumulatively with other projects impacting grazing lands in the County, the cumulative loss of grazing land may exceed 10,000 acres (this includes the three quarry projects, the Folsom SOI, and conversion of lands north and south of the site). Using the same production rate that exists on the Project site, this represents the loss of over 650 cattle. While on a singular level the Project does not cause substantial farmland impacts, the loss of grazing land due to the project in conjunction with other cumulative growth in the vicinity is cumulatively significant. Mitigation has already been included as part of the Biological Resources chapter for species which rely on grassland habitats; this mitigation will result in preservation of grasslands, and represents all feasible mitigation. Though land will be preserved, the cumulative loss of farmland is still considered significant, and thus impacts are *significant and unavoidable*.

AIR QUALITY

Project construction and operation will result in the generation of ozone precursors and particulate matter. Ozone precursors generated by construction can be mitigated to below threshold levels regardless of the amount, because of the availability of the SMAQMD mitigation fee program. All of the cumulative projects proposed are subject to the SMAQMD rules related to ozone precursors, and will be required to offset construction emissions. Even on a cumulative level, existing mitigation will be sufficient to offset construction-related ozone precursor emissions.

Even on a singular level, construction-level particulate matter emissions, operational particulate matter and ozone precursor emissions will exceed significance thresholds

despite the application of feasible mitigation, and thus the Project can also be expected to contribute to a cumulatively significant and unavoidable impact. Likewise, the Project will contribute to a cumulatively significant and unavoidable impact related to conflict with implementation of the State Implementation Plan.

Cumulative development would increase traffic and change traffic flows on the regional roadway network, and these changes would tend to increase local CO levels. The cumulative traffic impacts are anticipated to degrade the level of service to LOS E or F, or increase the traffic volume for intersections already operating at an LOS of E or worse for eighteen intersections, as shown in Table CU-1. None of the affected intersections would result in an hourly traffic volume of more than 31,000 vehicles. These intersections are not in a location where vertical or horizontal mixing would be limited, nor would the implementation of the Project substantially change the mix of vehicle fleets typical to Sacramento County at these intersections. Therefore, based on SMAQMD screening methodology as described in the methodology section of the Air Quality chapter, the cumulative impact related to increases in CO levels would be less than significant.

Though cumulative impacts related to construction emissions of ozone precursors and operational emissions of carbon monoxide are less than significant, cumulative impacts related to construction-level particulate matter, operational particulate matter and ozone precursors, and conflict with implementation of the State Implementation Plan will be *significant and unavoidable*.

Table CU-1: Cumulative Intersection LOS and Peak Hourly Volumes

BIOLOGICAL RESOURCES

Cumulative loss of grassland habitat (grazing land) may exceed 10,000 acres. Grassland habitats support a variety of special status species, as described in the Biological Resources chapter. Singular Project impacts can be reduced to less than significant levels though habitat preservation required through mitigation, but there will still be a net loss of habitat. The cumulative net loss of grassland habitat will be substantial, despite the application of singular project mitigation; the Project will contribute to a cumulatively significant and unavoidable impact related to loss of grassland habitat.

The grassland areas also include wetland resources such as vernal pools, seasonal wetlands, swales, and creeks. On the Project site alone there are nearly 90 acres of delineated wetlands. Wetlands within the three quarry areas are relatively sparse;

Teichert Quarry will impact approximately 1.5 acres of wetlands, for instance. Approximately 40 acres of wetlands would be impacted by the Folsom SOI, according to that project's FEIR (dated May 2011). Based on a review of aerial photography, the properties to the north contain wetlands in densities similar to those found on the Project site. Wetlands support special status invertebrates, amphibians, and plants. Singularly, Project impacts to wetlands and some of the associated species are significant even after the application of mitigation; thus, it can be concluded that cumulative impacts will also be considerable, and that despite the application of mitigation cumulative impacts will remain *significant and unavoidable*.

CLIMATE CHANGE

Climate change is by nature a cumulative impact, and the significance threshold is based on cumulative growth projections and the limits which must be set in order to meet reduction targets by the year 2020. To that extent, the cumulative analysis has already been completed. The cumulative development projects included in the MTP assumptions did not include greenhouse gas analyses, as the environmental work predates the 2006 Global Warming Solutions Act (AB 32), and other cumulative projects have not yet reached DEIR publication. Based on a review of the recent published EIRs, the two published quarry projects and the Folsom SOI included a greenhouse gas analysis. The Folsom SOI EIR calculated emissions of approximately 291,000 metric tons annually, while the total of both quarry projects is approximately 112,000 metric tons annually. The Project will emit approximately 147,000 metric tons annually. This results in a cumulative total of 550,000 metric tons per year of emissions, which is equivalent to approximately 4.5% of total County emissions based on the Countywide greenhouse gases inventory. Note that these figures are reported in gross totals because there is no residential component associated with those projects and they cannot be reported as a per capita figure. All of the published EIRs include mitigation to offset emissions, but for the same reasons described in the Climate Change Chapter, this mitigation may be insufficient to avert substantial climate change, and impacts are *significant and unavoidable*.

CULTURAL RESOURCES

Cumulative development in Sacramento County, could significantly impact historic, archaeological, paleontological, geologic, or human resources. The archaeology of prehistoric resources in their original contexts is crucial in developing an understanding of the social, economic, and technological character of the resources. The boundaries of an archaeologically important site could extend beyond property boundaries. As a result, a meaningful approach to preserving and managing cultural research should focus on the likely distribution of cultural resources, rather than on Project or parcel boundaries. The cultural system is represented archaeologically by the total inventory of all sites and other cultural remains. However, proper planning and appropriate mitigation can help to capture and preserve knowledge of such resources and can provide opportunities for increasing understanding of the past environmental conditions and cultures by recording data about any sites discovered and preserving artifacts

found. Based on the findings of the records and literature search and field survey, mitigation has been proposed that attempts to document and preserve cultural resources that have been identified or may be encountered during construction of this Project as well as other cumulative projects. This mitigation limits the cumulative contribution of impacts to cultural resources within the County to *less than significant* levels.

GEOLOGY AND SOILS

Most geologic impacts are not cumulative in nature. The exception is in cases where projects may obstruct access to valuable mineral resources, in which case losses can accumulate over multiple projects. The Project does not obstruct access to mineral resources, and thus does not contribute to a substantial impact; cumulative impacts are *less than significant*.

HAZARDS AND HAZARDOUS MATERIALS

Like geologic hazards, most impacts in this category are existing hazardous conditions which have the potential to impact projects, but which are not exacerbated by projects. The only impact discussed in the Hazards and Hazardous Materials chapter to which the Project could cumulatively contribute is increases in the transport, use, and disposal of hazardous materials. As concluded for the Project, all of the cumulative developments would be required to implement and comply with federal, state, and local hazardous materials regulations and codes monitored by the state and/or local jurisdictions, and as such would not create a cumulatively significant hazard; impacts are *less than significant*.

HYDROLOGY AND WATER QUALITY

The floodplain and hydromodification analyses for the Project assumed development north of the site, in order to ensure that facilities were adequately designed to handle cumulative conditions. On the basis of this cumulative environment, the Project drainage master plan has been designed to ensure that downstream impacts do not occur. Therefore, the Project will not contribute to a significant impact related to flooding or hydromodification.

As noted in the Hydrology and Water Quality chapter, Deer Creek, Carson Creek, and Laguna Creek are not listed as impaired for pollutants associated with urban runoff. All cumulative development affecting the same watersheds as the Project (this includes development to the north, development to the south, and development within the City of Rancho Cordova) will be required to comply with the Stormwater Quality Design Manual for the Sacramento and South Placer Regions, which requires that projects include source and/or treatment control measures on most new development projects. Compliance with adopted Ordinances and standards will ensure that future development projects will not cause violation of a water quality standard or waste discharge requirement. Developments are also required by the Sacramento County

General Plan and the City of Rancho Cordova General Plan to incorporate stormwater treatment basins into the drainage master plans for major development projects. This will ensure that cumulative impacts to water quality are *less than significant*.

LAND USE

Though the Land Use chapter of this EIR examined many topics (policy consistency, displacement of housing, etc), the potential cumulative impacts related to land use are restricted to the topic of land use compatibility with adjacent uses, because the character of adjacent land uses will be different in the cumulative condition than in the existing condition. The Land Use chapter already addressed probable future uses, which included master planning in the City of Rancho Cordova. Thus, the Land Use chapter has already addressed the cumulative land use impacts of the Project, and it was determined that with mitigation impacts would be *less than significant*.

NOISE

The Project analysis of noise included cumulative analyses of traffic noise, which is the noise source to which the Project could cumulatively contribute. To summarize, when comparing the cumulative condition with the cumulative plus project condition, the Project does not cause any significant impacts which cannot be mitigated; cumulative noise impacts are *less than significant*.

PUBLIC SERVICES

As described in the Public Services chapter, the Project includes adequate public services facilities and infrastructure, and also includes an infrastructure financing plan to fund the construction of those facilities. There are existing fees and other programs which fund operation of services. The Project has been reviewed by service providers. Given that the singular analysis concludes that the Project can be adequately served, the Project also does not contribute to any cumulative degradation of service; cumulative impacts are *less than significant*.

PUBLIC UTILITIES

The on-site and off-site wet and dry utility lines described in the facility master plans for the Project are designed to handle cumulative conditions, and that analysis concludes that capacity will be sufficient. The Zone 40 Water Supply Amendment prepared to accompany the Project already examines the cumulative water demand projections out to the year 2050, and projects that demand will reach 105,862 acre-feet/year. In the multiple-dry year scenario, the maximum groundwater demand will be approximately 54,000 acre-feet/year, which is within the sustainable yield of the groundwater basin. These cumulative demand projections include growth in the City of Rancho Cordova, within approved but incomplete developments within Sacramento County (e.g. Florin Vineyard Gap), and other reasonably foreseeable development. On a cumulative basis, there is sufficient water to supply the Project, and impacts are *less than significant*.

The existing capacity of the Sacramento Regional Wastewater Treatment Plant (SRWTP) is 181 million gallons per day (mgd), and existing treatment flows are 141 mgd. The SRWTP Master Plan uses an average figure of 132.4 gallons per day (gpd) per capita and combines that figure with population projections to determine the needed capacity. On this basis, the treatment plant can accommodate a population increase of approximately three million people. In terms of housing units, this is equivalent to 113,152 additional units (United States Census Bureau average household size in Sacramento Count from 2005 – 2009 was 2.67 people, (<http://quickfacts.census.gov/qfd/states/06/06067.html>, accessed on September 29, 2011). This capacity is within the projected population and household increases currently expected by the year 2035, according to the Sacramento Area Council of Governments most current draft growth projections. Cumulative impacts are *less than significant*.

TRAFFIC AND CIRCULATION

The Traffic and Circulation chapter contains cumulative analyses of impacts to the transportation network. To summarize briefly, the Project contributes to multiple cumulative impacts and mitigation is required, as listed in the topical chapter. Some of these impacts cannot be fully mitigated, and impacts are *significant and unavoidable*.

In addition to the standard cumulative condition facility analyses alluded to above, it is necessary to address the Capital Southeast Connector Project (Connector). The NOP for the Connector was published in February 2010, several months prior to the release of the Project NOP in June 2010, but a preferred alignment among the four alternatives offered had not been selected. Thus, though the Connector was reasonably foreseeable, modeling the cumulative traffic scenario with this project would have required four different cumulative base scenarios and four cumulative plus project scenarios. Given that the project design remained speculative, rather than including the Connector in the cumulative base model, a sensitivity analysis was prepared. This analysis also includes information from the Connector EIR, which was published in March 2011.

The traffic analysis of cumulative conditions for the Project assumes that Grant Line Road would have four lanes (consistent with the number of lanes in the region's currently adopted 2035 MTP) and would be improved to the County's thoroughfare standards. The Cumulative Plus Project conditions assumes that the Project's three proposed access points along Grant Line Road would be at-grade signalized intersections. The assumptions described above would not be consistent with the Connector project, if that Project identified Grant Line Road as the preferred alignment. At this time, a Final Programmatic EIR for the Connector has been published and the preferred alignment chosen is, in fact, one of the versions which uses Grant Line Road adjacent to the Project. The sensitivity analysis reflects the chosen Connector alignment.

Much of the 35 mile long Connector Project is being planned to function as an expressway, including the portion of Grant Line Road adjacent to the proposed Cordova

Hills project. An expressway is defined as a roadway with at least partial control of access, where limits are placed on the number and types of intersecting roadways and driveways. The Connector's expressway segments would consist of a four-lane or six-lane, divided roadway with grade-separated interchanges where necessary to maintain an acceptable LOS and a design speed of 65 mph. Grade separations provide opportunities to maximize the capacity of available lanes on the Connector. Where an LOS C can be maintained, the Connector Project could allow at-grade signalized intersections in lieu of the grade-separated interchanges.

The Connector EIR assumed the presence of the Project, and determined that grade-separated interchanges would be required at the access roadways to the Project along Grant Line Road to accommodate projected traffic volumes and maintain an acceptable LOS. Where grade-separated interchanges are required on the Connector, the spacing between interchanges should typically be at least one mile to provide adequate traffic operations at and between its ramp junctions. The EIR for the Connector evaluated the potential interchange locations along its expressway segments to determine if there would be adequate distance to maintain acceptable traffic operations. Table CU-2 summarizes the results of that analysis.

The analysis indicates that adequate traffic operations could be provided with the 0.7 mile spacing between Chrysanthy Boulevard and University Boulevard based on projected traffic volumes. However, the analysis indicates that the 0.5 mile spacing between Douglas Road and North Loop Road and between North Loop Road and Chrysanthy Boulevard would not allow adequate distance for weaving between ramps and merging at ramp junctions. Therefore, the Connector EIR recommends that the location where North Loop Road connects to Grant Line Road be relocated one-half mile to the north. The concept is to realign and extend North Loop Road so that it would connect to Grant Line Road as an eastern leg of a Douglas Road/Grant Line Road interchange. This connection would allow one-mile spacing between proposed interchanges at Douglas Road and Chrysanthy Boulevard and it would allow an acceptable LOS along Grant Line Road in the vicinity of the Cordova Hills project. However, the FEIR was amended from the DEIR to state that other connections which differ from the recommendation above could be allowed provided that the alternative design meets the LOS standards and performance standards for the Connector.

Though the Alternatives to the Project were identified and the traffic study initiated in August of 2010, long before the above Connector EIR analysis was published, comments from the Connector JPA on the Project NOP made it clear that the road spacing was likely to cause conflicts if Grant Line Road were selected. For this reason, the Expanded Footprint Alternative (which incorporates 90% of the Project development) includes the access design ultimately recommended by the Connector EIR.

**Table CU-2: Analysis of Distance between Planned Intersections
Along Grant Line Road**

Segment of Grant Line Road	Distance (Miles)	Distance Provides Acceptable Traffic Operations
Douglas Road to North Loop Road	0.5	No
North Loop Road to Chrysanthy Boulevard	0.5	No
Chrysanthy Boulevard to University Boulevard	0.7	Yes
University Boulevard to Kiefer Boulevard	1.2	Yes
Source: DKS Associates, 2011		

Table CU-3 presents the average daily traffic volumes along Grant Line Road and on access roadways to the Cordova Hills project under Cumulative Plus Project conditions with and without the Connector Project. The Connector would significantly increase the overall traffic volumes along Grant Line Road, since the higher speed expressway would attract more regional traffic. However, the capacity increase due to the Connector's grade-separations would be much more than the volume increase caused by the Connector. Therefore, all of Grant Line Road would operate at an acceptable level of service with the Connector. The faster speeds and improved capacity along Grant Line Road with the Connector would also increase the amount of Cordova Hills' traffic that would travel to destinations external to the project site by approximately 4.5 percent. However, the increase in external vehicle trips would not cause any of the Project's access roadways to operate at an unacceptable level of service.

To summarize, the presence of the Connector would tend to improve cumulative traffic conditions on Grant Line Road, so there are no additional Project impacts when assuming the Connector, but the current Project access design conflicts with the recommended Connector design. The access design of the Expanded Footprint Alternative would avoid this conflict.

Table CU-3: Cumulative Plus Project Roadway Operating Conditions with Connector Project

Roadway Segment	Lanes	Without Connector Project			With Connector Project		
		Volume	V/C	LOS	Volume	V/C	LOS
Grant Line Road							
Douglas Rd to North Loop Rd	4	47,380	1.32	F	44,380	0.62	B
North Loop Rd to Chrysanthy Blvd	4	27,440	0.76	C			
Chrysanthy Blvd to University Blvd	4	25,550	0.71	C	47,070	0.65	B
University Blvd to Kiefer Blvd	4	34,420	0.96	E	54,360	0.76	C

20 RESPONSE TO COMMENTS

The written comment period for the DEIR was set to close on February 22, 2012 at 5 p.m, but was extended to March 5, 2012 at the request of the California Department of Transportation (Caltrans). A total of 20 individual letters were received during the written comment period. Each letter has been given a numeric designation (e.g. Letter 1), which can be found on the upper right-hand corner of the attached letters. All 20 letters are included at the end of the Response to Comments chapter, except that the letter from Caltrans received during the comment period was superseded by a July letter; it is the July correspondence which has been included. Opportunity for oral comment on the DEIR was offered at the Sacramento County Planning Commission on September 24, 2012, at which time the comment period was closed. Each Draft EIR reviewer that submitted written comments is listed below. The letters are listed by respondent, in alphabetical order. Oral comments received during the public hearings before the Sacramento County Planning Commission are also included and are organized in accordance with the order in which they spoke. Oral comments begin after the written comments.

Individual comments addressing separate subjects within each letter are labeled in this chapter based on the letter's numeric designation and comment number (e.g. 1-1). Where a letter essentially addresses only one subject, comment numbers are not assigned. The text of the comments on DEIR adequacy has been provided, followed by a response. In cases where there is substantial letter text (spanning multiple pages), but little or none of the text addresses DEIR adequacy or this specific Project, the text of the comment has not been provided and reviewers are directed to the appropriate page of the attached comment letters. Also note that the preface language of the letters is often excluded (where the text consists of salutations and brief descriptions of the commenting organization). Oral comments have been paraphrased with a response following each comment. Oral comments which duplicated written comments submitted by the speaker are not presented; the text instead refers the reader back to the letter submitted by the speaker (this text is presented in brackets).

In some cases the response to the comment is "comment noted". Pursuant to Section 15088 of the CEQA Guidelines, no written responses are provided for those letters or comments that did not address the adequacy of the DEIR. While no response to the comment is provided, the comment letters are forwarded to the Board of Supervisors for consideration via this EIR.

LIST OF WRITTEN COMMENTS ON THE EIR (WITH PAGE ON WHICH RESPONSE BEGINS)

Written Comments on the EIR

LETTER 1

Eric Fredericks, California Department of Transportation; written correspondence; originally dated March 1, 2012 but superseded by July 6, 2012 letter

Comment 1-1

We disagree with the assertion that there are not “*any funding mechanisms established to collect money to fund such improvements*” listed on page 16-50. Caltrans has established specific mechanisms to collect and retain fair share funding to support the State Highway System (SHS) mitigation related to local development.

Response 1-1

Though Caltrans does have the means to collect fair-share funds, the statement quoted from page 16-50 is not general in nature, but refers only to the Zinfandel Drive and US 50 ramp intersection. It is accurate to state that there are no established funding mechanisms which are designed to collect funds for improvements to the facility where the Project impact is identified. There must be a nexus between an impact and the identified mitigation, so a lead agency cannot properly require payment of fair-share funds if there is no means to ensure that those funds will be used to offset the Project impact identified.

Comment 1-2

Approximately 10% of the overall trip generation is going to-or-from United States Highway (US) 50. As a result, this segment will degrade from Level of Service (LOS) E to F (Page 16-80). As mitigation for this significant impact, the DEIR has proposed to contribute fair share fees to add a transition lane on US 50 between Sunrise Boulevard (Blvd) and Hazel Avenue (Ave) in both directions. We do not agree with the Traffic Impact Study that adding a transition lane on Eastbound (EB)-50 between Sunrise Blvd and Hazel Ave will improve the LOS on this segment of EB-50 (Page 16-52). The bottle neck is located near the Folsom Blvd interchange due to the lane drop and the vertical/horizontal curves. In order to relieve the congestion on EB-50 between Sunrise Blvd and Hazel Ave, we request a fair share contribution for construction of a transition lane on EB-50 from Folsom Blvd to Scott Road (Rd) in addition to a transition lane from Sunrise Blvd. to Hazel Ave.

Response 1-2

The statements within this comment are not supported by the evidence. Firstly, of the seven freeway segments impacted, only two are a case in which the LOS is E without the Project and F with the Project (both of these are Cumulative Plus Project impacts). The mitigation referenced by this comment is for the Existing Plus Project condition, and the traffic impact study indicates that it would change LOS from F to E in the westbound direction, and from F to D in the eastbound direction. Though Caltrans states that they

do not believe the mitigation will have this effect on LOS, no evidence has been provided in support of this statement. Caltrans then suggests improving a freeway segment which is not within the study area, and which is not impacted by the Project. Though Caltrans staff may think that the reach of US 50 from Folsom Boulevard to Scott Road is in greater need of improvements, the purpose of the EIR analysis is to identify Project-related impacts and appropriate mitigation with a nexus to those impacts. Mitigation has been included for the segment of US 50 from Sunrise Boulevard to Hazel Avenue, because that is the segment impacted.

Comment 1-3

In addition, the following TDM strategies could be considered: hiring a full-time TDM coordinator for the development, providing commute shuttles to nearby Regional Transit/Capitol Corridor stations, coordinating carpools/vanpools, providing on-site satellite office space for telecommuting, incentivizing off-peak commuting, developing an internal job-housing match program, and reducing housing prices or Home Owner Association dues for units with reduced parking provision.

Response 1-3

The proposed SPA does include measures such as those recommended in this comment, including a Transit Management Association and a transit service which will connect to the Mather/Mills light rail station. Refer to the SPA Master Plan "Circulation" chapter for detailed descriptions.

LETTER 2

Glen Holstein, Botanist, California Native Plant Society, Sacramento Valley Chapter; written correspondence; undated (received February 16, 2012)

Comment 2-1

Due to length, reviewers are referred to the attached letter; the comment has not been included here. The comment begins at the outset of the letter and includes two pages of text, with a final paragraph on the third page (the portion which precedes the heading "Aesthetics").

Response 2-1

This is not a comment on the adequacy of the EIR. Comment noted.

Comment 2-2

Page 3-6 of the DEIR provides color examples of high and low visual quality places. The high quality example looks much like the Cordova Hills site does now except for its lack of oaks, while the low quality example resembles numerous places littering California left half built when the bubble burst and money ran out. The proposed Cordova Hills project promises to provide one more.

Subsequent photos in the aesthetics chapter suggest the project will have little visual impact, but all views are from outside the project site looking in. None examine the visual impact the project would cause inside its 2,669 acres. This is a significant omission since it is theoretically possible to cover the Grand Canyon's walls with condominiums invisible just a few yards from the its rim.

That's relevant to Cordova Hills since its central stream valley and the Grand Canyon share similar origins. Both are incised by erosion into nearly level flat-lying sediments (Twidale 1976). The central stream valley at Cordova Hills is tiny relative to the Grand Canyon, of course, but its relief is a rare and significant aesthetic resource in mostly level Sacramento County equal to 12.5% of total county relief (Suttle 1994). The central stream valley at Cordova Hills may be the last place in the county where natural landscapes free from the works of man can be seen. This place largely hidden from current public view is where the Cordova Hills project proposes to develop most intensively.

Response 2-2

Comment noted. CEQA requires that the impacts of a project be examined in light of the existing conditions. The site is vacant private property, and thus there are no existing public viewer groups within the Project boundaries which would be affected by Project construction. The EIR properly examines the impact of Project development on the existing viewer groups surrounding the site. The EIR found that the Project would substantially degrade the existing visual character and quality of the site and determined that the Project would have significant and unavoidable aesthetic impacts. See Draft EIR at Pages 3-10 to 3-20. It is also worth noting that the central drainage feature pointed out in this comment will be preserved within one of the Avoided Areas; it will not be filled and developed.

Comment 2-3

At the beginning of the air quality chapter (chapter 5) several air pollutants are defined but in latter parts of this chapter a pollutant category (ROG) appearing often in tables and text is left completely undefined. That kind of editorial carelessness suggests DEIR preparers were more interested in producing large numbers of pages than informing the public. Hidden in this lengthy chapter on Page 5-28 is the important conclusion that the proposed project would “exceed daily emissions thresholds” for NO_x and ROG ozone precursors that contribute significantly to unhealthy air pollution. Consequently Page 5-30 concludes that implementation of the project would have a significant and unavoidable impact on implementation of regional air quality plans

Response 2-3

The EPA uses the term VOC rather than ROG, and thus the term VOC was used in the explanation of ozone formation; however, the term ROG (reactive organic gases) is still the constituent reported by many models, and is still the term in use pursuant to the Sacramento Metropolitan Air Quality Management District’s thresholds for ozone precursors. A clarification has been added to the Air Quality chapter on this subject. Though a description of the acronym ROG was accidentally omitted, it is apparent from text located throughout the chapter that ROG is an ozone precursor (e.g. the impact heading “Impact: Operational Emissions of Ozone Precursors (NO_x or ROG)”). The conclusion referenced by the comment as being “hidden” is in fact clearly located under the major heading referenced in parentheses above.

Comment 2-4

The project’s distant location from places of employment is also in clear conflict with Sacramento County General Plan Policy EN-5 to “Reduce travel distances and reliance on the automobile and facilitate increased use of public transit through appropriate land use plans and regulations.”

Response 2-4

The Project includes an internal transit system with linkages to existing external transit provided by Sacramento Regional Transit, and also includes other trip-reducing features (described in the Air Quality Mitigation Plan and the Greenhouse Gas Reduction Plan). As described in the Climate Change chapter, compared to a “business-as-usual” development in this location, the Project design will reduce vehicle miles traveled.

Comment 2-5

On the very first page of this chapter the DEIR completely mischaracterizes vegetation of the Cordova Hills project site by stating: “The dominant vegetation is non-native grassland comprised of ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), barley (*Hordeum* species), and ryegrass (*Lolium multiflorum*).”

In fact these are only the site’s weeds. Similar areas in the site’s vicinity are native California prairie dominated by the native non-grass species *Holocarpus virgata* (Holstein 2001), and that author found during visits to Cordova Hills it also likely dominates there. Nothing in the DEIR suggests any effort was made to survey the site’s vegetation. Consequently its statement above about dominance by non-native grasses is utterly without supporting evidence.

Response 2-5

The Draft EIR states on page 6-58, “The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc.” All plant species observed on-site during those visits were documented by the surveying botanists, which is consistent with standard protocols for rare plant surveys (Appendix BR-3). The description of the grass species growing on the site is an accurate one, not just for this site but for the County’s (and even the Central Valley’s) grasslands as a whole. It is well-documented that most of the Central Valley grasslands are now dominated by non-native grass species¹. It would be inappropriate to describe these grasses as “weeds”; the term “weed” is not a scientific one², as all it means is a plant which is growing where it is not wanted. Calling the grasses weeds would seem to imply that the grassland area is not of habitat value – not wanted – when that is clearly not the case. The site supports the native plant *Holocarpha virgata*, commonly known as tarplant, but the purpose of the DEIR description was to describe the grass species which made up the grassland, not to describe all of the annual forbs. It is also worth noting that *Holocarpha virgata* is actually quite common in Central Valley grasslands, and has no special status designation. At the request of the commenter, a sentence listing some of the most common herbaceous plants on the site has been included after the description of the grasses on the site (page 6-1 of the FEIR).

Comment 2-6

This is extremely significant because among the 32 Sacramento General Plan policies cited on pages 6-3 to 6-6 are:

CO-59. Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function: native vegetative habitat. (California prairie is native vegetative habitat.)

CO-70. Community Plans, Specific Plans, and Master Plans, and development projects shall include the location, extent, proximity, and diversity of existing natural habitats and special status species in order to determine potential impacts, necessary mitigation and opportunities for preservation and restoration.

Most significantly not included among the 32 Sacramento County General Plan policies cited in these pages, however, is the following one perhaps most relevant of them all to Cordova Hills:

CO-135. Protect the ecological integrity of California Prairie habitat.

Since that is unquestionably the actual dominant habitat at Cordova Hills (Burcham 1957, p. 80; Shelford 1963, pp. 354-355; Keeler-Wolf et al. 2007, p. 22; Lulow & Young 2009), the proposed development project there would be a clear and utterly unmitigated violation of this Sacramento County General Plan policy. Cordova Hills is over 2,600 acres of the finest quality California Prairie habitat and is among the largest and most pristine areas of this habitat in Sacramento County. It is exactly what CO-135 intends to protect.

Consequently it violates the major goal outlined in the Conservation Element of the General Plan of management and protection of natural resources for the use and enjoyment of present and future generations while maintaining the long-term ecological health and balance of the environment.

Response 2-6

The term California Prairie and the relevant policy were not included due to some internal staff confusion over this policy, which was adopted two months prior to the release of the Project DEIR. Most documentation of habitats in the Sacramento Valley refers to the habitat assemblage known as Valley Grassland³, including the anticipated draft South Sacramento Habitat Conservation Plan; these same sources document that the dominant species within the grasslands are non-native, not native. It was assumed that the term California Prairie referred to a different type of grassland habitat than the term Valley Grassland, so the policy was excluded. Further investigation found that usage of the term California Prairie exists within published literature, but that it is not broadly used, and thus has no generally-recognized scientific definition. Examining the administrative record on the 2030 General Plan indicates that when the new policy was originally drafted, it was simply intended to apply to grasslands in general. Thus, the EIR has been revised to include the policy.

³ D'Antonio, et. al., Ecology and Restoration of California Grasslands with special emphasis on the influence of fire and grazing on native grassland species, page 5: "The California grassland has long been divided into two major community types, the Coastal Prairie and the Valley Grassland."

Though the term California Prairie was not used in the DEIR and the policy was excluded, it should be emphasized that the EIR does in fact analyze the impacts of the project on the ecological integrity of grassland habitats – which is to say, on the ability of the grassland habitat to support special status species reliant on that habitat. Furthermore, the Cumulative and Growth Inducing Impacts chapter specifically discusses cumulative grassland loss in the eastern County, and describes that impact as significant. Mitigation is also included for the loss of grassland habitat. The only thing absent from the EIR is the usage of the term “California Prairie”; the impact to grassland habitats has been properly assessed.

Comment 2-7

The United States Fish and Wildlife Service Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon to achieve self-sustaining populations of many species which rely on vernal pools identifies Cordova Hills as part one of its highest priority core areas vital to achieving the plan’s goals (Page 6-26). Despite this the project proposes to eliminate 46% wetlands and 33% vernal pools at Cordova Hills (Page 6-28). Such deliberate destruction of these vital wetlands would be an unconscionable environmental crime exacerbated by the project’s dubious economic prospects.

Despite DEIR discussion of mitigating this net loss, loss of vernal pools especially is essentially unmitigatable because they require specific intact soil profiles with permanent aquaculdes to pond water and thus function (Ferren & Gevirtz 1990; Leidy & White 1998). The typical mitigation project of creating artificial vernal pools is also usually done in natural California prairie landscapes. Since such construction of artificial vernal pools violates the ecological integrity of these prairie landscapes it is in direct conflict with Sacramento County General Plan policy CO-135.

Response 2-7

The Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (Recovery Plan) is cited on page 6-28 of the EIR, and it is disclosed that the Project lies within an area designated as vital to achieve the goals of the Recovery Plan. Although mitigation is included to reduce project impacts, the EIR found that “given the extent of wetland loss (46% of the wetlands on the site) and the fact that this is in a Rank 1 Vernal Pool Recovery Plan area the mitigation is not sufficient to reduce impacts.” Loss of wetland habitat was identified as a significant unavoidable impact of the Project.

Vernal pools are a functional part of grassland habitats in the County and in much of the Central Valley, and thus the inclusion of created vernal pools in grasslands – which are typically completed under the guidance of the Fish and Wildlife Service – does not degrade the ecological integrity of grasslands. The re-creation of vernal pools has long been required by the U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service as a manner of providing compensatory mitigation for lost vernal pools, with monitoring periods and success criteria that must be satisfied. In fact, created vernal pools are noted as a recovery strategy in the U.S. Fish and Wildlife Service’s Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon.

Comment 2-8

Special status species sections of the DEIR contain numerous errors of fact and interpretation. These errors do not appear to be accidental or random since they consistently minimize the impact of the proposed project on these species. Random errors are expected to be a mixture of those maximizing and minimizing impact. Examples of such errors are:

1. On Page 6-33 Ferruginous Hawk is listed as having moderate potential for occurrence on the site because “the nearest recorded occurrence is just under 6 miles west of the site.” It is well known that the recorded occurrence grid for this and several other highly vagile species is very incomplete. Consequently they must be assumed to at least occasionally use all available good habitat within their range. Since that includes all the Cordova Hills site (Small 1994, Wheeler 2003), Ferruginous Hawks have high rather than moderate potential for occurrence there.
2. On Page 6-33 Golden Eagle is listed as having moderate potential for occurrence on the site because “there are no recorded occurrences of this species within ten miles” although it is acknowledged that the species “could forage on the grassland of the site.” This is another vagile species with a very incomplete occurrence grid. Consequently they must be assumed to at least occasionally use all available good habitat within their range. Since that includes all the Cordova Hills site (Small 1994, Wheeler 2003), Golden Eagles have high rather than moderate potential for occurrence there.

Response 2-8

This is a suite of comments which takes issue with Table BR-3 of the EIR (“Special Status Species Matrix”). The reasoning behind the potential for occurrence designations is explained in the text preceding the table, and the probability of occurrence for the ferruginous hawk and golden eagle is consistent with this reasoning. The table simply provides a quick reference of all species considered, and provides a means of describing the available data for each of the species. If habitat was present but no recorded sightings occurred within five miles, the potential was “moderate” and if sightings had occurred within five miles, the potential was “high”. A rating of “high potential” versus a rating of “moderate potential” makes no difference to the subsequent analysis; all species with at least a moderate potential for occurrence are analyzed, because habitat is present for all such species. Presence of an occurrence on the CNDDDB was *not* used as the sole means to determine whether an analysis was warranted, as it was clearly stated that both lack of CNDDDB occurrence *and* lack of adequate on-site habitat must be confirmed before a discussion of the species would be excluded.

CEQA does not require the data used in an EIR to be exact, and an EIR may rely upon informed estimates. Use of an industry-standard approach for assessing an impact is also appropriate. (See, *Eureka Citizens for Responsible Government v. City of Eureka* (2007) 147 Cal.App.4th 357, 54 Cal.Rptr.3d 485. Reasonable assumptions may also be used in the impact analysis. See, *State Water Resources Control Board Cases* (2006) 136 Cal.App.4th 674, 39 Cal.Rptr.3d 189. The CNDDDB is commonly used as a database for the preparation of environmental documents. Like any database, it has its limitations (as noted by the commenter) and – to repeat – was not the sole source of the biological resources information used to prepare the Draft EIR for the Cordova Hills Project. There were also a number of site-specific biological surveys performed by

professional biologists, and a review of site habitat. Taken together, these data sources demonstrate that a good faith effort was made by the preparers of the Draft EIR to provide accurate and sufficient information to examine the proposed Project's impacts to biological resources. Please see the sources listed in the Draft EIR at Pages 19-1 to 19-9 and the Draft EIR Appendices BR-1, BR-2, BR-3 and BR-4.

Comment 2-9

3. On Page 6-33 Grasshopper Sparrow is listed as having moderate potential for occurrence despite being recorded "2.5 miles east of the site [which] contains potential foraging and nesting habitat." The DEIR thus violates its own criteria for high potential, which Page 6-31 gives as "Habitat is present and the species has been observed within five miles of the site." The DEIR emphasizes the site's lack of shrubs in an apparent attempt to minimize its habitat value for Grasshopper Sparrows, but they don't require habitat with shrubs (Small 1994). Their nests that I've personally seen were in areas completely lacking shrubs.

Response 2-9

The comment is correct that the "moderate" designation is an error, and should indicate "high". The correction has been made in the FEIR. As discussed in Response 2-8, this change has no effect on the discussion for the species, because the table was simply a means of displaying the habitat and occurrence data for each species examined, and an analysis was provided regardless of whether the potential was designated as "high" or "moderate".

Comment 2-10

4. On Page 6-34 Loggerhead Shrike is listed as having low potential for occurrence even though "the site contains foraging habitat" and "The nearest recorded occurrence is just over three miles to the west." Thus by the DEIR's own criteria given on Page 6-31 Loggerhead Shrike has high rather than low potential to occur on the site.

Response 2-10

The designation of "low potential" accurately reflects the data available for the species, and is consistent with the definitions described prior to the table. Page 6-30 of the Biological Resources chapter indicates that if the species is listed for loss of a particular habitat then the likelihood of occurrence will be based specifically on that habitat type. The loggerhead shrike is listed specifically for loss of breeding habitat. The California Department of Fish and Game Life History Account (links to these are provided at the end of Table BR-3 in the DEIR) indicate that the species breeds in shrublands or open woodlands, neither of which habitat is present on the site.

Comment 2-11

5. On Page 6-34 Northern Harrier is listed as having moderate potential for occurrence on the site because “no occurrences are recorded within ten miles” even though it is acknowledged that “foraging habitat is present on the site.” This is another vagile species with a very incomplete occurrence grid, but in suitable habitat like Cordova Hills it is seasonally abundant in Sacramento County (Bell et al. 1983). The DEIR emphasizes that the site lacks shrubs sometimes used by the species for nesting, but their use is only occasional since they often nest directly on the ground (Wheeler 2003). Since Cordova Hills is excellent habitat for Northern Harriers, their potential for occurrence there is high rather than moderate.

Response 2-11

Subsequent to DEIR release Environmental Review was made aware that northern harrier had been observed flying over the site. On this basis, the relevant section within Table BR-3 of the EIR has been changed from “moderate potential” to “high potential”. As discussed in Response 2-8, this change makes no difference to the actual analysis of the Project’s impacts to the species. Though northern harriers rarely nest within the Central Valley (refer to DEIR page 6-50) and the site nesting habitat is not optimal, the species has been added to the required raptor nesting surveys, in order to address the commenter’s apparent concerns.

Comment 2-12

6. On Page 6-34 American Badger is listed as having low potential for occurrence on the site for no apparent reason. Once again the DEIR violates its own criteria since Page 6-34 states that this species occurs in “grasslands” and “The nearest recorded occurrence is approximately 2.5 miles to the west.” According to Page 6-1 of the DEIR “grassland” is the site’s “dominant vegetation type”, and according to Page 6-31 species like American Badger for which “Habitat is present” that have “been observed within five miles of the site” have high, not low, potential for occurrence.

Response 2-12

The CNDDB occurrence listed in this comment as being 2.5 miles is noted within the CNDDB as “extirpated”, because the area was developed with residential uses. The nearest extant occurrence is more than five miles away. The American badger requires friable soils for denning; friable soils are those that break or crumble easily when handled. Dens are used on a more long-term basis for breeding, but according to the California Department of Fish and Game Life History Account for the species, they are also used in the short-term for cover – in the summer, some badgers have been observed digging a new den every night. This makes the presence of friable soils a critical habitat component. The species also prefers areas without steep topographic variation. Based on the Soil Survey of Sacramento County, the majority of site soils have a shallow hard-pan layer – which is not friable. For instance, the soils on the eastern plateau are mainly the Redding soil series, which are described as friable only up to a depth of 20 inches, after which the hardpan is usually present. This is very shallow for an animal the size of an adult badger (up to 40 pounds and, particularly when accounting for the nesting chamber necessary for the rearing of young. Areas where deeper friable soils are present on the site are located in the areas of greatest steepness, right along the margins of the deeply incised channels on the site. Soil

conditions are described in the Biological Resources chapter and in the Geology and Soils chapter.

Comment 2-13

7. On Page 6-38 Tuolumne Button-celery (*Eryngium pinnatisectum*) is listed as “Not Present” for no apparent reason. Since it is known to occur in vernal pools and in Sacramento County (Tibor 2001), its potential to occur at Cordova Hills is at least moderate and probably is high.

Response 2-13

Table BR-3 of the DEIR clearly states that the suitable habitat for Tuolumne button-celery is “mesic areas [seasonal wetland areas] within cismontane [foothills] woodland and lower montane [lower elevation mountains] coniferous forests”. The species can be found within vernal pools, but it is found within vernal pools in the above types of vegetative habitats. The site is clearly neither cismontane nor lower montane coniferous forest. There is a single occurrence of the species in Sacramento County, as noted in this comment, and it occurs near the eastern County line in the woodlands of the lower foothills.

Comment 2-14

8. On Pages 6-38 – 6-39 five rare vernal pool annual plants Dwarf Downingia, Bogg’s Lake Hedge Hyssop, Ahart’s Dwarf Rush, Pincushion Navarretia, and Slender Orcutt Grass are listed as not present at Cordova Hills because plant surveys didn’t find them. Such vernal pool annuals may not appear every year, however, even though they are present as seeds undetectable by standard plant surveys (Holland & Jain 1981). One such California annual, although not a vernal pool species, apparently survived exclusively as seeds for 102 years. Long thought extinct, it was rediscovered when its seeds finally germinated (McCune 2005). Many other examples of such rediscoveries are known in California although the duration of their presumed extinction is usually not a century long (Tibor 2001). In all such cases soil profiles have remained intact so seeds could germinate when conditions were favorable. There is at least some potential that any or all of the five rare vernal pool annuals not found by Cordova Hills plant surveys may exist there as seeds. As long as the site’s natural soil conditions are intact they might reappear at any time. The project’s proposal to destroy 33% of the site’s vernal pools significantly diminishes this possibility.

Response 2-14

The rare plant surveys were performed consistent with the guidelines established by the United States Fish and Wildlife Service, California Department of Fish and Game, and the commenter’s group, the California Native Plant Society. This included an examination of reference populations nearby the Project site, to ensure that the reference populations were in bloom at the time the on-site surveys were conducted. The EIR does conclude that wetland impacts, the habitat on which the listed rare plants are reliant, are significant and unavoidable despite mitigation.

Comment 2-15

9. On Pages 6-43 – 6-45 & 6-51 mitigation for Swainson’s Hawk habitat loss is discussed in a mishmash of statements. Some are quite strange like the claim on 6-43 that proposed avoided areas “will be connected to thousands of acres of open space to the north and west.” That conveniently ignores the likelihood of growth inducement by the proposed project that would encourage elimination of this open space.

Response 2-15

The impact of the Project to biological resources should be assessed by comparing the existing plus project condition to the existing condition. In the existing plus project condition, the lands to the north and west of the Project site are open grassland habitat, and thus the Project avoided areas would remain connected to open habitat. Certainly these lands are all within the Urban Services Boundary, and it is presumed that at some future time which is unknown these lands may develop. However, it is speculative to determine when such a future project would occur, and if it did, where and how that future project would develop. That being the case, it is also speculative to draw conclusions about the affect of such a project on the Cordova Hills avoided areas, since the impact would depend on the design of the future project (e.g. does it include preserves, and of what size, and where). Moreover, any impact would be the impact of that future project, not the impact of Cordova Hills. See, CEQA Guideline Section 15144; *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018, 48 Cal.Rptr.3d 544; *Save Round Valley Alliance v. County of Inyo* (2007) 157 Cal.App.4th 1437, 70 Cal.Rptr.3d 59.

Comment 2-16

The many potential mitigation measures discussed on 6-44 – 6-45 promise or propose nothing specific. On 6-45, for example, it is stated that “Projects impacting 40 acres or more of foraging habitat must provide land acceptable to CDFG and County.” The proposed project would clearly impact far more than 40 acres but makes no commitment to provide any land at all.

Response 2-16

The County Code referenced in the mitigation clearly indicates that projects impacting more than 40 acres cannot use the fee payment option, and must dedicate land. Mitigation Measure BR-4 also clearly indicates the amount of land which must be mitigated by land dedication (far more than 40 acres), and indicates that mitigation must be provided prior to recordation of the final map or approval of either building permits or improvement plans (whichever occurs first). In short, land dedication is explicitly required in the mitigation.

Comment 2-17

10. On Page 6-48 a “Fish and Game Life History Account” is listed as a source but not referenced in the DEIR’s bibliography. That may be another careless oversight or deliberate avoidance of sometimes inconvenient information from this source (Zeiner et al. 1990). For example the claim that “since [Ferruginous and Swainson’s hawks] use the same habitats, additional mitigation is unnecessary” is unsupported by either the source or the DEIR. Swainson’s Hawks primarily use cropland while Ferruginous Hawks mostly use rangeland (Zeiner et al. 1990), and the DEIR proposes no specific mitigation for destroying habitat of either species. The DEIR particularly emphasizes a brief and apparently casual statement in Zeiner et al. that Ferruginous Hawks successfully compete with Swainson’s Hawks to clearly imply they threaten them. If this occurs, it is likely very insignificant since in California Swainson’s are mostly present only in summer and confined to cropland while Ferruginous are present only in winter and confined to rangeland (Small 1944), and such interaction is unmentioned in modern surveys of western raptors like Wheeler’s (2003). Since Cordova Hills is significant as one of the largest remaining intact tracts of ideal wintering habitat for rare Ferruginous Hawks in the region, the DEIR’s claim that “The Development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to ferruginous hawk habitat are *less than significant*” is patently absurd.

Response 2-17

Links to the Life History Accounts published by the California Department of Fish and Game were provided in the DEIR at the foot of Table BR-3, and thereafter are simply referenced in the discussions as “the Life History Account for the species”. In the case of the Project site the two species do, in fact, use the same habitat – and it is the Project site under discussion, not a site with cropland habitat. Mitigation Measure BR-4, which requires mitigation for loss of Swainson’s hawk foraging habitat, explicitly states that dedication land must be grassland or a similar open habitat. This statement is included specifically because the grassland on the site provides habitat for other species – such as ferruginous hawk – and should be replaced with like habitat. Page 4-48 of the DEIR accurately summarizes the basic information within the Life History Account published by Fish and Game for the species. The summary includes a single sentence indicating that the species “has a tendency to displace red-tailed hawks and Swainson’s hawks” – no particular emphasis has been placed on this information.

Comment 2-18

11. Also on Page 6-48 the DEIR even more blatantly misrepresents the Golden Eagle life history account in Zeiner et al. (1990) than that of Ferruginous Hawk. The DEIR states Zeiner et al. says Golden Eagle “does not occur in the center of the Central Valley.” What it actually says is Golden Eagles don’t permanently reside in or migrate through that area. It makes quite clear, however, that they forage there in winter at places like Cordova Hills (Zeiner et al. 1990), a widely recognized fact (Wheeler 2003) even the DEIR acknowledges. Its claims that “mitigation for the golden eagle is unnecessary” because “Mitigation for foraging habitat loss has already been required as part of Swainson’s hawk impacts” and “The development of the project site would not result in substantial negative effects to the sustainability of the species, and thus impacts to golden eagle habitat are *less than significant*” are once again absurd since Golden Eagles and Swainson’s Hawks use completely different habitat and the DEIR identifies no specific mitigation plan for either species. It also fails to even mention Rough-legged Hawk, another raptor species that, like Ferruginous Hawk and Golden Eagle, uses prairie/grassland habitat for winter foraging but is somewhat less uncommon (Bell et al. 1983). Consequently it is likely to use Cordova Hills even more frequently.

Response 2-18

Refer to Response 2-17. The Fish and Game Life History Account for the species states: “Uncommon permanent resident and migrant throughout California, except center of Central Valley”. The sentence from Fish and Game does not use the term “migrate”, which would merely imply that migratory routes do not pass through the center of the Central Valley; it uses the term “migrant”, a term which describes all golden eagles which migrate. Thus, the sentence states that while the Golden Eagle exists uncommonly in California, neither migrants nor resident golden eagles (and this captures all golden eagles) occur in the center of the Central Valley.

The site is grassland, not cropland, and mitigation requires the dedication of grassland. As stated in the DEIR, to the extent that Swainson’s hawk and golden eagle individuals may forage in the same grassland habitat on the site, mitigation for the Swainson’s hawk habitat will also mitigate any impacts to golden eagle foraging habitat. Thus, it is entirely accurate to state that the species use the same habitat on this particular site, and that mitigation is sufficient for both species; the commenter has not provided any substantial evidence which runs contrary to this finding. Rough-legged hawk is not a special status species, and this comment has provided no evidence to support including a specific discussion for this species.

Comment 2-19

12. On Pages 6-48 – 6-49 the DEIR associates another species, Grasshopper Sparrow, with Swainson's Hawk despite very different habitat requirements. Grasshopper Sparrow, a California Species of Special Concern, is the California passerine species most obligately associated with undisturbed prairie/grassland habitat, and Cordova Hills is among the largest tracts of it in central California. While the species may use shrubs while singing, the DEIR's implication that lack of shrubs at Cordova Hills reduces its habitat value for this species is incorrect (Small 1994, Shuford & Gardali 2008). Once again the DEIR claims that the proposed project won't negatively impact this species because a non-existent mitigation plan for Swainson's Hawk will protect it are completely inaccurate. Large contiguous tracts of prairie/grassland habitat like Cordova Hills are the most important Grasshopper Sparrow habitat requirement, and urbanization by projects like the one now proposed there is the greatest threat to its survival (Shuford & Gardali 2008).

Response 2-19

Refer to Response 2-17. The Project site is undoubtedly large, and California's grassland habitats are being impacted by urbanization and agriculture, but it is unclear what evidentiary basis the commenter relies upon to offer the supernumerary statement that it is "among the largest tracts" of grassland in central California. There are equally large and larger tracts even in Sacramento County, as a simple review of parcel data and aerial photographs will demonstrate. Furthermore, since mitigation for lost Swainson's hawk habitat specifies grassland or a similar open habitat, this will also mitigate for any impacts to potential grasshopper sparrow habitat.

The Fish and Game Life History Account for the species states: "In general, however, Grasshopper Sparrows in California prefer short to middle-height, moderately open grasslands with scattered shrubs." The project site does not match this description, because while it is "short to middle-height" grassland, it is very open and contains no shrubs. Thus, it is accurate to state that this may inhibit use of the site when compared to nearby areas which do contain some scattered shrubs.

Comment 2-20

13. On Page 6-49 the claim is again made that a non-existent mitigation plan for Swainson's Hawk will greatly reduce the impact of development at Cordova Hills on a California Species of Special Concern, the raptor Northern Harrier, despite DEIR acknowledgement that thousands of acres of ideal harrier habitat would be lost. Contrary to the DEIR claim such "impacts to northern harrier are *less than significant*", California Department of Fish and Game states that "The primary threats to breeding harriers are loss and degradation of nesting and foraging habitat" (Shuford & Gardali 2008).

Response 2-20

Refer to Response 2-17. As stated in the DEIR, to the extent that Swainson's hawk and northern harrier individuals may forage in the same grassland habitat on the site, mitigation for the Swainson's hawk habitat will also mitigate any impacts to northern harrier foraging habitat.

Comment 2-21

14. On Pages 6-53 – 6-54 the DEIR claims “Project impacts to western spadefoot toad are *less than significant*” because various “conservation lands” it names are preserved, but it provides no evidence Western Spadefoot actually exists at any of them. Numerous places with apparently suitable habitat lack records of Western Spadefoot, a California Species of Special Concern that requires a specific pattern of wetland and upland habitat and associated fauna to survive (Jennings & Hayes 1994). The thriving population of Western Spadefoot at Cordova Hills confirms it has these suitable conditions, but the named “conservation lands” lack its unique wetland/upland geometry or any evidence provided by the DEIR of spadefoot presence. The healthy Western Spadefoot population at Cordova Hills makes it a biological treasure of great value. Wanton destruction of that treasure would be a crime against nature.

Response 2-21

The DEIR cites the Vernal Pool Recovery Plan published by the United States Fish and Wildlife Service, which is the source for many of the conservation lands listed as being regional preserves which support western spadefoot. Western spadefoot toads have been documented at both the Gill Ranch Conservation Bank (as reported in the *California Tiger Salamander Assessment-Level Aquatic Larval Survey for Gill Ranch*) and at the Mather Regional Park (CNDDDB Occurrences 56, 167, and 396). The reasoning for the determination that impacts could be mitigated is explained in the DEIR. The comment cites Jennings and Hayes, which is in fact the same source used by the EIR preparers to develop the habitat description for the species used in the EIR (the internet link to the publication is provided at the foot of Table BR-3). Nothing in Jennings and Hayes provides information which conflicts with the information presented in the EIR.

The commenter has provided no evidence that this particular population of western spadefoot is more “healthy” or “thriving” – terms which are subjective in any case – than other populations. Even for species listed under the California or federal Endangered Species Act, protocol surveys are not required to provide detailed assessments of populations and their abundance; the purpose of a survey is simply to determine presence or absence, so that it can be determined whether mitigation is necessary.

Comment 2-22

15. On Pages 6-54 to 6-55 the DEIR acknowledges that several special status invertebrates are expected to occur in Cordova Hills wetlands. These are three Federal Special Concern Species (California Linderiella, Ricksecker’s Water Scavenger Beetle, and Midvalley Fairy Shrimp) and one Federal Threatened Species (Midvalley Fairy Shrimp). It also acknowledges that the project’s proposal to eliminate 43% of Cordova Hills wetlands providing their habitat would be a “*significant and unavoidable*” impact to them.
16. On Page 2 of BR-3 (Special Status Plant Survey Reports) the presence of common vetch at the site is mentioned but it is not included in the site plant list (Attachment C). That’s a great rarity for this DEIR, an honest mistake.

Response 2-22

Comment noted. The Cordova Hills plant list has been amended to include the common vetch.

Comment 2-23

17. On Page 6 of BR-3 it is reported that the earliest rare plant surveys started April 21, 2008, and even later in other years. Starting that late and only including a single year of any April surveys may cause species to be missed, especially in years with early heat waves like 1988 when 90 degrees was recorded on March 28 at Sacramento (The Weather Channel 2012). The latest surveys ended August 9, too early to clearly record the site's dominance by native *Holocarpha virgata*.

Response 2-23

Refer to Response 2-14. The surveys were timed to identify rare vernal pool plants, not to identify a common, native species not found in vernal pools.

Comment 2-24

18. Page 12 of BR-3 states that Tuolumne button-celery was not surveyed for because it occurs in cismontane woodland and conifer forest, which aren't present at Cordova Hills, but it also occurs in vernal pools and in Sacramento County (Tibor 2001), which makes it a potential Cordova Hills rare species that should have been surveyed for.

Response 2-24

Refer to Response 2-13. The source quoted by the commenter is simply an inventory of listed species with a very basic listing of species facts (scientific name, a bullet-list of habitats, elevations, etc), and does not include life history details and other background information. Thus, the commenter appears to have taken the bullet-list of habitats for the species (cismontane woodland, lower montane coniferous forest, vernal pools) and erroneously determined that it occurs in vernal pools as a stand-alone habitat, wherever they may be found, rather than having more accurately concluded that they occur in vernal pools *within* cismontane woodlands and lower montane coniferous forest. The vernal pools on the site are not within woodland or forest habitats, and thus the site does not include suitable habitat for the species.

While the Tuolumne button-celery was not considered a target species for Project plant surveys, the surveys were floristic in nature, and would have detected and noted Tuolumne button-celery if it was present on-site at Cordova Hills.

Comment 2-25

This chapter is a vast haystack of information about climate change that's mostly irrelevant to Cordova Hills, but hidden in that haystack are a few very relevant needles. They are:

1. On Page 7-13 there is very brief reference to the Sacramento County Climate Action Plan goals of “reductions in vehicle miles traveled” and “higher density development”. The proposed Cordova Hills development plan’s great distance from existing communities and realistic employment opportunities is in direct conflict with these goals.
2. On Pages 7-26 – 7-27 it is acknowledged the proposed project would exceed acceptable levels of greenhouse gas emissions because its isolation from existing communities would cause too many long car trips. Consequently “it is concluded that [its] impacts [on greenhouse gas emissions] are *significant and unavoidable*.” The DEIR also suggests the model determining the project would violate greenhouse gas reduction targets is biased against it in various ways, but the model is actually strongly biased in the project’s favor since it assumes a university at Cordova Hills will provide employment and reduce car trips despite lack of evidence or any prospect such a university will ever be built (see above).

Response 2-25

The primary purpose of a community-level Climate Action Plan is to address emissions from the existing built community; at this time it is the thresholds of significance that are intended to address whether or not proposed future projects are contributing their fair share of offsets. The Climate Change chapter acknowledges well-known modeling limitations, but concludes that it is unknown whether removal of those limitations would result in higher or lower VMT – it specifically states that it should *not* be assumed that it would lower impacts. The university/college campus center is part of the proposed project; it is not “bias” to analyze a project as it has been proposed.

Comment 2-26

The DEIR’s climate change chapter completely ignores an important and very relevant issue regarding its mitigation. The over 2,600 acres of natural California prairie habitat at Cordova Hills currently provides a critical ecological service of sequestering the atmospheric carbon dioxide that primarily contributes to climate change. This habitat has greater and more sustainable capacity to provide this ecological service than the better known contribution made by forests in comparable climate zones since temperate prairies, grasslands, and steppes sequester an average of 21.2 kilograms of carbon per square meter while temperate forests sequester an average of only 19.8 (Schlesinger 1991). The Cordova Hills development project proposes eliminating the critical climate change mitigation ecological service California prairie currently provides there.

Response 2-26

There is a one-time release of greenhouse gases due to permanent changes in landscapes – for instance, when a forest burns down. Areas temporarily disturbed that will eventually recover to become vegetated do not need to be counted as part of that release, nor do areas which will be avoided. There is no standardized protocol for project-level modeling of greenhouse gases in California at this time. Methodologies and significance thresholds differ between jurisdictions and between Air Quality Management Districts. Landscape-level changes in greenhouse gas emissions can be a particular challenge to model, because research on the amount of sequestration provided by certain landscape types is highly variable. For instance, this comment cites

a study identifying grassland sequestration as approximately 87 metric tons per acre (converted from 21.2 kilograms per square meter), while the California Air Pollution Control Officer's Association (CAPCOA) lists a default number of 4.31 metric tons of CO₂ accumulation per acre for grassland. This is a dramatic difference in numbers. Due to these uncertainties, including the landform sequestration potential in greenhouse gas analyses is not the part of the standard methodology used by Sacramento County, nor was it required by the Sacramento Metropolitan Air Quality Management District. Sacramento County and the Sacramento Metropolitan Air Quality Management District have indicated an interest in calculating or otherwise including the usage of individual tree planting as mitigation, and thus there was a credit given for the planting of 15,000 trees (a very conservative number). But no credit was given for the planting of shrubs or groundcover, and no greenhouse gas reduction credit was taken for the removal of the cattle from the property, despite the fact that cattle generate methane, a high global warming potential greenhouse gas.

Comment 2-27

Page 9-19 acknowledges Sacramento County General Plan policy AG-28 requires "The County shall actively encourage conservation of soil resources." That is necessary in general for implementation of policy CO-59 ensuring that mitigation occurs for any loss of native vegetative habitat and in particular for implementation of policies CO-134 to maintain and establish a diversity of native vegetative species in Sacramento County and CO-135 to protect the ecological integrity of California Prairie habitat. Cordova Hills are almost entirely California Prairie habitat and currently support a diversity of native vegetative species highly dependent on soil resources with intact and undisturbed soil profiles (Jackson et al. 2007). The proposed Cordova Hills project thus directly conflicts with Sacramento County General Plan policies AG-28, CO-59, CO-134, and CO-135 because it would eliminate over 2,000 acres of intact soils and native California Prairie vegetation.

Response 2-27

The cited policy, AG-28, is preceded by language which states that the intent of the policy is to reduce soil losses associated with tillage of light-textured soils in the Delta, which are highly susceptible to wind erosion and are prime for agricultural use. The Project is not in the Delta, and does not contain light-textured soils. The policy should not have been included in the DEIR for that reason and has been stricken in the FEIR. Mitigation for habitat on the site has been provided; refer to the Biological Resources chapter. Also refer to Response 2-6. The Project does not "conflict" with the General Plan policies listed, because appropriate mitigation has been provided.

Comment 2-28

This chapter attempts to spin the unspinnable fact that the proposed Cordova Hills project is the opposite of smart growth and violates numerous policies encouraging it. Among them are the following Sacramento County General Plan policies:

1. LU-1 (P. 12-2) – “The County shall not provide urban services beyond the Urban Policy Area.” The proposed project is beyond the Urban Policy Area.
2. LU-12 (P. 12-2) – “The County will prohibit land use projects which are not contiguous to the existing UPA, city boundaries, or existing planned communities or master plan areas (i.e. leapfrog development.” The proposed project is a textbook example of leapfrog development.
3. LU-21 (Pp. 12-2 – 12-3) – “Promote a better balance of employment, neighborhood services, and different housing types by reviewing development projects and the surrounding community and designing new projects wherever feasible so that they maintain or improve the mix of uses in the community.” The proposed project has no surrounding community and depends for employment on a hypothetical university with no realistic prospect of ever existing.
4. LU-22 (P. 12-3) – “Specific Plans and Community Plans should provide a balance of employment, neighborhood services, and different housing types wherever feasible.” The proposed project’s Specific Plan depends on a hypothetical university with no realistic prospect of ever existing for employment.
5. LU-113 (P. 12-4) – The County shall work with SACOG to support implementation of Blueprint’s policies and land use objectives.” The proposed project massively conflicts with those objectives.

Response 2-28

All of the land use policies described in these comments were considered in the analysis of the Project. These comments are one-line statements indicating the commenter’s opinion about the Project’s interface with these policies. The comments do not provide any discussion indicating how or where the DEIR is deficient with regard to these. In fact, the comment on LU-113 states that the Project conflicts with the Blueprint – which is precisely the conclusion drawn in the DEIR. The statements are unsubstantiated, do not always even disagree with the DEIR, and the Land Use chapter provides substantiated analysis of the policies. Comment noted.

Comment 2-29

6. LU -120 (Pp. 12-4 – 12-5) – “The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside the UPA if the Board finds that the proposed project is planned and will be built in a manner that: meets all the requirements per PC-1 through PC-10 and; meets one of two alternative performance metrics.” The proposed project meets neither all the requirements nor the performance metrics. Among requirements not met are:
7. PC-6 (P. 12-7) – “Inclusion of an infrastructure Master Plan and Financing Plan [is required].” While such a plan is provided, its assumptions are unrealistic as discussed below.
8. PC-8 (P. 12-8) – “Consistency with all applicable County adopted plans not sought to be amended by the proposed project [is required].” The proposed project is inconsistent with numerous elements of the adopted Sacramento County General Plan as discussed in these comments.
9. PC-9 (P. 12-8) – “Inclusion of a discussion/analysis of how the proposed UPA expansion/Master Plan relates to broad-based and regional planning efforts, such as SACOG’s adopted Blueprint Vision and Metropolitan Transportation Plan, Sacramento County’s Visioning documents created for the Jackson Highway and Grant Line East Areas, any applicable Habitat Conservation Plan(s), The Sacramento Metropolitan Air Quality Management District’s State Implementation Plan, and Regional Transit’s Master Plan [is required].” While discussion/analysis of how the proposed UPA expansion relates to these broad-based regional planning efforts is present, it clearly shows it violates their spirit and letter as is discussed elsewhere in these comments.
10. PC-10 (P. 12-8) – “Inclusion of a discussion/analysis of the proposed UPA expansion/Master Plan’s jobs-housing balance [is required]. Master Plans should provide an internal jobs-housing balance and/or improve jobs-housing balance within the project’s vicinity.” The proposed UPA expansion depends for jobs on a hypothetical university with no realistic prospect of ever actually existing.

Response 2-29

Project impacts related to this policy are described beginning on page 12-32 of the DEIR. The policy states that it is up to the Board of Supervisors to make a finding of consistency or inconsistency. The DEIR provides the Planning section’s analysis of the Project in light of this policy, which concludes that the Board could find the Project is consistent. Responses from the Planning section are provided in bulleted form:

- PC-6: The policy requires an Infrastructure Financing Plan, which has been provided. The Cordova Hills Financing Plan, including associated assumptions, was subject to an extensive review by several county and non county staff. This effort was coordinated by the Infrastructure Financing Services of County’s Building and Code Enforcement Department. This comment provides no supporting evidence for the alleged deficiency.
- PC-8: The Project has been designed to be consistent with adopted infrastructure master plans. The Cordova Hills application includes several General Plan Amendment entitlements to bring the project into compliance with the adopted General Plan including amendments to the Urban Policy Area, Land Use Diagram, Transportation Diagram and Bikeways Master Plan. This comment provides no supporting evidence for the alleged inaccurate assumptions, nor does it identify the specific inaccurate assumptions.

- PC-9: The policy language requires such a discussion, but does not require any particular conclusion. A discussion has been provided; this criteria has been satisfied.
- PC-10: The Draft EIR, Appendix TR-1, Table 1 - Projected Land Use (page 152) identifies the 4,633 employees projected in Cordova Hills in addition to the 2,036 employees projected at the university/college campus center for a total of 6,669 employees. Thus, the majority of jobs are not affiliated with the university/college campus center. The non-university jobs include retail, business professional, public services, and schools. Minus the university site, the Cordova Hills Land Use Plan designates over one million square feet of commercial and office uses. Jobs will also be created following the establishment of the Cordova Hills Community Services District or County Services Area and construction of school sites. There is also an abundance of jobs within a five mile radius of Cordova Hills which includes the employment center along Highway 50 corridor in Rancho Cordova.

Comment 2-30

11. In Alternative #1 Criteria-based performance metrics the DEIR uses to justify a proposed UPA expansion increase desirable densification by counting group quarters at this entirely unrealistic hypothetical university (P. 12-10).

Response 2-30

Comment noted. The university/college campus center is part of the proposed Project, and must be analyzed as such – it should not be treated as being any more hypothetical than any other use in a long-term master plan.

Comment 2-31

12. In Alternative #1 Criteria-based performance metrics “Planned transit service shall be defined as service identified in SACOG’s Metropolitan Transportation Plan (MTP), Regional Transit’s (RT) Short Range Transit Plan (S RTP), and/or service to be provided as part of the Master Plan and funded via a secure financial mechanism (example: CSA 10; North Natomas TMA/developer fees). The MTP has a 20+ year planning horizon and is updated every four years; the S RTP has a 10-year planning horizon and is updated every year. Both the MTP and S RTP must be “financially constrained” in that only transportation projects and programs for which funding is reasonably expected to be available may be included in the plan. Therefore there is high likelihood that transit service identified in these plans will ultimately be provided. Service to be provided as part of a Master Plan and funded via a secure financial mechanism would provide similar assurances that identified service will ultimately be provided. In contrast transit service envisioned in RT’s long range TransitAction Plan cannot be implemented until a significant new revenue source is secured, making such service far more speculative. For example, a new ½ cent sales tax increase would only partially fund transit service envisioned in the TransitAction Plan. Therefore, service(s) identified in the TransitAction Plan and similar visioning documents will not be considered.” As discussed elsewhere in these comments, financing for transit and other services for the proposed project are hypothetical, highly speculative, and ultimately infeasible.

Response 2-31

The Draft EIR passage cited in the comment clearly states that the performance metrics consider “services provided as part of the Master Plan and funded via a secure financial mechanism” (example CSA 10; North Natomas TMA Developer fees). The Cordova Hills Master Plan includes a lengthy description of just such a transit service and finance mechanism. The planned Cordova Hills transit service does not rely on the MTP or Regional Transit Short Range Transit Plan or RT’s Long Range Transit Plan for implementation. As an example, the Draft EIR mentioned the North Natomas TMA as a transit system that is locally funded and does not depend on the SACOG or RT plans for funding. It is not speculative or infeasible to utilize a similar system at Cordova Hills. The comment does not substantiate the alleged deficiency. The appropriate County departments and agencies, including the Infrastructure Finance Section, have thoroughly vetted the adequacy of the Infrastructure Master Plans and the Financing Plan. Consideration and ultimate approval of these plans by the Board of Supervisors will be made with the input and recommendation of the appropriate agencies and departments. Commenter has not provided any substantial evidence that any specific assumptions used in those plans were unrealistic or inaccurate.

Comment 2-32

13. In Alternative #1 Criteria-based performance metrics (P.12-14) “Analysis of existing employment/jobs within a five mile radius of the proposed UPA/Master Plan boundary [is required].” Such employment/jobs are essentially non-existent at Cordova Hills.

Response 2-32

This statement is unsubstantiated. The Draft EIR, Appendix TR-1, Table 1 – Projected Land Use (page 152) identifies the 4,633 employees projected in Cordova Hills in

addition to the 2,036 employees projected at the university/college campus center for a total of 6,669 employees. Also see Response 2-29. Comment noted.

Comment 2-33

14. Low Vehicle Miles Travelled (VMT)/Greenhouse Gas (GHG) Emission metrics are Alternative #2 performance metrics (Pp. 12-14 – 12-15), but the DEIR's climate change chapter determined the proposed project's VMT and GHG are "*significant and unavoidable*" impacts on climate change (P. 7-26).

Response 2-33

Consistency with PC-1 through PC-10 is mandatory, after which an applicant must be consistent with Alternative criteria #1 or Alternative criteria #2. The applicant chose to use Alternative #1, and the Planning section reviewed the Project on that basis. Alternative #2 performance metrics are therefore not applicable to the project.

Comment 2-34

15. Sacramento County General Plan Policy LU-123 (P. 12-15) requires that "Before granting approval of an amendment to the Land Use Diagram, the Board of Supervisors shall find that the request is consistent with the objectives and policies of the General Plan; the request is consistent with the goals and objectives of a Sacramento County adopted Habitat Conservation Plan; approval of the proposal will not adversely affect the fiscal resources of the County; [and] the project will be consistent with the performance standards in this Plan and, for urban uses in urban growth areas, the project complies with the requirements of LU-13." The proposed plan violates this plan because it is inconsistent with numerous other Sacramento County General Plan policies, there is no adopted Habitat Conservation Plan and it would be inconsistent with the goals and objectives of one if it were adopted, fiscal resources of the County would be adversely affected as discussed below, and financial aspects of LU-13 are not adequately complied with as discussed below.

Response 2-34

Refer to Response 2-27, Response 2-28, and Response 2-29. The General Plan policy does not require an approved HCP to be in existence before an amendment to the General Plan's Land Use Diagram can be approved, it merely indicates that a project must be consistent with any existing plans. It is entirely speculative to declare that the Project would be inconsistent with an HCP after having just stated (correctly) that an HCP doesn't exist. The comment claims inadequacies in the financial analysis and numerous policy inconsistencies, but does not specifically identify any particular inadequacy.

Comment 2-35

The proposed Cordova Hills project also directly conflicts with the Sacramento Area Council of Governments (SACOG) Blueprint since it violates at least two of its seven core principles (Pages 12-15, 12-16):

1. Principle 5 is “strengthen and direct development toward existing communities.” The project directs it away from existing communities toward open space.
2. Principle 7 is “preserve open space, farmland, natural beauty, and critical environmental areas. The project is proposed to be sited entirely on open space of great natural beauty and critical environmental importance.

“The ultimate purpose of the ‘smart growth’ concept supported by the principles is sustainable communities, and is a reaction to the recognized health and safety impacts of urban sprawl and vehicle-centric development strategies.” The latter describes the proposed project, which is definitely not smart growth since that “must be consistent with all seven principles” (P. 12-17).

On Page 12-18 the concept of developing in existing communities is explained as follows:

“Directing development toward existing communities is accomplished by building on infill land and urban brownfields before developing greenfields, building on greenfields only after the prime infill and brownfield land is developed and developing greenfields in a logical and phased progression beginning in those areas nearest to existing urban lands.” Much Sacramento infill and brownfield land has not been developed, and the project proposes building on greenfields distant and isolated from existing urban lands (P. 12-30).

Page 12-19 states that the purpose of preserving open space in Principle 7 is to “ensure that a project preserves the most sensitive and prime resources within the area. This is partly accomplished through principle 5, which directs development toward existing communities.” Not only does the project not direct development toward existing communities, even its own inadequate environmental analysis acknowledges it will eliminate 43% of its environmentally critical wetlands. Its even more extensive critical uplands are entirely written off and ignored by being falsely labeled non-native annual grassland (see above)

On Page 12-20 the DEIR acknowledges that “Based on the CEQA guidelines, a land use impact is significant if Project implementation results in ...Substantial conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project.” These comments identify numerous examples of such conflicts.

Response 2-35

These comments do not appear to disagree with the analysis in the DEIR, but instead emphasize that the Project is inconsistent with Blueprint policies five and seven and that this is a significant land use impact. With regard to grasslands, refer to Response 2-5.

Comment 2-36

Other conflicts arise from the DEIR's internal contradictions. For example in reference to Swainson's Hawks P. 6-43 states "On the basis of the above research, the 298-acre Avoided Area on the western side of the site, plus two adjacent Avoided Areas to the north and south, will remain suitable habitat; this collective area is 382 acres, which will be connected to thousands of acres of open space to the north and west" while P. 12-24 states that "Although the land to the west of the Project is currently undeveloped open space, some of this area has land use entitlements and is likely to develop in the near-term." In other words the DEIR wants it both ways. The land to the west is long term open space when the goal is expanding Swainson's Hawk habitat but soon to be developed urban land when the goal is adjacency to other communities.

Response 2-36

There is no inconsistency between the cited sections. One section states that the onsite preserve will be connected to open space to the north and west, and the second section states that "*some* of the land to the west" (emphasis added) includes urban land use entitlements. A *portion* of lands to the west are the subject of an approved master plan (the Sunridge Specific Plan), while many other thousands of acres within the limits of the City of Rancho Cordova are not. The portion of land with the approved master plan is across from North Loop Road, while the land to the west which interfaces with the Project avoided area is not the subject of an approved master plan. Furthermore, Page 6-43 is focused on describing existing plus Project conditions as it relates to the Swainson's hawk, not cumulative conditions. In the existing condition, land to the north and west is largely undeveloped. It is also worth noting that there is connectivity to the Kiefer Landfill preserve areas, and that this direct connectivity links the onsite open space with large tracts of grassland and cropland outside of the Urban Services Boundary. Additional clarifying language, which mirrors this response, has been added to the FEIR discussion of Swainson's hawk.

Comment 2-37

On Page 12-26 it is acknowledged that "the [SACOG] Blueprint should be city-centric, focusing growth within the confines of incorporated city boundaries as a logical buildout from existing urban areas...on this basis the Project goes beyond the level of development assumed outside the city areas by the year 2050." Could there be any more explicit violation of the Blueprint? The same page states "The Project...includes a mass transit system operated by the Cordova Hills Community Services District." A reasonable person might think that means a significant mass transportation connection to Sacramento, but no. Page 16-82 makes it clear that "Since there are no plans to expand services to the Project site, it must be assumed that extension of existing transit to the Project area will not occur."

Response 2-37

The beginning of this comment appears to agree with Project analysis with regard to the Blueprint, but then discusses the planned transit system and misconstrues DEIR analysis by citing a section out of context. Sacramento Regional Transit District (Regional Transit) has no plans to extend existing service to the Project, but the Cordova Hills planned transit system, as described in multiple chapters of the DEIR (predominantly in the Traffic and Circulation chapter), will be coordinated with the Regional Transit Gold Line and will connect to the Mather/Mills light rail station.

Comment 2-38

Page 12-28 makes much of planned bicycle and pedestrian paths that “will make non-automotive routes the most direct line of travel in many cases.” An important question is travel to where? The plan is designed around a theoretical university with no realistic prospects of ever being built. Consequently what the project proposes are pedestrian and bicycle paths to nowhere. On the same page the DEIR claims this imaginary university will increase the project’s density and thus its “compact building and community design.”

Response 2-38

This comment seems to assume that all non-automotive travel would be going to the university/college campus center, rather than to the parks, elementary schools, restaurants, and adjacent neighborhoods that make up the bulk of travel in most communities. The university/college campus center is certainly a unique use in the proposed Project, but it is in the southwestern corner of the site, and is hardly the hub of the pedestrian and bicycle network. The pedestrian and bicycle network is an integral part of the proposal regardless of the university/college campus center. One hundred percent (100%) of all homes will be within ¼-mile of a park, paseo or open space corridor; 94% of all homes will be within ½-mile of a transit stop; 87% of all homes will be within ½-mile of a school; and 84% of all homes will be within ½-mile of a commercial service center. The university/college campus center is part of the proposed Project, and must be analyzed as such – it should not be treated as being any more hypothetical than any other use in a long-term master plan. The presence of student dormitories does increase the density of the Project.

Comment 2-39

On Page 12-29 the DEIR acknowledges that the project conflicts with SACOG Blueprint principle 5 since it proposes development directed away from rather than toward existing communities. It thus violates Sacramento County General Plan policies requiring conformance with Blueprint principles. The DEIR identifies the nearest existing communities to the site as being 4 and 6 miles away.

Principle 7 of the SACOG Blueprint is preserve open space, farmland, natural beauty, and critical environmental areas. The Cordova Hills site is 2,669 acres of such open space and has outstanding natural beauty. Its wetland acreage is identified as a critical environmental area of the highest priority in the United States Fish and Wildlife Service (USFWS) Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon. Nevertheless on Page 12-31 the DEIR acknowledges the proposed plan would eliminate 44% of the site’s wetland acreage and 33% of its vernal pool acreage despite its identification by USFWS as a highest priority critical environmental area. The site’s non-wetland open space, also proposed for elimination, is native California prairie habitat of great environmental value to many native plant and animal species, some of which are discussed elsewhere in these comments. The DEIR consequently concludes correctly that “the land area preserved is insufficient to meet the intent of the principle [7], and thus with General Plan Policy.”

On Page 12-32 the DEIR further concludes correctly that “the Project’s inconsistency with this principle [5] is considered a substantial conflict with the Blueprint and with General Plan policy which supports the Blueprint. Avoidance of this impact would require substantial Project redesign and relocation. Though Alternatives have been considered which would reduce this impact, there is no mitigation available and impacts are *significant and unavoidable*.”

Response 2-39

Refer to Response 2-29 and Response 2-35. Comment noted.

Comment 2-40

On Pages 12-32 – 12-34 the DEIR claims the proposed Cordova Hills project does not conflict with Sacramento County General Plan Policy LU-120 regarding growth management based on County Planning Division decisions summarized in Tables LA-2 and LA-3. These decisions so blatantly conflict with the plain language information both internal and external to the DEIR that they provide prima facie evidence of conflict of interest on the part of the Planning Division. A kindergartener could tell coal is black, snow is white, and the proposed Cordova Hills plan isn't smart growth. It takes the willfully blind, the insane, or highly paid advocates to claim otherwise.

Some examples in Tables LA-2 and LA-3 are:

1. Contrary to claims in Table LA-2 PC-1 the DEIR clearly demonstrates the proposed project is not "integrally linked" to existing communities. It is 4 to 6 miles distant from them. In current planning documents like the SACOG Blueprint such linkage is not contemplated until at least 2050. The DEIR also makes clear no significant transit linkage with existing communities is contemplated and public utility linkage is highly problematic.
2. PC-5 is about transit-oriented design, but the proposed project has no significant transit links to employment. Its transit proposal is almost entirely internal and consequently a system to nowhere since no realistic significant employment sources are identified at Cordova Hills.
3. PC-6 is about a Financing Plan. The one provided is utterly unrealistic and impossible to implement (see below).
4. PC-7 is about a Services Plan. The one provided conflicts with a water provider and potentially other service providers and depends on infeasible funding sources (see below).
5. PC-8 is about consistency with County-adopted plans. The project claims to be consistent with all County-adopted plans. In fact these comments identify numerous conflicts with such plans. An example is Sacramento County General Plan Policy CO-135 to protect the ecological integrity of California Prairie habitat. The project site is over 2,600 acres of the habitat this policy concerns, but it isn't even mentioned in the DEIR, which does, however, acknowledge the proposed project's conflicts with the County-adopted SACOG Blueprint (see above and below).
6. PC-9 is about consideration of regional planning efforts, but even the DEIR acknowledges the proposed project substantially conflicts with SACOG Principle 5 of directing development toward instead of away from existing communities and Principle 7 of preserving open space. Contrary to project claims, it is also not coordinated with regional transit and water plans (see above and below).
7. PC-10 is consideration of jobs-housing balance. The proposed plan's claim it will provide 6,548 jobs is patently false. It will provide essentially none beyond initial construction. Jobs claims are based on an imaginary "university" with no prospects of ever existing (see above).
8. On Table LA-2 the County Planning Department assigns the proposed project "points" for LU-120 Criteria in an apparently arbitrary manner. Five points are assigned for CB-1, minimum density. Much of this density is achieved through an imaginary "university" with no prospect of ever existing (see above).
9. Criteria CB-2 is about proximity to amenities. The proposed project claims that at least four of the amenity categories are within one mile but doesn't say which. In fact all amenities are entirely theoretical and may never exist. The most significant of these is the claim of an employment amenity at an imaginary "university" with no prospect of existing. Real amenities in actually existing communities are four and six miles away (see above).

10. Criteria CB-4a is about transit proximity. Its clear intent is interconnecting the Sacramento Metro area with mass transit. The proposed project's transit element is a primarily internal system to nowhere with little realistic prospect of connecting the isolated proposed project with the rest of the Metro area (see below).
11. Criteria CB-4b is about transit headway. The proposed project says its transit system will have headways of 15 minutes or less during peak hours, but since it has no realistic destinations and goes nowhere, it will have no peak hours.
12. Criteria CB-5 is about employment proximity. Since the proposed project's "employment" is based entirely on an imaginary "university" with no prospect of existing, the nearest realistic employment is a minimum of 4 to 6 miles away in existing communities, but is likely to be much farther (see above).

Response 2-40

Refer to Response 2-29. Responses from the Planning section are provided in bulleted form, numbered in the same manner as the comment:

1. The policy language of PC-1 states that a Project must "include a vision of how the development will connect to other adjacent existing and potential future development areas within the USB, including how roadways, transit, sewer, and water could occur within all adjacent areas". The Project clearly provides all of the above documentation, as described in the appropriate topical chapters of the EIR.
2. The Project proposes a local transit shuttle system consisting of two distinct but coordinated routes: one internal and one external. The internal system will be organized in a loop within the Project, and the external system will connect to the Mather/Mills Light Rail station. A transfer hub is envisioned in the Cordova Hills Town Center; both routes will be coordinated so that they can operate as a single continuous route with no transfer required. The external transit route would depart the planned transit node located in the Cordova Hills Town Center on Chrysanthy Boulevard, head west on Chrysanthy Boulevard, north on Rancho Cordova Parkway, west on Douglas Road, northwest on Mather Boulevard, north on Whitehead Street where it becomes Mather Field Road, and a final stop at the Light Rail Station. The external transit system would provide a link to employment centers along Highway 50 corridor in Rancho Cordova. Development triggers have been identified in the Cordova Hills Development Agreement to define start up and operations features of this service. The Development Agreement also provides additional details including the timing for such services, hours and days of operation, and peak and off peak frequency of operation.
3. The Cordova Hills Financing Plan, including associated assumptions, was subject to an extensive review by several county and non county experts retained by the County. This effort was coordinated by Infrastructure Financing Section of the County's Building and Code Enforcement Department. The commenter has provided no specific evidence that the Financing Plan is inadequate or based on specific faulty assumptions.
4. The methodologies, assumptions, and general conclusions of the Cordova Hills Urban Services Plan and Governance Plan and the Fiscal Impact Report were

reviewed by several county and non-county experts retained by the County and further verified by an outside third party consultant. The commenter has provided no specific evidence that the documentation is inadequate.

5. The Project has been designed to be consistent with adopted infrastructure master plans. The Cordova Hills application includes several General Plan Amendment entitlements to bring the project into compliance with the adopted General Plan including amendments to the Urban Policy Area, Land Use Diagram, Transportation Diagram and Bikeways Master Plan. Refer to Response 2-6. The SACOG Blueprint was endorsed by the Sacramento County Board of Supervisors and is supported by the Sacramento County General Plan, but it is not a County-adopted plan.
6. Policy language of PC-9 requires “consideration of regional planning efforts”, which should include a “discussion/analysis” of how the Project relates to regional planning efforts; it does not require absolute consistency. The required analysis has been provided in the DEIR (as acknowledged in this comment) to the degree that it relates to environmental impacts, and complete policy-level analysis has been included within the staff report for the Project. Also refer to item two of this response. The Public Utilities chapter provides an analysis of the proposed water supply, which included coordination with the Sacramento County Water Agency – the entity which will supply the water. This comment fails to support the allegations of inadequacy with any supporting evidence.
7. The Cordova Hills plan will generate an estimated 6,548 jobs, and over 4,500 jobs will be non-university jobs. The non-university jobs include retail, business professional, public services (Cordova Hills CSD) and schools. Minus the university site, the Cordova Hills Land Use Plan designates over one million square feet of commercial and office uses. Jobs will also be created following the establishment of the Cordova Hills Community Services District or Community Services Area and construction of school sites. There is also an abundance of jobs within a five mile radius of Cordova Hills which includes the employment center along Highway 50 corridor in Rancho Cordova.
8. Cordova Hills achieves a density of 10.1 dwelling units per acre based upon 8,000 residential units and 1,010 university residential units. A majority of residential units proposed in Cordova Hills are non-university housing units.
9. The Cordova Hills Land Use Plan has been designed to ensure that over 90 percent of all residential units are located within one mile of the following four amenities: transit, schools, shopping and parks/paseos/recreation. Several exhibits have been prepared to illustrate one-quarter and one half mile walking radius for each of the four destination land use categories. These exhibits are included in the SPA Master Plan. These linkages are also observable on the proposed land use master plan found in the DEIR, which clearly shows the integrations of parks, commercial, and institutional uses throughout the Project.
10. Refer to item two of this response.

11. Development triggers have been identified in the Development Agreement to define start up and operations features of Cordova Hills' internal and external transit service. The Development Agreement also provides additional details including the timing for such services, hours and days of operation, and peak and off peak frequency of operation.
12. Refer to item seven of this response.

Comment 2-41

On Pages 12-34 – 12-35 the DEIR claims the proposed Cordova Hills project isn't growth inducing although its own chapter on Cumulative and Growth Inducing Impacts says it is. It justifies this by claiming to be adjacent to "existing planned communities" to its west. The operable word here is "existing" since on Pages 12-29 – 12-30 the DEIR acknowledges no such communities actually exist. On Page 6-43 the DEIR even claims this area is "thousands of acres of open space to the north and west" that can help mitigate for Swainson's Hawk habitat the project proposes eliminating. The proposed project clearly is leapfrog development and thus directly violates Sacramento County General Plan Policy LU-12 prohibiting it. As noted above, even a kindergartner can understand leapfrog development. The frog leaps over a pond (open space) to a toadstool (development) but splashes mud (growth inducement) in its path. Only the insane, willfully blind, or well-paid advocates can deny that.

Response 2-41

The reason that the Land Use chapter and the Cumulative and Growth Inducing Impacts chapter differ is explained on the cited page 12-34. The Land Use chapter narrowly focuses on the impacts of the policy language, not the overall effects of the physical Project on growth inducement. With regard to Policy LU-12, the full text of the policy requires adjacency to "city boundaries, or existing planned communities or master plan areas". Though the policy states "or", and thus the Project need only satisfy one of these, the Project satisfies all of them. The Project is adjacent to the City of Rancho Cordova Boundary, and is adjacent to the existing *planned* communities within the existing approved master plan area called the Sunridge Specific Plan. The policy does not require that a project be adjacent to an existing *built* community. Refer to Response 2-36.

Comment 2-42

On Page 12-35 the DEIR briefly discusses public services and utilities and acknowledges "the need to ensure that adequate facilities will be constructed and that funding is secured for construction." It also claims a "facilities financing plan" and "Long term funding sources have been identified for the maintenance of public services." The DEIR's Public Services Chapter reveals, however, that the proposed project's financing plan and long term funding sources are unrealistic and grossly inadequate (see below). Consequently the project violates General Plan policies LU-13, LU-66, LU-110, and LU-123 to ensure minimum standards for public services and utilities are met.

On Pages 12-35 – 12-36 the DEIR lists Sacramento County General Plan Policies LU-34, LU-35, LU-36, and LU-46 but fails to discuss their call for development compatible with a regional transit system interconnecting the Sacramento Metropolitan Area. That's presumably because the proposed development would be largely distantly isolated from such a system and almost entirely dependent on roads for access. Since the only bone it throws transit concerns is a largely internal system to

nowhere lacking significant destinations, it greatly conflicts with General Plan policies mandating development compatible with regional transit.

Response 2-42

Refer to Response 2-31 and Response 2-37.

Comment 2-43

On Page 14-3 the DEIR says a new Cordova Hills Community Services District (CHCSD) will provide services for the proposed project, but CHCSD is purely hypothetical at this time since it must be approved by the Sacramento Local Agency Formation Commission (LAFCO). It's acknowledged on the same page that the proposed project is "not in close proximity to any existing public services, and as a result some extensive, costly improvements related to infrastructure and public facilities – discussed in the Public Utilities Chapter – will be required to adequately support the Project."

Pages 14-4 – 14-5 then explain how these "extensive, costly improvements" will be financed since they will cost "approximately \$453 million dollars." The DEIR states that some of this funding will be born by local, state, and federal taxpayers but it will also depend on construction and sale of 7,500 new homes out of the project's planned 8,000.

The 7,500 new homes needed to finance the proposed project are 2.5% of all new homes sold in the United States in 2011 (Kravitz 2012). Since the proposed project covers 0.0001% of U.S. area, that's 25,000 times its share of new American homes by area. Closer to home 14,000 new homes were sold in California in the first 7 months of 2011 (Lazo 1011). If we generously assume an equal number were sold in the last 5 months, that's a total of 28,000 new California homes sold in 2011. The 7,500 new homes needed to finance the proposed project are thus 27% of all new homes sold in California in 2011. The proposed project is 0.003% of California's area, so its 7,500 homes are 9,000 times its share by area in California.

Now of course all acres aren't the same. One in Silicon Valley may be much more desirable than many in the Mojave Desert. Is that the case for Cordova Hills? It may have been when gas was cheap and long commutes popular, but that's changing fast. Generation Y, the largest cohort of 21 to 30 year olds since the Baby Boom, is avoiding cars. They now contribute only 14% of miles driven even though that age group provided 21% of miles in 1995. They're so used to buying on line they consider commuting by car wasting time they could spend with their electronic devices on buses or trains (Ostroff 2010). That trend is evident in fewer young people getting drivers licenses and more moving to big cities where mass transit makes car ownership optional (Terlep 2012). Distantly isolated places with virtually no planned connection to urban areas by mass transit like the proposed Cordova Hills project are consequently becoming increasingly unattractive.

Despite these trends there will probably always be a niche market for rural homes made attractive by personal space provided by their often low density environments. The proposed Cordova Hills project is clearly rural since it is 4 and 6 miles from the nearest communities (DEIR Pages 12-29 – 12-30), but it is planned to be "twice as dense as the [Sacramento] county average (DEIR Page 12-28). High density rural developments certainly do exist like the neighboring Sacramento County Boys Ranch (DEIR Pages 12-36 – 12-37) but residence there tends to be less than voluntary and involve debts to society not paid in cash.

The proposed project's financial plan conflicts with far too many economic trends to be even marginally viable. Expecting the monopolization of 27% of the California new home market it takes to succeed is as realistic as expecting those with no jobs, income, or assets to make their mortgage payments. We know how that worked out. All the project offers is another ugly husk of a half built project like those that began littering the Central Valley after the real estate bubble burst. This would be doubly tragic at Cordova Hills since some of the Sacramento region's most beautiful and biologically critical habitat lands might be eliminated in the process for no good purpose.

The proposed project also increases taxes on the Sacramento region's current residents. For example:

1. On Page 14-18 the DEIR says "new fire stations will be built within the Project area" and that "funding for the construction and operation of the fire facilities will be provided by the District-wide Capital Fire Facilities fee." The district referred to is the Sacramento Metropolitan Fire District.
2. On Page 14-20 the DEIR says the financing plan doesn't call for "construction of additional police facilities" but the Urban Services Plan does.
3. On Page 14-21 the DEIR says "law enforcement services will be funded through the County General Fund" at least partially with the balance provided by the financing plan's shaky assumptions.
4. On Page 14-23 the DEIR says funding for new schools will come from "existing fee programs, state funding, and the [Elk Grove Unified School District] EGUSD" augmented by the financing plan's shaky assumptions.
5. On Page 14-28 the DEIR says "library operating costs will be fully funded through property tax revenue" assessed within the City and County of Sacramento.

Response 2-43

The Project is following the appropriate procedural pathway for the formation of a Community Services District, which obviously cannot be formed until the community it would serve is approved. Thus, at this stage, the requirement is to provide a plan for services. The remainder of this comment deals with the infrastructure financing for the project. This comment indicates that the issue being taken with the infrastructure financing plan is not that the plan inaccurately describes the costs, but rather that the reviewer believes that the profit margin for the project is too low to be viable given the high costs of infrastructure. It is the duty of the EIR preparers to describe what is physically necessary to complete a project, and what the potential environmental consequences of that will be; it is *not* to determine the profit margin of the Project.

The "half-built" communities referenced by the comment resulted from the fact that market conditions trended downward while projects were mid-stream in construction. That is not the case here; the current down conditions are well-known. Thus, even if the commenter is correct and the profit margin at this time is too low, the only potential result would be that the land would continue to be vacant until the market improved; it would not be a half-built "husk". Also, to bolster this statement the commenter presents an unsupportable calculation that purports to equate local residential absorption with the entire land mass of the United States. Then, in another calculation, the commenter uses the total housing proposed over a 30-year buildout and compares it with the real estate sales in a single down-market year. The Cordova Hills Project is estimated to have a 30-year buildout, not a one-year buildout. The comment concludes by asserting that a variety of taxes will increase in order to support Project infrastructure, which is not a comment on the adequacy of the EIR, and also ignores the funding which will be provided through the Infrastructure Financing Plan.

Comment 2-44

On DEIR Page 15-16 two Sacramento County General Plan policies related to water are incompatible with the proposed project. They are:

1. CO-23 is about “impact on valuable water supported ecosystems”. On Page 6-28 the DEIR acknowledges the proposed project would eliminate 46% of its wetlands and 33% of its vernal pools. On Page 6-26 it also acknowledges these wetlands are identified by the U.S. Fish and Wildlife as having their highest environmental protection priority.

Response 2-44

The purpose of policy CO-23 is to protect rivers and other water bodies, where water supplies are extracted, from experiencing the negative impacts of extraction. This policy is unrelated to the fill or excavation of seasonal wetlands.

Comment 2-45

2. CO-35 is about new development not being approved and building permits not being issued without sufficient water supply. The proposed project’s water supply is highly problematic as discussed below.

On DEIR Pages 15-26 – 15-36 a complex ad hoc system of pipes is proposed to bring water to the proposed project in a plan requiring approval by the Sacramento County Water Agency. On Page 15-34 the DEIR acknowledges that this agency opposes the project’s proposed water plan. Page 15-35 also acknowledges that the proposed water plan significantly impacts wetland resources and their species.

Response 2-45

This comment does not identify any deficiencies in the DEIR analysis. The water supply for the Project will require extension from an off-site location, and to that extent can be described as “problematic”. There are several means of conveying the water, only one of which the Sacramento County Water Agency has indicated is not supported for policy reasons. Instead, they prefer to use the North Vineyard well field, which was one of the delivery systems analyzed. It is not accurate to state that the Sacramento County Water Agency opposes the Project’s water plan. Comment noted.

Comment 2-46

On DEIR Pages 15-38 – 15-39 the need for significant new sewer infrastructure facilities to serve the proposed project is discussed. It is acknowledged their construction will have significant impact on biological resources but their financing is not discussed. Presumably Sacramento County Sewer District ratepayers are expected to fund these new facilities which are estimated to cost \$6.5 million for off-site sewer construction alone.

On DEIR Pages 15-42 – 15-45 construction requirements for extending electric and gas utilities to the proposed project are discussed but not their funding. Presumably Pacific Gas and Electric and Sacramento Municipal Utility District ratepayers are expected to fund these new facilities.

On DEIR Pages 15-45 – 15-46 the DEIR acknowledges the proposed project would violate Sacramento County General Plan policies LU-57 and LU-XX to not extend urban services beyond the Urban Policy Area except to 251 acres near the Kiefer Landfill. Its proponents consequently want these policies changed.

Response 2-46

The financing of the sewer system improvements is addressed in the Finance Plan. The commenter's presumption that the cost of improvements will fall on ratepayers outside of the Cordova Hills Project is incorrect. The Project will fund its fair share of the off-site sewer improvements through payment of SRCSD impact fees. It is the SRCSD that plans, designs, and constructs regional sewer infrastructure. With regard to sewer trunk infrastructure owned and operated by the SASD and required for the Cordova Hills Project, it is customary that such sewer trunk infrastructure would be constructed by the Cordova Hills Project. SASD will then give fee credits and reimbursements against the SASD sewer impact fees that Cordova Hills will otherwise have to pay to offset those construction costs.

Please see the "Cordova Hills Technical Dry Utilities Study" dated April 2010, prepared by Capitol Utility Specialists, and contained as Appendix PU-6, for a comprehensive description of the funding of the utility construction costs for electricity and natural gas.

The Project is not inconsistent with General Plan Policy LU-XX; this policy does not exist in the General Plan at this time. Pages 15-45 and 15-46 describe that because the Project is inconsistent with General Plan Policy LU-57, the Project includes a request to amend the policy and add the language in LU-XX. The amended language would make the Project consistent with the General Plan.

Comment 2-47

On Page 16-5 the DEIR acknowledges there are no transit connections to the proposed project. Without these the proposed project violates Sacramento County General Plan policy CI-4 on Page 16-7 to "provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services." Since the proposed project provides no realistic significant local employment sources and only weak transit connections to those elsewhere, it appears to violate this policy.

The proposed project appears to violate two other Sacramento County General Plan policies presented on DEIR Page 16-7:

1. CI-5 calls for "Land use and transportation planning and development should be cohesive, mutually supportive, and complement the objective of reducing per capita vehicle miles travelled (VMT). Since the project proposes only weak transit connections between Cordova Hills and the Sacramento Metro Area it tends to isolate any residents in a place distant from significant employment centers or other urban amenities. Their only option would be greatly increasing VMT.
2. CI-27 says "Public Facilities Financing Plans shall incorporate capital costs for transit. Infrastructure Master Plans shall include transit planning." The purpose of such transit is explained in Policy CI-4. It is to "link housing, recreational, employment, commercial, educational, and social services." Instead the project proposes a primarily internal transit system to nowhere providing no such significant linkage.

DEIR Pages 16-36 – 16-38 confirm the project proposes a local primarily internal transit system only weakly linked to the Sacramento Metro Area. Its only rationale is internal trips to an imaginary college with no prospects of ever being built (see above). Consequently it is a transit system to nowhere also unlikely to viably ever exist since it is dependent on the unrealistic financing plan discussed above. Pages 16-37 and 16-38 in particular demonstrate the proposed transit system's entire rationale is the imaginary college. Pages 16-81 – 16-82 reiterate the proposed project's isolation from actually existing mass transit.

Response 2-47

Sacramento Regional Transit District (Regional Transit) has no plans to extend existing service to the Project, but the Cordova Hills planned transit system, as described in multiple chapters of the DEIR (predominantly in the Traffic and Circulation chapter), will be coordinated with the Regional Transit Gold Line and will connect to the Mather/Mills light rail station. The Project is consistent with Policy CI-4. The Project will reduce vehicle miles traveled when compared with a “business as usual” project in the same location, and is thus consistent with policy CI-5 (Response 2-4). The Project includes a Public Facilities Financing Plan and an Urban Services Plan which lays out the costs for the transit system; the Project is consistent with policy CI-27.

Similar to earlier comments, this one takes the stance that the university/college campus center is the sole destination and primary job source in the Project. In a previous comment it was asserted that pedestrian and bicycle trips were going “nowhere” (see Response 2-38). In this comment it is asserted that the “only rationale” for the internal transit system is to shuttle people to the university/college campus center, and that absent the university/college campus center the Project provides “no realistic significant local employment”. None of these assertions are supported by the evidence. Refer to Response 2-32. It is certainly not true that without a university there is no point to non-automotive forms of travel, or that no one will have a place to work.

Refer to Response 2-31, Response 2-37, Response 2-38, and Response 2-40. Even if a university/college campus center were not constructed, residents would still need a transit system connection to light rail and would still benefit from a system connecting the community to the Town Center retail and employment area. The data on page 16-38 of the DEIR supports this response, not the comment, as it indicates that 34% of person trips are to non-university internal uses, while only 11% of person trips are to the university. The Draft EIR, Appendix TR-1, Table 1 - Projected Land Use (page 152) identifies the 4,633 employees projected in Cordova Hills in addition to the 2,036 employees projected at the university/college campus center for a total of 6,669 employees; thus, the majority of Project jobs are not associated with the university.

Comment 2-48

Pages 16-78 – 16-83 of the DEIR demonstrate the proposed project will increase VMT so much even assuming the imaginary college will actually exist that traffic congestion will be significantly increased on numerous intersections, roads, freeways, and freeway ramps in the Sacramento area.

Response 2-48

Comment noted. Refer to Response 2-28, Response 2-38, and Response 2-40.

Comment 2-49

The proposed project has numerous cumulative and growth inducing impacts. Among them are:

1. Pages 18-2 – 18-3 acknowledge extending public infrastructure to the proposed project, which would cost an estimated \$6.5 million dollars for off-site sewer construction alone, would greatly facilitate development of its thousands of acres of adjoining open space. Consequently the DEIR states that “a major barrier to growth would be removed.”
2. Page 18-3 acknowledges the project’s proposed expansion of the Urban Policy Area (UPA) would facilitate development of adjacent open space but claims the proposed expansion conforms with General Plan policy LU-120. As discussed above such expansion clearly violates LU-120.
3. Pages 18-3 – 18-4 acknowledge the proposed project includes a General Plan Amendment to extend provision of public water beyond the Urban Services Boundary (USB). It further states that “This action sets a precedent, as Zone 40 water has never been provided outside of the Urban Services Boundary to serve *proposed* uses” and that this “proposal is constrained both by supply and by contribution toward a hazardous condition” because it “could impact groundwater remediation efforts at Kiefer Landfill.”
4. Pages 18-5 – 18-6 acknowledge the proposed project would “contribute to significant and unavoidable cumulative aesthetic impacts.”
5. Page 18-6 acknowledges the proposed project would cause “cumulative loss of farmland” and consequently its “impacts are significant and unavoidable.”
6. Pages 18-6 – 18-7 acknowledge the proposed project’s “cumulative impacts related to construction-level particulate matter, operational particulate matter and ozone precursors, and conflict with implementation of the State [air quality] Implementation Plan will be significant and unavoidable.”
7. Pages 18-8 – 18-9 acknowledge that because of the proposed project “Cumulative loss of grassland habitat (grazing land) [i.e. California prairie] may exceed 10,000 acres [that] support a variety of special status species” and “Project impacts to wetlands and some of the associated species are significant even after the application of mitigation; thus, it can be concluded that cumulative impacts will also be considerable, and that despite the application of mitigation cumulative [biological] impacts will remain significant and unavoidable.”
8. Page 18-9 acknowledges “mitigation may be insufficient to avert substantial climate change, and impacts are significant and unavoidable.” That conclusion doesn’t even consider how loss of California prairie that may exceed 10,000 acres will reduce carbon sequestration.
9. Page 18-11 claims the proposed project’s cumulative land use impacts “would be less than significant”, but this conclusion is contradicted in numerous places throughout the DEIR and in these comments. Since the land use chapter of this DEIR negates the SACOG Blueprint’s plain language regarding regional land use planning, it essentially abolishes this significant regional planning effort. The cumulatively huge negative impact would be giving carte blanche to completely unplanned growth and development.
10. Page 18-11 claims the proposed project’s cumulative impacts on public services are less than significant, but that conclusion is based on assumed taxpayer subsidy and a deeply flawed financial plan as discussed above.
11. Page 18-11 – 18-12 also claim the proposed project’s cumulative impacts on public utilities are less than significant, but that conclusion assumes taxpayer and ratepayer subsidies as discussed above.
12. Pages 18-12 – 18-15 acknowledge the proposed project’s impacts on traffic and circulation “cannot be fully mitigated, and impacts are significant and unavoidable.”

Response 2-49

Most of these comments simply state facts and conclusions reported in the DEIR, which are sometimes followed by the commenter's opinion. Some refer back to previous comments on topical chapters, which have already been addressed in this response to comments. Refer to Response 2-6, Response 2-15, Response 2-26, Response 2-43, and Response 2-48. The only comment needing more specific response here is #9, which indicates that the cumulative land use discussion is in conflict with the topical chapter on land use. As stated on page 18-11, the cumulative land use discussion is restricted to the issue of compatibility with adjacent uses, as that is the only land use topic which changes between the existing and the cumulative condition. There is no conflict between the chapters.

Comment 2-50

The No Project alternative presented on Pages 2-14 – 2-15 of the DEIR is recommended because of numerous reasons discussed in these comments.

Response 2-50

Comment noted.

LETTER 3

Carol W. Witham, CNPS Treasurer, California Native Plant Society, Sacramento Valley Chapter; written correspondence; dated February 22, 2012

Comment 3-1

This letter supplements the comments of Dr. Glen Holstein of the Sacramento Valley Chapter of the California Native Plant Society (CNPS). We hereby incorporate Dr. Holstein's comments by reference. CNPS incorporates by reference the comments of the Environmental Council of Sacramento and Habitat 2020 submitted by Sean Wirth. CNPS is highly concerned with the overall level of take, undermining of the South Sacramento Habitat Conservation Plan, and leap frog development resulting in poor urban connectivity. The project also proposes misuse of the proposed Southeast Connector which will set precedence for additional sprawl along this "expressway".

CNPS is a statewide non-profit organization of some 10,000 scientists, educators, and laypeople dedicated to the conservation and understanding of the California native flora. As a science-based conservation organization, we believe that good land use decisions must be accompanied by a thorough assessment of the environmental impacts as required by the state and federal Endangered Species Acts, the Clean Water Act, the National Environmental Policy Act, the California Environmental Quality Act, and other resource protection laws.

The Sacramento Valley Chapter of CNPS has been highly involved in participating in and commenting upon land use decisions at all levels that affect vernal pool ecosystems in Sacramento County. Chapter volunteers serve on the South Sacramento Habitat Conservation Plan steering committee and biological subcommittee. Chapter volunteers serve on a stakeholders group to determine land use planning for the former Mather Air Force Base and its vernal pool grassland ecosystem. Chapter volunteers participated in the General Plan revision and the Visioning exercises for the eastern part of the county. Chapter volunteers serve on local land trust boards, steering committees, and management committees. Chapter volunteers have testified at innumerable planning commission, board of supervisors, and city council meetings on projects that impact vernal pool resources.

The Sacramento Valley Chapter of CNPS has long viewed the region including the area referenced in the Cordova Hills Project as the "Yellowstone" of vernal pool landscapes in Sacramento County. Geospatial analysis independently conducted for the developing South Sacramento Habitat Conservation Plan has confirmed that this region is unique within Sacramento County from the perspective of both density and diversity of vernal pools present, and in listed species presence. The diversity of vernal pool sizes, shapes, and hydroperiods is strongly correlated to high species diversity and a high level of ecosystem supporting function. The density of aquatic resources and listed species indicates that losses of this habitat will not easily be mitigated for elsewhere in the county.

The following comments are based on our knowledge of the wetland and endangered species resources in the vicinity of the proposed project and our understanding of the resource protection laws and their associated public review process.

Response 3-1

This section is preface language which does not provide any explicit comments on the integrity of the EIR analysis. Comment noted.

Comment 3-2

The Cordova Hills project description *fails to describe the whole of the proposed action*. Specifically, a wetlands mitigation plan will be required to offset destruction of vernal pools and other wetlands within the development. Construction of a minimum of 41.37 acres of mitigation wetlands will have environmental impacts above and beyond those described in the DEIR. Additionally, these impacts will occur on another, undisclosed site for which a baseline biological setting has not been provided. Preparation of a mitigation plan after local entitlements are granted constitutes *improper segmentation or piecemealing* of the project and precludes the public from receiving full disclosure of the environmental impacts of the proposed project in its entirety including any proposed mitigation.

The California Environmental Quality Act (CEQA) requires full disclosure of environmental impacts for the whole project regardless of whether they are detrimental or beneficial. Preparation of an after-the-fact mitigation plan negates CEQA's intended public participation process. For the purposes of informing the public, simply stating that the plan will be approved by the regulatory agencies is also insufficient and lacks transparency.

Response 3-2

Formulation of mitigation measures should not be deferred until some future time; however, measures may specify performance standards which would mitigate the significant effect of the project (CEQA Guidelines, Section 15126.4(a)(1)(B)). Mitigation Measure BR-1 establishes a minimum mitigation ratio of 1:1, and describes the interface between this requirement and the regulatory permitting process. It is possible that the mitigation plan will involve construction of created wetlands, but it is also possible that it will be achieved through other means (such as purchase of mitigation credits from wetlands which have already been created). Measures which defer these particular details to a later time have been challenged in the courts numerous times, but these challenges have failed. A recent example in our region is the Clover Valley Foundation v. City of Rocklin (2011) 197 Cal.App.4th 200, in which it was stated that “a condition requiring compliance with environmental regulations is a common and reasonable mitigating measure”. This statement was, in fact, a quote from yet another court case: *Sundstrom v. County of Mendocino* (1988) 202 Cal.App.3d 296, 308. Courts have approved deferring the formulation of the details of a mitigation measure where another regulatory agency will issue a permit for the project and is expected to impose mitigation requirements independent of the CEQA process, so long as the EIR included performance criteria and the lead agency committed itself to mitigation. Mitigation Measures BR-1 and BR-7 commit the County to ensuring that mitigation is provided at a minimum 1:1 mitigation ratio, which is a sufficient and common performance standard and is also consistent with County policy.

Comment 3-3

Throughout the DEIR, actual *mitigation measures are being deferred* to the future. The document continually refers to yet-to-be-prepared plans, studies, and reports. In addition to deferring a Wetland Mitigation and Monitoring Plan to some future date outside of the public review process, analyses and mitigation of other environmental impacts are also being deferred. For example, specific mitigation for noise will be determined after some future acoustical analysis and report. This failure to fully disclose impacts and to provide substantive and enforceable mitigation measures occurs throughout the document.

Simply creating a plan or an afterthought mitigation measure is not adequate for the purposes of CEQA disclosure. The DEIR must contain specific and measurable mitigation that demonstrates to both the land use authority and the public that impacts have been reduced through mitigation. The Board of Supervisors cannot make findings of "less than significant after mitigation" if they don't even know what the mitigation measures and success criteria are.

Response 3-3

Refer to Response 3-2. All of the mitigation measures within the document specify minimum performance standards, including the noise measures mentioned in this comment. The Noise measures indicate that developments must be consistent with the noise standards of the General Plan, and list potential options for achieving those standards. It is impossible at the master plan level to be more precise than this, because noise levels are highly dependent on specific lot layout details and construction designs which are not available until small-lot tentative maps and specific commercial site plans are proposed. The mitigation ensures that when these future project-level plans are submitted to the County, that they will comply with County noise standards. See CEQA Guideline 15126.4.

Comment 3-4

Deferral of a Wetland Mitigation and Monitoring Plan is particularly troubling because in its absence the project applicant cannot demonstrate that the mitigation measure(s) are feasible (able to be accomplished). Without sufficient information to determine whether the wetland mitigation is in fact feasible, the public is left with the uncertainty that it may never be accomplished.

The U.S. Army Corps of Engineers' (Corps) Record of Decision (dated 25 January 2011) related to the Sunridge Projects in the City of Rancho Cordova states the following:

- "e. The Corps recognizes the significant cumulative loss of vernal pool wetlands within the Mather Core Recovery Area. For future unavoidable impacts to vernal pools within the Mather Core Recovery Area... compensatory mitigation shall be:
- 1) based on a method for assessing the functions of all waters of the U.S. on the project site;
 - 2) accomplished at a ratio of greater than 1:1, after considering direct and indirect impacts, temporal loss and difficulties creating vernal pool wetlands; and
 - 3) located in the Mather Core Recovery Area, unless determined impracticable or inappropriate by the Corps."

A complete Wetland Mitigation and Monitoring Plan is necessary from two perspectives. First, the public has a right to know the environmental consequences of the proposed mitigation. Second, the Board of Supervisors has a public trust obligation to understand how this mitigation, supposedly to occur within the Mather Core Recovery Unit which is almost entirely within the USB, will impact future development (and mitigation) in the County of Sacramento. Will the mitigation for this project preclude development of a more worthwhile and better designed project in the future?

Response 3-4

Once adopted as part of an approved project, a mitigation measure cannot simply be deleted outside of a public hearing process. If Mitigation Measure BR-1 is adopted, then the applicant must provide 1:1 mitigation *before* building permits will be issued. The scenario posited by this comment, that unbeknownst to the public, the mitigation will fail to be carried out and yet the Project will be allowed to develop, is impermissible. Refer to Response 3-2. The final question posed by the comment is a policy question about regional prioritization of development. This is not an issue which can be or ought to be addressed by this individual master plan's CEQA document. Furthermore, it should not be assumed that the same conditions included in the Record of Decision for the Sunridge project will apply here.

Comment 3-5

The incomplete description of the environmental setting, the incomplete description of the proposed project, the inappropriately deferred mitigation measures, and the potential infeasibility of the proposed wetland mitigation all demonstrate that the DEIR is woefully inadequate for the purposes of public disclosure. CNPS requests that these deficiencies be remedied in a Revised DEIR to be recirculated to the public for additional consideration and comments.

Response 3-5

Refer to all of the responses to this letter. Recirculation is not required.

Comment 3-6Mitigation Measure BR-1

As discussed above, a commitment to prepare a (Wetland) Mitigation and Monitoring Plan is not mitigation. Additionally, the impacts of such a plan are not disclosed in the DEIR even though they are clearly an integral part of the proposed project.

Response 3-6

Refer to Response 3-2.

Comment 3-7Table BR-3: Special Status Species Matrix

Please note the comments of Dr. Glen Holstein on behalf of the Sacramento Valley Chapter of CNPS. In addition to his specific observations, we request the addition of *Lytta molesta* as a potential species of concern on the project site.

Response 3-7

Refer to the responses to Letter 2. *Lytta molesta*, also called the molestan blister beetle, has no federal or state special status designation through any agency⁴. It is tracked through the California Natural Diversity Database, and as part of that tracking is given a global and state rank of 2. This means that there are six to twenty element occurrences in the California Natural Diversity Database, and is on this basis considered through that database to be at high risk. The species is found on flowers, where they forage, and has been associated with dried vernal pools; very little is actually known about the life history of this species.⁵ The comment requests inclusion of this species, but does not explain why it is felt to be necessary. The species is not included – or even mentioned – in the anticipated draft South Sacramento Habitat Conservation Plan, and it has not been collected in Sacramento County. In addition, there are no documented occurrences of this species in the adjacent areas of Placer County and San Joaquin County. Nonetheless, the species has been added to Table BR-3, with a potential for occurrence designation of “low” – which means that no further discussion is included.

It is worth noting that Project mitigation already requires full replacement of all wetland and upland habitat which will be lost, and given that the molestan blister beetle is not agency-listed, it is reasonable to assume that this mitigation already in place would prevent substantial impacts to the species in the extremely unlikely event that it may use the site. It is thus unclear why the respondent wishes for the EIR to include treatment of this species, given the lack of any known occurrence in the County or adjacent counties and the fact that it would have no effect on the mitigation or conclusions of the EIR.

⁴ www.dfg.ca.gov/biogeodata/cnddb/pdfs/spanimals.pdf

⁵ http://www.dfg.ca.gov/biogeodata/cnddb/pdfs/invert/Insects_-_Coleoptera/Lytta_molesta.pdf

Comment 3-8**Mitigation Measures BR-3 through BR-6**

An additional mitigation measure needs to be added to survey for ground nesting birds if construction occurs between March 1 and June 30. Several special status bird species written off as having low potential to occur on the site, actually have a high potential (again see Dr. Holstein's comment letter) and are ground nesters.

Response 3-8

The only ground-nesting (or near-to-the-ground) bird species listed as having a low potential for occurrence in Table BR-3 is the loggerhead shrike. As discussed in the table, this species nests in shrubs or low in trees, and the site contains neither shrubs nor trees. Thus, the site does not contain nesting habitat for this species and mitigation is not required to offset an impact. Nonetheless, since pre-construction nesting surveys will already be performed for many other species, it is not burdensome to add this species, in an overabundance of caution. To try and alleviate any concerns, the species has been added to the pre-construction nesting survey mitigation.

Comment 3-9**Western Spadefoot**

Loss of Western Spadefoot breeding habitat on the Cordova Hills project would be significant. There are less than a handful of extant populations within the Mather Core Recovery Area and these occur on the very periphery of its range. The Mather Specific Plan is also proposing destruction of a breeding pool with no mitigation, so cumulatively the impacts are also significant. The Cordova Hills project should conduct additional surveys to determine the locations and extent of the onsite population and prepare a specific mitigation and monitoring plan for this species in order to reduce the impact to less than significant.

Response 3-9

Refer to Response 2-21. The statement that the Mather Specific Plan proposes to impact a breeding pool of western spadefoot without providing mitigation is not correct. Firstly, federal and state permits are required for any destruction of wetlands, and a minimum 1:1 mitigation typically results from this process – sometimes more. Secondly, the EIR for the Mather Specific Plan includes policy language requiring that future projects in the Specific Plan obtain the appropriate permits, and that replacement mitigation be provided for all wetland habitat lost. With regard to the request for detailed surveys of populations and numbers, even for amphibian species where protocols have been developed for surveys, the level of detail requested by this comment is not required (e.g. California tiger salamander). The purpose of a survey is simply to determine presence or absence, so that it can be determined whether mitigation is necessary. Presence of the western spadefoot is already known, and mitigation is being provided for all wetlands and uplands lost.

Comment 3-10Translocation of Inoculum

Because there is not a Wetland Mitigation and Monitoring Plan included for review as part of this project, it is impossible to speculate on all of the measures that might be incorporated into such a plan. However, language in Mitigation Measure ALT-1 suggests that the project proponents intend to translocate inoculum (soil, seeds and cysts) from the impact site to some yet-to-be-identified mitigation site. Such translocation of materials is inappropriate over any distance. Vernal pool landscapes are very similar to island archipelago biogeography, with near neighbors being more closely related genetically than distant neighbors. The practice of translocating propagules from one area to another could have significant consequences including: i) genetic swamping of closely related species, ii) crossbreeding that leads to mortality/extirpation, or iii) crossbreeding that leads to superweeds.

As an aside, Mitigation Measure ALT-1 also contains language that appropriate success for mitigation of rare plant populations would be a restoration criteria (sic) standard of 60 percent survivorship. Given that the plants are all annuals and subject to precipitation and temperature patterns, this criterion is both nonsensical and immeasurable.

These are examples of why it is important to fully disclose environmental impacts during the public comment phase of CEQA disclosure. Who knows what other ill informed practices and immeasurable criteria might be proposed in the Mitigation and Monitoring Plan? Who knows if the plan will be feasible?

Response 3-10

As indicated by the "ALT" acronym, the measure referenced applies to a CEQA Alternative to the Project and is found within the EIR section describing impacts related to Alternative 1. The applicants have not proposed this measure for the Project, given that the Project avoids all impacts to wetlands containing rare plants. It is common practice for the terms and conditions of Section 404 Permits to require the translocation of inoculum to preserve the genetic diversity of the affected species. (See, U.S. Army Corps of Engineers San Francisco District's *Mitigation and Monitoring Proposal Guidelines*, dated December 20, 2004, at Pages 7 and 13; See also, U.S. Army Corps of Engineers, *Regulatory Guidance Letter*, dated December 24, 2002). The statement of 60% survivorship has been misconstrued by the commenter, and has been clarified to prevent future confusion. Survivorship should be measured based on the population density in the destroyed pool, meaning that the population in the created or inoculated pool cannot fall below 60% of the population which had been present in the destroyed pool. The point is taken that stand-alone, this could result in the applicant either having a standard which is too high or too low in any given year, as populations would naturally be more abundant or less abundant depending on climatic conditions. Comparison to an undisturbed reference pool has been included in the measure, to take this into account. Also note that any such plan would require the review and approval of the U.S. Fish and Wildlife Service, as inoculum collection from a vernal pool is prohibited without their express approval. A note has also been added to state that the measure may be superseded by any plan approved by the U.S. Fish and Wildlife Service.

Comment 3-11

On behalf of CNPS, I appreciate the opportunity to provide these additional comments on the Draft Environmental Impact Report for Cordova Hills.

As articulated above, we believe that the document fails to comply with the spirit of the California Environmental Quality Act. While the DEIR may satisfy minimum standards, it has unsuccessfully informed the public of the environmental setting and environmental consequences of the project including its offsite mitigation components. Therefore, CNPS requests that a Revised DEIR be prepared for this project that addresses our concerns and that the Revised DEIR be recirculated for an additional round of public comment.

Please keep me informed of activities related to projects in this area that might impact vernal pool grasslands and endangered species habitat.

Response 3-11

Comment noted. See prior responses.

LETTER 4

James Herota, Staff Environmental Scientist, California Natural Resources Agency, Central Valley Flood Protection Board; written correspondence; dated February 6, 2012

Comment

Please refer to the letter, which begins on page 28 of the “Cordova Hills FEIR: Comment Letters”. The letter explains when a permit from the Central Valley Flood Protection Board is required, and describes the types of issues which could impact flood control facilities.

Response

This is a standard comment letter, which has typically been received for many EIRs published in Sacramento County. The impacts of the Project on floodplains and hydrologic conditions have been examined, and impacts addressed in the Hydrology and Water Quality chapter. The Project does not involve levees and there are no existing structures on the site.

LETTER 5

Genevieve Sparks, Environmental Scientist, California Regional Water Quality Control Board, Central Valley Region; written correspondence; dated February 22, 2012

Comment 5-1
Basin Plan:

The Water Quality Control Plan (Basin Plan) is not described in Chapter 11 (Hydrology and Water Quality). The Basin Plan is briefly referenced on page 15-11 in Chapter 15 (Public Utilities).

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues.

For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/.

The Draft Environmental Impact Report should provide an expanded discussion on the Proposed Project's consistency with the Basin Plan, in terms of protecting surface and ground water quality in, and downstream of, the Proposed Project area.

Response 5-1

Though the comment includes substantial text describing the Basin Plan and its adoption procedures, the only sentence which discusses the EIR is the final one, which simply requests an expansion of the discussion to tie the analysis of surface and groundwater quality to the Basin Plan. The Basin Plan is a broad-level policy document, while the Project is specific to a small area within the total area encompassed by the Basin Plan. Given this fact, it is typical for an analysis to focus on the specific local water quality rules and regulations which have been enacted as a means of determining consistency with overarching policy documents such as the Basin Plan. This is consistent with case law, which has found that an EIR need not contain an exhaustive description of the regulatory requirements and plans that may apply to a Project⁶. For clarity, text has been added to the Porter-Cologne Water Quality Act section of the Hydrology and Water Quality chapter to explicitly reference the Basin Plan as one of the enacting frameworks for Porter-Cologne. Discussion has also been added which describes the “Implementation” section of the Basin Plan, because the implementing programs are those which are discussed in the DEIR. In the DEIR it was determined that the Project would have no adverse impacts to surface water quality (pages 11-23 to 11-27), or to groundwater/groundwater recharge (pages 15-51 to 15-52).

⁶ City of Long Beach v. Los Angeles Unified School District (2009) 176 Cal.App.4th 889 at 918-919, 98 Cal.Rptr.3d 137 at 163.

Comment 5-2**Statement of Policy With Respect to Maintaining High Quality of Waters in California (State Water Board Resolution 68-16):**

State Water Board Resolution 68-16 is briefly described in Chapter 15 (Public Utilities) on page 15-12.

A key policy of California's water quality program is the State's Antidegradation Policy. This policy, formally known as the *Statement of Policy with Respect to Maintaining High Quality Waters in California* (State Water Board Resolution No. 68-16), restricts degradation of surface and ground waters. In particular, this policy protects water bodies where existing quality is higher than necessary for the protection of beneficial uses. Under the Antidegradation Policy, any actions that can adversely affect water quality in all surface and ground waters must:

1. meet Waste Discharge Requirements which will result in the best practicable treatment or control of the discharge necessary to assure that a pollution or nuisance will not occur and the highest water quality consistent with maximum benefit to the people of the State will be maintained;
2. not unreasonably affect present and anticipated beneficial use of the water; and
3. not result in water quality less than that prescribed in water quality plans and policies.

Furthermore, any actions that can adversely affect surface waters are also subject to the Federal Antidegradation Policy (40 CFR Section 131.12) developed under the Clean Water Act.

For more information on this policy, please visit our website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/1968/rs68_016.pdf.

The Draft Environmental Impact Report should provide an expanded discussion on the Proposed Project's consistency with the State Board Resolution No. 68-16, in terms of protecting surface and ground water quality in the Proposed Project area.

Response 5-2

Refer to Response 5-1. Also see pages 11-23 to 11-27 of the DEIR, where it was determined that the Project would have no adverse impacts on water quality, and pages 15-51 to 15-52 where it was determined that the Project would not have adverse impacts on groundwater quality or recharge. Since the DEIR determined that the Project would not result in adverse impacts, there is no need to provide an expansive discussion of consistency with Resolution No. 68-16. The comment does not provide any evidence to the contrary.

Comment 5-3**Clean Water Act 303(d) Listed for Impaired Water Bodies**

The Clean Water Act 303(d) List for impaired water bodies is discussed briefly in Chapter 11 (Hydrology and Water Quality), including pages 11-8, 11-10, 11-13, 11-14, and 11-26.

Please use the 2010 Clean Water Act 303(d) list for impaired water bodies, which can be located at

http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml

The Final Environmental Impact Report should provide a comprehensive list of all water bodies located within, and downstream of, the Proposed Project area which are included on the 2010 Clean Water Act 303(d) list for impaired water bodies, and the constituent(s) or parameter(s) each water body or water body segment is listed for.

If Total Maximum Daily Load (TMDL) and implementation plan is under development or completed for any receiving water body or water body segment listed on the Clean Water Act 303(d) list, the Draft Environmental Impact Report should include an expanded discussion on the Proposed Project's compliance with that TMDL and implementation plan.

Response 5-3

The DEIR discussion uses what this comment refers to as the 2010 Clean Water Act 303(d) list, but calls it the 2008 list. It appears that the State Water Board website needs updating. The comment directs the lead agency to the website www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml, while the information from the chapter was obtained from www.swrcb.ca.gov/rwqcb5/water_issues/tmdl/impaired_waters_list/303d_list.shtml. The latter website indicates that the current version is the 2006 list, and that the update is called the "2008 Update". The website referenced by the letter indicates that the list was approved in November 2010, and that it is called the 2008 – 2010 303(d) list. In either case Environmental Review has reviewed both sources cited and determined that it is the same list. Page 11-15 of the DEIR indicates the status of all three rivers to which Project waters will flow, via onsite tributaries, and notes the constituents for which they are listed. There are no TMDLs for these waterways. The text of the DEIR has been revised to reflect the current adoption status and nomenclature of the relevant 303d list.

Comment 5-4**Construction Storm Water General Permit**

The Construction Storm Water General Permit is briefly referenced in Chapter 11 (Hydrology and Water Quality) on page 11-9.

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

The Final Environmental Impact Report should provide an expanded discussion on the Proposed Project's compliance with this permit, including, but not limited to, the development of a SWPPP.

Response 5-4

The DEIR describes all of the grading permit requirements referenced by this comment, including that the County will not issue a grading permit until proof is submitted showing that a Notice of Intent was filed with the Regional Water Quality Control Board, and until submission of a site-specific SWPPP showing compliance with standards set forth in the County's Municipal Stormwater Permit (see page 11-9 of the DEIR). The DEIR does discuss construction stormwater impacts which could result from future developments, and describes common best management practices used to avoid impacts (see page 11-25). A master planned project of this size will be developed in increments over a long time period. Site-specific SWPPPs can only be prepared for specific areas when project-level proposals (small-lot subdivision maps, improvement plans, etc) are submitted.

Comment 5-5**Municipal Separate Storm Sewer System (MS4) Permit**

The MS4 permit is briefly referenced in Chapter 11 (Hydrology and Water Quality) on pages 11-3, 11-4, and 11-9. References to hydromodification and low impact development are made in Chapter 11 (Hydrology and Water Quality) and Chapter 15 (Public Utilities), among others.

The federal Clean Water Act makes municipalities responsible for regulating and managing the quality of storm water runoff throughout their jurisdictions, since municipalities own and operate the storm drain pipes and drainage channels that collect runoff prior to its discharge into creeks, rivers, and other water bodies. Under the Clean Water Act, storm water discharges are regulated through National Pollutant Discharge Elimination System (NPDES) storm water permits.

In California, the State Water Board and its nine Regional Water Boards have been authorized by the USEPA to oversee implementation of the Clean Water Act. The Central Valley Water Board issues and enforces NPDES municipal storm water permits in the Sacramento area. As such, the County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova are subject to the Sacramento area wide NPDES Municipal Storm Water Permit (NPDES No. CAS082597; Order NO. R5-2008-0142) (Storm Water Permit). This Storm Water Permit, originally issued in 1990, was re-issued by the Central Valley Water Board in September 2008, covering the period November 2008 –September 2013. The Storm Water Permit (Provision A) states:

1. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in § 13050 of the California Water Code are prohibited.
2. Discharges from MS4s which cause or contribute to exceedances of receiving water quality standards and water quality objectives (designated beneficial uses of the Basin Plan and water quality objectives developed to protect beneficial uses) for surface water or ground water are prohibited.
3. Discharges from MS4s containing pollutants that have not been reduced to the maximum extent practicable (MEP) are prohibited.

In addition, the Storm Water Permit contains specific requirements related to:

- Reporting and other project management functions
- Reducing specific target pollutants
- Monitoring and conducting special studies
- Reducing storm water impacts from new development projects, construction projects, municipal operations and commercial/industrial businesses
- Conducting public outreach and watershed stewardship

- Conducting public outreach and watershed stewardship
- Preventing illicit discharges
- Assessing program effectiveness

The current Storm Water Permit differs from the prior one in several notable ways:

- Many of the requirements are more general (less prescriptive) than in the prior permit.
- The permit includes requirements pertaining to protecting creeks from erosion and other harm caused by increased runoff volume and flow rate (i.e., hydromodification) due to new development and redevelopment.
- It requires a modest amount of additional monitoring (in addition to the existing extensive monitoring program) to learn more about discharges of pyrethroid insecticides and mercury, which are impairing water quality in various local waterways. The data could lead to new understanding on how to control these pollutants and eventually to additional requirements amended to the Storm Water Permit.

Storm Water Quality Improvement Plan (SQIP)

Another component of the Storm Water Permit is the implementation of the SQIP. The SQIP describes the storm water pollution prevention efforts to be implemented either jointly or individually by the County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova. Those agencies, collectively referred to as the Sacramento Storm Water Quality Partnership (Partnership), developed the SQIP to protect local waterways and fulfill regulatory requirements. The SQIP outlines Partnership priorities and activities planned for the 2008-2013 permit term. It also includes background information to provide readers with an understanding of the environmental and regulatory context as well as the Partnership's past accomplishments. The SQIP, adopted on 29 January 2010, supersedes and replaces all previous management plans developed for the Partnership, including the 1994 Comprehensive Storm Water Management Plan, the 1995 Effectiveness Evaluation Plan, the July 2003 SQIPs and their amendments, and the draft 2007 SQIPs.

The overall goals of the SQIP, as identified in the Storm Water Permit, are to: a) reduce the degradation of waters of the State and waters of the United States by urban runoff and protect their beneficial uses; and b) develop and implement an effective SQIP that is well understood and broadly supported by regional stakeholders. The core objectives of the SQIP are to:

- Identify and control those pollutants in urban runoff that pose significant threats to the waters of the State and waters of the United States and their beneficial uses;

- Comply with the federal regulations to eliminate or control, to the MEP, the discharge of pollutants from urban runoff associated with the storm drain system;
- Achieve compliance with water quality standards;
- Develop a cost-effective program which focuses on pollution prevention of urban storm water;
- Seek cost-effective alternative solutions where prevention is not a practical solution for a significant problem; and
- Coordinate implementation of control measures with other agencies.

As it relates to the Storm Water Permit, the SQIP proposes compliance activities to be conducted during the five-year term of the Storm Water Permit, and as specified, the SQIP is considered part of the permit and is enforceable as such.

For more information on the MS4 Permit the Proposed Project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

The Final Environmental Impact Report should provide an expanded discussion on the Proposed Project's compliance with the MS4 Permit held by Sacramento County, including, but not limited to, the implementation of specific Low Impact Development measures throughout the Proposed Project area and a post-construction hydromodification strategy.

Response 5-5

A discussion of hydromodification is included on page 11-24, and the EIR includes a detailed hydromodification technical appendix. A discussion of the SQIP for the region is provided beginning on page 11-26 of the DEIR. Also note that the proposed Cordova Hills Master Plan includes a section listing the low impact development proposals which will apply in the Project area (Chapter 7, Section 7.7.1 of the Master Plan). More detailed discussion cannot be included at this time because this is a plan-level proposal, and specific grading plans and other details will not be prepared until subsequent requests for subdivision maps and other discretionary approvals are submitted.

Comment 5-6**Clean Water Act Section 401 Permit – Water Quality Certification**

Water Quality Certifications issued under Section 401 of the Clean Water Act are briefly described under Chapter 6 (Biological Resources) on page 6-8.

If an United States Army Corps of Engineers (USACOE) permit, or any other federal permit, is required for the Proposed Project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification(s) must be obtained from the Central Valley Water Board prior to initiation of Proposed Project activities.

The Final Environmental Impact Report should clarify that (a) there are no waivers for Clean Water Act Section 401 Water Quality Certifications in the State of California; (b) a Clean Water Act Section 401 Water Quality Certification serves as both a certification, in part or in whole, of a federal permit, under Section 401 of the Clean Water Act, and as a Waste Discharge Requirement under the Porter-Cologne Water Quality Control Act; and (c) under Section 401 of the Clean Water Act, the State of California can review and approve, condition, or deny all federal permits that may result in a discharge to waters of the State, including wetlands.

The Central Valley Water Board does not issue Individual 401 Water Quality Certifications and/or Waste Discharge Requirements for Proposed Projects that are not in final design.

Required items for a complete Clean Water Act Section 401 Water Quality Certification application are based on Sections 3836 and 3856 of Title 23 of the California Code of Regulations.

Should one federal permit be issued for the all future individual projects, the Central Valley Water Board may opt to incrementally certify the federal permit according to the project proponent's demonstration of readiness-to-proceed with specific project phases. Should this occur, a sequence of 401 Water Quality Certifications and/or Waste Discharge Requirements may be issued in 5-year increments as specific project phases are ready-to-proceed and implemented.

Please clarify in the Final Environmental Impact Report whether the Project Proponent will be seeking one Water Quality Certification for the Proposed Project based on this environmental document, or a series of Water Quality Certifications for future tiered environmental documents.

Response 5-6

Comment noted. Page 6-8 of the DEIR indicates that any activities requiring a Section 404 permit will likewise require a Section 401 permit. The applicant has submitted a single application for a Section 404 permit which would cover the entire site, and will seek a Section 401 permit in the same manner.

Comment 5-7**Compensatory Mitigation**

Mitigation Measure BR-1 should be amended to include a discussion on the Central Valley Water Board's compensatory mitigation requirements. The Central Valley Water Board may require compensatory mitigation for impacts to waters of the State. Compensatory mitigation must comply with the State of California's 1993 Wetlands Conservation Policy, which ensures no overall net loss of wetlands for impacts to waters of the State.

If conservation easements are implemented as part of the compensatory mitigation strategy, the recorded executed conservation easement shall be consistent with California Civil Code Sections 815-816.

Waste Discharge Requirements

If USACOE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the Proposed Project area, the Proposed Project will require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation.

In the case a Water Quality Certification(s) is issued for the Proposed Project, the Water Quality Certification(s) would serve as to certify the federal permit(s) and as a Waste Discharge Requirement under Porter-Cologne Water Quality Control Act.

For more information on the Water Quality Certification and WDR processes, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Response 5-7

Mitigation Measure BR-1 already requires 1:1 mitigation of wetlands, regardless of federal jurisdictional status, consistent with County policy. Though already required by law, the mitigation has been amended to require that the applicant obtain all applicable federal and state permits (the term "permit" covers either a Section 401 permit or Waste Discharge Requirements). Any conservation easements used to implement the compensatory mitigation will comply with California Civil Code Sections 815 – 816. All wetlands on the site are both Waters of the U.S. and Waters of the State.

Comment 5-8**Definition of "Waters of the State"**

Page 6-11 Chapter 6 (Biological) of the Draft Environmental Impact Report references "waters of the State" under the discussion of the Porter-Cologne Water Quality Control Act.

The Final Environmental Impact Report should clarify the definition of "waters of the State", as related to "waters of the United States." "Waters of the State" are defined more broadly than "waters of the United States." According to California Water Code Section 13050(e), means "any surface water or groundwater, including saline waters, within the boundaries of the state", and includes all waters within the state's boundaries, whether public or private, including waters in both natural and artificial channels.

"Waters of the State" includes all "waters of the United States", including all federally jurisdictional and non-federally jurisdictional waters, whether hydrologically isolated or not, and territorial seas.

This definition is relevant and central to any action taken by the Central Valley Water Board on the Proposed Project and should be incorporated within the Final Environmental Impact Report accordingly.

Please clarify throughout the Final Environmental Impact Report, including, but not limited to, the discussion provided on page 6-11, in preface to any discussion regarding waters of the United States or federal jurisdictional waters, the definition of "waters of the State." All tables, figures, maps, discussions, and references to "waters of the United States" should be revised to "waters of the State and waters of the United States" throughout the entire Final Environmental Impact Report.

Response 5-8

Page 6-8, which describes the Clean Water Act permits, specifically states that although the SWANCC decision limits the applicability of federal jurisdiction over isolated waters, state and local jurisdiction still applies. A second note to this effect has been added to the Porter-Cologne discussion section on page 6-11, as requested by this comment. Rather than revising all exhibits, as this comment requests, a sentence has been added to the beginning of the "Wetlands and Surface Waters" section of the impact discussions noting that all delineated waters on the site are both Waters of the State and Waters of the United States; there are no "isolated" waters present. Also note that the wetland delineations of the Project site, as included in the DEIR, have already been verified by Army Corps and an application for a Section 404 Clean Water Act Permit is currently pending with the Army Corps.

Comment 5-9**Aerojet Facility Site**

Pages 10-4 through 10-5 and 10-14 of Chapter 10 (Hazardous Materials) provides a discussion on the Aerojet site, as related to the Proposed Project.

The description of the Aerojet site provided on these pages contains numerous errors and does not provide an adequate description of the Aerojet Site. The Central Valley Water Board has the following clarifications:

Response 5-9

This is simply a preface to the comments below. Refer to the comments and responses which follow.

Comment 5-10

- On page 10-4 the authors provide a description of the Aerojet facility and discuss underground tanks sites and associated contamination associated with the tanks sites. The tank sites provide an infinitesimal portion of the soil and groundwater contamination at the 8500-acre facility. Rocket manufacturing and testing and chemical manufacturing have led to extensive soil and groundwater contamination, with the groundwater plumes extending over 25 square miles. In fact there are over 350 potential source areas being investigated on the Aerojet Superfund site. Contamination includes solvents, components of liquid and solid rocket fuels, and chemical manufacturing residuals. Investigation of the contamination commenced in the late 1970's.

Response 5-10

Page 10-4 simply provides a brief background of contamination present at Aerojet; it is not intended to serve as a comprehensive description of all contamination present. The section states that the Aerojet site is a Federal Superfund site – it does not merely indicate that contamination is due to leaking tanks – and states that there is contamination of wells and groundwater from “volatile organic compounds and solvents (among other contaminants)”. A comprehensive list of the hundreds of known and potential contaminants would be unnecessary for the purposes of this EIR – it is simply necessary to establish that Aerojet is a Federal Superfund site which involves contamination of both soil and groundwater. The analysis section of the DEIR, which begins on page 10-14, gives a more detailed account of contaminants and their sources, to the extent that they are relevant to Project impacts.

Comment 5-11

- On page 10-14, the writer mistakenly talks about both the Inactive Rancho Cordova Test Site (IRCTS) and the Aerojet Superfund site as a single site. In fact, they are two distinct sites. The Aerojet Superfund Site currently comprises the 8500 acre site bounded roughly by US50, the Folsom South Canal, White Rock Road and Prairie City Road, plus Area 39 (portions of the State Highway Off-Road Vehicle Park), Area 40 (area east of Prairie City Road) and the former Cavitt Ranch (400 acres on Scott Road, east of Area 40). This site has significant soil and groundwater pollution and is being investigated and cleaned under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The IRCTS is 4000 acres south of White Rock Road, north of Douglas Road, east of Sunrise and extends about halfway to Grant Line Road. The IRCTS is being investigated and cleaned up under the State hazardous waste site cleanup program.

Response 5-11

The EIR does not mistakenly conflate the Aerojet Superfund and the IRCTS. An EIR will sometimes characterize or frame issues more simplistically, provided that the more precise or technical realities are not necessary in order to understand the outcome of the analysis. The EIR notes that the Aerojet Superfund and the IRCTS are two separate areas, but then notes that for the purposes of analysis they will both be referred to as Aerojet, given that they are adjacent, are both associated with the Aerojet company, and that soil and groundwater contamination are the relevant issues of concern for both areas. There was no need to discuss each separately for the purposes of describing probable impacts to the Project.

Comment 5-12

- On the IRCTS rocket-testing activities have ceased and the site is being cleaned up. The site will be developed as the Rio Del Oro project by Elliot Homes and Aerojet Real Estate. The groundwater pollution at the site and it is migrating to the west and southwest, away from the project site.

Response 5-12

Comment noted.

Comment 5-13

- The main groundwater pollution in the area is coming from the Superfund site and consists primarily of volatile organics such as trichloroethylene, perchlorate and n-nitrosodimethylamine. There are several different groundwater plumes associated with the Aerojet site. The main one of concern to this project is the plume emanating from the liquid rocket test-area on the far east side of Aerojet, west of Prairie City Road. This plume is heading south and bit west, and extends as far south as the southern edge of the Teichert processing facility on Grant Line Road. The southern edge of the plume is approximately 1.7 miles north of the project site and moving in the direction of the project. Aerojet is undertaking remedial actions to control the leading edge of the plume, but those actions are not yet complete. Failure of containment will allow the plume to continue to migrate to south and west. There is an additional groundwater plume associated with Area 39, but are in shallow groundwater and not moving very much.

Response 5-13

The EIR contains a link to a map showing the various areas of groundwater contamination (including the IRCTS). All of the various groundwater contamination plumes and their direction of migration are shown. There is a plume to the north of the Project site, but as stated in the comment this is nearly two miles from the site. The analysis focuses on the plumes closest to the Project site. At a distance of nearly two miles, it would take a serious and long-term containment failure before such a plume could reach the site. Such a serious failure is highly unlikely given that the scope of the problem is known, a plan for remediation is in place, and that similar remediation efforts in other Aerojet areas have been proceeding successfully. Also, the Project will be relying entirely on a public water system, not on groundwater beneath the site; the Project does not include drilling any groundwater wells.

Comment 5-14

- Not all of the cleanup sites in the vicinity of the project have been included in this section. There is another cleanup site just north of White Rock Road and west of Grant Line Road as is called the White Rock Road North Dump. The contaminants of concern in the groundwater plume are volatile organics and perchlorate. The plume associated with this project extends as far south as the Aerojet plume described above and is on the west side of Grant Line Road.

Response 5-14

The White Rock Road North Dump was included in the EIR, but it was included in the section on landfills, not in the "Aerojet" section. Refer to page 10-5 of the DEIR.

Comment 5-15

- Aerojet has had a groundwater extraction and treatment system program operating since 1982, not 2002. The 2002 date is associated with Aerojet's Western Groundwater Operable Unit and the commencement of remediation of that Operable Unit.

Response 5-15

The line in the EIR was meant to refer specifically to the GET system for the Administration Area of the IRCTS, which came online in 2002 and is the source of the nearest contaminated groundwater to the site. The section has been clarified.

LETTER 6

Ted A. Gaebler, City Manager, City of Rancho Cordova; written correspondence; dated February 22, 2012

Comment 6-1

The City of Rancho Cordova is submitting the following comments on the Cordova Hills EIR focusing on two primary areas of concern, municipal services and traffic mitigation. The Cordova Hills project is uniquely situated at the eastern boundary of our city and will rely heavily on City infrastructure and services. We anticipate some level of mutual impacts across jurisdictional boundaries from various development projects within the City and the County, but this project is extremely dependent on Rancho Cordova's urban investments. There are virtually no County services and very limited infrastructure in the Cordova Hills area. While the City generally supports the proposed development, these concerns must be addressed within the EIR prior to certification of the environmental document by the County Board of Supervisors.

Given Cordova Hills is far removed from other developed unincorporated areas that receive County services, there will be significant additional time and costs of trying to provide quality, timely services to the new development if services to the area are provided by existing County municipal service providers. Adjacent and neighboring service providers, by comparison, could provide more effective and efficient municipal services to Cordova Hills.

With government facing financial challenges into the future, it is critical that the most cost effective and efficient way to provide municipal services to new development be utilized. One such way would be to have Cordova Hills services be provided by the adjacent and neighboring service providers. Another option would be the formation of an additional government organization, such as a community services district (CSD). However this option seems duplicative and inefficient as it would require the additional expenses of its own board, manager, legal, human resources, finance, technology, and other costs for what would remain a small district.

The EIR should consider whether it is feasible for the County to provide all infrastructure and services needed to support the Cordova Hills project and whether providing services to the project in this manner has the potential to adversely affect the City of Rancho Cordova's infrastructure capacities and municipal services.

Response 6-1

The Project includes an Urban Services Plan (See Appendix PS-1 to the Draft EIR) that describes the service levels and financing strategy to fund an urban level of services that will be provided to future residents, businesses, and employees in the Project area. Services to be provided by independent agencies and by the County will be funded from the County General Fund, user fees, and existing property tax allocations. The services provided by the Cordova Hills Local Services District (which may consist of a County Service Area or a Community Services District) will be funded by user fees and special taxes or assessments on those utilizing those services. Other details regarding the funding of facility construction and operation are described within the Public Services and Public Utilities chapters of the DEIR, and are also considered in the required Infrastructure Financing Plan. This comment does not provide any evidence that these analyses are insufficient. There is also no evidence that if the County provides services

to areas which lie within the County, that this will negatively impact the City of Rancho Cordova. CEQA does not obligate the EIR to discuss the possibility of having the City provide services for an area within the County.

Comment 6-2

The City is in agreement that the majority of the project's off site trips will rely on roadways, transit facilities and bikeways that are within City of Rancho Cordova's jurisdictional boundary. As such, we are concerned about reasonable contributions to the development of our transportation facilities from the Cordova Hills development.

The Cordova Hills EIR identifies mitigation requirements within the City limits and indicates the project's intent to fairly participate in the development of the City's transportation infrastructure. However, we remain concerned that the alternatives analyzed in the traffic study do not adequately represent the actual timing and phasing of infrastructure development.

It is likely that most of the physical transportation improvements identified in the existing plus project scenario will be built once the Cordova Hills development begins to trigger these requirements. We agree that the mitigation trigger should be associated with level of service (LOS) standards, but feel that Rancho Cordova developments or other County projects, such as the Teichert and Stoneridge quarries, will have already triggered many of these requirements. As a result Cordova Hills will rely upon, and benefit from investments by other developing properties. This concern is also evident in the cumulative plus project scenario. The limited number of required improvements in the cumulative scenario is the consequence of very large infrastructure investments provided by other projects. The EIR should include mitigation measures that ensure the Cordova Hills project will pay its fair share of traffic improvements needed to mitigate impacts.

Response 6-2

Part of the implementation of the various transportation measures includes requirements within the Development Agreement that the County and the Project developer must pursue a reciprocal funding agreement between the County of Sacramento and the City of Rancho Cordova, since the County does not have the land use authority to implement mitigation within the City. CEQA Guideline 15091 and Public Resources Code 21081 both recognize that the lead agency cannot take responsibility for mitigation for the construction of roadway improvements outside of the lead agency's jurisdiction. The Conditions of Approval specify when the need for mitigation will be triggered (in terms of equivalent dwelling units), but the actual construction of those improvements is at the discretion of the City of Rancho Cordova, and is thus not a proper topic for a mitigation measure being adopted by the County. The County of Sacramento is without the legal authority to require a project applicant to construct roadway improvements that are within the exclusive jurisdiction and control of another government jurisdiction, and any mitigation measure that sought to do so would be infeasible. Fair-share mitigation fees are being required for impacts within Rancho Cordova, but Sacramento County cannot issue any requirements regarding the construction of those improvements. Consequently, the EIR was required to conclude that cross-jurisdictional roadway impacts were significant and unavoidable.

Regarding the interface between other reasonably foreseeable projects and the subject Project, the existing plus project and the cumulative plus project traffic modeling scenarios were developed consistent with CEQA provisions. Traffic modeling scenarios are intended to be constructed by including the existing conditions and then including

the Project, and by including cumulative conditions (including all reasonably foreseeable projects) and then the Project. This is the only way to clearly determine the additive impact of an individual Project. It would be infeasible to speculate about when all of the various reasonably foreseeable projects would be constructed relative to the Project in question, and to attempt to build a modeling scenario on that basis.

Comment 6-3

In reality, the expansion and development of new roadways east of Sunrise Boulevard will not resemble either of these two theoretical EIR scenarios. The result of relying on these scenarios is that the EIR does not identify any mitigation requirements on Chrysanthy Boulevard, Americanos Boulevard, Sunrise Boulevard, White Rock Road, or Rancho Cordova Parkway, even though the trip distribution diagrams for Cordova Hills indicate that significant trips will be added to these roadways. Cordova Hills takes advantage of the excess capacity on these roadways that will be created by the City's extensive Capital Improvement Program, yet it does not identify adequate fair share contributions toward these improvements. That means there will be less roadway capacity available for the intended beneficiaries of the City's Capital Improvement Program - future projects within the City. The EIR should include mitigation to address impacts from project trips on these roadways.

I would like to reiterate that the City is not opposed to the proposed Cordova Hills Development. However, the project must mitigate impacts to transportation infrastructure within the limits of the City of Rancho Cordova, and the County must provide an effective strategy to manage municipal services so that the Rancho Cordova is not burdened with additional costs for service.

We appreciate the opportunity to comment on this project and look forward to additional dialogue regarding these concerns.

Response 6-3

Refer to Response 6-2. It is entirely proper to assume that roadway projects identified for construction within a Capital Improvement Program will be in place in the cumulative model condition. With each additional or new travel lane added to a roadway, a roadway's vehicle capacity jumps a substantial amount (i.e., thousands of vehicles). While the Cordova Hills Project benefits from the existing and cumulative constructed roadway network within the City of Rancho Cordova, the same can be said for new projects within the City of Rancho Cordova which will benefit from the existing and cumulative constructed roadway network within Sacramento County. The City's comment is more related to an economic issue than a CEQA issue.

LETTER 7

William Heinicke, Director of Planning, Elk Grove Unified School District; written correspondence; dated February 27, 2012

Comment 7-1

The Elk Grove Unified School District (EGUSD) appreciates the opportunity to review and comment on the Draft Environmental Impact Report (EIR) for Cordova Hills. EGUSD requests that the following comment be considered and included in the Final Environmental Impact Report (EIR).

- **Page 1-35, Last paragraph** – EGUSD requests the paragraph entitled “Schools” be reworded as follows:

The Project includes three areas designated as elementary school sites (two of which are approximately ten acres each and one of which is **7 – 10** acres in size, and one area designated as a **middle/high** school (approximately 78 acres). Cordova Hills is within the Elk Grove Unified School District.

EGUSD requests the stated size of the “Town Center” elementary school site be changed from 6 acres to a range of 7 – 10 acres; because, six acres will not be large enough, and a range will allow some flexibility as the plan moves forward. Even with multi-story buildings, providing a complete school program requires a minimum of eight acres. A smaller site may be feasible dependent upon the availability of certain school facilities. For example, a minimum number of parking spaces are required, some of which could possibly be located in adjacent parking facilities. Likewise, required play field areas might be shared on the adjacent park property, if an appropriate joint use agreement is in place.

Response 7-1

The Applicant has agreed to show a school size of eight (8) acres at the Town Center elementary school site in response to this comment, and will make corresponding changes in the Cordova Hills Large Lot Tentative Map, Cordova Hills Master Plan and the Cordova Hills SPA to reflect that change in size. The FEIR also has been revised accordingly. Furthermore, since a precise acreage must be shown on the Land Plan, not a range between 7 to 10 acres, the Cordova Hills Master Plan has been amended to allow flexibility on the school site size. In an email to the applicant from the school district dated March 13, 2012, it was confirmed that Section 8.9 of the SPA Master Plan would have the following language incorporated into it in order to allow flexibility for the 8 acre school site noted on the land plan:

“Elementary school site sizes can be adjusted in size and configuration at the small lot subdivision level. Elementary schools in University/College Campus and East Valley are anticipated to be approximately 10 acres in size. The Town Center elementary school size may vary from 7 to 10 acres depending on educational programming, site design, and use of 2-story structures. Also, there may be joint use facilities of parks and

schools that may warrant a smaller school footprint. . A smaller school site in Town Center will be pursued if possible. However a 10-acre size may be needed if the above strategy is not practicable. The Town Center elementary school would ultimately serve the elementary education needs of students in the Town Center, but could be used to serve portions of other villages during phased development of Cordova Hills.”

LETTER 8

Jonathan Ellison, President, Environmental Council of Sacramento; written correspondence; dated February 21, 2012

Comment 8-1

These comments are submitted on behalf of the Environmental Council of Sacramento (ECOS) on the Cordova Hills Draft Environmental Impact Report (DEIR), dated 9 January 2012. ECOS is a coalition of environmental and civic organizations with a combined membership of more than 12,000 citizens throughout the Sacramento Region. Our mission is to achieve regional and community sustainability and a healthy environment for existing and future residents.

ECOS was quite dismayed that this DEIR was proceeding without an accompanying EIS, as is typically the situation. We believe there may well be a considerable disparity between these two required documents and that it is highly probable that the EIS may require substantial changes to the Project. It is therefore inappropriate for these two documents to proceed independently.

ECOS remains unequivocally opposed to the Cordova Hills project given the lack of foreseeable demand and lack of demonstrated economic feasibility. We are also opposed to the project due to its negative impacts on biological resources, air quality, climate change and the sustainability of the Sacramento region. We will attempt however to limit our comments here to the adequacy of the draft environmental impact report with respect to land use and growth inducement, transportation, biological resources and climate change.

Response 8-1

Comment noted. While CEQA allows the preparation of a joint EIR/EIS, it is not mandatory (see Public Resources Code Section 21083.70). CEQA Guideline Section 15170 provides that a "... lead agency under CEQA *may* work with a federal agency to prepare a joint document ..." [emphasis added]. Comment noted.

Comment 8-2

The primary justification for the original acceptance of this application by the Board of Supervisors was that it would bring the sought after asset of a university to Sacramento. The university initially interested is no longer interested and the likelihood of finding another university, particularly a self-contained university of the type described, is highly unlikely. The Sacramento Council of Governments (SACOG) in its letter to the project proponent dated October 7, 2011 (Attachment 1), states, *"Finding, financing and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region. Many of the short trips and multimodal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all."*

The entire environmental analysis is based on the university as an integral part of the Project. Without the university, the Project is inconsistent with numerous additional General Plan policies, particularly the growth management criteria. Consistency with the growth management criteria is a requirement for the Project to be considered for approval. The project proponents are themselves now saying that it is more likely that a combination campus complex would locate here. This type of complex would be made up of a number of educational institutions, with different specialties, locating here and perhaps sharing some facilities. This would much more likely be a commuter college, rather than a self-contained university as currently proposed and analyzed in this document. Given the very remote potential for a university of the type proposed, this document should have also analyzed the project without the university. This would be necessary for the document to be totally adequate and complete.

Response 8-2

The premise of this argument is that the loss of an identified end-user for the proposed university/college campus center means that the proposed use itself must be eliminated from the Project as part of the analysis. It has been consistently held by the courts that the identity of the end user of a project is irrelevant to CEQA review. See, *Maintain Our Desert Environment v. Town of Apple Valley* (2004) 124 Cal.App.4th 430, 15 Cal.Rptr.3d 322; *American Canyon Community v City of American Canyon* (2006) 145 Cal.App.4th 1062, 52 Cal.Rptr.3d 312; also see, *Friends of Davis v. City of Davis* (2000) 83 Cal.App.4th 1004, 100 Cal.Rptr.2d 413. In *Maintain Our Desert Environment v. Town of Apple Valley* the judicial opinion reads:

It is common knowledge that projects are often developed without any knowledge of who the user/tenant will be. If CEQA was to be interpreted as the Attorney General suggests, no such projects could ever proceed until all potential user/tenants were identified and subsequently investigated by the lead agency. In addition to being completely impractical, this interpretation finds no support in the sphere of law and regulation encompassed by CEQA, as we now explain.

No portion of a Project can simply be excluded from analysis at the discretion of the EIR preparers; this could be characterized as an improper segmentation, as CEQA requires analysis of the whole of a Project (CEQA Guidelines Section 15378.a). The analysis examines the Project application which has been submitted to, and accepted by, the County. The identification of the end user of a project is not required under CEQA for purposes of the project's environmental analysis.

The University as a land use has garnered much attention because it is unique, but in terms of the Project Description required to be analyzed pursuant to CEQA, we see no reason why it should be treated differently than any other land use proposed within the Project. It has been argued by these and other comments that many of the residential uses proposed are unlikely to develop, based on the current low housing demand and other market factors. CEQA does not allow the analysis to exclude examination of some portion of the residential land proposed because the current housing market is not presently growing at historic rates. The proposed Town Center of the project is unique in character, and contains many design characteristics which have an overall positive effect on trip lengths and trip number; this land use cannot be excluded or revised because no tenants have been identified and current market conditions do not support

this large amount of mixed-use development. It would set enormous precedent for the EIR preparers to undertake an analysis of the advisability, profitability, or potential market success of a long-term master plan proposal and then refuse to analyze the Project as submitted on the basis of that examination. Furthermore, such an analysis would be entirely speculative, because it presumes a knowledge of future market conditions.

What the commenter suggests – the segmentation of the Project based on speculation about the market suitability of one of the Project uses – is not within the scope of the EIR preparer's authority. Nor is it the directive of CEQA to define an Alternative on that basis. The primary purpose of an Alternative is to reduce identified Project impacts. None of the significant effects of the Project are tied to the fact that one of the proposed uses is a university/college campus center. In fact, this comment alleges that impacts would increase if the university/college campus center were removed, which is contrary to the primary purpose of identifying alternatives.

Comment 8-3

The phasing of the Project as illustrated in Plate PD-16 is also totally unrealistic. By allowing significant commercial and residential development to occur prior to development of the university, the analysis of impacts in this document is totally compromised. Given the very speculative nature of the university, a "what if" scenario needs to be included which addresses the impacts of the Project without the university. Additionally, **a mitigation measure should be included that requires that 25% of the university complex be completed prior to more than 10 commercial units being issued building permits and 200 residential units being issued building permits for the remainder of the project.**

Response 8-3

Refer to Response 8-2. The phasing exhibit is conceptual, and simply shows that development will occur from Grant Line Road – the area closest to existing infrastructure and other development – toward the east, which is simply the logical means of progression. The EIR analysis is not compromised, because the analysis has properly examined the impact of the Project as a whole on the existing conditions and on cumulative conditions – no phasing was used in any portion of the analysis, because doing so would be entirely speculative. For this reason, mitigation is developed by looking at the impact of the entire project as required by CEQA Guidelines Section 15378.a.

Comment 8-4

The document states that *in terms of internal community design, the Project appears to be an excellent example of "smart growth" development...., it must also be acknowledged that the Project conflicts with the principles with respect to preservation of open space and proximity to existing developed communities.* How can a project be considered "smart growth" development when it conflicts with some of the major foundation principles of "smart growth", contiguous development and open space preservation? Also, the remaining "smart growth" aspects of the project would be seriously compromised if a university is not constructed early in the project development, or at all.

Response 8-4

The EIR concludes that the Project results in significant impacts with respect to conformance with Blueprint smart growth principles, precisely because the two referenced principles are so central to smart growth. It is also a true statement that the Project conforms to all the smart growth principles related to community design (mix of housing, etc). All of these community design parameters would still be present if the university/college campus center were not present.

Comment 8-5

The DEIR states that the Project is inconsistent with LU-1 related to growth inducement, but that a General Plan Amendment is included to address this conflict. This General Plan Amendment adds Policy LU-XX to the General Plan. This policy allows for limited public water service beyond the Urban Policy Area/Urban Services Boundary for the 251 acres located with the landfill buffer. What about sewer service? Are all the permitted facilities going to rely on porta-potties? The document goes on to say that this policy is specifically intended to avoid growth-inducing impacts but contains no explanation as to how the policy will actually do that. It does avoid the conflict with the original policy, but it does not avoid growth inducing impacts. By avoiding conflict with the original policy in this instance, it opens the door for future policies LU-XXX and LU-XXXX. As acknowledged in the document, the action of adopting this General Plan Amendment would set a precedent and encourage future amendments and further growth inducement. The Amendment cannot therefore be justified.

If the Amendment is to be approved, the uses and development standards proposed for this area are far too general. A Use Permit should be required for any development in this area to ensure it is appropriate and does not result in additional growth inducement. This should be considered as an additional mitigation measure.

Response 8-5

The Project description chapter describes the intended uses within the area outside of the Urban Services Boundary (beginning on page 1-32), as well as how those uses will be supported. As described, most of the uses will not require sewage disposal because they are not associated with permanent staff (transit parking lots, park and rides, corporation yard, etc). The General Plan Amendment is being pursued to provide water; septic systems will be installed for sewage disposal. The policy amendment itself explicitly states that any uses reliant on this extended water should strengthen and preserve the existing Urban Services boundary (as stated on page 12-35 of the DEIR).

None of the proposed uses which will be within the area affected by the new policy require a rezone or General Plan Amendment to be approved. All of the proposed uses are those which are permissible or conditionally permissible within an agriculturally-zoned property in the existing condition. Furthermore, the majority of the uses do not involve the use of water (e.g. park and rides, roads, utility infrastructure, etc). Some of the uses allowed outright in the SPA would require a Use Permit in the existing condition, including a solar facility, an energy plant, and a corporation yard (plus fueling station). The potential impacts of developing the areas where these uses are proposed have been assessed in this EIR. Furthermore, as indicated on page 1-32 of the DEIR, Planning Division staff reviewed recent similar projects in Sacramento County (solar facilities, parks, etc) and have included appropriate conditions in the SPA which would

apply to these uses (see Section 4-7 of the SPA Master Plan). Thus, approval of water for these uses does not set a precedent which would result in growth inducement either in this location or elsewhere, because the types of facilities being enabled by the water supply are not those which induce growth, and are those which are already permitted or conditionally permitted by the zoning code outside of the Urban Services Boundary.

Comment 8-6

Aside from this General Plan Amendment, the project, in and of itself, will have a significant impact on growth inducement as indicated in the Growth Inducing Impacts Section of the DEIR. Yet, no mitigation is proposed. We believe that feasible mitigation is available, and if not applied, project applications to the north and south will soon appear. Perhaps more importantly, the Project is proposed immediately adjacent to the Urban Services Boundary (USB). Building up to the USB without providing mitigation for growth inducement beyond the USB is unacceptable. While the applicant has indicated to ECOS the intention to put restrictions on the property east of the project, we can find no reference to this important mitigation in the document.

Response 8-6

The comment states that mitigation is available, but then does not provide any suggested measures. Other than the No Project alternative, the EIR preparers are unaware of any measures which could avoid inducing growth north and south of the site. The Urban Services Boundary itself is the means of avoiding growth east of the site. Only agricultural, agricultural-residential, and similar low-intensity uses are permissible outside of the Urban Services Boundary. Furthermore, the land east of the site drops sharply downward in elevation to Carson Creek, and there is a floodplain associated with this waterway. Some of this property is also owned by Sacramento County, and is not available for private development. Ultimately, the presence of the Urban Services Boundary, the topographic change, and the creek and associated floodplain would prevent the extension of development from the site to the east.

Comment 8-7

Interestingly, the Summary of Impacts indicates that growth inducing impacts are less than significant, while the Growth Inducing Impacts Section indicates they are significant. Obviously the Summary of Impacts determination of less than significant needs to be corrected and as required by the California Environmental Quality Act (CEQA), feasible mitigation for growth inducing impacts applied.

Response 8-7

The Summary of Impacts section referred to summarizes the land use policy impacts described in the Land Use chapter, which are in fact less than significant. This does not need to be corrected. The conclusion of significance is found in the Cumulative and Growth Inducing Impacts chapter, and deals with impacts which go beyond policy impacts.

Comment 8-8

The DEIR identifies the project to be in conflict with the Blueprint, the MTP/SCS and the State Implementation Plan, as well as some General Plan policies. ECOS believes that this document underestimates the seriousness of these conflicts. The health and sustainability of the entire region are jeopardized as a result of these conflicts.

Response 8-8

The impacts discussed in this comment are described by the DEIR as significant and unavoidable - the most serious impact statement provided under CEQA.

Comment 8-9

The transportation analysis is seriously flawed because it does not base its significance determinations on the project without university scenario. As noted above, the university component is not realistic, and without it, many of the project characteristics that would have helped to reduce transportation and other impacts are not likely to occur.

Response 8-9

Refer to Response 8-2.

Comment 8-10

Two specific examples of how including the university in the transportation analysis results in flawed impact analyses are 1) unrealistically high non-automobile mode share, and 2) improper trip internalization reduction. First, the DEIR states that a whopping 43 percent of the total university trips that stay within Cordova Hills will use non-automotive modes (DEIR, 16-38). For comparison, the rest of Cordova Hills is expected to have a non-automotive mode share of only 11 percent. Without a university campus with substantial on-campus housing, the project would result in a much higher automotive mode share, and this must be analyzed. Second, the DEIR claims that 36 percent of all vehicle trips will have their origin and destination within the project. Table TC-14 shows how internal trips are used in the traffic analysis to reduce the total vehicle trip rates. For example, single family dwelling units are expected to generate 9.4 trip ends per day, but after adjusting for the internal trips, the rate is reduced to only 7.2 trips per day. It is improper to apply this internalization factor because it is highly dependent on the university. These impacts must be analyzed, and all significance determinations must be based on these more realistic worst-case impacts. Failure to do so could result in unidentified significant impacts, as well as impacts that are more significant than shown in the DEIR.

Response 8-10

Some of the numbers in the comment have been misused or misunderstood. It is accurate that the traffic analysis showed that 43% of university-associated trips would use non-automobile modes, and that 11% of trips not associated with the university would use non-automotive modes. But the comment then concludes that the project would result in even more automobile uses if the university were excluded. The figure reported as 11% *already* measures only those trips unaffiliated with the university, so that figure would not change (worsen). Later on the cited page (DEIR page 16-38) it is stated that combining the university-affiliated and non-affiliated trips results in a non-automotive mode share of 12%, which demonstrates that as a proportion of overall trips, the large non-automotive mode share of the university has a very small impact on overall mode-share.

An issue similar to the one described above occurs in the commenter's discussion of trip rates. The actual numbers reported are correct, but the conclusion is not supported by evidence. This comment assumes – with no supporting documentation – that all or a major portion of the trip rate reduction occurred due to the presence of the university/college campus center, but this is not the case. Trip reductions were included, but these were based on factors such as the proposed transit system, Neighborhood Electric Vehicle system, pedestrian and bicycle trails, and proximity to uses. One hundred percent (100%) of all homes will be within ¼-mile of a park, paseo or open space corridor; 94% of all homes will be within ½-mile of a transit stop; 87% of all homes will be within ½-mile of a school; and 84% of all homes will be within ½-mile of a commercial service center. It is expected that the trip rates would increase to some degree if the university/college campus center were excluded, but it would not be expected to eliminate all or even most of the trip reductions seen in the analysis.

Lastly, while the comment emphasizes the positive impact that university-affiliated trips have on internal trip dynamics, the comment neglects to account for the effect of the trips on the external environment. Removal of the university/college campus center would alter the trip rates for other uses to some degree, but would also remove nearly 9,000 daily trips, so it cannot be stated that removal of the university/college campus center is certain to be a “worst-case” traffic scenario. Furthermore, the same could be said for the removal of any of the other components of the Project, such as the high density residential uses or commercial uses. The removal of any component of a master planned land use proposal would always result in changes to its trip generation and distribution. An analysis would be required to determine how impacts would change, and with respect to that, refer to Response 8-2. CEQA does not require an analysis of a dissected project with and without its primary land use components.

Comment 8-11

The proposed limited transit service is not adequate to substantially reduce transportation, air quality, and climate change impacts. The Transit Analysis section of the DEIR (p. 16-81) claims that the project meets transit demand. However, nowhere does the DEIR disclose what the demand actually is. The only specific reference to transit demand is in tables 16 and 30 of the Traffic Impact Study in Appendix TR-1. However, transit demand is aggregated with bicycle and pedestrian demand, so it is impossible to determine if the proposed service actually meets transit demand, or if other options would provide better service. For example, Sacramento Regional Transit (RT) has no current plans to provide service in the area, which is easy to understand since there are no residents in the area now. Why didn't the EIR evaluate the potential for RT or another public transit provider to provide service? Many transit studies show that the need to transfer between services is a common reason that people chose to drive instead of taking transit. Would the proposed transit service require purchase of a transit ticket (for either Cordova Hills residents or the public in general)? Would people who work in Cordova

Hills but live elsewhere be required to purchase a ticket? Would students of elementary or high schools be able to use transit to get to and from school? It is important to note that the proposed service is very limited, with 15 minute headways only during peak commute periods on weekdays. In fact, much of the proposed service is only half hour or hourly headways, which is not sufficient to encourage substantial transit ridership. At a minimum, the DEIR must disclose what the specific transit demand projection is, the ridership assumptions relative to maximum capacity, and the amount of projected demand that can be satisfied by the proposed service. In addition, it is important that transit service is provided as soon as residents occupy the project and establish transportation routines. Therefore, the DEIR should include a mitigation measure that transit service becomes operational no later than completion of the first 200 residential units.

Response 8-11

The comment is incorrect and ignores the information provided in the Cordova Hills Master Plan, Figure 6.14 – External Transit Shuttle Route (At Page 6-41), and Table 6.5 – Proposed Service & Operating Characteristics for the External Transit Shuttle (At Page 6-40) or any of the other detailed information provided in the plan that describes the proposed transit system. The proposed transit system is directly linked to the time and frequency of light rail trains at the Mather/Mills Light Rail station and the Project proponents have coordinated the transit system with Regional Transit staff. The 15-minute headways during peak hours for both the internal and external transit routes are equal or superior to any service provided by Regional Transit. Please refer to Table 6.4 – Proposed Service & Operating Characteristics for the Internal Transit Shuttle in the Cordova Hills Master Plan (At Page 6-39). The Draft EIR states that the performance metrics consider “services provided as part of the Master Plan and funded via a secure financial mechanism (example CSA 10; North Natomas TMA Developer fees).” The Cordova Hills Master Plan includes a lengthy description of just such a transit service and finance mechanism. The planned service does not rely on SACOG’s MTP or Regional Transit’s Short Range Transit Plan or Regional Transit’s Long Range Transit Plan for implementation. Similar to the example of the North Natomas TMA cited in the Draft EIR, the Cordova Hills transit system is locally funded and does not depend on SACOG or Regional Transit plans for funding.

Comment 8-12

Consultations with the California Native Plant Society biologist Glen Holstein Phd have raised concerns as to the accuracy of the opening statement that: “The dominant vegetation is non-native grassland comprised of ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), barley (*Hordeum* species), and ryegrass (*Lolium multiflorum*).” His understanding of the literature, and his personal site visits in the past, suggest that this California prairie ecosystem is dominated by the native species *Holcarpa virgata*, which is not a grass (Holstein 2001). This DEIR needs to substantially support its conclusions with evidence (CEQA 15064(f)(5). Dr. Holstein further pointed out the omission of Sacramento General Plan policy CO-135, to protect the ecological integrity of California Prairie habitat, in those policies listed in 6-3 to 6-6. The plan preparers need to include all relevant information and policies in order to meet a good faith effort standard for informing the public and decision makers about the true nature of the environmental impacts to be considered (CEQA 15003(i) and 15151). The development of the California prairie habitat in the project area would clearly violate CO-135.

Response 8-12

Refer to Response 2-5 and Response 2-6.

Comment 8-13

An important discussion and consideration of the particular vernal pools to be lost is missing from this environmental document. These vernal pool resources are some of the very finest remaining examples of their type within the USB. This project is not merely impacting vernal pool resources, it is impacting some of the very highest quality pools and potentially threatening their connectivity to other vernal pool resources. The Recovery Plan for Vernal Ecosystems of California and Southern Oregon, prepared by the United States Fish and Wildlife Service, clearly identifies Cordova Hills as being within one of its highest priority core areas and as such is integral to attaining the goals set out in the recovery plan. This description of the particular significance of these pools needs to be included in the EIR in order for it to meet its good faith effort standard for informing the public and decision makers about the true nature of the environmental impacts to be considered (CEQA 15003(i) and 15151).

Response 8-13

Page 6-27 of the DEIR specifically references the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon, and describes that the Project site lies within an area identified as rank 1, which is the highest priority for recovery.

Comment 8-14

Given the extreme biological value of these vernal pool resources and their associated uplands, it is not made clear what the overall and cumulative impact of their removal will be. Consultations with USFWS and the Army Corps and compliance with the requirements of their permits are presented as mitigations, but no effort is made to address the question of the impact of removal of these pools, and further isolating those to be avoided, from the totality of the conservation effort in the Mather Core Recovery Area. It is

clear that the impact is great based on the effect this project and several others have had on the SSHCP and the creation of viable preserves in the Mather Core Recovery Area. The Plan has been stuck over this very issue and these very resources. As part of a good faith effort, there needs to be a discussion of the significance of these vernal pool resources in terms of the process of creating viable preserves within the USB that have adequate size, to minimize edge effect, and connectivity, as well as a discussion of the problems this project has posed for the completion of the SSHCP (CEQA 15003(i) and 15151). 33% of the vernal pool resources in this project area are slated for destruction.

As well, there remain serious concerns as to the connectivity of these vernal pool resources to potential vernal pool reserves to the west of Grant Line Road. The formation of these resources west of Grant Line road into a preserve is as of yet unresolved, but flexibility must be retained within the Cordova Hills plan to allow for such connectivity if the preserve materializes, or both vernal pool complexes will be further isolated and have diminished viability. A good faith effort necessitates discussion of this issue (CEQA 15003(i) and 15151).

Response 8-14

The DEIR concludes that impacts to wetlands are significant and unavoidable specifically because of the amount of wetland loss and the fact that these are within a Rank 1 area. This loss has been addressed both on a Project-specific level in the Biological Resources chapter and in the Cumulative and Growth Inducing Impacts chapter. A public draft of the South Sacramento Habitat Conservation Plan has not been released, and the preferred preservation areas have not been finalized. It is not the duty of this EIR or Project to describe impacts to an unpublished draft habitat conservation plan. It is the purpose of the habitat conservation plan, not the purpose of

this project-specific EIR, to define and describe the creation of a viable regional preserve network.

In addition, as noted by the commenter, the size and location of any wetland preserves on the southwestern side of Grant Line Road remains unresolved and unknown. Consequently, it would be speculation for the Draft EIR to attempt to discuss in detail any indirect connectivity and isolation issues with regard to other possible wetland preserves outside of the boundaries of the Cordova Hills Project area that may or may not be created. CEQA does not require speculation on such issues. See, CEQA Guideline Section 15145; *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018, 48 Cal.Rptr.3d 544; *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 30 Cal.Rptr.3d 1652; *Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979) 89 Cal.App.3d 274, 152 Cal.Rptr. 585.

Comment 8-15

The biological resource section misuses the CNDDDB throughout by assuming that the data base is a record of absence (i.e. by assuming that if a species does not show up in the CNDDDB, then it's not there). The CNDDDB has a clear disclaimer for users on this point. This constitutes a bad faith effort (CEQA 15003(i) and 15151).

The abuse of the CNDDDB leads to bizarre results such as the conclusion that, for example, there are no recorded incidences of Ferruginous Hawk within 5 miles of the project area, and no Golden Eagles or Northern Harriers within 10 miles, and so moderate potential for occurrences were provided for them despite the fact that suitable foraging habitat is available and despite the fact that the CNDDDB is notoriously incomplete and often only has incidence listing for nesting birds. The Grasshopper sparrow and Loggerhead Shrike are also given a moderate potential for occurrence even though suitable habitat is available and there are recorded incidences within five miles, the definition of high potential for occurrence provided in this EIR. There is no mention whatsoever of the Rough Legged Hawk that is a likely forager in this project area. American Badgers are listed as having low potential for occurrence despite the recorded incidence within 2.5 miles of the project area and the availability of suitable habitat for this species which has a large home range.

Consultations with Glen Holstein Phd indicated some plant deficiencies as well. Tuolumne Button-celery (*Eryngium pinnatisectum*) is listed as "Not Present" despite the fact that it is known to occur in vernal pools and in Sacramento County (Tibor 2001), and as such its potential to occur at Cordova Hills is at least moderate and probably is high. Furthermore, five rare vernal pool annual plants Dwarf Downingia, Bogg's Lake Hedge Hyssop, Ahart's Dwarf Rush, Pincushion Navarretia, and Slender Orcutt Grass are listed as not present at Cordova Hills because plant surveys didn't find them. Such vernal pool annuals may not appear every year, however, even though they are present as seeds undetectable by standard plant surveys (Holland & Jain 1981). One such California annual, although not a vernal pool species, apparently survived exclusively as seeds for 102 years. Long thought extinct, it was rediscovered when its seeds finally germinated (McCune 2005). Many other examples of such rediscoveries are known in California although the duration of their presumed extinction is usually not a century long (Tibor 2001). In all such cases soil profiles have remained intact so seeds could germinate when conditions were favorable. There is at least some potential that any or all of the five rare vernal pool annuals not found by Cordova Hills plant surveys may exist there as seeds. As long as the site's natural soil conditions are intact they might reappear at any time. The project's proposal to destroy 33% of the site's vernal pools significantly diminishes this possibility.

Response 8-15

As discussed in Response 2-8, presence of an occurrence on the CNDDDB was *not* used as the sole means to determine whether an analysis was warranted, as it was clearly

stated that both lack of CNDDDB occurrence *and* lack of adequate habitat must be confirmed before a discussion of the species would be excluded. All species with either a rating of “moderate” or “high” potential were analyzed, and the analysis was conducted to the same level of detail regardless of whether the rating was “moderate” or “high”. The remainder of this comment repeats comments found in Letter 2. Refer to Response 2-9, Response 2-10, Response 2-12, Response 2-13, and Response 2-14.

Comment 8-16

1. CalEEMod is the most appropriate and current modeling tool suitable for measuring greenhouse gas (GHG) emissions from a project. Please use CalEEMod and eliminate patchwork analysis.

Response 8-16

The Project analysis used the California Air Pollution Control Officers Association (“CAPCOA”) mitigation measures to assess emission reductions from greenhouse gas mitigation measures, which is the same technical study which was used to design CalEEMod. SMAQMD has recommended usage of CalEEMod for projects with a Draft EIR published after January 1, 2013. The Cordova Hills DEIR was published nearly one year prior to that date. Furthermore, the methodology used in the analysis for the Project was reviewed and found to be appropriate by County staff and by SMAQMD. (Note that though SMAQMD has expressed concerns in their comment letter, these concerns are unrelated to the methodology used.)

Comment 8-17

2. AQMP-2; SMAQMD 29: The Cordova Hills Master Plan requires all buildings to be constructed to at least 20 percent above 2008 Title 24 standards.

This GHG reduction measure is specious and meaningless for any project permitted after 2015, and nearly useless for projects built between 2012 and 2015. Title 24 is updated every three years and is intended to become approximately 15 percent more stringent for each three year cycle.

To remedy this deficiency, please revise the measure as follows:

At the time of building permit issuance, buildings will be designed to be at least 20% more efficient than Title 24 requirements in force at the time of building permit issuance. Construction must start within one year of receiving building permit and construction is to be completed within two years of receiving building permit, or the Title 24 compliance demonstration must be revised relative to the updated requirements.

Response 8-17

This measure cannot be written as suggested, because this is a master plan which will not be fully developed for decades. The intention of Title 24 is to eventually require that buildings achieve a net-zero energy use, and it would not be feasible for buildings to be 20% more efficient than net-zero. It is true that over time buildings will be required to be more efficient than current mitigation requires, but it is not uncommon for mitigation on a master plan to eventually be supplanted by future regulations which become more

stringent. Mitigation is based on what is deemed feasible and reasonable based on current technologies and evidence, which is the appropriate measure.

Comment 8-18

3. AQMP-2; SMAQMD 33: The TMA is speculative and cannot be counted on for the 5 points. It is difficult to understand whether the proposed transit system is economically justifiable without reviewing the proposed financial plan in parallel with the EIR. AQMP-2; SMAQMD 33 was too general and ECOS could find no specifics elsewhere in the EIR.
- Will the transit system collapse due to inadequate funding?
 - Will parcels go unsold due to high cost of fees to fund transit?
 - What is guaranteed minimum level of service?
 - What is the definition of a peak-time period?
 - What are the proposed contribution rates for commercial and residential properties?
 - i. How do these compare with other user-financed transit systems?

Response 8-18

The TMA and the transit service are core services of the proposed Cordova Hills County Service District, which will also provide parks, landscape maintenance, community internet, and other services for the residents, institutions, and businesses in the Cordova Hills Project. The Cordova Hills Master Plan includes a lengthy description of just such a transit service and finance mechanism. The planned service does not rely on SACOG's MTP or Regional Transit's Short Range Transit Plan or Regional Transit's Long Range Transit Plan for implementation or funding. Many of the economic questions raised by this comment are beyond the purview of CEQA analysis, and the other questions are answered within the Master Plan and Urban Services Plan. With regard to peak time periods, these represent the standard peak commute hours used in transportation analysis (7:00 to 9:00 a.m. and 4:00 to 6:00 p.m.).

Comment 8-19

4. AQMP-2; SMAQMD-99B: The entropy of the Cordova Hills project is low (LUT-3 from CAPCOA Quantification of GHG Measures); this is not a well-mixed project as compared to an urban setting; there are clearly high- medium and low density housing areas with off-site commercial. It is unclear how a 25.32% VMT reduction can be claimed relative to BAU. The DKS analysis claimed approximately 15% VMT reduction and additional CAPCOA measures claimed 10.5% additional VMT reduction. Although AQMP indicates that double counting was not done, it is hard to believe that the interactions between all modeled and estimated measures could achieve a combined 25.32% VMT reduction.

Response 8-19

Comment noted. The Project incorporates a mix of uses required for daily life within ¼- to ½-mile of all residential areas. In addition, all of these uses are directly accessible by the proposed bike and pedestrian network system. In the Cordova Hills Master Plan, Table 6.3 – Proximity to Services (at page 6-27) summarizes the connectivity afforded by the bike and pedestrian trail linkages to major destinations. One hundred percent (100%) of all homes will be within ¼-mile of a park, paseo or open space corridor; 94% of all homes will be within ½-mile of a transit stop; 87% of all homes will be within ½-mile of a school; and 84% of all homes will be within ½-mile of a commercial service center. The comment offers no evidence that the calculations were incorrect.

Comment 8-20

5. AQMP-2; SMAQMD-99B: Table C identifies business as usual conditions and has been replicated as Attachment 2. ECOS has derived proposed project conditions using data on page 8 of AQ-2 and presented in the same format as Table C. There are several notable comments when comparing the 2 tables:
- It is unclear how the 8,006 dwelling units, 7,140 K-12 students in this table relate to the 2.54 people per rented dwelling unit and 2.71 people per owned dwelling unit mesh. ECOS has adjusted conversion factors to try and achieve 25,419 residential population. What are the differences in populations?

Response 8-20

Attachment 2 of the comment letter takes Table C of Appendix AQ-2 and adds several new columns with calculations and factors generated by ECOS. The fundamental assumptions of these calculations are in error. Firstly, the commenter has attempted to calculate the total Project population in a manner which is different than the way it was calculated for the DEIR. The population estimate in the DEIR of 25,419 residents is based upon a simple calculation of the average number of persons per household for each residential dwelling unit (du) times the total number of dwelling units in that category⁷, plus adding a student population of 4,040. Attachment 2 of the comment letter, on the other hand, includes a column titled “conversion”, in which a population factor of unknown source is applied to every land use – including non-residential uses such as a racquetball court or a gas pump – in order to attempt to derive the total population. The calculations provided in this comment letter are in error.

Comment 8-21

- It is unclear how the 1,583 employees in Table C relate to the 6,548 employees from Table 3.

Response 8-21

Table C of the AQMP does not include any data on employees. The land uses identified in Table C are described in terms of size, not occupancy, (e.g. number of dwelling units or thousands of square feet of non-residential floor area). No correlation factors for re-interpreting that data to generate population or the number of employees for a particular use was provided or intended; thus there is no correlation between the estimated employment at the Cordova Hills Project shown in the AQMP’s Table 3 and the commenter’s effort to estimate 1,583 employees by using the size metrics contained in Table C.

Comment 8-22

- VMT between BAU and proposed drops 12.7% from 239 million mi/yr to 209 million mi/yr; Table D, page 8 indicates that the proposed VMT is 199 million miles
 - Why is there a 10 million mile difference? (209 vs. 199)

⁷ 2.71 people per single-family dwelling unit and 2.54 people per multi-family dwelling unit. The Sacramento Area Council of Governments (SACOG) is the source of these persons per household figures (see Appendix AQ-2, Page 14, Table 1 Master Plan and Table 2: Cordova Hills Population Estimate).

Response 8-22

The commenter's number of 209 million miles is a figure which has been calculated by ECOS, and does not appear in the AQMP. This calculation is incorrect, because it uses the incorrect trip generation rates. The trip generation figures used by ECOS are those which were initially *input* to the SACMET model as part of the traffic analysis for the Project, while the trip generation used in the DEIR and reported in Table C of Appendix AQ-2 is the *output* trip generation of the SACMET model. The Traffic and Circulation chapter simply reports the major assumptions which were used to define the Project for the purpose of modeling, and the unadjusted trip generation is only the first of many such input factors. Other input factors include pass-by rates, trip redistribution rates, and reductions taken for transit availability. These other factors reduce the total number of trips, the total trip lengths, or both; thus, it is only by looking at the output of the traffic modeling that the final trip generation can be obtained. The correct calculation of annual VMT generated by the Cordova Hills Project is shown in the AQMP's Table F: "Overall Annual VMT Reduction 2035."

Comment 8-23

- d. VMT/capita per day drops from 29 under BAU conditions (Attachment 1) to 26 under proposed project (Attachment 3), both are high numbers and will make SACOG's effort to meet 2020 and 2035 goals difficult
 - i. ECOS understands that attempting to assist SACOG in meeting their GHG reduction goals is voluntary, but the high VMT per capita calls into question the need for building such a large project on the urban fringe

Response 8-23

Refer to Response 8-22. The VMT calculations included in the ECOS letter are in error. The remainder of this comment is an opinion on whether or not the Project ought to be approved. Comment noted.

Comment 8-24

- e. The student population stands out as a tremendous VMT and GHG reduction measure, yet the University is a very speculative venture
 - i. Recommend splitting University students into those living on-campus vs. those living off-campus to highlight the VMT differences

Response 8-24

Refer to Response 8-2 and Response 8-10. The DEIR reports the proportion of trips which are external to the Project and have the university/college campus center as their destination/origin (page 16-38), but it is not possible or necessary to parse out the trips to the refined detail recommended by this comment. Also note that the university/college campus center is not a mitigation measure, it is a component of the Project.

Comment 8-25

6. AQMP-2; SMAQMD-99B: Since the proposed development of a University has become a very speculative item and because the on-campus student population skews VMT and GHG emissions to a very low per capita level, ECOS believes that the GHG analysis is flawed.

The analysis must either include:

- a. a complete analysis of what the project would consist of without a University that meets or exceeds Sacramento County suite of thresholds adopted 11/3/11 or
- b. a mitigation measure that does not allow construction of Cordova Hills to start until a University with a built out population of 6,000 with an on-campus population that is at least 67% shows good faith that it intends to occupy the space. Good faith might consist of [\$147¹] million in escrow that is forfeited to the SMAQMD for climate mitigation if a mutually agreed to timeline is not achieved. Timeline developed is to include input from public.
 - i. 100% commuter type Universities will NOT be consistent with analysis that indicates 67% of students live on-campus and is not a viable option
 - ii. This mitigation measure must be included in AQMP-2.

Response 8-25

Refer to Response 8-2 and Response 8-10. In addition, payment of funds to SMAQMD would not be appropriate mitigation because SMAQMD has not established a program at this time to ensure that those funds would be used for demonstrable mitigation projects. The “fee” suggested by this comment of \$20.00 per metric ton is not supported by any documentation indicating why this number was chosen by the commenter. A lead agency cannot arbitrarily determine a mitigation “fee”; any funding amount must be supported by evidence in the record which demonstrates both that the amount would be sufficient to offset the impact and that there is an identified means of implementing demonstrable mitigation projects with the funding. The comment has satisfied neither requirement.

Comment 8-26

7. CC-1 below is not acceptable as worded. The 5.80 efficiency metric includes the contribution of a very low per capita University component- say 3.8 or so. The wording of CC-1 could allow the 6,000 person, GHG efficient University to be replaced by a 6,000 person GHG average tenant thus increasing the overall emissions of the project tremendously.

CC-1. The following text shall be added to the Cordova Hills SPA: All amendments to the SPA shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on greenhouse gas emissions. The Amendment shall not increase greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles).

Response 8-26

Mitigation Measure CC-1 is intended to require any amendment to the SPA to meet the threshold of 5.80 MTCO₂e per capita for the overall Project. If an amendment to the SPA meets the 5.80 MTCO₂e per capita threshold, then there would be no need to amend the GHG Reduction Plan. In order to clarify the matter, Mitigation Measure CC-1 has been revised in the Final EIR as follows:

CC-1. The following text shall be added to the Cordova Hills SPA: All amendments to the SPA **with the potential to change SPA-wide GHG emissions** shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on **SPA-wide** greenhouse gas emissions. The Amendment shall not increase **SPA-wide** greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). **If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the Sacramento County Environmental Coordinator on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, who will coordinate with SMAQMD.**

Comment 8-27

8. Cordova Hills proponents indicated at a meeting with ECOS on 2/16/12 that a University will be built at the site or that the land will be surrendered to the County at expiration of 30-year agreement. This is deferred mitigation which has been disallowed by the courts (*Communities for A Better Environment v. Richmond* (2010) 184 Cal.App.4th 70. (CBE).). Liquidated damages (LD) must begin flowing to the SMAQMD Indirect Source program (or other responsible agency) by 2017 if no University with significant on-campus population has not been committed to. Timelines and LD amounts need to be developed with public input.

Response 8-27

The discussion referred to by ECOS was part of a meeting between the proponent and the applicant at which County staff were not present. As described in Response 8-2 and Response 8-10, the university/college campus center is a part of the Project as it has been proposed, and has been analyzed as such. Surrendering the property to the County if it were to remain undeveloped is not a mitigation measure in the DEIR; it is part of the Development Agreement. The transfer of a property from one owner to another is unrelated to any physical impact, and is not a mitigation measure. The proposed condition is also unrelated to the use of the site, because even if this condition were to come into effect, the property would still be designated for a university. This may be a policy consideration for the County, but is not a CEQA issue.

Comment 8-28

1. ECOS could find nothing in chapters 7, 11, 15 or AQMP-2 on water, sewer, or storm drain efficiency measures that might be employed by the project to reduce loads on off-site water, sewer or storm drain infrastructure and thus also reduce effects on climate change.

Water, sewer, and storm drain infrastructure is very expensive per unit. As an example, the high cost of the regional sewage treatment plant upgrade to tertiary status has been in the papers over the last 2 years. The proposed high sewer hook-up fees and hefty monthly rate increases that correspond to the need for capital cost recovery on the sewer plant upgrade are very costly on a unit basis and existing customers are blanching at the proposals. See http://ecosacramento.net/ClimateChange/?page_id=784 for more information.

In many cases efficiency improvements at the loads (in this case Cordova Hills (CH)) can be achieved at a lower unit cost than upgrading infrastructure.

Response 8-28

The DEIR specifically addresses the issues of water conservation on climate change. As stated in the Draft EIR, the Project's water will be supplied by the Sacramento County Water Agency's (SCWA) Zone 40, which is a conjunctive use water system. SCWA has taken climate change into account in its water supply planning, having assumed that surface water supplies could diminish by 25% (according to the Programmatic Water Supply Assessment prepared for the Sacramento County Draft 2030 General Plan Update). In addition, the 2010 California Green Building Standards Code requires the installation at the Cordova Hills Project of water-efficient fixtures in all new construction, including low-flow showerheads, faucets, and toilets. The Cordova Hills Special Planning Area ordinance also indicates that many of the public landscaped areas within the Project will consist of drought-tolerant species fed by drip irrigation or similar low-water systems. Taken together, the requirements for water efficiencies and the planning for water reduction would ensure that the Project has adequate water supply in the long-term. (See, Draft EIR, Page 7-31).

Commenter also asked for a description of the steps the Cordova Hills Project would be taking to reduce its overall demand for water, and thereby reduce its effects on climate change. The Cordova Hills Master Plan ("CHMP") contains substantial documentation on the conservation design measures that will reduce the Project's water, sewer and storm drainage demands on the regional systems. CHMP Section 2.4 on Water Conservation (CHMP, at Page 2-5) describes detailed measures included in the CHMP to reduce water demand. Also see the CHMP's Table 2-1 for water measures that describes the individual measures that will be applied throughout the Cordova Hills Project, including water efficient landscapes, water efficient irrigation, water efficient fixtures, and reduced turf in landscape and lawns (CHMP Section 2.5 on stormwater management, CHMP Section 4.41 on landscape design guidelines, and CHMP Section 7.7 on water quality protection and enhancement). With regard to wastewater, CHMP Section 2.6 describes wastewater management.

Comment 8-29

Because of the disconnect between the economics of supply and demand of commodities (water, sewer and storm), please evaluate above-and-beyond-code water, sewer and storm drain efficiency measures such as:

- gray water
- local scalping plants: (i.e. small plants that take sewage and treat it to recycled water standards and distribute locally)
 - with recycled water to serve non-potable needs
- low-impact storm water management
- water efficiency in new development (would above and beyond Green Code Tier 2 water efficiency measures be cost effective?)
- exemplary effort to keep storm water out of sanitary sewer system

Response 8-29

The availability of gray water to operate a recycled water distribution system is determined by the water services provider, not by the developer. During the preparation of this Final EIR, the County determined that there were no plans to provide future non-potable water to the Cordova Hills Project area and no funding for the County or the water and sewer agencies to maintain a recycled water distribution system at Cordova Hills until non-potable water could be provided. Consequently, in conformance with the County's current plans, it was decided that the Cordova Hills Project will not be installing a recycled water distribution system and the pertinent sections in the CHMP have been revised in this regard. The feasibility of local scalping plants is another service determined by the sewer services provider, not the developer. However, the requirement to otherwise implement water efficiency measures in plumbing fixtures and exterior landscape irrigation continues to be addressed in the CHMP's Section 2.4 on Water Conservation (See, CHMP at Page 2-5). Low impact storm water management was extensively described in the CHMP's Section 2.5.1. With regard to storm water and sewers, both the CHMP's Figure 8.5 "Cordova Hills Waste Water System" (CHMP at Page 8-14) and the CHMP's Figure 8.6 "Cordova Hills Storm Water Management Plan" (CHMP at Page 8-15) depict totally segregated sanitary sewer and storm water systems. In the CHMP, Section 8.5 on "Storm Drainage" states that "[t]he storm water detention and water quality features throughout Cordova Hills are designed as an integrated management system. Implementation of LID measures throughout Cordova Hills will help reduce overall development impacts on the quality of storm water runoff from the project." (See, CHMP at Page 8-16).

Comment 8-30

By NOT including water, sewer and storm drain efficiency improvement measures in the project design that are similar to the unit cost of infrastructure, the project is unknowingly forcing utility providers to pass along unnecessary costs to existing ratepayers in the form of unnecessary infrastructure. The ratepayers of the County cannot keep being tapped for higher monthly fees when lower unit cost alternatives such as on-site efficiency can be employed to societies (i.e. rate payers) advantage.

Response 8-30

Refer to Response 8-29. Commenter has fundamentally expressed an economic opinion, and not raised an issue concerning the environmental analysis in the DEIR.

Nonetheless, the Cordova Hills water, waste water, and storm water systems as described in the references cited in the preceding responses demonstrate the water conservation and system efficiency improvement measures that were designed into the Cordova Hills Project. The comment poses an opinion regarding economic equity that is beyond the scope of the DEIR and overlooks the efficiency measures already incorporated into the design of the Cordova Hills Project.

Comment 8-31

As referenced in the preceding sections, this document is deficient in numerous areas. The most basic flaw is associated with the project description, which includes a 6,000 student self-contained university that is unlikely to ever materialize, at least in the form described, making the project description totally unrealistic. By including this hypothetical university the entire analysis is biased, does not represent the project, and therefore is flawed. In order for this document to be accurate and complete, the project needs to be analyzed without the university.

Additionally, we do not believe the necessary findings and statements of overriding considerations can be defensibly made to approve this project. There is no substantial evidence in the record that a self-contained 6,000 student university will ever exist at this location. Given these considerations, the DEIR should be redrafted and recirculated for public review.

Response 8-31

CEQA does not require EIR's to evaluate and speculate as to what the environmental impacts of a project would be if specific components of the proposed project are not built. Lead agencies are not required to foresee the unforeseeable or to speculate about hypothetical future conditions, which include speculation about when or even whether a user may be found for the university/college campus center. See, CEQA Guidelines Section 15144; *Anderson First Coalition v. City of Anderson* (2005) 130 Cal.App.4th 1173, 30 Cal.Rptr.3d 738; *Residents Ad Hoc Stadium Committee v. Board of Trustees* (1979) 89 Cal.App.3d 274, 152 Cal.Rptr. 585. Also refer to Response 8-2.

LETTER 9

Judith Lamare, Ph.D., President, Friends of the Swainson's Hawk; written correspondence; dated February 22, 2012

Comment 9-1

FOSH is a volunteer group providing grassroots advocacy for wildlife and habitat in the Central Valley. We, along with others, have major concerns about the pending Application to County of Sacramento to develop 2,669 acres along Grant Line Road east of Rancho Cordova. We concur in the comments already submitted by the Environmental Council of Sacramento and the California Native Plant Society.

The EIR determines that the Project will require 2,231 acres of mitigation to compensate for the loss of Swainson's hawk foraging habitat, using the County's mitigation program, another mitigation plan acceptable to CDFG, or the South Sacramento County Habitat Conservation Plan, if it has been approved. The other 438 acres of project area are avoided areas that the EIR claims will retain their foraging value after the project is completed. We have a number of concerns with the analysis and the mitigation measures as presented in the DEIR.

These comments will focus on the Swainson's Hawk impact analysis and mitigation. However, we also have concerns about the environmental impacts of the timing and location of development approvals in Sacramento County for which the necessary infrastructure has not been assured.

We completely agree with the EIR's determination that all of the land within the project area is Swainson's Hawk foraging habitat and that the appropriate mitigation ratio for this area would be 1:1 for loss of foraging habitat.

The EIR relies on CNDDDB to identify species presence. CNDDDB records are poorly maintained, out of date, and are therefore not complete and often underestimate species presence and recent nesting behavior.

CNDDDB is not intended to provide definitive data for purposes of CEQA review of a project. The CNDDDB webpage says:

“...we cannot and do not portray the CNDDDB as an exhaustive and comprehensive inventory of all rare species and natural communities statewide. Field verification for the presence or absence of sensitive species will always be an important obligation of our customers.” (http://www.dfg.ca.gov/biogeodata/cnddb/cnddb_info.asp)

CNDDDB is a first stop for biological assessment, indicating where likely rare plants and animals may be found. When assessing Swainson's Hawk impacts, DERA should consult directly with CDFG to determine how well the area has been surveyed in the past, and include all data available at CDFG, not just what is reported in the CNDDDB.

In the attached email from CDFG's CNDDDB manager, Brian Acord, dated September 15, 2011, more information is provided about the backlog in updating the database with nesting site information. Mr. Acord notes: "...we currently have 418 unprocessed source documents for Swainson's hawk in the state." He also notes that these records could be nests, perched or flying birds.

In the case of Swainson's Hawk records, the County had access to recent, high quality data commissioned by the Cities of Elk Grove and Rancho Cordova as well as the Department of Fish and Game. Much of this data had been incorporated into the planning for the South Sacramento County Habitat Conservation Plan and is represented on maps we are submitting with our comments.

Response 9-1

Refer to Response 2-8 and Response 8-15. Environmental Review staff had multiple phone conversations and a meeting with California Department of Fish and Game as part of assessing the extent of the Project impacts and establishing appropriate mitigation.

Comment 9-2

The EIR is deficient in identifying the location of nesting Swainson's Hawks in relationship to the project site. Nor has it made a good faith effort to survey the site for Swainson's Hawk nesting territories.

Attached you will find several maps of Swainson's Hawk nesting sites. The map titled "Range of the Swainson's Hawk in the SSHCP Plan Area" was produced by the South Sacramento County Habitat Conservation Plan staff and shows nesting territories known to the County through the CNDDDB, and the surveys conducted for the Cities of Elk Grove and Rancho Cordova by Estep Biological Consulting. Measuring distances using the legend of distances on the Map, the Map shows at least three active SWH nests within one mile of the Project site, and many nesting territories within five and ten miles of the Project site.

We also include Figure 10 of Estep Environmental Consulting, 2006. The distribution, abundance, and habitat associations of Swainson's Hawk (*Buteo swainsoni*) in the City of Rancho Cordova Planning Area. (Prepared for the City of Rancho Cordova, CA.) This map confirms the siting documented in the SSHCP map.

We also attach a map prepared for FOSH by a volunteer which places the project site on the SSCHCP map and places circles around the nearest nesting territories on the map. The attached map shows yellow and purple dots representing known nesting territories identified by County of Sacramento SSCHCP staff in preparation of the attached map “Range of Swainson’s Hawk in the SSHCP Plan Area.” These include recent surveys done by Cities of Elk Grove and Rancho Cordova. Nesting sites close to the project are indicated with colored circles showing one (orange), two (yellow) and three (blue) mile radii circles around each nest site. Our map indicates that there are two known nesting sites quite close (within a mile) to the northwest corner of the project area, one within a mile of the southwest project boundary, one within a mile of the southeast project boundary and several others within 1 to 3 miles of the project.

These documents amply demonstrate that the EIR is deficient in identifying known nesting territories proximate to the project site and therefore the likely intensity of use of the site for foraging habitat as well as the likelihood of nesting activity within the project area.

Response 9-2

At the outset of this comment letter, Friends of the Swainson’s Hawk (FOSH) agrees that the entire site is foraging habitat and that a 1:1 mitigation ratio is appropriate. It is unnecessary to know exactly how many nests are located within a given radius of a site in order to determine whether impacts to a species will occur, and thus whether habitat mitigation is required. The amount of habitat mitigation is rarely tied to the number of species which may use the site. It is typical simply to require a set proportion of mitigation if a site contains habitat, regardless of the number of individuals which are proximate to a site. This is the case for Swainson’s hawk mitigation, which is required at a standard 1:1 ratio. Furthermore, the number of known nests within a five or ten mile radius of a site does not correlate to the relative use of that particular site as foraging habitat. According to both CNDDDB data and the data referred to by this comment letter, the vast majority of Sacramento County – including urbanized areas such as the City of Sacramento – are within five miles of multiple nests. Yet, the intensity of Swainson’s hawk foraging is not identical throughout all of Sacramento County. The DEIR discloses the nearest known Swainson’s hawk nest, just as it discloses the nearest occurrences for other species. The nearest known nest disclosed in the DEIR is the same nearest nest shown in the exhibits which accompany this comment letter.

Comment 9-3

Potential direct and cumulative impacts on the species range and reproductive activity should be identified, including but not limited to the following:

- a) potential impacts on reproductive activity in nesting sites and nesting success within two miles
- b) potential impacts on reproductive activity and nesting success of other nesting sites within 2 - 5 miles;
- c) cumulative impacts due to urbanization of foraging lands already permitted by the Cities of Rancho Cordova and Elk Grove and the County of Sacramento.
- d) potential impacts on survivability of fledged juveniles from these nesting sites as well as potential impacts on the adequacy of nourishment of SWH needed to provide the strength and energy required to survive the annual SWH Fall migration. (Undernourished birds, especially undernourished first-year birds, are unlikely to survive the rigors of long-distance migration to central Mexico and southward)
- e) the potential for the project to “take” Swainson’s Hawks, thus necessitating an incidental take permit from the Department of Fish and Game.

What are the risks of take from the project and how will the project mitigate these risks of take to less than significant?

Response 9-3

The California Department of Fish and Game has published guidelines on the assessment of nest disturbance impacts, as described on page 6-41 of the DEIR. The DEIR analysis is consistent with those guidelines, and the analysis recommends mitigation to avoid nesting disturbance or take of Swainson’s hawk (note that Mitigation Measure BR-3 has been amended to include the ½-mile survey radius specified in the discussion, which was inadvertently excluded from the measure). Mitigation has likewise been included for loss of foraging habitat, to ensure the survivability of Swainson’s hawk. Cumulative loss of the grassland habitat on the site is addressed on DEIR page 18-8. Commenter has not presented any substantial evidence that the findings and conclusions of the Draft EIR were in error.

Comment 9-4

The EIR mitigation measure to reduce take is unnecessarily vague and defers mitigation to an unknown future time. CEQA does not permit deferred mitigation. DERA should have standard language from DFG on these measures. In this case DERA did not set any minimum standard to meet the "mitigation below a level of significance" standard required of the lead agency. Instead, it defers the required mitigation on to DFG at some future time. We recommend the following language:

In order to avoid take of nesting raptors (including Swainson's hawks), a pre-construction raptor nest survey shall be conducted within 15 days prior to the beginning of construction activities by a California Department of Fish and Game (CDFG) approved biologist in order to identify active nests in the project site vicinity. The results of the survey shall be submitted to CDFG. If active nests are found, a quarter-mile (1320 feet) initial temporary nest disturbance buffer shall be established. If project related activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an on-site biologist/monitor experienced with raptor behavior shall be retained by the project proponent to monitor the nest, and shall along with the project proponent, consult with the CDFG to determine the best course of action necessary to avoid nest abandonment or take of individuals. Work may be allowed to proceed within the temporary nest disturbance buffer if raptors are not exhibiting agitated behavior such as defensive flights at intruders, getting up from a brooding position, or flying off the nest. The designated on-site biologist/monitor shall be on-site daily if necessary while construction related activities are taking place and shall have the authority to stop work if raptors are exhibiting agitated behavior. In consultation with the CDFG and depending on the behavior of the raptors, over time it may be determined that the on-site biologist/monitor may no longer be necessary due to the raptors' acclimation to construction related activities.

Response 9-4

This comment refers to Mitigation Measure BR-3, which requires preconstruction nesting surveys for raptors. As stated in the text of the DEIR (page 6-45 and 6-47), the lack of detailed avoidance and minimization measures is because the appropriate measures will depend on many variables, including the distance of activities from the found nest, the types of activities, and whether the landform between the nest and activities provides any kind of natural screening. Depending on these factors, a biological monitor may be deemed by Fish and Game to be unnecessary. While including a large amount of language related to the recommended biological monitor, the proposed measure does not indicate the time of year that the surveys should be conducted or recommend an appropriate survey distance. These are critical factors which are included in existing Mitigation Measure BR-3.

Comment 9-5

We have reviewed the DEIR discussion of avoided areas and the analysis of whether the avoided areas retain their foraging habitat value. The EIR concludes that 438 acres of the avoided area will not lose its Swainson's Hawk foraging habitat value.

This conclusion is unsupported. Review of the Project map shows that the large contiguous 298 acres of avoided area is largely surrounded by intensive urban development, with the exceptions of two corridors at the northern and southern ends opening onto adjacent undeveloped areas (grassland). Portions of the avoided area within the project site are quite narrow. Normally, raptors are reluctant to forage on lands adjacent to, or surrounded by, intensive urban uses. For that reason, it appears that a large portion of the 298-acre avoided area within the project would seldom or never be used by SWH.

The DEIR states that two multi-purpose trails will be constructed through the primary avoidance area, and roads will also cross the avoidance area. These impacts will further reduce the SWH foraging value of the avoidance area

CDFG should be asked to make a determination of the amount of the avoided area that would be significantly impacted by adjacent intensive urban development, and accordingly recalculate the SWH habitat that would remain usable by SWH in the avoided areas within the project at build-out of the planned urban development. There is no evidence that such analysis has been done in the preparation of the draft EIR.

Response 9-5

While stating that the DEIR conclusion is unsupported, the commenter does not provide any evidence of this, and in fact makes several unsupported statements of its own. For instance, the comment states that "normally, raptors are reluctant to forage on lands adjacent to, or surrounded by, intensive new uses". This is true for some raptor species, but is not true of raptors in general. Many species of raptor are quite tolerant of urbanized environments, such as falcons which nest on buildings and feed on pigeons⁸ and Cooper's hawk which are regularly found in residential backyards⁹.

With regard to Swainson's hawk, what the comment describes is the impact of urban edge conditions on the overall suitability of a habitat patch. There is abundant research on the suitability of different cover types (e.g. grassland, crops, orchards, etc) and on the size of home ranges, but to the lead agency's knowledge there is no research which defines when edge conditions render a habitat patch unsuitable. The commenter has also not offered any published studies or reports stating a minimum acreage threshold at which Swainson's hawks no longer forage where prey are otherwise abundant and available.

⁸ http://www.allaboutbirds.org/guide/Peregrine_Falcon/id

⁹ http://www.allaboutbirds.org/guide/Coopers_Hawk/id

The commenter also states that the EIR should have been prepared in consultation with Fish and Game. The analysis was formed with the input of Fish and Game, as the County had multiple phone conversations and a meeting with California Department of Fish and Game staff to discuss the Project's impacts on Swainson's hawk; however, the agency has declined to take a public position, on the basis that the County is lead agency. The analysis included in the EIR is based on reasonable assumptions predicated upon facts, and on expert opinion supported by facts. Though the commenter disagrees with the EIR conclusion, no evidence has been presented by the commenter which would require a contrary finding.

Comment 9-6

There is no evidence that the adjacent undeveloped areas connected to the planned avoided areas will remain undeveloped in perpetuity or that they will forever be managed in a manner which does not compromise or eliminate SWH foraging value. The fact that some the adjacent undeveloped area is outside the Urban Service Boundary does not mean that the adjacent undeveloped area will forever remain outside the USB. The County has already initiated a process to expand the Urban Service Boundary in Natomas Basin, and nothing prevents the County from expanding the Urban Service Boundary beyond Cordova Hills in the future. Nothing prevents the County from rezoning the adjacent undeveloped areas to small-parcel agricultural-residential uses outside the Urban Service Boundary.

Response 9-6

See Response 2-15. The EIR is not required to speculate about the potential future rezoning of adjacent lands outside the Urban Services Boundary into smaller agricultural-residential uses, and their impact on the Project and its Avoided Areas. See CEQA Guideline 15144; *Environmental Council of Sacramento v. City of Sacramento* (2006) 142 Cal.App.4th 1018, 48Cal.Rptr.3d 544.

Comment 9-7

Please explain how the avoided area will be managed to retain Swainson's Hawk foraging habitat? Currently, cattle grazing prevents dense overgrowth of weeds that impede SWH foraging access. Will cattle grazing be continued?

What measure will be taken to minimize the “edge effect” of adjacent intensive urban development on SWH foraging habitat in the avoided areas? What will be the vegetative cover?

Experience with open spaces next to other development projects has shown that unless human access is controlled – and enforced - the avoided areas will very likely be used by residents for bicycling (both on-trail and uncontrolled off-trail), running of dogs, kite flying, jogging, and other recreational activities.

How will human or canine (dogs) access be allowed or controlled?

Will there be bicycle or pedestrian trails within the avoided area in addition to the two trails mentioned in the DEIR?

What entity will be responsible for managing the avoided areas, and how will it be funded?

Response 9-7

Edge treatments outlined in the Draft EIR have been designed to minimize impacts from adjacent development and incorporate native plantings as appropriate. Also refer to the CHMP Section 7.6 (“Edge Conditions”). This section of the CHMP describes that there will be post and cable or split rail fencing along the Avoided Area boundaries and along the trail boundaries, educational signage describing the importance of staying outside of the fenced area, plus a swale and native plantings to further define the boundary and to buffer the grasslands from the urban environment. This section also describes that cattle grazing will be continued, as appropriate. The only trails through the primary Avoided Area are the two shown on the Project exhibits. Long-term management will be determined in conjunction with the County and resources agencies, as required by the various biological mitigation measures, and are required to be fully funded.

Comment 9-8

How will the existing undeveloped condition of adjacent lands connected to the “avoided area” be ensured in perpetuity?

Response 9-8

See Response 2-15 and Response 9-6.

Comment 9-9

Mitigation Measure BR-4 is inadequate because it incorrectly assumes that 438 acres of Swainson's Hawk foraging habitat in the project area will retain all its foraging value after project development and because it assumes that a conservation easement on 36 acres on the eastern and southeastern sides of the project area can mitigate for loss of 36 acres within the project area. There is no evidence that California Department of Fish and Game concurs with this measure as mitigating the project impacts to less than significant.

Response 9-9

Refer to responses to prior comment Response 9-5 and Response 9-7. The EIR preparer's disagree with the commenter's opinion that the description of retained habitat is inaccurate. Please see Mitigation Measure BR-4, subsection B, which requires the Swainson's hawk mitigation plan to be prepared and implemented for the protection of Swainson's hawk foraging habitat to the satisfaction of the California Department of Fish and Game. Also, the conservation easement is designed to prevent the loss of the 36 acres which will be within the easement, not to mitigate for other impacts elsewhere.

Comment 9-10

There is a good likelihood that approval of the Cordova Hills would result in the premature commitment of more land to urbanization than can be absorbed. The fact that water and other urban services are not guaranteed for the project further complicates the potential environmental impacts of premature approvals for urbanization. The EIR must analyze and disclose the environmental impacts of such a scenario.

Sacramento County staff, in response to proposals to greatly expand the County Urban Policy Area in its General Plan Update, addressed that issue in a staff report which recommended against the oversized expansion of the County Urban Policy Area. The County staff listed potential undesirable outcomes as follows:

1. Leapfrog development pressure;
2. Imbalance in focus between revitalizing the existing mature communities creating and serving new neighborhoods;
3. Unintended consequences to the partially built-out planned communities and if newer areas out-compete for buyers;
4. Inefficient extension of infrastructure and public services resulting in higher operating costs.
5. Pressure to approve uses that provide near term economic benefits to the developer over a long-term economically sustainable mix of land uses;
6. Impacts to the proposed SSCHCP and to the Connector expressway;
7. Difficulty in meeting State mandates related to climate change initiatives.

A copy of the Sacramento County County's Staff Report (Agenda for 10/13/10, 2030 General Plan Update: Adoption Hearings) with relevant pages 6 - 11, is attached.

Response 9-10

Comment noted. The provision of adequate water and other urban services for the Project is discussed in the Chapters 14 and 15 of the Draft EIR, and all affected agencies participated in the development of an Infrastructure Finance Plan for the Project. Commenter has also raised a number of policy issues related to decisions which were made during the hearings on the 2030 General Plan, which are not required to be addressed in an EIR whose discussion is confined to environmental issues related to this specific Project.

Comment 9-11

The EIR needs to consider the likelihood of occurrence of each of these potential scenarios and the potential environmental consequences, including the physical effects of potential urban decay that may result from prematurely committing more land to urbanization than can be absorbed.

CEQA requires that the EIR describe the environmental effects of potential urban decay that could result from urban development that could foreseeably result from approval of the SOI.

CEQA requires an EIR to disclose and analyze the potential environmental effects of potential urban decay that could result from approval of a project. See *Bakersfield citizens for Local Control v City of Bakersfield* (2004) 124 Cal. App. 4th 1184, 1204-1213. *Bakersfield Citizens*, and other cases cited therein, dealt with potential urban decay that could result from permitting of a major new shopping center where project approval would foreseeably create oversupply of retail capacity beyond market demand, potentially leading to the closure of other retail outlets in the area, resulting urban decay that may have physical effects on the environment. The “shopping center” situation of *Bakersfield Citizens* and the cases cited therein is very analogous to the effects of approving Cordova Hills in a region which is suffering from the detrimental effects of a huge oversupply of vacant housing and retail. The Sacramento region is nationally recognized as a foreclosure “hot spot” with thousands of new or foreclosed homes remaining unsold on the market.

Current real estate sales are often at prices which are less than the cost of new construction. The construction of yet more homes and commercial property on a market suffering from gross oversupply could lead to urban decay and the accompanying physical environmental effects of urban decay, existing homes remain unsold and deteriorate, or are purchased as rentals by absentee landlords who may neglect maintenance and appearance. Local municipal revenues have drastically declined already due to the collapse of home and retail values, leading to major reductions in the staff and budgets of those agencies charged with maintaining parks, sanitation, drainage, and other functions which physically affect the environment.

Won't the approval of the proposed Cordova Hills development compete with existing development and invariably worsen the market for housing and retail activity within the existing urban area, increase the current housing and retail vacancy amount within the existing urban area, and potentially cause yet more urban decay.

Response 9-11

Commenter has not provided any substantial evidence that the Cordova Hills Project would result in or cause urban decay of other areas. See, *Melom v. City of Madera* (2010) 183 Cal.App.4th 41, 106 Cal.Rptr.3d 755. The court cases which have concluded that an urban decay analysis was required were all for project-level proposals, not for multi-decade land use master plans which are not intended to be immediately and fully constructed.

LETTER 10

Donald Kennedy, Pacific Gas and Electric Company; written correspondence; dated February 9, 2012

Comment

Refer to the 2-page letter which begins on page 75 of the “Cordova Hills FEIR: Comment Letters”. The letter explains the services provided by PG&E and explains the processes the developers in the Project area will need to follow in order to develop within utility easements and to develop detailed utility designs.

Response

There will be no improvement plans submitted for areas within the easement as part of this proposal, because it is a land use master plan, not a project-level application. This is essentially a standard comment letter, advising the applicant of the restrictions within the PG&E easement on the property. An evaluation of the Project impacts related to gas transmission facilities was included in the DEIR. Comment noted.

LETTER 11

Tricia Hedahl, Executive Director; Sacramento Area Bicycle Advocates; written correspondence; dated February 22, 2012

Comment 11-1

Thank you for the opportunity to comment on the subject DEIR. The Cordova Hills Master Plan has many positive aspects that will enhance the internal livability for its residents. For example, the compact design for mixed uses shown in the plan is especially demonstrated by Figure 6.9 where nearly all residential areas are within ½ mile of retail and entertainment facilities in the “flex commercial” districts. Such proximity will make walking and bicycling very attractive modes of transportation. However, **the project’s great distance from existing development and infrastructure makes its external connections to the regional circulation system problematic, of uncertain timing, and expensive for local governments to accommodate.**

Response 11-1

The DEIR describes the proposed connections to the regional transportation network, with the costs to be borne by the Cordova Hills Local Service District (for the mass transit portion) and by development fees. The costs and timing of this infrastructure are described in the required Infrastructure Financing Plan. The Project transit system will provide a direct linkage to the Sacramento County Regional Transit District’s light rail system. Furthermore, the internal bike trails network in Cordova Hills will connect to bike commuting routes at two major locations on the west side of the Cordova Hills Project: Chrysanthy Boulevard and the Laguna Creek Trail.

Chrysanthy Boulevard includes a 10’ wide multi-use path and a 5’ Class II bike lane in Cordova Hills and in the City of Rancho Cordova to the west of Grantline Road. (See Cordova Hills SPA, Table 6.1: Cordova Hills Road Summary, page 6-13, and SunCreek Specific Plan (Draft) Figure 4-2 Major Streets Master Plan, page 1.4-5, and Figure 4-4 Minor Arterial Street, page 1.4-7).

The major east-west multi-use trail in Cordova Hills is a central spine that connects to all other trails in the Cordova Hills Project and provides a connection to the west along a 10’ multi-use path parallel to University Boulevard. At the intersection with Grant Line Road, the trail will connect to the Laguna Creek Trail shown in the County Bikeway Master Plan. Options for connection include an undercrossing of Grant Line Road where the road crosses the tributary to Laguna Creek, a signalized at-grade crossing, or a bike path integrated in a future interchange structure constructed as part of the Capital Southeast Connector. This link between the Cordova Hills primary trail network and the Laguna Creek Trail is clearly illustrated in the Cordova Hills Master Plan, Figure 6.12: Potential Links to Conceptual Regional Bike Trail System (Page 6-35).

Comment 11-2

Throughout the DEIR and the underlying Master Plan, the terminology used for bicycle facilities is inconsistent and confusing. Both documents should follow Caltrans' definitions for bikeways which are Class I off-street "bicycle paths", Class II "bicycle lanes" striped on streets, and Class III "bicycle routes" which do not have striped lanes but have signage and pavement markings to alert vehicle operators to the presence of bicyclists. This terminology should be corrected in multiple locations in the documents including pages 1-29, 1-31, and 16-36 of the DEIR and pages 6-32, 6-33, and 6-34 of the Master Plan. For example, page 1-29 and Plate PD-18 of the DEIR should specify and distinguish clearly between Class I paths and on-street Class II lanes. The documents should also acknowledge that other roadway treatments beyond the above 3-level classification are available to further protect bicyclists in special situations (see the NACTO Urban Bikeway Design Guide at <http://nacto.org/cities-for-cycling/design-guide/>).

Response 11-2

The terminology used in both the Cordova Hills Master Plan and the Draft EIR is consistent with the terms in the Sacramento County General Plan Circulation Element (November 9, 2011) and the Sacramento County Bikeway Master Plan (April 2011). The Circulation Element uses the term "multi-use trails" in policies CI-34, CI-35 and CI-37 when addressing the development of trail systems (page 22), but also refers to Class I bike paths in the description of thoroughfares and arterial streets "Bikeways along designated thoroughfares may be Class I, Class II, or Class III facilities" (page 7).

Likewise the Bikeway Master Plan references the County General Plan in noting the policy "Construct and maintain bikeways and multi-use trails to minimize conflicts between bicyclists, pedestrians, and motorists" (page 16) , and uses the hybridized term "Class I- Multi-use Path" in Figure 1 (page 7).

In the Cordova Hills Master Plan, the term "multi-use path" is used consistently to refer to all off-street bike and pedestrian paths. Bicycles will be allowed to use the NEV lanes on arterial streets, but a separate multi-use trail will be located in the corridor adjacent to the street where a dedicated NEV lane is included. The use of the term "Class 1" in the draft Cordova Hills Master Plan was incorrect and was corrected to read "multi-use trail" in the Cordova Hills Master Plan. The correction was made before the Master Plan was forwarded to the Sacramento County Planning Commission.

The term "Class I" describes a very specific standard established by the Highway Design Manual, CHAPTER 1000, BIKEWAY PLANNING AND DESIGN. The design of off-street trail systems in Cordova Hills demands flexibility to accommodate differing terrain, resource avoidance, and other factors that occur in the Cordova Hills Master Plan; thus, not all off-street bike and pedestrian trails could meet strict standards in the Highway Design Manual, therefore the more flexible multi-use path terminology is applied.

In all instances the terms “multi-use path,” is used correctly with respect to the intended character of the bike and pedestrian facility.

Comment 11-3

DEIR page 16-26 states the 3 significance criteria used to assess impacts to bicyclists and pedestrians; according to the 3rd criterion, an impact is significant if it would “result in unsafe conditions for bicyclists . . . including bicycle/pedestrian, [or] bicycle/motor vehicle . . . conflict.” When judging unsafe conditions, we must envision bicyclists of all ages and abilities, from middle-school students to grandparents, and how they would negotiate planned bicycle facilities and crossings. The following paragraphs describe **unsafe and hazardous conditions for bicyclists that therefore constitute significant adverse impacts of the project.**

Response 11-3

The Cordova Hills Project is designed to be consistent with Sacramento County Improvement Standards and was developed with direction and input from the Sacramento County Department of Transportation. The Project entitlements listed in the Draft EIR (including the large lot tentative map, rezoning, and other master plan level entitlements) do not deal with the level of design detail that will be found in subsequent project-level entitlements such as small-lot tentative maps. Consequently, the level of design detail that addresses certain issues such as intersection design can only be addressed in this EIR on the basis of approved County policies and standards that would apply to such improvements. These include the Sacramento County Improvement Standards and the Sacramento County Bicycle Master Plan. The issues of safety on multi-use bike and pedestrian facilities were considered in the design of the plan and the environmental analysis of the project. Subsequent design of specific improvements in the context of small-lot tentative maps and improvement plans will require additional environmental analysis at the level of individual intersection designs.

Comment 11-4

NEVs will be allowed to use Class II bicycle lanes along approximately 4 miles of the 2 major east-west arterials within the project (see Master Plan Figure 6-7). These 2 arterials constitute the sole vehicular access links between the Town Center in the west and the major residential areas to the east. The NEVs will be allowed in the bike lanes because vehicular speed limits on these arterial segments are planned to be 45 mph, excessive for legal NEV operation. NEVs typically operate at 25 – 35 mph while utilitarian bicyclists commonly travel at 8 – 12 mph. Clearly the NEVs will present a hazard for bicyclists when they overtake a bicyclist silently from behind in a bike lane at much greater speed. The greater weight and size of NEVs will make collisions with bicyclists as dangerous as with motor vehicles. Furthermore, the 8-ft width of the shared NEV/bike lanes will make them easily mistaken for vehicle travel lanes, thus requiring protective measures to keep vehicles out of them. Therefore, **NEV use of the Class II bike lanes along these arterials is a significant adverse impact of the project on bicyclists.**

Response 11-4

The comment states that “NEVs will be allowed to use Class II bicycle lanes”, which is a mischaracterization. There are some street sections where bicycles will be allowed to use the 8-foot NEV lanes, and these are designated as NEV/bike lanes. Though mischaracterized, the overall point of this statement is that there are sections where

NEVs and bicycles will be permitted to share the same facility, and this is true (though bicycles will not have to use this pathway – see Response 11-5). Throughout California and elsewhere, bicycles are permitted to share roadways with vehicles. Research has shown that accidents of the type described here – a vehicle striking a bicyclist from behind or swiping alongside – is the least frequent type of accident¹⁰. Research has likewise shown that when vehicle speeds are low, as they will be in the case of a NEV – accidents are rarely severe¹¹. There is also still debate – including amongst bicycling advocates¹² – about whether shared facilities are more or less safe than dedicated bicycle lanes. In this case, the shared facility will involve low vehicle volumes, low speeds, and more than adequate paved width. Bicyclists will have the option of sharing a lane with NEVs or of using the paved side pathway where no vehicles will be present. The comment provides no evidence that allowing bicycles to use the NEV lane would be unsafe.

Comment 11-5

Project proponents have suggested that bicyclists fearful of sharing bike lanes with NEVs can instead use the Class I bicycle paths planned to parallel these arterial segments. These Class I paths are described in the DEIR and Master Plan as “multi-use trails” that will be shared with pedestrians. These trails will be attractive to casual recreational bicyclists but will not be useful to utilitarian bike riders who desire to ride directly and efficiently for several miles or more to locations for shopping, jobs, schools, and other community facilities.

Response 11-5

The comment discounts the 10-foot, paved multi-use trail (for pedestrians and bicycles) which will also be present whenever a shared NEV/bike lane is present. Though the comment states that such a multi-use trail would not be useful to utilitarian riders, there is contrary evidence within Sacramento County. The most classic of these is the American River Bicycle Trail, which is used by large numbers of pedestrians, and yet is also used by large numbers of bicyclists for commuting and race training. The commenter presents no evidence in support of the statement that utilitarian riders will be unwilling to use the multi-use paved trail.

Comment 11-6

We request that the DEIR evaluate possible solutions (i.e. appropriate mitigation) to this hazardous bicycle/NEV conflict including 1) reducing the speed limit on these arterials to 35 mph, 2) demarcating separate NEV and bicycle lanes with protective buffers between them, and 3) allowing NEVs to use the vehicular traffic lanes.

¹⁰ Forrester, J. (1993). *Effective Cycling* (6th ed.). Cambridge, Mass: MIT Press.

¹¹ Cross, K.D. (1978) *Bicycle-Safety Education: Facts and Issues*. Falls Church, VA: AAA Foundation for Traffic Safety.

¹² <http://www.bicyclinginfo.org/faqs/answer.cfm?id=971>

Response 11-6

The design speed for arterial streets is established by the Department of Transportation based on anticipated traffic volumes and level of service standards. The NEV lane width (8 feet) and the vehicle travel lanes on the arterial street configurations (12 feet and 11 feet) were developed in collaboration with the Sacramento County Department of Transportation based on the Sacramento County Development Standards.

Alternative lane configurations would require modification of existing Development Standards. The NEV cannot exceed 25 mph regardless of the lane speed designation (California Vehicle Code Section 385.5), and the street design for the NEV lanes already includes striping with a rumble strip to establish the boundary between the NEV lane and the rest of the roadway. The comment suggests allowing NEV traffic to mix with the higher speed traffic, but this would violate the California Vehicle Code.

Comment 11-7

Class I bicycle paths will parallel the 2 main east-west arterials through approximately 10 intersections. The DEIR and the Master Plan do not describe the design of these intersections or the designs of the Class I paths where they cross side streets. Plate TC-3 of the DEIR shows that some of these intersections will be signaled and some will be roundabouts. Both signaled traditional intersections and roundabouts can be hazardous for bicyclists on the Class I paths because of interactions with vehicular traffic signaling, traffic movement patterns through planned roundabouts, pedestrian movements, and the on-street Class II bike lanes. Until such designs are specified and can be reviewed by experienced bicycle planners, these intersections should be regarded as hazardous to bicyclists and pedestrians. **The arterial intersections therefore pose significant adverse impacts of the project on bicyclists.**

Response 11-7

The Cordova Hills Project entitlements, and thus the level of analysis in the Draft EIR, do not extend to the level of street design that would include intersection designs. Such designs are addressed in the Sacramento County Development Standards that will apply to subsequent applications for street design and small lot tentative maps and will include that more finite level of detail. The Development Standards in Sacramento County have already been designed to consider safety. Intersections that mix various modes of transportation inherently involve potential conflicts not only between the different modes, but between any single mode (car vs. car; bicycle vs. bicycle). Care in designing all intersections to minimize potential conflicts and reduce the potential hazard is inherent in the more refined level of design that will occur in subsequent applications.

Comment 11-8

Figure 6.1 of the Master Plan describes transportation-mode alternatives for the project. The “service radius” for bicyclists is said to be only up to 3-mile radius and the figure also fails to acknowledge that bicyclists may want to use bicycle trips to access jobs; elsewhere the DEIR describes the main Rancho Cordova employment center as approximately 7 miles to the west, a relatively comfortable ride for a moderately experienced bicyclist to work locations with supportive facilities for bicyclists (secure parking, showers, etc.).

Response 11-8

The Cordova Hills Master Plan, Figure 6.1, “Traffic Mode Alternatives” identifies the range of travel mode alternatives within the Cordova Hills area and the description of bicycles being serviceable in a three mile range is consistent with the Plan description because the Plan area is three miles in its greatest dimension. The overall Project analysis does consider the use of alternative modes of transportation off-site as well. The Cordova Hills Project is designed to facilitate bicycle commuters to other employment centers, parks, schools, and shopping in other projects, to link to the regional bike trail network, and to utilize light rail at the Mather/Mills Light Rail Station for extended travel throughout the region. Mitigation Measure TR-7 requires Cordova Hills to fund its fair share of the construction cost of bicycle lanes that connect to Rancho Cordova.

Comment 11-9

Hazardous bike riding conditions increase with widths of streets (i.e. crossing distances), volume and speed of traffic, and complexity of intersection configurations (e.g. numbers and timing of left turn and right turn lanes). Such intersections must be considered barriers to bicycle travel for the average rider. **The DEIR does not assess hazards to bicyclists in trying to cross Grant Line Road at its intersection with Chrysanthy Boulevard or at the intersections of Grant Line Road with the project’s North Loop Road and University Boulevard.** Until such designs are specified and reviewed by experienced bicycle planners, these primary crossing points for accessing Rancho Cordova must be regarded as hazardous to bicyclists and therefore a significant impact of the project.

Response 11-9

The detailed design of intersections is not included in the Cordova Hills Master Plan or Draft EIR analysis because they are premature. However, the intersections of North Loop Boulevard and University Boulevard with Grant Line Road will conform to the Sacramento County Development Standards (unless unique design treatments occur in the context of the Capital Southeast Connector improvements). Based on the County Development Standards, the intersection of Chrysanthy Boulevard with Grant Line Road will also be a conventional intersection with Class II bike lanes. The design of this intersection will not pose an unusually greater risk than other comparable intersections throughout the County. Though not required to mitigate an impact, the applicant has added the following language to the SPA.

“Evaluate and, where feasible, incorporate design features that enhance the safety of bicyclists, pedestrians, NEV operators, and drivers at arterial street intersections such as described in, but not limited to the National Association of City Transportation Officials (NACTO) Urban Bikeway Design Guidelines.”

Comment 11-10

The DEIR's Traffic Analysis identifies significant impacts of the project on many intersections and road segments in the vicinity of the project caused by traffic generated by the project. At 23 of these intersections and segments, the DEIR recommends mitigation measures that include constructing additional traffic lanes (up to 6 lanes in some cases). The DEIR should acknowledge that each of these lane additions will increase the hazards for bicycle riders using those intersections or segments because of increased crossing widths, increased vehicle speeds and volumes, and increased complexity of traffic movements. Therefore, **these lane additions should be considered significant adverse impacts of the project**. The DEIR should further acknowledge that additional mitigation measures to protect bicyclists will be needed (see the NACTO Urban Bikeway Design Guide at <http://nacto.org/cities-for-cycling/design-guide/> for descriptions of intersection treatments to protect bicyclists).

Response 11-10

None of the intersection and roadway widenings identified as mitigation for the Project go beyond what is planned in either the City of Rancho Cordova General Plan or the Sacramento County General Plan. The timing of these impacts is related to the timing of the proposed Project and other reasonably foreseeable projects, but the fact of the actual facility widths were already analyzed and approved as part of the City and County General Plans. Thus, if there is a safety impact associated with allowing these widths – and the comment has provided no substantial evidence that the facility widths are substantially less safe – it was the impact of the General Plans, not of this particular project. At the request of SABA and to enhance the existing safety features of the City and County Improvement Standards, the requested language has been included in the SPA (see Response 11-9).

LETTER 12

Amandeep Singh, P.E.; Sacramento Area Sewer District; written correspondence; dated February 22, 2012

Comment 12-1

It is noted that the proposed project is located in the southeastern portion of Sacramento County on approximately 2,669 acres, adjacent to the City of Rancho Cordova. The area is designated by the Sacramento County General Plan as General Agriculture (80 acres) and is currently zoned for AG-80 agricultural uses. The project is within the Urban Services Boundary, but outside the Urban Policy Area and outside of the Sacramento Area Sewer District. Here are our summary comments.

- SASD's Board of Directors approved a SASD Sewer System Capacity Plan 2010 Update in January 2012. The Plan provides an updated mid-range and long-term plan for sewer service in this area. The sewer service alternatives identified in the subject document should be reviewed for consistency with the System Capacity Plan. Also, note the System Capacity Plan received a "Statutory Exemption" from the County of Sacramento's Division of Environmental Review and Assessment (Control Number 2011-70100).
- Annex the subject property to both the Sacramento Regional County Sanitation District (SRCSD) and the Sacramento Area Sewer District (SASD) prior to recordation of the Final Map or submission of any improvement plans, whichever occurs first. Upon annexation, conditions will apply to this project.

In addition, here are our comments on statements within the Draft Environmental Impact Report:

1. Page 15-4, Para 1: SASD does not construct trunk sewer lines serving new development. The developer constructs trunk facilities to District Standards and is eligible for reimbursement in accordance with the SASD Sewer Ordinance. SASD will own and operate the facilities upon acceptance.
2. Page 15-4, Para 1: SASD is responsible for more than just the maintenance of the lower lateral and mainline pumps.
3. Page 15-7: Remove discussion of SASD's Sewerage Facilities Expansion Master Plan 2006 Update and replace with discussion of System Capacity Plan.

Response 12-1

The relevant sections of the EIR have been updated to reflect the most current adopted plans, and clarifications to the text have been made in response to these comments. The County will require annexation of the Project area into the SRCSD and SASD as part of the Conditions of Approval for the Project's large lot tentative subdivision maps.

Comment 12-2

4. Page 15-38: Under "Regional Infrastructure", clarify the statement "service to Cordova Hills is not constrained." Sewer service alternatives are dependent on capacity availability at the time of development, and could be considered "constrained".

Response 12-2

The EIR preparers acknowledge that various service providers, including sewer service, will not "reserve" capacity for any upcoming project until such time as impact fees have been paid. To this extent, SASD considers service "constrained"; however, this does not mean that there is evidence that capacity will be unavailable. The DEIR uses the term "not constrained" to mean that there is adequate planned capacity to serve the Project, which is correct. As identified on Page 15-49 of the DEIR, the "SRWTP has a permitted average dry weather flow (ADWF) design capacity of 181 mgd and wet weather flow (AWWF) of 392 mgd." Cordova Hills will generate an ADWF of 4.99 mgd at buildout." Therefore, as identified in the Draft EIR, the Project's sewage disposal demand can be met by the existing capacity of the SRWTP. This is the sense in which the DEIR uses the term "not constrained".

Comment 12-3

5. Page 15-38: The statement "All of the regional off-site infrastructure shown is already contemplated in SASD or SRCSD master planning documents, and thus are not impacts of the Project" is not correct. Some of the sewer service alternatives identified in the subject document are not included in SASD's System Capacity Plan (e.g., force mains to the Mather or Bradshaw Interceptors).

Response 12-3

SASD and SRCSD's master planning documents address permanent sewer facilities (both existing and contemplated), their timing of implementation based on sewerage demand, as well as the cost of their implementation. They do not address interim facilities to be constructed by development projects; facilities that may be required to provide sewer service to development areas that cannot yet be served by permanent facilities that have not yet been extended to those new development areas.

Additionally, the District periodically updates its master plans to address changes in the short-, mid-, and long-range development forecasts and associated sewer capacity demands. According to SASD's current planning document, "Since the 2010 SCP is a high level planning document, the expansion trunk projects developed in this study may not be final projects. Expansion project alternatives may be further evaluated and developed through SASD's mid-range planning efforts if necessary." For the Cordova Hills Project, the SASD master plan document prior to the current 2010 SCP Update identified the Mather Interceptor project as one downstream facility capable of providing sewer service to Cordova hills ahead of the expansion of the Laguna Interceptor. Now

that neither of those two interceptors is contemplated any longer, extension of a force main by the Cordova Hills Project to the Mather Interceptor is no longer contemplated either. However, extension of a force main to the existing Bradshaw Interceptor may still be a feasible and practicable alternative, should capacity demands by the Project precede the extension of the Douglas Interceptor as contemplated by the SASD's 2010 SCP. As extension of this interim force main would follow existing road alignments and be located beneath existing pavement, extension of the force main would not cause any facility-specific physical impacts.

Comment 12-4

6. Page 15-49: The statement "SASD and SRCSD did not identify any facility constraints to service" is not correct. See comment 4 above.

Response 12-4

See Response 12-2. It is a correct statement to say that neither SASD nor SRCSD indicated that there would be insufficient planned capacity to serve the Project, which is the sense in which the EIR uses the term "constrained". The Sewer Master Plan prepared for the Project was reviewed and approved by the Sacramento Area Sewer District, and deemed to be adequate to provide service to the Project. Additionally, the SASD comment letter submitted on the Notice of Preparation stated that Project impacts to sewer facilities were expected to be less than significant.

LETTER 13

Kamal Atwal, P.E.; Sacramento County Department of Transportation; written correspondence; dated February 22, 2012

Comment 13-1

1. **Executive Summary. Page 34. Mitigation Measure TR-1.B.** The DEIR states “Mather Boulevard and Douglas Road –Construct a new traffic signal, Provide a shared through-right turn lane on the northbound approach; provide a separate left turn lane and a through lane on the southbound approach; and provide a separate left turn lane and a separate right turn lane on the westbound approach”. It should be noted that since the completion of the traffic study for this project, the Zinfandel Drive extension project has been completed and a new signal has been installed at the Douglas Road and Zinfandel Drive /Eagles Nest Road intersection. We do not see a need for another traffic signal in close proximity to this newly installed signal. We would ask that the Cordova Hills project impact at the Mather Boulevard and Douglas Road intersection be reevaluated and mitigation measure TR-1.B be either deleted or recommend an alternative mitigation measure. If new analysis reveals that a mitigation measure is needed to mitigate the project impact then it should be coordinated with SACDOT staff for consultation and recommendation. Please coordinate with us as necessary.

Response 13-1

Comment noted. Based upon this comment, additional analysis was performed to determine if the signal required by mitigation would still be necessary. As a result, the Final EIR has deleted the requirement for Mitigation Measure TR-1.B. since there is no longer any significant adverse impact from the Project to the intersection of Mather Boulevard and Douglas Road. Refer to the amended Traffic and Circulation chapter.

Comment 13-2

2. **Executive Summary. Page 34. Mitigation Measure TR-1.E.** The DEIR states “Grant Line Road and White Rock Road – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound approach; provide a through lane and a separate right turn lane on the southbound approach; and provide separate left turn lane and a separate right turn lane on the eastbound approach. Also an extra westbound departure lane is needed for the dual northbound left turn movement.” Please note that a traffic signal will be installed as part of the White Rock Road Improvements Project which will begin construction this year. But, Cordova Hills project’s need for dual left lane in the northbound direction at the Grant Line Road and White Rock Road intersection is not part of the White Rock Road Improvements Project. Therefore, the Cordova Hills project will be responsible for constructing the dual left turn lane at this intersection and modify the signal to accommodate the lane additions. As result of the dual left turn lane, the westbound receiving lane would also need to be extended for the northbound left turn traffic and northbound thru lanes will shift to east on the approach and departure side. Please update the mitigation measure. SACDOT staff will submit a condition of approval relating to this change.

Response 13-2

In response to this comment, Mitigation Measure TR-1.E. has been revised in the Final EIR to read as follows:

“TR-1: The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation measure recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

...

E. *Grant Line and White Rock Road.* ~~Construct a new~~ **Modify the intersection** **and** traffic signal **to** provide dual left turn lanes and a separate **two** through lanes on the northbound approach; provide a **two** through lane and a separate right turn lane on the southbound approach; and provide separate **two** left turn lanes and a separate right turn lane on the eastbound approach. ~~Also an extra~~ **The** westbound departure lane **shall be extended to accommodate** ~~is needed for the dual northbound left movement.”~~

Comment 13-3

3. **Executive Summary. Page 38 and 39. Mitigation Measure TR-4.A.** Please note that this mitigation measure is in City of Elk Grove and construction responsibility is beyond the control of the County of Sacramento and the project proponent. Therefore, the project should pay its fair share towards this improvement to the City of Elk Grove if a reciprocal agreement between the County of Sacramento and City of Elk Grove is in place at the time of implementation of the Public Facilities Financing Plan. Otherwise, the project is only responsible for paying the fair share of improvements within the control of County of Sacramento.

Response 13-3

In response to this comment, Mitigation Measure TR-4. has been revised in the Final EIR to read as follows:

“TR-4: The applicant shall ~~construct or~~ fund, as set forth in the phasing and financing plan approved by the Sacramento Department of Transportation, and in consultation with the City of Elk Grove **if the City has entered into a reciprocal funding agreement with the County at the time of implementation of the Public Facilities Financing Plan,** the below mitigation measure. **If the City has not entered into such an agreement with the County at the time of implementation of the Public Facilities Financing Plan, then the applicant shall only be responsible for funding its fair share of improvements located in the County of Sacramento.** The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures benefit other projects, a reimbursement agreement may be considered. Grant Line Road from Sheldon Road to Calvine Road. Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.”

Comment 13-4

4. **Executive Summary. Page 41. Mitigation Measure TR-7.A.** Mitigation measure states “Construct sidewalks and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road.” Since the Grant Line Road and Douglas Road would be six lanes ultimately, we understand that curb, gutter and sidewalk cannot be installed at the ultimate location as part of the 4 lane widening as recommended in mitigation measures TR-5.F and TR-5.I. We recommend the mitigation measure be revised to include interim pedestrian and bicycle facilities to the satisfaction of the Department of Transportation. Typically all four lane widening projects would require an appropriate detached AC path for pedestrians. Additionally, the bike lane/shoulder will be 6 feet due to lack of curb and gutter. SACDOT staff will submit a condition of approval to Planning and DERA staff relating to this matter. The mitigation measure should be revised.

Response 13-4

Mitigation Measure TR-7 has been revised in the Final EIR to read as follows:

“TR-7: The Applicant shall be responsible for a fair share of the below mitigation measure. The fair share shall be calculated to the satisfaction of the Sacramento County Department of Transportation any may be up to 100% of the cost of improvements.

Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road, to the satisfaction of the Sacramento County Department of Transportation."

Comment 13-5

5. **Traffic and Circulation. Page 16-1 to 16-83.** The above four comments will result in changes to this chapter. Please update in the FEIR.

Response 13-5

Changes have been made, as noted in the responses to the comments above.

Comment 13-6

6. **General.** The number of through lanes at mitigated intersections should be consistent with the number of through lanes for mitigated roadway segments. Please update the mitigation measures. Lane drops should be done on departure side of the intersections. The left turn lane will be set up based on the improvement standards for an arterial or thoroughfare. Please revise the intersection mitigation measures as necessary to match with roadway segment mitigation measures.

Response 13-6

The mitigation identified throughout the chapter are those which were determined to be appropriate to avoid impacts to the facility being analyzed. This results in cases where an intersection and roadway segment analysis require different facility sizes in order to effectively mitigate (e.g. a two-lane roadway, but a four-lane intersection). The appropriate place to address this issue is through conditions of approval, not through mitigation. The purpose of a mitigation measure is to identify the minimum facility change required to offset the identified impact, which has been done. A condition of approval would then identify how the County Improvement Standards should be applied in areas where the segment mitigation and the intersection mitigation interface.

Comment 13-7

7. **General.** The standard county left turn pocket length would not be sufficient to store the vehicle queues for intersections that carry more than 600 vehicles per hour for the dual left turn lane. For those locations, a queuing analysis needs to be completed prior to the approval of improvement plans and final maps to determine the appropriate left turn pocket length. A separate condition of approval will also be submitted to address this issue in the future for the Cordova Hills project.

Response 13-7

As stated in this comment, this would be addressed through conditions of approval, which would require the queuing analysis at the time when the more refined maps are submitted and the length of queue can be determined.

Comment 13-8

8. **General.** Please note that left turn pockets at some of these locations carry a lot of traffic compared to standard intersections. At those locations, the left pockets will be extended and analysis would be required to determine the length of these pockets (as discussed in the comment above). The standard sections at the intersections will need to be modified to fit the project needs. SACDOT staff recommends adding a condition of approval on the project for wider median on Grant Line Road as it will have long left turn pockets with a narrow median. To improve the aesthetics of the corridor, we will condition the project to provide landscaping for trees in the median up to cross walks. Please coordinate with SACDOT staff regarding this landscaping requirement and include this change in the draft public facilities financing plan.

Response 13-8

Refer to Response 13-6. As stated in this comment, this would be addressed through conditions of approval.

Comment 13-9

9. **General.** The project applicant should continue to work with SACDOT staff to find an appropriate design for the free right turn lane mitigation measure. The free right turn lane concept design should be submitted to SACDOT staff for preliminary approval.

Response 13-9

Refer to Response 13-6. The measure has identified the type of facility necessary to offset the impact. The detailed design considerations should be carried forward pursuant to the existing County Improvement Standards and through conditions of approval.

Comment 13-10

10. **General.** The applicant shall coordinate with the Capital Southeast Connector JPA and the Sacramento County Department of Transportation in order to develop an alternative access design for the North Loop Road intersection with Grant Line Road. The alternative design must either consist of moving the North Loop Road intersection to create a 4-way intersection with Douglas Road and Grant Line Road or shall consist of another design acceptable to both the Capital Southeast Connector JPA and the Sacramento County Department of Transportation. Any application for Capital Southeast Connector improvements to the relevant segment of Grant Line Road which is submitted for discretionary approval to Sacramento County shall be incorporated into the alternative design.

Response 13-10

Refer to Response 13-6. This comment is in the form of a recommended condition of approval related to detailed design considerations.

LETTER 14

Dave Ghirardelli; Sacramento County Department of Waste Management and Recycling; written correspondence; dated February 21, 2012

Comment 14-1

On page 5-36 the DEIR states “As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given all of the foregoing – with particular emphasis on the ability of the gas extraction system to reduce the potency and density of landfill odor – and the mitigation incorporated below, odor impacts are not expected to be substantial, and impacts are *less than significant*.” DWMR disagrees with this statement.

The landfill gas (LFG) collection system at Kiefer landfill will not reduce the Cordova Hills project’s odor impacts (bringing sensitive receptors into such close proximity to Kiefer landfill) to the level of *less than significant*. LFG collection system reductions in odor are ancillary, as clearly stated on the website referenced, and generally occur on closed sections of a landfill where an LFG system is installed.

Kiefer landfill generates odors primarily from unloading and spreading municipal solid waste and from unloading and processing greenwaste. The LFG collection system does not reduce those odors at all. Additionally, as the landfill is constructed, the odor generating operations will be closer to the Cordova Hills project. This is described in the Project Description chapter of the Certified (1998) Kiefer Landfill Final Supplemental Environmental Impact Report (Kiefer EIR).

The Cordova Hills project will bring sensitive receptors into close proximity to these operations and doing so is **a significant impact and requires additional mitigation on the part of the Cordova Hills project.**

Response 14-1

Landfill gas collection systems are referenced in many publications as being an important source of odor control. This includes CalRecycle¹³, which specifically states that odor is controlled both through the use of daily cover, which helps address the newly-delivered landfill materials described in this comment, and a landfill gas collection system, which addresses the odors generated by the buried waste. A properly-designed landfill gas capture system can significantly reduce odors from the buried waste, and in that respect is a critical component of landfill odor control. The analysis has used the methodology recommended by SMAQMD, and this comment has not provided any substantial evidence that this analysis was flawed.

¹³ <http://www.calrecycle.ca.gov/Archive/IWMBAR/2000/Enforcement/>

Mitigation has been included requiring disclosures on properties within one mile of the landfill. It is important to realize that CEQA was not enacted to protect people from the environment. Instead, CEQA was enacted to examine the impacts that new projects have on the environment (See, *South Orange County Wastewater Authority v. City of Dana Point* (2011) 127 Cal.Rptr.3d 636, at 646; *Baird v. County of Contra Costa* (1995) 32 Cal.App.4th 1464, 38 Cal.Rptr.2d 93). Buyers of properties within the Project area will have the potential nuisances of landfill proximity fully disclosed, and it is then up to that buyer's discretion to decide whether to purchase. In order to ensure that the disclosure concerns of Sacramento County Department of Waste Management and Recycling (DWMR) are addressed, Environmental Review coordinated with DWMR on modifying the mitigation measure requiring disclosure to list specific design details of the landfill which must be disclosed, as follows:

LU-2. The location and nature of the Kiefer Landfill facility shall be disclosed to all prospective buyers of properties within one mile of the ultimate active landfill boundary. **The disclosure notice shall include:**

- A. **A statement substantially consistent with the following: "The landfill will expand in height and land area over time, and thus the visibility and proximity of the landfill from the property at the time of purchase does not reflect how visible or proximate the landfill will be in the future." This statement shall be supplemented with relevant facts about ultimate landfill design, including the distance of the property to the ultimate planned edge of the landfill waste disposal area (to the nearest 100 feet) and the ultimate planned height of the landfill (as set forth in the Solid Waste Facilities Permit).**
- B. **Notification that the landfill operates under a Solid Waste Facilities Permit and is required to control pests, vectors, litter, and odor to the extent practicable, but that it is not possible to eliminate all of these nuisances. For this reason, property owners may experience some of these nuisance conditions.**
- C. **Notification that the active landfill area is lighted at night.**

Comment 14-2

On page 3-2 the DEIR states "...the property to the south is visually dominated by the Kiefer landfill." Kiefer landfill is currently constructing Module 3 of the 10 modules approved by the Kiefer EIR in 1998. Module three is approximately 4,000 feet from the Sports Park and 4,500 feet from the Living and Learning zone of the campus. Module 3 is currently being constructed at 100 to 150 feet elevation above MSL, approximately.

During approximately 2025 to 2035, module 5 (of 10) will be constructed approximately 1,700 feet from the Sports Park and 2,200 feet from the Living and Learning zone of the campus and to an elevation of 325 feet above MSL.

To understand the visual impacts of the Cordova Hills project, a "Kiefer landfill viewer group (viewpoint 6)" should be included in the Impacts and Analysis section of the Aesthetics chapter of the DEIR. The vantage should be taken from the Living and Learning area of campus or from the Sports Park and show the view residents of the campus or users of the park will have when Module 5 is being constructed. **The Cordova Hills project will have significant aesthetic impacts that will require mitigation.**

Response 14-2

This comment is describing potential aesthetic impacts associated with the cumulative development of the landfill on the Project. The DEIR discusses the visual impacts of Kiefer landfill on the Project in order to inform the land use analysis section on land use incompatibility. The ultimate permitted boundary of the landfill was the reference point for the analysis, not the current boundary – which, as noted by this comment, is currently set farther back. Refer to Response 14-1. Buyers of properties within the Project area will have the potential nuisances of landfill proximity fully disclosed, including features which could negatively impact their views, and it is then up to that buyer's discretion to decide whether to purchase.

Comment 14-3

DWMR maintains that, at a minimum, mitigation is necessary in the form of Restrictive Covenants, or some similar mechanism, recorded in perpetuity on deeds for all parcels created in the Cordova Hills Special Planning Area, stating that property owners acknowledge the preexistence and proximity of the Kiefer Landfill and release rights to seek corrective action to nuisances. Additionally, the Cordova Hills project must establish financial mechanisms to pay for responses to the inevitably increased number of complaints.

Response 14-3

In *South Orange County Wastewater Authority v. City of Dana Point* (2011) 127 Cal.Rptr.3d 636, at 646, the Wastewater Authority requested that an EIR be prepared which would assess the impacts of wastewater odor on the proposed Dana Point development, and further requested mitigation to offset impacts which is similar to the mitigation being requested in this comment. The court declined, on the basis that this was not an impact of the project on the environment. The Dana Point project "contemplated no changes in the sewage plant or in its odor-producing operations". The case is the same here. Also see *Baird v County of Contra Costa County* (1995) 32 Cal.App. 4th 1464, 38 Cal.Rptr. 2d 93. The issues raised within this comment are thus

more properly addressed as a policy matter by the decision-makers, not as a CEQA issue.

LETTER 15

Lea Gibson, Environmental Specialist; Sacramento County Environmental Management Department; written correspondence; dated February 21, 2012

Comment 15-1

- 1) **Aesthetics**, Page 3-21: The DEIR claims that the distance of the project from the landfill renders the impact of lights from Kiefer's operations insignificant. While the current location and size of Kiefer's operations may render the light impact insignificant to the project, the landfill's operations will eventually expand and the active face will move closer to the project site. The projected average daily tonnage in 2035 is nearly double the current permitted average daily tonnage. Also, the maximum permitted elevation of the landfill is 325 feet. Did the DEIR account for the increased amount of lighting required for an expanded landfill operation, as well as the eventual increase in elevation of the landfill, which will increase the visibility of Kiefer's operations from the project site?

Response 15-1

See Response 14-2 and Response 14-3.

Comment 15-2

- 2) **Air Quality**, Pages 5-36—5-37: This section states "with particular emphasis on the ability of the gas extraction system to reduce the potency and density of landfill odor – and the mitigation incorporated below, odor impacts are not expected to be substantial, and impacts are less than significant." Odors are also generated by the delivery and compacting of waste, the processing of green waste at the site, and the operation of the flare. The sub-surface landfill gas extraction system does not control these odors. The EIR should not rely on the landfill gas extraction system to reduce odors to a less-than-significant level. Further, while odors must be controlled under Title 27 of the California Code of Regulations (27 CCR), the generation of odors during routine landfill operation is unavoidable and there is no requirement to reduce the potential for odors to zero. The LEA recommends notifying potential tenants of the increased potential for odor issues associated with the proximity to the landfill.

Response 15-2

See Response 14-1 and Response 14-3.

Comment 15-3

- 3) **Hazards and Hazardous Materials**, Page 10-17: This section includes a mitigation measure stating that continuous landfill gas monitoring will be implemented in any structures within 1,000 feet of buried waste or proposed buried waste. Who will be responsible for implementing and maintaining the landfill gas monitoring equipment? The LEA does not have authority to ensure that landfill gas monitoring is being conducted outside of the permitted boundary of the landfill. Any structures within 1,000 feet of the permitted landfill boundary also ought to adhere to the construction standards contained in 27 CCR 21190 (g). Again, the LEA does not have authority to enforce this standard outside of the permitted boundary of the landfill, so the party responsible for implementing these construction standards should be clearly assigned in the FEIR.

Response 15-3

The vast majority of the Project site is outside the 2,000-foot buffer around the ultimate landfill boundary, so the likelihood of any structure being built within 1,000 feet of the buried waste or proposed buried waste at the Kiefer Landfill is remote. Please see Plate HM-2 on Page 10-18 of the DEIR. Mitigation Measure HM-1 has been revised by the FEIR to read as follows:

“Any structure within the Project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety of the environment) within 1,000 feet of buried waste or proposed buried waste at Kiefer Landfill (refer to Plate HM-2 of the EIR) shall be continuously monitored by the owner/operator of said structure for landfill gas and be designed and constructed to prevent landfill gas accumulation in those structures.”

As with the other Project mitigation, the enforcement of this Mitigation Measure will be part of the responsibility of the Department of Community Development for overseeing the measures which will be implemented within the SPA.

Comment 15-4

- 4) **Land Use**, Page 12-37, Paragraph 2: This paragraph states that Kiefer Landfill is permitted to accept 10,815 tons per day (tpd) and the average intake is approximately 6,000 tpd. The tonnage cited is the maximum permitted tonnage for the year 2034/35; the current permitted maximum tonnage is 5,598 tpd. The permitted tonnage increases each year according to a schedule referenced in the facility's Solid Waste Facility Permit. The EIR should clarify the permitted tonnage and year used to analyze the impacts of the landfill on the proposed development. This paragraph also states that the estimated remaining capacity is 108 million cubic yards. Per the Solid Waste Facility Permit, the remaining site capacity as of 2006 was 86,559,490 cubic yards.

Response 15-4

The second paragraph in the DEIR description of the Kiefer Landfill on Page 12-37 has been revised for the FEIR consistent with the clarifications provided in the comment.

Comment 15-5

- 5) **Land Use**, Page 12-37, Paragraph 3: This paragraph mentions the upcoming Kiefer Bufferlands Special Planning Area (SPA), which will designate areas around Kiefer Landfill for waste-industry uses; however, the DEIR does not include analysis of the potential impacts of the proposed SPA uses on the Cordova Hills tenants. The DEIR also does not include an analysis of the GreenCycle project, a proposed composting facility adjacent to Kiefer Landfill. The FEIR for the GreenCycle project was released in November 2010 and a Supplemental EIR is due for release in 2012. The addition of waste industries and a large-scale composting facility to the area will exacerbate the potential for nuisance conditions, including vectors/pests, dust, noise, and odors. The FEIR should include an analysis of the potential impacts of the GreenCycle project and the Kiefer SPA on the Cordova Hills project.

Response 15-5

The NOP for the proposed Project was released in June of 2010 while the NOP for the Kiefer Landfill Special Planning Area/GreenCycle was released in July 2011. The existing conditions at the time the NOP was issued normally form the baseline conditions for analysis; the Kiefer SPA/GreenCycle Project was not part of baseline conditions. By the time the Kiefer SPA/GreenCycle NOP was published, most of the major technical studies for the Cordova Hills Project were complete. Based on the fact that the Kiefer SPA/GreenCycle Project NOP was published subsequent to the Cordova Hills NOP, it is the duty of the EIR for the Kiefer SPA/GreenCycle Project to describe impacts to the Cordova Hills Project, not the other way around. *South Orange County Wastewater Authority v. City of Dana Point* (2011) 127 Cal.Rptr.3d 636 and *Baird v County of Contra Costa County* (1995) 32 Cal.App. 4th 1464, 38 Cal.Rptr. 2d 93.

Comment 15-6

- 6) **Land Use**, Page 12-38, Paragraph 2: This paragraph states that “nuisance pests and vectors are typically experienced only in close proximity to the source condition”. What is considered “close proximity”? Per the DEIR, the project abuts Kiefer Landfill and the adjacent area is to be designated as Agricultural land, which could provide additional habitat for pests. The LEA recommends notifying potential tenants of the increased potential for vector and pest issues associated with the proximity to the landfill.

Response 15-6

It is simpler to describe what “close proximity” is not, when it comes to vectors and pests; a distance of ½-mile, which is the minimum distance of all residential and commercial uses proposed within the Project area, is not close proximity (see Plate AQ-1, on page 5-35). The agricultural land within the Project area is all currently grazing land, and will remain grazing land, because it is not suitable for row crops or the other

intensive agricultural uses. It is intensive agriculture, not grazing land, which tends to support higher numbers of rodents.

Comment 15-7

- 7) **Land Use**, Page 12-38, Paragraph 2: This paragraph also states that litter was not observed during any of the site visits to the project area and that litter from the landfill would be caught in the intervening landscape. The active portion of the landfill will eventually move closer to the proposed project site, so the fact that litter was not observed during site visits from 2008-2012 would not be relevant to the future conditions of the landfill. Litter may also enter the proposed development from refuse vehicles delivering waste to the facility. Kiefer Landfill implements litter control measures as required in 27 CCR 20830, but it cannot control for litter blowing off of refuse vehicles. The LEA recommends notifying potential tenants of the increased potential for litter in their neighborhood due to the proximity of the landfill and the refuse vehicles utilizing the roadways.

Response 15-7

This comment cites Title 27, Section 20830, which states that litter shall be controlled and that “control shall prevent the accumulation, or off-site migration, of litter in quantities that create a nuisance or cause other problems”. With regard to the collection trucks, it is a violation of California Vehicle Code Section 23115 for any vehicle transporting garbage, refuse, or trash to be driven or moved upon any highway unless the load is totally covered in a manner that will prevent the load or any part of the load from spilling or falling from the vehicle. There are thus existing regulations in effect which will prevent litter from the landfill from being a substantial impact on the Project.

Comment 15-8

- 8) **Land Use**, Page 12-38, Paragraph 3: This paragraph states that CalRecycle is responsible for verifying compliance with State Minimum Standards. EMD, acting as the LEA in Sacramento County, is certified by CalRecycle to regulate Kiefer Landfill to ensure the facility meets the State Minimum Standards, per 14 CCR 18081 (c). The section of regulation cited in this paragraph, 27 CCR 21685(b)(8), pertains to CalRecycle’s concurrence with the issuance of a Solid Waste Facility permit or permit revision. Kiefer Landfill has already been issued a Solid Waste Facility permit, so the section pertaining to CalRecycle’s concurrence is not relevant to ensuring ongoing compliance with the State Minimum Standards. Another section of regulation cited in this paragraph, 14 CCR 17867 (a), pertains to composting facilities, not disposal sites. Kiefer Landfill is a permitted as a disposal site, so 27 CCR 20760 is the appropriate section to cite for nuisance control.

Response 15-8

The text has been amended in the FEIR consistent with the clarifications provided in the comment.

Comment 15-9

- 9) **Land Use**, Page 12-39: Mitigation measure LU-2 states that the location and nature of Kiefer Landfill will be disclosed to buyers within one mile of the “ultimate active landfill boundary.” What is the definition of the “ultimate active landfill boundary”? Is it the same as the disposal site permitted facility boundary, as specified in Kiefer Landfill’s Solid Waste Facility Permit? If not, what criteria were used to determine the “ultimate active landfill boundary”? Also, who will be responsible for providing the notification to the buyers and what information will be included in the notification?

Response 15-9

Refer to Plate AQ-1, on page 5-35, which shows the location of the ultimate active landfill boundary. This is the ultimate permitted boundary of the active disposal area. As part of real estate transaction, the prospective buyer is by law provided with a series of disclosures about the property under consideration. Standard items which must be disclosed include radon zones, whether a floodplain is present, fire hazard designations, and other items. This mitigation measure would add the Kiefer Landfill disclosure to all parcels created within the SPA, and this would become part of the required real estate disclosures. Additional language has been included in the mitigation measure to specify the minimum information which must be disclosed (see Response 14-1).

Comment 15-10

- 10) **Noise**, p13-39: This section uses a 1989 study to determine the impact of noise on the proposed project. In 1989, Kiefer landfill’s average permitted daily tonnage was approximately 2,700 tpd. In 2012, the average permitted daily tonnage is 3,293 tpd, and, in 2035, it will be 6,362 tpd. The increase in tonnage accepted at the landfill will require additional equipment to handle the waste and there will be additional traffic delivering waste, meaning increased noise levels at the landfill. The FEIR ought to consider future noise levels instead of using 1989 noise levels to determine the impact to the residents of the proposed development.

Response 15-10

Roadway noise analyses used cumulative noise levels, and these are provided in the traffic noise analysis section. The 1989 study was the most recent noise analysis available for the landfill, and was used as a screening tool. As stated on page 13-39, based on the location of the ultimate active landfill boundary, noise levels at the nearest noise-sensitive uses would be 44 dB. This is far below the noise standards. Furthermore, noise on the site itself would need to far exceed the safe limits for workplaces established by California Occupational Health and Safety Administration before noise nearly ½-mile away would exceed General Plan standards. An updated noise study was not necessary in order to conclude that impacts would be less than significant.

Comment 15-11

11) Public Services, p 14-21: This section states that the facility is permitted to accept 10,815 tpd and currently receives 700,000 tons per year. The permitted tonnage cited is the maximum daily tonnage for the year 2035. The facility's current maximum daily tonnage is 5,598 tpd and the projected annual tonnage for this fiscal year is 1,202,000 tons, per the Solid Waste Facility Permit. This section also cites "N. Yeats" of CalRecycle. The CalRecycle permitting contact for Sacramento County is Nevin Yeates, not Yeats.

Response 15-11

The text has been amended in the FEIR consistent with the clarifications provided in the comment.

LETTER 16

Donald J. Lockhart, Assistant Executive Officer; Sacramento Local Agency Formation Commission; written correspondence; dated February 22, 2012

Comment 16-1

Refer to page 92 of the “Cordova Hills FEIR: Comment Letters”. The comment spans slightly more than six pages, and ends with the paragraph preceding the “Recreation” subheading on page 98. This portion of the letter describes various analysis sections within the DEIR, and concurs with those analyses.

Response 16-1

Comment noted.

Comment 16-2**Recreation**

For recreation services, the project area would detach from the Sacramento County Regional Parks Department County Service Area 4B and a newly created Cordova Hills CSD would provide recreation services. Detachment from the Sacramento County CSA 4B would require LAFCo discretionary action.

The DEIR evaluates whether the park facilities distributed throughout the project area would meet Quimby Act and Sacramento County General Plan park standards (page 14-23 thru 14-24). Cordova Hills will generate an estimated population of approximately 21,379 residents, requiring a minimum park dedication requirement of 106.9 acres. The proposed project would include 99.1 acres of formal parkland, and an additional 151 acres of informal parkland. The analysis concludes that with the implementation of parks identified in the Cordova Hills Master Plan Special Planning Area, adequate recreation resources would be provided to meet County standards, and the cost of park maintenance would be fully covered by the proposed CSD special tax assessment (page 14-26). The DEIR concludes that because the project is consistent with the Quimby Act and the General Plan park standards, the project will not increase demand for existing park services.

LAFCo is statutorily required to evaluate whether the County (or proposed CSD) has the service capability and capacity to serve the project area, and also whether they can provide services to the project area without adversely affecting existing service levels elsewhere in their service area.

Additionally, LAFCo must evaluate whether the deletion of territory now served by the Sacramento County Regional Parks Department County Service Area 4B would lead to an adverse impact on current CSA 4B users or facilities resulting from any related loss of tax revenues, thereby diminishing the ability of the County to deliver adequate services within the remaining service area of CSA 4B. Adequate information on any such loss of tax revenue is not presented in the DEIR. The County or project proponents will need to provide sufficient information to LAFCo to evaluate these questions prior to the Commission's consideration of any related detachment or district formation.

Therefore, LAFCo requests the County evaluate whether the deletion of the territory now served by the Sacramento County Regional Parks Department County Service Area 4B would lead to the loss of tax revenues, thereby diminishing the ability of the agency to deliver adequate services within their remaining service areas.

Consideration should be given to the evaluation of regional park resources in the context of the adequacy of regional park resources on a regional basis to serve existing and projected populations, and the project's effect on the adequate provision of such resources. Also, the DEIR should further discuss information that supports the document's environmental conclusion regarding the adequacy of fees or other sources of revenue to support the development of any new needed regional park facilities, and/or the maintenance of existing facilities.

Response 16-2

The current tax revenue to County Service Area 4B ("CSA 4B") is modest and reflects the current low value agricultural use, therefore the impact of detachment from CSA 4B would be modest. Future revenues will be considerably higher with the development of the Cordova Hills Project, but along with that revenue would come the obligation to provide a considerably higher level of recreational services that are beyond CSA 4B's

capacity. Currently, funding for the Sacramento County Regional Parks Department is from a combination of general fund revenues, grants, and access fees. The increased population in Cordova Hills will contribute to the regional parks support through property taxes and by access fees when individuals choose to visit a County park facility. The open space and recreation facilities in Cordova Hills will meet the recreation demand of the Project residents.

Comment 16-3

Schools/Libraries

Neither service is subject to LAFCo purview.

Law Enforcement/Fire Protection

For law enforcement and fire protection services, the Sacramento County Sheriff's Department (SSD) and the California Department of Forestry and Fire Protection (CalFIRE) and the Sacramento Metropolitan Fire District (SMFD) would provide fire protection and emergency services. The proposed project includes a maximum of 8,000 residential units for a population of approximately 21,379 residents. Funding for increased law enforcement services would be provided through the County General Fund and the County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax. Compliance with General Plan goal and policies supporting law enforcement facilities, programs, and neighborhood security measures (page 14-21) would ensure the Sheriff's Department adequately serves new growth. The project includes sites for one or two fire stations to serve the project and adjacent development. It is anticipated that the station will require a truck, engine, and medic company. With adherence to existing regulations and the construction of new fire facilities, impacts associated with fire protection services will be less than significant (page 14-19).

Natural Resources/Open Space – The February 2011 NOP comment requested the DEIR include an evaluation of any open space resources as defined by Government Code §65560 that are located within or adjacent to the project area. While LAFCo had requested a separate evaluation on open space resources, such as a discrete impact statement, there is adequate information in Chapter 6, *Agricultural Resources*, to make findings for our Commission. Therefore, we request no changes to the EIR to address this issue.

Response 16-3

Comment noted.

Comment 16-4

Environmental Justice – State law requires LAFCo to consider the extent to which the project will promote environmental justice. "Environmental justice" means the fair treatment of people of all races, cultures, and incomes with respect to the location of public facilities and the provision of public services. The February 2011 NOP comment letter requested the DEIR evaluate environmental justice effects that could occur as a result of implementing the proposed project. The DEIR does not evaluate potential environmental justice effects related to the project. In order for LAFCo to comply with its statutory responsibilities with respect to environmental justice, we request that this issue area be addressed in the Final EIR.

Response 16-4

Comment noted. It is acknowledged that LAFCo is required to consider environmental justice pursuant to Government Code Section 56668. As defined in that Section, “environmental justice” means the fair treatment of people of all races, cultures, and incomes with respect to the location of public facilities and the provision of public services. Public facilities located in the public areas of the Cordova Hills Project will not have any limitation on access to any individuals regardless of race, color, culture, national origin, income, and educational levels, and will comply with the Americans with Disabilities Act. CEQA analyses may peripherally address environmental justice, simply because of the requirement to identify impacts compared to baseline environmental conditions, but “environmental justice” is not an impact topic requiring analysis under CEQA. So, for instance, the significance criteria for noise impacts recognizes that the louder the existing noise environment, the smaller an increase needs to be in order to result in an impact. In this respect, CEQA significance criteria and the nature of the analysis recognizes that some communities may be more sensitive to impacts than others, but there is no CEQA mandate to determine whether the community in question contains a disproportionate number of minorities or low incomes.

LETTER 17

Larry Greene, Executive Director; Sacramento Metropolitan Air Quality Management District; written correspondence; dated February 22, 2012

Comment 17-1

Thank you for the opportunity to review and comment on the Cordova Hills Draft Environmental Impact Report (DEIR). Staff of the Sacramento Metropolitan Air Quality Management District (District/SMAQMD) thanks the County and applicant for working with us early and often, especially during the development of the 35% Operational Air Quality Mitigation dated June 1, 2011 and Greenhouse Gas Reduction Plan dated May 2011 (AQMP, and GHG Plan, accordingly) that we determined to be technically adequate in June 2011 (documents and determination letters are attached).

District staff applauds the County in its clear presentation in the air quality, land use, and climate change chapters; in particular, the County's GHG thresholds of significance analysis and its explanation that its thresholds were modified mid-stream while the County was preparing the EIR. Also, the District concurs with the County's decision to require an AQMP to reduce ozone precursor emissions by 35%, as opposed to the standard 15%, as feasible mitigation since the emissions from the Cordova Hills project were not included in the State Implementation Plan to achieve the federal health based standards.

The project originally contemplated included the early development of key aspects of the University of Sacramento (University) campus component. As the District has indicated to County staff, as well as the project applicant, the University and its phasing played a pivotal role in the District's determination that the AQMP Plan met 35% mitigation requirement, and that the GHG Plan met the County's thresholds in place at that time. It was the District's understanding, based on discussions with the applicant, that construction of the overall project phases would be conditioned on the early construction of the Campus so that the integrity of the AQMP and GHG Plan analysis and conclusions would be protected.

The DEIR now anticipates development of a "University/College Campus" that appears to conceptually maintain the elements of the original University of Sacramento plan, but the DEIR contains no conditions requiring early development of the Campus, and in fact appears to anticipate that the Campus may not be built for 30 years. A letter from SACOG to Mr. Ron Alvarado representing Cordova Hills (attached) affirms our understanding that the County would require appropriate phasing. The SACOG letter states: "Cordova Hills indicated in a recent discussion that if Sacramento County approves an entitlement for the project it is very likely that it will attach a condition requiring the construction of the university before other substantial construction can occur."¹

If there is no early Campus development commitment, the DEIR should be recirculated with an analysis of project impacts that assumes the Campus is not constructed. Without the Campus, the existing air quality analysis misstates and underestimates the project's emissions because it assumes reductions associated with or generated by the Campus component, and these reductions may never occur.

Absent an early development commitment, the District's determination of technical adequacy for the GHG and AQMP plans is null and void.

The impact of the loss of the Campus component on the GHG Plan is plain. The GHG analysis and GHG Plan are based on the applicant's detailed project description that included 21,379 residents in 8,000 dwellings and over 4,000 students that would live in the 1,010 small, efficient, high density, alternative energy-producing dorm rooms on campus, and that the University would not allow first year students to maintain vehicles on campus. Collectively, these and many other promised features of the University acted to conserve resources and generate fewer GHG emissions than most projects of a comparable population. These detailed characteristics and emission reduction measures were embedded in the calculation that yielded a 5.8 MT CO₂e per capita efficiency. Without a Campus, for example, the density of the project would be reduced from an overall net density of 10.4 dwelling units per acre to 8.9 dwelling units per acre, which would impact the per capita emission calculation and prevent the project from achieving the reductions to which it has committed.

The impact on the AQMP is equally plain. A full 25% of emissions reductions are attributed to the relatively high internal trip capture rate, which was achievable through the diverse mix of uses including the presence of a functioning Campus.

Response 17-1

While the Project exhibits include a conceptual phasing plan showing the university/college campus center within Phase I, a condition to require early

development of the university/college campus center was not part of the Project application, and was not included in the Project description. In fact, the Project Description chapter of the DEIR specifically notes that no phasing was used in the analysis. This information was relayed to SMAQMD, along with the information that an “early development” condition was not required by CEQA and would not be in the EIR, but was being considered by other County staff for inclusion in the Development Agreement. See Response 8-3. That this condition was ultimately not included in the Staff Report or Draft Development Agreement has no bearing on the EIR analyses.

The GHG Plan and the AQMP were both developed based on the cumulative, full-build out development conditions; the analyses ignored the timing of all of the various land uses, and simply looked at the effect of the completed Project, as is appropriate and required by CEQA. The methodology which used full-build out for analysis was deemed technically adequate by SMAQMD, and neither mitigation plan refers to phasing. Exclusion of an “early development” requirement does not constitute a revision of the Project. Also see Response 8-2, Response 8-10, Response 8-24, Response 8-27, and Response 8-31.

Though removal of the university/college campus center could be expected to increase per-capita emissions (while reducing total emissions), the same could be said for the removal of many of the other components of the Project, such as the high density residential uses or commercial uses. The removal of any component of a master planned land use proposal would always result in changes to its trip generation and distribution. An analysis would be required to determine whether impacts would increase or decrease, and to what degree this would occur, and with respect to that, this response has already indicated that such an analysis is not required or even consistent with CEQA.

In addition, phasing or the project’s elements was not included in either the SMAQMD endorsed air quality mitigation plan or the SMAQMD endorsed greenhouse gas reduction plan. The emissions modeling for both plans was based upon emissions at full build out as required by CEQA and SMAQMD’s model, not the emissions generated when any specific phase of the project was developed. Further, the university/college campus center component of the project has always been presented as one of the proposed land use types whose approval is being sought as part of the project. It was never required or included in either plan as a mitigation measure. As stated in the Draft EIR and again at the Planning Commission hearing for the project, the air quality and greenhouse gas impacts of the project will be significant and unavoidable.

Comment 17-2

We make the following recommendations to specific mitigation measures **only if an early Campus development commitment is included in the FEIR and project approval, and an acceptable phasing agreement is developed.**

1. CC-1 should be modified to make it clear that any amendments to the Cordova Special Planning Area must maintain 5.80 MTCO₂e/capita max for the entire project (not just that parcel) and that the parties consult with the District during the amendment process. Our suggested changes appear in red underline:

CC-1. All amendments to the SPA shall include an analysis which quantifies to the extent practicable, the effect of the Amendment on greenhouse gas emissions for the entire project. The amendment shall not increase greenhouse gas emissions above an average 5.80 MT [CO₂e] per capita (including emissions from building energy usage and vehicles) for the entire Cordova Hills project. The proponent shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Plan for approval by the County, in consultation with SMAQMD.

Response 17-2

See Response 8-26. CC-1 has been amended in the Final EIR.

Comment 17-3

2. Currently, the Climate Change chapter on page 27 states that GHG reduction measures need not be imposed as a mitigation measure because "they are design features already embedded in the SPA..." Our experience has shown us that well intended mitigation may not be implemented because it gets overlooked or buried as projects build out. So, with the goal of providing a clear path linking the mitigation measures to the MMRP and then to actual implementation by a developer/contractor, we suggest that the County include a mitigation measure specifically requiring compliance with the GHG Plan as well as all other feasible and reasonable mitigation measures to which the applicant has committed. We request that the County include the following new mitigation measure:

CC-2: The GHG Plan, dated May, 2011 shall be consulted and implemented at every phase as the project builds out. The measures are as follows...

Response 17-3

Comment noted. For a master plan such as this, in which much of the development will occur over multiple decades and only after additional discretionary entitlements, it is

typical that an MMRP is not maintained for the life of the master plan. The MMRP on a master plan is usually only maintained until it has been verified that the measures have been included as zoning conditions and/or land use master plan conditions, at which time the MMRP is closed. CEQA Guideline 15097 (b) specifically allows this, stating: “Where the project at issue is the adoption of a general plan, specific plan, community plan, or other plan-level document (zoning, ordinance, regulation, policy) . . . the monitoring plan may consist of policies included in the plan-level documents.” Thus, the mitigation measure would simply require that the GHG Plan be included as part of the SPA. The GHG Plan has already been added as a section of the SPA, but Measure CC-1 has nonetheless been amended to refer to the GHG Plan (See Response 8-26).

Comment 17-4

3. In December 2011, a federal judge granted a preliminary injunction against California's low carbon fuel standard. We suggest that the EIR discuss the possibility that certain statewide greenhouse gas reduction rules may be rescinded, and discuss the potential impact on the emissions reductions efforts of the Cordova Hills project.

Response 17-4

No greenhouse gas reduction credit was given for the use of low carbon fuels in the analysis of the Project. Should the use of low carbon fuels be implemented by the State of California in the future, then the actual greenhouse gas emissions of the Project are likely to be lower than estimated in the Draft EIR.

Comment 17-5

4. The County should include a new mitigation measure requiring a revised AQMP be approved by the County in consultation with the District.

AQ-5: All amendments to the SPA shall include an analysis which quantifies to the extent practicable, the effect of the Amendment on ozone precursor emissions for the entire project. The amendment shall not increase ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project. The proponent shall consult with the SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.

Response 17-5

In response to this comment, the FEIR has modified Mitigation Measure AQ-2 to include language which is similar to measure CC-1, to address the effect of a possible future amendment to the Cordova Hills SPA that has the potential to impact the Project's ozone precursor emissions:

- AQ-2. Comply with the provisions of the Air Quality Management Plan dated June 1, 2011, and incorporate the requirements of this plan into the Cordova Hills Special Planning Area conditions. **Also, the following text shall be added to**

the Cordova Hills SPA: “All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.”

Comment 17-6

5. As suggested in underline and strikeout, please clarify the following statement on page 5-20 regarding operational ozone precursor reductions to indicate that emissions reductions have not yet taken place:

~~With the construction of the Campus component during the early phases Emissions reductions were accomplished through the production of an Air Quality Management Plan⁹ (AQMP), which was designed to, the Cordova Hills project will achieve a minimum 35% emissions reduction under the AQMP (per guidance from SMAQMD, indicating that this represents the feasible mitigation that should be applied).~~

Response 17-6

All Project impacts were analyzed by examining the impact of full-build out, and thus the timing of construction of the university/college campus center (or any of the other proposed land uses) is not relevant to the analysis. See Response 8-2, Response 8-3, and Response 8-10. The text has been amended so as not to imply that reductions have already occurred, but the statement about early campus construction has not been included.

Comment 17-7

6. Currently, AQ-1 states that the Special Planning Area will be revised to “include language requiring all individual development projects to implement SMAQMD rules and mitigation pertinent to construction-related ozone precursors, as defined by the most current version of the SMAQMD Guide to Air Quality Assessment.” As a backstop, we suggest including our current construction mitigation language, along with a statement that the project must comply with SMAQMD’s mitigation in force at the time the project goes to build/becomes operational in case the mitigation requirements change.

Response 17-7

Experience with implementation suggests that actually including the language “current” at the time of approval leads to confusion. This project will remain active for decades, and it is certain that the current language will become obsolete during that timeframe. There have been unfortunate circumstances when a County staff member simply uses the “fall-back” language, and fails to check and see whether there are more current standards in place. This experience has led to the conclusion that for multi-decade projects it is more effective to have the mitigation direct staff to look up the most current language, rather than providing a fall-back.

Comment 17-8

7. Finally, the Cordova Hills circulation plan- in particular its access policy- should be carefully crafted in order to support goals of the Capital South East Connector Project.

Response 17-8

Comment noted. This is a policy matter for consideration by the decision-makers, and has been addressed via conditions of approval recommended by the Sacramento County Department of Transportation.

Comment 17-9

In conclusion, the proper phasing of this project and development of a functioning University/College Campus are keys to ensuring that air quality and greenhouse gas mitigations are achieved. If there is no early Campus development commitment, the DEIR should be recirculated with an analysis of project impacts that assumes the Campus is not constructed. In the absence of a condition requiring early development of the Campus, the District will withdraw its approval of the AQMP and GHG Plans, because the revised project constitutes a significant change in the project analyzed in those Plans, and a new GHG and AQMP Plan should be developed in consultation with SMAQMD staff.

Response 17-9

See Response 17-1.

LETTER 18

Sarena Moore; Sacramento Regional County Sanitation District; written correspondence; dated February 21, 2012

Comment 18-1

Sacramento Regional County Sanitation District (SRCSD) has reviewed the Cordova Hills DEIR and determined that the sections on sewer service within this document contain inaccurate or outdated information. Please revise these sections based on the following comments:

The Cordova Hills area is located outside the SRCSD Service Area. This area will need to be annexed into the SRCSD Service Area through the Sacramento Local Agency Formation Commission (LAFCo) in order to receive sewer service from SRCSD. The annexation process is to be initiated by the project proponent, not SRCSD.

Response 18-1

Comment noted. The County will require annexation of the Project area into the SRCSD as set forth in draft Conditions of Approval for the Project's large lot tentative subdivision map. The Project Description chapter also discussed that annexation would be required.

Comment 18-2

Once annexed, local sewer service for the proposed project area will be provided by Sacramento Area Sewer District (SASD). Conveyance from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) will be provided by SRCSD through large pipelines called interceptors.

SRCSD is in the process of finalizing an Interceptor Sequencing Study that will aid SRCSD in planning and implementing regional conveyance projects and assists SASD in coordinating collection system facilities.

SRCSD sewer systems are designed using predicted wastewater flows that are dependent on land use information provided by each land use authority. Sewer studies, including points of connection and phasing information will need to be completed to fully assess the impacts of any project that has the potential to increase existing or future flow demands. Please remove any reference in this document regarding previous sewer studies, as they will need to be updated to reflect the most current information within the SASD System Capacity Plan and SRCSD planning documents.

Response 18-2

Comment noted. At the time of preparation of the Draft EIR, the Cordova Hills Sewer Facilities Master Plan was consistent with the then-current SASD and SRCSD planning documents. Since then, however, the SASD Board of Directors has, as part of its periodic update of its planning documents, approved the 2010 Sewer Capacity Plan Update. This update eliminates the previously planned future offsite Laguna Interceptor and Mather Interceptor in favor of the proposed Aerojet-2 Interceptor and Douglas Interceptor. Those two newly proposed interceptors will be constructed in the future by SRCSD to provide ultimate sewer service to the East Rancho Cordova sewer shed, which includes Cordova Hills. CEQA review of those two facilities would occur as part of the SRCSD's planning document update and prior to construction. Additional offsite revisions impacting the Cordova Hills Sewer Facilities Master Plan are the elimination of Alternative Points of Connection 4 and 5 associated with elimination of the Laguna and Mather Interceptors. Onsite sewer facility revisions associated with the 2010 Sewer Capacity Plan Update are limited to a downsizing of previously contemplated trunk sewer facilities, including elimination of sewer service provisions to the area north of Cordova Hills via facilities that Cordova Hills would need to construct for its own sewer service requirements. Actual onsite sewer facility alignments have not changed from what was contemplated in the Cordova Hills Sewer Facilities Master Plan. Detailed "Level -3" sanitary sewer studies will be prepared as part of small lot tentative subdivision map preparation, and will reflect the most current SASD and SRCSD planning information available at that time.

Comment 18-3

Customers receiving service from SRCSD are responsible for rates and fees outlined within the latest SRCSD ordinances. SRCSD fees for connecting to the sewer system are set up to recover the capital investment of sewer and treatment facilities that serves new customers.

SRCSD is not a land-use authority. Projects identified within SRCSD planning documents are based on growth projections by land-use authorities. Onsite and offsite impacts associated with constructing sanitary sewers facilities to provide service to the subject project must be included in this environmental impact report.

Response 18-3

Comment noted. Please see the Draft EIR at Pages 15-38 to 15-39, at Page 15-49, and at pages 18-1 through 18-4. Environmental impacts that would arise from the offsite sewer facilities that would be constructed by the project applicant to serve the Cordova Hills Project were examined by the Draft EIR's chapters on Air Quality, Biological Resources and Cultural Resources, and compliance with mitigation measures AQ-1, BR-1, BR-3, BR-4, BR-5, BR-6, BR-7, BR-8, and CR-1 will be required to reduce those environmental impacts. As noted on Page 15-39, the construction of regional sewer infrastructure would result in significant and unavoidable impacts to biological resources, namely significant impacts to wetlands and invertebrates, notwithstanding implementation of mitigation measures BR-1 and BR-7 to reduce those impacts. Any significant impacts to nesting raptors, Swainson's hawks, burrowing owls, tricolored blackbirds and special status vernal pool plants would be mitigated to a less than

significant level by compliance with Mitigation Measures BR-3, BR-4, BR-5, BR-6 and BR-8. Impacts arising from construction activities that could increase NO_x emissions would be avoided and be rendered less than significant by compliance with Mitigation Measure AQ-1. Potentially significant impacts to cultural resources arising from the construction of offsite sewer infrastructure by the applicant would be mitigated to a less than significant level by compliance with Mitigation Measure CR-1.

Comment 18-4

There are incorrect statements regarding the design of the SRWTP within the subject document. The SRWTP provides secondary treatment using an activated sludge process. Incoming wastewater flows through mechanical bar screens through a primary sedimentation process. This allows most of the heavy organic solids to settle to the bottom of the tanks. These solids are later delivered to the digesters. Next, oxygen is added to the wastewater to grow naturally occurring microscopic organisms, which consume the organic particles in the wastewater. These organisms eventually settle on the bottom of the secondary clarifiers. Clean water pours off the top of these clarifiers and is chlorinated, removing any pathogens or other harmful organisms that may still exist. Chlorine disinfection occurs while the wastewater travels through a two mile "outfall" pipeline to the Sacramento River, near the town of Freeport, California. Before entering the river, sulfur dioxide is added to neutralize the chlorine. The design of the SRWTP and collection system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. The SRWTP was designed to accommodate some wet weather flows while the storage basins and interceptors were designed to accommodate the remaining wet weather flows.

Response 18-4

The EIR description is much simpler than the description included in this comment, but it is not incorrect. The EIR states that the facility is a "high-purity oxygen-activated sludge facility", while this comment describes all the details that make up such a facility. At the request of this comment, these details have been added to the FEIR.

Comment 18-5

A new NPDES Discharge Permit was issued to Sacramento Regional County Sanitation District (SRCSD) by the Central Valley Regional Water Quality Control Board (Water Board) in December 2010. In adopting the new Discharge Permit, the Water Board required SRCSD to meet significantly more restrictive treatment levels over its current levels. SRCSD believes that many of these new conditions go beyond what is reasonable and necessary to protect the environment, and has appealed the permit decision to the State Water Resources Control Board. A decision on that appeal has not yet occurred. In the meantime, SRCSD is required to begin the necessary activities, studies and projects to meet the new permit conditions. All new treatment facilities must be completed by 2020. There are incorrect statements within the subject document regarding the permitted average dry weather flow (ADWF), permitted wet weather flow and the design capacity of the SRWTP. The SRWTP NPDES Permit adopted in December 2010 lists the permitted capacity as 181 mgd ADWF.

Response 18-5

The DEIR indicates that the permitted capacity is 181 mgd ADWF (page 15-6), and uses this figure throughout the analysis. The only place where a larger capacity is referenced is in the description of the 2020 Master Plan, where it states that the Master Plan would increase capacity to 218 mgd ADWF, but that the environmental document was invalidated. It is not clear from this comment where the EIR is felt to be in error. The information about the new NPDES permit has been added to the FEIR.

Comment 18-6

SRCSO currently owns and operates a 5-mgd Water Reclamation (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. A portion of the recycled water is used by SRCSO at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove.

Response 18-6

The information provided by the commenter has been added to the EIR description of the Water Recycling Program by revising the first paragraph on Page 15-9 of the DEIR.

Comment 18-7

The Cordova Hills DEIR's identified potential "Non-Potable Water" sources that could be used in its project area to meet non-potable water demands, e.g. landscape irrigation. SRCSO was referenced as a potential source of non-potable water, i.e. recycled water, in *the Non-Potable Water Master Plan for Cordova Hills (March 2011)*. It should be noted that SRCSO currently does not have any planned facilities that could provide recycled water to the proposed Cordova Hills project or its vicinity. Additionally, SRCSO is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers.

Response 18-7

Comment noted. The Cordova Hills "Non-potable Water Master Plan" only referred to the SRCSO as a "potential source" of non-potable water, not as "the source" of non-potable water. That reference was based upon the SRCSO's own "Water Recycling Opportunities Study" dated February 2007. It was mentioned as a possible source of recycled water because the SRCSO Study identified "Reclaimed Water Supply facilities" as a conceptual source of reclaimed water that might one day be able to provide reclaimed water in its identified target area", with Cordova Hills being within that target area. It was actually planned that SCWA would be the purveyor of reclaimed water to Cordova Hills, but SCWA has since determined that there are no plans to provide future non-potable water to the Cordova Hills Project area and no funding for the County or the water and sewer agencies to maintain a recycled water distribution system at Cordova Hills until non-potable water could be supplied. Consequently, in conformance with the County's current plans, it was decided that the Cordova Hills Project will not be installing a separate recycled water distribution system.

LETTER 19

Terry Davis, Director; Sierra Club, Mother Lode Chapter; written correspondence; dated February 21, 2012

Comment 19-1

Thank you for the opportunity to briefly comment on the DEIR for the Cordova Hills project. As a general comment, this is fundamentally a flawed project, located as it is on the fringe of the region's urban footprint, seven miles from light rail, surrounded by undeveloped land and outside the county's urban services boundary. Its remote location made it ineligible for inclusion in the Draft MTP/SCS; thus the project would hinder efforts of SACOG to achieve its targets under SB 375. The design of the project is inconsistent with efforts to develop the South Sacramento Habitat Conservation Plan since the proposed project would construct a shopping center in an important vernal pool area that federal agencies have indicated is needed for conservation under the SSHCP. In multiple ways the project fundamentally defies ongoing efforts by the region to achieve landscape level habitat conservation and responsible land use and transportation planning.

Response 19-1

Comment noted. The SCS is discussed on page 7-8 of the DEIR. The applicant did coordinate with the County and Fish and Wildlife to design the preserve in a manner which was consistent with the preserve boundaries contemplated at the time, but the South Sacramento Habitat Conservation Plan (HCP) has not been published at this time and the preserve areas in the conservation plan have not been finalized. Given that the HCP has neither been published nor finalized, it cannot be said that the Project is inconsistent.

Comment 19-2

Much of the project's site is a high-value vernal pool area, a significant portion of which will be impacted by the project. An EIS will be required by USEPA, a 404 permit from the ACOE, and a Section 7 consultation with FWS, which must issue a favorable Biological Opinion. The EIS and these federal permits will dictate the final onsite habitat avoidance and offsite mitigation. While CEQA requires the provision of feasible mitigation, the DEIR defers mitigation for impacts to vernal pool wetlands and to listed species to future federal permits, thus denying key information to decision-makers and the public, violating the very essence of CEQA. A combined EIR/EIS would have presented a complete picture of avoidable and unavoidable impacts and complete information regarding how the project would avoid or mitigate for its impacts to biological resources.

Response 19-2

See Response 3-2 and Response 8-1.

Comment 19-3

The Sacramento Metropolitan Air Quality Management District noted in its letter dated June 2, 2011 that Cordova Hills had provided sufficient mitigation to reduce its emissions to meet the air district's guidelines. That determination was based in part on a university being part of the project, with a resulting positive effect on VMT. However, while the DEIR anticipates construction of the university during the initial phase, there appears to be no requirement that housing and commercial development proceed only if there is a commitment of a university to locate on the site and construction has begun.

In fact there are substantial reasons to doubt that the university component of the project will ever be a reality. A letter from SACOG) dated October 7, 2011 and attached states, *"Finding, financing and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region."* And the letter goes on to state that, *"Many of the short trips and multimodal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all."*

Given the expressed concerns of SACOG, air quality impacts must be assessed both with and without the university. In order for the project to meet the SMAQMD emissions requirements the project should achieve a 35% reduction in emissions both with and without a university.

Response 19-3

See Response 8-2, Response 8-3, and Response 8-10.

Comment 19-4

For further comments on the DEIR, we incorporate by reference those of the Environmental Council of Sacramento (ECOS), which you have already received. Please keep me on your list of interested parties who will receive notices as the review process for Cordova Hills moves forward.

Response 19-4

Refer to the responses to the ECOS letter.

LETTER 20

Tom Zlotkowski, Executive Director; Capital SouthEast Connector Joint Powers Authority; written correspondence; dated February 22, 2012

Comment 20-1

The first page of this comment letter is not included, because it is not a comment on the DEIR; it is a description of the Connector project. Refer to "Cordova Hills FEIR: Comment Letters" page 122.

As part of that PEIR process, the Connector identified preferred access locations to adjacent roadways and land use in the immediate vicinity of the proposed Cordova Hills Special Planning Area (SPA). In this segment of the Connector, the PEIR analyzed an expressway configuration as the preferred functional cross section to provide for the necessary Level of Service and safety needs of the future corridor. This expressway configuration constitutes four through travel lanes in a 200' wide limited access right of way with very restrictive access allowed only at designated locations. Grade separations have been identified as the means to provide for accommodation of future volumes as noted in Table 16-13 of the PEIR, (copy attached) once planned growth and resulting traffic volumes justify.

Recognizing that the proposed access to the Cordova Hills SPA would not be compatible with the desired intersection/interchange spacing of the proposed expressway configuration of the Connector, JPA staff advised both the applicant and the County of Sacramento in writing, dated December, 2009, that an alternative connection for the northern access point to the Cordova Hills SPA should be reconfigured to eliminate its intersection with Grant Line Road. The letter further stated that if the Grant Line Road alignment was chosen as the preferred route for the Connector, the three major access points in the vicinity of the project would be Douglas Road, Crysanthus Road, and University Road under the planned expressway configuration.

Despite this expressed concern, the Connector project was not considered a "foreseeable project" at the time of the release of the Notice of Preparation (NOP) for the Cordova Hills SPA EIR, and the current Sacramento County General Plan designation for this section of Grant Line Road was used in the existing, existing plus project, cumulative, and cumulative plus project traffic analyses. The JPA feels this failure to recognize the Connector is in error in that activity on the PEIR for the Connector was initiated well in advance of the work on the Cordova Hills EIR and that the NOP for the Connector preceded the release of the NOP for Cordova Hills by six months. It is unclear as to the reasons why there was no mention of even the potential for an access conflict as expressed in the Traffic and Circulation chapter of the Cordova Hills EIR, given the aforementioned notice and understanding by the parties involved of the potential for the incompatibility of this access.

Response 20-1

The Connector was a transportation concept at the time of release of the Cordova Hills NOP and had a number of different conceptual routes. In addition, the Connector is not consistent with the recently adopted 2030 Sacramento County General Plan, and was

not even mentioned in the General Plan. The Cordova Hills Project is required to be consistent with the County's adopted General Plan as a matter of state planning law; the General Plan is the overriding land use document in the County. The County General Plan shows Grant Line Road as a six lane thoroughfare, not the four lane expressway concept now being proposed by the Connector JPA in the PEIR now being considered by the JPA. Insofar as the Connector is not yet approved by Sacramento County, and is not a funded transportation project, the Cordova Hills EIR is not required to speculate about the specific impacts of the Connector on the Cordova Hills Project because they were not reasonably foreseeable at the time the Cordova Hills NOP was issued. See, *Ebbets Pass Forest Watch v. California Department of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 77 Cal.Rptr.3d 239. In order to inform the decision-makers about the potential interface of the Connector concept and the Project, a sensitivity analysis was included in DEIR Chapter 18. In this chapter, the potential access conflicts between the Connector and the Project are described, but these are not impacts of the Project.

Comment 20-2

Although the aforementioned Cordova Hills DEIR traffic analysis does not acknowledge the proposed Connector expressway configuration, it is recognized in Chapter 18 of that DEIR under Cumulative and Growth Inducing Impacts. Under the Traffic and Circulation section on page 18-12, the issue of incompatibility involving the northern access to the project is clearly outlined both in text and in Tables CU-2 and CU-3. Both of these tables indicate that given the high probability that an expressway configured Connector will ultimately be constructed across the project frontage, both the spacing and operating conditions of the current North Loop Road access will result in unacceptable levels of service to both Connector JPA and County of Sacramento standards.

Presently, discussions between the applicant and JPA staff have resulted in only concept designs that require additional analysis to confirm their legitimacy. Some of these solutions may require the support of not only the applicant but of the land use authority(s) adjacent to the preferred Connector corridor. Additional refinement of these alternative accesses is considered essential before one might be considered applicable.

The Connector JPA strongly believes that a mitigation measure that resolves this conflict and improves operating conditions to acceptable levels for both the County of Sacramento and the Connector JPA be fully investigated and required as a part of the environmental process and the project approvals. Only with this assurance can the Connector project advance forward with the certainty that the Cordova Hills SPA will not compromise its viability as a regional transportation asset.

Response 20-2

Should the Board of Supervisors choose to initiate a General Plan Amendment project to adopt the design concepts of the Connector, it would be necessary to adopt improvement standards which would apply to this unique facility. As noted in this comment, environmental analysis would be required – but the analysis would fall to the Connector General Plan Amendment project, not to this Project. At this time, the Connector project has not been initiated by Sacramento County, and thus the analysis

of the Cordova Hills Project is based on the adopted General Plan. No mitigation is required. This issue is a matter of policy, which the Sacramento County Department of Transportation has attempted to address through recommended Conditions of Approval. These recommended Conditions are intended to preserve the ability to consider a Connector project General Plan Amendment in the future.

Oral Comments on the EIR

ORAL COMMENTER 1

Larry Greene, Executive Director; Sacramento Metropolitan Air Quality Management District; Sacramento County Planning Commission dated September 24, 2012

Comment

[The oral comments mostly repeated some of the points made in the comment letter submitted on the Project, and involved discussions with the Planning Commission about the desire to continue to work with County staff to address their concerns. The Planning Commission also asked several questions, including: what kind of condition would you like to see on the Project, how much time would you anticipate discussions with County staff on this issue would take, and can you explain the concept of “per capita” emissions. Only one of the points made was both new and addressed the adequacy of the environmental analysis. That point has been paraphrased below.]

We think that about 15% of the 35% ozone precursor emissions reduction was due to the presence of the University, and this represents the amount which would be unmitigated if the University were never constructed.

Response

The comment that 15% of the emissions reduction would be “lost” if the university/college campus center remained undeveloped could easily be made about any of the other components of the Project. If the Town Center remained undeveloped, a certain proportion of the 35% reduction calculated through the Air Quality Mitigation Plan would be “lost”. We must analyze the whole of the action, and cannot create speculative future scenarios in which the Project did not develop in the manner currently proposed. Given that fact, no attempt has been made to verify whether we agree with the stated 15% loss. Refer to Letter 17.

ORAL COMMENTER 2

Tom Zlotkowski, Executive Director; Capital SouthEast Connector Joint Powers Authority; Sacramento County Planning Commission dated September 24, 2012

Comment

[The oral comments repeated the points made in the comment letter submitted on the Project, and indicated a desire to continue working with the County and the applicant.]

Response

Refer to Letter 20.

ORAL COMMENTER 3

Peter Christiansen; Environmental Council of Sacramento; Sacramento County Planning Commission dated September 24, 2012

Comment

[The oral comments repeated the points made in the comment letter submitted on the Project.]

Response

Refer to Letter 8.

ORAL COMMENTER 4

Sean Worth; Environmental Council of Sacramento and Sierra Club Mother Lode Chapter; Sacramento County Planning Commission dated September 24, 2012

Comment

[The oral comments repeated the points made in the comment letters submitted on the Project.]

Response

Refer to Letter 8 and 19.

ORAL COMMENTER 5

**Keith Roberts; Environmental Council of Sacramento; Sacramento County
Planning Commission dated September 24, 2012**

Comment

[The oral comments repeated the points made in the comment letter submitted on the Project.]

Response

Refer to Letter 8.

ORAL COMMENTER 6

Kristain Heston; Rancho Cordova resident; Sacramento County Planning Commission dated September 24, 2012

Comment

[These comments touched on a wide array of topics, but were not related to the adequacy of the EIR. For this reason, the comments are not paraphrased, but a brief summary is provided within these brackets. The commenter expressed concerns that she and others in her neighborhood did not receive sufficient notice of the hearing, asked a variety of questions about the process for amending the SPA, asked for explanations about the planned transit system use fees for non-residents, expressed that one of the proposed transit routes was preferable to the other, and expressed property value concerns related to the inclusion of affordable housing in the Project.]

Response

Comment noted.

ORAL COMMENTER 7

**Glen Holstein; Environmental Council of Sacramento; Sacramento County
Planning Commission dated September 24, 2012**

Comment

[The oral comments repeated the points made in the comment letter submitted on the Project.]

Response

Refer to Letter 8.

ORAL COMMENTER 8

Betsy Wyland, Land Use Chair; Save the American River Association; Sacramento County Planning Commission dated September 24, 2012

Comment

We oppose this project because it is disorderly development. We wish to comment on the issue of parks. I would hope the Commission would not move forward without talking to the Regional Parks Director to ensure that the project is general-fund-neutral. We are still very loopy-goopy about how the parks within the project are going to be funded and governed, and we do not want the project to impact the regional park system. Sacramento County Regional Parks is faced with a crisis; we are in the process now of dismantling our regional parks. Whatever agreement is put in place had better have the approval of the Regional Parks Director, to be sure that it will not negatively impact the regional parks.

A more specific question is about the bufferlands: will those be managed as open space, and/or are they mitigation for habitat loss, and how does that work with the location of a proposed solar farm there.

On water supply, where is the Zone 40 surface water coming from? If it is the Freeport Project, we need to hear about that. There is the issue of Aerojet contamination, so how much water can we support without drying up our rivers?

Response

The Regional Parks Director, Jeff Leatherman, was one of the speakers during staff presentations at the Planning Commission hearing during which these comments were made. It was indicated that the Project parks plan was adequate, and the Infrastructure Financing Plan describes the funding sources, which have been deemed to be neutral with regard to the general fund.

The bufferlands described in this comment are the lands designated as “Agriculture” in the Project Master Plan, which is not a habitat preserve designation, but would allow a variety of low-intensity uses (including a solar facility). Refer to the Project Description chapter of the EIR, and to the proposed SPA.

With regard to water, the proposed water supply was described in detail within the Public Utilities chapter (Chapter 15). Please refer to that chapter.

ORAL COMMENTER 9

Jim Wiley; Taylor and Wiley; Sacramento County Planning Commission dated September 24, 2012

Comment

I am only coming forward to disclose that we may be submitting a comment letter in a week or so.

Response

Comment noted. No letter was received by the time this FEIR was processed for publication.

Cordova Hills

Draft Environmental Impact Report

SCH 2010062069

Ms. Catherine Hack
County of Sacramento
Division of Environmental Review and Assessment
827 7th Street, Room 220
Sacramento, CA 95814

Dear Ms. Hack:

Caltrans has met with several Sacramento County staff and consultants to discuss our March 1, 2012 response letter for the Cordova Hills Draft Environmental Impact Report (DEIR). In those discussions some points of contention were clarified while others still stand unresolved. To that end, this letter is to document our understanding and remaining concerns subsequent to our consultation since our March 1, 2012 letter.

- We disagree with the assertion that there are not “*any funding mechanisms established to collect money to fund such improvements*” listed on page 16-50. Caltrans has established specific mechanisms to collect and retain fair share funding to support the State Highway System (SHS) mitigation related to local development.
- Approximately 10% of the overall trip generation is going to-or-from United States Highway (US) 50. As a result, this segment will degrade from Level of Service (LOS) E to F (Page 16-80). As mitigation for this significant impact, the DEIR has proposed to contribute fair share fees to add a transition lane on US 50 between Sunrise Boulevard (Blvd) and Hazel Avenue (Ave) in both directions. We do not agree with the Traffic Impact Study that adding a transition lane on Eastbound (EB)-50 between Sunrise Blvd and Hazel Ave will improve the LOS on this segment of EB-50 (Page 16-52). The bottle neck is located near the Folsom Blvd interchange due to the lane drop and the vertical/horizontal curves. In order to relieve the congestion on EB-50 between Sunrise Blvd and Hazel Ave, we request a fair share contribution for construction of a transition lane on EB-50 from Folsom Blvd to Scott Road (Rd) in addition to a transition lane from Sunrise Blvd. to Hazel Ave.

Ms. Hack

- In addition, the following TDM strategies could be considered: hiring a full-time TDM coordinator for the development, providing commute shuttles to nearby Regional Transit/Capitol Corridor stations, coordinating carpools/vanpools, providing on-site satellite office space for telecommuting, incentivizing off-peak commuting, developing an internal job-housing match program, and reducing housing prices or Home Owner Association dues for units with reduced parking provision.

If you have any questions, comments or require further information, please contact the Sacramento County Intergovernmental Review Coordinator, Larry Brohman at (916) 274-0627 or larry_brohman@dot.ca.gov

Sincerely,

for ERIC FREDERICKS, Chief
Office of Transportation Planning –South

COMMENTS ON DRAFT CORDOVA HILLS DEIR

INTRODUCTION TO COMMENTS

Like a Bernie Madoff prospectus, this Cordova Hills DEIR reads like a relic from the Great Bubble that collapsed the world's economy. In 2003 housing starts began exceeding projected demand. By 2005 home sales started falling. By 2006 so did home prices. By 2007 the entire financial industry ground to a halt with worldwide effects (Ritholtz 2009; Zandi 2009). By 2008 when the initial environmental documents for this Cordova Hills project were submitted the party was already over and not coming back. That the project continues in 2012 is bizarre and incredibly dumb. The DEIR is not dumb though. It's like a sophisticated ad campaign to convince consumers Twinkies are health food.

The events that pushed millions around the world into poverty are no mystery. Their epicenter was California and their cause was projects like Cordova Hills. These were encouraged by bipartisan federal programs to make everyone a home owner while other federal policies had suppressed wages and caused incomes of most Americans to remain flat in constant dollars for a long time (Reich 2007). Such conflicting policies created a housing market that was ultimately unsustainable.

Like the irrational exuberance of all bubbles, things did look good for awhile even as speculators were pushing home prices higher and thus more and more out of reach of most potential buyers. Securitization of mortgage debt, which scarcely existed before the early nineties, expanded rapidly during the bubble even as home sales stalled. Soon trillions of dollars from around the world were being invested American real estate markets in general and California markets in particular (Zandi 2009). During the bubble 80 per cent of American GDP growth came from mortgage equity withdrawal as home values soared on paper while traditional elements of GDP like manufacturing declined rapidly relative to the rest of the world. Soon securitized mortgages, especially in California, became our largest export and building houses California's biggest industry (Ritholtz 2009). California and other states boomed as foreign investors bought shares in their mortgages, creating a vast conveyor belt of money that became critical for sustaining their economies. Money from around the world, especially China, flowed to America through investment in its securitized mortgages. The resulting inflated home values provided equity Americans drew on to buy the products from around the world, especially China, they no longer manufactured (Ferguson 2008).

Those were the good times. As in any boom, money flowed freely as long as the conveyor belt worked. And because we all knew it depended on building houses, nobody cared much where they were built as long as they got built. It was a great system while it lasted. What could possibly go wrong? Everybody knew the conventional wisdom that real estate only rises in value.

What could go wrong is that, just like Bernie Madoff's Ponzi scheme, it depended on the number of buyers for those houses constantly increasing. To provide those buyers, credit standards got looser and looser. Before long you could get a mortgage to buy a house with no traditional indications of ability to pay like having a job, assets, or income. As long as the bubble kept inflating, anything was OK. Soon such subprime loans, once again especially in California, became a major element of the home mortgage market. They were deliberate federal policy. In his autobiography written just

before the bubble collapsed Federal Reserve Chairman Alan Greenspan defended them while indicating awareness of their risk as follows:

“I was aware that the loosening of mortgage credit terms for subprime borrowers increased financial risk, and that subsidized home ownership initiatives distort market outcomes. But I believed then, as now, that the benefits of broadened home ownership are worth the risk. (Greenspan 2007, p. 233).”

That risk soon became reality as mortgage loan defaults started growing exponentially in 2006 even before Greenspan’s book was released. It started first in California among subprime borrowers who lacked means to pay but spread across America in subsequent years even among traditional mortgage holders. The conveyor belt had stopped and the entire economy began grinding to a halt as foreign investors learned their investments in the American housing market were now worthless. Jobs and income became increasingly scarce and even those who kept good jobs increasingly found themselves underwater with mortgages larger than their rapidly falling home values. So many of the financial incentives to home ownership were now gone that people began realizing what had been true for a long time: it was cheaper to rent (Zandi 2009).

Other factors were involved in California’s real estate boom and bust. Houses were increasingly built in greenfield locations far distant from employment sites, but few cared while house prices were rising and gas was cheap. The latter didn’t last either. Between 2007 and 2008, just as collapse of the real estate bubble caused the conveyor belt to stop and the global economy to freeze, the price of oil doubled from 61 to 130 dollars per barrel. This was just a brief speculation bubble in a trend of generally rising fuel prices but it was enough to deal the auto industry a nearly fatal blow. Long commutes by car to distant homes also suddenly became much less attractive (Yergin 2011).

Simultaneously it was realized long commutes by car were a significant source of carbon dioxide emissions expected to contribute to catastrophic climate change. Prevention of development involving long vehicle commutes became integral elements of government policies seeking to slow climate change (Yergin 2011) that coincided with earlier smart growth policies concerned with the negative effects of sprawl and loss of open space (Duany et al. 2000).

Cordova Hills is typical of California projects during the real estate bubble in its greenfield location and isolation from employment opportunities. It is natural to hope it will bring back those good times just as pits salted with gold dust once brought hope that the gold rush would come back. But projects like Cordova Hills are what caused the real estate bust and all the misery it brought. It is based on economic fantasies like its claim it has a university site to provide employment. That started with plans by the Catholic congregation Legionaries of Christ to build a college there, but these ended abruptly when the Legionaries were informed of the site’s environmental sensitivity and possibly for other reasons. Now California higher education struggles to survive in a very weak economy. No significant California colleges have been built on greenfield locations since UC Merced in 2005 at the building boom’s peak. To expect a new one at Cordova Hills now is like expecting sales of its projected homes to inhabitants of earth-like planets just now being discovered in distant solar systems light years away.

Once burned twice shy. Burst bubbles rarely if ever re-inflate. Tulips never regained their 1637 price when a single bulb cost thirty per cent more than the most expensive house in Holland (Pavord

1999; Pollan 2001). Cordova Hills is utterly out of sync with today's dominant trend of renting as close as possible to where one works. Fully 5 years after the crash that is evident in the fewest new home sales since relevant statistics began being kept in 1963 despite a vast increase in American population since then (Kravitz 2012). The 8,000 new homes proposed for Cordova Hills would actually exacerbate the recession by adding to the glut of unsold homes. Developing it profitably is consequently infeasible, but much damage can be done before that's confirmed. That is evident in this DEIR. Comments on its specific sections are provided below.

AESTHETICS

Page 3-6 of the DEIR provides color examples of high and low visual quality places. The high quality example looks much like the Cordova Hills site does now except for its lack of oaks, while the low quality example resembles numerous places littering California left half built when the bubble burst and money ran out. The proposed Cordova Hills project promises to provide one more.

Subsequent photos in the aesthetics chapter suggest the project will have little visual impact, but all views are from outside the project site looking in. None examine the visual impact the project would cause inside its 2,669 acres. This is a significant omission since it is theoretically possible to cover the Grand Canyon's walls with condominiums invisible just a few yards from the its rim.

That's relevant to Cordova Hills since its central stream valley and the Grand Canyon share similar origins. Both are incised by erosion into nearly level flat-lying sediments (Twidale 1976). The central stream valley at Cordova Hills is tiny relative to the Grand Canyon, of course, but its relief is a rare and significant aesthetic resource in mostly level Sacramento County equal to 12.5% of total county relief (Suttle 1994). The central stream valley at Cordova Hills may be the last place in the county where natural landscapes free from the works of man can be seen. This place largely hidden from current public view is where the Cordova Hills project proposes to develop most intensively.

AIR QUALITY

At the beginning of the air quality chapter (chapter 5) several air pollutants are defined but in latter parts of this chapter a pollutant category (ROG) appearing often in tables and text is left completely undefined. That kind of editorial carelessness suggests DEIR preparers were more interested in producing large numbers of pages than informing the public. Hidden in this lengthy chapter on Page 5-28 is the important conclusion that the proposed project would "exceed daily emissions thresholds" for NOx and ROG ozone precursors that contribute significantly to unhealthful air pollution. Consequently Page 5-30 concludes that implementation of the project would have a significant and unavoidable impact on implementation of regional air quality plans. The project's distant location from places of employment is also in clear conflict with Sacramento County General Plan Policy EN-5 to "Reduce travel distances and reliance on the automobile and facilitate increased use of public transit through appropriate land use plans and regulations."

BIOLOGICAL RESOURCES: Environmental setting and Sacramento County General Plan policies:

On the very first page of this chapter the DEIR completely mischaracterizes vegetation of the Cordova Hills project site by stating: "The dominant vegetation is non-native grassland comprised of

ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), barley (*Hordeum* species), and ryegrass (*Lolium multiflorum*).”

In fact these are only the site’s weeds. Similar areas in the site’s vicinity are native California prairie dominated by the native non-grass species *Holocarpha virgata* (Holstein 2001), and that author found during visits to Cordova Hills it also likely dominates there. Nothing in the DEIR suggests any effort was made to survey the site’s vegetation. Consequently its statement above about dominance by non-native grasses is utterly without supporting evidence.

This is extremely significant because among the 32 Sacramento General Plan policies cited on pages 6-3 to 6-6 are:

CO-59. Ensure mitigation occurs for any loss of or modification to the following types of acreage and habitat function: native vegetative habitat. (California prairie is native vegetative habitat.)

CO-70. Community Plans, Specific Plans, and Master Plans, and development projects shall include the location, extent, proximity, and diversity of existing natural habitats and special status species in order to determine potential impacts, necessary mitigation and opportunities for preservation and restoration.

Most significantly not included among the 32 Sacramento County General Plan policies cited in these pages, however, is the following one perhaps most relevant of them all to Cordova Hills:

CO-135. Protect the ecological integrity of California Prairie habitat.

Since that is unquestionably the actual dominant habitat at Cordova Hills (Burcham 1957, p. 80; Shelford 1963, pp. 354-355; Keeler-Wolf et al. 2007, p. 22; Lulow & Young 2009), the proposed development project there would be a clear and utterly unmitigated violation of this Sacramento County General Plan policy. Cordova Hills is over 2,600 acres of the finest quality California Prairie habitat and is among the largest and most pristine areas of this habitat in Sacramento County. It is exactly what CO-135 intends to protect.

Consequently it violates the major goal outlined in the Conservation Element of the General Plan of management and protection of natural resources for the use and enjoyment of present and future generations while maintaining the long-term ecological health and balance of the environment.

BIOLOGICAL RESOURCES: Wetlands and surface waters.

The United States Fish and Wildlife Service Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon to achieve self-sustaining populations of many species which rely on vernal pools identifies Cordova Hills as part one of its highest priority core areas vital to achieving the plan’s goals (Page 6-26). Despite this the project proposes to eliminate 46% wetlands and 33% vernal pools at Cordova Hills (Page 6-28). Such deliberate destruction of these vital wetlands would be an unconscionable environmental crime exacerbated by the project’s dubious economic prospects.

Despite DEIR discussion of mitigating this net loss, loss of vernal pools especially is essentially unmitigatable because they require specific intact soil profiles with permanent aquacludes to pond water and thus function (Ferren & Gevirtz 1990; Leidy & White 1998). The typical mitigation project of creating artificial vernal pools is also usually done in natural California prairie landscapes. Since such construction of artificial vernal pools violates the ecological integrity of these prairie landscapes it is in direct conflict with Sacramento County General Plan policy CO-135.

BIOLOGICAL RESOURCES: Special status species.

Special status species sections of the DEIR contain numerous errors of fact and interpretation. These errors do not appear to be accidental or random since they consistently minimize the impact of the proposed project on these species. Random errors are expected to be a mixture of those maximizing and minimizing impact. Examples of such errors are:

1. On Page 6-33 Ferruginous Hawk is listed as having moderate potential for occurrence on the site because “the nearest recorded occurrence is just under 6 miles west of the site.” It is well known that the recorded occurrence grid for this and several other highly vagile species is very incomplete. Consequently they must be assumed to at least occasionally use all available good habitat within their range. Since that includes all the Cordova Hills site (Small 1994, Wheeler 2003), Ferruginous Hawks have high rather than moderate potential for occurrence there.
2. On Page 6-33 Golden Eagle is listed as having moderate potential for occurrence on the site because “there are no recorded occurrences of this species within ten miles” although it is acknowledged that the species “could forage on the grassland of the site.” This is another vagile species with a very incomplete occurrence grid. Consequently they must be assumed to at least occasionally use all available good habitat within their range. Since that includes all the Cordova Hills site (Small 1994, Wheeler 2003), Golden Eagles have high rather than moderate potential for occurrence there.
3. On Page 6-33 Grasshopper Sparrow is listed as having moderate potential for occurrence despite being recorded “2.5 miles east of the site [which] contains potential foraging and nesting habitat.” The DEIR thus violates its own criteria for high potential, which Page 6-31 gives as “Habitat is present and the species has been observed within five miles of the site.” The DEIR emphasizes the site’s lack of shrubs in an apparent attempt to minimize its habitat value for Grasshopper Sparrows, but they don’t require habitat with shrubs (Small 1994). Their nests that I’ve personally seen were in areas completely lacking shrubs.
4. On Page 6-34 Loggerhead Shrike is listed as having low potential for occurrence even though “the site contains foraging habitat” and “The nearest recorded occurrence is just over three miles to the west.” Thus by the DEIR’s own criteria given on Page 6-31 Loggerhead Shrike has high rather than low potential to occur on the site.
5. On Page 6-34 Northern Harrier is listed as having moderate potential for occurrence on the site because “no occurrences are recorded within ten miles” even though it is acknowledged that “foraging habitat is present on the site.” This is another vagile species with a very incomplete occurrence grid, but in suitable habitat like Cordova Hills it is seasonally abundant in Sacramento County (Bell et al. 1983). The DEIR emphasizes that the site lacks shrubs sometimes used by the species for nesting, but their use is only occasional since they

- often nest directly on the ground (Wheeler 2003). Since Cordova Hills is excellent habitat for Northern Harriers, their potential for occurrence there is high rather than moderate.
6. On Page 6-34 American Badger is listed as having low potential for occurrence on the site for no apparent reason. Once again the DEIR violates its own criteria since Page 6-34 states that this species occurs in “grasslands” and “The nearest recorded occurrence is approximately 2.5 miles to the west.” According to Page 6-1 of the DEIR “grassland” is the site’s “dominant vegetation type”, and according to Page 6-31 species like American Badger for which “Habitat is present” that have “been observed within five miles of the site” have high, not low, potential for occurrence.
 7. On Page 6-38 Tuolumne Button-celery (*Eryngium pinnatisectum*) is listed as “Not Present” for no apparent reason. Since it is known to occur in vernal pools and in Sacramento County (Tibor 2001), its potential to occur at Cordova Hills is at least moderate and probably is high.
 8. On Pages 6-38 – 6-39 five rare vernal pool annual plants Dwarf Downingia, Bogg’s Lake Hedge Hyssop, Ahart’s Dwarf Rush, Pincushion Navarretia, and Slender Orcutt Grass are listed as not present at Cordova Hills because plant surveys didn’t find them. Such vernal pool annuals may not appear every year, however, even though they are present as seeds undetectable by standard plant surveys (Holland & Jain 1981). One such California annual, although not a vernal pool species, apparently survived exclusively as seeds for 102 years. Long thought extinct, it was rediscovered when its seeds finally germinated (McCune 2005). Many other examples of such rediscoveries are known in California although the duration of their presumed extinction is usually not a century long (Tibor 2001). In all such cases soil profiles have remained intact so seeds could germinate when conditions were favorable. There is at least some potential that any or all of the five rare vernal pool annuals not found by Cordova Hills plant surveys may exist there as seeds. As long as the site’s natural soil conditions are intact they might reappear at any time. The project’s proposal to destroy 33% of the site’s vernal pools significantly diminishes this possibility.
 9. On Pages 6-43 – 6-45 & 6-51 mitigation for Swainson’s Hawk habitat loss is discussed in a mishmash of statements. Some are quite strange like the claim on 6-43 that proposed avoided areas “will be connected to thousands of acres of open space to the north and west.” That conveniently ignores the likelihood of growth inducement by the proposed project that would encourage elimination of this open space. The many potential mitigation measures discussed on 6-44 – 6-45 promise or propose nothing specific. On 6-45, for example, it is stated that “Projects impacting 40 acres or more of foraging habitat must provide land acceptable to CDFG and County.” The proposed project would clearly impact far more than 40 acres but makes no commitment to provide any land at all.
 10. On Page 6-48 a “Fish and Game Life History Account” is listed as a source but not referenced in the DEIR’s bibliography. That may be another careless oversight or deliberate avoidance of sometimes inconvenient information from this source (Zeiner et al. 1990). For example the claim that “since [Ferruginous and Swainson’s hawks] use the same habitats, additional mitigation is unnecessary” is unsupported by either the source or the DEIR. Swainson’s Hawks primarily use cropland while Ferruginous Hawks mostly use rangeland (Zeiner et al. 1990), and the DEIR proposes no specific mitigation for destroying habitat of either species. The DEIR particularly emphasizes a brief and apparently casual statement in Zeiner et al. that Ferruginous Hawks successfully compete with Swainson’s Hawks to clearly imply they threaten them. If this occurs, it is likely very insignificant since in California Swainson’s are mostly present only in summer and confined to cropland while Ferruginous

- are present only in winter and confined to rangeland (Small 1944), and such interaction is unmentioned in modern surveys of western raptors like Wheeler's (2003). Since Cordova Hills is significant as one of the largest remaining intact tracts of ideal wintering habitat for rare Ferruginous Hawks in the region, the DEIR's claim that "The Development of the Project site would not result in substantial negative effects to the sustainability of the species and thus impacts to ferruginous hawk habitat are *less than significant*" is patently absurd.
11. Also on Page 6-48 the DEIR even more blatantly misrepresents the Golden Eagle life history account in Zeiner et al. (1990) than that of Ferruginous Hawk. The DEIR states Zeiner et al. says Golden Eagle "does not occur in the center of the Central Valley." What it actually says is Golden Eagles don't permanently reside in or migrate through that area. It makes quite clear, however, that they forage there in winter at places like Cordova Hills (Zeiner et al. 1990), a widely recognized fact (Wheeler 2003) even the DEIR acknowledges. Its claims that "mitigation for the golden eagle is unnecessary" because "Mitigation for foraging habitat loss has already been required as part of Swainson's hawk impacts" and "The development of the project site would not result in substantial negative effects to the sustainability of the species, and thus impacts to golden eagle habitat are *less than significant*" are once again absurd since Golden Eagles and Swainson's Hawks use completely different habitat and the DEIR identifies no specific mitigation plan for either species. It also fails to even mention Rough-legged Hawk, another raptor species that, like Ferruginous Hawk and Golden Eagle, uses prairie/grassland habitat for winter foraging but is somewhat less uncommon (Bell et al. 1983). Consequently it is likely to use Cordova Hills even more frequently.
 12. On Pages 6-48 – 6-49 the DEIR associates another species, Grasshopper Sparrow, with Swainson's Hawk despite very different habitat requirements. Grasshopper Sparrow, a California Species of Special Concern, is the California passerine species most obligately associated with undisturbed prairie/grassland habitat, and Cordova Hills is among the largest tracts of it in central California. While the species may use shrubs while singing, the DEIR's implication that lack of shrubs at Cordova Hills reduces its habitat value for this species is incorrect (Small 1994, Shuford & Gardali 2008). Once again the DEIR claims that the proposed project won't negatively impact this species because a non-existent mitigation plan for Swainson's Hawk will protect it are completely inaccurate. Large contiguous tracts of prairie/grassland habitat like Cordova Hills are the most important Grasshopper Sparrow habitat requirement, and urbanization by projects like the one now proposed there is the greatest threat to its survival (Shuford & Gardali 2008).
 13. On Page 6-49 the claim is again made that a non-existent mitigation plan for Swainson's Hawk will greatly reduce the impact of development at Cordova Hills on a California Species of Special Concern, the raptor Northern Harrier, despite DEIR acknowledgement that thousands of acres of ideal harrier habitat would be lost. Contrary to the DEIR claim such "impacts to northern harrier are *less than significant*", California Department of Fish and Game states that "The primary threats to breeding harriers are loss and degradation of nesting and foraging habitat" (Shuford & Gardali 2008).
 14. On Pages 6-53 – 6-54 the DEIR claims "Project impacts to western spadefoot toad are *less than significant*" because various "conservation lands" it names are preserved, but it provides no evidence Western Spadefoot actually exists at any of them. Numerous places with apparently suitable habitat lack records of Western Spadefoot, a California Species of Special Concern that requires a specific pattern of wetland and upland habitat and associated fauna to survive (Jennings & Hayes 1994). The thriving population of Western Spadefoot at Cordova

- Hills confirms it has these suitable conditions, but the named “conservation lands” lack its unique wetland/upland geometry or any evidence provided by the DEIR of spadefoot presence. The healthy Western Spadefoot population at Cordova Hills makes it a biological treasure of great value. Wanton destruction of that treasure would be a crime against nature.
15. On Pages 6-54 to 6-55 the DEIR acknowledges that several special status invertebrates are expected to occur in Cordova Hills wetlands. These are three Federal Special Concern Species (California Linderiella, Ricksecker’s Water Scavenger Beetle, and Midvalley Fairy Shrimp) and one Federal Threatened Species (Midvalley Fairy Shrimp). It also acknowledges that the project’s proposal to eliminate 43% of Cordova Hills wetlands providing their habitat would be a “*significant and unavoidable*” impact to them.
 16. On Page 2 of BR-3 (Special Status Plant Survey Reports) the presence of common vetch at the site is mentioned but it is not included in the site plant list (Attachment C). That’s a great rarity for this DEIR, an honest mistake.
 17. On Page 6 of BR-3 it is reported that the earliest rare plant surveys started April 21, 2008, and even later in other years. Starting that late and only including a single year of any April surveys may cause species to be missed, especially in years with early heat waves like 1988 when 90 degrees was recorded on March 28 at Sacramento (The Weather Channel 2012). The latest surveys ended August 9, too early to clearly record the site’s dominance by native *Holocarpha virgata*.
 18. Page 12 of BR-3 states that Tuolumne button-celery was not surveyed for because it occurs in cismontane woodland and conifer forest, which aren’t present at Cordova Hills, but it also occurs in vernal pools and in Sacramento County (Tibor 2001), which makes it a potential Cordova Hills rare species that should have been surveyed for.

CLIMATE CHANGE

This chapter is a vast haystack of information about climate change that’s mostly irrelevant to Cordova Hills, but hidden in that haystack are a few very relevant needles. They are:

1. On Page 7-13 there is very brief reference to the Sacramento County Climate Action Plan goals of “reductions in vehicle miles traveled” and “higher density development”. The proposed Cordova Hills development plan’s great distance from existing communities and realistic employment opportunities is in direct conflict with these goals.
2. On Pages 7-26 – 7-27 it is acknowledged the proposed project would exceed acceptable levels of greenhouse gas emissions because its isolation from existing communities would cause too many long car trips. Consequently “it is concluded that [its] impacts [on greenhouse gas emissions] are *significant and unavoidable*.” The DEIR also suggests the model determining the project would violate greenhouse gas reduction targets is biased against it in various ways, but the model is actually strongly biased in the project’s favor since it assumes a university at Cordova Hills will provide employment and reduce car trips despite lack of evidence or any prospect such a university will ever be built (see above).

The DEIR’s climate change chapter completely ignores an important and very relevant issue regarding its mitigation. The over 2,600 acres of natural California prairie habitat at Cordova Hills currently provides a critical ecological service of sequestering the atmospheric carbon dioxide that primarily contributes to climate change. This habitat has greater and more sustainable capacity to provide this ecological service than the better known contribution made by forests in comparable

climate zones since temperate prairies, grasslands, and steppes sequester an average of 21.2 kilograms of carbon per square meter while temperate forests sequester an average of only 19.8 (Schlesinger 1991). The Cordova Hills development project proposes eliminating the critical climate change mitigation ecological service California prairie currently provides there.

GEOLOGY AND SOILS

Page 9-19 acknowledges Sacramento County General Plan policy AG-28 requires “The County shall actively encourage conservation of soil resources.” That is necessary in general for implementation of policy CO-59 ensuring that mitigation occurs for any loss of native vegetative habitat and in particular for implementation of policies CO-134 to maintain and establish a diversity of native vegetative species in Sacramento County and CO-135 to protect the ecological integrity of California Prairie habitat. Cordova Hills are almost entirely California Prairie habitat and currently support a diversity of native vegetative species highly dependent on soil resources with intact and undisturbed soil profiles (Jackson et al. 2007). The proposed Cordova Hills project thus directly conflicts with Sacramento County General Plan policies AG-28, CO-59, CO-134, and CO-135 because it would eliminate over 2,000 acres of intact soils and native California Prairie vegetation.

LAND USE

This chapter attempts to spin the unspinnable fact that the proposed Cordova Hills project is the opposite of smart growth and violates numerous policies encouraging it. Among them are the following Sacramento County General Plan policies:

1. LU-1 (P. 12-2) – “The County shall not provide urban services beyond the Urban Policy Area.” The proposed project is beyond the Urban Policy Area.
2. LU-12 (P. 12-2) – “The County will prohibit land use projects which are not contiguous to the existing UPA, city boundaries, or existing planned communities or master plan areas (i.e. leapfrog development.” The proposed project is a textbook example of leapfrog development.
3. LU-21 (Pp. 12-2 – 12-3) – “Promote a better balance of employment, neighborhood services, and different housing types by reviewing development projects and the surrounding community and designing new projects wherever feasible so that they maintain or improve the mix of uses in the community.” The proposed project has no surrounding community and depends for employment on a hypothetical university with no realistic prospect of ever existing.
4. LU-22 (P. 12-3) – “Specific Plans and Community Plans should provide a balance of employment, neighborhood services, and different housing types wherever feasible.” The proposed project’s Specific Plan depends on a hypothetical university with no realistic prospect of ever existing for employment.
5. LU-113 (P. 12-4) – The County shall work with SACOG to support implementation of Blueprint’s policies and land use objectives.” The proposed project massively conflicts with those objectives.
6. LU -120 (Pp. 12-4 – 12-5) – “The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside the UPA if the Board finds that the proposed project is planned and will be built in a manner that: meets all the requirements per PC-1 through PC-

- 10 and; meets one of two alternative performance metrics.” The proposed project meets neither all the requirements nor the performance metrics. Among requirements not met are:
7. PC-6 (P. 12-7) – “Inclusion of an infrastructure Master Plan and Financing Plan [is required].” While such a plan is provided, its assumptions are unrealistic as discussed below.
 8. PC-8 (P. 12-8) – “Consistency with all applicable County adopted plans not sought to be amended by the proposed project [is required].” The proposed project is inconsistent with numerous elements of the adopted Sacramento County General Plan as discussed in these comments.
 9. PC-9 (P. 12-8) – “Inclusion of a discussion/analysis of how the proposed UPA expansion/Master Plan relates to broad-based and regional planning efforts, such as SACOG’s adopted Blueprint Vision and Metropolitan Transportation Plan, Sacramento County’s Visioning documents created for the Jackson Highway and Grant Line East Areas, any applicable Habitat Conservation Plan(s), The Sacramento Metropolitan Air Quality Management District’s State Implementation Plan, and Regional Transit’s Master Plan [is required].” While discussion/analysis of how the proposed UPA expansion relates to these broad-based regional planning efforts is present, it clearly shows it violates their spirit and letter as is discussed elsewhere in these comments.
 10. PC-10 (P. 12-8) – “Inclusion of a discussion/analysis of the proposed UPA expansion/Master Plan’s jobs-housing balance [is required]. Master Plans should provide an internal jobs-housing balance and/or improve jobs-housing balance within the project’s vicinity.” The proposed UPA expansion depends for jobs on a hypothetical university with no realistic prospect of ever actually existing.
 11. In Alternative #1 Criteria-based performance metrics the DEIR uses to justify a proposed UPA expansion increase desirable densification by counting group quarters at this entirely unrealistic hypothetical university (P. 12-10).
 12. In Alternative #1 Criteria-based performance metrics “Planned transit service shall be defined as service identified in SACOG’s Metropolitan Transportation Plan (MTP), Regional Transit’s (RT) Short Range Transit Plan (SRTP), and/or service to be provided as part of the Master Plan and funded via a secure financial mechanism (example: CSA 10; North Natomas TMA/developer fees). The MTP has a 20+ year planning horizon and is updated every four years; the SRTP has a 10-year planning horizon and is updated every year. Both the MTP and SRTP must be “financially constrained” in that only transportation projects and programs for which funding is reasonably expected to be available may be included in the plan. Therefore there is high likelihood that transit service identified in these plans will ultimately be provided. Service to be provided as part of a Master Plan and funded via a secure financial mechanism would provide similar assurances that identified service will ultimately be provided. In contrast transit service envisioned in RT’s long range TransitAction Plan cannot be implemented until a significant new revenue source is secured, making such service far more speculative. For example, a new ½ cent sales tax increase would only partially fund transit service envisioned in the TransitAction Plan. Therefore, service(s) identified in the TransitAction Plan and similar visioning documents will not be considered.” As discussed elsewhere in these comments, financing for transit and other services for the proposed project are hypothetical, highly speculative, and ultimately infeasible.
 13. In Alternative #1 Criteria-based performance metrics (P.12-14) “Analysis of existing employment/jobs within a five mile radius of the proposed UPA/Master Plan boundary [is required].” Such employment/jobs are essentially non-existent at Cordova Hills.

14. Low Vehicle Miles Travelled (VMT)/Greenhouse Gas (GHG) Emission metrics are Alternative #2 performance metrics (Pp. 12-14 – 12-15), but the DEIR’s climate change chapter determined the proposed project’s VMT and GHG are “*significant and unavoidable*” impacts on climate change (P. 7-26).
15. Sacramento County General Plan Policy LU-123 (P. 12-15) requires that “Before granting approval of an amendment to the Land Use Diagram, the Board of Supervisors shall find that the request is consistent with the objectives and policies of the General Plan; the request is consistent with the goals and objectives of a Sacramento County adopted Habitat Conservation Plan; approval of the proposal will not adversely affect the fiscal resources of the County; [and] the project will be consistent with the performance standards in this Plan and, for urban uses in urban growth areas, the project complies with the requirements of LU-13.” The proposed plan violates this plan because it is inconsistent with numerous other Sacramento County General Plan policies, there is no adopted Habitat Conservation Plan and it would be inconsistent with the goals and objectives of one if it were adopted, fiscal resources of the County would be adversely affected as discussed below, and financial aspects of LU-13 are not adequately complied with as discussed below.

The proposed Cordova Hills project also directly conflicts with the Sacramento Area Council of Governments (SACOG) Blueprint since it violates at least two of its seven core principles (Pages 12-15, 12-16):

1. Principle 5 is “strengthen and direct development toward existing communities.” The project directs it away from existing communities toward open space.
2. Principle 7 is “preserve open space, farmland, natural beauty, and critical environmental areas. The project is proposed to be sited entirely on open space of great natural beauty and critical environmental importance.

“The ultimate purpose of the ‘smart growth’ concept supported by the principles is sustainable communities, and is a reaction to the recognized health and safety impacts of urban sprawl and vehicle-centric development strategies.” The latter describes the proposed project, which is definitely not smart growth since that “must be consistent with all seven principles” (P. 12-17).

On Page 12-18 the concept of developing in existing communities is explained as follows:

“Directing development toward existing communities is accomplished by building on infill land and urban brownfields before developing greenfields, building on greenfields only after the prime infill and brownfield land is developed and developing greenfields in a logical and phased progression beginning in those areas nearest to existing urban lands.” Much Sacramento infill and brownfield land has not been developed, and the project proposes building on greenfields distant and isolated from existing urban lands (P. 12-30).

Page 12-19 states that the purpose of preserving open space in Principle 7 is to “ensure that a project preserves the most sensitive and prime resources within the area. This is partly accomplished through principle 5, which directs development toward existing communities.” Not only does the project not direct development toward existing communities, even its own inadequate environmental analysis acknowledges it will eliminate 43% of its environmentally critical wetlands. Its even more extensive critical uplands are entirely written off and ignored by being falsely labeled non-native annual grassland (see above)

On Page 12-20 the DEIR acknowledges that “Based on the CEQA guidelines, a land use impact is significant if Project implementation results in ...Substantial conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project.” These comments identify numerous examples of such conflicts.

Other conflicts arise from the DEIR’s internal contradictions. For example in reference to Swainson’s Hawks P. 6-43 states “On the basis of the above research, the 298-acre Avoided Area on the western side of the site, plus two adjacent Avoided Areas to the north and south, will remain suitable habitat; this collective area is 382 acres, which will be connected to thousands of acres of open space to the north and west” while P. 12-24 states that “Although the land to the west of the Project is currently undeveloped open space, some of this area has land use entitlements and is likely to develop in the near-term.” In other words the DEIR wants it both ways. The land to the west is long term open space when the goal is expanding Swainson’s Hawk habitat but soon to be developed urban land when the goal is adjacency to other communities.

On Page 12-26 it is acknowledged that “the [SACOG] Blueprint should be city-centric, focusing growth within the confines of incorporated city boundaries as a logical buildout from existing urban areas...on this basis the Project goes beyond the level of development assumed outside the city areas by the year 2050.” Could there be any more explicit violation of the Blueprint? The same page states “The Project...includes a mass transit system operated by the Cordova Hills Community Services District.” A reasonable person might think that means a significant mass transportation connection to Sacramento, but no. Page 16-82 makes it clear that “Since there are no plans to expand services to the Project site, it must be assumed that extension of existing transit to the Project area will not occur.”

Page 12-28 makes much of planned bicycle and pedestrian paths that “will make non-automotive routes the most direct line of travel in many cases.” An important question is travel to where? The plan is designed around a theoretical university with no realistic prospects of ever being built. Consequently what the project proposes are pedestrian and bicycle paths to nowhere. On the same page the DEIR claims this imaginary university will increase the project’s density and thus its “compact building and community design.”

On Page 12-29 the DEIR acknowledges that the project conflicts with SACOG Blueprint principle 5 since it proposes development directed away from rather than toward existing communities. It thus violates Sacramento County General Plan policies requiring conformance with Blueprint principles. The DEIR identifies the nearest existing communities to the site as being 4 and 6 miles away.

Principle 7 of the SACOG Blueprint is preserve open space, farmland, natural beauty, and critical environmental areas. The Cordova Hills site is 2,669 acres of such open space and has outstanding natural beauty. Its wetland acreage is identified as a critical environmental area of the highest priority in the United States Fish and Wildlife Service (USFWS) Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon. Nevertheless on Page 12-31 the DEIR acknowledges the proposed plan would eliminate 44% of the site’s wetland acreage and 33% of its vernal pool acreage despite its identification by USFWS as a highest priority critical environmental area. The site’s non-wetland open space, also proposed for elimination, is native California prairie habitat of great environmental value to many native plant and animal species, some of which are

discussed elsewhere in these comments. The DEIR consequently concludes correctly that “the land area preserved is insufficient to meet the intent of the principle [7], and thus with General Plan Policy.”

On Page 12-32 the DEIR further concludes correctly that “the Project’s inconsistency with this principle [5] is considered a substantial conflict with the Blueprint and with General Plan policy which supports the Blueprint. Avoidance of this impact would require substantial Project redesign and relocation. Though Alternatives have been considered which would reduce this impact, there is no mitigation available and impacts are *significant and unavoidable*.”

On Pages 12-32 – 12-34 the DEIR claims the proposed Cordova Hills project does not conflict with Sacramento County General Plan Policy LU-120 regarding growth management based on County Planning Division decisions summarized in Tables LA-2 and LA-3. These decisions so blatantly conflict with the plain language information both internal and external to the DEIR that they provide prima facie evidence of conflict of interest on the part of the Planning Division. A kindergartener could tell coal is black, snow is white, and the proposed Cordova Hills plan isn’t smart growth. It takes the willfully blind, the insane, or highly paid advocates to claim otherwise.

Some examples in Tables LA-2 and LA-3 are:

1. Contrary to claims in Table LA-2 PC-1 the DEIR clearly demonstrates the proposed project is not “integrally linked” to existing communities. It is 4 to 6 miles distant from them. In current planning documents like the SACOG Blueprint such linkage is not contemplated until at least 2050. The DEIR also makes clear no significant transit linkage with existing communities is contemplated and public utility linkage is highly problematic.
2. PC-5 is about transit-oriented design, but the proposed project has no significant transit links to employment. Its transit proposal is almost entirely internal and consequently a system to nowhere since no realistic significant employment sources are identified at Cordova Hills.
3. PC-6 is about a Financing Plan. The one provided is utterly unrealistic and impossible to implement (see below).
4. PC-7 is about a Services Plan. The one provided conflicts with a water provider and potentially other service providers and depends on infeasible funding sources (see below).
5. PC-8 is about consistency with County-adopted plans. The project claims to be consistent with all County-adopted plans. In fact these comments identify numerous conflicts with such plans. An example is Sacramento County General Plan Policy CO-135 to protect the ecological integrity of California Prairie habitat. The project site is over 2,600 acres of the habitat this policy concerns, but it isn’t even mentioned in the DEIR, which does, however, acknowledge the proposed project’s conflicts with the County-adopted SACOG Blueprint (see above and below).
6. PC-9 is about consideration of regional planning efforts, but even the DEIR acknowledges the proposed project substantially conflicts with SACOG Principle 5 of directing development toward instead of away from existing communities and Principle 7 of preserving open space. Contrary to project claims, it is also not coordinated with regional transit and water plans (see above and below).
7. PC-10 is consideration of jobs-housing balance. The proposed plan’s claim it will provide 6,548 jobs is patently false. It will provide essentially none beyond initial construction. Jobs claims are based on an imaginary “university” with no prospects of ever existing (see above).

8. On Table LA-2 the County Planning Department assigns the proposed project “points” for LU-120 Criteria in an apparently arbitrary manner. Five points are assigned for CB-1, minimum density. Much of this density is achieved through an imaginary “university” with no prospect of ever existing (see above).
9. Criteria CB-2 is about proximity to amenities. The proposed project claims that at least four of the amenity categories are within one mile but doesn’t say which. In fact all amenities are entirely theoretical and may never exist. The most significant of these is the claim of an employment amenity at an imaginary “university” with no prospect of existing. Real amenities in actually existing communities are four and six miles away (see above).
10. Criteria CB-4a is about transit proximity. Its clear intent is interconnecting the Sacramento Metro area with mass transit. The proposed project’s transit element is a primarily internal system to nowhere with little realistic prospect of connecting the isolated proposed project with the rest of the Metro area (see below).
11. Criteria CB-4b is about transit headway. The proposed project says its transit system will have headways of 15 minutes or less during peak hours, but since it has no realistic destinations and goes nowhere, it will have no peak hours.
12. Criteria CB-5 is about employment proximity. Since the proposed project’s “employment” is based entirely on an imaginary “university” with no prospect of existing, the nearest realistic employment is a minimum of 4 to 6 miles away in existing communities, but is likely to be much farther (see above).

On Pages 12-34 – 12-35 the DEIR claims the proposed Cordova Hills project isn’t growth inducing although its own chapter on Cumulative and Growth Inducing Impacts says it is. It justifies this by claiming to be adjacent to “existing planned communities” to its west. The operable word here is “existing” since on Pages 12-29 – 12-30 the DEIR acknowledges no such communities actually exist. On Page 6-43 the DEIR even claims this area is “thousands of acres of open space to the north and west” that can help mitigate for Swainson’s Hawk habitat the project proposes eliminating. The proposed project clearly is leapfrog development and thus directly violates Sacramento County General Plan Policy LU-12 prohibiting it. As noted above, even a kindergartner can understand leapfrog development. The frog leaps over a pond (open space) to a toadstool (development) but splashes mud (growth inducement) in its path. Only the insane, willfully blind, or well-paid advocates can deny that.

On Page 12-35 the DEIR briefly discusses public services and utilities and acknowledges “the need to ensure that adequate facilities will be constructed and that funding is secured for construction.” It also claims a “facilities financing plan” and “Long term funding sources have been identified for the maintenance of public services.” The DEIR’s Public Services Chapter reveals, however, that the proposed project’s financing plan and long term funding sources are unrealistic and grossly inadequate (see below). Consequently the project violates General Plan policies LU-13, LU-66, LU-110, and LU-123 to ensure minimum standards for public services and utilities are met.

On Pages 12-35 – 12-36 the DEIR lists Sacramento County General Plan Policies LU-34, LU-35, LU-36, and LU-46 but fails to discuss their call for development compatible with a regional transit system interconnecting the Sacramento Metropolitan Area. That’s presumably because the proposed development would be largely distantly isolated from such a system and almost entirely dependent on roads for access. Since the only bone it throws transit concerns is a largely internal system to

nowhere lacking significant destinations, it greatly conflicts with General Plan policies mandating development compatible with regional transit.

PUBLIC SERVICES

On Page 14-3 the DEIR says a new Cordova Hills Community Services District (CHCSD) will provide services for the proposed project, but CHCSD is purely hypothetical at this time since it must be approved by the Sacramento Local Agency Formation Commission (LAFCO). It's acknowledged on the same page that the proposed project is "not in close proximity to any existing public services, and as a result some extensive, costly improvements related to infrastructure and public facilities – discussed in the Public Utilities Chapter – will be required to adequately support the Project."

Pages 14-4 – 14-5 then explain how these "extensive, costly improvements" will be financed since they will cost "approximately \$453 million dollars." The DEIR states that some of this funding will be born by local, state, and federal taxpayers but it will also depend on construction and sale of 7,500 new homes out of the project's planned 8,000.

The 7,500 new homes needed to finance the proposed project are 2.5% of all new homes sold in the United States in 2011 (Kravitz 2012). Since the proposed project covers 0.0001% of U.S. area, that's 25,000 times its share of new American homes by area. Closer to home 14,000 new homes were sold in California in the first 7 months of 2011 (Lazo 1011). If we generously assume an equal number were sold in the last 5 months, that's a total of 28,000 new California homes sold in 2011. The 7,500 new homes needed to finance the proposed project are thus 27% of all new homes sold in California in 2011. The proposed project is 0.003% of California's area, so its 7,500 homes are 9,000 times its share by area in California.

Now of course all acres aren't the same. One in Silicon Valley may be much more desirable than many in the Mojave Desert. Is that the case for Cordova Hills? It may have been when gas was cheap and long commutes popular, but that's changing fast. Generation Y, the largest cohort of 21 to 30 year olds since the Baby Boom, is avoiding cars. They now contribute only 14% of miles driven even though that age group provided 21% of miles in 1995. They're so used to buying on line they consider commuting by car wasting time they could spend with their electronic devices on buses or trains (Ostroff 2010). That trend is evident in fewer young people getting drivers licenses and more moving to big cities where mass transit makes car ownership optional (Terlep 2012). Distantly isolated places with virtually no planned connection to urban areas by mass transit like the proposed Cordova Hills project are consequently becoming increasingly unattractive.

Despite these trends there will probably always be a niche market for rural homes made attractive by personal space provided by their often low density environments. The proposed Cordova Hills project is clearly rural since it is 4 and 6 miles from the nearest communities (DEIR Pages 12-29 – 12-30), but it is planned to be "twice as dense as the [Sacramento] county average (DEIR Page 12-28). High density rural developments certainly do exist like the neighboring Sacramento County Boys Ranch (DEIR Pages 12-36 – 12-37) but residence there tends to be less than voluntary and involve debts to society not paid in cash.

The proposed project's financial plan conflicts with far too many economic trends to be even marginally viable. Expecting the monopolization of 27% of the California new home market it takes to succeed is as realistic as expecting those with no jobs, income, or assets to make their mortgage payments. We know how that worked out. All the project offers is another ugly husk of a half built project like those that began littering the Central Valley after the real estate bubble burst. This would be doubly tragic at Cordova Hills since some of the Sacramento region's most beautiful and biologically critical habitat lands might be eliminated in the process for no good purpose.

The proposed project also increases taxes on the Sacramento region's current residents. For example:

1. On Page 14-18 the DEIR says "new fire stations will be built within the Project area" and that "funding for the construction and operation of the fire facilities will be provided by the District-wide Capital Fire Facilities fee." The district referred to is the Sacramento Metropolitan Fire District.
2. On Page 14-20 the DEIR says the financing plan doesn't call for "construction of additional police facilities" but the Urban Services Plan does.
3. On Page 14-21 the DEIR says "law enforcement services will be funded through the County General Fund" at least partially with the balance provided by the financing plan's shaky assumptions.
4. On Page 14-23 the DEIR says funding for new schools will come from "existing fee programs, state funding, and the [Elk Grove Unified School District] EGUSD" augmented by the financing plan's shaky assumptions.
5. On Page 14-28 the DEIR says "library operating costs will be fully funded through property tax revenue" assessed within the City and County of Sacramento.

PUBLIC UTILITIES

On DEIR Page 15-16 two Sacramento County General Plan policies related to water are incompatible with the proposed project. They are:

1. CO-23 is about "impact on valuable water supported ecosystems". On Page 6-28 the DEIR acknowledges the proposed project would eliminate 46% of its wetlands and 33% of its vernal pools. On Page 6-26 it also acknowledges these wetlands are identified by the U.S. Fish and Wildlife as having their highest environmental protection priority.
2. CO-35 is about new development not being approved and building permits not being issued without sufficient water supply. The proposed project's water supply is highly problematic as discussed below.

On DEIR Pages 15-26 – 15-36 a complex ad hoc system of pipes is proposed to bring water to the proposed project in a plan requiring approval by the Sacramento County Water Agency. On Page 15-34 the DEIR acknowledges that this agency opposes the project's proposed water plan. Page 15-35 also acknowledges that the proposed water plan significantly impacts wetland resources and their species.

On DEIR Pages 15-38 – 15-39 the need for significant new sewer infrastructure facilities to serve the proposed project is discussed. It is acknowledged their construction will have significant impact on biological resources but their financing is not discussed. Presumably Sacramento County Sewer

District ratepayers are expected to fund these new facilities which are estimated to cost \$6.5 million for off-site sewer construction alone.

On DEIR Pages 15-42 – 15-45 construction requirements for extending electric and gas utilities to the proposed project are discussed but not their funding. Presumably Pacific Gas and Electric and Sacramento Municipal Utility District ratepayers are expected to fund these new facilities.

On DEIR Pages 15-45 – 15-46 the DEIR acknowledges the proposed project would violate Sacramento County General Plan policies LU-57 and LU-XX to not extend urban services beyond the Urban Policy Area except to 251 acres near the Kiefer Landfill. Its proponents consequently want these policies changed.

TRAFFIC AND CIRCULATION

On Page 16-5 the DEIR acknowledges there are no transit connections to the proposed project. Without these the proposed project violates Sacramento County General Plan policy CI-4 on Page 16-7 to “provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services.” Since the proposed project provides no realistic significant local employment sources and only weak transit connections to those elsewhere, it appears to violate this policy.

The proposed project appears to violate two other Sacramento County General Plan policies presented on DEIR Page 16-7:

1. CI-5 calls for “Land use and transportation planning and development should be cohesive, mutually supportive, and complement the objective of reducing per capita vehicle miles travelled (VMT). Since the project proposes only weak transit connections between Cordova Hills and the Sacramento Metro Area it tends to isolate any residents in a place distant from significant employment centers or other urban amenities. Their only option would be greatly increasing VMT.
2. CI-27 says “Public Facilities Financing Plans shall incorporate capital costs for transit. Infrastructure Master Plans shall include transit planning.” The purpose of such transit is explained in Policy CI-4. It is to “link housing, recreational, employment, commercial, educational, and social services.” Instead the project proposes a primarily internal transit system to nowhere providing no such significant linkage.

DEIR Pages 16-36 – 16-38 confirm the project proposes a local primarily internal transit system only weakly linked to the Sacramento Metro Area. Its only rationale is internal trips to an imaginary college with no prospects of ever being built (see above). Consequently it is a transit system to nowhere also unlikely to viably ever exist since it is dependent on the unrealistic financing plan discussed above. Pages 16-37 and 16-38 in particular demonstrate the proposed transit system’s entire rationale is the imaginary college. Pages 16-81 – 16-82 reiterate the proposed project’s isolation from actually existing mass transit.

Pages 16-78 – 16-83 of the DEIR demonstrate the proposed project will increase VMT so much even assuming the imaginary college will actually exist that traffic congestion will be significantly increased on numerous intersections, roads, freeways, and freeway ramps in the Sacramento area.

CUMULATIVE AND GROWTH INDUCING IMPACTS

The proposed project has numerous cumulative and growth inducing impacts. Among them are:

1. Pages 18-2 – 18-3 acknowledge extending public infrastructure to the proposed project, which would cost an estimated \$6.5 million dollars for off-site sewer construction alone, would greatly facilitate development of its thousands of acres of adjoining open space. Consequently the DEIR states that “a major barrier to growth would be removed.”
2. Page 18-3 acknowledges the project’s proposed expansion of the Urban Policy Area (UPA) would facilitate development of adjacent open space but claims the proposed expansion conforms with General Plan policy LU-120. As discussed above such expansion clearly violates LU-120.
3. Pages 18-3 – 18-4 acknowledge the proposed project includes a General Plan Amendment to extend provision of public water beyond the Urban Services Boundary (USB). It further states that “This action sets a precedent, as Zone 40 water has never been provided outside of the Urban Services Boundary to serve *proposed* uses” and that this “proposal is constrained both by supply and by contribution toward a hazardous condition” because it “could impact groundwater remediation efforts at Kiefer Landfill.”
4. Pages 18-5 – 18-6 acknowledge the proposed project would “contribute to significant and unavoidable cumulative aesthetic impacts.”
5. Page 18-6 acknowledges the proposed project would cause “cumulative loss of farmland” and consequently its “impacts are significant and unavoidable.”
6. Pages 18-6 – 18-7 acknowledge the proposed project’s “cumulative impacts related to construction-level particulate matter, operational particulate matter and ozone precursors, and conflict with implementation of the State [air quality] Implementation Plan will be significant and unavoidable.”
7. Pages 18-8 – 18-9 acknowledge that because of the proposed project “Cumulative loss of grassland habitat (grazing land) [i.e. California prairie] may exceed 10,000 acres [that] support a variety of special status species” and “Project impacts to wetlands and some of the associated species are significant even after the application of mitigation; thus, it can be concluded that cumulative impacts will also be considerable, and that despite the application of mitigation cumulative [biological] impacts will remain significant and unavoidable.”
8. Page 18-9 acknowledges “mitigation may be insufficient to avert substantial climate change, and impacts are significant and unavoidable.” That conclusion doesn’t even consider how loss of California prairie that may exceed 10,000 acres will reduce carbon sequestration.
9. Page 18-11 claims the proposed project’s cumulative land use impacts “would be less than significant”, but this conclusion is contradicted in numerous places throughout the DEIR and in these comments. Since the land use chapter of this DEIR negates the SACOG Blueprint’s plain language regarding regional land use planning, it essentially abolishes this significant regional planning effort. The cumulatively huge negative impact would be giving carte blanche to completely unplanned growth and development.
10. Page 18-11 claims the proposed project’s cumulative impacts on public services are less than significant, but that conclusion is based on assumed taxpayer subsidy and a deeply flawed financial plan as discussed above.

11. Page 18-11 – 18-12 also claim the proposed project’s cumulative impacts on public utilities are less than significant, but that conclusion assumes taxpayer and ratepayer subsidies as discussed above.
12. Pages 18-12 – 18-15 acknowledge the proposed project’s impacts on traffic and circulation “cannot be fully mitigated, and impacts are significant and unavoidable.”

ALTERNATIVES TO THE PROPOSED PROJECT

The No Project alternative presented on Pages 2-14 – 2-15 of the DEIR is recommended because of numerous reasons discussed in these comments.

Subject: Draft Environmental Impact Report
Cordova Hills Project
Control Number: 2008-GPB-SDP-ZOB-AHP-00142
State Clearing House Number: 2010062069

Dear Ms. Hocker,

This letter supplements the comments of Dr. Glen Holstein of the Sacramento Valley Chapter of the California Native Plant Society (CNPS). We hereby incorporate Dr. Holstein's comments by reference. CNPS incorporates by reference the comments of the Environmental Council of Sacramento and Habitat 2020 submitted by Sean Wirth. CNPS is highly concerned with the overall level of take, undermining of the South Sacramento Habitat Conservation Plan, and leap frog development resulting in poor urban connectivity. The project also proposes misuse of the proposed Southeast Connector which will set precedence for additional sprawl along this "expressway".

CNPS is a statewide non-profit organization of some 10,000 scientists, educators, and laypeople dedicated to the conservation and understanding of the California native flora. As a science-based conservation organization, we believe that good land use decisions must be accompanied by a thorough assessment of the environmental impacts as required by the state and federal Endangered Species Acts, the Clean Water Act, the National Environmental Policy Act, the California Environmental Quality Act, and other resource protection laws.

The Sacramento Valley Chapter of CNPS has been highly involved in participating in and commenting upon land use decisions at all levels that affect vernal pool ecosystems in Sacramento County. Chapter volunteers serve on the South Sacramento Habitat Conservation Plan steering committee and biological subcommittee. Chapter volunteers serve on a stakeholders group to determine land use planning for the former Mather Air Force Base and its vernal pool grassland ecosystem. Chapter volunteers participated in the General Plan revision and the Visioning exercises for the eastern part of the county. Chapter volunteers serve on local land trust boards, steering committees, and management committees. Chapter volunteers have testified at innumerable planning commission, board of supervisors, and city council meetings on projects that impact vernal pool resources.

The Sacramento Valley Chapter of CNPS has long viewed the region including the area referenced in the Cordova Hills Project as the "Yellowstone" of vernal pool landscapes in Sacramento County. Geospatial analysis independently conducted for the developing South Sacramento Habitat Conservation Plan has confirmed that this region is unique within Sacramento County from the perspective of both density and diversity of vernal pools present, and in listed species presence. The diversity of vernal pool sizes, shapes, and hydroperiods is strongly correlated to high species diversity and a high level of ecosystem supporting function. The density of aquatic resources and listed species indicates that losses of this habitat will not easily be mitigated for elsewhere in the county.

Dedicated to the preservation of California native flora

The following comments are based on our knowledge of the wetland and endangered species resources in the vicinity of the proposed project and our understanding of the resource protection laws and their associated public review process.

GENERAL COMMENTS

Incomplete Environmental Setting and Proposed Project

The Cordova Hills project description *fails to describe the whole of the proposed action*. Specifically, a wetlands mitigation plan will be required to offset destruction of vernal pools and other wetlands within the development. Construction of a minimum of 41.37 acres of mitigation wetlands will have environmental impacts above and beyond those described in the DEIR. Additionally, these impacts will occur on another, undisclosed site for which a baseline biological setting has not been provided. Preparation of a mitigation plan after local entitlements are granted constitutes *improper segmentation or piecemealing* of the project and precludes the public from receiving full disclosure of the environmental impacts of the proposed project in its entirety including any proposed mitigation.

The California Environmental Quality Act (CEQA) requires full disclosure of environmental impacts for the whole project regardless of whether they are detrimental or beneficial. Preparation of an after-the-fact mitigation plan negates CEQA's intended public participation process. For the purposes of informing the public, simply stating that the plan will be approved by the regulatory agencies is also insufficient and lacks transparency.

Inappropriate Deferral of Mitigation

Throughout the DEIR, actual *mitigation measures are being deferred* to the future. The document continually refers to yet-to-be-prepared plans, studies, and reports. In addition to deferring a Wetland Mitigation and Monitoring Plan to some future date outside of the public review process, analyses and mitigation of other environmental impacts are also being deferred. For example, specific mitigation for noise will be determined after some future acoustical analysis and report. This failure to fully disclose impacts and to provide substantive and enforceable mitigation measures occurs throughout the document.

Simply creating a plan or an afterthought mitigation measure is not adequate for the purposes of CEQA disclosure. The DEIR must contain specific and measurable mitigation that demonstrates to both the land use authority and the public that impacts have been reduced through mitigation. The Board of Supervisors cannot make findings of "less than significant after mitigation" if they don't even know what the mitigation measures and success criteria are.

Feasibility of Proposed Wetland Mitigation

Deferral of a Wetland Mitigation and Monitoring Plan is particularly troubling because in its absence the project applicant cannot demonstrate that the mitigation measure(s) are feasible (able to be accomplished). Without sufficient information to determine whether the wetland mitigation is in fact feasible, the public is left with the uncertainty that it may never be accomplished.

The U.S. Army Corps of Engineers' (Corps) Record of Decision (dated 25 January 2011) related to the Sunridge Projects in the City of Rancho Cordova states the following:

- "e. The Corps recognizes the significant cumulative loss of vernal pool wetlands within the Mather Core Recovery Area. For future unavoidable impacts to vernal pools within the Mather Core Recovery Area... compensatory mitigation shall be:
 - 1) based on a method for assessing the functions of all waters of the U.S. on the project site;

- 2) accomplished at a ratio of greater than 1:1, after considering direct and indirect impacts, temporal loss and difficulties creating vernal pool wetlands; and
- 3) located in the Mather Core Recovery Area, unless determined impracticable or inappropriate by the Corps.”

A complete Wetland Mitigation and Monitoring Plan is necessary from two perspectives. First, the public has a right to know the environmental consequences of the proposed mitigation. Second, the Board of Supervisors has a public trust obligation to understand how this mitigation, supposedly to occur within the Mather Core Recovery Unit which is almost entirely within the USB, will impact future development (and mitigation) in the County of Sacramento. Will the mitigation for this project preclude development of a more worthwhile and better designed project in the future?

Revision and Recirculation Required

The incomplete description of the environmental setting, the incomplete description of the proposed project, the inappropriately deferred mitigation measures, and the potential infeasibility of the proposed wetland mitigation all demonstrate that the DEIR is woefully inadequate for the purposes of public disclosure. CNPS requests that these deficiencies be remedied in a Revised DEIR to be recirculated to the public for additional consideration and comments.

SPECIFIC COMMENTS

Mitigation Measure BR-1

As discussed above, a commitment to prepare a (Wetland) Mitigation and Monitoring Plan is not mitigation. Additionally, the impacts of such a plan are not disclosed in the DEIR even though they are clearly an integral part of the proposed project.

Table BR-3: Special Status Species Matrix

Please note the comments of Dr. Glen Holstein on behalf of the Sacramento Valley Chapter of CNPS. In addition to his specific observations, we request the addition of *Lytta molesta* as a potential species of concern on the project site.

Mitigation Measures BR-3 through BR-6

An additional mitigation measure needs to be added to survey for ground nesting birds if construction occurs between March 1 and June 30. Several special status bird species written off as having low potential to occur on the site, actually have a high potential (again see Dr. Holstein’s comment letter) and are ground nesters.

Western Spadefoot

Loss of Western Spadefoot breeding habitat on the Cordova Hills project would be significant. There are less than a handful of extant populations within the Mather Core Recovery Area and these occur on the very periphery of its range. The Mather Specific Plan is also proposing destruction of a breeding pool with no mitigation, so cumulatively the impacts are also significant. The Cordova Hills project should conduct additional surveys to determine the locations and extent of the onsite population and prepare a specific mitigation and monitoring plan for this species in order to reduce the impact to less than significant.

Translocation of Inoculum

Because there is not a Wetland Mitigation and Monitoring Plan included for review as part of this project, it is impossible to speculate on all of the measures that might be incorporated into such a plan. However, language in Mitigation Measure ALT-1 suggests that the project proponents intend to translocate inoculum (soil, seeds and cysts) from the impact site to some yet-to-be-identified mitigation site. Such translocation of materials is inappropriate over any distance. Vernal pool landscapes are very similar to island archipelago biogeography, with near neighbors being more closely related genetically than distant neighbors. The practice of translocating propagules from one area to another could have significant consequences including: i) genetic swamping of closely related species, ii) crossbreeding that leads to mortality/extirpation, or iii) crossbreeding that leads to superweeds.

As an aside, Mitigation Measure ALT-1 also contains language that appropriate success for mitigation of rare plant populations would be a restoration criteria (sic) standard of 60 percent survivorship. Given that the plants are all annuals and subject to precipitation and temperature patterns, this criterion is both nonsensical and immeasurable.

These are examples of why it is important to fully disclose environmental impacts during the public comment phase of CEQA disclosure. Who knows what other ill informed practices and immeasurable criteria might be proposed in the Mitigation and Monitoring Plan? Who knows if the plan will be feasible?

SUMMARY

On behalf of CNPS, I appreciate the opportunity to provide these additional comments on the Draft Environmental Impact Report for Cordova Hills.

As articulated above, we believe that the document fails to comply with the spirit of the California Environmental Quality Act. While the DEIR may satisfy minimum standards, it has unsuccessfully informed the public of the environmental setting and environmental consequences of the project including its offsite mitigation components. Therefore, CNPS requests that a Revised DEIR be prepared for this project that addresses our concerns and that the Revised DEIR be recirculated for an additional round of public comment.

Please keep me informed of activities related to projects in this area that might impact vernal pool grasslands and endangered species habitat.

Sincerely,

Carol W. Witham
CNPS Treasurer

LETTER 4

February 6, 2012

Ms. Catherine Hack
Sacramento County
827 7th Street, Room 220
Sacramento, California 95814

Subject: Cordova Hills SCH Number: 2010062069 Notice of Completion of a Draft
Environmental Impact Report

Dear Ms. Hack:

Staff for the Central Valley Flood Protection Board has reviewed the subject document and provides the following comments:

The proposed project is located within the jurisdiction of the Central Valley Flood Protection Board. The Board is required to enforce standards for the construction, maintenance, and protection of adopted flood control plans that will protect public lands from floods. The jurisdiction of the Board includes the Central Valley, including all tributaries and distributaries of the Sacramento River and the San Joaquin River, and designated floodways (Title 23 California Code of Regulations (CCR), Section 2).

A Board permit is required prior to starting the work within the Board's jurisdiction for the following:

- The placement, construction, reconstruction, removal, or abandonment of any landscaping, culvert, bridge, conduit, fence, projection, fill, embankment, building, structure, obstruction, encroachment, excavation, the planting, or removal of vegetation, and any repair or maintenance that involves cutting into the levee (CCR Section 6);
- Existing structures that predate permitting or where it is necessary to establish the conditions normally imposed by permitting. The circumstances include those where responsibility for the encroachment has not been clearly established or ownership and use have been revised (CCR Section 6);
- Vegetation plantings that will require the submission of detailed design drawings; identification of vegetation type; plant and tree names (i.e. common name and scientific name); total number of each type of plant and tree; planting spacing and irrigation method that will be utilized within the project area; a complete vegetative management plan for maintenance to prevent the interference with flood control, levee maintenance, inspection and flood fight procedures (Title 23, California Code of Regulations CCR Section 131).

Ms. Catherine Hack
February 6, 2012
Page 2 of 2

In accordance with CEQA Guidelines Section 15130 "Discussion of Cumulative Impacts. (a) An EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable, as defined in section 15065(a)(3). Where a lead agency is examining a project with an incremental effect that is not "cumulatively considerable," the lead agency need not consider that effect significant, but shall briefly describe its basis for concluding that the incremental effect is not cumulatively considerable."

Vegetation requirements in accordance with Title 23, Section 131(c) states, "Vegetation must not interfere with the integrity of the adopted plan of flood control, or interfere with maintenance, inspection, and flood fight procedures."

The accumulation and establishment of woody vegetation that is not managed has a negative impact on channel capacity and increases the potential for levee over-topping and flooding. When a channel develops vegetation that then becomes habitat for wildlife, maintenance to initial baseline conditions becomes more difficult, as the removal of vegetative growth is subject to federal and state agency requirements for on-site mitigation within the floodway.

Hydraulic impacts – Hydraulic impacts due to encroachments could impede flows, reroute flood flows, and/or increase sediment accumulation. The Draft EIR should include mitigation measures for channel and levee improvements and maintenance to prevent and/or reduce hydraulic impacts. Off-site mitigation outside of the State Plan of Flood Control should be used when mitigating for vegetation removed within the project location.

The permit application and Title 23 CCR can be found on the Central Valley Flood Protection Board's website at <http://www.cvfpb.ca.gov/>. Contact your local, federal and state agencies, as other permits may apply.

Should you have any further questions, please contact me by phone at (916) 574-0651, or via email at jherota@water.ca.gov.

Sincerely,

James Herota

COMMENTS TO DRAFT ENVIRONMENTAL IMPACT REPORT, CORDOVA HILLS PROJECT, SACRAMENTO COUNTY

Pursuant to the State Clearinghouse's 9 January 2012 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Draft Environmental Impact Report* for the Cordova Hills Project, located in Sacramento County (Proposed Project).

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

Hydrology and water quality are discussed in Chapter 11.

1. Regulatory Setting

Basin Plan:

The Water Quality Control Plan (Basin Plan) is not described in Chapter 11 (Hydrology and Water Quality). The Basin Plan is briefly referenced on page 15-11 in Chapter 15 (Public Utilities).

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

California Environmental Protection Agency

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues.

For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:

http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/.

The Draft Environmental Impact Report should provide an expanded discussion on the Proposed Project's consistency with the Basin Plan, in terms of protecting surface and ground water quality in, and downstream of, the Proposed Project area.

Statement of Policy With Respect to Maintaining High Quality of Waters in California (State Water Board Resolution 68-16):

State Water Board Resolution 68-16 is briefly described in Chapter 15 (Public Utilities) on page 15-12.

A key policy of California's water quality program is the State's Antidegradation Policy. This policy, formally known as the *Statement of Policy with Respect to Maintaining High Quality Waters in California* (State Water Board Resolution No. 68-16), restricts degradation of surface and ground waters. In particular, this policy protects water bodies where existing quality is higher than necessary for the protection of beneficial uses. Under the Antidegradation Policy, any actions that can adversely affect water quality in all surface and ground waters must:

1. meet Waste Discharge Requirements which will result in the best practicable treatment or control of the discharge necessary to assure that a pollution or nuisance will not occur and the highest water quality consistent with maximum benefit to the people of the State will be maintained;
2. not unreasonably affect present and anticipated beneficial use of the water; and
3. not result in water quality less than that prescribed in water quality plans and policies.

Furthermore, any actions that can adversely affect surface waters are also subject to the Federal Antidegradation Policy (40 CFR Section 131.12) developed under the Clean Water Act.

For more information on this policy, please visit our website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/1968/rs68_016.pdf.

The Draft Environmental Impact Report should provide an expanded discussion on the Proposed Project's consistency with the State Board Resolution No. 68-16, in terms of protecting surface and ground water quality in the Proposed Project area.

Clean Water Act 303(d) Listed for Impaired Water Bodies

The Clean Water Act 303(d) List for impaired water bodies is discussed briefly in Chapter 11 (Hydrology and Water Quality), including pages 11-8, 11-10, 11-13, 11-14, and 11-26.

Please use the 2010 Clean Water Act 303(d) list for impaired water bodies, which can be located at

http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml

The Final Environmental Impact Report should provide a comprehensive list of all water bodies located within, and downstream of, the Proposed Project area which are included on the 2010 Clean Water Act 303(d) list for impaired water bodies, and the constituent(s) or parameter(s) each water body or water body segment is listed for.

If Total Maximum Daily Load (TMDL) and implementation plan is under development or completed for any receiving water body or water body segment listed on the Clean Water Act 303(d) list, the Draft Environmental Impact Report should include an expanded discussion on the Proposed Project's compliance with that TMDL and implementation plan.

2. Permitting Requirements

Construction Storm Water General Permit

The Construction Storm Water General Permit is briefly referenced in Chapter 11 (Hydrology and Water Quality) on page 11-9.

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm

Water Pollution Prevention Plan (SWPPP).

For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

The Final Environmental Impact Report should provide an expanded discussion on the Proposed Project's compliance with this permit, including, but not limited to, the development of a SWPPP.

Municipal Separate Storm Sewer System (MS4) Permit

The MS4 permit is briefly referenced in Chapter 11 (Hydrology and Water Quality) on pages 11-3, 11-4, and 11-9. References to hydromodification and low impact development are made in Chapter 11 (Hydrology and Water Quality) and Chapter 15 (Public Utilities), among others.

The federal Clean Water Act makes municipalities responsible for regulating and managing the quality of storm water runoff throughout their jurisdictions, since municipalities own and operate the storm drain pipes and drainage channels that collect runoff prior to its discharge into creeks, rivers, and other water bodies. Under the Clean Water Act, storm water discharges are regulated through National Pollutant Discharge Elimination System (NPDES) storm water permits.

In California, the State Water Board and its nine Regional Water Boards have been authorized by the USEPA to oversee implementation of the Clean Water Act. The Central Valley Water Board issues and enforces NPDES municipal storm water permits in the Sacramento area. As such, the County of Sacramento and the cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova are subject to the Sacramento area wide NPDES Municipal Storm Water Permit (NPDES No. CAS082597; Order NO. R5-2008-0142) (Storm Water Permit). This Storm Water Permit, originally issued in 1990, was re-issued by the Central Valley Water Board in September 2008, covering the period November 2008 –September 2013. The Storm Water Permit (Provision A) states:

1. Discharges from MS4s in a manner causing, or threatening to cause, a condition of pollution, contamination, or nuisance as defined in § 13050 of the California Water Code are prohibited.
2. Discharges from MS4s which cause or contribute to exceedances of receiving water quality standards and water quality objectives (designated beneficial uses of the Basin Plan and water quality objectives developed to protect beneficial uses) for surface water or ground water are prohibited.
3. Discharges from MS4s containing pollutants that have not been reduced to the maximum extent practicable (MEP) are prohibited.

In addition, the Storm Water Permit contains specific requirements related to:

- Reporting and other project management functions
- Reducing specific target pollutants
- Monitoring and conducting special studies
- Reducing storm water impacts from new development projects, construction projects, municipal operations and commercial/industrial businesses
- Conducting public outreach and watershed stewardship
- Preventing illicit discharges
- Assessing program effectiveness

The current Storm Water Permit differs from the prior one in several notable ways:

- Many of the requirements are more general (less prescriptive) than in the prior permit.
- The permit includes requirements pertaining to protecting creeks from erosion and other harm caused by increased runoff volume and flow rate (i.e., hydromodification) due to new development and redevelopment.
- It requires a modest amount of additional monitoring (in addition to the existing extensive monitoring program) to learn more about discharges of pyrethroid insecticides and mercury, which are impairing water quality in various local waterways. The data could lead to new understanding on how to control these pollutants and eventually to additional requirements amended to the Storm Water Permit.

Storm Water Quality Improvement Plan (SQIP)

Another component of the Storm Water Permit is the implementation of the SQIP. The SQIP describes the storm water pollution prevention efforts to be implemented either jointly or individually by the County of Sacramento and the Cities of Sacramento, Citrus Heights, Elk Grove, Folsom, Galt and Rancho Cordova. Those agencies, collectively referred to as the Sacramento Storm Water Quality Partnership (Partnership), developed the SQIP to protect local waterways and fulfill regulatory requirements. The SQIP outlines Partnership priorities and activities planned for the 2008-2013 permit term. It also includes background information to provide readers with an understanding of the environmental and regulatory context as well as the Partnership's past accomplishments. The SQIP, adopted on 29 January 2010, supersedes and replaces all previous management plans developed for the Partnership, including the 1994 Comprehensive Storm Water Management Plan, the 1995 Effectiveness Evaluation Plan, the July 2003 SQIPs and their amendments, and the draft 2007 SQIPs.

The overall goals of the SQIP, as identified in the Storm Water Permit, are to: a) reduce the degradation of waters of the State and waters of the United States by urban runoff and protect their beneficial uses; and b) develop and implement an effective SQIP that

is well understood and broadly supported by regional stakeholders. The core objectives of the SQIP are to:

- Identify and control those pollutants in urban runoff that pose significant threats to the waters of the State and waters of the United States and their beneficial uses;
- Comply with the federal regulations to eliminate or control, to the MEP, the discharge of pollutants from urban runoff associated with the storm drain system;
- Achieve compliance with water quality standards;
- Develop a cost-effective program which focuses on pollution prevention of urban storm water;
- Seek cost-effective alternative solutions where prevention is not a practical solution for a significant problem; and
- Coordinate implementation of control measures with other agencies.

As it relates to the Storm Water Permit, the SQIP proposes compliance activities to be conducted during the five-year term of the Storm Water Permit, and as specified, the SQIP is considered part of the permit and is enforceable as such.

For more information on the MS4 Permit the Proposed Project applies to, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

The Final Environmental Impact Report should provide an expanded discussion on the Proposed Project's compliance with the MS4 Permit held by Sacramento County, including, but not limited to, the implementation of specific Low Impact Development measures throughout the Proposed Project area and a post-construction hydromodification strategy.

Clean Water Act Section 401 Permit – Water Quality Certification

Water Quality Certifications issued under Section 401 of the Clean Water Act are briefly described under Chapter 6 (Biological Resources) on page 6-8.

If an United States Army Corps of Engineers (USACOE) permit, or any other federal permit, is required for the Proposed Project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification(s) must be obtained from the Central Valley Water Board prior to initiation of Proposed Project activities.

The Final Environmental Impact Report should clarify that (a) there are no waivers for Clean Water Act Section 401 Water Quality Certifications in the State of California; (b) a Clean Water Act Section 401 Water Quality Certification serves as both a certification, in part or in whole, of a federal permit, under Section 401 of the Clean Water Act, and as a Waste Discharge Requirement under the Porter-Cologne Water Quality Control Act; and (c) under Section 401 of the Clean Water Act, the State of California can review and approve, condition, or deny all federal permits that may result in a discharge to waters of the State, including wetlands.

The Central Valley Water Board does not issue Individual 401 Water Quality Certifications and/or Waste Discharge Requirements for Proposed Projects that are not in final design.

Required items for a complete Clean Water Act Section 401 Water Quality Certification application are based on Sections 3836 and 3856 of Title 23 of the California Code of Regulations.

Should one federal permit be issued for the all future individual projects, the Central Valley Water Board may opt to incrementally certify the federal permit according to the project proponent's demonstration of readiness-to-proceed with specific project phases. Should this occur, a sequence of 401 Water Quality Certifications and/or Waste Discharge Requirements may be issued in 5-year increments as specific project phases are ready-to-proceed and implemented.

Please clarify in the Final Environmental Impact Report whether the Project Proponent will be seeking one Water Quality Certification for the Proposed Project based on this environmental document, or a series of Water Quality Certifications for future tiered environmental documents.

Compensatory Mitigation

Mitigation Measure BR-1 should be amended to include a discussion on the Central Valley Water Board's compensatory mitigation requirements. The Central Valley Water Board may require compensatory mitigation for impacts to waters of the State. Compensatory mitigation must comply with the State of California's 1993 Wetlands Conservation Policy, which ensures no overall net loss of wetlands for impacts to waters of the State.

If conservation easements are implemented as part of the compensatory mitigation strategy, the recorded executed conservation easement shall be consistent with California Civil Code Sections 815-816.

Waste Discharge Requirements

If USACOE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the Proposed Project area, the Proposed Project will require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control

Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation.

In the case a Water Quality Certification(s) is issued for the Proposed Project, the Water Quality Certification(s) would serve as to certify the federal permit(s) and as a Waste Discharge Requirement under Porter-Cologne Water Quality Control Act.

For more information on the Water Quality Certification and WDR processes, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

3. General

Definition of "Waters of the State"

Page 6-11 Chapter 6 (Biological) of the Draft Environmental Impact Report references "waters of the State" under the discussion of the Porter-Cologne Water Quality Control Act.

The Final Environmental Impact Report should clarify the definition of "waters of the State", as related to "waters of the United States." "Waters of the State" are defined more broadly than "waters of the United States." According to California Water Code Section 13050(e), means "any surface water or groundwater, including saline waters, within the boundaries of the state", and includes all waters within the state's boundaries, whether public or private, including waters in both natural and artificial channels.

"Waters of the State" includes all "waters of the United States", including all federally jurisdictional and non-federally jurisdictional waters, whether hydrologically isolated or not, and territorial seas.

This definition is relevant and central to any action taken by the Central Valley Water Board on the Proposed Project and should be incorporated within the Final Environmental Impact Report accordingly.

Please clarify throughout the Final Environmental Impact Report, including, but not limited to, the discussion provided on page 6-11, in preface to any discussion regarding waters of the United States or federal jurisdictional waters, the definition of "waters of the State." All tables, figures, maps, discussions, and references to "waters of the United States" should be revised to "waters of the State and waters of the United States" throughout the entire Final Environmental Impact Report.

Aerojet Facility Site

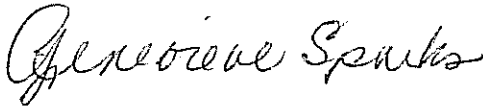

Pages 10-4 through 10-5 and 10-14 of Chapter 10 (Hazardous Materials) provides a discussion on the Aerojet site, as related to the Proposed Project.

The description of the Aerojet site provided on these pages contains numerous errors and does not provide an adequate description of the Aerojet Site. The Central Valley Water Board has the following clarifications:

- On page 10-4 the authors provide a description of the Aerojet facility and discuss underground tanks sites and associated contamination associated with the tanks sites. The tank sites provide an infinitesimal portion of the soil and groundwater contamination at the 8500-acre facility. Rocket manufacturing and testing and chemical manufacturing have led to extensive soil and groundwater contamination, with the groundwater plumes extending over 25 square miles. In fact there are over 350 potential source areas being investigated on the Aerojet Superfund site. Contamination includes solvents, components of liquid and solid rocket fuels, and chemical manufacturing residuals. Investigation of the contamination commenced in the late 1970's.
- On page 10-14, the writer mistakenly talks about both the Inactive Rancho Cordova Test Site (IRCTS) and the Aerojet Superfund site as a single site. In fact, they are two distinct sites. The Aerojet Superfund Site currently comprises the 8500 acre site bounded roughly by US50, the Folsom South Canal, White Rock Road and Prairie City Road, plus Area 39 (portions of the State Highway Off-Road Vehicle Park), Area 40 (area east of Prairie City Road) and the former Cavitt Ranch (400 acres on Scott Road, east of Area 40). This site has significant soil and groundwater pollution and is being investigated and cleaned under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The IRCTS is 4000 acres south of White Rock Road, north of Douglas Road, east of Sunrise and extends about halfway to Grant Line Road. The IRCTS is being investigated and cleaned up under the State hazardous waste site cleanup program.
- On the IRCTS rocket-testing activities have ceased and the site is being cleaned up. The site will be developed as the Rio Del Oro project by Elliot Homes and Aerojet Real Estate. The groundwater pollution at the site and it is migrating to the west and southwest, away from the project site.
- The main groundwater pollution in the area is coming from the Superfund site and consists primarily of volatile organics such as trichloroethylene, perchlorate and n-nitrosodimethylamine. There are several different groundwater plumes associated with the Aerojet site. The main one of concern to this project is the plume emanating from the liquid rocket test-area on the far east side of Aerojet, west of Prairie City Road. This plume is heading south and bit west, and extends as far south as the southern edge of the Teichert processing facility on Grant Line Road. The southern edge of the plume is approximately 1.7 miles north of the project site and moving in the direction of the project. Aerojet is undertaking remedial actions to control the leading edge of the plume, but those actions are not yet complete. Failure of containment will allow the plume to continue to migrate to south and west. There is an additional groundwater plume associated with Area 39, but are in shallow groundwater and not moving very much.

- Not all of the cleanup sites in the vicinity of the project have been included in this section. There is another cleanup site just north of White Rock Road and west of Grant Line Road as is called the White Rock Road North Dump. The contaminants of concern in the groundwater plume are volatile organics and perchlorate. The plume associated with this project extends as far south as the Aerojet plume described above and is on the west side of Grant Line Road.
- Aerojet has had a groundwater extraction and treatment system program operating since 1982, not 2002. The 2002 date is associated with Aerojet's Western Groundwater Operable Unit and the commencement of remediation of that Operable Unit.

Re: Cordova Hills Environmental Impact Report

Dear Mr. Hudson,

The City of Rancho Cordova is submitting the following comments on the Cordova Hills EIR focusing on two primary areas of concern, municipal services and traffic mitigation. The Cordova Hills project is uniquely situated at the eastern boundary of our city and will rely heavily on City infrastructure and services. We anticipate some level of mutual impacts across jurisdictional boundaries from various development projects within the City and the County, but this project is extremely dependent on Rancho Cordova's urban investments. There are virtually no County services and very limited infrastructure in the Cordova Hills area. While the City generally supports the proposed development, these concerns must be addressed within the EIR prior to certification of the environmental document by the County Board of Supervisors.

Municipal Services

Given Cordova Hills is far removed from other developed unincorporated areas that receive County services, there will be significant additional time and costs of trying to provide quality, timely services to the new development if services to the area are provided by existing County municipal service providers. Adjacent and neighboring service providers, by comparison, could provide more effective and efficient municipal services to Cordova Hills.

With government facing financial challenges into the future, it is critical that the most cost effective and efficient way to provide municipal services to new development be utilized. One such way would be to have Cordova Hills services be provided by the adjacent and neighboring service providers. Another option would be the formation of an additional government organization, such as a community services district (CSD). However this option seems duplicative and inefficient as it would require the additional expenses of its own board, manager, legal, human resources, finance, technology, and other costs for what would remain a small district.

The EIR should consider whether it is feasible for the County to provide all infrastructure and services needed to support the Cordova Hills project and whether providing services to the project in this manner has the potential to adversely affect the City of Rancho Cordova's infrastructure capacities and municipal services.

Traffic Mitigation

The City is in agreement that the majority of the project's off site trips will rely on roadways, transit facilities and bikeways that are within City of Rancho Cordova's jurisdictional boundary. As such, we are concerned about reasonable contributions to the development of our transportation facilities from the Cordova Hills development.

The Cordova Hills EIR identifies mitigation requirements within the City limits and indicates the project's intent to fairly participate in the development of the City's transportation infrastructure. However, we remain concerned that the alternatives analyzed in the traffic study do not adequately represent the actual timing and phasing of infrastructure development.

It is likely that most of the physical transportation improvements identified in the existing plus project scenario will be built once the Cordova Hills development begins to trigger these requirements. We agree that the mitigation trigger should be associated with level of service (LOS) standards, but feel that Rancho Cordova developments or other County projects, such as the Teichert and Stoneridge quarries, will have already triggered many of these requirements. As a result Cordova Hills will rely upon, and benefit from investments by other developing properties. This concern is also evident in the cumulative plus project scenario. The limited number of required improvements in the cumulative scenario is the consequence of very large infrastructure investments provided by other projects. The EIR should include mitigation measures that ensure the Cordova Hills project will pay its fair share of traffic improvements needed to mitigate impacts.

In reality, the expansion and development of new roadways east of Sunrise Boulevard will not resemble either of these two theoretical EIR scenarios. The result of relying on these scenarios is that the EIR does not identify any mitigation requirements on Chrysanthy Boulevard, Americanos Boulevard, Sunrise Boulevard, White Rock Road, or Rancho Cordova Parkway, even though the trip distribution diagrams for Cordova Hills indicate that significant trips will be added to these roadways. Cordova Hills takes advantage of the excess capacity on these roadways that will be created by the City's extensive Capital Improvement Program, yet it does not identify adequate fair share contributions toward these improvements. That means there will be less roadway capacity available for the intended beneficiaries of the City's Capital Improvement Program - future projects within the City. The EIR should include mitigation to address impacts from project trips on these roadways.

I would like to reiterate that the City is not opposed to the proposed Cordova Hills Development. However, the project must mitigate impacts to transportation infrastructure within the limits of the City of Rancho Cordova, and the County must provide an effective strategy to manage municipal services so that the Rancho Cordova is not burdened with additional costs for service.

We appreciate the opportunity to comment on this project and look forward to additional dialogue regarding these concerns.

Sincerely,

Ted A. Gaebler, City manager

SUBJECT: Comments on the Draft Environmental Impact Report for Cordova Hills (Control Number: 2008-GPB-SDP-ZOB-AHP-00142)

Dear Ms. Hack:

The Elk Grove Unified School District (EGUSD) appreciates the opportunity to review and comment on the Draft Environmental Impact Report (EIR) for Cordova Hills. EGUSD requests that the following comment be considered and included in the Final Environmental Impact Report (EIR).

- **Page 1-35, Last paragraph** – EGUSD requests the paragraph entitled “Schools” be reworded as follows:

The Project includes three areas designated as elementary school sites (two of which are approximately ten acres each and one of which is **7 – 10** acres in size, and one area designated as a **middle/high** school (approximately 78 acres). Cordova Hills is within the Elk Grove Unified School District.

EGUSD requests the stated size of the “Town Center” elementary school site be changed from 6 acres to a range of 7 – 10 acres; because, six acres will not be large enough, and a range will allow some flexibility as the plan moves forward. Even with multi-story buildings, providing a complete school program requires a minimum of eight acres. A smaller site may be feasible dependent upon the availability of certain school facilities. For example, a minimum number of parking spaces are required, some of which could possibly be located in adjacent parking facilities. Likewise, required play field areas might be shared on the adjacent park property, if an appropriate joint use agreement is in place.

If you have any questions, please feel free to contact me at wheinick@egusd.net or (916) 686-7711.

Sincerely,

William Heinicke
Director of Planning

**Re: Cordova Hills Draft Environmental Impact Report,
Control Number 2008-GPB-SDP-ZOB-AHP-00142**

Dear Ms. Hack:

These comments are submitted on behalf of the Environmental Council of Sacramento (ECOS) on the Cordova Hills Draft Environmental Impact Report (DEIR), dated 9 January 2012. ECOS is a coalition of environmental and civic organizations with a combined membership of more than 12,000 citizens throughout the Sacramento Region. Our mission is to achieve regional and community sustainability and a healthy environment for existing and future residents.

ECOS was quite dismayed that this DEIR was proceeding without an accompanying EIS, as is typically the situation. We believe there may well be a considerable disparity between these two required documents and that it is highly probable that the EIS may require substantial changes to the Project. It is therefore inappropriate for these two documents to proceed independently.

ECOS remains unequivocally opposed to the Cordova Hills project given the lack of foreseeable demand and lack of demonstrated economic feasibility. We are also opposed to the project due to its negative impacts on biological resources, air quality, climate change and the sustainability of the Sacramento region. We will attempt however to limit our comments here to the adequacy of the draft environmental impact report with respect to land use and growth inducement, transportation, biological resources and climate change.

LAND USE AND GROWTH INDUCEMENT

The primary justification for the original acceptance of this application by the Board of Supervisors was that it would bring the sought after asset of a university to Sacramento. The university initially interested is no longer interested and the likelihood of finding another university, particularly a self-contained university of the type described, is highly unlikely. The Sacramento Council of Governments (SACOG) in its letter to the project proponent dated October 7, 2011 (Attachment 1), states, *"Finding, financing and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region. Many of the short trips*

and multimodal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all."

The entire environmental analysis is based on the university as an integral part of the Project. Without the university, the Project is inconsistent with numerous additional General Plan policies, particularly the growth management criteria. Consistency with the growth management criteria is a requirement for the Project to be considered for approval. The project proponents are themselves now saying that it is more likely that a combination campus complex would locate here. This type of complex would be made up of a number of educational institutions, with different specialties, locating here and perhaps sharing some facilities. This would much more likely be a commuter college, rather than a self-contained university as currently proposed and analyzed in this document. Given the very remote potential for a university of the type proposed, this document should have also analyzed the project without the university. This would be necessary for the document to be totally adequate and complete.

The phasing of the Project as illustrated in Plate PD-16 is also totally unrealistic. By allowing significant commercial and residential development to occur prior to development of the university, the analysis of impacts in this document is totally compromised. Given the very speculative nature of the university, a "what if" scenario needs to be included which addresses the impacts of the Project without the university. Additionally, **a mitigation measure should be included that requires that 25% of the university complex be completed prior to more than 10 commercial units being issued building permits and 200 residential units being issued building permits for the remainder of the project.**

The document states that *in terms of internal community design, the Project appears to be an excellent example of "smart growth" development...., it must also be acknowledged that the Project conflicts with the principles with respect to preservation of open space and proximity to existing developed communities.* How can a project be considered "smart growth" development when it conflicts with some of the major foundation principles of "smart growth", contiguous development and open space preservation? Also, the remaining "smart growth" aspects of the project would be seriously compromised if a university is not constructed early in the project development, or at all.

The DEIR states that the Project is inconsistent with LU-1 related to growth inducement, but that a General Plan Amendment is included to address this conflict. This General Plan Amendment adds Policy LU-XX to the General Plan. This policy allows for limited public water service beyond the Urban Policy Area/Urban Services Boundary for the 251 acres located with the landfill buffer. What about sewer service? Are all the permitted facilities going to rely on porta-potties? The document goes on to say that this policy is specifically intended to avoid growth-inducing impacts but contains no explanation as to how the policy will actually do that. It does avoid the conflict with the original policy, but it does not avoid growth inducing impacts. By avoiding conflict with the original policy in this instance, it opens the door for future policies LU-XXX and LU-XXXX. As acknowledged in the document, the action of adopting this General Plan Amendment would set a precedent and encourage future amendments and further growth inducement. The Amendment cannot therefore be justified.

If the Amendment is to be approved, the uses and development standards proposed for this area are far too general. A Use Permit should be required for any development in this area to ensure it is appropriate and does not result in additional growth inducement. This should be considered as an additional mitigation measure.

Aside from this General Plan Amendment, the project, in and of itself, will have a significant impact on growth inducement as indicated in the Growth Inducing Impacts Section of the DEIR. Yet, no mitigation is proposed. We believe that feasible mitigation is available, and if not

applied, project applications to the north and south will soon appear. Perhaps more importantly, the Project is proposed immediately adjacent to the Urban Services Boundary (USB). Building up to the USB without providing mitigation for growth inducement beyond the USB is unacceptable. While the applicant has indicated to ECOS the intention to put restrictions on the property east of the project, we can find no reference to this important mitigation in the document.

Interestingly, the Summary of Impacts indicates that growth inducing impacts are less than significant, while the Growth Inducing Impacts Section indicates they are significant. Obviously the Summary of Impacts determination of less than significant needs to be corrected and as required by the California Environmental Quality Act (CEQA), feasible mitigation for growth inducing impacts applied.

The DEIR identifies the project to be in conflict with the Blueprint, the MTP/SCS and the State Implementation Plan, as well as some General Plan policies. ECOS believes that this document underestimates the seriousness of these conflicts. The health and sustainability of the entire region are jeopardized as a result of these conflicts.

TRANSPORTATION

The transportation analysis is seriously flawed because it does not base its significance determinations on the project without university scenario. As noted above, the university component is not realistic, and without it, many of the project characteristics that would have helped to reduce transportation and other impacts are not likely to occur.

Two specific examples of how including the university in the transportation analysis results in flawed impact analyses are 1) unrealistically high non-automobile mode share, and 2) improper trip internalization reduction. First, the DEIR states that a whopping 43 percent of the total university trips that stay within Cordova Hills will use non-automotive modes (DEIR, 16-38). For comparison, the rest of Cordova Hills is expected to have a non-automotive mode share of only 11 percent. Without a university campus with substantial on-campus housing, the project would result in a much higher automotive mode share, and this must be analyzed. Second, the DEIR claims that 36 percent of all vehicle trips will have their origin and destination within the project. Table TC-14 shows how internal trips are used in the traffic analysis to reduce the total vehicle trip rates. For example, single family dwelling units are expected to generate 9.4 trip ends per day, but after adjusting for the internal trips, the rate is reduced to only 7.2 trips per day. It is improper to apply this internalization factor because it is highly dependent on the university. These impacts must be analyzed, and all significance determinations must be based on these more realistic worst-case impacts. Failure to do so could result in unidentified significant impacts, as well as impacts that are more significant than shown in the DEIR.

The proposed limited transit service is not adequate to substantially reduce transportation, air quality, and climate change impacts. The Transit Analysis section of the DEIR (p. 16-81) claims that the project meets transit demand. However, nowhere does the DEIR disclose what the demand actually is. The only specific reference to transit demand is in tables 16 and 30 of the Traffic Impact Study in Appendix TR-1. However, transit demand is aggregated with bicycle and pedestrian demand, so it is impossible to determine if the proposed service actually meets transit demand, or if other options would provide better service. For example, Sacramento Regional Transit (RT) has no current plans to provide service in the area, which is easy to understand since there are no residents in the area now. Why didn't the EIR evaluate the potential for RT or another public transit provider to provide service? Many transit studies show that the need to transfer between services is a common reason that people chose to drive instead of taking transit. Would the proposed transit service require purchase of a transit ticket (for either Cordova Hills residents or the public in general)? Would people who work in Cordova

Hills but live elsewhere be required to purchase a ticket? Would students of elementary or high schools be able to use transit to get to and from school? It is important to note that the proposed service is very limited, with 15 minute headways only during peak commute periods on weekdays. In fact, much of the proposed service is only half hour or hourly headways, which is not sufficient to encourage substantial transit ridership. At a minimum, the DEIR must disclose what the specific transit demand projection is, the ridership assumptions relative to maximum capacity, and the amount of projected demand that can be satisfied by the proposed service. In addition, it is important that transit service is provided as soon as residents occupy the project and establish transportation routines. Therefore, the DEIR should include a mitigation measure that transit service becomes operational no later than completion of the first 200 residential units.

BIOLOGICAL RESOURCES

Environmental Setting

Consultations with the California Native Plant Society biologist Glen Holstein Phd have raised concerns as to the accuracy of the opening statement that: “The dominant vegetation is non-native grassland comprised of ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), barley (*Hordeum* species), and ryegrass (*Lolium multiflorum*).” His understanding of the literature, and his personal site visits in the past, suggest that this California prairie ecosystem is dominated by the native species *Holcarpa virgata*, which is not a grass (Holstein 2001). This DEIR needs to substantially support its conclusions with evidence (CEQA 15064(f)(5)). Dr. Holstein further pointed out the omission of Sacramento General Plan policy CO-135, to protect the ecological integrity of California Prairie habitat, in those policies listed in 6-3 to 6-6. The plan preparers need to include all relevant information and policies in order to meet a good faith effort standard for informing the public and decision makers about the true nature of the environmental impacts to be considered (CEQA 15003(i) and 15151). The development of the California prairie habitat in the project area would clearly violate CO-135.

Wetlands and Surface Waters

An important discussion and consideration of the particular vernal pools to be lost is missing from this environmental document. These vernal pool resources are some of the very finest remaining examples of their type within the USB. This project is not merely impacting vernal pool resources, it is impacting some of the very highest quality pools and potentially threatening their connectivity to other vernal pool resources. The Recovery Plan for Vernal Ecosystems of California and Southern Oregon, prepared by the United States Fish and Wildlife Service, clearly identifies Cordova Hills as being within one of its highest priority core areas and as such is integral to attaining the goals set out in the recovery plan. This description of the particular significance of these pools needs to be included in the EIR in order for it to meet its good faith effort standard for informing the public and decision makers about the true nature of the environmental impacts to be considered (CEQA 15003(i) and 15151).

Given the extreme biological value of these vernal pool resources and their associated uplands, it is not made clear what the overall and cumulative impact of their removal will be. Consultations with USFWS and the Army Corps and compliance with the requirements of their permits are presented as mitigations, but no effort is made to address the question of the impact of removal of these pools, and further isolating those to be avoided, from the totality of the conservation effort in the Mather Core Recovery Area. It is

clear that the impact is great based on the effect this project and several others have had on the SSHCP and the creation of viable preserves in the Mather Core Recovery Area. The Plan has been stuck over this

very issue and these very resources. As part of a good faith effort, there needs to be a discussion of the significance of these vernal pool resources in terms of the process of creating viable preserves within the USB that have adequate size, to minimize edge effect, and connectivity, as well as a discussion of the problems this project has posed for the completion of the SSHCP (CEQA 15003(i) and 15151). 33% of the vernal pool resources in this project area are slated for destruction.

As well, there remain serious concerns as to the connectivity of these vernal pool resources to potential vernal pool reserves to the west of Grant Line Road. The formation of these resources west of Grant Line road into a preserve is as of yet unresolved, but flexibility must be retained within the Cordova Hills plan to allow for such connectivity if the preserve materializes, or both vernal pool complexes will be further isolated and have diminished viability. A good faith effort necessitates discussion of this issue (CEQA 15003(i) and 15151).

Special Status Species

The biological resource section misuses the CNDDDB throughout by assuming that the data base is a record of absence (i.e. by assuming that if a species does not show up in the CNDDDB, then it's not there). The CNDDDB has a clear disclaimer for users on this point. This constitutes a bad faith effort (CEQA 15003(i) and 15151).

The abuse of the CNDDDB leads to bizarre results such as the conclusion that, for example, there are no recorded incidences of Ferruginous Hawk within 5 miles of the project area, and no Golden Eagles or Northern Harriers within 10 miles, and so moderate potential for occurrences were provided for them despite the fact that suitable foraging habitat is available and despite the fact that the CNDDDB is notoriously incomplete and often only has incidence listing for nesting birds. The Grasshopper sparrow and Loggerhead Shrike are also given a moderate potential for occurrence even though suitable habitat is available and there are recorded incidences within five miles, the definition of high potential for occurrence provided in this EIR. There is no mention whatsoever of the Rough Legged Hawk that is a likely forager in this project area. American Badgers are listed as having low potential for occurrence despite the recorded incidence within 2.5 miles of the project area and the availability of suitable habitat for this species which has a large home range.

Consultations with Glen Holstein Phd indicated some plant deficiencies as well. Tuolumne Button-celery (*Eryngium pinnatisectum*) is listed as "Not Present" despite the fact that it is known to occur in vernal pools and in Sacramento County (Tibor 2001), and as such its potential to occur at Cordova Hills is at least moderate and probably is high. Furthermore, five rare vernal pool annual plants Dwarf Downingia, Bogg's Lake Hedge Hyssop, Ahart's Dwarf Rush, Pincushion Navarretia, and Slender Orcutt Grass are listed as not present at Cordova Hills because plant surveys didn't find them. Such vernal pool annuals may not appear every year, however, even though they are present as seeds undetectable by standard plant surveys (Holland & Jain 1981). One such California annual, although not a vernal pool species, apparently survived exclusively as seeds for 102 years. Long thought extinct, it was rediscovered when its seeds finally germinated (McCune 2005). Many other examples of such rediscoveries are known in California although the duration of their presumed extinction is usually not a century long (Tibor 2001). In all such cases soil profiles have remained intact so seeds could germinate when conditions were favorable. There is at least some potential that any or all of the five rare vernal pool annuals not found by Cordova Hills plant surveys may exist there as seeds. As long as the site's natural soil conditions are intact they might reappear at any time. The project's proposal to destroy 33% of the site's vernal pools significantly diminishes this possibility.

CLIMATE CHANGE

Analysis is Flawed

1. CalEEMod is the most appropriate and current modeling tool suitable for measuring greenhouse gas (GHG) emissions from a project. Please use CalEEMod and eliminate patchwork analysis.
2. AQMP-2; SMAQMD 29: The Cordova Hills Master Plan requires all buildings to be constructed to at least 20 percent above 2008 Title 24 standards.

This GHG reduction measure is specious and meaningless for any project permitted after 2015, and nearly useless for projects built between 2012 and 2015. Title 24 is updated every three years and is intended to become approximately 15 percent more stringent for each three year cycle.

To remedy this deficiency, please revise the measure as follows:

At the time of building permit issuance, buildings will be designed to be at least 20% more efficient than Title 24 requirements in force at the time of building permit issuance. Construction must start within one year of receiving building permit and construction is to be completed within two years of receiving building permit, or the Title 24 compliance demonstration must be revised relative to the updated requirements.

3. AQMP-2; SMAQMD 33: The TMA is speculative and cannot be counted on for the 5 points. It is difficult to understand whether the proposed transit system is economically justifiable without reviewing the proposed financial plan in parallel with the EIR. AQMP-2; SMAQMD 33 was too general and ECOS could find no specifics elsewhere in the EIR.
 - Will the transit system collapse due to inadequate funding?
 - Will parcels go unsold due to high cost of fees to fund transit?
 - What is guaranteed minimum level of service?
 - What is the definition of a peak-time period?
 - What are the proposed contribution rates for commercial and residential properties?
 - i. How do these compare with other user-financed transit systems?
4. AQMP-2; SMAQMD-99B: The entropy of the Cordova Hills project is low (LUT-3 from CAPCOA Quantification of GHG Measures); this is not a well-mixed project as compared to an urban setting; there are clearly high- medium and low density housing areas with off-site commercial. It is unclear how a 25.32% VMT reduction can be claimed relative to BAU. The DKS analysis claimed approximately 15% VMT reduction and additional CAPCOA measures claimed 10.5% additional VMT reduction. Although AQMP indicates that double counting was not done, it is hard to believe that the interactions between all modeled and estimated measures could achieve a combined 25.32% VMT reduction.
5. AQMP-2; SMAQMD-99B: Table C identifies business as usual conditions and has been replicated as Attachment 2. ECOS has derived proposed project conditions using data on page 8 of AQ-2 and presented in the same format as Table C. There are several notable comments when comparing the 2 tables:
 - a. It is unclear how the 8,006 dwelling units, 7,140 K-12 students in this table relate to the 2.54 people per rented dwelling unit and 2.71 people per owned dwelling unit mesh. ECOS has adjusted conversion factors to try and achieve 25,419 residential population. What are the differences in populations?

- b. It is unclear how the 1,583 employees in Table C relate to the 6,548 employees from Table 3.
 - c. VMT between BAU and proposed drops 12.7% from 239 million mi/yr to 209 million mi/yr; Table D, page 8 indicates that the proposed VMT is 199 million miles
 - i. Why is there a 10 million mile difference? (209 vs. 199)
 - d. VMT/capita per day drops from 29 under BAU conditions (Attachment 1) to 26 under proposed project (Attachment 3), both are high numbers and will make SACOG's effort to meet 2020 and 2035 goals difficult
 - i. ECOS understands that attempting to assist SACOG in meeting their GHG reduction goals is voluntary, but the high VMT per capita calls into question the need for building such a large project on the urban fringe
 - e. The student population stands out as a tremendous VMT and GHG reduction measure, yet the University is a very speculative venture
 - i. Recommend splitting University students into those living on-campus vs. those living off-campus to highlight the VMT differences
6. AQMP-2; SMAQMD-99B: Since the proposed development of a University has become a very speculative item and because the on-campus student population skews VMT and GHG emissions to a very low per capita level, ECOS believes that the GHG analysis is flawed. The analysis must either include:
- a. a complete analysis of what the project would consist of without a University that meets or exceeds Sacramento County suite of thresholds adopted 11/3/11 or
 - b. a mitigation measure that does not allow construction of Cordova Hills to start until a University with a built out population of 6,000 with an on-campus population that is at least 67% shows good faith that it intends to occupy the space. Good faith might consist of [\$147¹] million in escrow that is forfeited to the SMAQMD for climate mitigation if a mutually agreed to timeline is not achieved. Timeline developed is to include input from public.
 - i. 100% commuter type Universities will NOT be consistent with analysis that indicates 67% of students live on-campus and is not a viable option
 - ii. This mitigation measure must be included in AQMP-2.
7. CC-1 below is not acceptable as worded. The 5.80 efficiency metric includes the contribution of a very low per capita University component- say 3.8 or so. The wording of CC-1 could allow the 6,000 person, GHG efficient University to be replaced by a 6,000 person GHG average tenant thus increasing the overall emissions of the project tremendously.
- CC-1.** The following text shall be added to the Cordova Hills SPA: All amendments to the SPA shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on greenhouse gas emissions. The Amendment shall not increase greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles).
8. Cordova Hills proponents indicated at a meeting with ECOS on 2/16/12 that a University will be built at the site or that the land will be surrendered to the County at expiration of 30-year agreement. This is deferred mitigation which has been disallowed by the courts (*Communities for A Better Environment v. Richmond* (2010) 184 Cal.App.4th 70. (CBE).). Liquidated damages (LD) must begin flowing to the SMAQMD Indirect Source program (or other responsible agency) by 2017 if no University with significant on-campus population has not been committed to. Timelines and LD amounts need to be developed with public input.

¹ 147,000 MT/yr*\$20/MT*50years = \$147 million

Mitigation Does Not Include All Feasible Measures

1. ECOS could find nothing in chapters 7, 11, 15 or AQMP-2 on water, sewer, or storm drain efficiency measures that might be employed by the project to reduce loads on off-site water, sewer or storm drain infrastructure and thus also reduce effects on climate change.

Water, sewer, and storm drain infrastructure is very expensive per unit. As an example, the high cost of the regional sewage treatment plant upgrade to tertiary status has been in the papers over the last 2 years. The proposed high sewer hook-up fees and hefty monthly rate increases that correspond to the need for capital cost recovery on the sewer plant upgrade are very costly on a unit basis and existing customers are blanching at the proposals. See http://ecosacramento.net/ClimateChange/?page_id=784 for more information.

In many cases efficiency improvements at the loads (in this case Cordova Hills (CH)) can be achieved at a lower unit cost than upgrading infrastructure.

Because of the disconnect between the economics of supply and demand of commodities (water, sewer and storm), please evaluate above-and-beyond-code water, sewer and storm drain efficiency measures such as:

- gray water
- local scalping plants: (i.e. small plants that take sewage and treat it to recycled water standards and distribute locally)
 - with recycled water to serve non-potable needs
- low-impact storm water management
- water efficiency in new development (would above and beyond Green Code Tier 2 water efficiency measures be cost effective?)
- exemplary effort to keep storm water out of sanitary sewer system

By NOT including water, sewer and storm drain efficiency improvement measures in the project design that are similar to the unit cost of infrastructure, the project is unknowingly forcing utility providers to pass along unnecessary costs to existing ratepayers in the form of unnecessary infrastructure. The ratepayers of the County cannot keep being tapped for higher monthly fees when lower unit cost alternatives such as on-site efficiency can be employed to societies (i.e. rate payers) advantage.

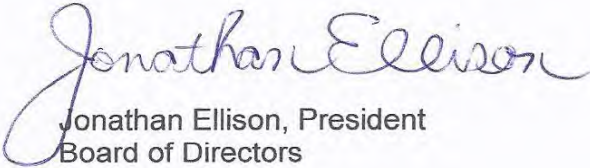

CONCLUSION

As referenced in the preceding sections, this document is deficient in numerous areas. The most basic flaw is associated with the project description, which includes a 6,000 student self-contained university that is unlikely to ever materialize, at least in the form described, making the project description totally unrealistic. By including this hypothetical university the entire analysis is biased, does not represent the project, and therefore is flawed. In order for this document to be accurate and complete, the project needs to be analyzed without the university.

Additionally, we do not believe the necessary findings and statements of overriding considerations can be defensibly made to approve this project. There is no substantial evidence in the record that a self-contained 6,000 student university will ever exist at this location. Given these considerations, the DEIR should be redrafted and recirculated for public review.

If you have any questions regarding these comments please contact Ron Maertz ronmaertz@surewest.net for land use, Sean Wirth wirthsoscrales@yahoo.com for biological resources, Keith Roberts keithroberts@aol.com for climate change or Peter Christensen ecospeter@me.com for transportation.

Yours very truly,

Jonathan Ellison, President
Board of Directors

Dear Mr. Alvarado:

We appreciated the opportunity to meet with you again last week to discuss the Cordova Hills project. As we discussed, SACOG has received several letters regarding Cordova Hills—we have identified four letters since 2007. In each case, the letters either followed up on, or resulted in, a meeting between SACOG and members of the Cordova Hills project team. SACOG staff, and I personally, also have had numerous other meetings and telephone calls with the Cordova Hills project team over the last few years. As I think you have acknowledged, SACOG has been willing to meet and discuss the project on all occasions. As a consequence, until last week we did not believe that there were any outstanding requests for information, meetings, or written responses. In fact, as discussed below, based on our conversation in August 2010, I believed that you understood and accepted SACOG's decision not to include Cordova Hills in the three Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) alternatives that were going to be vetted in the public workshop process last fall. In light of the foregoing, I am sending this letter only in response to your specific request last week that we put in writing the issues we have discussed in our many meetings. The letter provides a brief summary of the main questions and concerns we have raised about the suitability of including Cordova Hills in this MTP/SCS update cycle.

I will first say that in our many conversations about Cordova Hills we have noted several elements of the evolving land use plan and transportation system that we thought were consistent with SACOG's priorities, and we have made suggestions for refinements to the plan. The plan in its current form contains many elements that are consistent with principles we encourage our members and members of the development community to follow. We were particularly pleased to learn recently that you intend your project to be consistent with the smart growth criteria in the County draft updated General Plan. Notwithstanding the positive elements in the current plan, for over a year we have indicated that we did not believe Cordova Hills, at this juncture, would meet the criteria for inclusion in the current update to the Metropolitan Transportation Plan, which will for the first time include a Sustainability Communities Strategy that implements SB 375, a new state law.

In June 2010, SACOG published a memorandum titled "Method for Developing MTP Update Growth Projections" to help our members and stakeholders understand the federal and state rules, and SACOG priorities when developing the land use component of the MTP/SCS. Rather than repeat the examples of market and regulatory/policy issues that we address through this process, I am reattaching the memorandum for your information and reference.

Many in the development community who read this memorandum indicated that they better understood how we do our best to take into account all of the relevant market and regulatory/policy considerations that together drive the estimate of the likely future growth pattern for the planning period (2035 in this case). Many developers specifically acknowledged the limitations SACOG had including their project in this plan update, but wanted to work with us to develop a clear process for adding more lands to the plan in future updates. As mentioned above, you told me on August 10, 2010, after reading this memorandum that you could not argue with SACOG's decision not to include Cordova Hills in the three alternatives that were going to be vetted in the public workshop process that fall, but instead would work with us and hope to be included in the next update four years hence. Last week you stated that you would not have told me that had you understood the relevance of that decision to the SCS. Although we have tried to be clear about the integral connection between this MTP update and the SCS (a point that is made throughout the memorandum), I understand that SB 375 is a new law and that we are all climbing a learning curve as we implement it for the first time. For that reason, we have tried to make it very clear in our print materials and in the verbal presentations used in dozens of public focus groups and workshops, as well as at regular briefings with our Board and Committees over the last two years, how integrally connected the MTP and SCS would be.

The 2035 MTP/SCS is based on a growth forecast that projects a need to build approximately 300,000 new housing units in the six-county region by 2035. This forecast is lower than the one underpinning the current MTP by 145,000 housing units. This means that SACOG must find that many units to *subtract from* the projected growth pattern in the currently adopted MTP. This is a unique situation in this particular plan cycle, and it creates a very high bar for new projects to be added in this update that are not in the current MTP. The approximately 300,000 new housing units preliminarily identified to be included in the updated plan are located within developing communities, established communities, and centers and corridors. These communities have a planned capacity for approximately 500,000 units, which is nearly 70% of capacity beyond the projected 300,000 units of construction by 2035.

We consider a wide range of variables in trying to answer, to the best of our ability, the straightforward question: At this time, does it appear that Cordova Hills is more likely to be constructed during the 2035 planning horizon than the 300,000 plus units of housing projected to be built in our current draft—but also should it be preferred over the more than 150,000 housing units of additional capacity in other greenfield projects in various stages of planning around the region that also are not included in our draft plan documents? Many of these 150,000 other housing units not presently in the draft plan are in developments that have been included in locally adopted plans for some time, and some have either no, or relatively minor, outstanding federal permit issues.

Beyond the regional market demand and supply issue, the key questions and concerns specific to Cordova Hills that we have raised many times with you are briefly repeated below.

- **Federal Permits.** Both the U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service have jurisdiction on these lands through the Clean Water Act and Endangered Species Act. When asked to characterize the likelihood of securing the necessary federal permits under these two laws, Cordova Hills responded "it's going to be a war." While

that was obviously not to be taken literally, it unfortunately accurately foreshadowed the level of concern those two agencies have about this project. It also partially explains why, when the Blueprint map was adopted by the SACOG Board in December 2004, Sacramento County requested that a significant portion of the Cordova Hills site remaining as open or natural space. Moreover, while the County is working hard on the South Sacramento Habitat Conservation Plan (SSHCP), that document is not completed. One of the primary remaining outstanding issues relates to whether, and how, its resource conservation needs can be met for the Cordova Hills property given the current development plan. SACOG is a strong supporter of the SSHCP and we very much hope that it reaches a successful conclusion soon. However, recent conversations with the federal agencies confirm that there are substantial unresolved issues on the Cordova Hills site, especially that portion showing a planned 900,000 square foot commercial center fronting Grant Line Road and located in the heart of what the federal agencies consider to be a valuable vernal pool complex. The timing of the construction of Cordova Hills will remain in considerable doubt until these federal issues are resolved.

- **Commercial Center and Economic Viability.** While many aspects of the current land use plan have evolved and are now focused on building a self-contained and self-sustaining community (i.e., on-site housing substantially targeted at university students, staff, and faculty, and a series of paths to promote walking, biking, and the use of neighborhood electric vehicles for travel within the site), the large commercial center stands out as the exception. Project representatives repeatedly have said that it is sized and located not only to serve the needs of on-site residents, but a larger regional market, and have acknowledged that this will create longer distance car trips to the site. We have repeatedly raised questions about the market feasibility of a 900,000 square foot regional shopping center at that location, citing our studies showing that the region has an over 70-year supply of retail zoning now, including many other projects in the same general area that are also planning large quantities of retail. Cordova Hills consistently has told us that Cordova Hills is not economically viable without a large, regional shopping center. It has further indicated that because a large, regional shopping center on that site must have direct access to Grant Line Road it cannot be relocated to eliminate or reduce the impacts on the natural resources that the federal agencies are concerned about. Consequently, the retail center design and location creates a kind of double-bind for the project's feasibility. Our data lead us to be skeptical that the needed market demand to serve it will materialize. And it seems far from certain at this time that the project will be able to secure the needed federal permits soon, as long as the location and scale of the shopping center remain unchanged. We have suggested that a shopping center downsized to focus just on the needs of the project's residents would have both a smaller footprint and would not need to be located on Grant Line Road, in the middle of the natural resources. Cordova Hills has consistently maintained that those changes would render the project economically unviable. At the moment, it is not clear how the hard trade-offs related to the retail center are going to be successfully resolved to the mutual satisfaction of all the relevant parties.

- **University.** The planned university is a key component of this project, of course. It would be a wonderful asset to the County and region were it to be built. It is one of the few large-scale, new employers that can realistically create a relatively self-contained community, if planned and designed well. Our concerns about the university have nothing to do with its benefits, but rather, again, the current prospects for its construction given the growth forecast during the planning horizon. Finding, financing, and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region. Unfortunately, the planned institution, the University of Sacramento, recently withdrew their involvement in the project. We are aware that you are actively soliciting a replacement institution, but that you have not been able to secure a new commitment yet. Many of the short and multi-modal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all. Cordova Hills indicated in a recent discussion that if Sacramento County approves an entitlement for the project it very likely will attach a condition requiring the construction of the university before other substantial construction can occur. However, the uncertainty over whether a commitment from a 6,000 student, private university will be secured any time soon is another reason for us to conclude that, for this MTP/SCS update cycle, Cordova Hills does not meet the requirements we must follow to project a land use pattern that represents the most likely to be constructed for the region.

Given all of the above, SACOG staff has concluded, and continues to believe, that adding Cordova Hills to the MTP/SCS at this time is not justified, and that it would create risks for the timely adoption of the MTP/SCS and certification of the related EIR. I know you also understand that, since Cordova Hills was not included in the alternatives analysis, adding the project now would add several months, at a minimum, to our adoption process, with new public input, technical analysis, etc. required. It is important to emphasize, however, that most of the considerations listed here relate to practical obstacles that affect the suitability of including Cordova Hills in this plan update cycle. We certainly wish Cordova Hills the best in its worthy endeavor to secure a private university, and that it will be able to resolve the financial, transportation, and natural resources issues associated with the shopping center element of the land plan. Sacramento County appears headed towards adopting a new Growth Management Element to their General Plan, which will provide tighter linkage between projects approved according to their smart growth criteria and future MTPs/SCSs. As you know, we have supported the approach the Board of Supervisors tentatively approved last month—in particular, the important variables related to passenger vehicle greenhouse gas emissions and vehicle miles traveled that are so innovatively and effectively addressed through the smart growth criteria in the County draft plan. However, notwithstanding that support, federal and state law requires that the MTP/SCS be consistent with SACOG's regional forecast and its most reasonable estimate of what is likely to be built. We look forward to continuing our constructive discussions and reconsidering this proposal as it evolves and as our future plan updates include capacity for more years of growth, and presumably higher estimates for needed housing capacity in the region.

With regard to that final point, I want to reemphasize with you a portion of our discussion from last week. First, while I think we understand the general nature your concerns about including Cordova Hills in the MTP/SCS, you know that we do not agree with your conclusions about the

consequences of that determination. SB 375 was intended to create CEQA incentives for projects consistent with the MTP/SCS. We understand that Cordova Hills does not intend to avail itself of those benefits. Under those circumstances, SB 375 expressly states that the SCS does not regulate the use of land, does not supersede the exercise of local land use authority, and does not require a local government's land use policies and regulations, including its general plan, to be consistent with the MTP/SCS. Second, and perhaps most importantly, notwithstanding our strong commitment to facts and science, SACOG recognizes the limitations on our forecasting and modeling—we cannot predict market and regulatory forces with absolute certainty over a 20-year plus period. For this reason, the regular four-year updates of the plan are important. For the same reason, we understand that consistency with the MTP/SCS is not the only question regarding any project. Over the last decade, the region has embraced a Blueprint for growth in the region to 2050. We recognize that there are many projects consistent with that vision that, for a multitude and variety of reasons, will not be included in this MTP/SCS. Again, thank you for your time and we look forward to assisting you in the future.

Sincerely,

Mike McKeever
Chief Executive Officer

Comments of the Friends of the Swainson's Hawk, Inc. on the Draft Environmental Impact Report for Cordova Hills (Control Number 208-GPB-SDP-ZOB-AHP-00142)

Dear Ms Hack:

FOSH is a volunteer group providing grassroots advocacy for wildlife and habitat in the Central Valley. We, along with others, have major concerns about the pending Application to County of Sacramento to develop 2,669 acres along Grant Line Road east of Rancho Cordova. We concur in the comments already submitted by the Environmental Council of Sacramento and the California Native Plant Society.

The EIR determines that the Project will require 2,231 acres of mitigation to compensate for the loss of Swainson's hawk foraging habitat, using the County's mitigation program, another mitigation plan acceptable to CDFG, or the South Sacramento County Habitat Conservation Plan, if it has been approved. The other 438 acres of project area are avoided areas that the EIR claims will retain their foraging value after the project is completed. We have a number of concerns with the analysis and the mitigation measures as presented in the DEIR.

These comments will focus on the Swainson's Hawk impact analysis and mitigation. However, we also have concerns about the environmental impacts of the timing and location of development approvals in Sacramento County for which the necessary infrastructure has not been assured.

We completely agree with the EIR's determination that all of the land within the project area is Swainson's Hawk foraging habitat and that the appropriate mitigation ratio for this area would be 1:1 for loss of foraging habitat.

Improper Reliance on CNDDDB.

The EIR relies on CNDDDB to identify species presence. CNDDDB records are poorly maintained, out of date, and are therefore not complete and often underestimate species presence and recent nesting behavior.

CNDDDB is not intended to provide definitive data for purposes of CEQA review of a project.

The CNDDDB webpage says:

“...we cannot and do not portray the CNDDDB as an exhaustive and comprehensive inventory of all rare species and natural communities statewide. Field verification for the presence or absence of sensitive species will always be an important obligation of our customers.” (http://www.dfg.ca.gov/biogeodata/cnddb/cnddb_info.asp)

CNDDDB is a first stop for biological assessment, indicating where likely rare plants and animals may be found. When assessing Swainson's Hawk impacts, DERA should consult directly with CDFG to determine how well the area has been surveyed in the past, and include all data available at CDFG, not just what is reported in the CNDDDB.

In the attached email from CDFG's CNDDDB manager, Brian Acord, dated September 15, 2011, more information is provided about the backlog in updating the database with nesting site information. Mr. Acord notes: "...we currently have 418 unprocessed source documents for Swainson's hawk in the state." He also notes that these records could be nests, perched or flying birds.

In the case of Swainson's Hawk records, the County had access to recent, high quality data commissioned by the Cities of Elk Grove and Rancho Cordova as well as the Department of Fish and Game. Much of this data had been incorporated into the planning for the South Sacramento County Habitat Conservation Plan and is represented on maps we are submitting with our comments.

The DEIR Ignores Important Available Biological Data on the Swainson's Hawk

The EIR is deficient in identifying the location of nesting Swainson's Hawks in relationship to the project site. Nor has it made a good faith effort to survey the site for Swainson's Hawk nesting territories.

Attached you will find several maps of Swainson's Hawk nesting sites. The map titled "Range of the Swainson's Hawk in the SSHCP Plan Area" was produced by the South Sacramento County Habitat Conservation Plan staff and shows nesting territories known to the County through the CNDDDB, and the surveys conducted for the Cities of Elk Grove and Rancho Cordova by Estep Biological Consulting. Measuring distances using the legend of distances on the Map, the Map shows at least three active SWH nests within one mile of the Project site, and many nesting territories within five and ten miles of the Project site.

We also include Figure 10 of Estep Environmental Consulting, 2006. The distribution, abundance, and habitat associations of Swainson's Hawk (*Buteo swainsoni*) in the City of Rancho Cordova Planning Area. (Prepared for the City of Rancho Cordova, CA.) This map confirms the siting documented in the SSHCP map.

We also attach a map prepared for FOSH by a volunteer which places the project site on the SSCHCP map and places circles around the nearest nesting territories on the map. The attached map shows yellow and purple dots representing known nesting territories identified by County of Sacramento SSCHCP staff in preparation of the attached map "Range of Swainson's Hawk in the SSHCP Plan Area." These include recent surveys done by Cities of Elk Grove and Rancho Cordova. Nesting sites close to the project are indicated with colored circles showing one (orange), two (yellow) and three (blue) mile radii circles around each nest site. Our map indicates that there are two known nesting sites quite close (within a mile) to the northwest corner of the project area, one within a mile of the southwest project boundary, one within a mile of the southeast project boundary and several others within 1 to 3 miles of the project.

These documents amply demonstrate that the EIR is deficient in identifying known nesting territories proximate to the project site and therefore the likely intensity of use of the site for foraging habitat as well as the likelihood of nesting activity within the project area.

The poor Biological Assessment in the EIR does not give public and decision-makers a reasonably accurate picture of the impact of the project on Swainson's Hawks and other raptors.

Potential direct and cumulative impacts on the species range and reproductive activity should be identified, including but not limited to the following:

- a) potential impacts on reproductive activity in nesting sites and nesting success within two miles
- b) potential impacts on reproductive activity and nesting success of other nesting sites within 2 - 5 miles;
- c) cumulative impacts due to urbanization of foraging lands already permitted by the Cities of Rancho Cordova and Elk Grove and the County of Sacramento.
- d) potential impacts on survivability of fledged juveniles from these nesting sites as well as potential impacts on the adequacy of nourishment of SWH needed to provide the strength and energy required to survive the annual SWH Fall migration. (Undernourished birds, especially undernourished first-year birds, are unlikely to survive the rigors of long-distance migration to central Mexico and southward)
- e) the potential for the project to "take" Swainson's Hawks, thus necessitating an incidental take permit from the Department of Fish and Game.

What are the risks of take from the project and how will the project mitigate these risks of take to less than significant?

Measures to Reduce Take Are Inadequate

The EIR mitigation measure to reduce take is unnecessarily vague and defers mitigation to an unknown future time. CEQA does not permit deferred mitigation. DERA should have standard language from DFG on these measures. In this case DERA did not set any minimum standard to meet the "mitigation below a level of significance" standard required of the lead agency. Instead, it defers the required mitigation on to DFG at some future time. We recommend the following language:

In order to avoid take of nesting raptors (including Swainson's hawks), a pre-construction raptor nest survey shall be conducted within 15 days prior to the beginning of construction activities by a California Department of Fish and Game (CDFG) approved biologist in order to identify active nests in the project site vicinity. The results of the survey shall be submitted to CDFG. If active nests are found, a quarter-mile (1320 feet) initial temporary nest disturbance buffer shall be established. If project related activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an on-site biologist/monitor experienced with raptor behavior shall be retained by the project proponent to monitor the nest, and shall along with the project proponent, consult with the CDFG to determine the best course of action necessary to avoid nest abandonment or take of individuals. Work may be allowed to proceed within the temporary nest disturbance buffer if raptors are not exhibiting agitated behavior such as defensive flights at intruders, getting up from a brooding position, or flying off the nest. The designated on-site biologist/monitor shall be on-site daily if necessary while construction related activities are taking place and shall have the authority to stop work if raptors are exhibiting agitated behavior. In consultation with the CDFG and depending on the behavior of the raptors, over time it may be determined that the on-site biologist/monitor may no longer be necessary due to the raptors' acclimation to construction related activities.

The Presumption That Avoided Areas Are Deemed to Remain Foraging Habitat is Unsupported by Substantial Evidence; County Should Seek DFG Guidance

We have reviewed the DEIR discussion of avoided areas and the analysis of whether the avoided areas retain their foraging habitat value. The EIR concludes that 438 acres of the avoided area will not lose its Swainson's Hawk foraging habitat value.

This conclusion is unsupported. Review of the Project map shows that the large contiguous 298 acres of avoided area is largely surrounded by intensive urban development, with the exceptions of two corridors at the northern and southern ends opening onto adjacent undeveloped areas (grassland). Portions of the avoided area within the project site are quite narrow. Normally,

raptors are reluctant to forage on lands adjacent to, or surrounded by, intensive urban uses. For that reason, it appears that a large portion of the 298-acre avoided area within the project would seldom or never be used by SWH.

The DEIR states that two multi-purpose trails will be constructed through the primary avoidance area, and roads will also cross the avoidance area. These impacts will further reduce the SWH foraging value of the avoidance area

CDFG should be asked to make a determination of the amount of the avoided area that would be significantly impacted by adjacent intensive urban development, and accordingly recalculate the SWH habitat that would remain usable by SWH in the avoided areas within the project at build-out of the planned urban development. There is no evidence that such analysis has been done in the preparation of the draft EIR.

There is no evidence that the adjacent undeveloped areas connected to the planned avoided areas will remain undeveloped in perpetuity or that they will forever be managed in a manner which does not compromise or eliminate SWH foraging value. The fact that some the adjacent undeveloped area is outside the Urban Service Boundary does not mean that the adjacent undeveloped area will forever remain outside the USB. The County has already initiated a process to expand the Urban Service Boundary in Natomas Basin, and nothing prevents the County from expanding the Urban Service Boundary beyond Cordova Hills in the future. Nothing prevents the County from rezoning the adjacent undeveloped areas to small-parcel agricultural-residential uses outside the Urban Service Boundary.

Please explain how the avoided area will be managed to retain Swainson's Hawk foraging habitat? Currently, cattle grazing prevents dense overgrowth of weeds that impede SWH foraging access. Will cattle grazing be continued?

What measure will be taken to minimize the “edge effect” of adjacent intensive urban development on SWH foraging habitat in the avoided areas? What will be the vegetative cover?

Experience with open spaces next to other development projects has shown that unless human access is controlled – and enforced - the avoided areas will very likely be used by residents for bicycling (both on-trail and uncontrolled off-trail), running of dogs, kite flying, jogging, and other recreational activities.

How will human or canine (dogs) access be allowed or controlled?

Will there be bicycle or pedestrian trails within the avoided area in addition to the two trails mentioned in the DEIR?

What entity will be responsible for managing the avoided areas, and how will it be funded?

How will the existing undeveloped condition of adjacent lands connected to the “avoided area” be ensured in perpetuity?

Mitigation Measure BR-4 is inadequate because it incorrectly assumes that 438 acres of Swainson’s Hawk foraging habitat in the project area will retain all its foraging value after project development and because it assumes that a conservation easement on 36 acres on the eastern and southeastern sides of the project area can mitigate for loss of 36 acres within the project area. There is no evidence that California Department of Fish and Game concurs with this measure as mitigating the project impacts to less than significant.

Project creates detrimental effects of prematurely committing more land to urbanization than can be absorbed.

There is a good likelihood that approval of the Cordova Hills would result in the premature commitment of more land to urbanization than can be absorbed. The fact that water and other urban services are not guaranteed for the project further complicates the potential environmental impacts of premature approvals for urbanization. The EIR must analyze and disclose the environmental impacts of such a scenario.

Sacramento County staff, in response to proposals to greatly expand the County Urban Policy Area in its General Plan Update, addressed that issue in a staff report which recommended against the oversized expansion of the County Urban Policy Area. The County staff listed potential undesirable outcomes as follows:

1. Leapfrog development pressure;
2. Imbalance in focus between revitalizing the existing mature communities creating and serving new neighborhoods;
3. Unintended consequences to the partially built-out planned communities and if newer areas out-compete for buyers;
4. Inefficient extension of infrastructure and public services resulting in higher operating costs.
5. Pressure to approve uses that provide near term economic benefits to the developer over a long-term economically sustainable mix of land uses;
6. Impacts to the proposed SSCHCP and to the Connector expressway;
7. Difficulty in meeting State mandates related to climate change initiatives.

A copy of the Sacramento County County's Staff Report (Agenda for 10/13/10, 2030 General Plan Update: Adoption Hearings) with relevant pages 6 - 11, is attached.

The EIR needs to consider the likelihood of occurrence of each of these potential scenarios and the potential environmental consequences, including the physical effects of potential urban decay that may result from prematurely committing more land to urbanization than can be absorbed.

CEQA requires that the EIR describe the environmental effects of potential urban decay that could result from urban development that could foreseeably result from approval of the SOI.

CEQA requires an EIR to disclose and analyze the potential environmental effects of potential urban decay that could result from approval of a project. See *Bakersfield citizens for Local Control v City of Bakersfield* (2004) 124 Cal. App. 4th 1184, 1204-1213. *Bakersfield Citizens*, and other cases cited therein, dealt with potential urban decay that could result from permitting of a major new shopping center where project approval would foreseeably create oversupply of retail capacity beyond market demand, potentially leading to the closure of other retail outlets in the area, resulting urban decay that may have physical effects on the environment. The “shopping center” situation of *Bakersfield Citizens* and the cases cited therein is very analogous to the effects of approving Cordova Hills in a region which is suffering from the detrimental effects of a huge oversupply of vacant housing and retail. The Sacramento region is nationally recognized as a foreclosure “hot spot” with thousands of new or foreclosed homes remaining unsold on the market.

Current real estate sales are often at prices which are less than the cost of new construction. The construction of yet more homes and commercial property on a market suffering from gross oversupply could lead to urban decay and the accompanying physical environmental effects of urban decay, existing homes remain unsold and deteriorate, or are purchased as rentals by absentee landlords who may neglect maintenance and appearance. Local municipal revenues have drastically declined already due to the collapse of home and retail values, leading to major reductions in the staff and budgets of those agencies charged with maintaining parks, sanitation, drainage, and other functions which physically affect the environment.

Won't the approval of the proposed Cordova Hills development compete with existing development and invariably worsen the market for housing and retail activity within the existing urban area, increase the current housing and retail vacancy amount within the existing urban area, and potentially cause yet more urban decay.

Please keep us informed regarding the availability of a recirculated DEIR, or FEIR, future public review of the proposed application, and public hearings. Thank you for this opportunity to comment.

PROJECT DESCRIPTION

Overview

This project proposes adoption of an updated General Plan for the County of Sacramento. The existing General Plan was adopted in 1993 and is approaching the end of its 2010 timeframe. The proposed General Plan will guide growth within the County through the year 2030. Elements with major updates include:

- Land Use Element and Land Use Diagram, including major changes to growth management strategies and a proposal to expand the Urban Policy Area;
- Circulation Element and Transportation Plan, a major rewrite to focus on overall mobility and creation of a multi-modal transportation system;
- Conservation Element, comprehensive update to reflect current regulatory environment and local initiatives including the South Sacramento Habitat Conservation Plan;
- Open Space Element, including new Open Space Vision diagram and policy changes;
- Agricultural Element, including support for agri-tourism and protect important farmland;
- Human Services Element, including support for closer integration with the land use planning process;
- Noise Element, revised to address current noise environment;
- Economic Development Element, a new element; and
- Delta Protection Element, created as a new element from an existing policy document.

Several new growth areas are being considered, including: an area West of Watt Avenue in the North Highlands community plan area; the Jackson Highway Corridor, north and south of Jackson Highway in the Rancho Cordova and Vineyard community plan areas; and the Grant Line East area which is east of the City of Rancho Cordova in the Cosumnes community plan area. The Land Use Element also includes a new Commercial Corridor strategy to revitalize a number of key corridors with strategic improvements and additional development.

four corridor planning areas, well in advance of the General Plan adoption. This program recognizes that in many ways, development within existing urban areas is more difficult than development within new growth areas, partly because of the lack of a coordinated master developer. In addition, parcels may be of odd configurations and difficult to develop within existing zoning requirements, infrastructure may be outdated and undersized, and existing communities may resist change, particularly within established residential neighborhoods. Projects in new growth areas have their own sets of challenges, but because initial land costs are likely lower and comprise much larger quantities of developable land, costs can be easier to allocate. Consequently, excessive capacity in new growth areas is likely to draw development away from the more challenging revitalization project areas and infill sites.

3. *Unintended consequences to the partially built-out planned communities if newer areas out-compete for new buyers*

Three planned communities exist in the Vineyard area, located south of the Jackson Highway Area: Vineyard Springs (generally built-out), North Vineyard Station (approved but with extensive remaining capacity), and Florin-Vineyard Gap (approval pending). Attention should be paid to ensuring that a reasonable pace of buildout is occurring in these master planned communities. While an extremely fast pace of buildout can cause "growth pains", an excessively slow pace can be equally problematic. Essential infrastructure (roads, transit) and amenities (parks, schools) rely on development fees. Opening up competing large tracts of land in amounts well above forecasted demand could result those areas "out-competing" development in Vineyard. Not only would there be a delay in building necessary infrastructure, services and amenities, there may also be a change to the character of the planned community to respond to changing market conditions. If these planned communities are unable to compete due to oversaturation of the market, the quality of these communities may be compromised.

4. *Inefficient extension of infrastructure and public services resulting in higher development fees and/or operating costs*

1. Provision of Infrastructure and Public/Municipal Services: Sacramento County is the municipal services provider to the unincorporated area. As such, the County should address effective and efficient provision of services and associated infrastructure to both existing and new development when exercising its land use authority. This is particularly pertinent when making decisions regarding new growth areas, as how and when they develop can impact (positively or negatively) the County's ability to provide excellent municipal services to these areas. For instance, due to economies of scale, costs of providing such services are generally lower in denser areas that are close to urban centers (Burchell and Mukherji, 2003)¹. In contrast, in the outlying metropolitan area, dispersed development patterns can inflate the costs of new infrastructure by 20 to 40 percent, some of which may be subsidized by local government (HOK, 2005, p. 2). In addition, interim infrastructure and facilities may be necessary if development occurs before and/or inconsistent with planned infrastructure improvements. The resulting higher cost of these

¹ Burchell and Mukherji, (2003), Auckland Regional Growth Forum, 1999.

sustainable mix of land uses (i.e. "complete communities") to ensure that revenue generated by development are sufficient to support necessary municipal services.

6. *Impacts to the South Sacramento Habitat Conservation Plan and the Capital Southeast Connector*

There are two key County-wide efforts currently underway that may affect or be affected by development in the Grant Line East area and in the Jackson Highway area east of Excelsior Road: the \$800 million Capital Southeast Connector (Connector) project and the South Sacramento Habitat Conservation Plan (SSHCP). High-level, multi-jurisdictional discussions are currently underway for both; initiating master planning efforts in these areas before these projects are finalized could affect or be affected by the outcome of these projects.

The SSHCP will require a habitat corridor connecting preserves at Mather to the Sacramento Valley Conservancy area and out to the Cosumnes River. The exact location and extent of this connection is currently unknown but will be defined as part of the ongoing negotiations related to the SSHCP. Additionally, the ultimate alignment and character of the Connector facility has yet to be finalized. Key issues related to the Connector are still being explored, such as location, general access to the facility, spacing between intersections, and the need for grade-separated vs. at-grade intersections. Projects proposing to take access from Grant Line Road (such as those in the Grant Line East area) could influence the alignment or performance of the Connector facility. Approval of projects, especially those proposing development near and/or with direct access to Grant Line Road, could be impacted by noise from traffic along the Connector and complicate efforts to limit access points along the corridor.

Decisions regarding timing of planning and development in any adopted new growth area should ensure that these two important projects reach fruition and can be successfully implemented. As adoption of the SSHCP is not anticipated until 2011 and the timing of the Connector project still unknown, the County should carefully analyze the relationship between the proposed new growth areas and these important projects so as to not impact these critical County-wide efforts.

7. *Difficulty in meeting recent State mandates related to climate change initiatives*

1. AB 32: Executive Order S-3-05 was signed by Governor Schwarzenegger in June 2005. It established emission reduction targets for the state: reduce greenhouse gas (GHG) emissions to 2000 levels by 2010, to 1990 levels by 2020 and to 80% below 1990 levels by 2050. In September 2006, the Governor signed Assembly Bill (AB) 32 which requires California GHG emissions be reduced to 1990 levels by the year 2020, just like Executive Order S-3-05. However, AB 32 is a comprehensive bill that requires the California Air Resources Board (CARB) to adopt regulations requiring the reporting and verification of statewide greenhouse gas emissions, and establishes a schedule of action measures. AB 32 also requires that a list of emission reduction strategies be published to achieve emissions reduction goals.

In October 2008, CARB published its Scoping Plan to describe what local governments and others must do to comply with AB 32. The document recognized that local

As noted in the attached flier (Attachment E), SB 375 requires each Metropolitan Planning Organization (MPO) to include a "Sustainable Communities Strategy" (akin to SACOG's Blueprint) in the regional transportation plan (the MTP) that demonstrates how the region will meet its greenhouse gas emission targets. SB 375 requires that decisions relating to the allocation of transportation funding be consistent with the Sustainable Communities Strategy (SCS). It also provides CEQA streamlining incentives for projects that are consistent with the regional Sustainable Communities Strategy (or the Alternative Planning Strategy if one is required.)

Sacramento County benefits from the fact that SACOG has already prepared a Blueprint Vision for the region and has used the results in their MTP process. It is anticipated that the land use scenario used for the MTP (Attachment F) will likely be used to form the SCS as required by state law. Since SB 375 requires that decisions related to the allocation of transportation funding must be consistent with the Sustainable Communities Strategy (SCS), it is important to note that the County's General Plan as currently scoped is inconsistent with the land use assumptions used in the MTP and therefore may be inconsistent with the future SCS. Potential implications regarding this inconsistency are unknown at this time, although there may be consequences for the County related to transportation funding and ability to take advantage of CEQA streamlining incentives.

It is important to note that the current MTP (and any future MTP/SCS) is based on performance-based decision making. Since transportation funding is a limited resource and needed improvements are essentially limitless, the region must identify transportation improvements that will result in the largest benefit per dollar spent. As such, even if Sacramento County adopts all new growth identified in the Draft 2030 General Plan, there is no guarantee that these areas will be included in the future MTP/SCS if serving the area with an efficient and effective transportation system is found to be financially infeasible or if it is out-competed by other necessary improvements. For example, jurisdictions throughout the region have identified capacity for new growth that is not included in the current MTP. To ensure that the unincorporated County can compete for and efficiently use limited transportation funds, adoption of new growth areas (particularly those with little to no transportation infrastructure like the Grant Line East area) and the strategic planning and buildout of those area should be a key discussion point in the adoption hearings.

Potential Solutions

The Jackson and Grant Line East Visioning Studies touch upon the issue of growth management relative to the Jackson Highway and Grant Line East areas. The final staff report submitted for the studies include a description of the following potential approaches to growth management in these areas (Attachment G), including:

- A. Constrained land supply approach
- B. Project merit-based approach
- C. Proactive management approach
- D. Market-based approach

Dear Ms. Lamare,

Thank you for contacting me. I appreciate your passion for Swainson's hawks, and the willingness to be actively involved in their protection and preservation. Before I answer your questions I do have some good news. Yes, you are correct that our data in the California Natural Diversity Database is not as up to date as we would like it to be. We have limited resources to cover such as biologically diverse state as California. Fortunately we have received support and we will be updating our Swainson Hawk records in the near future, but realize this may take several months to complete.

"Can you tell me if it has been submitted, and if it has been added to the database?"

There is not currently a CNDDDB occurrence for Swainson's hawk in the area you described near Sutter's Landing Regional Park. Our raw source data is logged into our raw data database by 24k quadrangle and county for general location fields. The area you describe is on the Sacramento East quad. We have 4 unprocessed documents for this quad. 1 is a Sacramento Bee article referencing a nest near Sutter's Landing (title). It is unknown exactly where or what the other 3 documents may represent. See attachment.

"Can you also tell me how many Swainson's Hawk nest site reports have been submitted to you that have not been included in the Cnddb database?"

First, let me explain our free Quick Viewer:

http://imaps.dfg.ca.gov/viewers/cnnddb_quickviewer/app.asp. This free, online map querying tool allows people to answer similar questions to yours. The tool represented by the icon with an "i" in front of a file drawer will return a list of species that have unprocessed data for that quad. Likewise, the tool immediately to the right will return a list of

species that have unprocessed data for that county. What it won't tell you is how many unprocessed source documents there are.

Your question specifically asks about nest sites. This question can not be answered by looking at our raw data database. Some of these records may represent nest sites that will be mapped into the CNDDDB, but others may represent foraging or perched birds and may or may not be added to the database. Furthermore, some of the documents may represent multiple observations of a single nest, or may be data added to an existing CNDDDB occurrence. It is unknown what source records will be added to the database until they are critiqued and mapped. So, with that caveat in mind, we currently have 418 unprocessed source documents for Swainson's hawk in the state.

Sincerely,
Brian

Hi Brian:

I am writing to you because you are an expert on CNDDDB. We at FOSH - Friends of the Swainson's Hawk- try to be sure that nesting sites that we are aware of are turned into DFG to include in the CNDDDB. But we are aware that DFG's survey date and date from other researchers, such as Jim Estep's nest surveys of Rancho Cordova, Elk Grove, Natomas Basin, and South Sacramento County, are not included in the CNDDDB, though I believe they have been submitted.

We often review environmental documents and biological assessments that rely heavily on CNDDDB to identify the location of closest nesting Swainson's Hawks. We often comment on these documents in something like the following way:

Assessment. In terms of identifying the impacts on Swainson's Hawk nesting pairs, the biological assessment is inadequate. It apparently is based on outdated CNDDDB records rather than a direct consultation with CDFG or assessment using the recommended nesting survey protocol. CNDDDB records are poorly maintained, out of date, and are therefore not complete and often underestimate species presence.

LETTER 10

From: Kennedy, Donald [mailto:DLKn@pge.com]
Sent: Thursday, February 09, 2012 11:46 AM
To: DERA (Web Page)
Subject: Cordova Hills Project (Control Number: 2008-GPB-SDP-ZOB-AHP-00142)

Dear Sacramento County Environmental Coordinator,

Thank you for giving PG&E the opportunity to review and comment on the Notice of Availability for the Cordova Hills project (Control Number: 2008-GPB-SDP-ZOB-AHP-00142). PG&E has the following comments to offer.

PG&E operates and maintains a 115kV electric transmission tower line within the project boundaries. Land use is restricted around PG&E's facilities and within PG&E's easement area. To promote the safe and reliable maintenance and operation of utility facilities, the California Public Utilities Commission (CPUC) has mandated specific clearance requirements between utility facilities and surrounding objects or construction activities. One of PG&E's concerns is for continued access to its facilities with heavy equipment for maintenance and repair work. Another is for adequate ground clearance from the overhead electrical wires as set forth in California Public Utilities Commission General Order No. 95 for the proposed improvements. To ensure compliance with these standards, project proponents should coordinate with PG&E early in the development of their project plans. Any proposed development plans should provide for unrestricted utility access and prevent encroachments that might impair the safe and reliable maintenance and operation of PG&E's facilities.

The project proponent for the Cordova Hills project will need to work closely with PG&E in obtaining a "**No Objection**" letter for their project prior to any final approvals are granted by the County or prior to any construction activities taking place around PG&E's high voltage facilities. The project proponent shall work closely with PG&E to minimize potential impacts to existing utilities. Improvement plans should be sent to me at the address in my signature block below, and the plans should show the following information to be submitted for PG&E's review and approval:

PG&E's Easement Area in Relation to Project Area
 Tower Structures
 Wire Shots to determine Wire Heights should their be significant cuts or fills
 Grading Plans (Existing & Proposed)
 Landscape and Lighting Plan
 Any proposed crossings/encroachments within PG&E's Easement area

Any potential conflicts shall be identified as soon as possible because facility relocation's require long lead times and are not always feasible, the requesting party should be encouraged to consult with PG&E as early in their planning stages as possible. The requestor will be responsible for the costs associated with the relocation of PG&E electric transmission facilities to accommodate the proposed improvements.

Relocations of PG&E's electric transmission facilities (50,000 volts and above) could also require formal approval from the California Public Utilities Commission. If required, this approval process could take up to two years to complete. Proponents with development plans which could affect such electric transmission facilities should be referred to PG&E for additional information and assistance in the development of their project schedules.

There appears to be residential and road improvements within the vicinity of PG&E's tower line. Below are a few examples of restrictions within PG&E's Electric Transmission Line Easements, but shall not be limited to the following:

Buildings, Structures, and Wells are prohibited within PG&E's Easement area. This includes, but not limited to trash enclosures and block walls.

Any and all light fixtures located within PG&E's easement area shall not exceed a maximum height of 15 feet above grade, and shall be located a minimum horizontal clearance of 15 feet from the conductor's at rest.

No grading cuts or fills are allowed within PG&E's easement area without prior written approval from PG&E.

With regards to the placement and height of trees, within PG&E Electric Transmission Line Easement, the Project Proponent shall follow the standards as provided in Right-of-Way Diagram in the attached link (you may have to cut and paste the link): http://selectree.calpoly.edu/utilityTree_zones2.lasso. Any deviations from these standards shall be approved by PG&E's Vegetation Management Department.

There are restrictions when operating any equipment or tools in the proximity to the tower line. You must not erect, handle, or operate any such equipment or tools, closer to any of PG&E's overhead high-voltage electric conductors than the minimum clearances set forth in the High-Voltage Electrical Safety Orders of the California Division of Industrial Safety, but in no event closer than 13 feet.

General Order No. 95 of the California Public Utilities Commission sets forth certain clearance requirements for the construction and operation of electric lines. Therefore, you must control your excavations and digging, including spoils, in such a manner as not to decrease the ground-to-conductor clearance below thirty feet.

Continued development will have a cumulative impact on PG&E's gas systems and may require on-site and off-site additions and improvements to the facilities which supply these services. Because utility facilities are operated as an integrated system, the presence of an existing gas transmission or distribution facility does not necessarily mean the facility has capacity to connect new loads. Expansion of distribution and transmission lines and related facilities is a necessary consequence of growth and development. In addition to adding new distribution feeders, the range of gas system improvements needed to accommodate growth may include regulator stations, odorizer stations, valve lots, distribution and transmission lines.

We would like to recommend that environmental documents for your proposed project include adequate evaluation of cumulative impacts to utility systems, the utility facilities needed to serve the project and any potential environmental issues associated with extending utility service, and any possible relocations. This will assure the projects compliance with CEQA and reduce potential delays to the project schedule.

PG&E request's that the County and/or developers dedicate a standard 12.5 foot Public Utility Easement for underground facilities and appurtenances adjacent to all public ways, private drives and/or Irrevocable Offer of Dedication.

Gas service may be available to the area if desired. The project proponent should contact PG&E's Service Planning Department at (800) 743-5000 as soon as possible to coordinate construction with their project so as not to delay the project. We would also appreciate being copied on future correspondence as these various projects develop.

Sincerely,

Donny Kennedy

SACRAMENTO AREA BICYCLE ADVOCATES

February 22, 2012

Sacramento County Environmental Coordinator
Division of Environmental Review and Assessment
827 7th Street, Room 220
Sacramento, CA 95814

Subject: Draft Environmental Impact Report (DEIR) for Cordova Hills Master Plan

Dear Sacramento County Environmental Coordinator:

Thank you for the opportunity to comment on the subject DEIR. The Cordova Hills Master Plan has many positive aspects that will enhance the internal livability for its residents. For example, the compact design for mixed uses shown in the plan is especially demonstrated by Figure 6.9 where nearly all residential areas are within ½ mile of retail and entertainment facilities in the “flex commercial” districts. Such proximity will make walking and bicycling very attractive modes of transportation. However, **the project’s great distance from existing development and infrastructure makes its external connections to the regional circulation system problematic, of uncertain timing, and expensive for local governments to accommodate.**

Throughout the DEIR and the underlying Master Plan, the terminology used for bicycle facilities is inconsistent and confusing. Both documents should follow Caltrans’ definitions for bikeways which are Class I off-street “bicycle paths”, Class II “bicycle lanes” striped on streets, and Class III “bicycle routes” which do not have striped lanes but have signage and pavement markings to alert vehicle operators to the presence of bicyclists. This terminology should be corrected in multiple locations in the documents including pages 1-29, 1-31, and 16-36 of the DEIR and pages 6-32, 6-33, and 6-34 of the Master Plan. For example, page 1-29 and Plate PD-18 of the DEIR should specify and distinguish clearly between Class I paths and on-street Class II lanes. The documents should also acknowledge that other roadway treatments beyond the above 3-level classification are available to further protect bicyclists in special situations (see the NACTO Urban Bikeway Design Guide at <http://nacto.org/cities-for-cycling/design-guide/>).

DEIR page 16-26 states the 3 significance criteria used to assess impacts to bicyclists and pedestrians; according to the 3rd criterion, an impact is significant if it would “result in unsafe conditions for bicyclists . . . including bicycle/pedestrian, [or] bicycle/motor vehicle . . . conflict.” When judging unsafe conditions, we must envision bicyclists of all ages and abilities, from middle-school students to grandparents, and how they would negotiate planned bicycle facilities and crossings. The following paragraphs describe **unsafe and hazardous conditions for bicyclists that therefore constitute significant adverse impacts of the project.**

Neighborhood Electric Vehicles (NEVs)

NEVs will be allowed to use Class II bicycle lanes along approximately 4 miles of the 2 major east-west arterials within the project (see Master Plan Figure 6-7). These 2 arterials constitute the sole vehicular access links between the Town Center in the west and the major residential areas to the east. The NEVs will be allowed in the bike lanes because vehicular speed limits on these arterial segments are planned to be 45 mph, excessive for legal NEV operation. NEVs typically operate at 25 – 35 mph while utilitarian bicyclists commonly travel at 8 – 12 mph. Clearly the NEVs will present a hazard for bicyclists when they overtake a bicyclist silently from behind in a bike lane at much greater speed. The greater weight and size of NEVs will make collisions with bicyclists as dangerous as with motor vehicles. Furthermore, the 8-ft width of the shared NEV/bike lanes will make them easily mistaken for vehicle travel lanes, thus requiring protective measures to keep vehicles out of them. Therefore, **NEV use of the Class II bike lanes along these arterials is a significant adverse impact of the project on bicyclists.**

Project proponents have suggested that bicyclists fearful of sharing bike lanes with NEVs can instead use the Class I bicycle paths planned to parallel these arterial segments. These Class I paths are described in the DEIR and Master Plan as “multi-use trails” that will be shared with pedestrians. These trails will be attractive to casual recreational bicyclists but will not be useful to utilitarian bike riders who desire to ride directly and efficiently for several miles or more to locations for shopping, jobs, schools, and other community facilities.

We request that the DEIR evaluate possible solutions (i.e. appropriate mitigation) to this hazardous bicycle/NEV conflict including 1) reducing the speed limit on these arterials to 35 mph, 2) demarcating separate NEV and bicycle lanes with protective buffers between them, and 3) allowing NEVs to use the vehicular traffic lanes.

Design of Arterial Intersections.

Class I bicycle paths will parallel the 2 main east-west arterials through approximately 10 intersections. The DEIR and the Master Plan do not describe the design of these intersections or the designs of the Class I paths where they cross side streets. Plate TC-3 of the DEIR shows that some of these intersections will be signaled and some will be roundabouts. Both signaled traditional intersections and roundabouts can be hazardous for bicyclists on the Class I paths because of interactions with vehicular traffic signaling, traffic movement patterns through planned roundabouts, pedestrian movements, and the on-street Class II bike lanes. Until such designs are specified and can be reviewed by experienced bicycle planners, these intersections should be regarded as hazardous to bicyclists and pedestrians. **The arterial intersections therefore pose significant adverse impacts of the project on bicyclists.**

Connections to External Bicycle Facilities.

Figure 6.1 of the Master Plan describes transportation-mode alternatives for the project. The “service radius” for bicyclists is said to be only up to 3-mile radius and the figure also fails to acknowledge that bicyclists may want to use bicycle trips to access jobs; elsewhere the DEIR describes the main Rancho Cordova employment center as approximately 7 miles to the west, a relatively comfortable ride for a moderately experienced bicyclist to work locations with supportive facilities for bicyclists (secure parking, showers, etc.).

Hazardous bike riding conditions increase with widths of streets (i.e. crossing distances), volume and speed of traffic, and complexity of intersection configurations (e.g. numbers and timing of left turn and right turn lanes). Such intersections must be considered barriers to bicycle travel for the average rider. **The DEIR does not assess hazards to bicyclists in trying to**

cross Grant Line Road at its intersection with Chrysanthy Boulevard or at the intersections of Grant Line Road with the project's North Loop Road and University Boulevard. Until such designs are specified and reviewed by experienced bicycle planners, these primary crossing points for accessing Rancho Cordova must be regarded as hazardous to bicyclists and therefore a significant impact of the project.

Widening of Intersections in Project Vicinity.

The DEIR's Traffic Analysis identifies significant impacts of the project on many intersections and road segments in the vicinity of the project caused by traffic generated by the project. At 23 of these intersections and segments, the DEIR recommends mitigation measures that include constructing additional traffic lanes (up to 6 lanes in some cases). The DEIR should acknowledge that each of these lane additions will increase the hazards for bicycle riders using those intersections or segments because of increased crossing widths, increased vehicle speeds and volumes, and increased complexity of traffic movements. Therefore, **these lane additions should be considered significant adverse impacts of the project.** The DEIR should further acknowledge that additional mitigation measures to protect bicyclists will be needed (see the NACTO Urban Bikeway Design Guide at <http://nacto.org/cities-for-cycling/design-guide/> for descriptions of intersection treatments to protect bicyclists).

SABA works to ensure that bicycling is safe, convenient, and desirable for everyday transportation. Bicycling is the healthiest, cleanest, cheapest, quietest, most energy efficient, and least congesting form of transportation

Thank you for considering our comments.

Sincerely,

Subject: Cordova Hills Draft Environmental Impact Report

Dear Ms. Hocker,

Sacramento Area Sewer District (SASD) has reviewed the Draft Environmental Impact Report (DEIR) for the subject project. The Sacramento Regional County Sanitation District (SRCSD) has provided comments in a separate letter.

It is noted that the proposed project is located in the southeastern portion of Sacramento County on approximately 2,669 acres, adjacent to the City of Rancho Cordova. The area is designated by the Sacramento County General Plan as General Agriculture (80 acres) and is currently zoned for AG-80 agricultural uses. The project is within the Urban Services Boundary, but outside the Urban Policy Area and outside of the Sacramento Area Sewer District. Here are our summary comments.

- SASD's Board of Directors approved a SASD Sewer System Capacity Plan 2010 Update in January 2012. The Plan provides an updated mid-range and long-term plan for sewer service in this area. The sewer service alternatives identified in the subject document should be reviewed for consistency with the System Capacity Plan. Also, note the System Capacity Plan received a "Statutory Exemption" from the County of Sacramento's Division of Environmental Review and Assessment (Control Number 2011-70100).
- Annex the subject property to both the Sacramento Regional County Sanitation District (SRCSD) and the Sacramento Area Sewer District (SASD) prior to recordation of the Final Map or submission of any improvement plans, whichever occurs first. Upon annexation, conditions will apply to this project.

February 22, 2012

In addition, here are our comments on statements within the Draft Environmental Impact Report:

1. Page 15-4, Para 1: SASD does not construct trunk sewer lines serving new development. The developer constructs trunk facilities to District Standards and is eligible for reimbursement in accordance with the SASD Sewer Ordinance. SASD will own and operate the facilities upon acceptance.
2. Page 15-4, Para 1: SASD is responsible for more than just the maintenance of the lower lateral and mainline pumps.
3. Page 15-7: Remove discussion of SASD's Sewerage Facilities Expansion Master Plan 2006 Update and replace with discussion of System Capacity Plan.
4. Page 15-38: Under "Regional Infrastructure", clarify the statement "service to Cordova Hills is not constrained." Sewer service alternatives are dependent on capacity availability at the time of development, and could be considered "constrained".
5. Page 15-38: The statement "All of the regional off-site infrastructure shown is already contemplated in SASD or SRCSD master planning documents, and thus are not impacts of the Project" is not correct. Some of the sewer service alternatives identified in the subject document are not included in SASD's System Capacity Plan (e.g., force mains to the Mather or Bradshaw Interceptors).
6. Page 15-49: The statement "SASD and SRCSD did not identify any facility constraints to service" is not correct. See comment 4 above.

If you have any questions regarding these comments please call me at (916) 876-6296.

Sincerely,

A handwritten signature in black ink, appearing to read "Amandeep Singh" followed by a stylized flourish.

LETTER 13

February 22, 2012

Ms. Catherine Hack
County of Sacramento
Community Planning & Development Department
Division of Environmental Review and Assessment
827 7th Street, Suite 220
Sacramento, CA 95814

SUBJECT: COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE CORDOVA HILLS SPECIAL PLANNING AREA.

Dear Ms. Hack:

The Department of Transportation (SACDOT) has received a copy of the draft environmental impact report (DEIR) for the Cordova Hills Special Planning Area project. We appreciate the opportunity to review this document and have the following comments to offer:

1. **Executive Summary. Page 34. Mitigation Measure TR-1.B.** The DEIR states “Mather Boulevard and Douglas Road –Construct a new traffic signal. Provide a shared through-right turn lane on the northbound approach; provide a separate left turn lane and a through lane on the southbound approach; and provide a separate left turn lane and a separate right turn lane on the westbound approach”. It should be noted that since the completion of the traffic study for this project, the Zinfandel Drive extension project has been completed and a new signal has been installed at the Douglas Road and Zinfandel Drive /Eagles Nest Road intersection. We do not see a need for another traffic signal in close proximity to this newly installed signal. We would ask that the Cordova Hills project impact at the Mather Boulevard and Douglas Road intersection be reevaluated and mitigation measure TR-1.B be either deleted or recommend an alternative mitigation measure. If new analysis reveals that a mitigation measure is needed to mitigate the project impact then it should be coordinated with SACDOT staff for consultation and recommendation. Please coordinate with us as necessary.
2. **Executive Summary. Page 34. Mitigation Measure TR-1.E.** The DEIR states “Grant Line Road and White Rock Road – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound approach; provide a through lane and a separate right turn lane on the southbound approach; and provide separate left turn lane and a separate right turn lane on the eastbound approach. Also an extra westbound departure lane is needed for the dual northbound left turn movement.” Please note that a traffic signal will be installed as part of the

“Leading the Way to Greater Mobility”

Design & Planning: 906 G Street, Suite 510, Sacramento, CA 95814 . Phone: 916-874-6291 . Fax: 916-874-7831
Operations & Maintenance: 4100 Traffic Way, Sacramento, CA 95827 . Phone: 916-875-5123 . Fax: 916-875-5363
www.sacdot.com

White Rock Road Improvements Project which will begin construction this year. But, Cordova Hills project's need for dual left lane in the northbound direction at the Grant Line Road and White Rock Road intersection is not part of the White Rock Road Improvements Project. Therefore, the Cordova Hills project will be responsible for constructing the dual left turn lane at this intersection and modify the signal to accommodate the lane additions. As result of the dual left turn lane, the westbound receiving lane would also need to be extended for the northbound left turn traffic and northbound thru lanes will shift to east on the approach and departure side. Please update the mitigation measure. SACDOT staff will submit a condition of approval relating to this change.

3. **Executive Summary. Page 38 and 39. Mitigation Measure TR-4.A.** Please note that this mitigation measure is in City of Elk Grove and construction responsibility is beyond the control of the County of Sacramento and the project proponent. Therefore, the project should pay its fair share towards this improvement to the City of Elk Grove if a reciprocal agreement between the County of Sacramento and City of Elk Grove is in place at the time of implementation of the Public Facilities Financing Plan. Otherwise, the project is only responsible for paying the fair share of improvements within the control of County of Sacramento.
4. **Executive Summary. Page 41. Mitigation Measure TR-7.A.** Mitigation measure states "Construct sidewalks and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road." Since the Grant Line Road and Douglas Road would be six lanes ultimately, we understand that curb, gutter and sidewalk cannot be installed at the ultimate location as part of the 4 lane widening as recommended in mitigation measures TR-5.F and TR-5.I. We recommend the mitigation measure be revised to include interim pedestrian and bicycle facilities to the satisfaction of the Department of Transportation. Typically all four lane widening projects would require an appropriate detached AC path for pedestrians. Additionally, the bike lane/shoulder will be 6 feet due to lack of curb and gutter. SACDOT staff will submit a condition of approval to Planning and DERA staff relating to this matter. The mitigation measure should be revised.
5. **Traffic and Circulation. Page 16-1 to 16-83.** The above four comments will result in changes to this chapter. Please update in the FEIR.
6. **General.** The number of through lanes at mitigated intersections should be consistent with the number of through lanes for mitigated roadway segments. Please update the mitigation measures. Lane drops should be done on departure side of the intersections. The left turn lane will be set up based on the improvement standards for an arterial or thoroughfare. Please revise the intersection mitigation measures as necessary to match with roadway segment mitigation measures.
7. **General.** The standard county left turn pocket length would not be sufficient to store the vehicle queues for intersections that carry more than 600 vehicles per hour for the dual left turn lane. For those locations, a queuing analysis needs to be completed prior to the approval of improvement plans and final maps to determine the appropriate left turn pocket length. A separate condition of approval will also be submitted to address this issue in the future for the Cordova Hills project.

Ms. Hack.

Comments on the DEIR for the Cordova Hills SPA.

Page 3

8. **General.** Please note that left turn pockets at some of these locations carry a lot of traffic compared to standard intersections. At those locations, the left pockets will be extended and analysis would be required to determine the length of these pockets (as discussed in the comment above). The standard sections at the intersections will need to be modified to fit the project needs. SACDOT staff recommends adding a condition of approval on the project for wider median on Grant Line Road as it will have long left turn pockets with a narrow median. To improve the aesthetics of the corridor, we will condition the project to provide landscaping for trees in the median up to cross walks. Please coordinate with SACDOT staff regarding this landscaping requirement and include this change in the draft public facilities financing plan.
9. **General.** The project applicant should continue to work with SACDOT staff to find an appropriate design for the free right turn lane mitigation measure. The free right turn lane concept design should be submitted to SACDOT staff for preliminary approval.
10. **General.** The applicant shall coordinate with the Capital Southeast Connector JPA and the Sacramento County Department of Transportation in order to develop an alternative access design for the North Loop Road intersection with Grant Line Road. The alternative design must either consist of moving the North Loop Road intersection to create a 4-way intersection with Douglas Road and Grant Line Road or shall consist of another design acceptable to both the Capital Southeast Connector JPA and the Sacramento County Department of Transportation. Any application for Capital Southeast Connector improvements to the relevant segment of Grant Line Road which is submitted for discretionary approval to Sacramento County shall be incorporated into the alternative design.

Should you have any questions, please feel free to contact me at (916) 875-2844 or atwalk@sacounty.net.

Sincerely,

Kamal Atwal, P.E.

LETTER 14

MEMORANDUM

To: Lauren Hocker, Department of Environmental Review and Assessment

From: Dave Ghirardelli, Department of Waste Management & Recycling

Date: February 21, 2012

Subject: **DWMR comments on Cordova Hills DEIR**

The Sacramento County Department of Waste Management and Recycling (DWMR), which owns the Kiefer Landfill adjacent to the proposed project, has reviewed the Draft Environmental Impact Report and have the following comments:

Odors.

On page 5-36 the DEIR states “As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given all of the foregoing – with particular emphasis on the ability of the gas extraction system to reduce the potency and density of landfill odor – and the mitigation incorporated below, odor impacts are not expected to be substantial, and impacts are *less than significant*.” DWMR disagrees with this statement.

The landfill gas (LFG) collection system at Kiefer landfill will not reduce the Cordova Hills project’s odor impacts (bringing sensitive receptors into such close proximity to Kiefer landfill) to the level of *less than significant*. LFG collection system reductions in odor are ancillary, as clearly stated on the website referenced, and generally occur on closed sections of a landfill where an LFG system is installed.

Kiefer landfill generates odors primarily from unloading and spreading municipal solid waste and from unloading and processing greenwaste. The LFG collection system does not reduce those odors at all. Additionally, as the landfill is constructed, the odor generating operations will be closer to the Cordova Hills project. This is described in the Project Description chapter of the Certified (1998) Kiefer Landfill Final Supplemental Environmental Impact Report (Kiefer EIR).

The Cordova Hills project will bring sensitive receptors into close proximity to these operations and doing so is **a significant impact and requires additional mitigation on the part of the Cordova Hills project.**

Aesthetics.

On page 3-2 the DEIR states "...the property to the south is visually dominated by the Kiefer landfill." Kiefer landfill is currently constructing Module 3 of the 10 modules approved by the Kiefer EIR in 1998. Module three is approximately 4,000 feet from the Sports Park and 4,500 feet from the Living and Learning zone of the campus. Module 3 is currently being constructed at 100 to 150 feet elevation above MSL, approximately.

During approximately 2025 to 2035, module 5 (of 10) will be constructed approximately 1,700 feet from the Sports Park and 2,200 feet from the Living and Learning zone of the campus and to an elevation of 325 feet above MSL.

To understand the visual impacts of the Cordova Hills project, a "Kiefer landfill viewer group (viewpoint 6)" should be included in the Impacts and Analysis section of the Aesthetics chapter of the DEIR. The vantage should be taken from the Living and Learning area of campus or from the Sports Park and show the view residents of the campus or users of the park will have when Module 5 is being constructed. **The Cordova Hills project will have significant aesthetic impacts that will require mitigation.**

Mitigation.

DWMR maintains that, at a minimum, mitigation is necessary in the form of Restrictive Covenants, or some similar mechanism, recorded in perpetuity on deeds for all parcels created in the Cordova Hills Special Planning Area, stating that property owners acknowledge the preexistence and proximity of the Kiefer Landfill and release rights to seek corrective action to nuisances. Additionally, the Cordova Hills project must establish financial mechanisms to pay for responses to the inevitably increased number of complaints.

Thank you for the opportunity to comment on the DEIR. Please contact me at 875-4557 if you have any additional questions.

LETTER 15

Lauren Hocker
Division of Environmental Review and Assessment
827 7th Street
Sacramento, CA 95814

Dear Ms. Hocker:

**SUBJECT: REVIEW OF THE CORDOVA HILLS PROJECT DRAFT ENVIRONMENTAL
IMPACT REPORT, CONTROL NUMBER 2008-00142**

The Sacramento County Environmental Management Department (EMD) has reviewed the Draft Environmental Impact Report (DEIR) for the Cordova Hills project. EMD acts as the Local Enforcement Agency (LEA) for the California Department of Resources, Recycling, and Recovery (CalRecycle) in the cities and County of Sacramento. The permitted boundary of Kiefer Landfill is adjacent to the southwest edge of this project.

The LEA's comments focus on concerns about the proximity of the project to an active municipal solid waste landfill, as follows:

- 1) **Aesthetics**, Page 3-21: The DEIR claims that the distance of the project from the landfill renders the impact of lights from Kiefer's operations insignificant. While the current location and size of Kiefer's operations may render the light impact insignificant to the project, the landfill's operations will eventually expand and the active face will move closer to the project site. The projected average daily tonnage in 2035 is nearly double the current permitted average daily tonnage. Also, the maximum permitted elevation of the landfill is 325 feet. Did the DEIR account for the increased amount of lighting required for an expanded landfill operation, as well as the eventual increase in elevation of the landfill, which will increase the visibility of Kiefer's operations from the project site?
- 2) **Air Quality**, Pages 5-36—5-37: This section states "with particular emphasis on the ability of the gas extraction system to reduce the potency and density of landfill odor – and the mitigation incorporated below, odor impacts are not expected to be substantial, and impacts are less than significant." Odors are also generated by the delivery and compacting of waste, the processing of green waste at the site, and the operation of the flare. The sub-surface landfill gas extraction system does not control these odors. The EIR should not rely on the landfill gas extraction system to reduce odors to a less-than-significant level. Further, while odors must be controlled under Title 27 of the California Code of

Regulations (27 CCR), the generation of odors during routine landfill operation is unavoidable and there is no requirement to reduce the potential for odors to zero. The LEA recommends notifying potential tenants of the increased potential for odor issues associated with the proximity to the landfill.

- 3) **Hazards and Hazardous Materials**, Page 10-17: This section includes a mitigation measure stating that continuous landfill gas monitoring will be implemented in any structures within 1,000 feet of buried waste or proposed buried waste. Who will be responsible for implementing and maintaining the landfill gas monitoring equipment? The LEA does not have authority to ensure that landfill gas monitoring is being conducted outside of the permitted boundary of the landfill. Any structures within 1,000 feet of the permitted landfill boundary also ought to adhere to the construction standards contained in 27 CCR 21190 (g). Again, the LEA does not have authority to enforce this standard outside of the permitted boundary of the landfill, so the party responsible for implementing these construction standards should be clearly assigned in the FEIR.
- 4) **Land Use**, Page 12-37, Paragraph 2: This paragraph states that Kiefer Landfill is permitted to accept 10,815 tons per day (tpd) and the average intake is approximately 6,000 tpd. The tonnage cited is the maximum permitted tonnage for the year 2034/35; the current permitted maximum tonnage is 5,598 tpd. The permitted tonnage increases each year according to a schedule referenced in the facility's Solid Waste Facility Permit. The EIR should clarify the permitted tonnage and year used to analyze the impacts of the landfill on the proposed development. This paragraph also states that the estimated remaining capacity is 108 million cubic yards. Per the Solid Waste Facility Permit, the remaining site capacity as of 2006 was 86,559,490 cubic yards.
- 5) **Land Use**, Page 12-37, Paragraph 3: This paragraph mentions the upcoming Kiefer Bufferlands Special Planning Area (SPA), which will designate areas around Kiefer Landfill for waste-industry uses; however, the DEIR does not include analysis of the potential impacts of the proposed SPA uses on the Cordova Hills tenants. The DEIR also does not include an analysis of the GreenCycle project, a proposed composting facility adjacent to Kiefer Landfill. The FEIR for the GreenCycle project was released in November 2010 and a Supplemental EIR is due for release in 2012. The addition of waste industries and a large-scale composting facility to the area will exacerbate the potential for nuisance conditions, including vectors/pests, dust, noise, and odors. The FEIR should include an analysis of the potential impacts of the GreenCycle project and the Kiefer SPA on the Cordova Hills project.

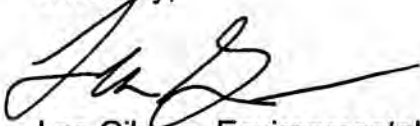

- 6) **Land Use**, Page 12-38, Paragraph 2: This paragraph states that "nuisance pests and vectors are typically experienced only in close proximity to the source condition". What is considered "close proximity"? Per the DEIR, the project abuts Kiefer Landfill and the adjacent area is to be designated as Agricultural land, which could provide additional habitat for pests. The LEA recommends notifying potential tenants of the increased potential for vector and pest issues associated with the proximity to the landfill.
- 7) **Land Use**, Page 12-38, Paragraph 2: This paragraph also states that litter was not observed during any of the site visits to the project area and that litter from the landfill would be caught in the intervening landscape. The active portion of the landfill will eventually move closer to the proposed project site, so the fact that litter was not observed during site visits from 2008-2012 would not be relevant to the future conditions of the landfill. Litter may also enter the proposed development from refuse vehicles delivering waste to the facility. Kiefer Landfill implements litter control measures as required in 27 CCR 20830, but it cannot control for litter blowing off of refuse vehicles. The LEA recommends notifying potential tenants of the increased potential for litter in their neighborhood due to the proximity of the landfill and the refuse vehicles utilizing the roadways.
- 8) **Land Use**, Page 12-38, Paragraph 3: This paragraph states that CalRecycle is responsible for verifying compliance with State Minimum Standards. EMD, acting as the LEA in Sacramento County, is certified by CalRecycle to regulate Kiefer Landfill to ensure the facility meets the State Minimum Standards, per 14 CCR 18081 (c). The section of regulation cited in this paragraph, 27 CCR 21685(b)(8), pertains to CalRecycle's concurrence with the issuance of a Solid Waste Facility permit or permit revision. Kiefer Landfill has already been issued a Solid Waste Facility permit, so the section pertaining to CalRecycle's concurrence is not relevant to ensuring ongoing compliance with the State Minimum Standards. Another section of regulation cited in this paragraph, 14 CCR 17867 (a), pertains to composting facilities, not disposal sites. Kiefer Landfill is a permitted as a disposal site, so 27 CCR 20760 is the appropriate section to cite for nuisance control.
- 9) **Land Use**, Page 12-39: Mitigation measure LU-2 states that the location and nature of Kiefer Landfill will be disclosed to buyers within one mile of the "ultimate active landfill boundary." What is the definition of the "ultimate active landfill boundary"? Is it the same as the disposal site permitted facility boundary, as specified in Kiefer Landfill's Solid Waste Facility Permit? If not, what criteria were used to determine the "ultimate active landfill boundary"? Also, who will be

responsible for providing the notification to the buyers and what information will be included in the notification?

- 10) **Noise**, p13-39: This section uses a 1989 study to determine the impact of noise on the proposed project. In 1989, Kiefer landfill's average permitted daily tonnage was approximately 2,700 tpd. In 2012, the average permitted daily tonnage is 3,293 tpd, and, in 2035, it will be 6,362 tpd. The increase in tonnage accepted at the landfill will require additional equipment to handle the waste and there will be additional traffic delivering waste, meaning increased noise levels at the landfill. The FEIR ought to consider future noise levels instead of using 1989 noise levels to determine the impact to the residents of the proposed development.
- 11) **Public Services**, p 14-21: This section states that the facility is permitted to accept 10,815 tpd and currently receives 700,000 tons per year. The permitted tonnage cited is the maximum daily tonnage for the year 2035. The facility's current maximum daily tonnage is 5,598 tpd and the projected annual tonnage for this fiscal year is 1,202,000 tons, per the Solid Waste Facility Permit. This section also cites "N. Yeats" of CalRecycle. The CalRecycle permitting contact for Sacramento County is Nevin Yeates, not Yeats.

Thank you for the opportunity to comment on the DEIR for the proposed Cordova Hills project. Please contact me at (916) 875-8468, if you have any questions or concerns about the LEA's comments.

Sincerely,

Lea Gibson, Environmental Specialist
Environmental Compliance Division

LG:se

c: Nevin Yeates, CalRecycle

W:\DATA\GIBSON_LEA\SOLID WASTE\FACILITIES\KIEFER\CORDOVAHILLSEIR\DEIRCOMMENTLETTER.DOCX

February 22, 2012

Ms. Catherine Hack, Sacramento County Environmental Coordinator
Division of Environmental Review and Assessment
827 7th Street, Room 220, Sacramento, CA 95814

SUBJECT: CORDOVA HILLS DEIR (LAFC #M-2010-008)

Thank you for the opportunity to review and provide comments on the Draft Environmental Impact Report (DEIR) for the Cordova Hills project regarding the Sacramento Local Agency Formation Commission (LAFCo). These comments should be considered in the context of those provided as a responsible agency under the California Environmental Quality Act, on February 21, 2011, regarding the Notice of Preparation (NOP.) Those earlier comments clarified that LAFCo will be a responsible agency for this project because LAFCo will conduct various project related proceedings, including annexation to the Sacramento Area Sewer District (SASD) for the collection of wastewater and the Sacramento Regional County Sanitation District (SRCSD) for conveyance and treatment of wastewater. Additionally, project implementation will require detachment from the Sacramento County Regional Parks Department County Service Area 4B and County Service Area 10, and formation of the Cordova Hills Community Services District (CSD). Thus, LAFCo will be a responsible agency and will rely on the County's environmental document with respect to the project.

To assist in review of the proposed project, it was requested that the DEIR include analyses of several specific topics of interest: describing the role of LAFCo in the approval and CEQA processes in the EIR Project Description; and evaluating potential effects to affordable housing, public services and utilities (both on and off-site,) agricultural lands, open space, and environmental justice. This review consists of identifying whether the environmental issues cited in the NOP comment letter were comprehensively addressed consistent with state and local LAFCo requirements. During this review of the DEIR, LAFCo has not conducted an independent analysis of the County's or affected special districts' capacity to provide various services to the project site, as that will more appropriately be analyzed during subsequent LAFCo proceedings, as will any potential adverse economic effects to other service providers.

The review of the Cordova Hills DEIR indicates that many of the specific topics of interest to LAFCo were addressed or are acknowledged by the County as necessary actions that need to occur prior to LAFCo taking action on any subsequent annexation requests. This letter sets forth our understanding of the project's compliance with the CEQA process as documented in the County's DEIR, and the adequacy of that document to serve LAFCo as a responsible agency when conducting subsequent discretionary proceedings regarding the project.

Specific comments on the DEIR include:

1. **Project Description** (DEIR, Chapter 1, Project Description) – This chapter adequately sets forth LAFCo's role in the entitlement process, including all required LAFCo proceedings and actions, such as

annexation of the project site to the SRCSD and SASD service areas, detachment from the Sacramento County Regional Parks Department County Service Area 4B and County Service Area 10, and the formation of a CSD (pages 1-8 thru 1-9). The description includes a discussion of the role of LAFCo, as a responsible agency in the decision-making process to process the application and supporting documentation (Municipal Services Review) for the creation of the CSD.

The DEIR clearly and adequately addressed the following issues of statutory concern, unless otherwise stated, to permit LAFCo to use the County's environmental documentation in the Commission's consideration of the proposed annexation to the SASD and SRCSD, detachment from the County Service Areas 4B and 10, and the formation of the CSD.

2. **Population, Employment and Housing** (DEIR, Chapter 1, Project Description) – LAFCo is required to ensure that there will be no net loss of targeted housing resources on a countywide basis, both in incorporated and unincorporated areas. The project description states the proposed project site is currently used for cattle grazing and does not contain any structures or development (page 1-6). Because there is no existing residential zoning, nor housing located within the proposed project area, it would not result in the loss of affordable housing.

Prior to LAFCo considering any annexation request within the project area, the County must demonstrate compliance with the SACOG Regional Housing Needs Allocation (RHNA) and obtain confirmation of compliance from the California Department of Housing and Community Development that the County is meeting its Regional Share Housing goals for all income levels through its adopted General Plan Housing Element. The DEIR summarizes the proposed housing mix and includes an affordable housing plan (page 1-8). Plate PD-12 shows the locations of proposed affordable housing units (page 1-17).

3. **Utilities & Service Systems** (DEIR, Chapter 1, Project Description; Chapter 15, Public Utilities) – LAFCo requested that the public utilities evaluation focus on whether any physical facilities would need to be constructed to serve the project, including those outside of the project site, whose construction potentially could result in environmental effects. The following summarizes the information provided in the DEIR on the proposed physical facilities that would need to be constructed to serve the Cordova Hills project.

Proposed Utility Infrastructure

Proposed public infrastructure and service connections include physical facilities, whose construction could result in potential environmental effects. Physical facilities proposed to be constructed within the project site include a corporation yard, solar facility, district energy plant, schools, and new public utility infrastructure (page 1-34 thru 1-37). Public utility infrastructure includes water supply distribution, wastewater conveyance and treatment, and storm drainage improvements.

Water Supply: The Sacramento County Water Agency (SCWA) would provide water supply. Connection would occur outside of the Urban Services Boundary (USB) and outside the SCWA service area via off-site water line extensions. The project involves the extension of water to a 241-acre portion of the project site outside the USB, which requires a General Plan amendment (page 1-36).

Sanitary Sewer/Wastewater Treatment: The proposed project would need to be annexed into the SASD and the SRCSD in order to connect to public wastewater conveyance and treatment infrastructure services. The SASD owns and operates the sewer trunk and collection system

throughout Sacramento County. SRCSD owns and operates the Sacramento Regional Wastewater Treatment Plant (SWRTP) and interceptor system in the County. The proposed project is within the Sphere of Influence (SOI) for both the SASD and SRCSD (page 1-37). The SOI is coterminous with the USB. Connection to the SASD sewer lines would require off-site extensions and on-site transmission lines.

Storm Drainage: Storm drainage features include on-site detention basins, open stormwater swales, and an underground pipe system. Water quality measures include features such as, grassy swales, settling basins, and natural filters to be incorporated into the open space corridors and parks (page 1-37). LAFCo requested that the secondary effects of constructing and operating these facilities be evaluated in the DEIR. LAFCo also requested the evaluation assess whether the SRCSD and SASD have (1) the service capability and capacity to serve the project area, and (2) whether they can provide services to the project area without adversely affecting existing service levels elsewhere in their service areas.

Chapter 15, Public Utilities evaluates the project's potential impacts related to infrastructure improvements. The DEIR states that with the exception of a few facilities that may involve off-site construction, most of the public utility infrastructure construction has either been evaluated as part of other infrastructure projects, or is within the boundaries of the project site. Below is a summary of the public utilities and services impacts evaluated in the DEIR:

Potable & Non-Potable Water Supply: Infrastructure. For potable water supply, the proposed project would not result in new infrastructure outside the project area. The project is within the Zone 40 service area of the SCWA. The Vineyard Surface Water Treatment Plant (VSWTP) and the North Service Area Pipeline (NSAP) would provide potable water to the existing and future development (page 15-26). Project infrastructure would include pipelines and facilities that already exist or have already been approved by the SCWA (page 15-28).

None of the regional infrastructure options would result in new significant adverse environmental effects (page 15-34). All infrastructure and pipelines would be located in areas where such facilities already exist, with the exception of a 30-inch transmission pipeline from the North Douglas Storage Tanks to the intersection of Grant Line Road and Glory Lane. This alignment will occur within an existing private unpaved roadway (page 15-35). Portions of the pipeline would occur in areas known to contain biological resources, such as wetlands and protected species habitat (page 15-35). As an alternative, construction of pipeline infrastructure of the currently undeveloped, off-site Cordova Hills storage tank site will also impact biological resources. Therefore, the local water line and the storage tanks would result in a significant and unavoidable impact to wetland resources and species supported by those wetlands. Mitigation BR-1 thru BR-9 is provided in Chapter 6, Biological Resources (page 6-28 thru 6-29; page 6-51 thru 6-52; 6-57; 6-61) to reduce impacts.

For non-potable water supply, the proposed project will involve an interim connection to an on-site non-potable water system. When the County's future reclaimed water transmission system becomes available, the project connection to the on-site non-potable system will be terminated and the reclaimed water will be distributed through the separate non-potable pipe network. Construction activities associated with the non-potable pipe network will take place within the project boundaries. The reclaimed water system will be laid out within arterial and collector streets and connect to irrigated land uses within the project area (page 15-25). Infrastructure impacts would not occur outside the project boundary (page 15-26).

Capacity: A Water Supply Master Plan (WSMP) was prepared for the project to determine whether project water demands would be met by the SCWA. The projected annual water demand for the entire project is 6,549.9 acre-feet per year (AFY) (pages 15-46 thru 15-47, Table PU-3). As identified in the Water Forum Agreement and the WSMP, the SWCA has appropriative rights to 40,900 AFY in the underlying groundwater in the Central Basin and from three sources of surface water totaling up to 61,251 AFY (page 15-46; page 15-51). Approximately 102,151 AFY would be supplied to Zone 40. While the project would add to the overall demand for water within the Zone 40 services area, it would not require water beyond the service area's projected supplies (page 15-46). Demands will be met by a combination of groundwater and surface water delivered by SCWA through the North Vineyard Well Field, the NSAP, and the Anatolia Raw Water Pipeline Conversion (page 15-28 thru 15-34).

Sewer Conveyance/Treatment: Infrastructure. For sewer conveyance and treatment, the proposed project will rely on annexation into both the SASD and SRCSD service boundaries. The SRCSD 2000 Master Plan included a 20 million gallons per day (mgd) regional interceptor pump station to collect flows from the Upper Deer Creek (DCU) shed, which includes the Cordova Hills area. A 2.02 mgd pump station is proposed to serve the first phase of the project. It is sited in the southwestern portion of the project site (page 15-38). Because this pump station would be located in an area already impacted by the project development, and the construction of all other pump stations and lines would be built within the project area, no adverse utility-related impacts would result. All other local on-site infrastructure would occur within the project boundary (page 15-39.)

With the exception of one on-site regional line, (POC-4 shown on Plate PU-8, Sewer Infrastructure Plan) all other regional lines are located in areas designated for developed uses. One regional line is being routed through an off-site area, but wetland delineations, cultural resource surveys, and other resources studies have not been conducted for the area. Although impacts would vary depending on the chosen alignment, it is assumed construction of this line can avoid cultural resources impacts, but may result in wetland impacts that are significant and unavoidable. Mitigation BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1 are provided in Chapter 6, Biological Resources (pages 6-28 thru 6-57) and Chapter 8, Cultural Resources (page 8-29) to reduce impacts.

Capacity. On an interim basis, the proposed project would utilize capacity at existing facilities. According to the SRCSD 2000 Master Plan, the 2006 CSD-1 Sewerage Facilities Expansion Master Plan, and the SASD/SRCSD Strategic Plan, service to Cordova Hills is not constrained. The SRWTP has a permitted average dry weather flow design capacity of 181 mgd and wet weather flow of 392 mgd. There is sufficient treatment capacity to accommodate sewage from the project without the need for facility expansion (page 15-38 and 15-49). The project will not exceed existing or planned disposal and conveyance capacity, and it not expected to impact the SRCSD's service levels.

Electrical/Natural Gas: Infrastructure. For energy services and dry utilities, the Sacramento Municipal Utility District (SMUD) would provide service. The majority of all on-site electrical transmission line construction would occur within road right-of-ways already impacted by the project. Off-site electrical lines would occur along public right-of-ways and within public utility easements. Off-site impacts may occur because some impacts have not been evaluated as part of the SMUD master plan. Construction activities would occur at existing electrical line poles and near wetlands located along the eastern side of Grant Line Road. Because environmental studies have not been conducted, it is possible that impacts will occur as part of the line upgrades (page 15-43). SMUD would act as the lead agency on the utility upgrades and would evaluate impacts in a separate environmental analysis, consistent with CEQA. Therefore, there is the potential that off-site

electrical line construction would result in impacts to biological resources that are significant and unavoidable. These impacts are described in more detail in Chapter 6, Biological Resources.

For natural gas, services would be provided by Pacific Gas & Electric Company (PG&E;) an investor owned utility, not subject to LAFCo purview.

Capacity. Energy usage for the project indicates the estimated annual residential and commercial electricity demand for the project will be 122,903,000-kilowatt hours. Because the estimated energy usage of the project is substantially less than the annual energy production for SMUD, the electrical energy service provider will have sufficient capacity to serve the project.

4. **Agricultural Lands** – (DEIR, Chapter 4, Agricultural Resources) As noted in our February 21, 2011 comment letter, the analysis should include a discussion of current agricultural uses and activities within and adjacent to the project area. LAFCo is required to make findings regarding five tests of “prime agricultural land” as defined by Government Code §56064. The DEIR needs to provide information regarding such lands to permit LAFCo to make these findings as a responsible agency. The DEIR correctly notes that no high value agricultural resources are located within the project area, and that no adverse effects to such resources would result. The following summarizes the project area agricultural uses and the information supporting the five tests that determine the presence of “prime agricultural land.”

Agricultural Uses

The impact analysis discusses whether the proposed project would conflict with existing agricultural use and zoning. The Sacramento County General Plan designates the project site as General Agriculture (80 acres). It is zoned for AG-80 agricultural uses (page 4-1 thru 4-2, Plate AR-1). The site consists of grassland, used for cattle grazing. There was a small eucalyptus grove on the southwest quadrant of the site that was cut down several years ago. That portion of the site was designated as Unique Farmland. The remainder of the site is classified as Grazing land, as displayed on Plate AR-2, Farmland Classifications. There are no other intensive agricultural uses on the site (page 4-1). Surrounding land uses to the north, east, and south of the site are zoned for agricultural uses (AG-80 and AG-20). The project requests a Zoning Ordinance and General Plan amendment to ensure the proposed land uses are consistent with the County’s General Plan and Zoning Ordinance.

Williamson Act Land: The DEIR addresses the presence of any lands protected by a Williamson Act contract. Approximately 480 acres in the southeastern quadrant of the site are under a Williamson Act contract (Plate AR-4, Williamson Act Contracts in Vicinity). The landowner initiated the non-renewal process for the contract in February 2007. Under the non-renewal process, the contract is expected to expire in 2016 (page 4-1). At that time, the land would no longer be subject to the Williamson Act contract.

The project includes a large-lot subdivision map that would create parcels that range from less than one acre to approximately 35 acres. Pursuant to the Subdivision Map Act, subdivision maps involving parcels less than 40 acres in size cannot be approved on contracted lands unless the contract is three years from nonrenewal or findings are made. Because the on-site contract will expire in 2016, approval of the subdivision map could occur in early 2013. If the Board of Supervisors makes findings pertinent to the subdivision proposal, defers the effective date of the rezone until contract expiration, and grazing is continued until the expiration date, the project would not result in significant conflicts with the Williamson Act (page 4-16). Mitigation AG-2 would further reduce these impacts to a less than significant level.

Important Farmlands: The DEIR discusses the FMMP classification according to the Department of Conservation (DOC) Important Farmlands Map. The majority of the project area consists of Grazing Land, but includes a small area within the project site classified as Unique Farmland. The small area was designated Unique Farmland because a small eucalyptus grove used to be planted at the location. Because the grove no longer exists, the DOC may redesignate this portion of the site during the next farmland mapping update (page 4-11). While the project would not result in the loss of prime agricultural land or protected agricultural lands, the DEIR did evaluate the countywide trend of agricultural loss in Chapter 18, Cumulative and Growth-Inducing Impacts. The cumulative analysis discusses the loss of 2,660 acres of Grazing Land and nine acres of Unique Farmland (page 18-6).

Soil Types: The DEIR summarizes the types of soils found within the project area according to the Natural Resource Conservation Service (NRCS) land use capability classification and Storie Index rating from the DOC, Soil Survey of Sacramento County. This analysis determines the presence or absence of “prime agricultural land” as defined by Government Code §56064. As shown on Plate AR-5 (page 4-13), there are 16 different soil types within the project boundaries. Four soils on the site are listed as prime soils (i.e. 132, 158, 160, 192), if irrigated. These soils are hatch-marked on Plate AR-5. The Storie Index rating for these soils are 66, 61, 46, and 51. The Storie Index expresses the relative suitability of soil for general intensive agricultural or rangeland uses on a scale of zero to 100, with 100 being the best soil suitability (page 4-12). Therefore, only four of the sixteen soil types are considered prime, if irrigated. While there are wells on the site to provide water for cattle, the site has not been irrigated; thus, none of the soils would qualify as a prime soil. All four soil types exhibit moderate soil suitability.

Irrigated Capability Classes: The land use capability classes are listed according to Roman numerals I thru VIII, with the first four representing land suitable for crops and the last four representing land suitable for pasture or rangeland uses. Within the project area, the land use capability classes range from III, IIIw, to IIIe (page 4-12). The limitations on use increase as the Roman numeral increases. The letter “e” indicates that the soils are subject to erosion, the letter “s” indicates that soils are shallow and/or rocky, and the letter “w” indicates excess wetness. The four soil classes described are only considered prime farmland, if they are irrigated. As discussed above, the site has not been irrigated. The topography of the site is highly varied (i.e. slopes of 30% – 50%), which would make installation of an irrigation system expensive and difficult to operate. Also, the area containing prime soils is small relative to the site as a whole; approximately 170 acres out of 2,669, or 6% (page 4-12).

Agricultural Economic Value: Because some historical agricultural uses are present within the project area, for each use or operation the DEIR determined if the use supports, at a minimum, one Animal Unit (AU)/acre or has returned, or would return if planted with fruit or nut bearing trees, an agricultural value of at least \$400/acre for 3 of the last 5 years. With the exception of the small eucalyptus grove, there are no agricultural crops harvested within the project site. This indicates the site was mainly used for cattle grazing and supports one head of cattle for every 15 acres. Cattle grazing is not considered an intensive agricultural investment because the cattle are not densely concentrated.

5. **Public Services** – (DEIR Chapters 14, Public Services) – LAFCo requires the public services evaluation to focus on whether any physical facilities would need to be constructed to serve the project, including those outside of the project site, whose construction could have environmental effects. The majority of

the project area is located within the USB. The portion of the project that occurs outside the USB does not include any residential or retail uses, but it does include the sports parks and corporation yard. None of the project area is within the UPA. In order to receive public services, the project must be within both the UPA and USB. Therefore, the project includes a General Plan Amendment to move the UPA to include approximately 2,366 acres of the project site (page 14-1). The following discusses the overall impacts that could result from construction new facilities, such as parks, schools, libraries, sheriff stations, fire stations, and solid waste facilities that would be needed to serve the Cordova Hills project.

Recreation

For recreation services, the project area would detach from the Sacramento County Regional Parks Department County Service Area 4B and a newly created Cordova Hills CSD would provide recreation services. Detachment from the Sacramento County CSA 4B would require LAFCo discretionary action.

The DEIR evaluates whether the park facilities distributed throughout the project area would meet Quimby Act and Sacramento County General Plan park standards (page 14-23 thru 14-24). Cordova Hills will generate an estimated population of approximately 21,379 residents, requiring a minimum park dedication requirement of 106.9 acres. The proposed project would include 99.1 acres of formal parkland, and an additional 151 acres of informal parkland. The analysis concludes that with the implementation of parks identified in the Cordova Hills Master Plan Special Planning Area, adequate recreation resources would be provided to meet County standards, and the cost of park maintenance would be fully covered by the proposed CSD special tax assessment (page 14-26). The DEIR concludes that because the project is consistent with the Quimby Act and the General Plan park standards, the project will not increase demand for existing park services.

LAFCo is statutorily required to evaluate whether the County (or proposed CSD) has the service capability and capacity to serve the project area, and also whether they can provide services to the project area without adversely affecting existing service levels elsewhere in their service area.

Additionally, LAFCo must evaluate whether the deletion of territory now served by the Sacramento County Regional Parks Department County Service Area 4B would lead to an adverse impact on current CSA 4B users or facilities resulting from any related loss of tax revenues, thereby diminishing the ability of the County to deliver adequate services within the remaining service area of CSA 4B. Adequate information on any such loss of tax revenue is not presented in the DEIR. The County or project proponents will need to provide sufficient information to LAFCo to evaluate these questions prior to the Commission's consideration of any related detachment or district formation.

Therefore, LAFCo requests the County evaluate whether the deletion of the territory now served by the Sacramento County Regional Parks Department County Service Area 4B would lead to the loss of tax revenues, thereby diminishing the ability of the agency to deliver adequate services within their remaining service areas.

Consideration should be given to the evaluation of regional park resources in the context of the adequacy of regional park resources on a regional basis to serve existing and projected populations, and the project's effect on the adequate provision of such resources. Also, the DEIR should further discuss information that supports the document's environmental conclusion regarding the adequacy of fees or other sources of revenue to support the development of any new needed regional park facilities, and/or the maintenance of existing facilities.

Schools/Libraries

Neither service is subject to LAFCo purview.

Law Enforcement/Fire Protection

For law enforcement and fire protection services, the Sacramento County Sheriff's Department (SSD) and the California Department of Forestry and Fire Protection (CalFIRE) and the Sacramento Metropolitan Fire District (SMFD) would provide fire protection and emergency services. The proposed project includes a maximum of 8,000 residential units for a population of approximately 21,379 residents. Funding for increased law enforcement services would be provided through the County General Fund and the County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax. Compliance with General Plan goal and policies supporting law enforcement facilities, programs, and neighborhood security measures (page 14-21) would ensure the Sheriff's Department adequately serves new growth. The project includes sites for one or two fire stations to serve the project and adjacent development. It is anticipated that the station will require a truck, engine, and medic company. With adherence to existing regulations and the construction of new fire facilities, impacts associated with fire protection services will be less than significant (page 14-19).

6. **Natural Resources/Open Space** – The February 2011 NOP comment requested the DEIR include an evaluation of any open space resources as defined by Government Code §65560 that are located within or adjacent to the project area. While LAFCo had requested a separate evaluation on open space resources, such as a discrete impact statement, there is adequate information in Chapter 6, *Agricultural Resources*, to make findings for our Commission. Therefore, we request no changes to the EIR to address this issue.
7. **Environmental Justice** - State law requires LAFCo to consider the extent to which the project will promote environmental justice. "Environmental justice" means the fair treatment of people of all races, cultures, and incomes with respect to the location of public facilities and the provision of public services. The February 2011 NOP comment letter requested the DEIR evaluate environmental justice effects that could occur as a result of implementing the proposed project. The DEIR does not evaluate potential environmental justice effects related to the project. In order for LAFCo to comply with its statutory responsibilities with respect to environmental justice, we request that this issue area be addressed in the Final EIR.

We look forward to continuing our coordination with all interested parties regarding this project. Please contact me if you have any questions.

Very truly yours,

Subject: Cordova Hills Draft Environmental Impact Report
SMAQMD #: SAC200600987

Dear Ms. Hocker:

Thank you for the opportunity to review and comment on the Cordova Hills Draft Environmental Impact Report (DEIR). Staff of the Sacramento Metropolitan Air Quality Management District (District/SMAQMD) thanks the County and applicant for working with us early and often, especially during the development of the 35% Operational Air Quality Mitigation dated June 1, 2011 and Greenhouse Gas Reduction Plan dated May 2011 (AQMP, and GHG Plan, accordingly) that we determined to be technically adequate in June 2011 (documents and determination letters are attached).

District staff applauds the County in its clear presentation in the air quality, land use, and climate change chapters; in particular, the County's GHG thresholds of significance analysis and its explanation that its thresholds were modified mid-stream while the County was preparing the EIR. Also, the District concurs with the County's decision to require an AQMP to reduce ozone precursor emissions by 35%,

as opposed to the standard 15%, as feasible mitigation since the emissions from the Cordova Hills project were not included in the State Implementation Plan to achieve the federal health based standards.

The project originally contemplated included the early development of key aspects of the University of Sacramento (University) campus component. As the District has indicated to County staff, as well as the project applicant, the University and its phasing played a pivotal role in the District's determination that the AQMP Plan met 35% mitigation requirement, and that the GHG Plan met the County's thresholds in place at that time. It was the District's understanding, based on discussions with the applicant, that construction of the overall project phases would be conditioned on the early construction of the Campus so that the integrity of the AQMP and GHG Plan analysis and conclusions would be protected.

The DEIR now anticipates development of a "University/College Campus" that appears to conceptually maintain the elements of the original University of Sacramento plan, but the DEIR contains no conditions requiring early development of the Campus, and in fact appears to anticipate that the Campus may not be built for 30 years. A letter from SACOG to Mr. Ron Alvarado representing Cordova Hills (attached) affirms our understanding that the County would require appropriate phasing. The SACOG letter states: "Cordova Hills indicated in a recent discussion that if Sacramento County approves an entitlement for the project it is very likely that it will attach a condition requiring the construction of the university before other substantial construction can occur."¹

If there is no early Campus development commitment, the DEIR should be recirculated with an analysis of project impacts that assumes the Campus is not constructed. Without the Campus, the existing air quality analysis misstates and underestimates the project's emissions because it assumes reductions associated with or generated by the Campus component, and these reductions may never occur. *Absent an early development commitment, the District's determination of technical adequacy for the GHG and AQMP plans is null and void.*

¹ McKeever, Mike. Letter to Ron Alvarado. October 7, 2011.

The impact of the loss of the Campus component on the GHG Plan is plain. The GHG analysis and GHG Plan are based on the applicant's detailed project description that included 21,379 residents in 8,000 dwellings and over 4,000 students that would live in the 1,010 small, efficient, high density, alternative energy-producing dorm rooms on campus, and that the University would not allow first year students to maintain vehicles on campus. Collectively, these and many other promised features of the University acted to conserve resources and generate fewer GHG emissions than most projects of a comparable population. These detailed characteristics and emission reduction measures were embedded in the calculation that yielded a 5.8 MT CO₂e per capita efficiency. Without a Campus, for example, the density of the project would be reduced from an overall net density of 10.4 dwelling units per acre to 8.9 dwelling units per acre, which would impact the per capita emission calculation and prevent the project from achieving the reductions to which it has committed.

The impact on the AQMP is equally plain. A full 25% of emissions reductions are attributed to the relatively high internal trip capture rate, which was achievable through the diverse mix of uses including the presence of a functioning Campus.

We make the following recommendations to specific mitigation measures **only if an early Campus development commitment is included in the FEIR and project approval, and an acceptable phasing agreement is developed.**

1. CC-1 should be modified to make it clear that any amendments to the Cordova Special Planning Area must maintain 5.80 MTCO₂e/capita max for the entire project (not just that parcel) and that the parties consult with the District during the amendment process. Our suggested changes appear in red underline:

CC-1. All amendments to the SPA shall include an analysis which quantifies to the extent practicable, the effect of the Amendment on greenhouse gas emissions for the entire project. The amendment shall not increase greenhouse gas emissions above an average 5.80 MT [CO₂e] per capita (including emissions from building energy usage and vehicles) for the entire Cordova Hills project. The proponent shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Plan for approval by the County, in consultation with SMAQMD.

2. Currently, the Climate Change chapter on page 27 states that GHG reduction measures need not be imposed as a mitigation measure because “they are design features already embedded in the SPA...” Our experience has shown us that well intended mitigation may not be implemented because it gets overlooked or buried as projects build out. So, with the goal of providing a clear path linking the mitigation measures to the MMRP and then to actual implementation by a developer/contractor, we suggest that the County include a mitigation measure specifically requiring compliance with the GHG Plan as well as all other feasible and reasonable mitigation measures to which the applicant has committed. We request that the County include the following new mitigation measure:

CC-2: The GHG Plan, dated May, 2011 shall be consulted and implemented at every phase as the project builds out. The measures are as follows...

3. In December 2011, a federal judge granted a preliminary injunction against California’s low carbon fuel standard. We suggest that the EIR discuss the possibility that certain statewide greenhouse gas reduction rules may be rescinded, and discuss the potential impact on the emissions reductions efforts of the Cordova Hills project.
4. The County should include a new mitigation measure requiring a revised AQMP be approved by the County in consultation with the District.

AQ-5: All amendments to the SPA shall include an analysis which quantifies to the extent practicable, the effect of the Amendment on ozone precursor emissions for the entire project. The amendment shall not increase ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project. The proponent shall consult with the SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.

5. As suggested in underline and strikeout, please clarify the following statement on page 5-20 regarding operational ozone precursor reductions to indicate that emissions reductions have not yet taken place:

~~With the construction of the Campus component during the early phases Emissions reductions were accomplished through the production of an Air Quality Management Plan⁹ (AQMP), which was designed to, the Cordova Hills project will achieve a minimum 35% emissions reduction under the AQMP (per guidance from SMAQMD, indicating that this represents the feasible mitigation that should be applied).~~

6. Currently, AQ-1 states that the Special Planning Area will be revised to "include language requiring all individual development projects to implement SMAQMD rules and mitigation pertinent to construction-related ozone precursors, as defined by the most current version of the SMAQMD Guide to Air Quality Assessment." As a backstop, we suggest including our current construction mitigation language, along with a statement that the project must comply with SMAQMD's mitigation in force at the time the project goes to build/becomes operational in case the mitigation requirements change.
7. Finally, the Cordova Hills circulation plan- in particular its access policy- should be carefully crafted in order to support goals of the Capital South East Connector Project.

In conclusion, the proper phasing of this project and development of a functioning University/College Campus are keys to ensuring that air quality and greenhouse gas mitigations are achieved. If there is no early Campus development commitment, the DEIR should be recirculated with an analysis of project impacts that assumes the Campus is not constructed. In the absence of a condition requiring early development of the Campus, the District will withdraw its approval of the AQMP and GHG Plans, because the revised project constitutes a significant change in the project analyzed in those Plans, and a new GHG and AQMP Plan should be developed in consultation with SMAQMD staff.

Again, we would like to thank the County and applicant for working with us early and often. We look forward to working in future to ensure greenhouse and ozone precursor reductions are achieved.

Sincerely,

Larry Greene
Executive Director
Sacramento Metropolitan Air Quality Management District

**Subject: Cordova Hills Greenhouse Gas Mitigation Plan- determination of technical adequacy
SAC200600987**

Dear Ms. Hocker:

SMAQMD has reviewed the May 2011 Cordova Hills Greenhouse Gas Mitigation Plan (GHG Plan, version received June 1, 2011) as well as its accompanying technical analysis. The GHG Plan narrative sufficiently describes the commitments which will allow Cordova Hills to meet the greenhouse gas CEQA threshold expectations that the County currently requires of the project. In addition, SMAQMD finds the GHG Plan technical analysis suitable for CEQA purposes. SMAQMD wishes to thank the County, and particularly the proponent, for their close consultation with SMAQMD throughout the development of the Plan.

SMAQMD would like to note that the County released revised greenhouse gas CEQA thresholds in mid-April 2011. Because this GHG Plan was developed over a long period of time, the County has allowed the proponent to use the previous thresholds. We would like to point out that the project would not meet the new thresholds, nor does it meet three thresholds currently required individually (instead, the project meets a threshold that combines all three into one). These facts are clearly and satisfactorily disclosed in the GHG Plan narrative.

In order for the Cordova Hills development to achieve the actual reductions committed to in this GHG Plan, each measure and policy must be codified in one or more of the following documents: development agreement, master plan, mitigation and monitoring report, urban services plan, financing plan, etc. Successful implementation will be verified by site visits and lead agency consultation. If any measure becomes obsolete or are no longer applicable, please contact us for assistance in identifying replacements.

Again, we thank the County and proponent for working so closely with us. Please do not hesitate to contact me if you have any questions or comments.

Sincerely,

Rachel DuBose

Statement of Endorsement

The above operational Air Quality Mitigation Plan for the project known as Cordova Hills (SAC200600987) has been found by the Sacramento Metropolitan Air Quality Management District to be consistent with the District's *Recommended Guidance for Land Use Emission Reductions v2.5* and meets the recommended level of emissions reduction for this type of project.

The District anticipates that implementation of the Mitigation Measures described in the plan will lead to a 35.32 percent or greater reduction in operational criteria emissions from the project.

Endorsed this 2nd day of June, 2011

Dear Mr. Alvarado:

We appreciated the opportunity to meet with you again last week to discuss the Cordova Hills project. As we discussed, SACOG has received several letters regarding Cordova Hills—we have identified four letters since 2007. In each case, the letters either followed up on, or resulted in, a meeting between SACOG and members of the Cordova Hills project team. SACOG staff, and I personally, also have had numerous other meetings and telephone calls with the Cordova Hills project team over the last few years. As I think you have acknowledged, SACOG has been willing to meet and discuss the project on all occasions. As a consequence, until last week we did not believe that there were any outstanding requests for information, meetings, or written responses. In fact, as discussed below, based on our conversation in August 2010, I believed that you understood and accepted SACOG's decision not to include Cordova Hills in the three Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) alternatives that were going to be vetted in the public workshop process last fall. In light of the foregoing, I am sending this letter only in response to your specific request last week that we put in writing the issues we have discussed in our many meetings. The letter provides a brief summary of the main questions and concerns we have raised about the suitability of including Cordova Hills in this MTP/SCS update cycle.

I will first say that in our many conversations about Cordova Hills we have noted several elements of the evolving land use plan and transportation system that we thought were consistent with SACOG's priorities, and we have made suggestions for refinements to the plan. The plan in its current form contains many elements that are consistent with principles we encourage our members and members of the development community to follow. We were particularly pleased to learn recently that you intend your project to be consistent with the smart growth criteria in the County draft updated General Plan. Notwithstanding the positive elements in the current plan, for over a year we have indicated that we did not believe Cordova Hills, at this juncture, would meet the criteria for inclusion in the current update to the Metropolitan Transportation Plan, which will for the first time include a Sustainability Communities Strategy that implements SB 375, a new state law.

In June 2010, SACOG published a memorandum titled "Method for Developing MTP Update Growth Projections" to help our members and stakeholders understand the federal and state rules, and SACOG priorities when developing the land use component of the MTP/SCS. Rather than repeat the examples of market and regulatory/policy issues that we address through this process, I am reattaching the memorandum for your information and reference.

Many in the development community who read this memorandum indicated that they better understood how we do our best to take into account all of the relevant market and regulatory/policy considerations that together drive the estimate of the likely future growth pattern for the planning period (2035 in this case). Many developers specifically acknowledged the limitations SACOG had including their project in this plan update, but wanted to work with us to develop a clear process for adding more lands to the plan in future updates. As mentioned above, you told me on August 10, 2010, after reading this memorandum that you could not argue with SACOG's decision not to include Cordova Hills in the three alternatives that were going to be vetted in the public workshop process that fall, but instead would work with us and hope to be included in the next update four years hence. Last week you stated that you would not have told me that had you understood the relevance of that decision to the SCS. Although we have tried to be clear about the integral connection between this MTP update and the SCS (a point that is made throughout the memorandum), I understand that SB 375 is a new law and that we are all climbing a learning curve as we implement it for the first time. For that reason, we have tried to make it very clear in our print materials and in the verbal presentations used in dozens of public focus groups and workshops, as well as at regular briefings with our Board and Committees over the last two years, how integrally connected the MTP and SCS would be.

The 2035 MTP/SCS is based on a growth forecast that projects a need to build approximately 300,000 new housing units in the six-county region by 2035. This forecast is lower than the one underpinning the current MTP by 145,000 housing units. This means that SACOG must find that many units to *subtract from* the projected growth pattern in the currently adopted MTP. This is a unique situation in this particular plan cycle, and it creates a very high bar for new projects to be added in this update that are not in the current MTP. The approximately 300,000 new housing units preliminarily identified to be included in the updated plan are located within developing communities, established communities, and centers and corridors. These communities have a planned capacity for approximately 500,000 units, which is nearly 70% of capacity beyond the projected 300,000 units of construction by 2035.

We consider a wide range of variables in trying to answer, to the best of our ability, the straightforward question: At this time, does it appear that Cordova Hills is more likely to be constructed during the 2035 planning horizon than the 300,000 plus units of housing projected to be built in our current draft—but also should it be preferred over the more than 150,000 housing units of additional capacity in other greenfield projects in various stages of planning around the region that also are not included in our draft plan documents? Many of these 150,000 other housing units not presently in the draft plan are in developments that have been included in locally adopted plans for some time, and some have either no, or relatively minor, outstanding federal permit issues.

Beyond the regional market demand and supply issue, the key questions and concerns specific to Cordova Hills that we have raised many times with you are briefly repeated below.

- **Federal Permits.** Both the U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service have jurisdiction on these lands through the Clean Water Act and Endangered Species Act. When asked to characterize the likelihood of securing the necessary federal permits under these two laws, Cordova Hills responded “it’s going to be a war.” While

that was obviously not to be taken literally, it unfortunately accurately foreshadowed the level of concern those two agencies have about this project. It also partially explains why, when the Blueprint map was adopted by the SACOG Board in December 2004, Sacramento County requested that a significant portion of the Cordova Hills site remaining as open or natural space. Moreover, while the County is working hard on the South Sacramento Habitat Conservation Plan (SSHCP), that document is not completed. One of the primary remaining outstanding issues relates to whether, and how, its resource conservation needs can be met for the Cordova Hills property given the current development plan. SACOG is a strong supporter of the SSHCP and we very much hope that it reaches a successful conclusion soon. However, recent conversations with the federal agencies confirm that there are substantial unresolved issues on the Cordova Hills site, especially that portion showing a planned 900,000 square foot commercial center fronting Grant Line Road and located in the heart of what the federal agencies consider to be a valuable vernal pool complex. The timing of the construction of Cordova Hills will remain in considerable doubt until these federal issues are resolved.

- **Commercial Center and Economic Viability.** While many aspects of the current land use plan have evolved and are now focused on building a self-contained and self-sustaining community (i.e., on-site housing substantially targeted at university students, staff, and faculty, and a series of paths to promote walking, biking, and the use of neighborhood electric vehicles for travel within the site), the large commercial center stands out as the exception. Project representatives repeatedly have said that it is sized and located not only to serve the needs of on-site residents, but a larger regional market, and have acknowledged that this will create longer distance car trips to the site. We have repeatedly raised questions about the market feasibility of a 900,000 square foot regional shopping center at that location, citing our studies showing that the region has an over 70-year supply of retail zoning now, including many other projects in the same general area that are also planning large quantities of retail. Cordova Hills consistently has told us that Cordova Hills is not economically viable without a large, regional shopping center. It has further indicated that because a large, regional shopping center on that site must have direct access to Grant Line Road it cannot be relocated to eliminate or reduce the impacts on the natural resources that the federal agencies are concerned about. Consequently, the retail center design and location creates a kind of double-bind for the project's feasibility. Our data lead us to be skeptical that the needed market demand to serve it will materialize. And it seems far from certain at this time that the project will be able to secure the needed federal permits soon, as long as the location and scale of the shopping center remain unchanged. We have suggested that a shopping center downsized to focus just on the needs of the project's residents would have both a smaller footprint and would not need to be located on Grant Line Road, in the middle of the natural resources. Cordova Hills has consistently maintained that those changes would render the project economically unviable. At the moment, it is not clear how the hard trade-offs related to the retail center are going to be successfully resolved to the mutual satisfaction of all the relevant parties.

- **University.** The planned university is a key component of this project, of course. It would be a wonderful asset to the County and region were it to be built. It is one of the few large-scale, new employers that can realistically create a relatively self-contained community, if planned and designed well. Our concerns about the university have nothing to do with its benefits, but rather, again, the current prospects for its construction given the growth forecast during the planning horizon. Finding, financing, and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region. Unfortunately, the planned institution, the University of Sacramento, recently withdrew their involvement in the project. We are aware that you are actively soliciting a replacement institution, but that you have not been able to secure a new commitment yet. Many of the short and multi-modal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all. Cordova Hills indicated in a recent discussion that if Sacramento County approves an entitlement for the project it very likely will attach a condition requiring the construction of the university before other substantial construction can occur. However, the uncertainty over whether a commitment from a 6,000 student, private university will be secured any time soon is another reason for us to conclude that, for this MTP/SCS update cycle, Cordova Hills does not meet the requirements we must follow to project a land use pattern that represents the most likely to be constructed for the region.

Given all of the above, SACOG staff has concluded, and continues to believe, that adding Cordova Hills to the MTP/SCS at this time is not justified, and that it would create risks for the timely adoption of the MTP/SCS and certification of the related EIR. I know you also understand that, since Cordova Hills was not included in the alternatives analysis, adding the project now would add several months, at a minimum, to our adoption process, with new public input, technical analysis, etc. required. It is important to emphasize, however, that most of the considerations listed here relate to practical obstacles that affect the suitability of including Cordova Hills in this plan update cycle. We certainly wish Cordova Hills the best in its worthy endeavor to secure a private university, and that it will be able to resolve the financial, transportation, and natural resources issues associated with the shopping center element of the land plan. Sacramento County appears headed towards adopting a new Growth Management Element to their General Plan, which will provide tighter linkage between projects approved according to their smart growth criteria and future MTPs/SCSs. As you know, we have supported the approach the Board of Supervisors tentatively approved last month—in particular, the important variables related to passenger vehicle greenhouse gas emissions and vehicle miles traveled that are so innovatively and effectively addressed through the smart growth criteria in the County draft plan. However, notwithstanding that support, federal and state law requires that the MTP/SCS be consistent with SACOG's regional forecast and its most reasonable estimate of what is likely to be built. We look forward to continuing our constructive discussions and reconsidering this proposal as it evolves and as our future plan updates include capacity for more years of growth, and presumably higher estimates for needed housing capacity in the region.

With regard to that final point, I want to reemphasize with you a portion of our discussion from last week. First, while I think we understand the general nature your concerns about including Cordova Hills in the MTP/SCS, you know that we do not agree with your conclusions about the

consequences of that determination. SB 375 was intended to create CEQA incentives for projects consistent with the MTP/SCS. We understand that Cordova Hills does not intend to avail itself of those benefits. Under those circumstances, SB 375 expressly states that the SCS does not regulate the use of land, does not supersede the exercise of local land use authority, and does not require a local government's land use policies and regulations, including its general plan, to be consistent with the MTP/SCS. Second, and perhaps most importantly, notwithstanding our strong commitment to facts and science, SACOG recognizes the limitations on our forecasting and modeling—we cannot predict market and regulatory forces with absolute certainty over a 20-year plus period. For this reason, the regular four-year updates of the plan are important. For the same reason, we understand that consistency with the MTP/SCS is not the only question regarding any project. Over the last decade, the region has embraced a Blueprint for growth in the region to 2050. We recognize that there are many projects consistent with that vision that, for a multitude and variety of reasons, will not be included in this MTP/SCS. Again, thank you for your time and we look forward to assisting you in the future.

Sincerely,

A handwritten signature in blue ink, appearing to read "Mike McKeever", with a stylized flourish at the end.

Mike McKeever

LETTER 18

Lauren Hocker
Department of Environmental Review
827 7th Street, Room 220,
Sacramento, California, 95814

Subject: Cordova Hills Draft Environmental Impact Report (CN# 2008-GPB-SDP-ZOB-AHP-00142)

Dear Ms. Hocker:

Sacramento Regional County Sanitation District (SRCSD) has reviewed the Cordova Hills DEIR and determined that the sections on sewer service within this document contain inaccurate or outdated information. Please revise these sections based on the following comments:

The Cordova Hills area is located outside the SRCSD Service Area. This area will need to be annexed into the SRCSD Service Area through the Sacramento Local Agency Formation Commission (LAFCo) in order to receive sewer service from SRCSD. The annexation process is to be initiated by the project proponent, not SRCSD.

Once annexed, local sewer service for the proposed project area will be provided by Sacramento Area Sewer District (SASD). Conveyance from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) will be provided by SRCSD through large pipelines called interceptors.

SRCSD is in the process of finalizing an Interceptor Sequencing Study that will aid SRCSD in planning and implementing regional conveyance projects and assists SASD in coordinating collection system facilities.

SRCSD sewer systems are designed using predicted wastewater flows that are dependent on land use information provided by each land use authority. Sewer studies, including points of connection and phasing information will need to be completed to fully assess the impacts of any project that has the potential to increase existing or future flow demands. Please remove any reference in this document regarding previous sewer studies, as they will need to be updated to reflect the most current information within the SASD System Capacity Plan and SRCSD planning documents.

Customers receiving service from SRCSD are responsible for rates and fees outlined within the latest SRCSD ordinances. SRCSD fees for connecting to the sewer system are set up to recover the capital investment of sewer and treatment facilities that serves new customers.

SRCSD is not a land-use authority. Projects identified within SRCSD planning documents are based on growth projections by land-use authorities. Onsite and offsite impacts associated with constructing sanitary sewers facilities to provide service to the subject project must be included in this environmental impact report.

There are incorrect statements regarding the design of the SRWTP within the subject document. The SRWTP provides secondary treatment using an activated sludge process. Incoming wastewater flows through mechanical bar screens through a primary sedimentation process. This allows most of the heavy organic solids to settle to the bottom of the tanks. These solids are later delivered to the digesters. Next, oxygen is added to the wastewater to grow naturally occurring microscopic organisms, which consume the organic particles in the

wastewater. These organisms eventually settle on the bottom of the secondary clarifiers. Clean water pours off the top of these clarifiers and is chlorinated, removing any pathogens or other harmful organisms that may still exist. Chlorine disinfection occurs while the wastewater travels through a two mile "outfall" pipeline to the Sacramento River, near the town of Freeport, California. Before entering the river, sulfur dioxide is added to neutralize the chlorine. The design of the SRWTP and collection system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. The SRWTP was designed to accommodate some wet weather flows while the storage basins and interceptors were designed to accommodate the remaining wet weather flows.

A new NPDES Discharge Permit was issued to Sacramento Regional County Sanitation District (SRCSD) by the Central Valley Regional Water Quality Control Board (Water Board) in December 2010. In adopting the new Discharge Permit, the Water Board required SRCSD to meet significantly more restrictive treatment levels over its current levels. SRCSD believes that many of these new conditions go beyond what is reasonable and necessary to protect the environment, and has appealed the permit decision to the State Water Resources Control Board. A decision on that appeal has not yet occurred. In the meantime, SRCSD is required to begin the necessary activities, studies and projects to meet the new permit conditions. All new treatment facilities must be completed by 2020. There are incorrect statements within the subject document regarding the permitted average dry weather flow (ADWF), permitted wet weather flow and the design capacity of the SRWTP. The SRWTP NPDES Permit adopted in December 2010 lists the permitted capacity as 181 mgd ADWF.

SRCSD currently owns and operates a 5-mgd Water Reclamation (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. A portion of the recycled water is used by SRCSD at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove.

The Cordova Hills DEIR's identified potential "Non-Potable Water" sources that could be used in its project area to meet non-potable water demands, e.g. landscape irrigation. SRCSD was referenced as a potential source of non-potable water, i.e. recycled water, in the *Non-Potable Water Master Plan for Cordova Hills (March 2011)*. It should be noted that SRCSD currently does not have any planned facilities that could provide recycled water to the proposed Cordova Hills project or its vicinity. Additionally, SRCSD is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers.

If you have any questions regarding these comments, please contact me at 916-876-9994

Sincerely,

Sarena Moore

Subject: Comments on the Cordova Hills Draft Environmental Impact Report

Sacramento Group

Dear Ms. Hack,

Shasta Group

Thank you for the opportunity to briefly comment on the DEIR for the Cordova Hills project. As a general comment, this is fundamentally a flawed project, located as it is on the fringe of the region's urban footprint, seven miles from light rail, surrounded by undeveloped land and outside the county's urban services boundary. Its remote location made it ineligible for inclusion in the Draft MTP/SCS; thus the project would hinder efforts of SACOG to achieve its targets under SB 375. The design of the project is inconsistent with efforts to develop the South Sacramento Habitat Conservation Plan since the proposed project would construct a shopping center in an important vernal pool area that federal agencies have indicated is needed for conservation under the SSHCP. In multiple ways the project fundamentally defies ongoing efforts by the region to achieve landscape level habitat conservation and responsible land use and transportation planning.

Sierra Nevada Group

Tahoe Group

Tuolumne Group

Yahi Group

Biological Resources

Yokuts Group

Much of the project's site is a high-value vernal pool area, a significant portion of which will be impacted by the project. An EIS will be required by USEPA, a 404 permit from the ACOE, and a Section 7 consultation with FWS, which must issue a favorable Biological Opinion. The EIS and these federal permits will dictate the final onsite habitat avoidance and offsite mitigation. While CEQA requires the provision of feasible mitigation, the DEIR defers mitigation for impacts to vernal pool wetlands and to listed species to future federal permits, thus denying key information to decision-makers and the public, violating the very essence of CEQA. A combined EIR/EIS would have presented a complete picture of avoidable and unavoidable impacts and complete information regarding how the project would avoid or mitigate for its impacts to biological resources.

Air Quality

The Sacramento Metropolitan Air Quality Management District noted in its letter dated June 2, 2011 that Cordova Hills had provided sufficient mitigation to reduce its emissions to meet the air district's guidelines. That determination was based in part on a university being part of the project, with a resulting positive effect on VMT. However, while the DEIR anticipates construction of the university during the initial phase, there appears to be no requirement that housing and commercial development proceed only if there is a commitment of a university to locate on the site and construction has begun.

In fact there are substantial reasons to doubt that the university component of the project will ever be a reality. A letter from SACOG dated October 7, 2011 and attached states, *"Finding, financing and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region."* And the letter goes on to state that, *"Many of the short trips and multimodal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all."*

Given the expressed concerns of SACOG, air quality impacts must be assessed both with and without the university. In order for the project to meet the SMAQMD emissions requirements the project should achieve a 35% reduction in emissions both with and without a university.

For further comments on the DEIR, we incorporate by reference those of the Environmental Council of Sacramento (ECOS), which you have already received. Please keep me on your list of interested parties who will receive notices as the review process for Cordova Hills moves forward.

Sincerely,

Terry Davis | Director

Attachment: SACOG Letter of October 7, 2011

October 7, 2011

Ron Alvarado
Partner
Conwy LLC
5241 Arnold Avenue
McClellan, CA 95652

Dear Mr. Alvarado:

We appreciated the opportunity to meet with you again last week to discuss the Cordova Hills project. As we discussed, SACOG has received several letters regarding Cordova Hills—we have identified four letters since 2007. In each case, the letters either followed up on, or resulted in, a meeting between SACOG and members of the Cordova Hills project team. SACOG staff, and I personally, also have had numerous other meetings and telephone calls with the Cordova Hills project team over the last few years. As I think you have acknowledged, SACOG has been willing to meet and discuss the project on all occasions. As a consequence, until last week we did not believe that there were any outstanding requests for information, meetings, or written responses. In fact, as discussed below, based on our conversation in August 2010, I believed that you understood and accepted SACOG's decision not to include Cordova Hills in the three Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) alternatives that were going to be vetted in the public workshop process last fall. In light of the foregoing, I am sending this letter only in response to your specific request last week that we put in writing the issues we have discussed in our many meetings. The letter provides a brief summary of the main questions and concerns we have raised about the suitability of including Cordova Hills in this MTP/SCS update cycle.

I will first say that in our many conversations about Cordova Hills we have noted several elements of the evolving land use plan and transportation system that we thought were consistent with SACOG's priorities, and we have made suggestions for refinements to the plan. The plan in its current form contains many elements that are consistent with principles we encourage our members and members of the development community to follow. We were particularly pleased to learn recently that you intend your project to be consistent with the smart growth criteria in the County draft updated General Plan. Notwithstanding the positive elements in the current plan, for over a year we have indicated that we did not believe Cordova Hills, at this juncture, would meet the criteria for inclusion in the current update to the Metropolitan Transportation Plan, which will for the first time include a Sustainability Communities Strategy that implements SB 375, a new state law.

In June 2010, SACOG published a memorandum titled "Method for Developing MTP Update Growth Projections" to help our members and stakeholders understand the federal and state rules, and SACOG priorities when developing the land use component of the MTP/SCS. Rather than repeat the examples of market and regulatory/policy issues that we address through this process, I am reattaching the memorandum for your information and reference.

Many in the development community who read this memorandum indicated that they better understood how we do our best to take into account all of the relevant market and regulatory/policy considerations that together drive the estimate of the likely future growth pattern for the planning period (2035 in this case). Many developers specifically acknowledged the limitations SACOG had including their project in this plan update, but wanted to work with us to develop a clear process for adding more lands to the plan in future updates. As mentioned above, you told me on August 10, 2010, after reading this memorandum that you could not argue with SACOG's decision not to include Cordova Hills in the three alternatives that were going to be vetted in the public workshop process that fall, but instead would work with us and hope to be included in the next update four years hence. Last week you stated that you would not have told me that had you understood the relevance of that decision to the SCS. Although we have tried to be clear about the integral connection between this MTP update and the SCS (a point that is made throughout the memorandum), I understand that SB 375 is a new law and that we are all climbing a learning curve as we implement it for the first time. For that reason, we have tried to make it very clear in our print materials and in the verbal presentations used in dozens of public focus groups and workshops, as well as at regular briefings with our Board and Committees over the last two years, how integrally connected the MTP and SCS would be.

The 2035 MTP/SCS is based on a growth forecast that projects a need to build approximately 300,000 new housing units in the six-county region by 2035. This forecast is lower than the one underpinning the current MTP by 145,000 housing units. This means that SACOG must find that many units to *subtract from* the projected growth pattern in the currently adopted MTP. This is a unique situation in this particular plan cycle, and it creates a very high bar for new projects to be added in this update that are not in the current MTP. The approximately 300,000 new housing units preliminarily identified to be included in the updated plan are located within developing communities, established communities, and centers and corridors. These communities have a planned capacity for approximately 500,000 units, which is nearly 70% of capacity beyond the projected 300,000 units of construction by 2035.

We consider a wide range of variables in trying to answer, to the best of our ability, the straightforward question: At this time, does it appear that Cordova Hills is more likely to be constructed during the 2035 planning horizon than the 300,000 plus units of housing projected to be built in our current draft—but also should it be preferred over the more than 150,000 housing units of additional capacity in other greenfield projects in various stages of planning around the region that also are not included in our draft plan documents? Many of these 150,000 other housing units not presently in the draft plan are in developments that have been included in locally adopted plans for some time, and some have either no, or relatively minor, outstanding federal permit issues.

Beyond the regional market demand and supply issue, the key questions and concerns specific to Cordova Hills that we have raised many times with you are briefly repeated below.

- **Federal Permits.** Both the U.S. Army Corps of Engineers and U.S. Fish and Wildlife Service have jurisdiction on these lands through the Clean Water Act and Endangered Species Act. When asked to characterize the likelihood of securing the necessary federal permits under these two laws, Cordova Hills responded “it’s going to be a war.” While

that was obviously not to be taken literally, it unfortunately accurately foreshadowed the level of concern those two agencies have about this project. It also partially explains why, when the Blueprint map was adopted by the SACOG Board in December 2004, Sacramento County requested that a significant portion of the Cordova Hills site remaining as open or natural space. Moreover, while the County is working hard on the South Sacramento Habitat Conservation Plan (SSHCP), that document is not completed. One of the primary remaining outstanding issues relates to whether, and how, its resource conservation needs can be met for the Cordova Hills property given the current development plan. SACOG is a strong supporter of the SSHCP and we very much hope that it reaches a successful conclusion soon. However, recent conversations with the federal agencies confirm that there are substantial unresolved issues on the Cordova Hills site, especially that portion showing a planned 900,000 square foot commercial center fronting Grant Line Road and located in the heart of what the federal agencies consider to be a valuable vernal pool complex. The timing of the construction of Cordova Hills will remain in considerable doubt until these federal issues are resolved.

- **Commercial Center and Economic Viability.** While many aspects of the current land use plan have evolved and are now focused on building a self-contained and self-sustaining community (i.e., on-site housing substantially targeted at university students, staff, and faculty, and a series of paths to promote walking, biking, and the use of neighborhood electric vehicles for travel within the site), the large commercial center stands out as the exception. Project representatives repeatedly have said that it is sized and located not only to serve the needs of on-site residents, but a larger regional market, and have acknowledged that this will create longer distance car trips to the site. We have repeatedly raised questions about the market feasibility of a 900,000 square foot regional shopping center at that location, citing our studies showing that the region has an over 70-year supply of retail zoning now, including many other projects in the same general area that are also planning large quantities of retail. Cordova Hills consistently has told us that Cordova Hills is not economically viable without a large, regional shopping center. It has further indicated that because a large, regional shopping center on that site must have direct access to Grant Line Road it cannot be relocated to eliminate or reduce the impacts on the natural resources that the federal agencies are concerned about. Consequently, the retail center design and location creates a kind of double-bind for the project's feasibility. Our data lead us to be skeptical that the needed market demand to serve it will materialize. And it seems far from certain at this time that the project will be able to secure the needed federal permits soon, as long as the location and scale of the shopping center remain unchanged. We have suggested that a shopping center downsized to focus just on the needs of the project's residents would have both a smaller footprint and would not need to be located on Grant Line Road, in the middle of the natural resources. Cordova Hills has consistently maintained that those changes would render the project economically unviable. At the moment, it is not clear how the hard trade-offs related to the retail center are going to be successfully resolved to the mutual satisfaction of all the relevant parties.

- **University.** The planned university is a key component of this project, of course. It would be a wonderful asset to the County and region were it to be built. It is one of the few large-scale, new employers that can realistically create a relatively self-contained community, if planned and designed well. Our concerns about the university have nothing to do with its benefits, but rather, again, the current prospects for its construction given the growth forecast during the planning horizon. Finding, financing, and constructing a private 6,000 student institution of higher learning rates very high on the degree of difficulty scale, especially in this economic environment. It has never been done in this region. Unfortunately, the planned institution, the University of Sacramento, recently withdrew their involvement in the project. We are aware that you are actively soliciting a replacement institution, but that you have not been able to secure a new commitment yet. Many of the short and multi-modal trips from the project will turn into longer distance car trips if the university is not constructed early in the project, or at all. Cordova Hills indicated in a recent discussion that if Sacramento County approves an entitlement for the project it very likely will attach a condition requiring the construction of the university before other substantial construction can occur. However, the uncertainty over whether a commitment from a 6,000 student, private university will be secured any time soon is another reason for us to conclude that, for this MTP/SCS update cycle, Cordova Hills does not meet the requirements we must follow to project a land use pattern that represents the most likely to be constructed for the region.

Given all of the above, SACOG staff has concluded, and continues to believe, that adding Cordova Hills to the MTP/SCS at this time is not justified, and that it would create risks for the timely adoption of the MTP/SCS and certification of the related EIR. I know you also understand that, since Cordova Hills was not included in the alternatives analysis, adding the project now would add several months, at a minimum, to our adoption process, with new public input, technical analysis, etc. required. It is important to emphasize, however, that most of the considerations listed here relate to practical obstacles that affect the suitability of including Cordova Hills in this plan update cycle. We certainly wish Cordova Hills the best in its worthy endeavor to secure a private university, and that it will be able to resolve the financial, transportation, and natural resources issues associated with the shopping center element of the land plan. Sacramento County appears headed towards adopting a new Growth Management Element to their General Plan, which will provide tighter linkage between projects approved according to their smart growth criteria and future MTPs/SCSs. As you know, we have supported the approach the Board of Supervisors tentatively approved last month—in particular, the important variables related to passenger vehicle greenhouse gas emissions and vehicle miles traveled that are so innovatively and effectively addressed through the smart growth criteria in the County draft plan. However, notwithstanding that support, federal and state law requires that the MTP/SCS be consistent with SACOG's regional forecast and its most reasonable estimate of what is likely to be built. We look forward to continuing our constructive discussions and reconsidering this proposal as it evolves and as our future plan updates include capacity for more years of growth, and presumably higher estimates for needed housing capacity in the region.

With regard to that final point, I want to reemphasize with you a portion of our discussion from last week. First, while I think we understand the general nature your concerns about including Cordova Hills in the MTP/SCS, you know that we do not agree with your conclusions about the

consequences of that determination. SB 375 was intended to create CEQA incentives for projects consistent with the MTP/SCS. We understand that Cordova Hills does not intend to avail itself of those benefits. Under those circumstances, SB 375 expressly states that the SCS does not regulate the use of land, does not supersede the exercise of local land use authority, and does not require a local government's land use policies and regulations, including its general plan, to be consistent with the MTP/SCS. Second, and perhaps most importantly, notwithstanding our strong commitment to facts and science, SACOG recognizes the limitations on our forecasting and modeling—we cannot predict market and regulatory forces with absolute certainty over a 20-year plus period. For this reason, the regular four-year updates of the plan are important. For the same reason, we understand that consistency with the MTP/SCS is not the only question regarding any project. Over the last decade, the region has embraced a Blueprint for growth in the region to 2050. We recognize that there are many projects consistent with that vision that, for a multitude and variety of reasons, will not be included in this MTP/SCS. Again, thank you for your time and we look forward to assisting you in the future.

Sincerely,

Mike McKeever
Chief Executive Officer

LETTER 20

Catherine Hack, Environmental Coordinator
Sacramento County Division of Environmental Review
827 7th Street, Room 220
Sacramento, California 95814

RE: Cordova Hills Draft Environmental Impact Report

Dear Ms. Hack:

Thank you for the opportunity to provide comments on the Cordova Hills Draft Environmental Impact Report. These comments are submitted on behalf of the Capital SouthEast Connector Joint Powers Authority (Connector JPA).

The Capital SouthEast Connector (Connector) is a proposed multi-modal transportation project within a 35 - mile service area that spans two Counties (Sacramento and El Dorado) and links the Cities of Elk Grove, Rancho Cordova, Folsom and the community of El Dorado Hills. These communities and the contiguous study area define the Connector corridor. The project is intended to be developed and operated as a local facility (non Caltrans) but to provide a higher degree of mobility, safety, and mode choice than most local area roadways.

The Connector project will link residential areas and employment centers in the Corridor, serve both local and regional travel, and relieve congestion on the heavily congested existing roadways, all while preserving open space and habitat. The Connector Project will also provide new options for bicycle, pedestrian, transit, and automobile mobility throughout the corridor to address the increased travel demand. This project was included in the 2004 voter approved Measure A half cent sales tax renewal expenditure plan.

The Connector corridor extends from the Hood-Franklin Road interchange on I-5 in Sacramento County on the west, through the City of Elk Grove, unincorporated Sacramento County, the City of Rancho Cordova, the southern sphere of influence of the City of Folsom (mostly in Sacramento County), then through El Dorado County, terminating in the east at U.S. Highway 50 (U.S. 50) in the vicinity of Silva Valley Parkway.

In October, 2011, the Connector JPA Board of Directors selected the Grant Line Road alignment as its preferred alignment for the project and certified the Program Environmental Impact Report (PEIR) for that route. That alignment utilizes mostly existing roadway right of ways that include Kammerer Road, Grant Line Road, and White Rock Road. A technical clarification initiated a recirculation in December, 2011, but the PEIR is expected to be recertified in March, 2012 adopting that same alignment.

As part of that PEIR process, the Connector identified preferred access locations to adjacent roadways and land use in the immediate vicinity of the proposed Cordova Hills Special Planning Area (SPA). In this segment of the Connector, the PEIR analyzed an expressway configuration as the preferred functional cross section to provide for the necessary Level of Service and safety needs of the future corridor. This expressway configuration constitutes four through travel lanes in a 200' wide limited access right of way with very restrictive access allowed only at designated locations. Grade separations have been identified as the means to provide for accommodation of future volumes as noted in Table 16-13 of the PEIR, (copy attached) once planned growth and resulting traffic volumes justify.

Recognizing that the proposed access to the Cordova Hills SPA would not be compatible with the desired intersection/interchange spacing of the proposed expressway configuration of the Connector, JPA staff advised both the applicant and the County of Sacramento in writing, dated December, 2009, that an alternative connection for the northern access point to the Cordova Hills SPA should be reconfigured to eliminate its intersection with Grant Line Road. The letter further stated that if the Grant Line Road alignment was chosen as the preferred route for the Connector, the three major access points in the vicinity of the project would be Douglas Road, Crysanthus Road, and University Road under the planned expressway configuration.

Despite this expressed concern, the Connector project was not considered a "foreseeable project" at the time of the release of the Notice of Preparation (NOP) for the Cordova Hills SPA EIR, and the current Sacramento County General Plan designation for this section of Grant Line Road was used in the existing, existing plus project, cumulative, and cumulative plus project traffic analyses. The JPA feels this failure to recognize the Connector is in error in that activity on the PEIR for the Connector was initiated well in advance of the work on the Cordova Hills EIR and that the NOP for the Connector preceded the release of the NOP for Cordova Hills by six months. It is unclear as to the reasons why there was no mention of even the potential for an access conflict as expressed in the Traffic and Circulation chapter of the Cordova Hills EIR, given the aforementioned notice and understanding by the parties involved of the potential for the incompatibility of this access.

Although the aforementioned Cordova Hills DEIR traffic analysis does not acknowledge the proposed Connector expressway configuration, it is recognized in Chapter 18 of that DEIR under Cumulative and Growth Inducing Impacts. Under the Traffic and Circulation section on page 18-12, the issue of incompatibility involving the northern access to the project is clearly outlined both in text and in Tables CU-2 and CU-3. Both of these tables indicate that given the high probability that an expressway configured Connector will ultimately be constructed across the project frontage, both the spacing and operating conditions of the current North Loop Road access will result in unacceptable levels of service to both Connector JPA and County of Sacramento standards.

Presently, discussions between the applicant and JPA staff have resulted in only concept designs that require additional analysis to confirm their legitimacy. Some of these solutions may require the support of not only the applicant but of the land use authority(s) adjacent to the preferred Connector corridor. Additional refinement of these alternative accesses is considered essential before one might be considered applicable.

The Connector JPA strongly believes that a mitigation measure that resolves this conflict and improves operating conditions to acceptable levels for both the County of Sacramento and the Connector JPA be fully investigated and required as a part of the environmental process and the project approvals. Only with this assurance can the Connector project advance forward with the certainty that the Cordova Hills SPA will not compromise its viability as a regional transportation asset.

Sincerely,

Tom Zlotkowski
Executive Director
Capital SouthEast Connector JPA

MITIGATION MONITORING AND REPORTING PROGRAM

CONTROL NUMBER: PLNP2008-GPB-SDP-ZOB-AHP-00142

NAME: Cordova Hills

LOCATION: The project site is located in the southeastern portion of Sacramento County on approximately 2,669 acres on the eastern side of Grant Line Road, and south of Glory Lane.

ASSESSOR'S PARCEL NUMBER: 073-0040-020 through -026, 073-0040-029, 073-0050-023, and 073-0050-052

OWNER:

Conwy, LLC; Cielo LLC; and Grantline
LLC
Attn: Ron Alvarado

APPLICANT:

Cordova Hills Ownership Group
Attn: Ron Alvarado

PROJECT DESCRIPTION:

1. A **General Plan Amendment** to move the Urban Policy Area (UPA) boundary east to include approximately 2,366.3 acres of the Cordova Hills site.

2. A **General Plan Amendment** to amend the Land Use Diagram from General Agriculture to Low Density Residential, Medium Density Residential, Commercial and Office, Recreation, Natural Preserve, and Public/Quasi Public for approximately 2,366.3 acres.
3. A **General Plan Amendment** to include a new policy in the Land Use Element to address the provision of limited public water service to serve uses potentially allowed by the Cordova Hills Special Planning Area for 251 acres located in proximity to the Kiefer Landfill, and an Amendment to LU-1 to reference this exception.
4. **Amend the General Plan Transportation Plan** to show new thoroughfares, arterials and collectors as shown in the Transportation General Plan Amendment Diagram dated October 17, 2011.
5. **Amend the Bikeway Master Plan to add on- and off-street bikeways** as shown in the Bikeways Master Plan Amendment Diagram dated October 17, 2011.
6. A **Zoning Ordinance Amendment** to adopt the Cordova Hills Special Planning Area (SPA) to incorporate a Master Plan including Design Guidelines and Development Standards. The SPA consists of a total of 2,668.7 acres in three distinct areas:
 - a. Cordova Hills urban areas – 2,119.7 acres
 - b. University/College Campus Center – 246.6 acres
 - c. Buffer lands and floodplain outside the Urban Policy Area – 302.4 acres. The areas will be designated Agriculture, Recreation (sports park), and Avoidance in the SPA.
7. A **Large Lot Tentative Subdivision Map** to create 155 large parcels for the purpose of creating legal parcels corresponding to villages within Cordova Hills SPA and within the approximately 2,668.7-acre SPA.
8. An **Affordable Housing Plan** consisting of on-site construction of affordable units and/or land dedication.
9. A **Development Agreement** by and between the County of Sacramento and the landowners.
10. **Adoption of a Public Facilities Financing Plan** for Cordova Hills that includes a Capital Improvement Program and Financing Plan.
11. A **Street Resolution** to allow certain County streets within the Cordova Hills Land Use Master Plan to be based on less than a 40-foot right-of-way, pursuant to the State Streets and Highways Code Section 906.
12. **Zone 40 Boundary:** Amend Zone 40 boundary to include the 251 +/- acres of the Cordova Hills project which lies outside of the Urban Services Boundary.
13. **Zone 41 Boundary:** Amend Zone 41 boundary to include 251 +/- acres of the Cordova Hills project which lies outside of the Urban Services Boundary.

14. Adoption of the Cordova Hills Water Supply Master Plan Amendment:

Amends the existing Zone 40 Water Supply Master Plan to include provision of water service to Cordova Hills.

IMPLEMENTATION

The project applicant/owner shall create a “Mitigation Monitoring and Reporting Program” section in the Cordova Hills SPA Master Plan, which includes all of the mitigation measures, along with all numbered implementation and verification measures. The following mitigation measures contained within the EIR specified that changes should be made to the policy language of the SPA: AE-1, AQ-1, AQ-2, AQ-3, AQ-4, and CC-1. It is important to ensure that the measures are immediately implemented (i.e. that the changes to the SPA occur) and to provide a mechanism to verify that the actions required by those measures occur (e.g. that appropriate fixtures pursuant to measure AE-1 are installed). To this end, the list below provides the changes which must be made to the SPA prior to recordation of the MMRP, while the Mitigation Measures AE-1, etc which will be incorporated into the Mitigation Monitoring and Reporting Program section of the SPA do not contain the direction to amend the SPA.

The following policies shall be incorporated into the Cordova Hills SPA Master Plan prior to recordation of the MMRP, to the satisfaction of the Environmental Coordinator:

- All lighting applications subject to the 2008 Building Efficiency Standards Section 147 shall use fixtures approved by the International Dark Sky Association.
- All individual development projects shall implement Sacramento Metropolitan Air Quality Management District rules and mitigation pertinent to construction-related ozone precursor emissions, as defined by the most current version of the Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment.
- All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.
- Buffers shall be established on a project-by-project basis and incorporated during permit or project review to provide for buffer separations between sensitive land uses and sources of air pollution or odor. The California Air Resources Board’s “Air Quality and Land Use Handbook: A Community Health Perspective”, or more current document, shall be utilized when establishing these buffers. Sensitive uses include schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency for people (this includes both single- and multiple-family). The buffers shall be applied to the source of air pollution or odor, and shall be established based either on proximity to existing sensitive

uses or proximity to the property boundary of land designated for sensitive uses. Buffers current at the time of the establishment of this SPA indicate that sensitive uses should be:

- A. A least 500 feet from auto body repair services.
 - B. At least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons.
 - C. At least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC, including furniture manufacturing and repair services.
- The western perimeter of the Sports Park and University/College Campus Center (where these are within 2,000 feet of the Kiefer landfill) include a minimum 25-foot-wide landscaping area. This landscaping area shall include a dense mix of trees and shrubs, to screen the uses from the landfill. Acceptable tree species include those expected to reach minimum heights of 40 feet.
 - All amendments to the SPA with the potential to change SPA-wide GHG emissions shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on SPA-wide greenhouse gas emissions. The Amendment shall not increase SPA-wide greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, in consultation with SMAQMD.

In addition to the above policies, the requirements of the Air Quality Mitigation Plan dated June 1, 2011 shall also be incorporated into the Cordova Hills SPA, and Appendix NO-1 of the November 2012 FEIR for the Project shall be incorporated as an Appendix of the Cordova Hills SPA. The Environmental Coordinator will review the Cordova Hills SPA Master Plan and ensure that the above language has been appropriately incorporated prior to recordation of the MMRP.

PURPOSE AND PROCEDURES

Pursuant to Section 21081.6 of the Public Resources Code and Chapter 20.02 of the Sacramento County Code, a Mitigation Monitoring and Reporting Program has been established for the project entitled Cordova Hills **(Control Number: PLNP2008-GPB-SDP-ZOB-AHP-00142)**.

PURPOSE

The purpose of this program is to assure diligent and good faith compliance with the Mitigation Measures which have been recommended in the environmental document, and adopted as part of the project or made conditions of project approval, in order to avoid or mitigate potentially significant effects on the environment.

NOTIFICATION AND COMPLIANCE

It shall be the responsibility of the project applicant/owner to provide written notification to the Environmental Coordinator, in a timely manner, of the completion of each Mitigation Measure as identified on the following pages. The Environmental Coordinator will verify that the project is in compliance with the adopted Mitigation Monitoring and Reporting Program (MMRP). Any non-compliance will be reported to the project applicant/owner, and it shall be the project applicant's/owner's responsibility to rectify the situation by bringing the project into compliance and re-notifying the Environmental Coordinator. Any indication that the project is proceeding without good-faith compliance could result in the imposition of administrative, civil and/or criminal penalties upon the project applicant/owner in accordance with Chapter 20.02 of the Sacramento County Code.

PAYMENT

It shall be the responsibility of the project applicant/property owner to reimburse the County for all expenses incurred in the implementation of the Mitigation Monitoring and Reporting Program (MMRP), including any necessary enforcement actions. The applicant/property owner shall pay an initial deposit of **\$15,000.00**. This deposit includes administrative costs of **\$800.00**, which must be paid to the Department of Community Development, Planning and Environmental Review Division **prior to recordation of the MMRP and prior to recordation of any final parcel or subdivision map. The remaining balance will be due prior to review of any plans by the Environmental Coordinator or issuance of any building or grading permits.** Over the course of the project, Department of Community Development, Planning and Environmental Review Division will regularly conduct cost accountings and submit invoices to the applicant/property owner when the County monitoring costs exceed the initial deposit.

RECORDATION

In order to record the adopted Mitigation Monitoring and Reporting Program with the County Recorder as required by Section 20.02.050(b)(2) of the Sacramento County Code, the project applicant/owner shall provide to the Environmental Coordinator a Legal Description for the real property that is the subject of the project.

COMPLETION

Pursuant to Section 20.02.060 of the Sacramento County Code, upon the determination of the Environmental Coordinator that compliance with the terms of the approved Mitigation Monitoring and Reporting Program has been achieved, and that there has been full payment of all fees for the project, the Environmental Coordinator shall record and issue a Program Completion Certificate for the project.

PROPERTY TRANSFER

The requirements of this adopted Program run with the real property that is the subject of the project, as described in Exhibit A. Successive owners, heirs and assigns of this real property are bound to comply with all of the requirements of the adopted Program.

Prior to any lease, sale, transfer or conveyance of any portion of the real property that is the subject of the project, the record owner(s) at the time of the application for the project, or his or her successor's in interest, shall provide a copy of the adopted Program to the prospective lessee, buyer, transferee, or one to whom the conveyance is made.

PENALTIES

Chapter 20.02 of the Sacramento County Code permits civil remedies and criminal penalties to be imposed in the event of non-compliance with an adopted Mitigation Monitoring and Reporting Program. The civil remedies, which are found in Section 20.02.090 of the Sacramento County Code, include injunctive relief, stop work orders, revocation of any special permit granted concurrently with the approval of a Program, and the abatement of any resulting nuisance. The criminal penalties, which are found in Section 20.02.080 of the Sacramento County Code, include a fine not to exceed five hundred dollars or imprisonment in the County jail not to exceed six months, or both.

Plans that are inconsistent with the adopted Mitigation Measures will not be approved.

In the event of an ongoing, serious non-compliance issue, the Environmental Coordinator may call for a "stop work order" on the project or phase.

STANDARD PROVISIONS

Page one of all Project Plans within the Cordova Hills boundaries must include the following statement in a conspicuous location:

“All Plans associated with this project are subject to the conditions of Mitigation Monitoring and Reporting Program 2008-GPB-SDP-ZOB-AHP-00142. For any questions regarding compliance with the MMRP document, contact MMRP staff at (916) 874-7914.”

All Project Plans and any revisions to those Plans shall be in full compliance with the adopted Mitigation Monitoring and Reporting Program (MMRP). The project applicant/owner shall submit one copy of all such Plans and any revisions to the Environmental Coordinator prior to final approval by the Sacramento County Building Permits and Inspection Division (BPID) or Site Improvement and Permit Section (SIPS). If the Environmental Coordinator determines that the Plans are not in full compliance with the adopted MMRP, the Plans shall be returned to the project applicant/owner with a letter specifying the items of non-compliance, and instructing the applicant/owner to revise the Plans, and then resubmit one copy of the revised Plans to the Environmental Coordinator, for determination of compliance, prior to final approval by BPID or SIPS.

Additionally, the project applicant/owner shall notify the Environmental Coordinator **no later than 48 hours** prior to the start of construction and no later than 24 hours after its completion. The applicant/owner shall notify the Environmental Coordinator no later than 48 hours prior to any/all Final Inspection(s) by the County of Sacramento.

☐ MITIGATION MEASURE AE-1: LIGHTING

All lighting applications subject to the 2008 Building Efficiency Standards Section 147 shall use fixtures approved by the International Dark Sky Association.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit a list of proposed fixtures along with documentation indicating that they are approved by the International Dark Sky Association to the Planning and Environmental Review Division for approval. Once approved and the fixtures have been purchased, submit receipts or other proofs of purchase to the Planning and Environmental Review Division.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other submitted documentation prior to the start of construction. Approve Project Plans and other documentation that are determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE AG-1: RIGHT-TO-FARM NOTICE

The applicant shall disclose to all prospective buyers of properties within 500 feet of the northern property boundary that they could be subject to inconvenience or discomfort resulting from accepted farming practices as per provisions of the County Right-To-Farm Ordinance and shall include a Note on all final maps disclosing the Right-To-Farm Ordinance.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit documentation which demonstrates that notification has been given consistent with this measure.

Verification (Action by the Environmental Coordinator):

1. Review the final maps for consistency with this measure, along with any other submitted documentation, and approve final maps which are compliant.

☐ MITIGATION MEASURE AG-2: CONTINUANCE OF AGRICULTURE

The applicant shall enter into an agreement with an agricultural operator to maintain grazing use, or other more intensive use, on the land which is subject to Williamson Act contract 72-AP-109. Agricultural use shall be maintained until Williamson Act contract expiration. Documentation of this agreement shall be submitted to the Environmental Coordinator prior to approval of the zoning agreement for the Williamson Act contracted property.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. If for any reason the agreement with the agricultural operator is terminated or the operator violates the agreement by failure to maintain agricultural use, the condition shall be remedied within 30 days. If circumstances are such that the applicant finds this timeframe to be infeasible, then the applicant shall submit documentation which demonstrates infeasibility, to the satisfaction of the Environmental Coordinator. The applicant shall concurrently submit documentation which demonstrates a good faith effort to remedy the situation in as short a timeframe as possible.

Verification (Action by the Environmental Coordinator):

1. Review submitted documentation for compliance with the measure, and approve the documentation if deemed sufficient. This measure may be deleted after the Williamson Contract expires (in February 2016).

☐ MITIGATION MEASURE AG-3: AGRICULTURAL LAND REPLACEMENT

Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, the applicant shall offset the loss of 8.6 acres of Unique Farmland and 242.4 acres of Grazing Land through 1:1 preservation of farmland within a permanent conservation easement. Preservation land must be in-kind or of similar resource value.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit documentation which demonstrates measure compliance to the Environmental Coordinator for review and approval.

Verification (Action by the Environmental Coordinator):

1. Review submitted documentation and, if deemed sufficient, approve project plans/maps which are consistent with the measure.

☐ MITIGATION MEASURE AQ-1: CONSTRUCTION AIR QUALITY

All individual development projects shall implement Sacramento Metropolitan Air Quality Management District rules and mitigation pertinent to construction-related ozone precursor emissions, as defined by the most current version of the Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work, and coordinate with SMAQMD, as necessary, to verify compliance.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE AQ-2: OPERATIONAL AIR QUALITY

Comply with the provisions of the Air Quality Mitigation Plan dated June 1, 2011. All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project and shall achieve the original 35% reduction in total overall project emissions. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure, including submittal of documentation which may be requested by the Environmental Coordinator in order to demonstrate compliance.
2. Upon submittal of an SPA Amendment application, supply all technical information requested by the Environmental Coordinator in order to determine whether a revised AQMP is required.

Verification (Action by the Environmental Coordinator):

1. Review all project plans for compliance with the Air Quality Management Plan.
2. Review all proposed SPA Amendments for compliance with this measure, and coordinate with SMAQMD on a revised analysis if necessary.
3. Review and approve any revised AQMP, if one is prepared which is deemed satisfactory, and amend Measure AQ-2 to reflect the new AQMP date, as appropriate, as part of the SPA Amendment.

☐ MITIGATION MEASURE AQ-3: BUFFERS FOR SENSITIVE USES

Buffers shall be established on a project-by-project basis and incorporated during permit or project review to provide for buffer separations between sensitive land uses and sources of air pollution or odor. The California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective", or more current document, shall be utilized when establishing these buffers. Sensitive uses include schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency for people (this includes both single- and multiple-family). The buffers shall be applied to the source of air pollution or odor, and shall be established based either on proximity to existing sensitive uses or proximity to the property boundary of land designated for sensitive uses. Buffers current at the time of the establishment of this SPA indicate that sensitive uses should be:

- A. At least 500 feet from auto body repair services.
- B. At least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons.
- C. At least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC, including furniture manufacturing and repair services.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure.
- 2. Incorporate the above measure into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).

Verification (Action by the Environmental Coordinator):

- 1. Review submitted improvement plans or other maps to ensure compliance with this measure, and approve all plans determined to be in compliance.

☐ MITIGATION MEASURE AQ-4: LANDSCAPING BUFFER FROM KIEFER

The western perimeter of the Sports Park and University/College Campus Center (where these are within 2,000 feet of the Kiefer landfill) shall include a minimum 25-foot-wide landscaping area. This landscaping area shall include a dense mix of trees and shrubs, to screen the uses from the landfill. Acceptable tree species include those expected to reach minimum heights of 40 feet.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-1: WETLAND COMPENSATION

To compensate for the permanent loss of wetlands, the applicant shall perform one or a combination of the following prior to issuance of building permits, and shall also obtain all applicable permits from the Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Central Valley Regional Water Quality Control Board, and the California Department of Fish and Game:

- A. Where a Section 404 Permit has been issued by the Army Corps of Engineers, or an application has been made to obtain a Section 404 Permit, the Mitigation and Management Plan required by that permit or proposed to satisfy the requirements of the Corps for granting a permit may be submitted for purposes of achieving a no net-loss of wetlands. The required Plan shall be submitted to the Sacramento County Environmental Coordinator, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service for approval prior to its implementation.
- B. If regulatory permitting processes result in less than a 1:1 compensation ratio for loss of wetlands, the Project applicant shall demonstrate that the wetlands which went unmitigated/uncompensated as a result of permitting have been mitigated through other means. Acceptable methods include payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.
- C. The Project applicant may participate in the South Sacramento Habitat Conservation Plan if it is adopted, and if the Project area and activities are covered. The applicant shall prepare Project plans in accordance with that Plan and any and all fees or land dedications shall be completed prior to construction.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit documentation which demonstrates compliance with this measure to the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review submitted documentation and Project Plans prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-2: WETLAND PROTECTION

Prior to issuance of building permits, all areas designated within the SPA as Avoided shall be placed within a permanent conservation easement, which shall be reviewed and approved by the Environmental Coordinator. At a minimum, the permanent conservation easements must cover all areas which are required to be preserved as part of the Section 404 and Section 401 wetland permits.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit documentation which demonstrates that the easements have been established to the Environmental Coordinator.
3. All Project Plans must show conservation easements if they are located adjacent to the project construction site, along with a Construction Note indicating that all construction activity is prohibited in these areas (including stockpiling, storing equipment/vehicles, driving of vehicles, and other disturbance activities).

Verification (Action by the Environmental Coordinator):

1. Review the submitted documentation and Project Plans prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-3: RAPTOR SURVEYS

If construction, grading, or Project-related improvements are to occur between March 1 and September 15, a focused survey for tree- or ground-nesting raptors within 500 feet of the construction site (1/2-mile for Swainson's hawk) and for ground-nesting grasshopper sparrow shall be conducted by a qualified biologist within 14 days prior to the start of construction work (including clearing and grubbing). If active nests are found, the California Department of Fish and Game shall be contacted to determine appropriate protective measures. If no active nests are found during the focused survey, no further mitigation will be required.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit a nesting survey report, prepared by a qualified biologist, to the Environmental Coordinator for review and approval prior to the start of construction work. In the event that nests are found and consultation with Fish and Game is initiated, submit documentation describing the outcome of the coordination to the Environmental Coordinator prior to the start of construction work. This documentation must include the name(s) of Fish and Game staff members who were contacted and a description of the protective measures or other actions which were scoped and agreed to by the agency.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-4: SWAINSON'S HAWK

Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, implement one of the options below to mitigate for the loss of Swainson's hawk foraging habitat on the Project site; based on current Project designs this is 2,267 acres. Based on current designs, this can be reduced to 2,231 acres of mitigation if the applicant establishes a permanent conservation easement over the areas designated Agriculture on the eastern and southeastern sides of the site (these are areas outside of the Urban Services Boundary). Foraging habitat preserved shall consist of grassland or similar habitat open habitat, not cropland, because this mitigation measure also offsets impacts to other species that do not use cropland habitat.

- A. The project proponent shall utilize one or more of the mitigation options (land dedication and/or fee payment) established in Sacramento County's Swainson's Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code).
- B. The Project proponent shall, to the satisfaction of the California Department of Fish and Game, prepare and implement a Swainson's hawk mitigation plan that will include preservation of Swainson's hawk foraging habitat.
- C. Should the County Board of Supervisors adopt a new Swainson's hawk mitigation policy/program (which may include a mitigation fee payable prior to issuance of building permits) prior to the implementation of one of the measures above, the Project proponent may be subject to that program instead.

If the design of the primary avoided area on the western plateau (currently 382 acres in size) is increased in size in response to Section 404 wetland permitting requirements, the total amount of mitigation land required may be adjusted downward to reflect this increased avoidance, at the discretion of the Environmental Coordinator.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit documentation which demonstrates compliance to the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review submitted Project Plans and other documentation and consult with Fish and Game as necessary, in order to determine compliance.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-5: BURROWING OWL

Prior to construction activity (including site improvements, and building construction) focused surveys shall be conducted by a qualified biologist for burrowing owls in the construction area and within 500 feet of the construction area. Surveys shall be conducted no less than 14 days and no more than 30 days prior to commencement of construction activities. Surveys shall be conducted in accordance with "Burrowing Owl Survey Protocol and Mitigation Guidelines" published by The California Burrowing Owl Consortium (April 1993). The following shall also apply:

- A. If no occupied burrows are found in the survey area, a letter report documenting survey methods and findings shall be submitted to the County and no further mitigation is necessary.
- B. If an occupied burrow is found the applicant shall contact the Environmental Coordinator and consult with the California Department of Fish (CDFG), prior to construction, to determine if avoidance is possible or if burrow relocation will be required.
- C. If owls are to remain on-site, a minimum of 6.5 acres of foraging habitat for each occupied burrow needs to be permanently preserved according to California Department of Fish and Game guidelines. In addition, no activity shall take place within 160 feet of an active burrow from September 1 to January 31 (wintering season) or 250 feet from February 1 through August 31 (breeding season). Protective fencing shall be placed, at the distances above, around the active burrows and no activity shall occur within the protected buffer areas. Permanent improvements shall be a minimum of 250 feet from an occupied burrow.
- D. Any impact to active owl burrows, relocation of owls, or mitigation for habitat loss shall be done in accordance with the Fish and Game "Staff Report on Burrowing Owl Mitigation" (October 17, 1995) or the version current at the time of construction. Written evidence from Fish and Game staff shall be provided to the Environmental Coordinator attesting to the permission to remove burrows, relocate owls, or mitigate for lost habitat, and shall include a plan to monitor mitigation success.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit the required documentation to the Environmental Coordinator for review and approval prior to the start of construction work. In the event that owls are

found and consultation with Fish and Game is initiated, submit documentation describing the outcome of the coordination to the Environmental Coordinator prior to the start of construction work. This documentation must include the name(s) of Fish and Game staff members who were contacted and a description of the protective measures or other actions which were scoped and agreed to by the agency.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-6: TRICOLORED BLACKBIRD

If construction occurs between March 1 and July 31 pre-construction surveys for nesting tricolored blackbirds shall be performed by a qualified biologist. Surveys shall include the construction site and areas of appropriate habitat within 300 feet of the construction site. The survey shall occur no longer than 14 days prior to the start of construction work (including clearing, grubbing or grading). The biologist shall supply a brief written report (including date, time of survey, survey method, name of surveyor and survey results) to the Environmental Coordinator prior to ground disturbing activity. If no tricolored blackbird were found during the pre-construction survey, no further mitigation would be required. If an active tricolored blackbird colony is found on-site or within 300 feet of the construction site the project proponent shall do the following:

- A. Consult with the California Department of Fish and Game to determine if project activity will impact the tricolored blackbird colony(s), and implement appropriate avoidance and impact minimization measures if so directed. Provide the Environmental Coordinator with written evidence of the consultation or a contact name and number from the California Department of Fish and Game.
- B. The applicant may avoid impacts to tricolored blackbird by establishing a 300-foot temporary setback with fencing that prevents any project activity within 300 feet of the colony. A qualified biologist shall verify that setbacks and fencing are adequate and will determine when the colonies are no longer dependent on the nesting habitat (i.e. nestlings have fledged and are no longer using habitat), which will determine when the fencing may be removed. The breeding season typically ends in July.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit the required documentation to the Environmental Coordinator for review and approval prior to the start of construction work. In the event that nests are found and consultation with Fish and Game is initiated, submit documentation describing the outcome of the coordination to the Environmental Coordinator prior to the start of construction work. This documentation must include the name(s) of Fish and Game staff members who were contacted and a description of the protective measures or other actions which were scoped and agreed to by the agency.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-7: VERNAL POOL INVERTEBRATES

Presence of California linderiella, midvalley fairy shrimp, vernal pool fairy shrimp and vernal pool tadpole shrimp shall be assumed unless determinate surveys that comply with U.S. Fish and Wildlife protocol conclude that the species are absent. If the protocol surveys are performed and all listed crustacean species are absent, Ricksecker's water scavenger beetle may also be presumed absent, and no further mitigation shall be required for listed vernal pool invertebrates. If species are found, one or a combination of the following shall apply:

- A. *Total Avoidance: Species are present or assumed to be present.* Unless a smaller buffer is approved through formal consultation with the Fish and Wildlife Service, construction fencing shall be installed a minimum of 250 feet from all delineated vernal pool margins. All construction activities are prohibited within this buffer area. For all vernal pools where total avoidance is achieved, no further action is required.
- B. *Compensate for habitat removed.* Obtain all applicable permits from the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, California Department of Fish and Game, and the Central Valley Regional Water Quality Control Board for any proposed modifications to vernal pools and mitigate for habitat loss in accordance with the Biological Opinion and Section 404 permits obtained for the Project. At a minimum, mitigation ratios shall be consistent with County General Plan Policy, which requires no net loss of wetland resources. Any vernal pool loss not mitigated through the permitting process shall be mitigated for by payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit the required documentation (including any permits) to the Environmental Coordinator for review and approval. In the event that a smaller buffer is requested, submit documentation which demonstrates that Fish and Wildlife has approved the smaller buffer to the Environmental Coordinator prior to the start of construction work. This documentation must include the name(s) of Fish and Wildlife staff members who were contacted and a description of the protective measures or other actions which were scoped and agreed to by the agency.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-8: WETLAND WATER QUALITY

If construction activities encroach within the 250-foot buffer for vernal pools 358, 363, 370, 426 or 511 the applicant shall prepare a pesticide and pollution prevention plan. The plan shall include measures to reduce pollution run-off, pesticide drift, and other similar potential contaminants, to protect surrounding preserve areas from urban contaminants. Measures shall include the implementation of best management practices (e.g. straw wattles, silt fencing, and soil stabilization) for stormwater control. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).
3. Submit all required documentation to the Environmental Coordinator for review and approval prior to construction activities within the 250-foot buffer.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.
3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE BR-9: INVASIVE SPECIES CONTROL

The project applicant shall prepare an invasive species removal and prevention plan. The plan shall provide methods to remove invasive species from preservation areas and to restore the affected wetland features. The plan shall include methods for the prevention of the introduction of new invasive species from landscapes associated with the development. Minimum components of such a plan shall include: mapping of existing invasive plant populations within the avoided areas, with the map being updated a minimum of every five years; a description of acceptable methods for removing invasive species, examples of which include hand removal or biological controls (e.g. natural parasites); and a prohibition on the use of non-native plants within either the avoided areas or the Recreation-2 areas. The plan shall be incorporated in the Operations and Management Plan which is a requirement of the Section 404 permit process.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit the required plan to the Environmental Coordinator for review and approval prior to the start of construction work, and submit the updated invasive plant populations map every five years thereafter.

Verification (Action by the Environmental Coordinator):

1. Review the submitted documentation prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Ensure that the documentation is updated as required. If an updated map is due but has not been submitted, do not approve further Project Plans until such time as the update is submitted and approved. This verification action may be superseded should an alternative timeframe or pathway for compliance be approved by the United States Fish and Wildlife Service.

☐ MITIGATION MEASURE CC-1: GREENHOUSE GAS REDUCTION

All amendments to the SPA with the potential to change SPA-wide GHG emissions shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on SPA-wide greenhouse gas emissions. The Amendment shall not increase SPA-wide greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, in consultation with SMAQMD.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Prepare a revised GHG analysis, as necessary, which accounts for plan-wide changes in GHG emissions and submit the analysis to the Environmental Coordinator for review and approval. Concurrently, the analysis must also be submitted to SMAQMD for review.
3. If necessary, prepare and submit a revised GHG Reduction Plan to the Environmental Coordinator for review and approval. Concurrently, the analysis must also be submitted to SMAQMD for review.

Verification (Action by the Environmental Coordinator):

1. Review all proposed SPA Amendment applications to determine whether the project has the potential to change SPA-wide greenhouse gas emissions. Examples include projects which would change the average housing density of the plan area and projects which could change the distribution of vehicle trips.
2. Review any revised GHG analysis for adequacy, and consult with SMAQMD on the analysis.
3. Review any revised GHG Reduction Plan, and approve the plan if found to be adequate. Ensure that the revised Plan is incorporated into the Cordova Hills SPA Master Plan, which will replace to any prior Plan.

☐ MITIGATION MEASURE CR-1: CULTURAL RESOURCES PROTECTION

If subsurface deposits believed to be cultural or human in origin are discovered during construction, then all work must halt within a 200-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for prehistoric and historic archaeology, shall be retained at the Applicant's expense to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native American Heritage Commission shall be followed, and the monitor shall be retained at the Applicant's expense.

Work cannot continue within the 200-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources.

If a potentially-eligible resource is encountered, then the archaeologist, the Environmental Coordinator, and project proponent shall arrange for either 1) total avoidance of the resource, if possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to the Environmental Coordinator as verification that the provisions of CEQA for managing unanticipated discoveries have been met.

In addition, pursuant to Section 5097.97 of the State Public Resources Code and Section 7050.5 of the State Health and Safety Code, in the event of the discovery of human remains, all work is to stop and the County Coroner shall be immediately notified. If the remains are determined to be Native American, guidelines of the Native American Heritage Commission shall be adhered to in the treatment and disposition of the remains.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Include the above measure verbatim as a Construction Note and incorporate it into all Plans and Specifications for the project, and submit one copy to the Environmental Coordinator for review and approval prior to the start of any construction work (including clearing and grubbing).

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans prior to the start of construction. Approve Project Plans that are determined to be in compliance with all required mitigation.
2. Monitor compliance during periodic site inspections of the construction work.

3. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE HM-1: LANDFILL GAS MONITORING

Any structure within the project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety or the environment) within 1,000 feet of buried waste or proposed buried waste at Kiefer Landfill shall be continuously monitored by the owner/operator of said structure for landfill gas and be designed and constructed to prevent landfill gas accumulation in those structures.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Under the circumstances described by this measure, submit a plan for landfill gas monitoring to the Environmental Coordinator for review and approval. Also submit documentation which verifies that the proposed building design complies with the measure.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE LU-1: BOY'S RANCH DISCLOSURE

The location and nature of the Sacramento County Boys Ranch facility shall be disclosed to all prospective buyers of estate-residential properties.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Prior to recordation of any small-lot subdivision map within the Estate Residential area (which is the only land use along the easternmost portion of the site where properties are most proximate to the facility), submit the proposed notice to the Environmental Coordinator, along with a description of the means by which the notice will be given.
3. Submit documentation certifying that the appropriate notice was given.

Verification (Action by the Environmental Coordinator):

1. Prior to recordation of any small-lot subdivision map within the Estate Residential area (which is the only land use along the easternmost portion of the site where properties are most proximate to the facility), review the proposed notice and the means of conveying the notice to ensure that it will comply with the measure.

☐ MITIGATION MEASURE LU-2: KIEFER LANDFILL DISCLOSURE

The location and nature of the Kiefer Landfill facility shall be disclosed to all prospective buyers of properties within one mile of the ultimate active landfill boundary. The disclosure notice shall include:

- A. A statement substantially consistent with the following: “The landfill will expand in height and land area over time, and thus the visibility and proximity of the landfill from the property at the time of purchase does not reflect how visible or proximate the landfill will be in the future.” This statement shall be supplemented with relevant facts about ultimate landfill design, including the distance of the property to the ultimate planned edge of the landfill waste disposal area to the nearest 100 feet and the ultimate planned height of the landfill (as set forth in the Solid Waste Facilities Permit).
- B. Notification that the landfill operates under a Solid Waste Facilities Permit and is required to control pests, vectors, litter, and odor to the extent practicable, but that it is not possible to eliminate all of these nuisances. For this reason, property owners may experience some of these nuisance conditions.
- C. Notification that the active landfill area is lighted at night.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure.
- 2. Prior to recordation of any subdivision map, submit the proposed notice to the Environmental Coordinator, along with a description of the means by which the notice will be given.
- 3. Submit documentation certifying that the appropriate notice was given.

Verification (Action by the Environmental Coordinator):

- 1. Prior to recordation of any subdivision map, review the proposed notice and the means of conveying the notice to ensure that it will comply with the measure.

☐ MITIGATION MEASURE NO-1: NOISE AFFECTING RESIDENTIAL EXTERIOR

All residential development projects exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels to within General Plan Noise Element standards for exterior activity areas.

Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Refer to Appendix NO-1 of the November 2012 FEIR prepared for the Cordova Hills SPA project (Control Number 2008-00142), which has also been included as an Appendix of the SPA, and if applicable, submit an acoustical analysis to the Environmental Coordinator for review and approval. The analysis may use updated noise data or calculation methodologies, subject to the approval of the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE NO-2: NOISE AFFECTING RESIDENTIAL INTERIOR

All residential development projects exposed to greater than 70 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to achieve an interior noise level of 45 dB L_{dn} or less. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the site.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Refer to Appendix NO-1 of the November 2012 FEIR prepared for the Cordova Hills SPA project (Control Number 2008-00142), which has also been included as an Appendix of the SPA, and if applicable, submit an acoustical analysis to the Environmental Coordinator for review and approval. The analysis may use updated noise data or calculation methodologies, subject to the approval of the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE NO-3: NOISE AFFECTING NON-RESIDENTIAL

Non-residential development projects such as churches, libraries, meeting halls, and schools exposed to greater than 60 dB L_{dn} , and all non-residential development projects such as transient lodging, hospitals and nursing homes, and office buildings exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall demonstrate that interior noise volumes will not exceed General Plan Noise Element standards for non-residential uses exposed to traffic noise. This may be accomplished by providing documentation that the type of use is within acceptable limits based on the location of the identified noise contours and assuming standard exterior-to-interior attenuation of 25 dB. If this cannot be demonstrated, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. The measure does not apply to commercial uses.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Refer to Appendix NO-1 of the November 2012 FEIR prepared for the Cordova Hills SPA project (Control Number 2008-00142), which has also been included as an Appendix of the SPA, and if applicable, submit an acoustical analysis or other documentation to the Environmental Coordinator for review and approval. The analysis may use updated noise data or calculation methodologies, subject to the approval of the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE NO-4: NOISE AFFECTING PARKS

All parks exposed to noise volumes in excess of 70 dB (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels within park activity areas (benches, play structures, etc) to within General Plan Noise Element standards for parks. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. For barrier and other structural options, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Refer to Appendix NO-1 of the November 2012 FEIR prepared for the Cordova Hills SPA project (Control Number 2008-00142), which has also been included as an Appendix of the SPA, and if applicable, submit an acoustical analysis or other documentation to the Environmental Coordinator for review and approval. The analysis may use updated noise data or calculation methodologies, subject to the approval of the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE NO-5: NOISE ANALYSIS FOR NON-RESIDENTIAL

All non-residential development projects located adjacent to residentially designated properties shall be designed and constructed to ensure that noise levels generated by the uses do not result in General Plan Noise Element standards being exceeded on adjacent properties. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the non-residential projects with the potential to generate substantial noise (e.g. car wash, auto repair, or buildings with heavy-duty truck loading docks) if those uses are adjacent to residentially designated properties. The acoustical analysis shall include, but not be limited to, consideration of potential noise conflicts due to operation of the following items:

- Outdoor playing fields;
- Mechanical building equipment, including HVAC systems;
- Loading docks and associated truck routes;
- Refuse pick up locations; and
- Refuse or recycling compactor units.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure.
2. Submit an acoustical analysis or other documentation to the Environmental Coordinator for review and approval. The analysis may use updated noise data or calculation methodologies, subject to the approval of the Environmental Coordinator.

Verification (Action by the Environmental Coordinator):

1. Review the Project Plans and other documentation prior to the start of construction. Approve Project Plans and other documentation that is determined to be in compliance with all required mitigation.
2. Participate in any Final Inspection(s) as necessary.

☐ MITIGATION MEASURE NO-6: MATHER AIRPORT DISCLOSURE

The following conditions will be required to ensure adequate disclosure of Mather Airport operations:

- A. Notification in the Public Report prepared by the California Department of Real Estate shall be provided disclosing to prospective buyers that the parcel is located within the applicable Airport Planning Policy Area and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level.
- B. Avigation Easements prepared by the Sacramento County Counsel's Office shall be executed and recorded with the Sacramento County Recorder on each individual residential parcel contemplated in the development in favor of the County of Sacramento. All Avigation Easements recorded pursuant to this policy shall, once recorded, be copied to the director of Airports and shall acknowledge the property location within the appropriate Airport Planning Policy Area and shall grant the right of flight and obstructed passage of all aircraft into and out of the appropriate airport.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure.
- 2. Prior to recordation of any subdivision map, submit the proposed notice to the Environmental Coordinator.
- 3. Submit documentation certifying that the appropriate notice was given.

Verification (Action by the Environmental Coordinator):

- 1. Prior to recordation of any subdivision map, review the proposed notice to ensure that it will comply with the measure.

☐ MITIGATION MEASURE TR-1: COUNTY INTERSECTIONS

The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

- A. *Bradshaw Road and Jackson Road* – Provide a second westbound through lane.
- B. *Eagles Nest Road and Jackson Road* – Construct a new traffic signal. Provide a left turn lane and a through-right turn shared lane on the northbound and southbound approaches.
- C. *Grant Line Road and Sunrise Boulevard* – Provide a separate southbound right turn lane so the southbound approach has one left turn lane, one through lane and one right turn lane.
- D. *Grant Line Road and White Rock Road* – Modify the intersection and traffic signal to provide dual left turn lanes and two through lanes on the northbound approach; provide two through lanes and a separate right turn lane on the southbound approach; and provide two left turn lanes and a separate right turn lane on the eastbound approach. On the western leg of the intersection, two westbound departure lanes are required.
- E. *School Access and North Loop Road* – Provide dual eastbound left turn lanes. The applicant shall be responsible for a focused access study addressing the internal circulation of the Cordova Hills project to finalize the design of intersection geometries and length of left turn pockets. The scope of work for the analysis shall be submitted to the Sacramento County DOT staff. Upon completion, the analysis shall be submitted to the Sacramento County DOT for approval and recommendations.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-2: RANCHO CORDOVA INTERSECTIONS

The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Zinfandel Drive and White Rock Road* – The applicant shall be responsible for a fair share of this measure. Provide separate dual right turns on the westbound approach so the westbound approach has two left turn lanes, two through lanes and two right turn lanes. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- B. *Sunrise Boulevard and White Rock Road* – Provide overlap phasing on the eastbound and westbound approaches.
- C. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the westbound approach.
- D. *Sunrise Boulevard and Jackson Road* – Provide an eastbound through lane, and eastbound through-right turn shared lane, and an eastbound left turn lane; a northbound left turn lane and a northbound through-right turn shared lane; two westbound through lanes, a westbound right turn lane, and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane.
- E. *Grant Line Road and Jackson Road* – The applicant shall be responsible for a fair share of this measure. Provide a left turn lane and a through-right shared turn lane on the eastbound and westbound approaches. Provide a separate left turn lane, a through lane and a separate right turn lane on the northbound and southbound approaches. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- F. *Grant Line Road and Kiefer Boulevard* – Construct a new traffic signal. Provide a left turn lane, a through lane and a through-right turn shared lane on the northbound and southbound approaches; provide a left turn lane and a through-right turn shared lane on the eastbound and westbound approaches.
- G. *Grant Line Road and Douglas Road* – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound, a through lane and a through-right turn shared lane on the southbound approach, and a separate left turn lane and a free-right turn lane on the eastbound approach. Also

an extra southbound departure lane is needed for the eastbound free-right movement. To be consistent with the segment mitigations a second northbound through lane is included.

- H. *Grant Line Road and North Loop Road* – Construct a new traffic signal. Provide two through lanes and a separate right turn lane on the northbound approach, dual left turn lanes and one through on the southbound approach, and one left turn lane and one free-right turn lane on the westbound approach. Also an extra northbound departure lane is needed for the westbound free-right movement. To be consistent with the segment mitigations a second southbound through lane is included.
- I. *Grant Line Road and Chrysanthy Boulevard* – Construct a new traffic signal. Provide a through lane and a separate right turn lane on the northbound approach, dual left turn lanes and a through lane on the southbound approach, and dual left turn lanes and one right turn lane on the westbound approach. To be consistent with the segment mitigations a second northbound and southbound through lane is included. Also provide two westbound through lanes for when Chrysanthy Boulevard is connected through Rancho Cordova.
- J. *Grant Line Road and University Boulevard* – Construct a new traffic signal. Provide a through lane and a separate free-right turn lane on the northbound approach, dual left turn lanes and one through lanes on the southbound approach, and dual left turn lanes and a right turn lane on the westbound approach. Also an extra eastbound departure lane is needed for the northbound free-right movement. To be consistent with the segment mitigations a second northbound and southbound through lane is included.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-3: COUNTY ROADWAY

The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

- A. *Prairie City Road from US 50 to White Rock Road* – Increase roadway capacity by upgrading the capacity class for this segment from a rural highway without shoulders to a rural highway with shoulders.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-4: ELK GROVE ROADWAY

The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Elk Grove, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Grant Line Road from Sheldon Road to Calvine Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-5: RANCHO CORDOVA ROADWAYS

The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Grant Line Road from Jackson Road to Kiefer Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- C. *Grant Line Road from University Boulevard to Chrysanthy Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- D. *Grant Line Road from Chrysanthy Boulevard to North Loop* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- E. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to 6 lanes and upgrading the capacity class to an arterial with moderate access control.
- F. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- G. *Jackson Road from Sunrise Boulevard to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- H. *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control between Americanos Boulevard and Grant Line Road, and by adding two westbound travel lanes to Douglas between Rancho Cordova Parkway to Americanos Boulevard. Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-6: CALTRANS MAINLINE FACILITIES

The applicant shall be responsible for funding a fair share of the construction costs of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with Caltrans.

- A. *Westbound US 50 from Hazel Avenue to Sunrise Boulevard* – Add an auxiliary lane.
- B. *Eastbound US 50 from Sunrise Boulevard to Hazel Avenue* – Add an auxiliary lane.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-7: PEDESTRIAN/BICYCLE FACILITIES

The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road, to the satisfaction of the Sacramento County Department of Transportation.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-8: COUNTY INTERSECTIONS (CUMULATIVE)

The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *School Access and North Loop Road* – Provide dual eastbound left turn lanes.

Implementation and Notification (Action by Project Applicant):

1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-9: RANCHO CORDOVA INTERSECTIONS
(CUMULATIVE)

The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the eastbound and westbound right turns.
- B. *Grant Line Road and Douglas Road* – Provide a third southbound through lane and overlap phasing on the eastbound right turn lane. To be consistent with the segment mitigations a third northbound through lane is included.
- C. *Grant Line Road and North Loop Road* – Provide a westbound free-right turn lane. Also an extra northbound departure lane is needed for the westbound free-right movement.
- D. *Grant Line Road and University Boulevard* – Provide a northbound free-right turn lane. Also an extra eastbound departure lane is needed for the northbound free-right movement.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-10: COUNTY ROADWAY (CUMULATIVE)

The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

- A. *North Loop Road from Street D to Street F* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with low access control.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

☐ MITIGATION MEASURE TR-11: RANCHO CORDOVA ROADWAYS
(CUMULATIVE)

The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- C. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- D. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.

Implementation and Notification (Action by Project Applicant):

- 1. Comply fully with the above measure and the implementing Conditions of Approval which stipulate the timing of the improvements, in coordination with the Sacramento County Department of Transportation.

Verification (Action by the Environmental Coordinator):

- 1. Prior to approval of any Project Plans, coordinate with the Sacramento County Department of Transportation to determine compliance.

RESOLUTION NO. LAFC 2013-05-0807-02-13

THE SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

***ADOPTING FINDINGS OF FACT AND A STATEMENT OF OVERRIDING
CONSIDERATIONS FOR THE FORMATION OF COUNTY SERVICE AREA No. 13,
DETACHMENT OF CSA No. 4B, ANNEXATION TO SACRAMENTO REGIONAL COUNTY
SANITATION DISTRICT, AND SACRAMENTO AREA SEWER DISTRICT
FOR THE COUNTY OF SACRAMENTO (LAFC 02-13)
(State Clearinghouse # 2010062069)***

WHEREAS, on June 18, 2013, the County of Sacramento (County) submitted an application to the Sacramento Local Agency Formation Commission ("Commission") for the formation of a County Service Area (CSA) and detachment from CSA No 4B (CSA 4B);

WHEREAS, the landowners have concurrently submitted a petition to annex Sacramento Regional County Sanitation District and Sacramento Area Sewer District into the Cordova Hills project territory to provide sewer service to the Cordova Hills Development Project;

WHEREAS, a Draft EIR and Final EIR were prepared and circulated for public review and comment by the County of Sacramento for the project known as Cordova Hills;

WHEREAS, Sacramento Local Agency Formation Commission (LAFCo) is a Responsible Agency under CEQA;

WHEREAS, LAFCo reviewed and provided comments as a Responsible Agency;

WHEREAS, the County of Sacramento certified the Final EIR, adopted a Mitigation, Monitoring, and Reporting Program, and adopted Findings of Fact and Statement of Overriding Considerations for the Cordova Hills Development Project;

WHEREAS, the Commission as a Responsible Agency must consider the following:

- Prior to reaching a decision on the project, the responsible agency must consider the environmental effects of the project as shown in the EIR or Negative Declaration.
- In considering the environmental conclusions of the EIR or Negative Declaration, the responsible agency must evaluate whether any of the conditions set forth in Sections 15162 or 15163 of the CEQA Guidelines requiring preparation of a subsequent or supplemental environmental document exist.
- When considering alternatives and mitigation measures, a responsible agency is more limited than a Lead Agency. A responsible agency has responsibility for mitigating or avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve.
- When an EIR has been prepared for a project, the responsible agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment.

- The responsible agency shall make the findings required by Section 15091 for each significant effect of the project and shall make the findings in Section 15093 if necessary.
- The responsible agency should file a Notice of Determination in the same manner as a lead agency under Section 15075 or 15094 except that the responsible agency does not need to state that the EIR or Negative Declaration complies with CEQA. The responsible agency should state that it considered the EIR or Negative Declaration as prepared by a lead agency.

WHEREAS, the Commission has considered the statutory CEQA requirements set forth above;

WHEREAS, the Commission held a Public Hearing on August 7, 2013, and considered all public comments and the Executive Officers Report, and all other information related to the LAFCo action;

WHEREAS, the Commission has considered the EIR (**State Clearinghouse # 2010062069**) and has determined that it was prepared in accordance with the requirements of the California Environmental Quality Act;

NOW, THEREFORE, THE SACRAMENTO LOCAL AGENCY FORMATION COMMISSION RESOLVES AS FOLLOWS:

1. The Commission hereby approves and adopts the Findings of Fact and Statement of Overriding Consideration attached hereto as Exhibit "A", which are incorporated herein, pursuant to CEQA Guidelines § 15162 and § 15163.

2. The Commission declares that it has considered the Final EIR prepared by the Lead Agency (County of Sacramento Final EIR SCH 2010062069) that has been presented to the Commission. The Commission has reviewed the Final EIR and has considered the information contained in the Final EIR prior to acting on the County's application for the formation of CSA No. 13, detachment from CSA No. 4B, annexation to Sacramento Regional County Sanitation District, and Sacramento Area Sewer District, together with the respective Sphere of Influence Amendments, and that the Final EIR reflects the Commission's independent judgment and analysis.

3. The Commission finds that the County of Sacramento did adopt all of the mitigation measures set forth in the Final EIR and has adopted the Mitigation, Monitoring and Reporting Program as required by CEQA.

4. LAFCo finds that it is imperative to balance competing goals in approving the Project and the remaining environmental impacts resulting from the Project. Not every policy or environmental concern has been fully satisfied because of the need to satisfy competing concerns to a certain extent. Accordingly, in some instances LAFCo has chosen to accept certain environmental impacts because to eliminate them would unduly compromise some other important economic, social, environmental, educational or other goal. LAFCo finds and determines that the Project and the supporting environmental documentation provide for a positive balance of the competing goals and that the economic, fiscal, social, environmental, educational and other

benefits to be obtained by the Project outweigh any environmental and related potential detriments from the Project.

Any remaining significant effects on the environment attributable to the Project that are found to be unavoidable, irreversible or not substantially mitigated to a less-than-significant level are acceptable due to the overriding considerations set forth above. LAFCo has concluded that with all the environmental trade-offs of the Project taken into account, the Project's implementation will represent a net positive impact on the County, and based upon such considerations after a comprehensive analysis of all the underlying planning and environmental documentation, LAFCo has approved the Project.

5. The Commission directs that, upon approval of the County's application for the Formation of CSA No 13, the detachment of CSA No. 4B, the annexation of Sacramento Regional County Sanitation District, and the annexation of Sacramento Area Sewer District the Executive Officer is directed to file a Notice of Determination with the County Clerk of Sacramento County

6. Pursuant to CEQA Guideline § 15091(e), the documents and other materials that constitute the Record of Proceedings upon which the Commission has based its decision are located in and may be obtained from the Commission Clerk at 1112 I Street Suite No.100, Sacramento, California.

BE IT FURTHER RESOLVED that Resolution No. ***LAFC 2013-05-0807-02-13*** was adopted by the ***SACRAMENTO LOCAL AGENCY FORMATION COMMISSION***, on the ***7th day of August 2013***, by the following vote, to wit:

CORDOVA HILLS PROPERTY

Legal Description for CSA Formation and CSA-4B Detachment

Being a portion of Sections 13, 14, 22, & 23, Township 8 North, Range 7 East & a portion of Section 18, Township 8 North, Range 8 East, Mount Diablo Meridian, County of Sacramento, State of California, being more particularly described as follows:

Beginning at the Northwest corner of said Section 14, said corner being the **TRUE POINT OF BEGINNING**;

1. thence South 89°53'53" East along the North line of said Section 14 a distance of 2648.35 feet;
2. thence leaving said North line South 00°41'41" East along the West line of the Kellett property a distance of 987.11 feet;
3. thence North 89°43'47" East along the South line of said Kellett property a distance of 932.73 feet;
4. thence North 00°42'22" West along the East line of said Kellett property a distance of 981.05 feet to a point on the North line of said Section 14;
5. thence South 89°53'53" East along said North line a distance of 1694.42 feet to the Northeast corner of said Section 14;
6. thence North 89°04'12" East along the North line of said Section 13 a distance of 1706.57 feet;
7. thence leaving said North line South 00°55'48" East along the West line of Well Site #4 as described in Book 20090205, Page 0974 Official Records Sacramento County a distance of 200.00 feet;
8. thence North 89°04'12" East along the South line of said Well Site #4 a distance of 100.00 feet;
9. thence North 00°55'48" West along the East line of said Well Site #4 a distance of 200.00 feet to the North line of said Section 13;
10. thence North 89°04'12" East along said North line a distance of 839.33 feet to the North ¼ corner of said Section 13;
11. thence continuing along said North line North 89°06'59" East a distance of 2630.68 feet to the Northeast corner of Said Section 13;
12. thence North 88°53'52" East along the North line of said Section 18 a distance of 2933.82 feet ;
13. thence leaving said North line South 01°14'05" East along the West line of that certain real property as described in Book 3660, Page 633 Official Records Sacramento County a distance of 2639.82 feet to the Southwest corner of said property;
14. thence continuing South 01°14'05" East along the West line of that certain real property as described in Book 20080930, Page 0331, Official Records Sacramento county a distance of 2641.07 feet to the Southwest corner of said property coincident with the South line of said Section 18;
15. thence South 88°53'27" West along said South line a distance of 2917.90 feet to the southwest corner of said Section 18;

16. thence leaving said South line South 00°43'33" East along the East line of said Section 24 a distance of 5297.55 feet to the Southeast corner of said Section 24;
17. thence South 89°42'30" West along the South line of said Section 24 a distance of 2656.25 feet to the South ¼ corner of said Section 24;
18. thence North 00°48'17" West along the West line of the Southeast ¼ of said Section 24 a distance of 2634.97 feet to the Northwest corner of said Southeast 1/4;
19. thence South 89°49'29" West along the South line of the northwest ¼ of said Section 24 a distance of 2662.82 feet to the West ¼ corner of said Section 24;
20. thence South 00°56'45" East along the East line of said Section 23 a distance of 2640.45 to the southeast corner of said Section 23;
21. thence South 89°34'49" West a distance of 2542.76 feet to the South ¼ corner of said Section 23;
22. thence South 89°32'16" West a distance of 1128.58 feet;
23. thence North 23°48'54" West a distance of 1525.00 feet;
24. thence North 23°24'29" West a distance of 875.00 feet;
25. thence North 23°37'04" West a distance of 1345.77 feet;
26. thence South 40°32'21" West a distance of 246.75 feet;
27. thence North 00°35'59" West a distance of 73.89 feet;
28. thence North 71°23'31" West a distance of 118.02 feet;
29. thence in a northerly direction with a non-tangent curve turning to the left with a radius of 2540.00 feet, having a chord bearing of North 13°20'05" East and a chord distance of 462.81, having a central angle of 10°27'16" and an arc length of 463.46;
30. thence North 00°35'59" West a distance of 1479.04 feet;
31. thence North 00°52'14" West a distance of 5273.59 feet; to the point of beginning.

Containing 2667.835 acres, more or less..

CEQA FINDINGS OF FACT

AND

STATEMENT OF OVERRIDING CONSIDERATIONS

OF THE

SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

FOR THE

FORMATION OF COUNTY SERVICE AREA 13 AND
ESTABLISHMENT OF A COTERMINOUS SPHERE OF
INFLUENCE; DETACHMENT FROM COUNTY SERVICE AREA
4B; AND ANNEXATION TO THE SACRAMENTO REGIONAL
COUNTY SANITATION DISTRICT (SRCSD) AND THE
SACRAMENTO AREA SEWER DISTRICT (SASD)

FOR THE

CORDOVA HILLS PROJECT

ENVIRONMENTAL IMPACT REPORT

July 2013

I. INTRODUCTION

The Final Environmental Impact Report (“FEIR”) prepared for the Cordova Hills Project (the “Project”) as adopted by Sacramento County addresses the environmental effects associated with construction and operation of the proposed Cordova Hills Special Planning Area. As part of the implementation process of the Cordova Hills project, the Sacramento Local Agency Formation Commission (“LAFCo”) would approve the formation of the County Service Area No. 13 (CSA) to serve the Cordova Hills Community, detachment from the Sacramento County Regional Parks Department County Service Area 4B, and annexation to the Sacramento Area Sewer District (SASD) for the collection of wastewater and the Sacramento Regional County Sanitation District (SRCSD) for conveyance and treatment of wastewater. These LAFCo actions are part of the larger Cordova Hills project described below and is the “LAFCo Project” subject to these findings.

Formatted: Justified

These CEQA Findings of Fact and Statement of Overriding Considerations have been prepared to comply with the requirements of the California Environmental Quality Act (“CEQA”) (Public Resources Code, Section 21000 *et seq.*) and the CEQA Guidelines (Cal. Code of Regulations, Title 14, Section 15000 *et seq.*) These findings refer to the Final EIR (“FEIR”) where the material appears in that document. Otherwise, references are to the Draft EIR (“DEIR”).

CEQA generally requires that a lead agency must take reasonable efforts to mitigate or avoid significant environmental impacts when approving a project. For the Cordova Hills, the lead agency is Sacramento County. In order to effectively evaluate any potentially significant environmental impacts of a proposed project, an environmental impact report (“EIR”) must be prepared. The EIR is an informational document that serves to inform the agency decision-making body and the public in general of any potentially significant environmental impacts. The preparation of an EIR also serves as a medium for identifying possible methods of minimizing any significant effects and assessing and describing reasonable alternatives to the project.

~~The Cordova Hills EIR has been prepared as a Project EIR pursuant to CEQA Guidelines Section 15161. The purpose of a project-level EIR is to provide environmental review of the planning, construction, and operational impacts of a project.~~

~~All other agencies with jurisdiction over aspects of the Cordova Hills project are considered to be “responsible agencies” for purposes of CEQA. As specified by Section 15096 of the CEQA Guidelines, the duties of a responsible agency in using an environmental document prepared by the lead agency include:~~

- ~~•Prior to reaching a decision on the project, the responsible agency must consider the environmental effects of the project as shown in the EIR or Negative Declaration.~~
- ~~•In considering the environmental conclusions of the EIR or Negative Declaration, the responsible agency must evaluate whether any of the conditions set forth in Sections 15162 or 15163 of the CEQA Guidelines requiring preparation of a subsequent or supplemental environmental document exist.~~
- ~~•When considering alternatives and mitigation measures, a responsible agency is more limited than a Lead Agency. A responsible agency has responsibility for mitigating or~~

Formatted: Bullets and Numbering

~~avoiding only the direct or indirect environmental effects of those parts of the project which it decides to carry out, finance, or approve.~~

- ~~•When an EIR has been prepared for a project, the responsible agency shall not approve the project as proposed if the agency finds any feasible alternative or feasible mitigation measures within its powers that would substantially lessen or avoid any significant effect the project would have on the environment.~~
- ~~•The responsible agency shall make the findings required by Section 15091 for each significant effect of the project and shall make the findings in Section 15093 if necessary.~~
- ~~•The responsible agency should file a Notice of Determination in the same manner as a lead agency under Section 15075 or 15094 except that the responsible agency does not need to state that the EIR or Negative Declaration complies with CEQA. The responsible agency should state that it considered the EIR or Negative Declaration as prepared by a lead agency.~~

~~For the proposed formation of CSA No. 13, detachment from the Sacramento County Regional Parks Department County Service Area 4B, and annexation to the SASD and the SRCSD, the responsible agency is LAFCo. As a responsible agency, Project consideration by LAFCo is governed by the requirements of CEQA Guidelines Section 15096 as set forth above.~~

II. TERMINOLOGY OF FINDINGS

Section 15091 of the CEQA Guidelines requires that, for each significant environmental effect identified in an EIR for a proposed project, the approving agency must issue a written finding reaching one or more of three allowable conclusions. As a responsible agency, the Sacramento LAFCo ("LAFCo") is required to make these findings for the proposed project (CEQA Guidelines Section 15096(h)). Once an EIR has been completed which identifies one or more potentially significant environmental impacts, the approving agency must make one or more of the following findings for each identified area of impact:

1. Changes or alterations which avoid or mitigate the significant environmental effects as identified in the EIR have been required or incorporated into the project; or,
2. Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency; or,
3. Specific economic, legal, social, technological, or other considerations, including consideration for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the EIR. (Public Resources Code Section 21081)

For purposes of these findings, the terms listed below will have the following definitions:

- The term "mitigation measures" shall constitute the "changes or alterations" discussed above.
- The term "avoid or substantially lessen" will refer to the effectiveness of one or more of the mitigation measures or alternatives to reduce the severity of an environmental effect.

Formatted: Justified

- The term “feasible,” pursuant to the CEQA Guidelines, means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

When LAFCo finds a measure is not feasible, it will provide evidence for its decision and may adopt substitute mitigation that is feasible, and designed to reduce the magnitude of the impact. In other cases, LAFCo may decide to modify the proposed mitigation. Modifications generally update, clarify, streamline, or revise the measure to comport with current engineering practices, budget conditions, market conditions or existing LAFCo or Sacramento County policies, practices, and/or goals. Modifications achieve the intent of the proposed mitigation without reducing the level of protection. Thus, LAFCo may have modified the language of some of the mitigation measures set forth herein for purposes of clarification and consistency, to enhance enforceability, to defer more to the expertise of agencies with jurisdiction over the affected resources, to summarize or strengthen their provisions, and/or make the mitigation measures more precise and effective, all without making any substantive changes to the mitigation measures.

III. DEFINITIONS

“APN” means Assessor’s Parcel Number.

“Applicants” collectively means Cordova Hills, LLC; Grant Line, LLC; and Cielo, LLC.

“Board” means the Board of Supervisors of the County of Sacramento.

“CAAQ” means the California Ambient Air Quality Standard.

“CARB” means the California Air Resources Board.

“CEQA” means the California Environmental Quality Act.

“CEQA Findings” means these CEQA Findings of Fact and Statement of Overriding Considerations for the Cordova Hills Project.

“CO₂e” means carbon dioxide equivalent.

“Commission” means Sacramento Local Agency Formation Commission

“Condition” or “Condition of Approval” means a condition of approval adopted by the County in connection with approval of the Project.

“Cordova Hills LSD” or “Cordova Hills Local Services District” means a county service area formed to provide municipal services to the Project area.

“County” means the County of Sacramento.

“County Planning Commission” means the County Planning Commission of the County of Sacramento.

“CPAC” means Community Planning Advisory Council.

“CSA” means County Service Area

“dB” means decibels.

“DEIR” or “Draft EIR” means the Draft Environmental Impact Report for the Project (January 9, 2012).

“DERA” means the County of Sacramento Community Development Department’s Planning and Environmental Review Division.

“DOT” means the County of Sacramento Department of Transportation.

“EIR” means Environmental Impact Report, consisting of both the DEIR and FEIR.

“Environmental Coordinator” means the person within the County of Sacramento’s Community Development Department designated to act as the Environmental Coordinator for DERA.

“FEIR” or “Final EIR” means the Final Environmental Impact Report for the Project (November 2012).

“GHG” means greenhouse gases.

“lbs./day” means pounds per day.

“Ldn” means Day-Night Equivalent Noise Level.

“LAFCo” means Sacramento Local Agency Formation Commission

“LOS” means level of service.

“MMRP” means Mitigation Monitoring and Reporting Program.

“MT” means metric tons.

“NOP” means Notice of Preparation.

“NOx” means oxides of nitrogen.

“Planning Department” means the County of Sacramento Department of Community Development.

“PM10” means fine particulate matter 10 microns in diameter or less.

“PM2.5” means fine particulate matter 2.5 microns in diameter or less.

“Project” means the Cordova Hills Project.

“ROG” means reactive organic gases.

“SACOG” means the Sacramento Area Council of Governments.

“SASD” means Sacramento Area Sewer District

“SMAQMD” means the Sacramento Metropolitan Air Quality Management District.

“SRCSD” means Sacramento Regional County Sanitation District

“Staff Report” means the Sacramento County Staff Report to the Board of Supervisors for the Project for the Agenda of December 12, 2012.

“Staff Report Addendum #12” means Addendum #12 to the Sacramento County Staff Report, for the Agenda of January 29, 2013.

“Staff Report Addendum B” means Addendum #B to the Sacramento County Staff Report, for the Agenda of March 12, 2013.

“TAC” means toxic air contaminants.

“USB” means Urban Services Boundary

“U.S. 50” means United States Highway 50.

“V/C” means volume-to-capacity ratio.

“VMT” means vehicle miles travelled.

IV. PROJECT DESCRIPTION

PROJECT LOCATION AND SETTING

The Project site is located in the southeastern portion of Sacramento County on approximately 2,669 acres, adjacent to the east side of the City of Rancho Cordova. Grant Line Road extends along the Project’s western boundary. The eastern side of the Project site abuts Carson Creek. The northern boundary of the Project site is Glory Lane, an unimproved two-lane gravel road that intersects Grant Line Road just south of Douglas Road. The Kiefer Landfill and the Landfill’s 2,000 ft. buffer zone are southwest of the Project site. The Property that contains the Project site consists of APNs 073-0040-020 through -026, 073-0040-029, 073-0050-023, and 073-0050-052. As identified on the U.S. Geological Survey “Buffalo Creek, California” 7.5’ topographic quadrangle map, the project site consists of portions of Sections 13, 14, and most of Section 23 in Township 8 North, Range 7 East, and the western half of Section 18 in Township 8 North, Range 8 East, Mount Diablo Base and Meridian.

Formatted: Justified

PROJECT DESCRIPTION

The Project includes a mix of residential uses from high density residential along the western edge of the Project to low density residential along the eastern boundary approaching the Urban Services Boundary (USB). The Project includes a Town Center commercial area adjacent to Grant Line Road. Just southeast of the Town Center is the proposed location of a university/college campus center. The Project includes mixed uses consisting of residential, office, retail, a university/college campus center, schools, parks, and a trail network. Cordova Hills is organized into six distinct districts/villages (Town Center, University Village, Ridgeline, East Valley, Creekside, and Estates). The proposed Project includes a maximum of 8,000 residential units and 1.3 million square feet of commercial uses, approximately 70 acres of formal parkland and 150 acres of passive recreation land, 26 miles of Community Class II on-street bicycle paths and 22 miles of off-street trails and paths, three designated school sites, and plans for a transit system.

Formatted: Justified

The Project will require amendments to the Sacramento County General Plan in order to include the site within the Urban Policy Area and recognize the proposed land uses, streets, and bikeways on the Land Use Diagram, Transportation Plan, and Bikeway Master Plan. The entire site will be rezoned from Agriculture (AG-80) to Special Planning Area (SPA). The adopted SPA will then become the primary land use document that stipulates uses and designs allowable within the Project area. There are 485 acres in the southeastern portion of the site that are under Williamson Act contract. The contract is in non-renewal and is expected to expire in 2016. The Project will also require an amendment of the Zone 40 Water Supply Master Plan, as the Project area is not included in the existing planning document, and includes a General Plan Amendment to allow limited water service outside of the Urban Services Boundary.

PROJECT OBJECTIVES

The proponent's Project objectives are as follows:

- Develop a mixed use community that is designed in a manner that provides compatible land uses and reduces overall internal vehicle trips.
- Develop an economically feasible master planned community that reasonably minimizes its impact on biologically sensitive natural resources with feasible onsite wetland avoidance and preservation.
- Develop a sustainable, multi-service town center that promotes walkability and alternative transit modes including but not limited to Neighborhood Electric vehicles (NEVs), light rail, shuttle bus, and carpool facilities.
- Provide uses for two underserved markets in the southeast Sacramento region:
 - Provide for development of a major private university/college campus center in Sacramento County.
 - Provide residential neighborhoods that are age restricted in order to serve seniors and larger lot sizes for executive housing to serve corporate executives.
- Develop internal Project infrastructure and circulation networks of multiple modes that provide efficient connections to various land use components throughout the Project; specifically, trail opportunities to enhance the integration between the university/college

Formatted: Justified

campus center, town center, schools, and preserves/open space corridors surrounding the Project.

- Develop recreational and open space opportunities that include neighborhood and community parks that are fully integrated into the Project through adequate trail connections and provide critical regional trail connections associated with adjacent trail systems.
- Allow for the inclusion of alternative energy sources to serve the mixed use community.

The objective of the LAFCo Project is to support orderly and systematic regional development, including adequate provision of services.

DISCRETIONARY ACTIONS

Under the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, LAFCo has the power to approve or disapprove applications, modify boundaries of a proposal, and impose reasonable conditions of approval (Government Code Section 560000, et. seq.). As a responsible agency for the Cordova Hills EIR, LAFCo complies with CEQA by considering the EIR and reaching its own conclusions regarding the environmental effects of the project. As part of the implementation of the Cordova Hills project, LAFCo would take the following actions:

- Approve formation of the County Service Area No. 13 and its coterminous Sphere of Influence
- Approve detachment from the Sacramento County Regional Parks Department County Service Area 4B
- Annex the Project area into the SASD for the collection of wastewater and the SRCSD for conveyance and treatment of wastewater.

The County has taken the following actions as part approval of the Cordova Hills project:

- Certification of the Environmental Impact Report
- Adoption of a Mitigation Monitoring Program for the Project
- Approval of the Cordova Hills project, which includes the following entitlements to permit its physical development:
 - 1) A **General Plan Amendment** to move the Urban Policy Area (UPA) boundary east to include approximately 2,366.3 \pm acres of the Project Area.
 - 2) A **General Plan Amendment** to amend the Land Use Diagram from General Agriculture to Low Density Residential, Medium Density Residential, Commercial and Office, Recreation, Natural Preserve, and Public/Quasi Public for approximately 2,366.3 \pm acres.
 - 3) A **General Plan Amendment** to include a new policy in the Land Use Element to address the provision of limited public water service to serve uses potentially allowed by the Cordova Hills Special Planning Area and currently allowed in the County of Sacramento Permanent Agricultural Zone designation for 251 acres located in proximity to the Kiefer Landfill, and an Amendment to LU-1 to reference this exception.
 - 4) Amend the **General Plan Transportation Diagram** to show new thoroughfares,

Formatted: Justified

arterials and collectors as shown in the Transportation General Plan Amendment Diagram dated October 17, 2011.

- 5) Amend **the Bikeway Master Plan to add on-street and off-street bikeways** as shown in the Bikeways Master Plan Amendment Diagram dated October 17, 2011.
- 6) A **Zoning Ordinance Amendment** to adopt the Cordova Hills Special Planning Area (SPA) to incorporate the Cordova Hills Master Plan including Design Guidelines and Development Standards. The SPA consists of a total of approximately 2,668.7 \pm acres.
- 7) A **Large Lot Tentative Subdivision Map** to create 155 large lot parcels for the purpose of creating legal parcels corresponding to villages within the Cordova Hills SPA and within the approximately 2,669 \pm acre SPA. Included on the Map are requests for abandonment of easements.
- 8) An **Affordable Housing Plan** with two options as presented in the Plan consisting of on-site construction of multi-family units or land dedication.
- 9) A **Development Agreement** by and between the County of Sacramento and Property Owners.
- 10) Adoption of a **Public Facilities Financing Plan** for the Cordova Hills Project that includes a Capital Improvement Program and Financing Plan.
- 11) A **Street Resolution** to allow certain County streets within the Cordova Hills Land Use Master Plan to be based on less than a 40-foot right-of-way, pursuant to State of California Streets and Highways Code Section 906.
- 12) **Zone 40 Boundary:** Amend Zone 40 boundary to include the 251 \pm acres of the Cordova Hills Project which lies outside of the Urban Services Boundary.
- 13) **Zone 41 Boundary:** Amend Zone 41 boundary to include the 251 \pm acres of the Cordova Hills Project which lies outside of the Urban Services Boundary.
- 14) Adoption of the **Cordova Hills Water Supply Master Plan Amendment:** Amends the existing Zone 40 Water Supply Master Plan to include provision of water service to Cordova Hills.

| The discretionary action required of the Sacramento County Board of Supervisors (Board) to approve the Project was the adoption of all of those requested entitlements in order to allow the development of the Project, with the exception of the Zone 40 and Zone 41 Boundary amendments and the Cordova Hills Water Supply Master Plan Amendment, which are to be adopted by the Board of the Sacramento County Water Agency in connection with the Project.

Formatted: Justified

V. BACKGROUND

| On July 1, 2008, the Applicants submitted an application for the Project (Control #2008-GBP-SDP-ZOB-AHP-00142). Previously, on May 14, 2008, the Board of Supervisors voted to accept an application to amend the Urban Policy Area boundary and to accept an application for the future development of the Project.

Formatted: Justified

| On June 22, 2010, the County issued a Notice of Preparation (NOP) of an EIR for the Project. The NOP for the Project was distributed to the State Clearinghouse, responsible agencies, interested groups and individuals, and surrounding property owners. The NOP was circulated for a 30-day

comment period, which ended on July 22, 2010. Fifteen (15) letters were received in response to the NOP.

- | On August 3, 2010, the County held a public scoping meeting for the Project at the offices of the Sacramento County Department of Transportation, 9630 Conservation Way, Sacramento, California. A notice of the scoping meeting was sent to all individuals and agencies on the NOP mailing list, counties and cities surrounding the area, property owners within 500 feet of the Project site and other interested parties known to the County. The purpose of the scoping meeting was to solicit comments regarding the scope of the EIR.
- | On January 9, 2012, the Draft Environmental Impact Report (DEIR) for the Project was released for public review. The DEIR was circulated through the State Clearinghouse for a 45-day public review period, which ended on February 22, 2012.
- | On March 18, 2010, the Cordova Community Planning Advisory Council (CPAC) considered the Project as an informational item with a Project overview and introduction to the Project given by the Applicants and received public comments regarding the Project. No action was taken.
- | On June 23, 2010, the Cosumnes Community Planning Advisory Council (CPAC) considered the Project as an informational item with a Project overview and introduction to the Project given by the Applicants and received public comments regarding the Project. No action was taken.
- | On January 19, 2012, the Cordova CPAC held a public hearing on the Project. After receiving public comments regarding the Project and DEIR, the CPAC voted in favor of recommending approval of the Applicants' requested General Plan Amendment and all other requested land use entitlements.
- | On January 25, 2012, the Cosumnes CPAC held a public hearing on the Project. After receiving public comments regarding the Project and DEIR, the CPAC voted in favor of recommending approval of the Applicants' requested General Plan Amendment and all other requested land use entitlements.
- | On September 24, 2012, the Planning Commission held a public hearing on the Project and DEIR. After receiving public comments regarding the Project and DEIR, the Planning Commission closed the public comment period, directed staff to prepare the Final EIR and recommended approval of the project to the Board on a 4-0 (with 1 absent) vote.
- | On November 28, 2012, the Final EIR (FEIR) for the Project was released for public review by the County.
- | On December 12, 2012 the Board of Supervisors held a public hearing regarding the Project. After receiving public comments on the Project, the Board closed the public comment period and continued the Project to January 29, 2013.
- | On December 12, 2012 the Board of Supervisors held a public hearing regarding the Project. After receiving public comments on the Project, the Board closed the public comment period and continued the Project to January 29, 2013.

On January 29, 2013 the Board of Supervisors opened the continued hearing regarding the Project. The Board took action on several entitlements associated with the project and continued the Project to March 12, 2013.

On March 12, 2013, the Board of Supervisors opened the continued hearing regarding the Project. The Board approved a Zoning Code Amendment to adopt the Cordova Hills Special Planning Area and Master Plan, a Public Facilities Financing Plan, and an Urban Services and Governance Plan.

LAFCo is making findings that the relevant CEQA issues of the potential environmental impacts from the reorganization actions that have been included in the Cordova Hills project EIR and are described in Section III of these findings. These findings will focus on those impacts and respective mitigation measures that are relevant to LAFCo actions. The impacts not relevant to these actions will be identified.

VI. RECORD OF PROCEEDINGS

For purposes of CEQA and these Findings, the record of proceedings for the Project consists of the following documents, at a minimum:

Formatted: Justified

- The Project application package for the Cordova Hills Project (Sacramento County Project Control Number 2008-GPB-SDP-ZOB-AHP-00142, including all written documentation, maps, and subsequent amendments and submittals;
- The Notice of Preparation and other public notices issued by the County in conjunction with the Project;
- The Draft Environmental Impact Report for the Project (January 9, 2012);
- All comments submitted by agencies or members of the public during the comment period on the Draft EIR and responses to those comments;
- The Final EIR prepared for the Project (November 28, 2012), including comments received on the Draft EIR and responses to those comments;
- All comments and correspondence submitted to the County with respect to the Project, in addition to timely comments on the Draft EIR;
- The Mitigation, Monitoring and Reporting Program for the Project;
- All findings and resolutions adopted by LAFCo, Sacramento County, and the Sacramento County Water Agency decision-makers in connection with the Project, and all documents cited or referred to therein;
- All reports, studies, memoranda, maps, staff reports, and other planning documents relating to the Project prepared by LAFCo, consultants to LAFCo, Sacramento County, and the Sacramento County Water Agency, and responsible or trustee agencies with respect to LAFCo's, Sacramento County's, and the Sacramento County Water Agency's compliance with the requirements of CEQA and with respect to LAFCo, Sacramento County, and the Sacramento County Water Agency actions on the Project;
- All minutes and verbatim transcripts of all information sessions, public meetings, and public hearings held by LAFCo, Sacramento County, and the Sacramento County Water Agency in connection with the Project;

- Any documentary or other evidence submitted to LAFCo, Sacramento County, and the Sacramento County Water Agency at such information sessions, public meetings and public hearings;
- Matters of common knowledge to LAFCo, Sacramento County, and the Sacramento County Water Agency, including, but not limited to, the following:

- 1) Federal, state, and local laws and regulations;
- 2) The County General Plan (2011);
- 3) The Zoning Code of Sacramento County;
- 4) The Sacramento County Code;
- 5) Other formally adopted policies and ordinances.

- Any documents expressly cited in these CEQA Findings, in addition to those cited above; and
- Any other materials required for the record of proceedings by Public Resources Code Section 21167.6, subdivision (e).

The custodian of LAFCo documents comprising the record of proceedings is **Peter Brundage**, LAFCo Executive Officer, whose office is located at 1112 I Street, Suite 100, Sacramento, CA 95814.

LAFCo has relied on all of the documents listed above in reaching its decision on the Cordova Hills project, even if not every document was formally presented to LAFCo as part of the LAFCo and County files generated in connection with the Project. Without exception, any documents set forth above not found in the Project files fall into one of two categories. Many of them reflect prior planning or legislative decisions with which LAFCo was aware in approving the project. (See City of Santa Cruz v. Local Agency Formation Commission (1978) 76 Cal.App.3d 381, 391-392; Dominey v. Department of Personnel Administration (1988) 205 Cal.App.3d 729, 738, fn. 6.) Other documents influenced the expert advice provided to LAFCo or consultants. For that reason, such documents form part of the underlying factual basis for the Commission's decisions relating to the formation of the CSA and concurrent detachment of the project area from the Sacramento County County Service Area 4B and County Service Area 10, and annexation to the SASD and SRCSD. (See Pub. Resources Code, Section 21167.6, subd. (e)(10); Browning-Ferris Industries v. City Council of City of San Jose (1986) 181 Cal.App.3d 852, 866; Stanislaus Audubon Society, Inc. v. County of Stanislaus (1995) 33 Cal.App.4th 144, 153, 155.)

VII. FINDINGS REQUIRED UNDER CEQA

Public Resources Code Section 21002 provides that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would *substantially lessen* the significant environmental effects of such projects" (emphasis added). The procedures required by CEQA "are intended to assist public agencies in systematically identifying both the significant effects of projects and the feasible alternatives or feasible mitigation measures which will *avoid* or *substantially lessen* such significant effects" (emphasis added). Section 21002 goes on to state that "in the event [that] specific economic, social, or other conditions make infeasible such project alternatives or such mitigation measures, individual projects may be approved in spite of one or more significant effects thereof."

Formatted: Justified, Indent:
First line: 0"

Formatted: Justified

Formatted: Justified

| The mandate and principles announced in Public Resources Code Section 21002 are implemented, in part, through the requirement that agencies must adopt findings before approving projects for which EIRs are required (see Public Resources Code Section 21081, subd. (a); CEQA Guidelines Section 15091, subd. (a)). For each significant environmental effect identified in an EIR for a proposed project, the approving agency must issue a written finding reaching one or more of three permissible conclusions. The first such finding is that “[c]hanges or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR” (CEQA Guidelines Section 15091, subd. (a)(1)). The second permissible finding is that “[s]uch changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency” (CEQA Guidelines Section 15091, subd. (a)(2)). The third potential conclusion is that “[s]pecific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR” (CEQA Guidelines Section 15091, subd. (a)(3)). Public Resources Code Section 21061.1 defines “feasible” to mean “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social and technological factors.” CEQA Guidelines Section 15364 adds another factor: “legal” considerations (see also Citizens of Goleta Valley v. Board of Supervisors (“Goleta II”) (1990) 52 Cal.3d 553, 565).

| The concept of “feasibility” also encompasses the question of whether a particular alternative or mitigation measure promotes the underlying goals and objectives of a project (City of Del Mar v. City of San Diego (1982) 133 Cal.App.3d 410, 417). “[F]easibility” under CEQA encompasses ‘desirability’ to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors” (*Ibid.*; see also Sequoyah Hills Homeowners Assn. v. City of Oakland (1993) 23 Cal.App.4th 704, 715). Further, alternatives are to be selected based on the “rule of reason”, and there is not an established directive that dictates the scope or nature of the alternative (Citizens for Open Government v. City of Lodi (2012) 205 Cal.App.4th 296).

| The CEQA Guidelines do not define the difference between “avoiding” a significant environmental effect and merely “substantially lessening” such an effect. LAFCo must therefore glean the meaning of these terms from the other contexts in which the terms are used. Public Resources Code Section 21081, on which CEQA Guidelines Section 15091 is based, uses the term “mitigate” rather than “substantially lessen.” The CEQA Guidelines therefore equate “mitigating” with “substantially lessening.” Such an understanding of the statutory term is consistent with the policies underlying CEQA, which include the policy that “public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would *substantially lessen* the significant environmental effects of such projects” (Public Resources Code Section 21002, emphasis added).

| For purposes of these findings, the term “avoid” refers to the effectiveness of one or more mitigation measures to reduce an otherwise significant effect to a less-than-significant level. In contrast, the term “substantially lessen” refers to the effectiveness of such measure or measures to substantially reduce the severity of a significant effect, but not to reduce that effect to a less-than-significant level. These interpretations appear to be mandated by the holding in Laurel Hills Homeowners Association v. City Council (1978) 83 Cal.App.3d 515, 519-527, in which the Court of Appeal held that an agency had satisfied its obligation to substantially lessen or avoid significant

effects by adopting numerous mitigation measures, not all of which rendered the significant impacts in question less than significant.

- | Although CEQA Guidelines Section 15091 requires only that approving agencies specify that a particular significant effect is “avoid[ed] *or* substantially lessen[ed],” these findings, for purposes of clarity, in each case will specify whether the effect in question has been reduced to a less-than-significant level, or has simply been substantially lessened but remains significant.
- | Moreover, although Section 15091 of the CEQA Guidelines, read literally, does not require findings to address environmental effects that an EIR identifies as merely “potentially significant,” these findings will nevertheless fully account for all such effects identified in the EIR.
- | CEQA requires that the lead agency adopt mitigation measures or alternatives, where feasible, to substantially lessen or avoid significant environmental impacts that would otherwise occur. Project modification or alternatives are not required, however, where such changes are infeasible or where the responsibility for modifying the project lies with some other agency (CEQA Guidelines Section 15091, subd. (a), (b)).
- | With respect to a project for which significant impacts are not avoided or substantially lessened either through the adoption of feasible mitigation measures or feasible environmentally superior alternative, a public agency, after adopting proper findings, may nevertheless approve the project if the agency first adopts a statement of overriding considerations setting forth the specific reasons why the agency found that the project’s “benefits” rendered “acceptable” its “unavoidable adverse environmental effects” (CEQA Guidelines Sections 15093, 15043, subd. (b); see also Public Resources Code Section 21081, subd. (b)). The California Supreme Court has stated that, “[t]he wisdom of approving . . . any development project, a delicate task which requires a balancing of interests, is necessarily left to the sound discretion of the local officials and their constituents who are responsible for such decisions. The law as we interpret and apply it simply requires that those decisions be informed, and therefore balanced” (Goleta II, 52 Cal.3d 553, 576).
- | In seeking to effectuate the substantive policy of CEQA to substantially lessen or avoid significant environmental impacts to the extent feasible, a public agency, in adopting findings, need not necessarily address the feasibility of both mitigation measures and environmentally superior alternatives when contemplating approval of a project with significant impacts. Where a significant impact can be mitigated to an “acceptable” level solely by the adoption of feasible mitigation measures, the public agency, in drafting its findings, has no obligation to also consider the feasibility of any environmentally superior alternative that could also mitigate or substantially lessen that same impact – even if the alternative would render the impact less severe than would the proposed project as mitigated. (Laurel Hills Homeowners Association v. City Council (1978) 83 Cal.App.3d 515,521, see also Kings County Farm Bureau v. City of Hanford (1990) 221 Cal.App.3d 692, 730-731; and Laurel Heights Improvement Association v. Regents of the University of California (“Laurel Heights I”) (1998) 47 Cal.3d 376, 400-403.)
- | These findings reflect the independent judgment of LAFCo and constitute its best efforts to set forth the rationales and support for its decision under the requirements of CEQA.

VIII. LEGAL EFFECTS OF FINDINGS

To the extent that these findings conclude that various proposed mitigation measures outlined in the Final EIR are feasible and have not been modified, superseded or withdrawn, LAFCo hereby finds that such measures are within the jurisdiction of another public agency and not that of LAFCo, and that such other agency has adopted such measures. These measures have been adopted by the County through the preparation and adoption of the MMRP as described below.

Formatted: Justified

The mitigation measures are referred to in the Mitigation Monitoring and Reporting Plan (MMRP) adopted by the County in conjunction with its own findings, and will be effectuated through the process of constructing and implementing the Project.

IX. MITIGATION MONITORING AND REPORTING PROGRAM

A Mitigation Monitoring and Reporting Program (MMRP) has been prepared for the Project and has been adopted in conjunction with Findings made by the Board of Directors of Sacramento County. (See Pub. Resources Code, Section 21081.6, subd. (a)(1).) The County will use the MMRP to track compliance with Project mitigation measures. Implementation of the mitigation measures is outside the jurisdiction of LAFCo.

Formatted: Justified

X. SIGNIFICANT EFFECTS AND MITIGATION MEASURES

The Draft EIR identified several significant environmental effects (or “impacts”) that adoption and implementation of the Cordova Hills project would cause. Many significant effects were avoided altogether because the proposed Project, as adopted, contains requirements that prevent the occurrence of significant effects in the first place. Such provisions are identified as mitigation in the DEIR and FEIR. Some significant impacts of implementation of the Project, however, cannot be avoided by the adoption of feasible mitigation measures or feasible alternatives; these effects are outweighed by overriding considerations set forth in Section XII below. This Section (X) presents in greater detail LAFCo’s findings with respect to the environmental effects of the Project.

Formatted: Justified

A. LESS-THAN-SIGNIFICANT IMPACTS/NO MITIGATION.

These CEQA Findings do not address impacts that were determined to be less than significant or beneficial prior to mitigation. Therefore, these Findings do not address the following impacts because they were determined to be either less than significant or beneficial in the Final EIR:

Formatted: Justified

- **Air Quality / Project Operation Would Generate CO Emissions** – Eighteen intersections would either be subject to degradation of LOS to a level of service E or worse, or add vehicles to an intersection already operating at an LOS of E or worse. Examining these facilities as compared to the SMAQMD screening methodology for CO impacts, Project traffic would not cause threshold exceedance.
- **Geology and Soils** – Multiple topics were examined: soil erosion, expansive soils, naturally occurring asbestos, mineral resources, and geologic hazards. The Project has the potential to increase soil erosion due to disturbance of onsite soils, and some of the

soils in the Project area have a high shrink-swell potential. There are existing regulations in place to address both of these issues, including the Sacramento County Land Grading and Erosion Control Ordinance, the Uniform Building Code, and the California Building Code. The Project site is not considered likely to include asbestos-containing soils, and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site, and furthermore, the Project includes a plan to use whatever suitable rock deposits are found on the site to serve Project construction needs; the Project will not obstruct access to mineral resources. Seismic ground-shaking hazards are low in Sacramento County, and existing building codes require adherence to seismic design standards.

- **Hydrology and Water Quality / Hydrology** – The Project included a Drainage Master Plan which evaluated the on- and off-site floodplains, the potential for hydromodification of stream channels, and the adequacy of existing and planned stormwater infrastructure. The existing floodplains on the site will be within the Avoided Areas where no development will occur, and detention basins have been included to ensure that the post-Project flow rates do not exceed pre-Project rates. Put in general terms, the design to prevent hydromodification is typically a detention basin outlet control structure which retains all stormwater runoff generated up to a 10-year event and slowly releases the runoff through a very small outlet. The Project also includes stormwater infrastructure which is sufficient to handle flows.
- **Hydrology and Water Quality / Water Quality** – Compliance with adopted Ordinances and standards will ensure that future development projects implemented as a result of Project approval will not cause violation of a water quality standard or waste discharge requirement, result in substantial erosion or siltation, and will not result in substantial increases to polluted runoff associated with construction. Compliance with the County Stormwater Ordinance, implementation of Low impact Development Standards, and implementation of the Drainage Master Plan will ensure that development of the site will not alter the course of local waterways in a manner that results in substantial erosion or siltation, will not cause violation of a water quality standard or waste discharge requirement, and will not result in substantial increases to polluted runoff.
- **Land Use / Conflict with Adopted Land Use Plans** – The Project uses are compatible with the surrounding existing and proposed land use plans, and would not result in substantial conflicts with land use plans designed to avoid environmental effects.
- **Land Use / Conflict with General Plan Growth Management Policy** – General Plan Policy LU-120 is intended to reduce impacts of many different types – such as growth inducement, unacceptable operating conditions on roadways, poor air quality, and lack of appropriate infrastructure – by establishing design criteria for all amendments to the Urban Policy Area. A project must be consistent with LU-120 before it may be considered for approval. The Planning Division has reviewed the Project for consistency with LU-120 and has found in the affirmative. The Project has been deemed consistent with criteria PC-1 through PC-10, and has achieved a total of 21 points in the criteria-based standards (CB-1 through CB-5). A total of 18 points is required and 24 points are possible. Given that the Project has been deemed consistent, Project impacts related to conflict with growth management policy are less than significant.

- **Land Use / Conflict with General Plan Policies related to Growth Inducement** – The Project is inconsistent with Policy LU-1, and includes a General Plan Amendment to address this inconsistency. The General Plan Amendment includes language specifically intended to avoid growth-inducing impacts.
- **Land Use / Conflict with General Plan Policies related to Public Services and Utilities** - Compliance with General Plan Policies LU-13, LU-66, LU-110, and LU-123 is intended to ensure that minimum service standards for public services and utilities are met. The Project includes a facilities financing plan that was submitted to all of the applicable service entities for review and approval. Long-term funding sources have been identified for the maintenance of public services. The Project will not result in any substantial environmental impacts related to conflict with General Plan policies that pertain to public services or utilities.
- **Land Use / Conflict with General Plan Policies related to Air Quality and Transportation** – The Project results in significant impacts related to both transportation and air quality, but these impacts are not due to General Plan Policy inconsistency. The Project is consistent with policies intended to alleviate air quality and transportation impacts.
- **Land Use / Division or Disruption of an Established Community - The division or disruption** of an established community is an impact considered by CEQA. Case law has established that a project must create physical barriers within the established community in order to be considered under this impact category. There is no existing development on the project site, nor are there developments north, south, or east of the site that could be divided or disrupted by the project. Furthermore, the Project includes stub streets so that if there ever is development north or south of the site in the future as indicated in the City of Rancho Cordova General Plan, those uses could connect into the Project. The project will not disrupt or divide an established community.
- **Land Use / Displacement of Housing** – There is no existing housing on the Project site that could be displaced by the Project, nor would the Project uses cause the displacement of nearby housing. The site is not included in the affordable housing inventory as part of implementation of the Sacramento County General Plan Housing Element.
- **Noise / Construction Noise** – it is acknowledged that construction related noise could be a nuisance to sensitive receptors; however, this increase in noise is short term, and noise standards are intended to address long term sources of noise. Construction related noise would not result in a permanent increase in ambient noise. Though noise volumes would undergo short term increases, the existing construction ordinance is designed to avoid significant community effects through the restriction of nighttime and weekend disturbance.
- **Noise / Kiefer Landfill Noise** – All sensitive uses are located a sufficient distance from the landfill to avoid substantial noise exposure. Noise at the university/college campus center (the nearest area where residences would be located) would be 44 dB, which is well within standards.
- **Public Services / Fire Protection** – The Project site is located within an area of Sacramento County designated as a State Responsibility Area (SRA) by the California Department of Forestry and Fire Protection (CAL FIRE), and has been assigned a moderate fire hazard severity risk rating (the lowest fire hazard rating applied to SRAs).

The site will be served by the Sacramento Metropolitan Fire District, which will need up to two fire stations on the site. The Project will be subject to the building standards and regulations of the County of Sacramento Building Code, and these regulations will be sufficient to ensure adequate protection.

- **Public Services / Police Protection** – The Project is within the service area of the Sacramento County Sheriff's Department (SSD) and will increase the demand for SSD services. According to SSD, the development of the Project will “not likely necessitate the construction of additional police facilities.” In order to meet staffing ratios, SSD would need to add 16 staff members. Law enforcement services will be funded through the County General Fund and through County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax, which will be levied on each new home. Existing funding mechanisms, policies and regulations will ensure that the Sheriff's Department can adequately serve the new growth.
- **Public Services / Solid Waste** – An annual total of 18,592 tons of waste will require landfill disposal, and a total of 25,241 tons of construction debris will need to be disposed of in the Kiefer Landfill. The Sacramento County Department of Waste Management and Recycling has indicated that landfill capacity is adequate to support the waste disposal needs generated by the Project.
- **Public Services/ Schools** – Student enrollment resulting from the Project will be approximately 4,686 total students, with approximately 2,553 of these in grades K – 6 (elementary school), 748 in grades 7 – 8 (middle school), and 1,384 in grades 9-12 (high school). The Project will generate the need for three elementary schools but only about 63% of a middle/high school; the land use plan includes these school sites. Elk Grove Unified School District (EGUSD) Facilities and Planning Department staff (K. Williams) has indicated that EGUSD has been working with the Project proponents to be sure that adequate school facilities can be accommodated within the Project area and is satisfied with the proposed development and financing plans for the needed schools.
- **Public Services / Parks and Recreation** – The Project area is located within CSA 4b, which is staffed by the Sacramento County Regional Parks Department (Parks Department). The Project area will be detached from CSA 4b, and will be provided park and recreation services under the proposed Cordova Hills LSD; discretionary action by LAFCO is required for the detachment and formation actions. The Project generates a need for approximately 106.9 acres of parkland, and provides 99.1 acres of formal parkland that will be developed. In addition to the formal parks, the Project includes approximately 151 acres of R-2 open space areas that will include trails, informal play areas, picnic areas, and paseos. The informality of these areas precludes full park credit for these areas, but partial Quimby Act credit may be given. If 5% of the R-2 areas received Quimby Act credit, that would be sufficient to achieve the full requirement of 106.9 acres of credited parkland. The Parks Department has reviewed the plans and deemed them adequate.
- **Public Services / Libraries** – The Cordova Hills SPA indicates that a new full service, 15,000 square foot branch library is planned within the proposed Town Center to serve the Cordova Hills community as well as residents in the surrounding area. According to the Sacramento Public Library Authority Facility Master Plan 2007 – 2015 (Library Master Plan), the proposed library size is adequate to serve the demands generated by the Project at buildout. The Project includes a funding mechanism for a new library that

is of sufficient size to accommodate the expected population of the Project, which has been developed in coordination with the Sacramento Public Library System.

- **Public Utilities / Adequacy of Water Supply** – The projected annual water demand for the entire Project is 6,549.9 acre feet per year (AFY), including system losses. The Project will be served by the Sacramento County Water Agency (SCWA) Zone 40, which has a total maximum water supply to Zone 40 of 102,151 AFY. There is sufficient capacity to serve the Project.
- **Public Utilities / Adequacy of Sewage Disposal** – The Project will result in an average dry weather flow of 4.99 million gallons per day (mgd). The peak wet weather flow for Project buildout is 10.41 mgd. The Sacramento Regional Wastewater Treatment Plant has a permitted average dry weather flow (ADWF) design capacity of 181 mgd and wet weather flow (AWWF) of 392 mgd. The plant receives and treats approximately 141 ADWF (Seyfried, 2008). The Project disposal demand can be met by this existing capacity.
- **Public Utilities / Adequacy of Energy Services** – The estimated annual residential and commercial electricity demand for the Project will be 122,903,000 kilowatt hours and that the estimated annual residential and commercial natural gas demand for the Project will be 4,201,494 therms. The California Energy Commission's Energy Consumption Data Management System reports that 10,691.67 million kilowatt hours of energy and 315.57 million therms were consumed within Sacramento County in the year 2010. The estimated energy usage of the Project is substantially less than the annual energy production for either SMUD or PG&E.
- **Public Utilities / Exceed Sustainable Groundwater Yield** – A long-term average annual yield of 40,900 AFY of groundwater has been identified in both the Water Forum Agreement (WFA) and Water Supply Master Plan for SCWA in the Central Basin. Additionally, as a signatory to the WFA and a member of the Sacramento Central Groundwater Authority (Groundwater Authority), SCWA recognizes the Water Forum-defined long-term sustainable average annual yield of the underlying groundwater basin of 273,000 AFY. The additional groundwater draw caused from implementation of the proposed Project will not result in exceedance of the agreed-upon sustainable yield of 273,000 AFY.
- **Public Utilities – Groundwater Recharge** – The central intermittent drainage on the site is mapped as an area of high groundwater recharge potential. This area is being retained within open space in the Project, and will not be subject to direct impacts.

The Project's impacts to the above listed environmental issues are less than significant. Therefore, the EIR did not identify or require any mitigation measures to lessen or avoid those environmental impacts.

B. LESS-THAN-SIGNIFICANT IMPACTS/ MITIGATION SUGGESTED.

With regard to impacts that were found by the EIR to be less-than-significant, there were several of them where the EIR nonetheless recommended mitigation to ensure that the impact would remain less-than-significant. These impacts and their suggested mitigation measures were as follows:

- **Agricultural Resources** – The proposed land uses are permitted with approval of the Zoning Ordinance Amendment adopting the Cordova Hills SPA. There are no lands

Formatted: Justified

designated as Prime Farmland on the site, and the land does not support intensive agricultural investment. Though there are soils that are considered prime when irrigated, the site is not irrigated. The Project will result in the loss of 8.6 acres of Unique Farmland (a former eucalyptus grove that has been removed) and 242.4 acres of Grazing Land, which exceeds the 50-acre threshold established by the County; mitigation is required. The Project will not result in substantial conflicts with existing agricultural use of adjacent lands, though mitigation requiring deed notices is recommended. There is one existing Williamson Act contract (72-AP-109) within the Project limits. The landowner initiated the non-renewal process for this contract in February 2007. Under the nonrenewal process the contract will expire in the year 2016, and the land will no longer be subject to Williamson Act contract restrictions. The Project proposal includes a large-lot subdivision map which would create parcels that range from less than an acre in size to approximately 35 acres, and also includes a rezone from an agricultural to an urban designation. In order to approve the subdivision map, the approval action would either need to be deferred until February 2013 (within three years of contract nonrenewal) or the Board of Supervisors would need to make findings that the parcels can maintain agricultural use. In order to approve the rezoning, the approval action would need to stipulate that the zoning agreement will not become effective until 2016. Mitigation is included to ensure agricultural activities are maintained until expiration. Provided these actions take place the Project would be consistent with the provisions of the Williamson Act. Required Mitigation: **AG-1:** "The applicant shall provide all prospective buyers of properties within 500 feet of the northern property boundary with written notice that they could be subject to inconvenience or discomfort resulting from accepted farming activities as per provisions of the County Right-To-Farm Ordinance and shall include a Note on all final maps disclosing the Right-To-Farm Ordinance." **AG-2:** "The applicant shall enter into an agreement with an agricultural operator to maintain grazing use, or other more intensive use, on the land which is subject to Williamson Act contract 72-AP-109. Agricultural use shall be maintained until Williamson Act contract expiration. Documentation of this agreement shall be submitted to the Environmental Coordinator prior to approval of the zoning agreement for the Williamson Act contracted property." **AG-3:** "Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, the applicant shall offset the loss of 8.6 acres of Unique Farmland and 242.6 acres of Grazing Land through 1:1 preservation of farmland within a permanent conservation easement. Preservation land must be in-kind or similar resource value."

- **Biological Resources – Amphibians.** The Project site contains suitable habitat and suitable upland habitat for the western spadefoot. The latter species has been observed within the site. The Project will result in loss of approximately 19 acres of seasonal wetlands and vernal pools which are potential breeding habitat for the species, for which 1:1 mitigation is required pursuant to County policies regarding wetland loss. Western spadefoot, a Species of Concern, has been observed in several counties across the state, and a number of sites with suitable habitat for western spadefoot are already being protected. Additionally, 23 vernal pool species are federally protected; preservation efforts for those species and associated habitats will contribute to the conservation of the western spadefoot. While a localized population of the western spadefoot may be reduced through development of the Project site, the regional population will not be reduced significantly for the reasons stated above. Required Mitigation: **BR-1:** "To

compensate for the permanent loss of wetlands, the applicant shall perform one or a combination of the following prior to issuance of building permits, and shall also obtain all applicable permits from the Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Central Valley Regional Water Quality Control Board, and the California Department of Fish and Game: A. Where a Section 404 Permit has been issued by the Army Corps of Engineers, or an application has been made to obtain a Section 404 Permit, the Mitigation and Management Plan required by that permit or proposed to satisfy the requirements of the Corps for granting a permit may be submitted for purposes of achieving a no net-loss of wetlands. The required Plan shall be submitted to the Environmental Coordinator, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service for approval prior to its implementation. B. If regulatory permitting processes result in less than a 1:1 compensation ratio for loss of wetlands, the Project applicant shall demonstrate that the wetlands which went unmitigated/uncompensated as a result of permitting have been mitigated through other means. Acceptable methods include payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator. C. The Project applicant may participate in the South Sacramento Habitat Conservation Plan if it is adopted and if the Project area and activities are covered. The applicant shall prepare Project plans in accordance with that Plan and any and all fees or land dedications shall be completed prior to construction.”

- **Land Use / Conflict with General Plan Policies related to Land Use Compatibility.** Policy LU-19 states that appropriate buffers should be placed between incompatible uses, and Policy LU-94 states that new development should be compatible with existing development. The Project is adjacent to two existing uses, the Boys Ranch and Kiefer Landfill, with potential to result in conflicts. For the Boys Ranch, the distance from the majority of the site and the topographical changes between the site and the Boys Ranch acts as a natural barrier. For the Kiefer Landfill, distance from the site combined with existing regulations for landfills will prevent substantial impacts. For both facilities, there remains the potential for nuisance impacts. For this reason, mitigation is included requiring disclosure of the facilities to prospective buyers. **Required Mitigation:** **LU-1:** “The location and nature of the Sacramento County Boys Ranch facility shall be disclosed to all prospective buyers of estate-residential properties. **LU-2:** The location and nature of the Kiefer Landfill facility shall be disclosed to all prospective buyers of properties within one mile of the ultimate active landfill boundary. The disclosure notice shall include: A. A statement substantially consistent with the following: ‘The landfill will expand in height and land area over time, and thus the visibility and proximity of the landfill from the property at the time of purchase does not reflect how visible or proximate the landfill will be in the future.’ This statement shall be supplemented with relevant facts about ultimate landfill design, including the distance of the property to the ultimate planned edge of the landfill waste disposal area to the nearest 100 feet and the ultimate planned height of the landfill (as set forth in the Solid Waste Facilities Permit). B. Notification that the landfill operates under a Solid Waste Facilities Permit and is required to control pests, vectors, litter, and odor to the extent practicable, but that it is not possible to eliminate all of these nuisances. For this reason, property owners may experience some of these nuisance conditions. C. Notification that the active landfill area is lighted at night.”

- **Noise / Mather Airport.** The Project site is located approximately four miles east of Mather Airport. Although the Project site is located outside the 60 dB CNEL contour of Mather Airport, the Project site is located within the overflight path of approaching and departing aircraft that fly below 3,000 feet above ground level. During an average one-month time period, a very small percentage of total departure (two percent) and arrival (eight percent) flights are passing over the Project site and there are less than 15 percent of the total touch-and-go flights passing over the Project site. Though the Project will not expose people to excessive aircraft noise, continued and future use of Mather Airport has the potential to be a nuisance and generate objections by residents and other sensitive receptors. An Avigation Easement to inform future potential residential buyers will be required to help reduce the impact to Mather Airport from new complaints by future residents or other sensitive receptors of the proposed Project; these various conditions are included as mitigation. Required Mitigation: NO-6: “The following conditions will be required to ensure adequate disclosure of Mather Airport operations: 1. Notification in the Public Report prepared by the California Department of Real Estate shall be provided disclosing to prospective buyers that the parcel is located within the applicable Airport Planning Policy Area and that aircraft operations can be expected to overfly that area at varying altitudes less than 3,000 feet above ground level. 2. Avigation Easements prepared by the Sacramento County Counsel’s Office shall be executed and recorded with the Sacramento County Recorder on each individual parcel contemplated in the development in favor of the County of Sacramento. All Avigation Easements recorded pursuant to this policy shall, once recorded, be copied to the director of Airports and shall acknowledge the property location within the appropriate Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the appropriate airport.”

C. SIGNIFICANT AND POTENTIALLY SIGNIFICANT IMPACTS/ MITIGATION REQUIRED.

The EIR also identified a number of significant or potentially significant environmental effects or impacts that the Project will or may cause. Some of those significant effects can be fully avoided through the adoption of feasible mitigation measures. Other effects cannot be avoided or substantially lessened by the adoption of feasible mitigation measures or alternatives and are, therefore, considered significant and unavoidable. However, for the reasons set forth below in Section X.C, LAFCo has determined that those significant, unavoidable effects of the Project are outweighed by overriding economic, social and other considerations.

It has been found that the Project would result in significant or potentially significant environmental effects that can be fully avoided through the adoption of feasible mitigation measures with respect to the following issues or resources:

- **Air Quality / Construction Activities Would Increase NO_x Emissions** – The Project has the potential to result in significant impacts throughout most of the life of the Project, even after implementation of the Basic Construction Emissions Control Practices and Enhanced Construction Emission Control Practices which are required by rule through the Sacramento Metropolitan Air Quality District (SMAQMD). Mitigation is included (which is in addition to the rules) to ensure that all subsequent projects which

Formatted: Justified

occur within the Project area conform to the SMAQMD mitigation and abatement requirements which are in effect at the time. This will offset Project emissions.

- **Air Quality / Project Operation Would result in TAC Emissions** – Using the published California Air Resources Board siting criteria for sources of toxic air contaminants (TAC) and sensitive receptors, there are no off-site TAC sources proximate to the sensitive receptors of the Project, and the Project will not generate TAC that would impact off-site sensitive receptors. The Project could result in exposure of proposed on-site uses to proposed on-site stationary source TAC, but mitigation is included to ensure that the siting of new uses conforms to ARB recommendations.
- **Air Quality / Project Operation May Result in Exposure to Objectionable Odors** – The Project is proximate to both the Boys Ranch and the Kiefer Landfill. The former facility is specifically prohibited from causing a nuisance odor condition, and nuisance odor is fully controllable through maintenance of aerated conditions in the ponds. Though based on historic operation of wastewater facilities in general and of this facility in particular it can be expected that there will be events when aeration fails (a pump malfunctions, for instance), it can also be expected that these will be infrequent events of short duration. Only considering meteorological conditions and the proximity of the Project to the landfill, it would be likely that some significant odor impacts to the Project could occur; however, the SMAQMD Guide does not provide further information regarding factors that can reduce odor impacts, if present. Kiefer Landfill has established an active gas-to-energy system that employs active gas extraction from the landfill for use in electrical generation. As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given the foregoing and the mitigation incorporated below, odor impacts are not expected to be substantial.
- **Biological Resources / Special Status Species / Bird Species** – The following special status bird species are identified as having potential to occur on or near the Project site: burrowing owl, Cooper's hawk, ferruginous hawk, golden eagle, grasshopper sparrow, northern harrier, Swainson's hawk, tricolored blackbird, and white-tailed kite. Excluding the large avoided area and two adjacent smaller avoided areas on the western side of the site, the Project will result in the conversion of 2,120 acres of grassland habitat to urban uses (note that the central linear avoided area is not considered preserved for the purposes of Swainson's hawk habitat, which is why the mitigation requirement in BR-4 is higher than the total grassland lost). Except the tricolored blackbird, all of the species listed above use grasslands for foraging and/or nesting and will be impacted by Project development. The Swainson's hawk is the only threatened species, and mitigation is included requiring 1:1 habitat mitigation. Mitigation of habitat for the benefit of the Swainson's hawk will also provide habitat compensation for other bird species. The Project site does not contain any trees for nesting, but there are offsite trees nearby; pre-construction nesting surveys have been included for tree-nesting raptors. Pre-construction nesting surveys are also included for burrowing owl (which is ground-nesting), and are also included for tricolored blackbird (for those areas which are within 300 feet of suitable habitat, such as cattail or blackberry).
- **Biological Resources / Special Status Species / Plants** – The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc. The special status plant surveys revealed two special status species present on the Project site: legenere and Sacramento Orcutt grass.

The wetlands containing those plants are located within Avoided Areas, but given the proximity of these wetlands to development areas, mitigation requires additional measures be implemented to control invasive species and to avoid pollution runoff from urban activities.

- **Cultural Resources** - The Project area contains three historic era sites, and a fourth historical site that is included in a multi-component site. One prehistoric bedrock mortar station site and one prehistoric component of a multi-component site were discovered in the project area. None of the sites are associated with any important persons or events in California or national history. They are not considered to be unique and do not represent the work of a master or possess high artistic values. In all cases, the historic sites lack sufficient cultural material to address research questions. All of the historic sites were evaluated as not eligible under any criteria for the National Register of Historic Places or the California Register of Historical Resources and are not considered a historical resource or unique archeological resource as defined by CEQA. There always remains a potential to encounter buried or as yet undiscovered resources during land clearing and construction work. Mitigation is included to ensure that such resources are treated appropriately if discovered.
- **Hazards and Hazardous Materials** - The site was assessed for on-site hazardous conditions, and this assessment concluded that there is no evidence of any recognized hazardous conditions that may have a significant adverse effect on the development of the Project site. There are three agency-listed contaminated sites within approximately one mile of the Project site. These include the Sacramento County Boys Ranch (a juvenile correction facility within 1,000 feet of the eastern Project boundary), Aerojet (located just over a mile to the northwest), and the Kiefer Landfill (located approximately 2,000 feet to the south). The Boys Ranch hazardous condition was remediated and the case closed. Aerojet remediation activities are ongoing. Contaminated soils from Aerojet would not affect the Project, as these are off-site, while the groundwater contamination plumes are migrating away from the Project area. Groundwater contamination at Kiefer Landfill is likewise migrating away from the Project site. The Project will also be using public water provided through the Sacramento County Water Agency, not groundwater. Landfill gas migration from Kiefer Landfill also appears not to affect the site, but a mitigation measure is nonetheless included for the small portion of the site outside of the Urban Services Boundary that is within the 2,000 foot buffer established around the Kiefer Landfill.
- **Noise / Traffic Noise** – Traffic on the internal Project roadways and on Grant Line Road will generate noise that has the potential to exceed General Plan noise standards related to both residential and non-residential uses. Mitigation is included to ensure that future subdivisions and non-residential developments are constructed in a manner that achieves compliance with General Plan standards.
- **Noise / On-site Stationary and Community Noise** - The Project includes uses which include noise-generating sources such as playing fields, loading docks, a corporation yard, and other uses. Mitigation is included to require that all such uses located adjacent to residential lands be designed so as not to cause the General Plan standards to be exceeded.

D. SIGNIFICANT AND UNAVOIDABLE IMPACTS.

The Final EIR identified mitigation measures that would reduce the above significant impacts to a less-than-significant level. The Project was determined in the Final EIR to result in significant and unavoidable environmental effects with respect to the following impacts regardless of whether all feasible mitigation was required:

Formatted: Justified

- **Aesthetics / Degradation of Existing Views and Visual Quality** – The Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada significantly and negatively impacts the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed. The Project will substantially degrade the existing visual character and quality of the site.
- **Aesthetics / New Source of Light or Glare** - Project lighting will not result in sleep disruption or significant wildlife impacts, but will nonetheless introduce a substantial new source of light. This impact is not due to any individual feature or features, but due to the result of introducing a large urban development within a rural landscape. Though the impact cannot be made less than significant, usage of lighting fixtures that minimize glare and light trespass can reduce the impact to some degree.
- **Air Quality / Operational Emissions of Ozone Precursors** - The Project will result in worst-case NOx and ROG emissions of 415.22 pounds per day and 857.40 pounds per day, respectively, which is significantly above the threshold of 65 pounds per day. A mitigation plan is included to reduce emissions by 35%, but emissions will still exceed the threshold.
- **Air Quality / Construction Activities Would Increase Particulate Matter Emissions** – Modeling conducted by SMAQMD has indicated that applying basic construction rules will ensure that impacts will not be significant provided that construction is limited to no more than 15 acres of active grading per day. On a project of this size, it is unreasonable to assume that construction will be limited to such a small area. The Project will generate particulate matter emissions that exceed the SMAQMD thresholds.
- **Air Quality / Conflict With or Obstruct Air Quality Plans** - The current State Implementation Plan (SIP) did not assume that the land east of Grant Line Road would develop, and thus even if the Project's emissions of ozone precursors were not significant, the Project would still conflict with implementation of the SIP.
- **Biological Resources / Wetlands and Surface Waters** – In total, there are approximately 89.11 acres of wetland resources on the Project site. The Project will result in the fill or dredge of 41.37 acres of wetlands on the site, which includes approximately 16 acres of vernal pool; three acres of seasonal wetland; 15 acres of seasonal wetland swale; six acres of intermittent drainage; and less than one acre of seep, stock pond, and creek. Mitigation is required to offset these direct impacts, but given

the extent of wetland loss (46% of the wetlands on the site) and the fact that this is in a Rank 1 Vernal Pool Recovery Plan area the mitigation is not sufficient to reduce impacts. Future development within the SPA could include amendments to the SPA which would modify the Avoided Area boundaries. This could result in additional incremental losses of needed uplands and/or wetlands, increasing the severity of what is already a significant impact in an area noted as vital to the recovery of vernal pool resources. For this reason, mitigation is also included which would require the establishment of a permanent conservation easement over all areas designed as Avoided.

- **Biological Resources / Special Status Species / Invertebrates** - The site contains wetlands suitable for the California linderella, midvalley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Published protocols for the vernal pool fairy shrimp and vernal pool tadpole shrimp contain survey requirements for determining absence, and mitigation to be applied in case of presence or if presence is being assumed. These same measures are applied to the Species of Concern, California linderella and midvalley fairy shrimp as well. Mitigation being required for these species will also serve to provide mitigation for the Ricksecker's water scavenger beetle, which uses the same habitats. Though in-kind mitigation will be required for the loss of habitat on the site, the loss of 46% of the wetlands on the site within an area identified as vital to the recovery for vernal pool habitats and their dependent species is significant even with mitigation.
- **Climate Change** - In concert with state and federal activities, the design features of the SPA are intended to offset the Project climate change impact. Ideally, this mitigation would reduce the Project emissions and climate change impacts to levels that are not cumulatively significant, but there are many unknown variables and implementation challenges. Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling this analysis concludes that Project impacts may remain significant. The effects of climatic changes on the Sacramento region are potentially significant, and can only be mitigated through both adaptation and reduction strategies. By requiring mitigation of projects that may result in significant greenhouse gas emissions, and by adopting County programs and changes in government operations, the County is implementing all feasible strategies to reduce the effects of climate change on the region. Nonetheless, it is probable that these strategies will not be sufficient to offset all of the impacts of climate change, and that some of these impacts will be significant.
- **Land Use / Conflict With the SACOG Blueprint and General Plan Policy** - The Project includes a wide variety of transportation choices, an array of housing choices, a mix of uses, compact community design, and fosters a sense of place. While acknowledging that in terms of internal community design the Project appears to be an excellent example of "smart growth" development and is consistent with relevant General Plan policies, it must also be acknowledged that the Project conflicts with the principles with respect to the preservation of open space and the proximity to existing developed communities. In terms of open space preservation, the analysis is somewhat subjective, and the Project has directed preservation toward the most sensitive vernal pool areas of the site. In terms of directing development toward existing communities, the conflict is more clear. Though projected for future development, the Blueprint envisions growth occurring from the existing city centers outward rather than the

reverse. This is a fundamental underpinning to the Blueprint, and as a result, the Project's inconsistency with this principle is considered substantial.

- **Noise / Substantial Increase in Existing Ambient Noise** - The Project would result in a substantial increase in existing ambient noise for multiple roadway segments, but only two of these include receptors which would be impacted: Sunrise Boulevard and Douglas Boulevard. Noise volumes would be increased by 2 dB on Sunrise Boulevard and by 7 dB and 10 dB along Douglas Boulevard. Based on the existing noise environments, these are substantial increases. On Sunrise Boulevard, a noise barrier is not appropriate because businesses rely on visibility to attract customers, and on Douglas Road a barrier is already present. Thus, no further improvements can be made to reduce impacts.
- **Public Utilities / Construction Impacts** - Water, sewer, and dry utility lines constructed within the Project boundaries would not cause any additional utility-specific construction impacts, as utility construction will occur within areas that will already urbanize as part of the Project. Most of the off-site utility lines are shown within areas already proposed for utility construction as part of service provider master planning documents. There are some improvement areas that have not already been studied or approved, and which are likely to contribute to wetland impacts and impacts to associated species.
- **Traffic and Circulation / Existing Plus Project** - The Project results in significant impacts to six County intersections, ten City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, two County roadway segments, one City of Elk Grove roadway segment, eleven City of Rancho Cordova roadway segments, two US 50 freeway segments, and bicycle and pedestrian facilities. Mitigation is included which will improve operating conditions to acceptable levels for most of these facilities, but there are some impacts for which no feasible mitigation exists. These are: the Zinfandel and US 50 freeway ramp intersection and Sunrise Boulevard from US 50 to White Rock Road. Furthermore, the County does not have land use authority in other jurisdictions, and cannot guarantee that non-County facilities will be constructed.
- **Traffic and Circulation / Cumulative Plus Project** - The Project results in significant impacts to five City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, one new Project roadway segment, four City of Rancho Cordova roadway segments, six Caltrans freeway segments, and four Caltrans freeway ramps. Mitigation is included which will improve operating conditions to acceptable levels for most of these facilities, but there are some impacts for which no feasible mitigation exists. These are: the Zinfandel and US 50 freeway ramp intersection, the intersection of Sunrise Boulevard and International Drive, Grant Line Road from North Loop Road to Douglas Road, eastbound US 50 from Watt Avenue to Bradshaw Road, eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue, westbound US 50 from Hazel Avenue to Rancho Cordova Parkway, westbound US 50 from Mather Field Road to Power Inn/Howe Avenue, eastbound US 50 Exit Ramp to Watt Avenue, eastbound US 50 Slip Ramp Entrance from Watt Avenue, westbound US 50 Exit Ramp to Watt Avenue, and westbound US 50 Slip Ramp Entrance from Watt Avenue.

E. IMPACTS AND REQUIRED MITIGATION MEASURES:

AESTHETICS

Impact: Degradation of Existing Views and Visual Quality.

The Project will remove the illusion of continuity – that is, the illusion that the grasslands continue unbroken up to the foothills – both due to the introduction of the structures themselves, and because of the substantial changes in the color and texture of the viewshed. The Project will introduce hard, angled shapes into an area that previously appeared smooth, and will introduce a wider array of color into an area that was previously quite uniform. Though this will increase the diversity of the view, the loss of continuity and the partial obstruction of views of the Sierra Nevada significantly and negatively impacts the quality of the views. These impacts are due to the placement of a large urban development in an area currently dominated by open space; the impact is not due to any particular feature or features that could be changed. The Project will substantially degrade the existing visual character and quality of the site. (Significant)

Formatted: Justified

Finding: The EIR did not identify any changes or alterations that could be required in, or incorporated into, the Project to substantially reduce the significant environmental effect identified in the EIR. The Project will introduce hard, angled shapes into an area that previously appeared smooth and uniform. The Project's impact on visual quality or character is considered significant and unavoidable because the Project site will no longer present its current natural state. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The EIR determined that no mitigation measures were available to substantially lessen this impact.

Level of Significance After Mitigation: Since there is no feasible mitigation, this impact will remain Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: New Source of Light and Glare.

Project lighting will not result in sleep disruption or significant wildlife impacts, but will nonetheless introduce a substantial new source of light. This impact is not due to any individual feature or features, but due to the result of introducing a large urban development within a rural landscape. Though the impact cannot be made less than significant, usage of lighting fixtures that minimize glare and light trespass can reduce the impact to some degree. (Significant)

Formatted: Justified

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially reduce the significant environmental effect as identified in the EIR. While the proposed aesthetics mitigation measure requires all lighting to be subject to the 2008 Building Efficiency Standards Section 147 and to use only fixtures approved by the International Dark Sky Association to reduce the Project's impact on the nighttime sky, this impact is significant and

unavoidable because the Project site will still be a source of urban nighttime light and glare in an area where there is no other light pollution. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measure has been incorporated into the Project to substantially lessen this impact, but not to a less-than-significant level:

Mitigation Measure AE-1. The SPA shall be amended to require all lighting applications subject to the 2008 Building Efficiency Standards Section 107 to use fixtures approved by the International Dark Sky Association.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo additionally finds that the measures are feasible, and could and should be adopted by Sacramento County. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

AIR QUALITY

Impact: *Construction Activities Would Increase NO_x Emissions.*

The Project has the potential to result in significant impacts throughout most of the life of the Project, even after implementation of the Basic Construction Emission Control Practices and Enhanced Construction Emission Control Practices that are required by rule through the Sacramento Metropolitan Air Quality District (SMAQMD). Mitigation is included (which is in addition to the rules) to ensure that all subsequent projects that occur within the Project area conform to the SMAQMD mitigation and abatement requirements that are in effect at the time. This will offset Project emissions. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially reduce the significant environmental effect as identified in the EIR by requiring all individual development projects in the Project Area to implement SMAQMD rules and mitigation pertinent to construction-related ozone precursor emissions, as defined by the most current version of the SMAQMD Guide to Air Quality Assessment. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measures: The following mitigation measure has been incorporated into the Project to avoid this impact and reduce it to a less-than-significant level:

Mitigation Measure AQ-1. The following language shall be added to the SPA:

All individual development projects shall implement Sacramento Metropolitan Air Quality Management District rules and mitigation pertinent to construction-related ozone precursor

emissions, as defined by the most current version of the Sacramento Metropolitan Air Quality Management District Guide to Air Quality Assessment.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Operational Emissions of Ozone Precursors.

The Project will result in worst-case NO_x and ROG emissions of 415.22 pounds per day and 857.40 pounds per day, respectively, which is significantly above the threshold of 65 pounds per day. A mitigation plan is included to reduce emissions by 35%, but emissions will still exceed the threshold. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project that substantially lessen the significant environmental effects from operational emissions of ozone precursors identified in the EIR by requiring compliance with the provisions of the Air Quality Management Plan dated June 1, 2011, as updated March 2012 (errata) and as amended January 2013; these measures will reduce the emissions of ozone precursors by requiring the incorporation of the requirements of that plan into the Cordova Hills SPA conditions. However, those measures will not completely avoid this impact or reduce it below the 65 pounds per day threshold, and the impact will still remain significant and unavoidable. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measure: The following mitigation measure has been incorporated into the Project to substantially lessen this impact, but not to a less-than-significant level:

Mitigation Measure AQ-2. Comply with the provisions of the Air Quality Management Plan dated June 1, 2011, as updated March 2012 (errata) and as amended January 2013, and incorporate the requirements of this plan into the Cordova Hills Special Planning Area conditions. Also the following text shall be added to the Cordova Hills SPA:

“All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project and shall achieve the original 35% reduction in total overall project emissions. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.”

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo additionally finds that the measure is feasible, and could and should be adopted by Sacramento County. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Construction activities Would Increase Particulate Matter Emissions.

Modeling conducted by SMAQMD has indicated that applying basic construction rules will ensure that impacts will not be significant provided that construction is limited to no more than 15 acres of active grading. On a project of this size, it is unreasonable to assume that construction will be limited to such a small area. The Project will generate particulate matter emissions that exceed thresholds. (Significant)

Finding: The EIR did not identify any changes or alterations that could be required in, or incorporated into, the Project to substantially reduce the particulate matter emissions from construction activities because it would be unreasonable to expect that construction activities could be limited to 15 acres of active grading per day in a project of this size. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measures: There were no feasible mitigation measures identified in the EIR that could avoid or substantially lessen this impact.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Conflict With or Obstruct Air Quality Plans.

The current State Implementation Plan (SIP) did not assume that the land east of Grant Line Road would develop, and thus even if the Project's emissions of ozone precursors were not significant, the Project would still conflict with implementation of the SIP. (Significant)

Finding: Aside from requiring compliance with Mitigation Measure AQ-2, the EIR did not identify any other changes or alterations that could be required in, or incorporated into, the Project to substantially reduce this impact. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measure: The following mitigation measure has been incorporated into the Project to substantially lessen this impact, but not to a less-than-significant level:

Mitigation Measure AQ-2. Comply with the provisions of the Air Quality Management Plan dated June 1, 2011, as updated March 2012 (errata) and as amended January 2013, and incorporate the requirements of the amended AQMP into the Cordova Hills Special Planning Area conditions. Also the following text shall be added to the Cordova Hills SPA:

“All amendments to the Cordova Hills SPA with the potential to result in a change in ozone precursor emissions shall include an analysis which quantifies, to the extent practicable, the effect of the proposed SPA amendment on ozone precursor emissions. The amendment shall not increase total ozone precursor emissions above what was considered in the AQMP for the entire Cordova Hills project and shall achieve the original 35% reduction in total overall project emissions. If the amendment would require a change in the AQMP to meet that requirement, then the proponent of the SPA amendment shall consult with SMAQMD on the revised analysis and shall prepare a revised AQMP for approval by the County, in consultation with SMAQMD.”

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Project Operation Would result in TAC Emissions.

Using the published California Air Resources Board siting criteria for sources of toxic air contaminants (TAC) and sensitive receptors, there are no off-site TAC sources proximate to the sensitive receptors of the Project, and the Project will not generate TAC that would impact off-site sensitive receptors. The Project could result in exposure of proposed on-site uses to proposed on-site stationary source TAC, but mitigation is included to ensure that the siting of new uses conforms to ARB recommendations. (Potentially Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially avoid the potentially significant impacts from the TAC emissions that would result from project operation by requiring buffers to be established on a project-by-project basis between sources that emit TACs or odors and sensitive receptors, such as schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency (including single and multi-family). LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measure: The following mitigation measure has been incorporated into the Project to avoid this impact and reduce it to a less-than-significant level:

Mitigation Measure AQ-3. The following language shall be added to the SPA:

Buffers shall be established on a project-by-project basis and incorporated during permit or project review to provide for buffer separations between sensitive land uses and sources of air pollution or odor. The California Air Resources Board’s “Air Quality and Land Use Handbook: A Community Health Perspective”, or more current document, shall be utilized when establishing these buffers. Sensitive uses include schools, daycare facilities, congregate care facilities, hospitals, or other places of long-term residency for people (this includes both single-

and multiple-family). The buffers shall be applied to the source of air pollution or odor, and shall be established based either on proximity to existing sensitive uses or proximity to the property boundary of land designated for sensitive uses. Buffers current at the time of the establishment of this SPA indicate that sensitive uses should be:

- A. A least 500 feet from auto body repair services.
- B. At least 50 feet from existing gasoline dispensing stations with an annual throughput of less than 3.6 million gallons and 300 feet from existing gasoline dispensing stations with an annual throughput at or above 3.6 million gallons.
- C. At least 300 feet from existing land uses that use methylene chloride or other solvents identified as a TAC, including furniture manufacturing and repair services.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Project Operation May Result in Exposure to Objectionable Odors.

The Project is proximate to both the Boys Ranch and the Kiefer Landfill. The former facility includes wastewater treatment ponds. The Boys Ranch is specifically prohibited from causing a nuisance odor condition, and nuisance odor is fully controllable through maintenance of aerated conditions in the ponds. Though based on historic operation of wastewater facilities in general and of the Boys Ranch facility in particular, it can be expected that there will be events when aeration fails (a pump malfunctions, for instance), but it can also be expected that these will be infrequent events of short duration. Considering the meteorological conditions and the proximity of the Project to the Kiefer Landfill, it would be likely that some significant odor impacts to the Project also could occur; however, the SMAQMD Guide does provide further information regarding factors that can reduce odor impacts, if present. Kiefer Landfill has established an active gas-to-energy system that employs active gas extraction from the landfill for use in electrical generation. As landfill gas is a major source of odor from a landfill, the active extraction of gases for use in generating electricity is an effective form of limiting odors. Given the foregoing and the mitigation incorporated below, odor impacts are not expected to be substantial. (Potentially Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially avoid the potentially significant impacts during Project operation that may arise from exposure to objectionable odors from the Boys Ranch water treatment ponds or the Kiefer Landfill. Those changes include adding a requirement to the SPA that the western perimeter of the Sports Park and University/College Campus Center that are within 2,000 feet of the Kiefer Landfill include a minimum 25-foot wide landscaping area with a dense mix of trees that will grow to at least 40 feet in height to reduce odors and the uses from the Landfill. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation Measure: The following mitigation measure has been incorporated into the Project to avoid this impact and reduce it to a less-than-significant level:

Mitigation Measure AQ-4: Include in the SPA a requirement that the western perimeter of the Sports Park and University/College Campus Center (where these are within 2,000 feet of the Kiefer landfill) include a minimum 25-foot-wide landscaping area. This landscaping area shall include a dense mix of trees and shrubs, to screen the uses from the landfill. Acceptable tree species include those expected to reach minimum heights of 40 feet.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

BIOLOGICAL RESOURCES

Impact: Wetlands and Surface Waters.

In total, there are approximately 89.11 acres of wetland resources on the Project site. The Project could result in the fill or dredge of approximately 39.63 acres of wetlands on the site, which includes approximately 16 acres of vernal pools; three acres of seasonal wetlands; 15 acres of seasonal wetland swales; six acres of intermittent drainages; and less than one acre of seep, stock pond, and creek. However, it is possible that the Project could impact up to a total of approximately 41.37 acres of wetlands if a 50-foot buffer is applied to non-linear wetland impacts, as well as taking into account possible impacts that might arise to off-site wetlands associated with the construction of water tanks and other utilities on adjacent lands. However, the offsite water tanks and associated utilities will not be designed until later Project phases, so it is likely that 41.37 acres is an overestimate of the total Project wetland impacts. Mitigation is required to offset these direct impacts, but given the extent of wetland loss (46% of the wetlands on the site) and the fact that this is in a Rank 1 Vernal Pool Recovery Plan area the mitigation is not sufficient to reduce impacts. Future development within the SPA could include amendments to the SPA that would modify the Avoided Area boundaries. This could result in additional incremental losses of needed uplands and/or wetlands, increasing the severity of what is already a significant impact in an area noted as vital to the recovery of vernal pool resources. For this reason, mitigation is also included which would require the establishment of a permanent conservation easement over all areas designed as Avoided. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project that substantially lessen the potential environmental impacts on wetlands and surface waters identified in the EIR. In order to substantially lessen the impacts, the EIR proposed mitigation measures requiring the Applicants to obtain and comply with the requirements of Clean Water Act Section 404 and Section 401 Permits prior to issuance of any building permits at the Project, and to the extent the required mitigation did not require 1:1 compensation for the loss of wetlands, the mitigation measures will require mitigation to be provided by the Applicants through other means,

such as by the purchase of mitigation credits at a mitigation bank for the shortfall, protecting offsite wetlands via a conservation easement to make up the shortfall, or participation in the South Sacramento Habitat Conservation Plan (if it should be adopted) in order to ensure there is no net loss of wetlands. In addition, the EIR's mitigation measures required all Avoided Areas at the Project site to be placed under a permanent conservation easement in order to protect the wetlands and surface waters in those Avoided Areas. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project as conditions of approval to substantially lessen this impact, but the impact will nonetheless remain significant and unavoidable:

Mitigation Measure BR-1: To compensate for the permanent loss of wetlands, the Applicants shall perform one or a combination of the following prior to issuance of building permits and shall also obtain all applicable permits from the Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Central Valley Regional Water Quality Control Board, and the California Department of Fish and Game:

- A. Where a Section 404 Permit has been issued by the Army Corps of Engineers, or an application has been made to obtain a Section 404 Permit, the Mitigation and Management Plan required by that permit or proposed to satisfy the requirements of the Corps for granting a permit may be submitted for purposes of achieving a no net-loss of wetlands. The required Plan shall be submitted to the Environmental Coordinator, U.S. Army Corps of Engineers, and U.S. Fish and Wildlife Service for approval prior to its implementation.
- B. If regulatory permitting processes result in less than a 1:1 compensation ratio for loss of wetlands, the Project applicant shall demonstrate that the wetlands which went unmitigated/uncompensated as a result of permitting have been mitigated through other means. Acceptable methods include payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.
- C. The Project applicant may participate in the South Sacramento Habitat Conservation Plan if it is adopted, and if the Project area and activities are covered. The Applicant shall prepare Project plans in accordance with that Plan and any and all fees or land dedications shall be completed prior to construction.

Mitigation Measure BR-2: Prior to issuance of building permits, all areas designated within the SPA as Avoided shall be placed within a permanent conservation easement, which shall be reviewed and approved by the Environmental Coordinator. At a minimum, the permanent conservation easements must cover all areas which are required to be preserved as part of the Section 404 and Section 401 wetland permits.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measures are within the purview of Sacramento County and not that of LAFCo. LAFCo additionally finds that the measures are feasible, and could and should be adopted by Sacramento County. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of

this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Special Status Species / Bird Species.

The following special status bird species are identified as having potential to occur on or near the Project site: burrowing owl, Cooper's hawk, ferruginous hawk, golden eagle, grasshopper sparrow, northern harrier, Swainson's hawk, tricolored blackbird, and white-tailed kite. Excluding the large avoided area and two adjacent smaller avoided areas on the western side of the site, the Project will result in the conversion of 2,120 acres of grassland habitat to urban uses (note that the central linear Avoided Area is not considered preserved for the purposes of Swainson's hawk habitat, which is why the mitigation requirement in BR-4 is higher than the total grassland lost). Except for the tricolored blackbird, all of the species listed above use grasslands for foraging and/or nesting and will be impacted by Project development. The Swainson's hawk is the only Threatened Species, and mitigation is included requiring 1:1 habitat mitigation. Mitigation of habitat for the benefit of the Swainson's hawk will also provide habitat compensation for other bird species. The Project site does not contain any trees for nesting, but there are offsite trees nearby; pre-construction nesting surveys have been included for tree-nesting raptors. Pre-construction nesting surveys are also included for burrowing owl (which is ground-nesting), and are also included for tricolored blackbird (for those areas which are within 300 feet of suitable habitat, such as cattail or blackberry). (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project that avoid the significant environmental effects identified in the EIR to a less than significant level. The mitigation measures will require a focused tree survey by a qualified biologist within 14 days prior to the start of any construction work between March 1 and September 15 to detect active raptor nests. If active nests are found, protective measures determined by the California Dept. of Fish and Game will be implemented to protect the nests. Mitigation for the loss of Swainson's hawk foraging habitat will also be required in the form of placing permanent conservation easements over agricultural lands providing foraging habitat to the satisfaction of the California Dept. of Fish and Game, complying with the County's Swainson's Hawk Impact Mitigation Program, or complying with a new Swainson's Hawk mitigation policy/program adopted by the County Board of Supervisors. Mitigation must be provided prior to the approval of improvement plans, building permits or the recordation of final maps, whichever occurs first. The foraging habitat provided must consist of grassland or similar habitat, not cropland, because this mitigation measure also compensates for impacts to species that do not use cropland habitat. The total mitigation habitat area required is 2,267 acres, but may be reduced to 2,231 acres if the areas designated for continued agricultural uses on the eastern and southeastern sides of the Project outside of the Urban Services Boundary are placed under a permanent conservation easement to preserve their availability as foraging habitat. Further adjustments in the amount of replacement foraging habitat may be made at the discretion of the Environmental Coordinator if the avoided area on the western plateau at the Project is increased in size as a result of the Section 404 Permit's requirements. Significant impacts to burrowing owls will also be avoided because the mitigation requires focused burrowing owl surveys within 500 feet of a construction area by a qualified biologist prior to any construction activities. Surveys must be conducted between 14 and 30 days prior to the commencement of construction and be in accordance with the "Burrowing Owl Survey Protocol and Mitigation

Guidelines” of the DFG. If no burrows are found, then a letter report shall be submitted to the County and no further mitigation will be necessary. If an occupied burrow is found, then the applicants shall contact the Environmental Coordinator and consult with DFG to determine if burrow avoidance is possible or if burrow relocation is necessary. If burrows are to remain, then a minimum of 6.5 acres of foraging habitat per burrow must be permanently preserved and all construction activity within 160 feet of an occupied burrow will be prohibited between September 1 and January 31, and prohibited within 250 feet between February 1 and August 31. Protective fencing must also be placed around active burrows to protect those buffer zones, and any permanent improvements located at least 250 feet from an occupied burrow being avoided. All mitigation for impacts to burrowing owls, whether they are relocated or their burrows are preserved onsite, must be conducted in accordance with the DFG’s “Staff Report on Burrowing Owl Mitigation (October 17, 1995)”, and any current updates. In order to avoid significant impacts to tricolored blackbird and their nesting habitat, the Applicants will be required to have a qualified biologist conduct preconstruction surveys for any work undertaken between March 1 and July 31 for nesting tricolored blackbirds. Such surveys will include the construction site and 300 ft., surrounding the site, and will be performed between 14 days and 30 days before work begins. A written report of survey results must be submitted to the Environmental Coordinator prior to any ground disturbing activity taking place. If nesting tricolored blackbird are present, then further mitigation will be required that includes consultation with the DFG to implement avoidance and impact minimization measures as directed by the DFG. Impacts to tricolored blackbirds are to be avoided by establishing a 300 foot temporary fenced setback from any nesting colony until the nesting colony is no longer dependent on the nesting habitat, as determined by a qualified biologist. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project as conditions of approval to avoid this impact to special status bird species:

Mitigation Measure BR-3. If construction, grading, or Project-related improvements are to occur between March 1 and September 15, a focused survey for tree- or ground-nesting raptors within 500 feet of the construction site (1/2 mile for Swainson’s hawk) and for ground-nesting grasshopper sparrow shall be conducted by a qualified biologist within 14 days prior to the start of construction work (including clearing and grubbing). If active nests are found, the California Department of Fish and Game shall be contacted to determine appropriate protective measures. If no active nests are found during the focused survey, no further mitigation will be required.

Mitigation Measure BR-4. Prior to the approval of improvement plans, building permits, or recordation of the final map, whichever occurs first, implement one of the options below to mitigate for the loss of Swainson’s hawk foraging habitat on the Project site; based on current Project designs this is 2,267 acres. Based on current designs, this can be reduced to 2,231 acres of mitigation if the Applicant establishes a permanent conservation easement over the areas designated Agriculture on the eastern and southeastern sides of the site (these are areas outside of the Urban Services Boundary). Foraging habitat preserved shall consist of grassland or similar habitat open habitat, not cropland, because this mitigation measure also offsets impacts to other species that do not use cropland habitat.

A. The project proponent shall utilize one or more of the mitigation options (land dedication and/or fee payment) established in Sacramento County’s Swainson’s Hawk Impact Mitigation Program (Chapter 16.130 of the Sacramento County Code).

- B. The Project proponent shall, to the satisfaction of the California Department of Fish and Game, prepare and implement a Swainson's hawk mitigation plan that will include preservation of Swainson's hawk foraging habitat.
 - C. Should the County Board of Supervisors adopt a new Swainson's hawk mitigation policy/program (which may include a mitigation fee payable prior to issuance of building permits) prior to the implementation of one of the measures above, the Project proponent may be subject to that program instead.
- If the design of the primary Avoided Area on the western plateau (currently 382 acres in size) is increased in size in response to Section 404 wetland permitting requirements, the total amount of mitigation land required may be adjusted downward to reflect this increased avoidance, at the discretion of the Environmental Coordinator.

Mitigation Measure BR-5. Prior to construction activity (including site improvements, and building construction) focused surveys shall be conducted by a qualified biologist for burrowing owls in the construction area and within 500 feet of the construction area. Surveys shall be conducted no less than 14 days and no more than 30 days prior to commencement of construction activities. Surveys shall be conducted in accordance with "Burrowing Owl Survey Protocol and Mitigation Guidelines" published by The California Burrowing Owl Consortium (April 1993). The following shall also apply:

- A. If no occupied burrows are found in the survey area, a letter report documenting survey methods and findings shall be submitted to the County and no further mitigation is necessary.
- B. If an occupied burrow is found the applicant shall contact the Division of Environmental Review and Assessment and consult with the California Department of Fish (CDFG), prior to construction, to determine if avoidance is possible or if burrow relocation will be required.
- C. If owls are to remain on-site, a minimum of 6.5 acres of foraging habitat for each occupied burrow needs to be permanently preserved according to California Department of Fish and Game guidelines. In addition, no activity shall take place within 160 feet of an active burrow from September 1 to January 31 (wintering season) or 250 feet from February 1 through August 31 (breeding season). Protective fencing shall be placed, at the distances above, around the active burrows and no activity shall occur within the protected buffer areas. Permanent improvements shall be a minimum of 250 feet from an occupied burrow.
- D. Any impact to active owl burrows, relocation of owls, or mitigation for habitat loss shall be done in accordance with the Fish and Game "Staff Report on Burrowing Owl Mitigation" (October 17, 1995) or the version current at the time of construction. Written evidence from Fish and Game staff shall be provided to the Environmental Coordinator attesting to the permission to remove burrows, relocate owls, or mitigate for lost habitat, and shall include a plan to monitor mitigation success.

Mitigation Measure BR-6. If construction occurs between March 1 and July 31 pre-construction surveys for nesting tricolored blackbirds shall be performed by a qualified biologist. Surveys shall include the construction site and areas of appropriate habitat within 300 feet of the construction site. The survey shall occur no longer than 14 days prior to the start of construction work (including clearing, grubbing or grading). The biologist shall supply a brief written report (including date, time of survey, survey method, name of surveyor and survey

results) to the Environmental Coordinator prior to ground disturbing activity. If no tricolored blackbird were found during the pre-construction survey, no further mitigation would be required. If an active tricolored blackbird colony is found on-site or within 300 feet of the construction site the project proponent shall do the following:

- A. Consult with the California Department of Fish and Game to determine if project activity will impact the tricolored blackbird colony(s), and implement appropriate avoidance and impact minimization measures if so directed. Provide the Environmental Coordinator with written evidence of the consultation or a contact name and number from the California Department of Fish and Game.
- B. The applicant may avoid impacts to tricolored blackbird by establishing a 300-foot temporary setback with fencing that prevents any project activity within 300 feet of the colony. A qualified biologist shall verify that setbacks and fencing are adequate and will determine when the colonies are no longer dependent on the nesting habitat (i.e. nestlings have fledged and are no longer using habitat), which will determine when the fencing may be removed. The breeding season typically ends in July.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measures are within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Special Status Species – Invertebrates.

The site contains wetlands suitable for the California linderella, midvalley fairy shrimp, Ricksecker's water scavenger beetle, vernal pool fairy shrimp, and vernal pool tadpole shrimp. Published protocols for the vernal pool fairy shrimp and vernal pool tadpole shrimp contain survey requirement for determining absence, and mitigation to be applied in case of presence or if presence is being assumed. These same measures are applied to the Species of Concern, California linderella and midvalley fairy shrimp as well. Mitigation being required for these species will also serve to provide mitigation for the Ricksecker's water scavenger beetle, which uses the same habitats. Though in-kind mitigation will be required for the loss of habitat on the site, the loss of 46% of the wetlands on the site within an area identified as vital to the recovery for vernal pool habitats and their dependent species is significant even with mitigation. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially lessen the significant environmental impacts as identified in the EIR, but not to a less-than-significant level. The presence of California linderella, midvalley fairy shrimp, vernal pool shrimp and vernal pool tadpole shrimp will be assumed, unless USFWS protocol surveys are performed to determine that those species are not present. If those species are absent, then the Ricksecker's water scavenger may also be presumed to be absent, and no further mitigation will be required. If the species are present or their presence is being assumed, then the vernal pools to be avoided shall have a 250 ft. buffer established where no construction will be allowed. Where vernal pools are being filled, then all applicable permits must be obtained from the USFWS, Army Corps

of Engineers, DFG and Central Valley California Regional Water Quality Control Board and mitigation provided as required by the permits. At a minimum, the mitigation ratios shall be consistent with County General Plan Policy of no net loss of wetland resources. Any vernal pool loss not mitigated for through the permit process shall be mitigated for by purchase of credits at a mitigation bank or by the protection of offsite wetlands with a permanent conservation easement approved by the Environmental Coordinator. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project as conditions of approval to lessen and reduce the Project's significant and unavoidable impacts on the identified special status invertebrates:

Mitigation Measure BR-7: Presence of California linderella, midvalley fairy shrimp, vernal pool fairy shrimp and vernal pool tadpole shrimp shall be assumed unless determinate surveys that comply with U.S. Fish and Wildlife protocols conclude that the species are absent. If the protocol surveys are performed and all listed crustacean species are absent, Ricksecker's water scavenger beetle may also be presumed absent, and no further mitigation shall be required for listed vernal pool invertebrates. If species are found, one or a combination of the following shall apply:

- A. *Total Avoidance: Species are present or assumed to be present.* Unless a smaller buffer is approved through formal consultation with the Fish and Wildlife Service, construction fencing shall be installed a minimum of 250 feet from all delineated vernal pool margins. All construction activities are prohibited within this buffer area. For all vernal pools where total avoidance is achieved, no further action is required.
- B. *Compensate for habitat removed.* Obtain all applicable permits from the U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, California Department of Fish and Game, and the Central Valley Regional Water Quality Control Board for any proposed modifications to vernal pools and mitigate for habitat loss in accordance with the Biological Opinion and Section 404 permits obtained for the Project. At a minimum, mitigation ratios shall be consistent with County General Plan Policy, which requires no net loss of wetland resources. Any vernal pool loss not mitigated through the permitting process shall be mitigated for by payment into a mitigation bank or protection of off-site wetlands through the establishment of a permanent conservation easement, subject to the approval of the Environmental Coordinator.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measures are within the purview of Sacramento County and not that of LAFCo. LAFCo additionally finds that the measures are feasible, and could and should be adopted by Sacramento County. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Special Status Species – Plants.

The Project site was surveyed for special status plant species in May 2007, April and June 2008, and May and July 2010 by ECORP Consulting Inc. The special status plant surveys revealed two special status species present on the Project site: legumens and Sacramento Orcutt grass. The wetlands containing these plants are located within Avoided Areas, but given the proximity of these wetlands to development areas, mitigation requires additional measures be implemented to control invasive species and to avoid pollution runoff from urban activities. (Potentially Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which avoid the potentially significant environmental impacts to the identified special status plant species identified in the EIR and will make the impact less-than-significant. In order to ensure that the potentially significant impact is reduced to a less-than-significant level, the mitigation measures require the Applicants to prepare a pesticide and pollution prevention plan for any construction activities that might encroach within the 250 ft. buffer around vernal pools 358, 363, 370, 426 or 511 in order to reduce pollution run-off, pesticide drift and other similar contaminants from impacting those vernal pools and their plants, and to protect the preserve areas from urban contaminants. Such a plan will have to be incorporated into the Operations and Management Plan for the preserves required by the Section 404 Permit process. In addition, to further protect the special status plant species in the preserve areas, the Applicants will be required to prepare an invasive species removal and prevention plan to remove invasive species from preserve areas and to restore the affected wetland features. This plan will also have to be incorporated into the operations and Management Plan required as part of the Section 404 permit process and thereby protect the special status plant species from harm by invasive species. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project to substantially lessen the Project's significant and unavoidable impacts to the special status plant species identified in the EIR:

Mitigation Measure BR-8: If construction activities encroach within the 250-foot buffer for vernal pools 358, 363, 370, 426 or 511 the applicant shall prepare a pesticide and pollution prevention plan. The plan shall include measures to reduce pollution run-off, pesticide drift, and other similar potential contaminants, to protect surrounding preserve areas from urban contaminants. Measures shall include the implementation of best management practices (e.g. straw wattles, silt fencing, and soil stabilization) for stormwater control. The plan shall be incorporated in the Operations and Management Plan, which is a requirement of the Section 404 permit process.

Mitigation Measure BR-9: The project applicant shall prepare an invasive species removal and prevention plan. The plan shall provide methods to remove invasive species from preservation areas and to restore the affected wetland features. The plan shall include methods for the prevention of the introduction of new invasive species from landscapes associated with the development. Minimum components of such a plan shall include: mapping of existing invasive plant populations within the avoided areas, with the map being updated a minimum of every five years; a description of acceptable methods for removing invasive species, examples of which include hand removal or biological controls (e.g. natural parasites); and a prohibition on the use of non-native plants within either the avoided areas or the Recreation-2 areas. The plan shall be

incorporated in the Operations and Management Plan, which is a requirement of the Section 404 permit process.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measures are within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

CLIMATE CHANGE

Impact: Climate Change.

In concert with state and federal activities, the design features of the SPA are intended to offset the Project climate change impact. Ideally, this mitigation would reduce the Project emissions and climate change impacts to levels that are not cumulatively significant, but there are many unknown variables and implementation challenges. Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling the analysis in the EIR concluded that the Project impacts on climate change may remain significant. The effects of climatic changes on the Sacramento region are potentially significant, and can only be mitigated through both adaptation and reduction strategies. By requiring mitigation of projects that may result in significant greenhouse gas emissions, and by adopting County programs and changes in government operations, the County is implementing all feasible strategies to reduce the effects of climate change on the region. Nonetheless, it is probable that these strategies will not be sufficient to offset all of the impacts of climate change, and that some of these impacts will continue to be significant. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which substantially lessen the significant environmental impact as identified in the EIR, but not to a less-than-significant level. While climate change mitigation measure CC-1 will reduce and lessen the climate change impacts generated by the Project by requiring all amendments to the SPA to include an analysis of the effect of the amendment on greenhouse gas emissions so as not to exceed an average of 5.80 metric tons per capita (including emissions from building energy usage and vehicles) the cumulative contribution to greenhouse gas emissions will nonetheless remain significant and unavoidable. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measure has been incorporated into the Project to substantially lessen the Project's significant and unavoidable impacts on climate change:

Mitigation Measure CC-1. The following text shall be added to the Cordova Hills SPA:

“All amendments to the SPA with the potential to change the SPA-wide GHG emissions shall include an analysis which quantifies, to the extent practicable, the effect of the Amendment on SPA-wide greenhouse gas emissions. The Amendment shall not increase SPA-wide greenhouse gas emissions above an average 5.80 metric tons per capita (including emissions from building energy usage and vehicles). If the SPA amendment would require a change in the approved GHG Reduction Plan in order to meet the 5.80 MT CO₂e threshold, then the proponent of the SPA amendment shall consult with the SMAQMD on the revised analysis and shall prepare a revised GHG Reduction Plan for approval by the County, in consultation with SMAQMD.”

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo additionally finds that the measure is feasible, and could and should be adopted by Sacramento County. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA

Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

CULTURAL RESOURCES

Impact: Cultural Resources.

The Project area contains three historic era sites, and a fourth historical site that is included in a multi-component site. One prehistoric bedrock mortar station site and one prehistoric component of a multi-component site were discovered in the Project area. None of the sites are associated with any important persons or events in California or national history. They are not considered to be unique and do not represent the work of a master or possess high artistic values. In all cases, the historic sites lack sufficient cultural material to address research questions. All of the historic sites were evaluated as not eligible under any criteria for the National Register of Historic Places or the California Register of Historical Resources and are not considered a historical resource or unique archeological resource as defined by CEQA. There always remains a potential to encounter buried or as yet undiscovered resources during land clearing and construction work. Mitigation is included to ensure that such resources are treated appropriately if discovered. (Potentially Significant)

Formatted: Justified

Finding: Mitigation measures require that the Applicants halt all work within a 200 ft. radius of the discovery and have a qualified archeologist evaluate the significance of the find. If a resource is found that is potentially eligible for listing on the National Register or California Register or is cultural in origin, then the Applicants shall either arrange for total avoidance or test excavations or total data recovery as mitigation. A determination of how to treat the resource shall be made by the archeologist, DERA and the Applicants, and shall be documented in writing and submitted to DERA. If human remains are discovered, then work will stop and the County Coroner shall be notified. If the remains are determined to be Native American in origin, then the guidelines of the Native American Heritage Commission shall be followed in the treatment and disposition of the remains. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measure has been incorporated into the Project to avoid the potentially significant impacts to cultural resources identified in the EIR:

Mitigation Measure CR-1. If subsurface deposits believed to be cultural or human in origin are discovered during construction, then all work must halt within a 200-foot radius of the discovery. A qualified professional archaeologist, meeting the Secretary of the Interior's Professional Qualification Standards for prehistoric and historic archaeology, shall be retained at the Applicant's expense to evaluate the significance of the find. If it is determined due to the types of deposits discovered that a Native American monitor is required, the Guidelines for Monitors/Consultants of Native American Cultural, Religious, and Burial Sites as established by the Native American Heritage Commission shall be followed, and the monitor shall be retained at the Applicant's expense. Work cannot continue within the 200-foot radius of the discovery site until the archaeologist conducts sufficient research and data collection to make a determination that the resource is either 1) not cultural in origin; or 2) not potentially eligible for listing on the National Register of Historic Places or California Register of Historical Resources. If a potentially-eligible resource is encountered, then the archaeologist, the Environmental Coordinator, and project proponent shall arrange for either 1) total avoidance of the resource, if

possible; or 2) test excavations or total data recovery as mitigation. The determination shall be formally documented in writing and submitted to the Environmental Coordinator as verification that the provisions of CEQA for managing unanticipated discoveries have been met. In addition, pursuant to Section 5097.97 of the State Public Resources Code and Section 7050.5 of the State Health and Safety Code, in the event of the discovery of human remains, all work is to stop and the County Coroner shall be immediately notified. If the remains are determined to be Native American, guidelines of the Native American Heritage Commission shall be adhered to in the treatment and disposition of the remains.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

HAZARDS AND HAZARDOUS MATERIALS

Impact: Hazards and Hazardous Materials

The Project area was assessed for on-site hazardous conditions, and this assessment concluded that there is no evidence of any recognized hazardous conditions that may have a significant adverse effect on the development of the Project. There are three agency-listed contaminated sites within approximately one mile of the Project. These include the Sacramento County Boys Ranch (a juvenile correction facility within 1,000 feet of the eastern Project boundary), Aerojet (located just over a mile to the northwest), and the Kiefer Landfill (located approximately 2,000 feet to the south). The Boys Ranch hazardous condition was remediated and the case closed. Aerojet remediation activities are ongoing. Contaminated soils from Aerojet would not affect the Project, as these are off-site, while the groundwater contamination plumes are migrating away from the Project area. Groundwater contamination at Kiefer Landfill is likewise migrating away from the Project. The Project will also be using public water provided through the Sacramento County Water Agency, not groundwater. Landfill gas migration from Kiefer Landfill also appears not to affect the site, but a mitigation measure is nonetheless included for the small portion of the site outside of the Urban Services Boundary that is within the 2,000 foot buffer established around the Kiefer Landfill. (Potentially Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project that avoid the potentially significant environmental effects of hazardous materials on the Project area from landfill gas generated by buried waste at the Kiefer Landfill. Those measures require any structure within the Project area that is within 1,000 feet of buried waste at Kiefer Landfill to be continuously monitored for the landfill gas and designed and constructed to prevent landfill gas accumulation within the structure in order to prevent adverse impacts from the landfill gas. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measure has been incorporated into the Project to avoid the potentially significant impacts arising from landfill gas generated by buried waste at the Kiefer Landfill on people and structures in the Project area identified in the EIR:

Mitigation Measure HM-1. Any structure within the Project boundaries (including but not limited to, buildings, subsurface vaults, utilities, or any other areas where potential landfill gas buildup may cause adverse impacts to the public health or safety or the environment) within 1,000 feet of buried waste or proposed buried waste at Kiefer Landfill (refer to Plate HM-2 of the EIR) shall be continuously monitored by the owner/operator of said structure for landfill gas and be designed and constructed to prevent landfill gas accumulation in those structures.

Level of Significance After Mitigation: Less-than-Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

LAND USE

Impact: *Conflict with SACOG Blueprint and General Plan Policy.*

Formatted: Justified

The Project includes a wide variety of transportation choices, an array of housing choices, a mix of uses, compact community design, and fosters a sense of place. While acknowledging that in terms of internal community design the Project appears to be an excellent example of “smart growth” development and is consistent with relevant General Plan policies, it must also be acknowledged that the Project conflicts with the principles with respect to the preservation of open space and the proximity to existing developed communities. In terms of open space preservation, the analysis is somewhat subjective, and the Project has directed preservation toward the most sensitive vernal pool areas of the site. In terms of directing development toward existing communities, the conflict is more clear. Though projected for future development, the Blueprint envisions growth occurring from the existing city centers outward rather than the reverse and did not forecast growth taking place in the Project area until the Year 2050. This is a fundamental underpinning to the Blueprint, and as a result, the Project’s inconsistency with this principle is considered substantial. (Significant and Unavoidable)

Finding: There are no mitigation measures that would lessen the Project’s conflict with the SACOG Blueprint. While the Project is adjacent to areas within the City of Rancho Cordova that are zoned and fully entitled for urban development, the nearest developed area with housing and infrastructure is approximately one mile away from the Project site. As stated in the SACOG Blueprint, it is not intended to be applied or implemented in a literal, parcel-level manner and was not intended to indicate that a specific parcel should or should not be developed in a particular manner. That level of planning is the responsibility of local governments and is beyond the specificity appropriate for regional scale, long-term scenario planning. (See, SACOG, *Blueprint Growth Principles*, 2004.) The Project’s conflict with the SACOG Blueprint is one of timing and differences in principle interpretation, insofar as the Blueprint did not estimate growth taking place

in the Project area until the Year 2050. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: There is no mitigation available.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

NOISE

Impact: Traffic Noise.

Traffic on the internal Project roadways and on Grant Line Road will generate noise that has the potential to exceed General Plan noise standards related to both residential and non-residential uses. Mitigation is included to ensure that future subdivisions and non-residential developments are constructed in a manner that achieves compliance with General Plan standards. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project that will avoid the potentially significant environmental effects arising from traffic noise that could exceed General Plan noise standards related to residential uses and non-residential uses. Those measures require any residential uses that would be exposed to a noise level greater than 65 dB Ldn at the property line to be designed to reduce noise levels for exterior activity areas in compliance with the standards stated in the General Plan's Noise Element. Residential projects exposed to noise levels greater than 70 dB Ldn at the property line must be designed and constructed to achieve an interior noise level of 45 dB Ldn or less. Non-residential development projects, such as churches, libraries, meeting halls, and schools exposed to greater than 60 dB Ldn, and all non-residential development projects such as transient lodging, hospitals and nursing homes, and office buildings exposed to greater than 65 dB Ldn at the property line must demonstrate that the interior noise level will not exceed the standards in the General Plan's Noise Element. Those standards may be satisfied by use of noise barriers, increased setbacks, enhanced building construction techniques, or the strategic placement of structures. Non-residential projects may demonstrate compliance by documenting that the location of the noise contours and assuming a standard exterior-to-interior noise attenuation of 25 dB. In all other cases the noise reduction must be substantiated by an acoustical analysis performed by a qualified acoustical consultant that is submitted to and verified by DERA prior to the issuance of any building permits for residential areas. All parks exposed to noise levels in excess of 70 dB Ldn must be designed and constructed to reduce noise levels in park activity areas to comply with General Plan Noise Element standards by means of noise barriers, setbacks and strategic placement of play structures, and substantiate the reduction by way of an acoustical analysis prepared by a qualified acoustical consultant and verified by DERA prior to issuance of building permits for the park sites in order to demonstrate compliance with the mitigation requirements. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project to avoid the significant impacts from noise on residential uses, non-residential uses and park sites within the Project, as identified in the EIR:

NO-1. All residential development projects exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels to within General Plan Noise Element standards for exterior activity areas. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.

NO-2. All residential development projects exposed to greater than 70 dB L_{dn} (as identified in Appendix NO-1) at the property line shall be designed and constructed to achieve an interior noise level of 45 dB L_{dn} or less. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the site.

NO-3. Non-residential development projects such as churches, libraries, meeting halls, and schools exposed to greater than 60 dB L_{dn} , and all non-residential development projects such as transient lodging, hospitals and nursing homes, and office buildings exposed to greater than 65 dB L_{dn} (as identified in Appendix NO-1) at the property line shall demonstrate that interior noise volumes will not exceed General Plan Noise Element standards for non-residential uses exposed to traffic noise. This may be accomplished by providing documentation that the type of use is within acceptable limits based on the location of the identified noise contours and assuming standard exterior-to-interior attenuation of 25 dB. If this cannot be demonstrated, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant, shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, strategic placement of structures and/or enhanced building construction techniques. The measure does not apply to commercial uses.

NO-4. All parks exposed to noise volumes in excess of 70 dB (as identified in Appendix NO-1) at the property line shall be designed and constructed to reduce noise levels within park activity areas (benches, play structures, etc.) to within General Plan Noise Element standards for parks. Potential options for achieving compliance with noise standards include, but are not limited to, noise barriers, increased setbacks, and/or strategic placement of structures. For barrier and other structural options, an acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for affected sites.

Level of Significance After Mitigation: Less than Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines,

Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Onsite Stationary and Community Noise.

The Project includes uses that include noise-generating sources such as playing fields, loading docks, a corporation yard, and other uses. Mitigation is included to require that all such uses located adjacent to residential lands be designed so as not to cause the General Plan standards to be exceeded. (Significant)

Finding: Changes or alterations have been required in, or incorporated into, the Project which will avoid the significant environmental effects arising from noise generated from onsite stationary and community sources that could exceed General Plan noise standards by requiring non-residential development adjacent to residential properties to be constructed so as to ensure that noise levels generated by the non-residential use does not exceed the standards in the General Plan Noise Element and requiring the noise level reduction is substantiated by an acoustical analysis prepared by a qualified acoustical consultant and submitted to the Environmental Coordinator prior to issuance of any building permits for the non-residential uses that have the potential to generate substantial noise levels if located adjacent to residential uses. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures have been incorporated into the Project to avoid the significant impacts from noise generated from onsite stationary sources and community noise sources on residential uses at the Project, as identified in the EIR:

NO-5. All non-residential development projects located adjacent to residentially designated properties shall be designed and constructed to ensure that noise levels generated by the uses do not result in General Plan Noise Element standards being exceeded on adjacent properties. An acoustical analysis substantiating the required noise level reduction, prepared by a qualified acoustical consultant shall be submitted to and verified by the Environmental Coordinator prior to the issuance of any building permits for the non-residential projects with the potential to generate substantial noise (e.g. car wash, auto repair, or buildings with heavy-duty truck loading docks) if those uses are adjacent to residentially designated properties. The acoustical analysis shall include, but not be limited to, consideration of potential noise conflicts due to operation of the following items:

- Outdoor playing fields;
- Mechanical building equipment, including HVAC systems;
- Loading docks and associated truck routes;
- Refuse pick up locations; and
- Refuse or recycling compactor units.

Level of Significance After Mitigation: Less than Significant.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County and not that of LAFCo. LAFCo further finds that the above measure is appropriate and feasible; would substantially lessen or avoid the adverse impacts

with the Cordova Hills project to a less than significant level; and that Sacramento County could and should adopt the above mitigation. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Substantial Increase in Existing Ambient Noise.

The Project would result in a substantial increase in existing ambient noise for multiple roadway segments, but only two of these include receptors which would be impacted: Sunrise Boulevard and Douglas Boulevard. Noise volumes would be increased by 2 dB on Sunrise Boulevard and by 7 dB and 10 dB along Douglas Boulevard. Based on the existing noise environments, these are substantial increases. On Sunrise Boulevard, a noise barrier is not appropriate because businesses rely on visibility to attract customers, and on Douglas Road a barrier is already present. Thus, no further improvements can be made to reduce impact. (Significant and Unavoidable)

Finding: There are no mitigation measures that would lessen the substantial increase in the ambient noise level that would result from the noise generated on Sunrise Boulevard and Douglas Boulevard by Project-generated traffic. A noise barrier is already present on Douglas Road and there is no other feasible mitigation possible. A noise barrier would not be appropriate and feasible mitigation along Sunrise Boulevard because the commercial uses along it depend on visibility from the roadway to attract their customers. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: There is no mitigation available.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

PUBLIC UTILITIES

Impact: Construction Impacts.

Water, sewer, and dry utility lines constructed within the Project boundaries would not cause any additional utility-specific construction impacts, as utility construction will occur within areas that will already urbanize as part of the Project. Most of the off-site utility lines are shown within areas already proposed for utility construction as part of service provider master planning documents. There are some improvement areas which have not already been studied or approved, and which are likely to contribute to wetland impacts and impacts to associated species. (Significant and Unavoidable)

Finding: There are no mitigation measures that would lessen the impacts from construction related to providing public utilities to the project site to a less-than-significant level. While mitigation measures AQ-1, BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1 described above all would apply to the construction of public utilities at the Project site, they would not reduce the construction

impacts to a less than significant level. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: There is no mitigation available in addition to Mitigation Measures AQ-1, BR-1, BR-3, BR-4, BR-5, BR-7, BR-8, and CR-1 that have already been required at the Project to lessen its environmental impacts.

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation. LAFCo finds that this impact remains significant and unavoidable. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

TRAFFIC AND CIRCULATION

Mitigation Measures in the EIR being implemented through Conditions of Approval.

The Board considered each of the proposed Mitigation Measures in the EIR for the Project's Traffic and Circulation impacts. In most circumstances, the Board determined that it would be appropriate to implement the proposed Mitigation Measures with Conditions of Approval that were adopted for the Project in order to better accomplish the mitigation. In the instances when the Board has done so, it was determined that the Condition of Approval was more specific and better designed to implement the mitigation for the identified impact described in the FEIR.

With regard to Mitigation Measure TR-1.B, it was determined in the FEIR that due to the completion of construction of the Zinfandel Drive extension project and the installation of a new traffic signal at the Douglas Road and Zinfandel Drive/Eagles Nest Road intersection, Mitigation Measure TR-1.B is no longer needed. Mitigation Measure TR-1.F was deleted because the County is currently constructing this improvement. Mitigation Measure TR-5.H was deleted because the improvement has been constructed by others. The timing for the implementation of Condition of Approval #61 that is being used to implement Mitigation Measure TR-2.D has also been changed by Condition of Approval No. 61 to require them at 500 DUEs, instead of at 3,200 DUEs.

Also note that the language of Mitigation Measure TR-2.D has changed. The reasoning for the change was dual: the Board desired a measure which would succeed in reducing the impact while also improving the north-south flow conditions at this intersection (though not necessary due to a Project impact) and because Measure TR-2.D. would have required more extensive roadway work. County DOT performed further analysis of the mitigation measure and found that there was an alternative reconfiguration which would reduce the amount of reconstruction needed, which would improve north-south flow, and would also result in an equivalent LOS as measure TR-2.D. The revised lane reconfigurations consist of the following: two eastbound through lanes, an eastbound right turn lane, and an eastbound left turn lane; a northbound left turn lane, two northbound through lanes and a northbound right turn lane; a westbound through lane, a westbound right turn lane and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane. The threshold for construction of the above intersection improvements has also been changed by Condition of Approval No. 61 to require them at 500 DUEs, instead of at 3,200 DUEs.

LAFCo finds that the Conditions of Approval identified below will implement the roadway and intersection improvements needed by the corresponding Mitigation Measure for the identified impacts and therefore implements the revised Mitigation Measures in the FEIR with the identified Conditions of Approval. LAFCo further finds that while those referenced Conditions of Approval would substantially lessen the Project's significant and unavoidable impacts on transportation and circulation arising from the Project in the "Cumulative Plus Project" scenario, they would not reduce the impacts to a less than significant level. In addition, the Board determined that because many of the traffic improvements would be needed in jurisdictions beyond the County's control and authority, the traffic impacts on those roadway segments and intersections identified in the EIR to be significant and unavoidable. Within the Cordova Hills Project Area, the impacts to North Loop Road from Street D to Street F would not be addressed by any of those Conditions of Approval, so Mitigation Measure TR-10 proposed in the EIR will continue to be required to substantially reduce the Cumulative Plus Project traffic impact, although it would not do so to a less than significant level. As noted in the EIR, because the County does not have exclusive jurisdiction over roadways and intersections situated partly or wholly within the boundaries of another government jurisdiction, the County cannot be assured that the recommended improvements situated wholly or partly in those other jurisdictions will be constructed, and must therefore conclude that the below identified impacts would remain significant and unavoidable for purposes of CEQA.

Impact: Existing Plus Project.

The Project results in significant impacts to six County intersections, ten City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, two County roadway segments, one City of Elk Grove roadway segment, eleven City of Rancho Cordova roadway segments, two US 50 freeway segments, and bicycle and pedestrian facilities. Mitigation is included which will improve operating conditions to acceptable levels for most of these facilities, but there are some impacts for which no feasible mitigation exists. These are: the Zinfandel and US 50 freeway ramp intersection and Sunrise Boulevard from US 50 to White Rock Road. Furthermore, the County does not have land use authority in other jurisdictions, and cannot guarantee that non-County facilities will be constructed. The following intersections and roadway segments would be significantly impacted under the "Existing Plus Project" scenario:

- Bradshaw Road and Jackson Road – intersection.
- Mather Boulevard and Douglas Road – intersection.
- Eagles Nest Road and Jackson Road – intersection.
- Grant Line Road and Sunrise Boulevard – intersection.
- Grant Line Road and White Rock Road – intersection.
- Prairie City Road and White Rock road – intersection.
- School Access and North Loop Road – intersection.
- Zinfandel Drive and White Rock Road – intersection.
- Sunrise Boulevard and White Rock Road – intersection.
- Sunrise Boulevard and Douglas Road – intersection.
- Sunrise Boulevard and Jackson Road – intersection.
- Grant Line Road and Jackson Road – intersection.
- Grant Line Road and Kiefer Boulevard – intersection.
- Grant Line Road and Douglas Road – intersection.

- Grant Line Road and North Loop Road – intersection.
- Grant Line Road and Chrysanthy Boulevard – intersection.
- Grant Line Road and University Boulevard – intersection.
- Prairie City Road from US 50 to White Rock Road – roadway.
- Grant Line Road from Sheldon Road to Calvine Road – roadway.
- Grant Line Road from Jackson Road to Kiefer Boulevard – roadway.
- Grant Line Road from Kiefer Boulevard to University Boulevard – roadway.
- Grant Line Road from University Boulevard to Chrysanthy Boulevard – roadway.
- Grant Line Road from Chrysanthy Boulevard to North Loop Road – roadway.
- Grant Line Road from North Loop Road to Douglas Road – roadway.
- Grant Line Road from Douglas Road to White Rock Road – roadway.
- Jackson Road from Sunrise Boulevard to Grant Line Road – roadway.
- Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway – roadway.
- Douglas Road from Rancho Cordova Parkway to Grant Line Road – roadway.
- Westbound US 50 from Hazel Avenue to Sunrise Boulevard – freeway.
- Eastbound US 50 from Sunrise Boulevard to Hazel Avenue – freeway.

Finding: Specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the EIR. There are a number of mitigation measures that would avoid the impacts from traffic generated by the Project in the “Existing Plus Project” scenario to a less than significant level, but due to the fact that many of the mitigation measures described in the EIR would need to be implemented in adjacent jurisdictions, the County cannot guarantee that the suggested traffic improvements would ever get funded and constructed. Consequently, LAFCo must find that because many of the traffic improvements would be needed in jurisdictions beyond the County’s control and authority, LAFCo must find that the Project’s traffic impacts on those roadways segments and intersections identified in the EIR to be significant and unavoidable. In other cases, even if the suggested traffic mitigation improvement were to get built, it would still not result in a level of service that would allow LAFCo to reach a conclusion that the Project’s impacts are less-than-significant. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures or agency recommendations/requirements have been incorporated into the Project as conditions of approval to substantially lessen the Project’s traffic and circulation impacts, but not to a less than significant level:

Mitigation Measure TR-1. The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

- A. *Bradshaw Road and Jackson Road* – Provide a second westbound through lane.
- B. *Mather Boulevard and Douglas Road* – Deleted because a traffic signal at Douglas Road/Zinfandel Drive was constructed during preparation of the Final EIR and additional analysis showed that another signal is no longer needed.

- C. *Eagles Nest Road and Jackson Road* – Construct a new traffic signal. Provide a left turn lane and a through-right turn shared lane on the northbound and southbound approaches.
- D. *Grant Line Road and Sunrise Boulevard* – Provide a separate southbound right turn lane so the southbound approach has one left turn lane, one through lane and one right turn lane.
- E. *Grant Line Road and White Rock Road* – Modify the intersection and traffic signal To provide dual left turn lanes and two through lanes on the northbound approach; provide two through lanes and a separate right turn lane on the southbound approach; and provide two left turn lanes and a separate right turn lane on the eastbound approach. On the western leg of the intersection, two westbound departure lanes are required.
- F. *Prairie City Road and White Rock Road* – Deleted because this improvement is in the process of being completed by a County DOT project.
- G. *School Access and North Loop Road* – Provide dual eastbound left turn lanes. The applicant shall be responsible for a focused access study addressing the internal circulation of the Cordova Hills project to finalize the design of intersection geometries and length of left turn pockets. The scope of work for the analysis shall be submitted to the Sacramento County DOT staff. Upon completion, the analysis shall be submitted to the Sacramento County DOT for approval and recommendations.

Implementation of Mitigation Measure TR-1 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

- Condition 41. As part of intersection improvements, provide dual eastbound left turn lanes at the intersection of North Loop Road and the proposed school access pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. (Mitigation Measures TR-1.G and TR-8.A)
- Condition 59. Modify the existing intersection of Bradshaw Road and Jackson Road (State Route 16) to provide a second westbound through lane pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation and Caltrans. Note: The additional westbound through lane shall be carried through the intersection. (Mitigation Measure: TR-1.A) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 2,000 DUEs within the Cordova Hills SPA)
- Condition 60. Commence reconstruction and widening of the existing intersection of Grant Line Road and White Rock Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. Improvements shall include dual northbound left turn lanes and two northbound through lanes; two southbound through lanes and one southbound right turn lane; two eastbound left turn lanes, and one eastbound right turn lane. On the western leg of the intersection, two westbound departure lanes are required. Note: A project to widen White Rock Road from two lanes to four lanes between Grant Line Road and Prairie City Road is currently (2012) under construction. (Mitigation Measure: TR-1.E) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)
- Condition 67. Commence reconstruction and widening of the existing intersection of Eagles Nest Road at Jackson Road (State Route 16) to a signalized intersection pursuant to the

Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation and Caltrans. Improvements shall include a left turn lane and a through-right turn shared lane on the all approaches. (Mitigation Measure: TR-1.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 4,500 DUEs within the Cordova Hills SPA)

Condition 68. Commence reconstruction and widening of the existing intersection of Grant Line Road at Sunrise Boulevard to provide a separate southbound right turn lane so the southbound approach has one left turn lane, one through lane, and one right turn lane pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. (DEIR Mitigation Measure: TR-1.D) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 5,800 DUEs within the Cordova Hills SPA)

Mitigation Measure TR-2. The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Zinfandel Drive and White Rock Road* – The applicant shall be responsible for a fair share of this measure. Provide separate dual right turns on the westbound approach so the westbound approach has two left turn lanes, two through lanes and two right turn lanes. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- B. *Sunrise Boulevard and White Rock Road* – Provide overlap phasing on the eastbound and westbound approaches.
- C. *Sunrise Boulevard and Douglas Road* – Provide overlap phasing on the westbound approach.
- D. *Sunrise Boulevard and Jackson Road* – Provide an eastbound through lane, an eastbound through-right turn shared lane, and an eastbound left turn lane; a northbound left turn lane, two northbound through lanes, and a right turn lane; one westbound through lane, a westbound right turn lane, and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane.
- E. *Grant Line Road and Jackson Road* – The applicant shall be responsible for a fair share of this measure. Provide a left turn lane and a through-right shared turn lane on the eastbound and westbound approaches. Provide a separate left turn lane, a through lane and a separate right turn lane on the northbound and southbound approaches. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.
- F. *Grant Line Road and Kiefer Boulevard* – Construct a new traffic signal. Provide a left turn lane, a through lane and a through-right turn shared lane on the northbound and southbound approaches; provide a left turn lane and a through-right turn shared lane on the eastbound and westbound approaches.
- G. *Grant Line Road and Douglas Road* – Construct a new traffic signal. Provide dual left turn lanes and a separate through lane on the northbound, a through lane and a through-right turn shared lane on the southbound approach, and a separate left turn lane and a free-right turn lane on the eastbound approach. Also an extra southbound departure lane is

needed for the eastbound free-right movement. To be consistent with the segment mitigations a second northbound through lane is included.

- H. *Grant Line Road and North Loop Road* – Construct a new traffic signal. Provide two through lanes and a separate right turn lane on the northbound approach, dual left turn lanes and one through on the southbound approach, and one left turn lane and one free-right turn lane on the westbound approach. Also an extra northbound departure lane is needed for the westbound free-right movement. To be consistent with the segment mitigations a second southbound through lane is included.
- I. *Grant Line Road and Chrysanthy Boulevard* – Construct a new traffic signal. Provide a through lane and a separate right turn lane on the northbound approach, dual left turn lanes and a through lane on the southbound approach, and dual left turn lanes and one right turn lane on the westbound approach. To be consistent with the segment mitigations a second northbound and southbound through lane is included. Also provide two westbound through lanes for when Chrysanthy Boulevard is connected through Rancho Cordova.
- J. *Grant Line Road and University Boulevard* – Construct a new traffic signal. Provide a through lane and a separate free-right turn lane on the northbound approach, dual left turn lanes and one through lanes on the southbound approach, and dual left turn lanes and a right turn lane on the westbound approach. Also an extra eastbound departure lane is needed for the northbound free-right movement. To be consistent with the segment mitigations a second northbound and southbound through lane is included.

Implementation of Mitigation Measure TR-2 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

Condition 49. Commence reconstruction and widening of the intersection of University Boulevard and Grant Line Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of such improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include modification of the existing traffic signal, providing a u-turn lane, two through lanes, and a free right turn lane on the northbound approach; two left turn lanes and two through lanes on the southbound approach; and two left turn lanes and a right turn lane on the westbound approach. Note: The two westbound left turn lanes shall be extended to a length based on the queuing analysis and to the satisfaction of the Department of Transportation. For the free-right turn movement, provide sufficient acceleration lane and taper length and grant the right of direct vehicular access to the County of Sacramento along the acceleration/taper lane length to the satisfaction of the Department of Transportation. Bus turnouts will be required on Grant Line Road and University Boulevard. (Mitigation Measures TR-2.J and TR-9.D) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)

Condition 51. Commence reconstruction and widening of the intersection of North Loop Road and Grant Line Road pursuant to the latest Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached an agreement for construction of the portion of such improvements within the City's jurisdiction. Performance of this condition shall be held in

abeyance pending such agreement and development may continue. Improvements shall include modification to the traffic signal, providing a u-turn lane, three through lanes, and a right turn lane on the northbound approach; two left turn lanes and a free right turn lane on the westbound approach; and two left turn lanes and three through lanes on the southbound approach. Note: The two southbound left turn lanes shall be extended to a length based on the queuing analysis and to the satisfaction of the Department of Transportation. For the free-right turn movement, provide sufficient acceleration lane and taper length and grant the right of direct vehicular access to the County of Sacramento along the acceleration/taper lane length to the satisfaction of the Department of Transportation. Bus turnouts will be required on Grant Line Road and North Loop Road. (Mitigation Measures TR-2.H and TR-9.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

| Condition 52. Commence reconstruction and widening of the intersection of Chrysanthy Boulevard and Grant Line Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of such improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include modification to the traffic signal, providing a u-turn lane, two through lanes, and a right turn lane on the northbound approach; two left turn lanes and two through lanes on the southbound approach; and two left turn lanes, pavement for two future through lanes, and a right turn lane on the westbound approach. Note: The two southbound left turn lanes shall be extended to a length based on a queuing analysis and to the satisfaction of the Department of Transportation. Bus turnouts will be required on Grant Line Road and Chrysanthy Boulevard. (Mitigation Measure TR-2.I) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 7,500 DUEs within the Cordova Hills SPA)

| Condition 54a. Commence reconstruction and widening of the existing intersection of Sunrise Boulevard at Jackson Road (State Route 16) pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation and Caltrans, provided that the County, Caltrans and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Improvements shall include an eastbound through lane, an eastbound through-right turn shared lane,, and an eastbound left turn lane; a northbound left turn lane, two northbound through lanes and a right turn lane; one westbound through lane, a westbound right turn lane and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane. Note: The two eastbound and northbound through lanes shall be carried through the intersection. (Mitigation Measure: TR-2.D) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 500 DUEs within the Cordova Hills SPA).

| Condition 62. Commence reconstruction and widening of the existing intersection of Grant Line Road at Jackson Road (State Route 16) pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation and Caltrans, provided that the County, Caltrans and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue.

Improvements shall include a traffic signal modification to accommodate dual eastbound left turn lanes, an eastbound through lane, and an eastbound through-right turn shared lane; a westbound left turn lane, westbound through lane and a westbound through-right turn shared lane; a northbound left turn lane, a northbound through lane, and a northbound through-right turn shared lane; and a southbound shared through-right turn lane, a southbound through lane and a southbound left turn lane. (Mitigation Measure: TR-2.E) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA).

Condition 63. Commence reconstruction and widening of the existing intersection of Grant Line Road at Kiefer Boulevard to a signalized intersection pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include a northbound left turn lane, a northbound through lane, and a northbound through-right turn shared lane; a westbound left turn shared lane and a westbound through-right turn shared lane; a southbound left turn lane and a southbound through-right turn shared lane; and a southbound through-right turn shared lane; and an eastbound left turn lane and an eastbound through-right turns shared lane. (Mitigation Measure: TR-2.F) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA).

Condition 56. Commence reconstruction and widening of the Grant Line Road at Douglas Road intersection to modify a signalized intersection pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include a southbound u-turn lane, two southbound through lanes and a southbound right turn lane; an eastbound left turn lane and an eastbound free right turn lane; and dual northbound left turn lane and two through lanes. For the free-right turn movements, provide sufficient acceleration lane length and grant the right of direct vehicular access to the County of Sacramento along the acceleration lane length to the satisfaction of the Department of Transportation. Note: Bus turnouts will be required on Grant Line Road and Douglas Road. The through lanes in the northbound and southbound directions shall be carried through the intersection. Prior to the time of issuance of the first building permit, and again before the issuance of the building permit for the 1,000th DUE, updated intersection analyses shall be performed by County that include this intersection. The timing of this intersection improvement may be revised to preserve the County's LOS E standard, and may increase or decrease the DUE trigger for the construction of this improvement, but shall not require the improvement any sooner than 250 DUEs. If the DUE trigger for the construction of the foregoing intersection improvements is lowered, then Developer shall make commercially reasonable efforts to commence the improvements prior to the lower DUE being exceeded; however, the development of the Cordova Hills Project shall not be suspended or delayed so long as Developer has made reasonable efforts to commence construction prior to exceeding the lower DUE trigger. Developer shall make a contribution to the costs of each updated intersection analyses to be conducted for this and three other intersections in an amount not to exceed \$2,000, with the total Developer contribution for both exceed \$4,000. (Mitigation

Measure TR-2.G) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 1,800 DUEs within the Cordova Hills SPA)

| Condition 55. Commence reconstruction and widening of the Grant Line Road at Douglas Road intersection to modify a signalized intersection pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include dual northbound left turn lanes and a northbound through lane; a southbound u-turn lane, a southbound through lane and an eastbound right turn lane. Note: Bus turnouts will be required on Grant Line Road and Douglas Road. The through lanes in the northbound and southbound directions shall be carried through the intersection. Prior to the time of issuance of the first building permit, and again before the issuance of the building permit for the 1,000th DUE, updated intersection analyses shall be performed by County that include this intersection. The timing of this intersection improvement may be revised to preserve the County's LOS E standard, and may increase or decrease the DUE trigger for the construction of this improvement, but shall not require the improvement any sooner than 250 DUEs. If the DUE trigger for the construction of the foregoing intersection improvements is lowered, then Developer shall make commercially reasonable efforts to commence the improvements prior to the lower DUE being exceeded; however, the development of the Cordova Hills Project shall not be suspended or delayed so long as Developer has made reasonable efforts to commence construction prior to exceeding the lower DUE trigger. Developer shall make a contribution to the costs of each updated intersection analyses to be conducted for this and three other intersections in an amount not to exceed \$2,000, with the total Developer contribution for both exceed \$4,000. (Mitigation Measure TR-2.G) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 850 DUEs within the Cordova Hills SPA)

| Condition 81. Pay a fair share (18%) contribution towards the modification and associated improvements to the intersection of Sunrise Boulevard and White Rock Road pursuant to the City of Rancho Cordova Improvement Standards to provide overlap phasing on the eastbound and westbound approaches. (Mitigation Measure TR-2.B)

| Condition 84. Pay a fair share (16%) contribution towards the modification and associated improvements at the intersection of Zinfandel Drive and White Rock Road pursuant to the City of Rancho Cordova Improvement Standards and to the satisfaction of the Department of Transportation in order to provide separate dual right turns on the westbound approach so the westbound approach has two left turn lanes, two through lanes and two right turn lanes. (Mitigation Measure TR-2.A)

| Condition 85. Pay a fair share (16%) contribution towards the modification and associated improvements at the intersection of Sunrise Boulevard and Douglas Road pursuant to the City of Rancho Cordova Improvement Standards and to the satisfaction of the Department of Transportation to provide overlap phasing on the westbound approach. (Mitigation Measure TR-2.C)

| **Mitigation Measure TR-3.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, the below

mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below applicable County standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement and/or a fee credit to the applicant may be considered.

| *A. Prairie City Road from US 50 to White Rock Road* – Increase roadway capacity by upgrading the capacity class for this segment from a rural highway without shoulders to a rural highway with shoulders.

| **Implementation of Mitigation Measure TR-3 will be accomplished by satisfaction of the following Condition of Approval requiring the identified transportation improvements:**

| Condition 70. Commence reconstruction and widening of Prairie City Road from a rural highway without shoulders to a rural highway with shoulders from U.S. 50 to White Rock Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Folsom have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measure: TR-3.A) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

| **Mitigation Measure TR-4.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Elk Grove, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

| *A. Grant Line Road from Sheldon Road to Calvine Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.

| **Implementation of Mitigation Measure TR-4 will be accomplished by satisfaction of the following Condition of Approval requiring the identified transportation improvements:**

| Condition 80. Pay a fair share (9%) contribution towards the reconstruction and widening of Grant Line Road from an existing two-lane road section to a four-lane thoroughfare center road section from Sheldon Road to Calvine Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. (Mitigation Measure TR-4.A)

| **Mitigation Measure TR-5.** The applicant shall construct or fund, as set forth in the phasing and financing plan approved by the Sacramento County Department of Transportation, and in consultation with the City of Rancho Cordova, the below mitigation measures. The phasing and financing plan shall ensure commencement of construction of traffic improvements prior to degradation of LOS below the applicable County or City standards. This mitigation recognizes that should any of the measures below benefit other projects, a reimbursement agreement may be considered.

- A. *Grant Line Road from Jackson Road to Kiefer Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- C. *Grant Line Road from University Boulevard to Chrysanthy Boulevard* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- D. *Grant Line Road from Chrysanthy Boulevard to North Loop* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- E. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to 6 lanes and upgrading the capacity class to an arterial with moderate access control.
- F. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- G. *Jackson Road from Sunrise Boulevard to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control.
- H. *Douglas Road from Sunrise Boulevard to Rancho Cordova Parkway* – Deleted because this improvement was constructed by others.
- I. *Douglas Road from Rancho Cordova Parkway to Grant Line Road* – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with moderate access control. Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes.

Implementation of Mitigation Measure TR-5 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

- Condition 64. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to a four-lane thoroughfare center section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Jackson Road (State Route 16) to Kiefer Boulevard based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measure: TR-5.A) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)
- Condition 65. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to a four-lane thoroughfare center section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Kiefer

Boulevard to University Boulevard based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Note: Bus turnouts will be required on Grant Line Road. Refer to Condition 49 that requires improvements to the intersection of University Boulevard and Grant Line Road. (Mitigation Measure: TR-5.B) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)

| Condition 66. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to four-lane thoroughfare center section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Douglas Road to White Rock Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measures: TR-5.F and TR-7.A) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)

| Condition 71. Commence reconstruction and widening of Grant Line Road from a four-lane road section to a six-lane thoroughfare section from North Loop Road to Douglas Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Note: Bus turnouts will be required on Grant Line Road. Condition number 51 requires improvements to the intersection of North Loop Road and Grant Line Road and Condition number 69 requires improvements to the intersection of Douglas Road and Grant Line Road.) (Mitigation Measures TR-5.E and TR-11.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

| Condition 72. Commence reconstruction and widening of Jackson Road (State Route 16) from an existing two-lane road section to four-lane thoroughfare center section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Sunrise Boulevard to Grant Line Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measure: TR-5.G) (Prior to the recordation of the final

maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,900 DUEs within the Cordova Hills SPA)

Condition 73. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to a four-lane thoroughfare center road section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from University Boulevard to Chrysanthy Boulevard based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measure: TR-5.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 7,500 DUEs within the Cordova Hills SPA)

Condition 74. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to a four-lane thoroughfare center road section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Chrysanthy Boulevard to North Loop Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measure: TR-5.D) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 7,500 DUEs within the Cordova Hills SPA)

Condition 83. Pay a fair share (58%) contribution towards the reconstruction and widening of Douglas Road from an existing two-lane road section to a four-lane arterial section from Americanos Boulevard to Grant Line Road, including a raised center median, interim AC paths and six-foot bike lanes pursuant to the City of Rancho Cordova Improvement Standards. Also, pay a fair share (58%) contribution towards construction of a landscape median, two westbound travel lanes (any turn lanes at major intersections as applicable), a westbound six foot bike lane, and a westbound interim AC path for 5,030 feet on Douglas Road from Rancho Cordova Parkway to Americanos Boulevard. (Mitigation Measures TR-5.I and TR-7.A)

Mitigation Measure TR-6. The applicant shall be responsible for funding a fair share of the construction costs of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with Caltrans.

- A. Westbound US 50 from Hazel Avenue to Sunrise Boulevard – Add an auxiliary lane.
- B. Eastbound US 50 from Sunrise Boulevard to Hazel Avenue – Add an auxiliary lane.

Implementation of Mitigation Measure TR-6 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

Condition 78. Pay a fair share (4%) contribution towards the addition of an auxiliary lane on westbound U.S. 50 from Hazel Avenue to Sunrise Boulevard. (Mitigation Measure TR-6.A)

Condition 79. Pay a fair share (9%) contribution towards the addition of an auxiliary lane on eastbound U.S. 50 from Sunrise Boulevard to Hazel Avenue. (Mitigation Measure TR-6.B)

Mitigation Measure TR-7. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

A. Construct interim sidewalk improvements (typically a detached asphaltic concrete path) and bicycle lanes along Grant Line Road from Douglas Road to White Rock Road and on Douglas Road from Rancho Cordova Parkway to Grant Line Road, to the satisfaction of the Sacramento County Department of Transportation.

Implementation of Mitigation Measure TR-7 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

Condition 66. Commence reconstruction and widening of Grant Line Road from an existing two-lane road section to four-lane thoroughfare center section with an interim raised center median (with Type 4 curbs, but no root barrier), interim AC paths (refer to Standard Detail 4-5 for separation requirements of AC path from right-of-way) and six-foot bike lanes from Douglas Road to White Rock Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Mitigation Measures: TR-5.F and TR-7.A) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)

Condition 83. Pay a fair share (58%) contribution towards the reconstruction and widening of Douglas Road from an existing two-lane road section to a four-lane arterial section from Americanos Boulevard to Grant Line Road, including a raised center median, interim AC paths and six-foot bike lanes pursuant to the City of Rancho Cordova Improvement Standards. Also, pay a fair share (58%) contribution towards construction of a landscape median, two westbound travel lanes (any turn lanes at major intersections as applicable), a westbound six foot bike lane, and a westbound interim AC path for 5,030 feet on Douglas Road from Rancho Cordova Parkway to Americanos Boulevard. (Mitigation Measures TR-5.I and TR-7.A)

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measures are within the purview of Sacramento County or other agencies and not that of LAFCo. LAFCo additionally finds that the measures are feasible, and could and should be adopted by said agencies. LAFCo further finds that the impacts would still be considered significant, even with the imposition of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Impact: Cumulative Plus Project.

The Project results in significant impacts to five City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, one new Project roadway segment, four City of Rancho Cordova roadway segments, six Caltrans freeway segments, and four Caltrans freeway ramps. Mitigation is included which will improve operating conditions to acceptable levels for most of these facilities, but there are some impacts for which no feasible mitigation exists. These are: the Zinfandel and US 50 freeway ramp intersection, the intersection of Sunrise Boulevard and International Drive, Grant Line Road from North Loop Road to Douglas Road, eastbound US 50 from Watt Avenue to Bradshaw Road, eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue, westbound US 50 from Hazel Avenue to Rancho Cordova Parkway, westbound US 50 from Mather Field Road to Power Inn/Howe Avenue, eastbound US 50 Exit Ramp to Watt Avenue, eastbound US 50 Slip Ramp Entrance from Watt Avenue, westbound US 50 Exit Ramp to Watt Avenue, and westbound US 50 Slip Ramp Entrance from Watt Avenue. The following intersections and roadway segments would be significantly impacted under the “Cumulative Plus Project” scenario:

- School Access and North Loop Road – intersection.
- Sunrise Boulevard and Douglas Road – intersection.
- Grant Line Road and Douglas Road – intersection.
- Grant Line Road and North Loop Road – intersection.
- Grant Line Road and University Boulevard – intersection.
- North Loop Road from Street D to Street F – roadway.
- Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard – roadway.
- Grant Line Road from Kiefer Boulevard to University Boulevard – roadway.
- Grant Line Road from North Loop Road to Douglas Road – roadway.
- Grant Line Road from Douglas Road to White Rock Road – roadway.

Finding: Specific economic, legal, social, technological, or other considerations make infeasible the project alternatives identified in the EIR. There are a number of mitigation measures that would avoid the impacts from traffic generated by the Project in the “Cumulative Plus Project” scenario to a less than significant level, but due to the fact that many of the mitigation measures described in the EIR would need to be implemented in adjacent jurisdictions, the County cannot guarantee that the suggested traffic improvements would ever get funded and constructed. Consequently, LAFCo must find that because many of the traffic improvements would be needed in jurisdictions beyond the County’s control and authority, LAFCo must find that the traffic impacts on those roadways segments and intersections identified in the EIR to be significant and unavoidable. In other cases, even if the suggested traffic mitigation improvement were to get built, it would still not result in a level of service that would allow LAFCo to reach a conclusion that the Project’s impacts are less-than-significant. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

Mitigation: The following mitigation measures or agency recommendations/requirements have been incorporated into the Project as conditions of approval to substantially lessen the Project’s traffic and circulation impacts, but not to a less than significant level:

Mitigation Measure TR-8. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

A. School Access and North Loop Road – Provide dual eastbound left turn lanes.

Implementation of Mitigation Measure TR-8 will be accomplished by satisfaction of the following Condition of Approval requiring the identified transportation improvements:

Condition 41. As part of intersection improvements, provide dual eastbound left turn lanes at the intersection of North Loop Road and the proposed school access pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. (Mitigation Measures TR-1.G and TR-8.A)

Mitigation Measure TR-9. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

A. Sunrise Boulevard and Douglas Road – Provide overlap phasing on the eastbound and westbound right turns.

B. Grant Line Road and Douglas Road – Provide a third southbound through lane and overlap phasing on the eastbound right turn lane. To be consistent with the segment mitigations a third northbound through lane is included.

C. Grant Line Road and North Loop Road – Provide a westbound free-right turn lane. Also an extra northbound departure lane is needed for the westbound free-right movement.

D. Grant Line Road and University Boulevard – Provide a northbound free-right turn lane. Also an extra eastbound departure lane is needed for the northbound free-right movement.

Implementation of Mitigation Measure TR-9 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

Condition 49. Commence reconstruction and widening of the intersection of University Boulevard and Grant Line Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of such improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include modification of the existing traffic signal, providing a u-turn lane, two through lanes, and a free right turn lane on the northbound approach; two left turn lanes and two through lanes on the southbound approach; and two left turn lanes and a right turn lane on the westbound approach. Note: The two westbound left turn lanes shall be extended to a length based on the queuing analysis and to the satisfaction of the Department of Transportation. For the free-right turn movement, provide sufficient acceleration lane and taper length and grant the right of direct vehicular access to the County of Sacramento along the acceleration/taper lane length to the satisfaction of the Department of Transportation. Bus turnouts will be required on Grant Line Road and University Boulevard. (Mitigation Measures TR-2.J and TR-9.D) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 3,200 DUEs within the Cordova Hills SPA)

Condition 51. Commence reconstruction and widening of the intersection of North Loop Road and Grant Line Road pursuant to the latest Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached an agreement for construction of the portion of such improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include modification to the traffic signal, providing a u-turn lane, three through lanes, and a right turn lane on the northbound approach; two left turn lanes and a free right turn lane on the westbound approach; and two left turn lanes and three through lanes on the southbound approach. Note: The two southbound left turn lanes shall be extended to a length based on the queuing analysis and to the satisfaction of the Department of Transportation. For the free-right turn movement, provide sufficient acceleration lane and taper length and grant the right of direct vehicular access to the County of Sacramento along the acceleration/taper lane length to the satisfaction of the Department of Transportation. Bus turnouts will be required on Grant Line Road and North Loop Road. (Mitigation Measures TR-2.H and TR-9.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

Condition 69. Commence reconstruction and widening of the Grant Line Road at Douglas Road intersection to a signalized intersection pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. Improvements shall include dual northbound left turn lanes (length of northbound left turn lanes to be determined based on future analysis) and three northbound through lanes; a southbound u-turn lane, three southbound through lanes and a southbound right turn lane; and an eastbound left turn lane and an eastbound free right turn lane. For the free-right turn movements, provide sufficient acceleration lane length to the satisfaction of the Department of Transportation. Note: The through lanes in the northbound and southbound directions shall be carried through the intersection. (Mitigation Measures TR-2.G and TR-9.B) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

Condition 82. Pay a fair share (16%) contribution towards the modification and associated improvements at the intersection of Sunrise Boulevard and Douglas Road pursuant to the City of Rancho Cordova Improvement Standards and to the satisfaction of the Department of Transportation to provide overlap phasing on the eastbound and westbound right turns. (Mitigation Measure TR-9.A)

Mitigation Measure TR-10. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County Department of Transportation and may be up to 100% of the cost of the improvements.

A. North Loop Road from Street D to Street F – Increase roadway capacity by widening this segment to 4 lanes and upgrading the capacity class to an arterial with low access control.

Mitigation Measure TR-11. The applicant shall be responsible for a fair share of the below mitigation measures. The fair share shall be calculated to the satisfaction of Sacramento County

Department of Transportation, in consultation with the City of Rancho Cordova, and may be up to 100% of the cost of the improvements.

- A. *Grant Line Road from Rancho Cordova Parkway to Kiefer Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- B. *Grant Line Road from Kiefer Boulevard to University Boulevard* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- C. *Grant Line Road from North Loop to Douglas Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.
- D. *Grant Line Road from Douglas Road to White Rock Road* – Increase roadway capacity by widening this segment to a 6 lane arterial with moderate access control.

Implementation of Mitigation Measure TR-11 will be accomplished by satisfaction of the following Conditions of Approval requiring the identified transportation improvements:

Condition 71. Commence reconstruction and widening of Grant Line Road from a four-lane road section to a six-lane thoroughfare section from North Loop Road to Douglas Road based on a 96-foot standard thoroughfare pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation, provided that the County and the City of Rancho Cordova have reached agreement for construction of the portion of the improvements within the City's jurisdiction. Performance of this condition shall be held in abeyance pending such agreement and development may continue. (Note: Bus turnouts will be required on Grant Line Road. Condition number 51 requires improvements to the intersection of North Loop Road and Grant Line Road and Condition number 69 requires improvements to the intersection of Douglas Road and Grant Line Road.) (Mitigation Measures TR-5.E and TR-11.C) (Prior to the recordation of the final maps for residential land uses or issuance of building permits for non-residential land uses (including the University) for 6,500 DUEs within the Cordova Hills SPA)

Condition 75. Pay a fair share (21%) contribution towards the reconstruction and widening of Grant Line Road from an existing four-lane thoroughfare center road section to a six-lane thoroughfare section from Douglas Road to White Rock Road pursuant to the Sacramento County Improvement Standards and to the satisfaction of the Department of Transportation. (Mitigation Measure: TR-11.D)

Condition 76. Pay a fair share (34%) contribution towards the reconstruction and widening of Grant Line Road from an existing four-lane thoroughfare center road section to a six-lane thoroughfare section from Rancho Cordova Parkway to Kiefer Boulevard. (Mitigation Measure: TR-11.A)

Condition 77. Pay a fair share (54%) contribution towards the reconstruction and widening of Grant Line Road from an existing four-lane thoroughfare center road section to a six-lane thoroughfare section from Kiefer Boulevard to University Boulevard. (Mitigation Measure: TR-11.B)

Level of Significance After Mitigation: Significant and Unavoidable.

Findings on Adopted Mitigation: LAFCo finds that the adoption of the above-stated measure is within the purview of Sacramento County or other agencies and not that of LAFCo. LAFCo additionally finds that the measure is feasible, and could and should be adopted by said agencies. LAFCo further finds that the impacts would still be considered significant, even with the imposition

of measures identified above. Implementation of the foregoing mitigation measures would reduce the severity of this impact, but not to a less than significant level. (Pub. Resources Code, Section 21002; CEQA Guidelines, Sections 15091, 15126.4, subd. (a)(2).) LAFCo has been presented with no evidence to contradict its conclusion in this regard.

XI. PROJECT ALTERNATIVES

Where an agency has determined that, even after the adoption of all feasible mitigation measures, a project as proposed will still cause one or more significant environmental effects that cannot be substantially lessened or avoided, the agency, prior to approving the project as mitigated, must first determine whether, with respect to such impacts, there remain any project alternatives that are both environmentally superior and feasible within the meaning of CEQA. As noted earlier, in Sections II and VII of these Findings, an alternative may be “infeasible” if it fails to fully promote the lead agency’s underlying goals and objectives with respect to the project. Thus, “ ‘feasibility’ under CEQA encompasses ‘desirability’ to the extent that desirability is based on a reasonable balancing of the relevant economic, environmental, social, and technological factors” of a project. (*City of Del Mar*, *supra*, 133 Cal.App.3d at 417; see also *Sequoyah Hills*, *supra*, 23 Cal.App.4th at 715.)

The detailed discussion in Section X demonstrates that many significant environmental effects of the Project have been either substantially lessened or avoided through the imposition of existing policies or regulations or by the adoption of additional, formal mitigation measures recommended in the FEIR.

Formatted: Justified

However, even with mitigation in the form of the application of existing policies and, where feasible, the addition of formal mitigation measures, the Project will cause unavoidable significant environmental effects to aesthetics, air quality, biological resources, climate change, land use, noise, public utilities, and traffic and circulation, though they have been substantially lessened.

Formatted: Justified

LAFCo can fully satisfy its CEQA obligations by determining whether any alternatives identified in the EIR are both feasible and environmentally superior with respect to these impacts. (*Laurel Hills*, *supra*, 83 Cal.App.3d at pp. 520-521 and pp. 526-527); *Kings County Farm Bureau v. City of Hanford*, *supra*, 221 Cal.App.3d at pp. 730-731; and *Laurel Heights I*, *supra*, 47 Cal.3d at pp. 400-403; see also Pub. Resources Code, § 21002.) As the succeeding discussion will show, no identified alternative is both feasible and environmentally superior with respect to the unmitigated impacts.

To fully account for these unavoidable significant effects, and the extent to which particular alternatives might or might not be environmentally superior with respect to them, these Findings will not focus solely on these impacts, but instead will address the environmental merits of the alternatives with respect to all impacts. The Findings will also assess whether each alternative is feasible in light of the proponent’s objectives for the Project.

The degree of specificity required in an EIR “will correspond to the degree of specificity involved in the underlying activity which is described in the EIR.” (Guidelines, § 15146.) *Al Larson Boat Shop, Inc. v. Board of Harbor Commissioners* (1993) 18 Cal. App. 4th 729, 746.) LAFCo’s evaluation of alternatives is limited to those alternatives within LAFCo’s statutory ability to approve or implement

pursuant to CEQA Guidelines §15096. In LAFCo's case, these would be limited to approving or disapproving the proposed reorganization actions.

As noted above in these CEQA Findings, the Project will result in significant and unavoidable environmental effects with respect to aesthetics, air quality, biological resources, climate change, land use, noise, public utilities, and traffic and circulation. The EIR examined alternatives to the Project to determine whether an alternative could meet the Project's objectives, while avoiding or substantially lessening the significant unavoidable impacts of the Project. The EIR examined in detail the following alternatives to the Project:

- No Project Alternative
- Expanded Preserves Alternative
- Expanded Footprint Alternative

LAFCo's review of project alternatives is guided primarily by the need to reduce potential impacts associated with the Project, while still achieving the basic objectives of the Project. As stated in the EIR, the Project has the following objectives, as provided by the Applicant for the Project (DEIR, page 1-38):

- Develop a mixed use community that is designed in a manner that provides compatible land uses and reduces overall internal vehicle trips.
- Develop an economically feasible master-planned community that reasonably minimizes its impact on biologically sensitive natural resources with feasible onsite wetland avoidance and preservation.
- Develop a sustainable, multi-service town center that promotes walkability and alternative transit modes including but not limited to Neighborhood Electric Vehicles (NEVs), light rail, shuttle bus, and carpool facilities.
- Provide uses for two underserved markets in the southeast Sacramento region:
 - Provide for the development of a major private university facility in Sacramento County.
 - Provide residential neighborhoods that are age restricted in order to serve seniors and larger lot sizes for executive housing to serve corporate executives.
- Develop internal Project infrastructure and circulation networks of multiple modes that provide efficient connections to various land use components throughout the Project; specifically, trail opportunities to enhance the integration between the university/college campus center, town center, schools, and preserves/open space corridors surrounding the Project.
- Develop recreational and open space opportunities that include neighborhood and community parks that are fully integrated into the project through adequate trail connections and provide critical regional trail connections associated with adjacent trail systems.
- Allow for inclusion of alternative energy sources to serve the mixed use community.

A. NO PROJECT ALTERNATIVE

DESCRIPTION OF NO PROJECT ALTERNATIVE

With respect to the analysis of a “no project” alternative, Section 15126.6(e)(2) of the CEQA Guidelines provides:

The “no project” analysis shall discuss the existing conditions at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.

Consistent with that direction, the EIR’s analysis of the No Project Alternative assumes no changes to the site’s existing land use designation and zoning. The No Project Alternative would continue the existing agricultural use for cattle grazing or other uses allowed under the existing General Plan land use designation and zoning. The site is zoned AG-80 (Agriculture – 80 acre minimum lot size). Some of the allowed uses other than the existing uses include single family dwellings and farm employee housing. The No Project Alternative was analyzed as if up to ten (10) homes would be constructed under the AG-80 zoning, and conservatively assumed that each home would involve taking one acre of land out of agricultural uses. That assumption included access roads, the homes, and appurtenant improvements.

ENVIRONMENTAL IMPACTS OF NO PROJECT ALTERNATIVE

Aesthetics. The No Project Alternative would avoid any significant and unavoidable aesthetic impacts. While the project site would continue in agricultural uses, up to ten (10) houses could be built on it but they would have minimal visual impacts. There would be no significant impacts associated with glare or nighttime lighting. Consequently, there would be no contribution to cumulative aesthetic impacts by the No Project Alternative.

Agricultural Resources. Under the No Project Alternative, the Project site would continue in agricultural uses; therefore, all impacts to agricultural uses would be less than significant. However, because of its AG-80 zoning, the site could be subdivided into with up to ten lots of 80-acres each that could each contain a single family dwelling. The No Project Alternative would not conflict with the existing agricultural designations or use, conflict with a Williamson Act contract, or convert agricultural lands to a non-agricultural use.

Air Quality. There could be an increase in construction NOx emissions over the existing agricultural activities with the potential construction of up to ten homes under the No Project Alternative. However, that construction would be regarded as less than significant under SMAQMD thresholds. Operational impacts from ozone precursors (NOx and ROG) would also be considered less than significant from ten homes under SMAQMD guidelines. While the construction of up to ten homes would generate increased particulate matter emissions, it would not be likely to disturb more than 15 acres at the same time. Consequently, the No Project Alternative is not considered to exceed the screening threshold for particulate matter emissions and would have less than significant impacts. The No Project Alternative would not exceed the SMAQMD thresholds of 65 lbs./day of NOx or ROG during operational activities, so it would conflict or obstruct implementation of an Air Quality

Plan. While the No Project Alternative would generate CO emissions, they would not exceed ambient standards and would have a less than significant impact. The No Project Alternative would not expose sensitive receptors to toxic air contaminants (TACs). Although three of the parcels under the No Project Alternative are situated within one mile of Kiefer Landfill and one parcel is proximate to the Sacramento County Boys Ranch, this Alternative would not expose a substantial number of people to objectionable odors.

| Biological Resources. Under the No Project Alternative, agricultural activities would continue at the site, but the construction of up to ten homes could result in some minimal losses of habitat if each home was on a one acre site. Existing regulations for the protection of wetlands and special status species prohibit direct impacts without obtaining appropriate permits and satisfying applicable permit mitigation requirements. Thus, while some impacts to wetlands might occur, these would be minimal and most of the site's approximately 89 acres of wetlands would be retained. It was also assumed that no take of special status species would occur in the No Project Alternative.

| Climate Change. Under the No Project Alternative the current agricultural land use would not significantly contribute to greenhouse gas emissions. Even if the site were developed with ten homes, the total emissions from the No Project Alternative would only be a tiny fraction (0.005%) of total County emissions. In sum, the No Project Alternative's climate change impacts were determined to be less than significant.

| Cultural Resources. Under the No Project Alternative, there would not be any impacts to cultural resources. There are no known historical resources on the site as defined by CEQA. Because the Alternative has a much smaller construction footprint than the proposed Project, there is a much lower probability of discovering unknown subsurface deposits. The EIR determined that the impacts on cultural resources would be less than significant.

| Geology and Soils. There are existing regulations in place to assure that construction on the site does not cause soil erosion, and will avoid substantial risk to life and property associated with expansive soils or geological hazards, such as seismicity. The site is not likely to have asbestos-containing soils and soil testing found no evidence of naturally occurring asbestos. There are no mapped mineral resources on the site, and the construction of up to ten homes would not preclude the site's future mining. Impacts to soils and geology were therefore found to be less than significant.

| Hazards and Hazardous Materials. While the No Project Alternative would involve the use of wells as a source of potable water, the groundwater contamination from the Aerojet facility and the Kiefer Landfill properties is migrating away from the site, so the wells would not be negatively impacted by contamination. Impacts from hazards and hazardous materials are less than significant.

| Hydrology and Water Quality. The No Project Alternative would impact less than 1% of the watershed area on the site. This would not result in substantial hydrologic changes to the site. County regulations and ordinances would preclude building any homes in the 100-year floodplain or impeding or redirecting flood flows. The No Project Alternative either would require appropriate erosion controls through permitting requirements, or would be too small to generate substantial polluted runoff. Consequently, the No Project Alternative would have less than significant impacts on hydrology and water quality.

| Land Use. There would be no change in the land use designations under the No Project Alternative. The site would remain AG-80 and be consistent with the SACOG Blueprint, inasmuch as urbanization of the site was not contemplated under the Blueprint until the cumulative planning horizon. This Alternative would not displace an existing community or displace housing elsewhere. The Land Use impacts are less than significant.

| Noise. The construction of up to ten homes would not have significant construction noise impacts. The homes would not generate significant traffic noise, nor be sources of significant stationary source noise. Since the Alternative would not result in the exposure of people to a substantial noise source or exceed a noise standard, the noise impacts are less than significant.

| Public Services. The addition of up to ten new homes with this Alternative would not result in substantial demands for public services, increased staffing or additional facilities. The impacts to public services from the No Project Alternative would be less than significant.

| Public Utilities. The No Project Alternative would not have a public water or public sewer, but would rely on private wells and septic systems that have to be installed in compliance with County ordinances and requirements. Electrical and gas lines would have to be extended to home sites, but SMUD and PG&E have the ability to supply services. Impacts from public utilities would be less than significant.

| Traffic and Circulation. Traffic volumes generated by up to ten new homes under the No Project Alternative would be too low to require a traffic impact analysis. This Alternative would not cause any level of significance threshold to be exceeded, nor would the existing deficiencies in bicycle and pedestrian facilities on Grant Line and Douglas Road be significantly impacted. The Alternative would not conflict with any adopted transit plan or non-automotive master plan. Impacts to traffic and circulation would be less than significant.

RELATIONSHIP TO PROJECT OBJECTIVES

| The No Project Alternative would not meet any of the Project objectives because the Project would not be constructed.

FINDING

| LAFCo rejects the No Project Alternative as infeasible for each and every reason listed, each reason being a separate and independent basis upon which LAFCo finds the alternative to be infeasible.

- | (a) The No Project Alternative would not develop a mixed use community that was designed with compatible land uses to reduce overall internal vehicle trips when compared to a “business-as-usual” development;
- | (b) The No Project Alternative would not result in an economically feasible master-planned community;
- | (c) The No Project Alternative would not create a sustainable, multi-service town center that promotes walkability and alternative transit modes, including but not limited to Neighborhood Electric Vehicles, light rail, shuttle bus, and carpool facilities.
- | (d) The No Project Alternative would not provide for land uses that would allow for the development of a major private university in Sacramento County or provide for land uses that

allow residential neighborhoods that are age restricted in order to serve seniors, nor would the No Project Alternative create large lot sizes suitable for executive housing to serve corporate executives;

- | (e) The No Project Alternative would not create any internal Project infrastructure and circulation networks of multiple modes that provide efficient connections to various land use components in the Project;
- | (f) The No Project Alternative would not develop any neighborhood and community parks or provide connections to adjacent trail systems or regional trail systems; and
- | (g) The No Project Alternative would not provide any alternative energy sources to serve a mixed use community.

| In light of the foregoing, the LAFCo further finds that the No Project Alternative would not meet any of the Project Objectives. To the extent that any environmental impacts might be less significant under the No Project Alternative, the rejection of this alternative is appropriate for the reasons stated above and in the statement of overriding considerations. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

B. EXPANDED PRESERVES ALTERNATIVE

DESCRIPTION OF EXPANDED PRESERVES ALTERNATIVE

| Under the Expanded Preserves Alternative, the Project would be significantly changed by placing approximately 1,142 acres into preserves, primarily by expanding the preserve on the western plateau of the site, compared to the Project that would avoid only 493 acres. The expanded preserve size would remove any development along Grant Line Road north of the University Boulevard intersection. Overall, it would reduce the non-residential square footage to only 382,640 sq.ft. compared to the Project's 1,349,419 sq.ft. of non-residential uses. It would also reduce the area of urban development at the site to only 1,527 acres. These changes are highlighted on Plate ALT-5 in the Draft EIR. An Expanded Preserves Alternative would remove the Town Center from the western side of the site and result in the loss of its mixed use retail and commercial center along a major roadway. No replacement of the Town Center land use was included in this Alternative.

| The Expanded Preserves Alternative would avoid nearly all impacts to vernal pools by significantly expanding the avoidance areas to 1,142 acres, although impacts would still occur due to construction of access roads across the expanded preserve at the western side of the site. Expansion of the preserves would not only result in the loss of the Town Center area, but also result in reducing the size of other land uses, such as removing 23 acres of the Academic Zone at the University/College Campus Center, losing 20 acres of the Sports Park, 9 acres of medium density residential in Ridgeline Village, 10 acres of high density residential in Ridgeline Village, 3 acres of low density residential in Ridgeline Village, 29 acres of medium density residential in University Village, 31 acres of low density residential in East Valley Village, and 39 acres of public/quasi-public uses in East Valley Village. As a result of the losses in developed area the Expanded Preserves Alternative would contain only 6,845 housing units compared to the Project's 9,010 total units.

ENVIRONMENTAL IMPACTS OF EXPANDED PRESERVES ALTERNATIVE

| Aesthetics. The Expanded Preserves Alternative would preclude any development of the western plateau area along Grant Line Road, and allow development in portions of the site that area not

currently visible from Grant Line Road or by the Douglas Road/Rancho Cordova viewer groups. This would maintain the continuity of most of the existing views. Consequently, the degradation of views and visual quality would be less than significant for those viewer groups.

| The impacts to viewers along Kiefer Road and Latrobe Road would be similar to the impacts from the Proposed Project, but due to distance from the site and the intervening landforms, the impacts to these existing views would be less than significant as well. However, the existing views for the viewer group north of the Project site would still have their visual quality reduced from moderately high to moderately low by the Expanded Preserved Alternative, resulting in aesthetic impacts from the Expanded Preserves Alternative that would be significant and unavoidable. This Alternative would also introduce new sources of light and glare at the site from the more than 6,000 new homes and nearly 400,000 square feet of commercial uses it would create. That would be a substantial new source of nighttime lighting, and while application of Mitigation Measure AE-1 could lessen this impact, the impact would remain significant and unavoidable for this Alternative.

| Agricultural Resources. While the Expanded Preserves Alternative would result in less urbanization of the existing grazing lands at the site, its impacts would be similar to that of the Proposed Project. Mitigation Measure AG-1 would reduce conflicts with neighboring offsite agricultural uses. This Alternative's impacts on Williamson Act contracts would be the same as those for the Proposed Project, and would require Mitigation Measure AG-2 in order to reduce them to a less than significant level. In the Expanded Preserve Alternative, the 8.6 acres of Unique Farmland would be situated within a Preserve, as would some of the grazing land now situated outside of the USB. Placing existing farmland within a preserve would preclude unrestricted farming activities. Consequently, those 255.6 acres of impacted farmland also would require mitigation by Mitigation Measure AG-3 in order to reduce this Alternative's impact on agricultural resources to a less than significant level.

| Air Quality. Changes made by the Expanded Preserves Alternative would be unlikely to reduce the impact of the worst-case NOx emissions scenario from construction activities. Its impacts would be similar to the proposed Project, and require implementation of Mitigation Measure AQ-1 in order to reduce the impact of construction period NOx emissions to a less than significant level. Operational emissions of ozone precursors (NOx and RPG) would be less, but would still exceed the SMAQMD's thresholds and therefore require preparation and implementation of an air quality mitigation plan. However, even with an air quality mitigation plan that required a 35% reduction in ozone precursor emissions, the operational emissions impacts of the Expand Preserves Alternative would remain significant and unavoidable.

| Construction of the Expanded Preserves Alternatives would generate particulate matter emissions of PM2.5 and PM10. While compliance with existing rules and regulations would be required, construction is likely to exceed 15 acres per day at any given time, and this Alternative would have significant and unavoidable impacts relating to PM2.5 and PM10 from construction activities. Because the Expanded Preserves Alternative would be expected to have construction emissions that exceeded 85 lbs./day of NOx and ROG and operational activities that would exceed 65 lbs./day of NOx and ROG, the Alternative has the potential to conflict with or obstruct the implementation of the regional ozone attainment plan and would have a significant and unavoidable impact on Air Quality. CO emissions from this Alternative are not expected to exceed ambient standards or create any CO hotspots, so its impacts on CO emissions would be less than significant.

| The Expanded Preserves Alternative has the same potential for producing toxic air contaminants (TACs) as does the proposed Project. However, with implementation of Mitigation Measure AQ-3, the siting of new uses would conform with CARB recommendations and the impact from exposure to TACs would be less than significant. This Alternative would place sensitive land uses in close proximity to the Kiefer Landfill and the Sacramento County Boys' Ranch, and the same mitigation would apply in order to reduce this impact from odors they generate to a less than significant level.

| Biological Resources. The Expanded Preserves Alternative would create 1,142 acres of preserves to protect 72 acres of wetlands and place an additional 37.3 acres of agricultural lands under a conservation easement. Thus, 81% of the site's wetlands would be in a preserve. Mitigation Measure BR-1 would apply to reduce the impacts on wetlands to an estimated 17 acres, and with mitigation the impact would be considered less than significant since 99% of the vernal pools would be preserved and 81% of the total wetlands preserved.

| As a result of the increased preserves and agricultural areas protected from future development by way of conservation easements, the area where impacts to special status species are avoided increases to 1,179 acres and the impacted areas are reduced to 1,490 acres. Mitigation Measures BR-3, BR-5 and BR-6 would reduce impacts to birds to a less than significant level. Impacts to amphibians, such as the western spadefoot, would be less than significant since more wetlands and more upland areas are being preserved. Impacts to invertebrates, such as the listed species of shrimp, would be less than significant once mitigation is provided as required by the state and federal permits and the County's requirement for no net loss of wetlands. Similarly, impacts to special status plants, such as those found around vernal pools, would similarly be reduced to a less than significant level due to the increased preservation and mitigation requirements of existing regulations and ordinances that assure no net loss of wetlands.

| Climate Change. With the Expanded Preserves Alternative, the reduction in size of the developed area is not expected to alter the per capita and per square foot energy sector GHG emissions from those of the proposed Project which were 1.18 MT per capita for residential uses and 5.75 MT per 1,000 sq.ft. of commercial uses. Total GHG emissions from the energy usage of the Expanded Preserves Alternative was estimated as 8,460 MT annually. Transportation GHG emissions for this Alternative were estimated at 4.48 MT per capita annually, that would be reduced to 3.77 MT per capita with implementation of the GHG Reduction Plan. Because the Expanded Preserves Alternative would have transportation sector GHG emissions that are above the current County thresholds now in effect, the Alternative's GHG emissions would be considered to have significant and unavoidable impacts.

| Cultural Resources. There are no known historic resources on the site. There would be a slightly reduced likelihood of discovering unknown subsurface cultural resources when compared to the proposed Project because this Alternative has a smaller construction footprint. Mitigation Measure CR-1 would apply and reduce this Alternative's impacts on cultural resources to a less than significant level.

| Geology and Soils. As with the proposed Project, the observance of existing regulations would ensure that construction does not cause substantial soil erosion and will avoid substantial risk to life and property associated with expansive soils or geological hazards. The site is not likely to have asbestos-containing soils and there is no naturally occurring asbestos. There are no mapped mineral

resources on the site. Consequently, the Expanded Preserves Alternative would have less than significant impacts on geology and soils.

| Hazards and Hazardous Materials. The Expanded Preserves Alternative would have the same less-than-significant impacts from hazards and hazardous materials as would the proposed Project and the No Project Alternative. Mitigation Measure HM-1 would assure that no impacts arise.

| Land Use. The impacts of the Expanded Preserves Alternative are the same as the proposed Project with regard to conflicts with adopted land use plans, and are therefore less than significant. The Expanded Preserves Alternative has similar conflicts with the SACOG Blueprint as does the proposed Project, and they are therefore significant and unavoidable. This Alternative would have less than significant impacts related to General Plan policies regarding growth inducement, public services and utilities, transportation and air quality, land use compatibility, disruption of an existing community, and displacement of housing.

| Noise. The noise impacts of the Expanded Preserves Alternative are similar to the proposed Project with regard to construction noise levels, onsite traffic noise, onsite community and stationary noise, Mather Airport noise, and noise due to Kiefer Landfill activities, all of which are less-than-significant. There would be significant and unavoidable noise impacts from this Alternative due to the substantial increase it would cause in the ambient noise level at the site.

| Public Services. The Expanded Preserves Alternative would result in an estimated population of 19,690 residents including the university/college campus center. The demand for public services is reduced as a result of the smaller population, with only an additional 13 Sheriff's Department staff members being needed, only 14,292 tons of waste being produced annually and 19,436 tons of construction waste, only 79 acres of parkland being needed, library remaining the same, and schools remaining the same. As a result, the impacts to public services would remain less-than-significant.

| Public Utilities. As with the proposed Project, the Expanded Preserves Alternative would have similar impacts to those of the proposed Project. Impacts from the construction of infrastructure would be significant and unavoidable since the regional and offsite improvements are still needed to serve the site. Energy efficiency impacts would remain less than significant, as would water demand and sewer disposal demand. Impacts to groundwater yield and groundwater recharge would be less-than-significant.

| Traffic and Circulation. A reduction in the number of access points along Grant Line Road would result from the Expanded Preserves Alternative from three to two points, and a number of internal roadways also would be eliminated. Six offsite intersections would experience significant impacts in the absence of any mitigation to add improvements to them: Bradshaw Road and Jackson Road; Mather Boulevard and Douglas Road; Eagles Nest Road and Jackson Road; Grant Line Road and Sunrise Boulevard; Grant Line Road and White Rock Road; and Prairie City Road and White Rock Road. There will be no adverse impacts to any intersections in the City of Elk Grove with this Alternative. In the City of Rancho Cordova, the Expanded Preserves Alternative would have significant impacts to the following intersections if no mitigation improvements are provided: Sunrise Boulevard and White Rock Road; Sunrise Boulevard and Douglas Road; Sunrise Boulevard and Jackson Road; Grant Line Road and Jackson Road; Grant Line Road and Kiefer Boulevard; Grant Line Road and Douglas Road; Grant Line Road and North Loop Road; and Grant Line Road and University Boulevard. No Caltrans state freeway intersection impacts would arise from this

Alternative. Impacts to Sacramento County roadway segments would be less than significant. In the City of Elk Grove, roadway impacts to Grant Line Road between Sheldon Road and Calvine Road would be significant without the implementation of Mitigation Measure TR-4 that would reduce them to less-than-significant if it were to be implemented. Ten roadway segments in the City of Rancho Cordova would be impacted by the Expanded Preserves Alternative, and all but one of them could be reduced to less-than-significant if Mitigation Measure TR-5 could be implemented. However the roadway segment on Sunrise Boulevard from Folsom Boulevard to White Rock Road would remain at an unacceptable LOS of E even with Mitigation Measure TR-5's implementation. Caltrans freeway segments impacted by this Alternative are those on Westbound US 50 from Hazel to Sunrise and Eastbound US 50 from Sunrise to Hazel that would remain significant and unavoidable impacts, even with Mitigation Measure TR-6. With the implementation of Mitigation Measure TR-7, impacts to bicycles and pedestrians would be less-than-significant from the Expanded Preserves Alternative.

In the Cumulative Plus Project scenario, the Expanded Preserves alternative would have less-than-significant impacts on County intersections, City of Folsom intersections, City of Elk Grove intersections and Caltrans freeway intersections. In the City of Rancho Cordova, this Alternative would have significant and unavoidable impacts to the intersections of Sunrise Boulevard and Douglas Road that could not be mitigated to achieve a level of service above LOS E; Grant Line Road and Douglas Road that could be mitigated to LOS C; Grant Line Road and North Loop Road that could be mitigated to LOS C; and Sunrise Boulevard and International Drive that could not be mitigated above LOS E. Even where mitigation could improve some of the intersections in Rancho Cordova, there is no guarantee that it would be implemented, so the impacts must be considered significant and unavoidable. Under the Cumulative Plus Project scenario, roadway segment impacts in Sacramento County and the City of Elk Grove with the Expanded Preserves Alternative would be less than significant. Impacts to roadway segments in the City of Rancho Cordova could be improved by Mitigation Measures TR-10.C. and TR-10.D. to less than significant levels if implemented, otherwise the impacts would be significant and unavoidable. Impacts of this Alternative in the Cumulative Plus Project scenario on Caltrans freeway segments and ramp junctions would be significant and unavoidable at the following locations: Eastbound US 50 from Watt Avenue to Bradshaw Road; Eastbound US 50 from Rancho Cordova Parkway to Hazel Avenue; Westbound US 50 from Hazel to Rancho Cordova Parkway; Westbound US 50 from Bradshaw Road to Watt Avenue; Westbound US 50 from Watt Avenue to Power Inn Road/Howe Avenue; Eastbound US 50 Slip Ramp Entrance from Watt Avenue; Westbound US 50 Exit Ramp to Watt Avenue; and Westbound US 50 Slip Ramp Entrance from Watt Avenue. Impacts to bicycles, pedestrians and transit with the Expanded Preserves Analysis would be less-than-significant.

RELATIONSHIP TO PROJECT OBJECTIVES

The Expanded Preserves Alternative would meet most of the basic Project objectives, but not all of them. It would not provide any land along Grant Line Road for a sustainable, multi-service Town Center. It would substantially reduce the square footage of non-residential land uses to only 382,640 sq.ft. when compared to the Project's 1,349,419 sq.ft, and would remove the ability to locate any of those types of non-residential uses along Grant Line Road. The ability to create a sustainable, multi-service town center is questionable. In addition, it would reduce the number of dwelling units to only 6,845 compared to the 9,010 dwelling units the Project could provide.

FINDING

LAFCo finds that the Expanded Preserves Alternative is the environmentally superior alternative because it will result in fewer significant and unavoidable impacts in several categories, most notably in wetland loss due to the larger preserves/avoided areas and in impacts to invertebrate species. It will result in the least amount of land being urbanized at 1,490 acres, the lowest water demand at 5,484 AFY, the least amount of pollutants such as NOx at 319.72 tons and 660.20 tons of ROG, the least amount of impacts to wetlands and other habitat losses due to placing 43% of the site in preserves and avoided areas, and would have lower utility demands for electricity of 72,003,00 kWh and 2,988,810 therms of natural gas when compared to the proposed Project.

LAFCo rejects the Expanded Preserves Alternative as infeasible for each and every reason listed, each reason being a separate and independent basis upon which LAFCo finds the alternative to be infeasible.

- (a) The Expanded Preserves Alternative would not create a sustainable, multi-service town center that promotes walkability and alternative transit modes, including but not limited to Neighborhood Electric Vehicles, light rail, shuttle bus, and carpool facilities
- (b) The Expanded Preserves Alternative would substantially reduce land uses that would allow for the development of a major private university in Sacramento County or provide for land uses that allow residential neighborhoods that are age restricted in order to serve seniors, or create large lot sizes suitable for executive housing to serve corporate executives
- (c) The Expanded Preserves Alternative would substantially reduce neighborhood and community parks and would interfere with connections to adjacent trail systems or regional trail systems

In light of the foregoing, the LAFCo further finds that the Expanded Preserves Alternative would not meet any of the Project Objectives. To the extent that any environmental impacts might be less significant under the Expanded Preserves Alternative, the rejection of this alternative is appropriate for the reasons stated above and in the statement of overriding considerations. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

C. EXPANDED FOOTPRINT ALTERNATIVE

DESCRIPTION

The Expanded Footprint Alternative is composed of the Expanded Preserves Alternative together with another 862 acres of land added to the north of the Project site referred to as “Grant Line Pilatus.” The total area of this Alternative is 3,531 acres. It would designate 2,016 acres for development and preserve 1,515 acres. Plate ALT-8 in the Draft EIR shows a potential land use plan for the Expanded Footprint Alternative. Within this Alternative, a modified Town Center could be relocated into the Ridgeline Village area, while the displaced housing from Ridgeline Village could be moved to the Grant Line Pilatus property on the north. This still creates a problem, since the Town Center would not be directly accessible from Grant Line Road. The Town Center would be smaller than the proposed Project, and the ability to support a viable commercial land use with 1,032,640 sq.ft. of non-residential uses would be questionable since reduced vehicle access and reduced visibility from Grant Line Road would result in less traffic at the site. However, the commercial and residential land uses of this Alternative would be more in balance than with the Expanded Preserves Alternative, which had only 382,640 sq.ft. of non-residential land uses. The

Grant Line Pilatus property contains wetlands and linear waterways; as a result, a system of preserves for it was created based upon the standard 250 ft. buffer. This resulted in 373 acres of the total 862 acre Grant Line Pilatus property being placed into preserves, only leaving 489 acres for potential development.

The Town Center use that could be provided in the Expanded Footprint Alternative is only 150 acres, versus over 200 acres at the proposed Project. In addition, the smaller Town Center of this Alternative could not serve as a significant retail/commercial center because of its location in the Project site's interior, rather than along Grant Line Road, a major regional transportation corridor. Access and exposure to the traffic along Grant Line Road for the commercial uses would be significantly compromised. This Alternative would result in approximately 8,045 dwelling units, a reduction to 1,032,640 sq.ft. of non-residential uses, and have an estimated population of 22,850 persons.

ENVIRONMENTAL IMPACTS OF THE EXPANDED FOOTPRINT ALTERNATIVE

Aesthetics. Under the Expanded Footprint Alternative, there would be similar views and visual quality for the Grant Line Road and Douglas Road / Rancho Cordova viewer groups as there would be for the proposed Project, which was a less than significant impact. View and visual quality impacts to the Kiefer Road and Latrobe Road viewer groups would also be less than significant. There would be no impacts to the residents to the north, because the residences would exist on land that would be developed. A new viewer group on Scott Road would be impacted, but that impact would be less than significant. As with the proposed Project, this Alternative would introduce new nighttime light and glare into the area, and such an impact would be significant and unavoidable.

Agricultural Resources. The added northern properties in the Expanded Footprint Alternative have the same AG-80 zoning and uses as the proposed Project area. Mitigation Measure AG-1 would be applied to reduce any impacts to adjacent agricultural uses to a less than significant level.

Impacts to lands under Williamson Act contracts would be similar to the proposed Project. Since the lands in the added northern area are now in a Williamson Act contract non-renewal status, approval of a subdivision map for the northern area would need to be deferred until February 2013 (within 3 years of nonrenewal). A rezone of the northern area would need to specify that the rezoning was not effective until 2016, and Mitigation Measure AG-2 would be included to ensure the continued agricultural use of the northern area until 2016. These actions would make the Expanded Footprint Alternative consistent with the Williamson Act.

The Expanded Footprint Alternative would convert 255.6 acres of protected farmland to non-agricultural uses. Mitigation Measure AG-3 would require mitigation for that conversion, and thereby reduce this impact to a less than significant level.

Air Quality. Although the number of residential units and size of the commercial development that would be constructed with the Expanded Footprint Alternative is less than with the proposed Project, the production of NOx emissions by construction activities would still exceed significance thresholds. Mitigation Measure AQ-1 would need to be implemented in order to make these impacts less than significant.

| Operational emissions of ozone precursors, such as NOx and ROG, would be less than for the proposed Project, they would still exceed the thresholds of significance. An air quality mitigation plan would be required, and the same plan as used for the proposed Project could be implemented to reduce emissions by 35%. However, the reduction in emissions would still be above the threshold, so this impact would be significant and unavoidable.

| The northern area of the Expanded Footprint Alternative has the potential to expose people to offsite emissions of particulate matter due to the existence of an active aggregate mining operation on adjacent property. However, the area of the mine nearest the northern area is scheduled to be the deposit that is mined first, while the northern area is the one assumed to be developed last due to the need to extend infrastructure to serve it. Consequently, this impact could be reduced to a less than significant level by requiring mitigation that would prohibit development within 2,500 feet of an active or approved and planned mining operation, as suggested in the Draft EIR.

| Construction activities at the Expanded Footprint Alternative would increase particulate matter emissions of PM2.5 and PM10. Because those construction activities are likely to involve more than 15 acres per day at any given time, it will result in significant emissions. In spite of the mitigation measures that would be imposed by existing rules and regulations to reduce this particulate matter impact, the Expanded Footprint Alternative will result in significant and unavoidable PM2.5 and PM10 emissions.

| The Expanded Footprint Alternative would exceed SMAQMD thresholds of 85 lbs./day for NOx during construction and 65 lbs./day of NOx or ROG during its operation. That would have the potential for interfering with the success of regional ozone attainment plans, and would be a significant and unavoidable impact of this Alternative. Traffic would increase on a cumulative basis with this Alternative, but to a lesser degree than with the proposed Project. Since localized CO concentrations near major vehicular access routes were not found to exceed ambient standards with the proposed Project's traffic, this Alternative's CO emissions would have a less than significant impact.

| As with the proposed Project, there are no existing sources of toxic air contaminants (TACs) in proximity to the Expanded Footprint Alternative. Mitigation Measure AQ-3 would apply to ensure that new uses in the Alternative would not expose sensitive receptors to TACS from the new uses, such as gasoline stations. Impacts of this Alternative relating to exposure to TACs would therefore be less than significant. The Expanded Footprint Alternative will result in the placement of sensitive uses in proximity to the Kiefer Landfill and the Sacramento County Boys' Ranch, with the same potential for exposure to objectionable odors. Implementation of the same mitigation as required for the proposed Project would result in this being a less than significant impact.

| Biological Resources. The Expanded Footprint Alternative would have a total of 1,552 acres of preserves and avoided areas, and 1,979 acres of development. 89 acres of vernal pools and other wetlands would be placed in preserves, resulting in 81% of the total wetland acres being preserved. Of the 54.09 acres of vernal pools onsite, a total of 51.44 acres would be preserved, which results in the preservation of 95% of all vernal pools. The impacts from roadways on the preserves for this Alternative would be increased due to three crossings of the central preserve on the Grant Line Pilatus property in the northern area. In addition, there would be unknown impacts to offsite wetlands on adjacent properties through which the northern access road to the Project site would have to travel. That offsite area contains dense concentrations of vernal pools, but no jurisdictional

wetland delineation has been performed. Nonetheless, the wetland impacts of the Expanded Footprint Alternative would be less than significant for the same reasons as stated above for the Expanded Preserves Alternative. With the implementation of Mitigation Measures BR-3, BR-4, BR-5 and BR-6, impacts to special status bird species would be reduced to less than significant. Impacts to special status amphibians, such as the western spadefoot, would also be less than significant, just as they were for the proposed Project. Impacts to vernal pool crustaceans would be less than significant due to compliance with the County's no net loss of wetlands policy and the permitting requirements of other agencies when a wetland area is filled. The Grant Line Pilatus property contains a single elderberry plant that could provide habitat for the valley elderberry longhorn beetle. That plant would be placed within a preserve area, so impacts would be less than significant. Surveys for special status plants were not conducted at the Grant Line Pilatus property. However, with the implementation of mitigation requiring a rare plant survey and mitigation if any rare plants are found, the impacts of this Alternative would be reduced to less than significant.

| Climate Change. While there would be fewer homes and businesses with the Expanded Footprint Alternative, the per capita and per square foot energy emissions of GHGs would be essentially unchanged at 1.18 MT per capita for residential and 5.75 MT per 1,000 sq.ft. for commercial. Total GHG emissions from energy usage in this Alternative were estimated at 10,526 MT annually. GHG emissions from the transportation sector for this Alternative were estimated at 3.78 MT per capita. Because these emissions, even with mitigation, are above current County GHG thresholds, this Alternative would have significant and unavoidable climate change impacts.

| Cultural Resources. The cultural resources impacts for that portion of this Alternative that is the same as the Expanded Preserves Alternative would be the same. The northern area has not had a cultural resources survey conducted, but a record search showed six historical isolates within or adjacent to it that consisted of miscellaneous farming equipment, a tractor, and an oil can. Isolates lack historical context and are not considered significant historical resources. Thus, there are no known significant cultural resources at the northern area. Because there has never been a survey of the northern area and because it is unknown what subsurface resources may exist, a mitigation measure requiring a survey by a qualified professional should be adopted that in combination with Mitigation Measure CR-1 will ensure that any impacts to cultural resources would be less than significant.

| Geology and Soils. The impacts to geology and soils would be the same as for the Expanded Preserves Alternative and be less than significant. The northern area has the same geologic characteristics as the proposed Project.

| Hazards and Hazardous Materials. Under the Expanded Footprint Alternative, the impacts related to this topic would be virtually the same as for the proposed Project. Mitigation Measure HM-1 would apply and reduce any impacts to a less than significant level.

| Hydrology and Water Quality. While the Expanded Footprint Alternative includes more land overall, it results in the conversion of less land to urban development than does the proposed Project. It also includes the same watershed areas, though its drainage master plan would have to be revised to take in the northern area. It is expected that this will still result in the Alternative's development having a less than significant impact. Construction related and operational water quality impacts of this Alternative would be the same as those for the proposed Project, and with observance of existing regulations, the impacts are expected to be less than significant.

Land Use. The Expanded Footprint Alternative would not conflict with any adopted County or city land use plans that avoids environmental impacts, consequently its impact in this regard is less than significant. This Alternative uses the same basic internal designs as the proposed Project, so the conclusions as to providing a variety of transportation choices, compact building and community design, a range of housing, as well as fostering a sense of place apply. While it provides more open space than the proposed Project, it still conflicts with the SACOG Blueprint because it does not direct growth toward an existing urban core. The portion of the Expanded Footprint Alternative north of the proposed Project does not have frontage on Grant Line Road in contrast to the proposed Project which abuts actively planned urban development in the City of Rancho Cordova along the Grant Line Road frontage. Consequently, this portion of the alternative does not have direct contact with existing urban development or land currently in planning by the City of Rancho Cordova. This is a significant and unavoidable impact of the Alternative. Its growth inducing impacts are less than significant. Impacts related to General Plan policies concerning public services and utilities are similar to those for the proposed Project and are less than significant. Impacts related to the General Plan policies for air quality are also less than significant, just as for the proposed Project. General Plan policies require new development to be compatible with existing development. The proposed mitigation for reducing this Alternative's particulate matter exposure impacts that would require a 2,500 ft. buffer from active mining operations at the nearby Teichert mining company property would reduce any land use compatibility impacts to a less than significant level. This Alternative would not divide or disrupt an existing community, and would not displace any housing, so its impacts in these areas are less than significant.

Noise. Construction of the Expanded Footprint Alternative would increase noise levels, but remain less than significant, just as for the proposed Project. With implementation of mitigation measures, impacts from onsite traffic would be less than significant. Onsite sources of community and stationary noise would have less than significant impacts, just as for the proposed Project. Noise impacts from the Kiefer Landfill would be less than significant, just as for the proposed Project. Ambient noise levels at the site of this Alternative would increase and be a significant and unavoidable impact, just as they would be for the proposed Project. Mather Airport noise would have a less than significant impact on this Alternative.

Public Services. The estimated population for this Alternative is 22,850 persons, which is about 90% of the population of the proposed Project. Existing regulations, ordinances, codes and fee mechanisms would ensure that the necessary facilities are constructed and funded to provide the public services needed for this Alternative's population. Impacts on public services would be less than significant.

Public Utilities. The water supply master plan and sewer master plan would all need to be amended to serve this Alternative, as fewer supply lines would be needed on the main Cordova Hills section and new lines would be needed to serve the northern area added by this Alternative. The same regional and offsite improvements would be needed, so the impacts are similar to the infrastructure construction impacts of the proposed Project and would therefore be significant and unavoidable. In terms of energy efficiency, this Alternative will not result in the wasteful, inefficient and unnecessary consumption of energy, and its demand for energy will not exceed the available supply, so its impacts in this regard are less than significant. Its demand for water and sewer services will also be less than significant. The Alternative will not use groundwater to the extent that it would exceed the sustainable yield, so its impacts are less than significant. Nor will it adversely impact groundwater recharge.

| Traffic and Circulation. The Expanded Footprint Alternative would reduce the number of access points at Grant Line Road to only two points, and the inclusion of larger preserves would also eliminate several internal roadways from the proposed Project. Under existing plus project conditions, the implementation of Mitigation Measure ALT -5 in the Draft EIR would ensure that the Expanded Footprint Alternative has less than significant impacts on the intersections situated in Sacramento County. Impacts of this Alternative on intersections in the City of Elk Grove would be less than significant as well. However, impacts to intersections in the City of Rancho Cordova would be significant and unavoidable because the County cannot ensure that Mitigation Measure ALT-6 in the Draft EIR and any other mitigation improvements to roadways suggested in the EIR would be implemented by the City of Rancho Cordova. Any Caltrans state highway intersection impacts from this Alternative would be less than significant.

| Implementation of Mitigation Measures TR-3A and TR-4 for the proposed Project would result in the roadway segment impacts from the Expanded Footprint Alternative being less than significant in Sacramento County. Impacts to roadway segments in the City of Rancho Cordova, City of Folsom and City of Elk Grove from the Expanded Footprint Alternative would be significant and unavoidable because the County cannot be certain that the suggested roadway segment improvements proposed as mitigation would be implemented by the cities. In addition, in some cases within Rancho Cordova there is no mitigation available to restore the LOS to an acceptable level on certain roadway segments, such as along Sunrise Boulevard from US 50 to White Rock Road. Along the Caltrans US 50 freeway, implementation of Mitigation Measure TR-6 would reduce traffic impacts of the Expanded Footprint Alternative to a less than significant level in the existing plus project scenario. There would be less than significant impacts to Caltrans ramp junctions with this Alternative in the existing plus project scenario. Impacts of this Alternative on bicycles and pedestrians would be the same as those of the proposed Project. Implementation of Mitigation Measure TR-7 would reduce impacts of this Alternative to less than significant in the existing plus project condition. This Alternative would have less than significant impacts on transit service in the existing plus project condition, assuming the same internal transit system is adopted as would be used for the proposed Project.

| In the cumulative plus project scenario, the Expanded Footprint Alternative requires the implementation of Mitigation Measure ALT-7 in the Draft EIR in order to reduce impacts on Sacramento County intersections to a less than significant level. In this scenario, the Alternative would not require any mitigation in order for its impacts on intersections in the City of Elk Grove and in the City of Folsom to be less than significant. However, under the cumulative plus project condition, impacts to intersections in the City of Rancho Cordova would be significant and unavoidable, because the County cannot be certain that the suggested mitigation would be implemented in the City. In addition, in some cases there is no mitigation available to reduce impacts on Rancho Cordova intersections to an acceptable level of service. With regard to Caltrans intersections, this Alternative does not have any significant impacts in the cumulative plus project condition.

| With implementation of Mitigation Measure ALT-9 suggested in the Draft EIR, the Expanded Footprint Alternative's impacts on Sacramento County roadway segments in the cumulative plus project condition would be reduced to a less than significant level. Impacts to roadway segments in the City of Elk Grove for this Alternative in the cumulative plus project scenario would also be less than significant. However, impacts to a number of roadway segments in the City of Rancho Cordova and City of Folsom would be significant and unavoidable in the cumulative plus project

condition with this Alternative. That conclusion was reached because the County cannot be certain that the City of Rancho Cordova and City of Folsom would implement the suggested mitigation in order to improve the LOS to acceptable levels. Significant impacts from the Expanded Footprint Alternative would also be caused to a number of freeway segments along US 50 in the cumulative plus project condition. Caltrans has no plans or funding to make further improvements to those segments of US 50 and to the impacted US 50 ramp junctions, so there is no feasible mitigation available to lessen the impacts of this Alternative on US 50.

| In the cumulative plus project scenario, the Expanded Footprint Alternative would have nearly identical impacts as would the proposed Project on bicycles, pedestrians and the transit system. All of those impacts would be less than significant and would not require any additional mitigation for this scenario.

RELATIONSHIP TO PROJECT OBJECTIVES

| The Expanded Footprint Alternative would only partially meet the basic Project objectives for the same reasons as the Expanded Preserve Alternative fails to meet them. It would not provide any land along Grant Line Road for a sustainable, multi-service Town Center. Relocating the Town Center uses into the interior of the Project site would deny them any visibility to the users on Grant Line Road.

FINDING

| While the Expanded Footprint Alternative results in one fewer significant impact to Aesthetics compared to the Expanded Preserves Alternative, the Expanded Preserves Alternative results in the least amount of land being urbanized, the least amount of pollutants such as NOx and ROG, the least amount of impacts to wetlands and other habitat loss, and the least utility demand. When the expanded Footprint Alternative is compared to the proposed Project, the Expanded Footprint Alternative results in fewer impacts to Aesthetics, and fewer significant impacts to wetlands and invertebrate species when mitigation is performed. Consequently, the Expanded Footprint Alternative would not be the environmentally superior alternative when compared to the Expanded Preserves Alternative. However, it would have fewer significant and unavoidable impacts than the proposed Project. LAFCo rejects the Expanded Footprint Alternative as infeasible for each and every reason listed, each reason being a separate and independent basis upon which LAFCo finds the alternative to be infeasible.

| (a) The Expanded Footprint Alternative would not create a sustainable, multi-service town center that promotes walkability and alternative transit modes, including but not limited to Neighborhood Electric Vehicles, light rail, shuttle bus, and carpool facilities

| In light of the foregoing, the LAFCo further finds that the Expanded Footprint Alternative would not meet one of the Project Objectives. To the extent that any environmental impacts might be less significant under the Expanded Footprint Alternative, the rejection of this alternative is appropriate for the reason stated above and in the statement of overriding considerations. LAFCo has been presented with no evidence to contradict its conclusion in this regard.

D. ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The Draft EIR concluded that the Expanded Preserves Alternative would be the environmentally superior alternative. Although this alternative does not reduce many of the identified significant and unavoidable impacts of the Project to a less-than-significant level, it does reduce the impacts on wetlands and on invertebrate species (vernal pool crustaceans) to a less than significant level with mitigation when compared to the proposed Project. The proposed Project's impacts on wetland loss and on invertebrate species are significant and unavoidable, even with mitigation. As a result, the LAFCo finds the Expanded Preserves Alternative to be the environmentally superior alternative.

XII. STATEMENT OF OVERRIDING CONSIDERATIONS

A. INTRODUCTION

As set forth in the preceding sections, LAFCo's approval of the Project will result in significant adverse impacts that cannot be substantially lessened or avoided even with the adoption of all feasible mitigation measures or Project alternatives. Despite these impacts, however, LAFCo chooses to approve the Project because, in its view, the economic, social, and other benefits that the Project will produce will render the significant effects acceptable. To do so, LAFCo must first adopt this Statement of Overriding Considerations. (Pub. Resources Code Section 21081; CEQA Guidelines, Section 15093.)

LAFCo recognizes that approval of the Project will result in significant adverse environmental impacts on: aesthetics; air quality; biological resources; climate change; land use; noise; public utilities; and traffic and circulation that cannot be avoided or reduced to a less-than-significant level even with the adoption of all feasible mitigation measures. In LAFCo's judgment and acting pursuant to Section 15093 of the CEQA Guidelines, LAFCo finds that the project and its benefits outweigh its unavoidable significant effects.

The following statement identifies the reasons why, in LAFCo's judgment, the benefits of the Project as approved outweigh its unavoidable significant effects and remaining residual impacts. The EIR described certain environmental impacts that cannot be avoided if the Project is implemented. In addition, the EIR described certain impacts that, although substantially mitigated or lessened, are potentially not mitigated to a point of being less than significant.

This Statement of Overriding Considerations applies specifically to those impacts found to be significant and unavoidable, as well as to any residual impacts. Such significant impacts include, but are not limited to:

- Aesthetics: Degradation of existing views and visual quality.
- Aesthetics: New source of light or glare.
- Air Quality: Operational emissions of ozone precursors.
- Air Quality: Construction activities would increase particulate matter emissions.
- Air Quality: Conflict with or obstruct air quality plans.
- Biological Resources: Wetlands and surface waters.
- Biological Resources: Special status species – invertebrates

- Climate Change: Given the substantial emissions which will result from the Project and the uncertainties related to target-setting and the current state of modeling this analysis concludes that Project impacts may remain significant.
- Land Use: Conflict with the SACOG Blueprint and General Plan Policy.
- Noise: Substantial increase in existing ambient noise.
- Public Utilities: Construction impacts.
- Traffic and Circulation: Existing Plus Project. The project results in significant impacts to six County intersections, ten City of Rancho Cordova intersections, one City of Folsom intersection, one City of Folsom intersection, the Zinfandel and US 50 freeway ramp intersection, two County roadway segments, one City of Elk Grove roadway segment, eleven City of Rancho Cordova roadway segments, two US 50 freeway segments, and bicycle and pedestrian facilities.
- Traffic and Circulation: Cumulative Plus Project. The Project results in significant impacts to five City of Rancho Cordova intersections, the Zinfandel and US 50 freeway ramp intersection, one new Project roadway segment, four City of Rancho roadway segments, six Caltrans freeway segments, and four Caltrans freeway ramps.

In addition to the above impacts, this Statement of Overriding Considerations applies to any residual impacts that have been substantially lessened or avoided, but not necessarily to a level of less than significant.

LAFCo believes that many of the unavoidable and irreversible environmental effects, as well as many of the environmental effects which have not been mitigated to a less than significant level, will be substantially reduced by the mitigation measures for the Project. LAFCo recognizes that the implementation of the Project will result in certain potentially irreversible environmental effects.

In reaching LAFCo's decision to approve the Project and all related documentation, LAFCo has carefully considered each of the unavoidable impacts, each of the impacts that have not been substantially mitigated to a less than significant level, as well as each of the residual impacts over which there is a dispute concerning the impact's significance after mitigation. Notwithstanding the identification and analysis of impacts which are identified as significant and unavoidable, LAFCo, acting consistent with Section 15093 of the CEQA Guidelines, hereby determines that the benefits of the Project outweigh the unavoidable adverse impacts and remaining residual impacts, and that the Project should be approved.

The following statement identifies the reasons why, in LAFCo's judgment, the benefits of the Project as approved outweigh its significant and unavoidable effects. Any one of the reasons for approval cited below is sufficient to justify approval of the Project. Thus, even if a Court were to conclude that not every reason is supported by substantial evidence, LAFCo will stand by its determination that each individual reason is sufficient. The substantial evidence supporting the various benefits can be found in the preceding findings, which are incorporated by reference into this Section, and in the documents found in the Record of Proceedings.

B. SPECIFIC FINDINGS.

1. The Project's Benefits Outweigh Unavoidable Impacts. The remaining unavoidable and irreversible impacts of the Project are acceptable in light of the economic, fiscal, social, public

safety, environmental, land use, and other considerations set forth herein because LAFCo finds that the benefits of the Project outweigh any significant and unavoidable or irreversible adverse environmental impacts of the Project, as well as outweighing any residual impacts over which a controversy exists concerning the impacts' significance following mitigation.

| 2. Rejected or Deleted Mitigation Measures. Any of the mitigation measures that were suggested in the DEIR and FEIR but not incorporated into the Project due to their infeasibility are infeasible in part because such measures would impose limitations and restrictions on the Project so as to prohibit the attainment of economic, social, and other benefits of the Project which LAFCo finds outweigh the unmitigated impacts of the Project. In addition, several proposed mitigation measures were deleted because the suggested roadway/intersection improvements had already been constructed by others or the proposed roadway/intersection improvements were determined not to be necessary in light of other nearby improvements built by others.

| As a result of comments received during the public hearing on the Project concerning its potential air quality impacts and ability to achieve a 35% reduction in those impacts, the Applicant has amended the Project's AQMP. The County and SMAQMD have worked together to reach a consensus on additional feasible mitigation to reduce the Project's operational air quality impacts and have determined that the additional mitigation is equivalent or more effective at reducing those air quality impacts. As a result, SMAQMD provided a verification of the Amended AQMP on January 17, 2013. The Amended AQMP has added the following new feasible mitigation requirements, in addition to those found in the original endorsed AQMP:

- | • The Project will provide low-emission furnaces and electrical outlets for appliances. (SMAQMD 99C)
- | • The Project will exceed the Year 2013 Title 24 requirements by 20%, and will include energy star cool roofs and tankless water heaters. (SMAQMD 99D)
- | • The Project will provide on-site renewable energy systems for at least 20% of the Project's energy needs. (SMAQMD 99E)

| In regard to rejected mitigation measures, LAFCo finds that the Conditions of Approval Numbers 40 through 85 relating to traffic and circulation improvements (listed beginning on page 50 of these Findings) to be constructed or funded by the Applicants and/or their successors are necessary to implement proposed Mitigation Measures TR-1 through TR-9 and TR-11 in the EIR; these measures have not been rejected or modified (except as described in paragraphs which follow) but will be implemented via the Conditions of Approval. LAFCo has determined that the Conditions of Approval are more specific and better designed to implement the roadway improvements needed to mitigate for the identified transportation and circulation impacts described in the EIR.

| Mitigation Measure TR-1.E. was modified and replaced with Condition of Approval 60 because a portion of the required roadway/intersection improvement is currently being constructed by the County as part of the County's White Rock Road Improvement Project. TR-1.E would have required the Applicant to install two eastbound left turn lanes. That portion of the mitigation measure has been deleted, since the dual eastbound left turn lanes are being constructed by the County.

| Mitigation Measure TR-1.F. was deleted in its entirety because the County also is currently making the proposed roadway/intersection improvements to the intersection of White Rock Road and

Prairie City Road as part of the County's White Rock Road Improvement Project. Consequently, this mitigation measure is no longer required and was deleted.

Implementation of the specific lane modifications to the Sunrise Boulevard and Jackson Highway (State Route 16) intersection recommended by Mitigation Measure TR-2.D. have been revised, as reflected in Condition of Approval No. 61. The reasoning for the change was dual: the Board desired a measure which would succeed in reducing the impact while also improving the north-south flow conditions at this intersection (though not necessary due to a Project impact) and because Measure TR-2.D. would have required more extensive roadway work. County DOT performed further analysis of the mitigation measure and found that there was an alternative reconfiguration which would reduce the amount of reconstruction needed, which would improve north-south flow, and would also result in an equivalent LOS as measure TR-2.D. The revised lane reconfigurations consist of the following: two eastbound through lanes, an eastbound right turn lane, and an eastbound left turn lane; a northbound left turn lane, two northbound through lanes and a northbound right turn lane; a westbound through lane, a westbound right turn lane and a westbound left turn lane; a southbound through lane, a southbound left turn lane, and a southbound right turn lane. The threshold for construction of the above intersection improvements has also been changed by Condition of Approval No. 61 to require them at 500 DUEs, instead of at 3,200 DUEs.

Mitigation Measure TR-5.H. was deleted in its entirety because the widening of Douglas Road to a four lane arterial between Sunrise Boulevard and Rancho Cordova Parkway has already been completed by others, so there is no need for the Project to contribute funding for the construction of this roadway segment.

Mitigation Measure TR-1.B. also has been deleted in its entirety because the roadway/intersection improvements proposed in the EIR at Douglas Road and Mather Boulevard subsequently were determined by the County Department of Transportation to no longer be necessary due to other traffic improvements built at the Douglas Road and Zinfandel Drive intersection, as described in the FEIR.

Some mitigation measures were rejected or their implementation revised because they sought to implement a level of service ("LOS") on roadways or intersections shared with an adjacent jurisdiction, or entirely within an adjacent jurisdiction, that conflicted with and was more stringent than the County's policy of maintaining a LOS "E" on roadways and intersections in urban areas. For policy reasons, as well as for economic ones, the County has declined to apply a LOS standard established by a neighboring jurisdiction that was in direct conflict with the County's own policies and standards. LAFCo finds that use of a more stringent level of service standard from another jurisdiction would impede the achievement of the Project's goals and objectives and interfere with the County's inherent police power and discretion to control land use decisions within the County's jurisdiction. County General Plan Policy CI-9 provides that the County should:

"Plan and design the roadway system in a manner that meets Level of Service (LOS) D on rural roadways and LOS E on urban roadways, unless it is infeasible to implement project alternatives or mitigation measures that would achieve LOS D on rural roadways or LOS E on urban roadways. The urban areas are those areas within the Urban Service Boundary as shown on the Land Use Element of the Sacramento County General Plan. The areas outside the Urban Service Boundary are considered rural."

In addition, the County General Plan contains Policy LU-65 that specifies:

“Level of service shall be consistent with policies in this Plan, or where none are applicable, shall use Federal and State environmental standards and commonly accepted industry norms and standards as guidelines.”

For those reasons, the County has rejected proposed mitigation measures in the EIR that were based on maintaining LOS “D” on roads shared with another jurisdiction which conflicted with the County’s own policy of maintaining an LOS “E” standard for urban roadways. However, in order to ameliorate the decline in the level of service on such shared roadways, the triggers for commencement of the required roadway improvements have been adjusted so that they fall between an LOS D and LOS E threshold.

In a related vein, LAFCo has also found it infeasible to require the implementation of proposed mitigation measures that would have required the Applicants and/or their successors to construct many substantial improvements to Grant Line Road without there being any reasonable expectation of receiving a reimbursement for those construction costs that exceeded the Project’s fair share of the Grant Line Road improvements. LAFCo finds that other developments in adjacent jurisdictions not only benefit from those roadway improvements, but also trigger the need for such improvements. Instead of requiring the Applicants to build such physical improvements in another jurisdiction, LAFCo finds that it is more feasible to simply require the Project to pay its fair share of the cost to construct the Grant Line Road improvements or to construct only Grant Line Road improvements situated within the boundary of the County.

3. Balance of Competing Goals. LAFCo finds that it is imperative to balance competing goals of protecting the environment while allowing new economic development to take place in approving the Project and certifying the EIR for the Project. Not every policy or environmental concern has been fully satisfied because of the need to satisfy competing concerns to a certain extent. Accordingly, in some instances LAFCo has chosen to accept certain environmental impacts because to eliminate them would unduly compromise some other important economic, social, environmental or other goals, such as providing a site designated for future university/college campus uses, encouraging people to walk or bicycle, promoting a new community that is designed for the use of neighborhood electric vehicles (NEVs) from the very outset. LAFCo further finds and determines that the design of the Project provides for a positive balance of competing goals and that the economic, fiscal, social, environmental, land use and other benefits to be provided by the Project outweigh any environmental and related potential detriment from the Project.

C. OVERRIDING CONSIDERATIONS.

Based upon the above enumerated objectives and the comprehensive vision developed by the County through extensive public participation, LAFCo has determined that the Project should be approved and that any remaining unmitigated environmental impacts attributable to the Project are outweighed by the following specific economic, fiscal, social, environmental, land use and other overriding considerations.

1. Economic Considerations.

LAFCo finds that substantial evidence is included in the administrative record demonstrating the economic benefits that the County would derive from implementation of the Project, including, but not limited to the following:

- LAFCo finds that employment opportunities within the County will be provided at the Project by creating construction jobs and jobs at the regional retail/commercial uses, neighborhood-serving retail uses, business-professional office uses, research and development uses, public service facilities and university/college campus center. LAFCo further finds that at build-out, the Project is estimated to provide a total of 6,669 new jobs.
- LAFCo finds that the Project's 223-acre university/college campus area provides the opportunity to attract a major employer of highly trained and educated workers such as university professors, school administrators, researchers and teaching assistants. LAFCo finds that there is demand for such an institution in California, and in the Sacramento region. In making this finding, LAFCo has determined that it is beneficial to have land already designated in a manner compatible with the use being sought; the need to go through a lengthy entitlement and permit process before construction can begin can be an important deterrent for major employers of this kind. Thus, the Project will attract and incentivize a higher-learning institution.
- LAFCo finds that the 966,779 sq.ft. of commercial uses proposed at the Town Center area of the Project have the potential to generate substantial sales tax revenue for the County that can be used to support numerous important County public safety and health services and programs. LAFCo further finds that the Project represents a significant capital investment in the County and will generate substantial property tax revenue. In addition, LAFCo finds that businesses locating in the Project will provide substantial employment opportunities in a variety of jobs in the retail, office and educational environments, and that such employment provides steady income, thus supporting other businesses and provides stable employment and income that in turn enhances the local economy.

2. Environmental, Educational and Land Use Considerations.

Substantial evidence is included in the record that the implementation of the Project will have beneficial as well as potential adverse impacts relating to environmental and land use considerations. In reaching that conclusion, the Board has relied upon the following factors:

- LAFCo finds that the Project is within an area that has already been designated as being within a future urban development area, because the Project is within the Urban Services Boundary (with the exception of the 251 acres known as the "bufferlands" and the agricultural/floodplain areas along the eastern boundary, which will remain in agricultural zoning). The Urban Services Boundary of the County General Plan defines the limits of future urban development, and was first established in 1993. LAFCo further finds that Project is located immediately adjacent to the City of Rancho Cordova and to areas within the City that are approved for development and in which development is now taking place.

- The Board has found as part of the adopted Sacramento County General Plan that future development should include a variety of housing types, have a pedestrian- and transit-oriented design, and be higher density (minimum 7 or 9.3 homes to the acre, depending on the methodology), as established through Policy LU-121. It is recognized that these goals compete with the goal to preserve habitat. LAFCo finds that the Project has achieved a reasonable balance between these competing goals. Specifically, the project has provided the desired designs as follows:
 - LAFCo finds that the Project provides the County with a high quality mixed use community containing a variety of housing types, a 223+ acre site designated for a university/college campus center, school sites, a 50-acre sports park, community parks, large retail and commercial centers, and neighborhood-serving retail uses on vacant property located in the southeastern area of the County that meets current and future needs for those types of land uses in the County.
 - LAFCo finds that the Project is consistent with the County General Plan Policies LU-21 and LU-22 because of the Project's balance of employment, neighborhood services and housing types. LAFCo further finds that the Project complies with Policy LU-23 by providing a compact and mixed use development in a new growth area. The Cordova Hills SPA Ordinance provides a commercial-flex zone with mixed use residential and commercial uses in certain areas, thereby promoting home-work and small business activities and avoiding additional commute trips.
 - LAFCo finds that the Project, through implementation of the SPA Ordinance and the Cordova Hills Master Plan's Design Guidelines and Development Standards, incorporates strong architectural and design features that are compatible with adjacent land uses, while providing a unique identity for the Project as a whole.
 - LAFCo finds that the Project's 223-acre site for a campus of higher education benefits the County by addressing both regional and state-wide current and long-term deficiencies in local options for students seeking a college education.
 - LAFCo finds that the Project's 223-acre university/college center site implements County General Plan Policy ED-68 by serving to attract "additional institutions of higher education to Sacramento County." In addition, the Project supports the continued integration of regional institutions of higher education into the local and regional economies, as set forth in General Plan Policy ED-69.
 - LAFCo finds that the Project accommodates a mix of new and traditional housing types ranging from single-family to multi-family to high-density residential units in order to serve all income levels.
 - LAFCo finds that the Project provides for the long-term preservation of the Urban Services Boundary by recording a deed restriction precluding urban development along the eastern boundary within the Project site, and by securing a conservation easement on off-site land to the east of the Project (known as the East Carson Creek property).

While achieving the above desired designs, LAFCo also finds the following:

- LAFCo finds that the Project creates approximately 538 acres of open space and avoidance areas, which is 20 percent of the land within the approximately 2,669-acre Project site. The Project preserves 56 percent of the wetlands on the site and preserves 67 percent of its vernal pool acreage, and preserves the most sensitive vernal pool areas.

The open space areas at the Project connect with existing and proposed open space areas outside the boundaries of the Project to the north, east and south.

- LAFCo finds that the Project provides for large, contiguous habitat conservation with its avoidance and preserve areas that total approximately 538 acres at the Project. Those areas assist the County with successfully designing and implementing the South Sacramento Habitat Conservation Plan.
- LAFCo finds that the Project's design will provide neighborhood serving retail uses that reduce the length and number of vehicle trips and the resulting global climate change impacts when compared to a "business-as-usual" development in this same location, and has included all feasible mitigation in this regard.
- LAFCo finds that the Cordova Hills SPA Ordinance is a plan for sustainable, greenfield planning and development through its enhanced environmental designs. Examples include the potential solar farm within the Project area's "bufferlands" and a commitment that 20 percent of all electricity required by the Project area will come from renewable onsite energy sources.
- LAFCo finds that the Project conserves energy and reduces GHG emissions by requiring all commercial and residential development to achieve a 20 percent energy efficiency above that required by the 2013 Title 24 energy efficiency regulations.
- LAFCo finds that the Project's land use pattern integrates a multi-modal circulation system with a trail network, a locally funded transit system that connects to the regional transit network with an internal transit loop, and contains a street system that serves the requirements of neighborhood electric vehicles (NEVs). All of these features reduce the production of greenhouse gases and reduce the use of fossil fueled motor automobiles for short trips at the Project compared to a conventional community in the Sacramento region. There will be no need for the County to retrofit or modify the Project's roadway system in order to allow the use of NEVs or incorporate a transit system within the Project area. The Board further finds that the above features meet the goals in General Plan Policy LU-27 to provide safe, interesting and convenient environments for pedestrians and bicyclists; Policy LU-37 to provide support and the development of pedestrian and bicycle connections between transit stations and nearby uses; Policy LU-39 to implement the ADA Transitional Plan and Pedestrian Master Plan; Policy CI-3 to interconnect travel modes and form an integrated, coordinated and balanced multi-modal transportation system consistent with the land uses being served; Policy CI-4 to provide multiple transportation choices to link housing, recreational, employment, commercial, educational, and social services; Policy CI-32 to provide a comprehensive, safe, convenient and accessible bicycle and pedestrian system; Policy AQ-1 that requires new development to be designed to promote pedestrian/bicycle access and circulation; and Policy CI-34 to construct and maintain bikeways and multi-use trails to minimize conflicts between bicyclists, pedestrians and motorists.
- LAFCo finds that the Project's design reduces its climate change impacts, when compared to a "business-as-usual" development, by promoting pedestrian uses, providing retail and residential uses adjacent to employment opportunities, by requiring the planting of numerous trees along the Project's roadways, trails, paseos and parking areas, and by providing a fully Project-funded internal transit shuttle bus system that will reduce vehicle miles travelled and motor vehicle emissions. LAFCo further finds that the Project contains a pedestrian and bike trail loop system with off-road and on-road routes

that link the homes with recreation areas, open space areas, shopping areas and the university/college campus facilities, resulting in reduced VMTs and automobile use.

- LAFCo finds that the Project's dedicated neighborhood electric vehicle (NEV) lanes on the Project's internal streets promote and encourage the use of NEVs as an environmentally sound alternative to the use of the automobile for destinations within the Project site.
- LAFCo finds that the Project's transportation system includes an internal transit system loop that also connects outside of the Project area to the Highway 50 corridor, including Regional Transit's bus and light rail facilities at the Mather/Mills light rail station and thereby promotes the use of public transit instead of the automobile.
- LAFCo finds that the Project creates a safe and efficient network of inter-connected streets with public bike and pedestrian trails. The Project contains approximately 27.6 miles of Community Class II on-street bicycle paths and approximately 27.8 miles of off-street trails and 20 miles of paseos for a total of 75 miles of trails, paseos, and class II bicycle paths that result in enhanced walkability because no home will be more than ¼ mile from one of the trails, paths, or other open space.
- LAFCo finds that the Project provides a total of approximately 75 miles of trails, bike lanes and paseos, and is required to dedicate a trail easement to the County for an off-site connection to a potential future County-wide trail system.
- LAFCo finds that the Project's transit system and its connection to Regional Transit's light rail system implements County General Plan Policy CI-26 by expanding neighborhood shuttle services in unincorporated areas and implements Policy CI-30 by collaborating with transit service providers to promote phased implementation of transit services to all growth areas as development occurs.
- LAFCo finds that the Project benefits the County by providing land at no cost to the County with an irrevocable offer of dedication in order to accommodate traffic improvements along Grant Line Road outlined in the current County General Plan, as well as provide land needed by the County for a potential future expansion of Grant Line Road as a limited access expressway.
- LAFCo finds that while the Project has substantial impacts related to transportation, air quality and climate change, those impacts are not due to any significant conflicts with the County's General Plan.

Based upon the above land use and environmental considerations, LAFCo has determined that any environmental detriment caused by the Project has been minimized to the extent feasible. Where not feasible, the environmental detriment is outweighed and counterbalanced by the significant economic, fiscal, educational, environmental and land use benefits to be generated for the County.

3. Other Related Overriding Considerations.

In addition to the economic, environmental, educational, and land use considerations identified above, LAFCo has considered various factors in arriving at its decision to approve the Project. Although economic, fiscal, environmental, educational, and land use benefits to be derived by the County are the primary reasons for LAFCo's decision to approve the Project, other factors have been considered by the County in the planning process and add to the benefits of the Project when weighed against any unavoidable environmental impacts identified in the EIR. Among these factors

include the prospect of creating a development plan with substantial open space for vacant, underutilized land which will serve as a model for future environmentally sensitive development.

CONCLUSION

~~LAFCo finds that it is imperative to balance competing goals in approving the Project and the remaining environmental impacts resulting from the Project. Not every policy or environmental concern has been fully satisfied because of the need to satisfy competing concerns to a certain extent. Accordingly, in some instances LAFCo has chosen to accept certain environmental impacts because to eliminate them would unduly compromise some other important economic, social, environmental, educational or other goal. LAFCo finds and determines that the Project and the supporting environmental documentation provide for a positive balance of the competing goals and that the economic, fiscal, social, environmental, educational and other benefits to be obtained by the Project outweigh any environmental and related potential detriments from the Project.~~

~~Any remaining significant effects on the environment attributable to the Project that are found to be unavoidable, irreversible or not substantially mitigated to a less than significant level are acceptable due to the overriding considerations set forth above. LAFCo has concluded that with all the environmental trade-offs of the Project taken into account, the Project's implementation will represent a net positive impact on the County, and based upon such considerations after a comprehensive analysis of all the underlying planning and environmental documentation, LAFCo has approved the Project.~~

LAFCo hereby approves and adopts the foregoing CEQA Findings and Statement of Overriding Considerations for the Project.

Date: _____, 2013

By: _____

RESOLUTION NO. LAFC 2013-06-0807-02-13

THE SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

***MAKING DETERMINATIONS FOR THE MUNICIPAL SERVICES REVIEW AND
APPROVING THE ESTABLISHMENT OF THE SPHERE OF INFLUENCE FOR
COUNTY SERVICE AREA No. 13 (LAFC 02-13)***

WHEREAS, the Sacramento Local Agency Formation Commission (“Commission” or “LAFCo”) is the sole entity authorized to approve a Sphere of Influence pursuant to the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000;

WHEREAS, pursuant to Government Code section 56425(a), in order to carry out its purposes and responsibilities for planning and shaping the logical and orderly development and coordination of local governmental agencies so as to advantageously provide for the present and future needs of the county and its communities, the Commission shall develop and determine the Sphere of Influence of each local governmental agency within the county;

WHEREAS, the Commission is required to update the Sphere of Influence for each local government agency within the county every five years, as necessary;

WHEREAS, in determining the Sphere of Influence of each local governmental agency, the Commission shall consider and prepare a written statement of its determinations with respect to its approval of the Sphere of Influence;

WHEREAS, on June 18, 2013 the County of Sacramento (COUNTY) submitted an application to the Commission requesting the Formation of County Service Area No. 13 and Detachment from County Service Area No. 4B for the Cordova Hills Development Project;

WHEREAS, the landowners of the Cordova Hills Development Project also submitted a petition to annex Sacramento Regional County Sanitation District and Sacramento Area Sewer District into the boundaries of the Cordova Hills Development Project;

WHEREAS, LAFCo is required to complete a Municipal Service Review and establish a Sphere of Influence prior to formation and/or annexations;

WHEREAS, the County of Sacramento was the Lead Agency under CEQA to prepare an Environmental Impact Report for the Cordova Hills Development Project. LAFCo is a Responsible Agency;

WHEREAS, the County of Sacramento certified the EIR, prepared Statement of Facts and Overriding Considerations, and adopted a Mitigation, Monitoring, and Reporting Program as required by CEQA;

WHEREAS, the Commission held a noticed public meeting on August 7, 2013, to receive public comments, and consider the Executive’s Officer Report;

WHEREAS, a Municipal Services Review (“MSR”), the Cordova Hills Special Planning Area Urban Services and Governance Plan, and Public Facilities Financing Plan was prepared and submitted by the County/landowner on March, 2013 as part of the Cordova Hills Development Project;

WHEREAS, the Commission discussed the Municipal Service Review, SOI, and Final EIR during its meeting on August 7, 2013, and heard public comments on the SOI, Municipal Service Review, and Final EIR;

WHEREAS, the Commission has, by means of Resolution No. LAFC 2013-05-0807-02-13, concurrently considered and determined that the Final EIR has been prepared in full compliance with the terms of the California Environmental Quality Act (“CEQA”);

WHEREAS, the Commission has, by means of Resolution No. LAFC 2013-05-0807-02-13 approved the Findings of Fact and Statement of Overriding Considerations as a Responsible Agency in accordance with CEQA;

WHEREAS, the Commission has undertaken a comprehensive analysis of the Cordova Hills’ CSA No.13 SOI establishment;

WHEREAS, the SOI evaluation and review process involved public participation and public hearings at which both written and oral comments were received from concerned citizens;

WHEREAS, local jurisdictions, community groups, businesses, and other interested parties were able to provide testimony throughout the planning and evaluation process;

WHEREAS, public agencies have reviewed and commented upon the SOI, MSR, and Final EIR;

NOW, THEREFORE, THE SACRAMENTO LOCAL AGENCY FORMATION COMMISSION does hereby find, determine, resolve and order as follows:

1. Notice as required by law has been given.
2. The boundaries of the SOI for County Service Area No. 13 are represented in Exhibit “A” attached hereto and incorporated herein. The SOI boundary is coterminous with the CSA No. 13 service boundary, the attached map and legal description set forth the boundary;
3. The SOI for CSA No. 13 as set forth in the respective applications is approved.
4. The Commission concurrently adopts Resolution No. LAFC 2013-05-0807-02-13, adopting Findings of Fact and a Statement of Overriding Considerations as required by CEQA;
5. Surrounding land uses include agriculture to the north and east, and urban, commercial, and residential uses to west within the City of Rancho Cordova;
6. The Commission determines that the proposed SOI is consistent with the Commission’s purpose and responsibility for planning, shaping and coordinating the logical and

orderly development of local governmental agencies so as to advantageously provide for the present and future needs of the county and its communities. In making this determination, the Commission has considered:

- a. The Executive Officer's report;
- b. The MSR and Public Facilities Financing Plan and Cordova Hills Special Planning Area Urban Services and Governance Plan, dated March, 2013;
- c. The Final EIR and Mitigation and Monitoring Plan prepared and certified by the County of Sacramento;
- d. All oral and written public comments; and
- e. Public agency comments, staff reports and other pertinent information in the Commission's Record of Proceedings, as defined in the Findings of Fact and Statement of Overriding Considerations adopted concurrently herewith.

7. The Commission makes the following determinations and findings in approving the SOI. The Commission considered the policies set forth in Government Code section 56425. Pursuant to Government Code section 56425, and based upon the entire record, the Commission makes the following determinations:

The Present and Planned Land Uses in the Area, Including Agricultural and Open-Space Lands

The Cordova Hills Development Project is currently undeveloped. The County of Sacramento has adopted a land use plan that includes residential, commercial, and a proposed university that contains approximately 2,669 acres in the eastern portion of the unincorporated county.

The service area proposed for the CSA No. 13 is coterminous with the boundary of the Project. If, at some time in the future, the Project area is amended to include additional territory, then an SOI boundary change must be considered, before any related annexation could be approved.

Currently, there are minimal services being provided to this area. The proposed County Service Area No. 13, together with existing special districts, and the County of Sacramento will provide urban and municipal services needed for development of this project.

The Cordova Hills Special Planning Area (Cordova Hills or Project) is located in the unincorporated area of Sacramento County on 2,668 acres just east of the approved Sunridge Specific Plan and the proposed Suncreek Specific Plan in the City of Rancho Cordova bordered to the west by Grant Line Road, to the north by Glory Lane (about one-third mile south of Douglas Road), and to the east by Carson Creek. The Kiefer Landfill and its associated buffer lands are southwest of the Project, and the required buffer lands extend into the southwest portion of Cordova Hills. Planned development in Cordova

Hills consists of a maximum of 8,000 residential units on approximately 1,089 acres, and approximately 103 acres of commercial and office development

The Project will include a mix of uses consisting of residential, office, retail, university/college campus center, schools, parks, trails, open space, and public uses. The Project includes six distinct villages, the proposed university/college campus center, a large preservation (avoided) area, and other permanent open space that serves to separate villages. The Project includes a wide mix of residential uses, from high-density residential along the western edge, to low-density residential along the eastern edge. The majority of the commercial development is planned for the Town Center Village in the western part of the Project adjacent to Grant Line Road. A 223-acre university/college campus center is planned just southeast of the Town Center. The land uses and estimated development, population, and employees in this report are obtained from the Public Review Final Cordova Hills Public Facilities Financing Plan (Financing Plan).

The Present and Probable Need for Public Facilities and Services in the Area

a. The SOI is a plan for the CSA No. 13 future probable physical and service area boundaries for the Cordova Hills Development project. The SOI may be subject to terms and conditions imposed by the Commission to ensure orderly and planned growth is tempered by the need to preserve open space, habitat for species and agricultural land. No objections to the SOI have been raised by affected agencies, jurisdictions, or the public.

The CSA would be authorized to provide the following services:

- b. Parks and recreation.
- c. Open space and trails.
- d. Habitat operations and maintenance.
- e. Enhanced levels of landscaping.
- f. Supplemental road maintenance.
- g. Transit operations and maintenance.
- h. Transportation systems management.
- i. Administration and community communications.
- j. Solid Waste.

The Final EIR identifies the probable impacts that may occur from future development based on the proposed land use designations. The Commission has considered the EIR as a Responsible Agency and adopted Statement of Facts and Overriding considerations in accordance with CEQA;

The SOI is consistent with County General Plan and the Cordova Hills Development Plan approved by the County of Sacramento;

The SOI does not split parcels and does not create any areas that are difficult to serve. This finding is based on the Record of Proceedings, the Boundary Map, and the Executive Officer's report.

The SOI does not pose a threat to public health and safety. This finding is based on the Record of Proceedings, the Boundary Map, the Executive Officer's report, the Final EIR, and the MSR.

The Present Capacity of Public Facilities and Adequacy of Public Services Which the Agency Provides or is Authorized to Provide

The SOI will not result in significant unmitigable adverse effects upon other service recipients or other agencies serving the affected area. This finding is based on the Record of Proceedings, the MSR, and the comments of affected agencies. The Commission is required to consider the EIR as a Responsible Agency and has adopted Statements of Fact and Overriding Considerations.

Currently, the County and affected Special Districts have the capacity to provide public services to area residents and commercial/industrial customers.

At this time, minimal services are provided to this area because of its rural character.

The Existence of any Social or Economic Communities of Interest in the Area

The territory within the SOI area is mostly rural and agricultural and has economic and social communities of interest similar to the existing characteristics of the County.

In many cases the territory within the SOI area directly benefits from the services provided by the County and indirectly benefits from the County's economic and social community, such as businesses, social clubs, recreational activities, churches, and other community organizations.

The County and landowner have provided information and data in the MSR concluding that development will not adversely affect adjacent communities of interest.

The SOI does not divide any existing communities or other areas having identifiable social and economic homogeneity.

FURTHERMORE, the Commission makes the following determinations and findings in approving the SOI. The Commission considered its own Policies, Standards and Procedures, and based upon the entire record, the Commission makes the following determinations:

8. The SOI area to be added does not overlap the SOI of any other municipality.
9. The MSR for the SOI identifies types and adequacy of municipal services to be provided.
10. The MSR for the SOI identifies existing land uses and reasonable projection of land uses that may occur.

11. The MSR for the proposed SOI identifies existing and proposed facilities.

12. The County's projected population growth and development patterns indicate that the SOI Amendment will provide future economic development opportunities for the County and improve the jobs/housing balance.

13. The SOI Amendment area to be added, although currently largely agricultural lands, is in the logical path of urban development and adjacent to developing land within the City of Rancho Cordova, which promotes orderly growth and discourages sprawl.

FURTHERMORE, in accepting the MSR, the Commission has considered the policies set forth in Government Code section 56430. Pursuant to Government Code section 56430, the Commission finds and determines that:

14. The Executive Officer presented the MSR on August 7, 2013, to the Commission, and the Commission accepted it.

15. Growth and population projections for the SOI area have been provided by the affected entities, as set forth in the MSR and the Record of Proceedings.

16. The County has provided for its infrastructure needs and this determination is based upon the MSR, the Executive Officer's report, and the Record of Proceedings.

17. The County operates at an efficient level and utilizes cost avoidance opportunities when available, as demonstrated in the MSR and the Record of Proceedings.

18. The County's rates and fees are reasonable compared to other comparable cities and demonstrates efficient management of its rate structuring opportunities, as set forth in the MSR and the Record of Proceedings.

19. The County maximizes its opportunities to share facilities where possible, as set forth in the MSR and the Record of Proceedings.

20. The County's organizational structure allows for reorganization of service providers as demonstrated by the MSR and the Record of Proceedings.

21. Based upon its current fees, rates, and management structure, the County has demonstrated management efficiencies.

22. The County is governed by five locally elected Board of Supervisors members.

23. The MSR and supporting documents are current as it was submitted.

24. In the MSR, the County demonstrated a projected need for service based upon growth and population projections. The MSR is consistent with the County's development policies and its General Plan. These findings are based upon this Resolution, the Record of Proceedings, the Executive Officer's report, and the MSR.

25. The MSR includes determinations with respect to each of the following: (1) growth and population projections for the SOI Amendment area; (2) infrastructure needs or deficiencies; (3) financing constraints and opportunities; (4) cost avoidance opportunities; (5) opportunities for rate restructuring; (6) opportunities for shared facilities; (7) government structure options, including advantages and disadvantages of consolidation or reorganization of service providers; (8) evaluation of management efficiencies; and (9) local accountability and governance.

26. In the MSR, the Commission comprehensively reviewed all of the agencies that provide the identified service or services within the designated geographic area.

27. The MSR includes statements for each existing district specifying the functions or classes of services provided by those districts. The MSR also establishes the nature, location, and extent of any functions or classes of service provided by existing districts.

28. The County is the subject agency that will be the most logical and efficient provider of services to the SOI Amendment area. This finding is based the Record of Proceedings, the Executive Officer's report, and the MSR.

29. The MSR prepared by the County/landowner and the Commission includes an assessment of services and providers and states how providers will implement the proposed development contemplated by the proposed SOI. Through this analysis, the Commission concludes that there are no Spheres of Influence of overlapping jurisdictions.

30. The MSR concludes that adequate services, including water, wastewater, drainage and flood control, solid waste, circulation and roadways, fire protection, police services, animal control, code enforcement, parks and recreation, libraries, and electricity and natural gas will be provided within the timeframe needed by the inhabitants of the SOI area. A finance plan demonstrates that services will be phased in as development occurs.

31. Existing land use and a reasonable projection of land uses which would occur if services were provided consistent with the MSR.

32. Maps indicating existing and proposed facilities and the timing of proposed facilities are included in the MSR and Public Facilities Financing Plan.

33. The nature of each service to be provided is discussed in detail in the MSR and Public Facilities Financing Plan. It discusses how water, wastewater, drainage and flood control, solid waste, circulation and roadways, fire protection, police services, animal control, code enforcement, parks and recreation, libraries, and electricity and natural gas will be provided within the timeframe needed by the inhabitants of the SOI area.

34. The service level capacity to be provided is discussed in the MSR.

35. All actions, improvements, or construction necessary to reach required service levels, including costs and financing methods, is discussed in detail in the MSR and Public Facilities Financing Plan.

36. The Commission has reviewed and continued to have access to all district enabling legislation pertinent to the provision of services and annexations, including the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (Government Code §§ 56000 – 57550) and the Municipal Utilities District Act (Pub. Utilities Code §§ 11501 – 14403.5).

37. Based upon the conclusions in the MSR, the Record of Proceedings, and the Executive Officer's report, the Commission concludes that the County will be able to efficiently ensure reliable services at an acceptable cost to the new residents.

FURTHERMORE, the Commission makes the following determinations for the Municipal Service Review:

1. Infrastructure needs or deficiencies.

There is no infrastructure in Cordova Hills. Construction of the infrastructure will be controlled by the Project conditions of approval, the Development Agreement with the County, and the EIR. The infrastructure funding program is detailed in the Public Facilities Financing Plan. The CSA would be responsible for construction of park and recreation facilities and landscaping in the open space corridors and in certain streetscape areas outside the public ROW. This will include some signage, lighting, and transit support facilities including bus shelters and bus parking. These facilities may be funded by a variety of sources, including direct developer funding, development impact fees, and a Cordova Hills Mello-Roos CFD.

2. Growth and population projections for the affected area.

There is no present population within the boundaries of the Project area. The maximum build out population is estimated at 21,379.

3. Financing constraints and opportunity.

A Mello-Roos CFD special tax is planned to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes will be established to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes on undeveloped property would cover shortfalls in the early years until the tax base has grown to a sufficient level to fund needed services.

4. Cost avoidance opportunities.

The annual CSA budget would be evaluated by a County BOS appointed advisory committee to provide the highest level of service for the least cost. Because the CSA would be a new entity, it could implement many "best practices" techniques as it begins to provide services.

5. Rate restructuring.

Because the CSA would be a new special district, it would have the opportunity to set the appropriate rate structure to pay for the necessary services. The rate structure would have a built-in cost-of-living escalation factor.

6. Opportunities for shared cost.

The goals of the Project include partnerships with other public entities. The most likely arrangement would be shared park and recreation facilities with the EGUSD. Another opportunity may be a joint partnership with the SMFD and Regional Transit for a transit link.

7. Government structure options, including advantages and disadvantages of consolidation or reorganization.

The Urban Services and Governance Plan has been designed to minimize the need for new government organizations. Many of the services are planned to be provided by existing service providers.

The proposed services that would be provided by the CSA are more comprehensive than the authorized services for any other service provider. The CSA would be designed to be the community organizing vehicle that brings together all elements of the community. The communication, recreation, and transportation functions of the CSA would form the basis of the community network.

One advantage of a CSA is the efficiencies in the cost of providing the multiple services proposed. Where a multitude of single-purpose agencies would have administrative and other overhead costs associated with each agency, a CSA would have a single unified administration. Where a multitude of single purpose agencies would require individual employees with limited skill sets, the CSA would facilitate use of cross-trained, multifunctional personnel who can be allocated to diverse tasks efficiently. For example, park maintenance staff also could maintain the open space and trails network, signage, streetscape, and bus shelters. The cost savings because of efficiencies in administrative overhead, continuing use of maintenance equipment, and staffing flexibility is one of the chief attributes of a multi-service CSA. In addition, the creation of a locally controlled advisory Board could significantly rectify the limited representation that Cordova Hills' residents and businesses would have in other organizations that could provide a similar set of services.

8. Evaluation of management efficiencies.

As a new entity, the CSA would be designed to promote management efficiencies. It would be funded adequately through the levy of a special tax without burdening other special districts. The CSA would have the advantage of starting out with a highly efficient network communications system, which should produce substantial savings in day-to-day operations. The CSA services plan would provide the option of contracting out many of the maintenance functions, which could provide cost effective delivery of these services.

9. Local accountability and governance.

A CSA would be planned to start out as a dependent district governed ex-officio by the County BOS. It would be managed by a five-member advisory board of directors appointed by the County BOS. At some point in the future, the residents of Cordova Hills could decide to become an independent district and elect their own Board of Directors. Outreach would be provided by the communications services function of the CSA. The CSA would establish and operate a

communitywide intranet as the key component of a communications network that would distribute information about community activities and services and provide transportation management services such as ride-sharing bulletins, real-time bus location information, and transit system routing and schedules, as well as provide emergency information. Community meetings would be held in the CSA administrative building or other community meeting spaces.

BE IT FURTHER RESOLVED by the Commission that the Executive Officer:

38. Mail a certified copy of this Resolution to the affected governmental agencies whose boundaries are affected by the Resolution;

39. File a certified copy of this Resolution with the Clerk of the Board of Supervisors of the County of Sacramento; and

BE IT FURTHER RESOLVED that Resolution No. ***LAFC 2013-06-0807-02-13*** was adopted by the ***SACRAMENTO LOCAL AGENCY FORMATION COMMISSION***, on the ***7th day of August 2013***, by the following vote, to wit:

RESOLUTION NO. LAFC 2013-07-0807-02-13

THE SACRAMENTO LOCAL AGENCY FORMATION COMMISSION

***APPROVING THE FORMATION OF COUNTY SERVICE AREA NO. 13, DETACHMENT
FROM CSA No. 4B, ANNEXATION TO SACRAMENTO REGIONAL COUNTY
SANITATION DISTRICT AND SACRAMENTO AREA SEWER DISTRICT
(LAFC 02-13)***

WHEREAS, Sacramento County Resolution No. 2013-0386, Resolution of Application by the Board of Supervisors of the County of Sacramento Requesting the Sacramento Local Agency Formation Commission Commence Proceedings to Form a County Service Area and detachment of CSA No. 4B Wilton-Cosumnes Recreation and Park Area, adopted on the date of June 18, 2013, was received by the Executive Officer of this Commission, and the Executive Officer has examined said Resolution and has determined that said filing is sufficient; and

WHEREAS, the Executive Officer also received an application from landowners petitioning the Sacramento Local Agency Formation Commission to annex affected territory into Sacramento Regional County Sanitation District and Sacramento Area Sewer District.

WHEREAS, the Executive Officer has merged both applications into one project;

WHEREAS, the Commission has considered the merits of the proposal and held a Public Hearing on August 7, 2013 for this proposal;

NOW THEREFORE, the SACRAMENTO LOCAL AGENCY FORMATION COMMISSION HEREBY RESOLVES AND DETERMINES AS FOLLOWS:

1. The Commission adopted LAFC Resolution 2013-05-0807-02-13 as a Responsible Agency as required under CEQA. LAFCo considered, approves and adopts the CEQA Findings and Statement of Overriding Considerations adopted by the Lead Agency, the County of Sacramento.
2. The Commission approves the Formation of County Service Area No. 13 to provide the following miscellaneous extended services:
 - ✓ Parks and recreation
 - ✓ Open space and trails
 - ✓ Habitat
 - ✓ Enhanced levels of landscaping
 - ✓ Road maintenance
 - ✓ Transit
 - ✓ Transportation systems management
 - ✓ Community communications
 - ✓ Solid Waste

The Commission approves the Detachment from CSA No. 4B Wilton-Cosumnes Recreation and Park Area;

The Commission approves the annexation of subject territory into Sacramento Regional County Sanitation District; and

The Commission approves the annexation of subject territory into Sacramento Area Sewer District.

The Commission finds that the Reorganization proposal is consistent with the Commission's purposes and responsibility of providing efficient governmental services and encouraging the logical and orderly development of local governmental agencies so as to advantageously provide for the present and future needs of the County and its communities.

3. As approved, the proposed County Service Area No. 13, the detachment of CSA No. 4B, the annexation of Sacramento Regional County Sanitation District, and the annexation of Sacramento Area Sewer District is in conformity with the applicable General and Community Specific Plans adopted by the County Board of Supervisors.
4. The Commission hereby approves the Formation of County Service Area No. 13, the detachment of CSA No. 4B, the annexation of Sacramento Regional County Sanitation District, and the annexation of Sacramento Area Sewer District subject to the following terms and conditions:
 - a. The effective date of said formation will be upon the filing of the Certificate of Completion by the Executive Officer of the Sacramento Local Agency Formation Commission subject to landowner approval of assessments, charges, fees, or special taxes to fund services provided by CSA No. 13.
 - b. The name of the County Service Area shall be COUNTY SERVICE AREA No. 13, and it shall have the following miscellaneous extended services:
 - i. Recreation and Parks
 - ii. Open Space and Trails
 - iii. Habitat Operations and Maintenance
 - iv. Landscape Corridors
 - v. Road Maintenance
 - vi. Transit Operations and Maintenance
 - vii. Transportation Demand Management
 - viii. Administration and Communications
 - ix. Solid Waste
 - c. The service boundary of the CSA No. 13 is set forth in the attached legal description.
 - d. Formation is dependent upon the landowner voter adoption of assessments, fees, charges and any Special Taxes as provided under Proposition 218 to fund services to be provided by CSA No. 13.

7. Adopt a Sphere of Influence for County Service Area No. 13 which is coterminous with the CSA No. 13 boundary.
8. Pursuant to provisions of the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, your Commission may waive the Conducting Authority Hearing (protest hearings) since it is uninhabited and there is 100 percent landowner consent and no agency protest has been received.
9. Order the formation of CSA No. 13 subject to approval by the voters of a Special Tax, the approval by the property owners of a Benefit Assessment, or the approval of property related fees or charges, as required by law. The County Board of Supervisors shall conduct the necessary election(s).
10. Authorize your Chair to sign the Resolution making these determinations.

BE IT FURTHER RESOLVED that Resolution No. ***LAFC 2013-07-0807-02-13*** was adopted by the ***SACRAMENTO LOCAL AGENCY FORMATION COMMISSION***, on the ***7th day of August 2013***, by the following vote, to wit:

1. INTRODUCTION AND SUMMARY

This Urban Services and Governance Plan (Urban Services Plan) provides a description of the urban services that will be required to serve the Cordova Hills Community, along with how and by whom these services will be provided. This plan is consistent with the policies and programs included in the Cordova Hills Master Plan, the public services analysis contained in the Cordova Hills Draft Environmental Impact Report (EIR), and service cost and revenue information contained in the Cordova Hills Fiscal Analysis. Going forward, the Urban Services and Governance Plan will provide a framework for extending or creating the urban services needed as the Cordova Hills Community is developed and grows and matures in the coming years. As a framework document, it is likely that what actually develops over time may vary from what is reflected herein, while remaining consistent with the overarching policies, plans, and agreements establishing the Cordova Hills Community.

A key aspect of this process will be the formation of a County Service Area (CSA) or Community Services District (CSD) to serve the Cordova Hills Community. It is expected that, following consideration of the entitlement documents by the Sacramento County (County) Board of Supervisors (BOS), application will be made to the Sacramento Local Agency Formation Commission (LAFCo) regarding CSA or CSD formation. The Urban Services and Governance Plan contains information needed to support this LAFCo application and the related technical studies that will be required, including completion of a Plan for Services, creation of a coterminous sphere of influence for the CSA or CSD, and other documentation deemed appropriate by the LAFCo Executive Officer.

Throughout this document, these two governance options will be collectively referred to as the Cordova Hills Local Services District (CHLSD). The CHLSD means the government arrangement used to provide the municipal services to the Cordova Hills Community. The CHLSD could be either a CSA formed pursuant to the County Service Area Law contained in Government Code Sections 25210 et. seq., a CSD formed pursuant to the Community Services District Law found in Government Code Sections 61000, et. seq., a combination of both, or some other governance structure to the mutual satisfaction of property owners and the County.

During the Project approval hearings, it was determined that the governance structure for the CHLSD should be a CSA. This was memorialized in the Development Agreement as presented to the Sacramento County Board of Supervisors on January 29th, 2013 which indicates “the governance structure utilized to provide the municipal services to the Project Area will be a county service area formed for the Project pursuant to the County Service Area Law contained in Government Code Sections 25210 et. Seq.” Since this report was written prior to the Project approval hearings, there is discussion throughout it about varying requirements should a CSA or a CSD be formed.

Project Description

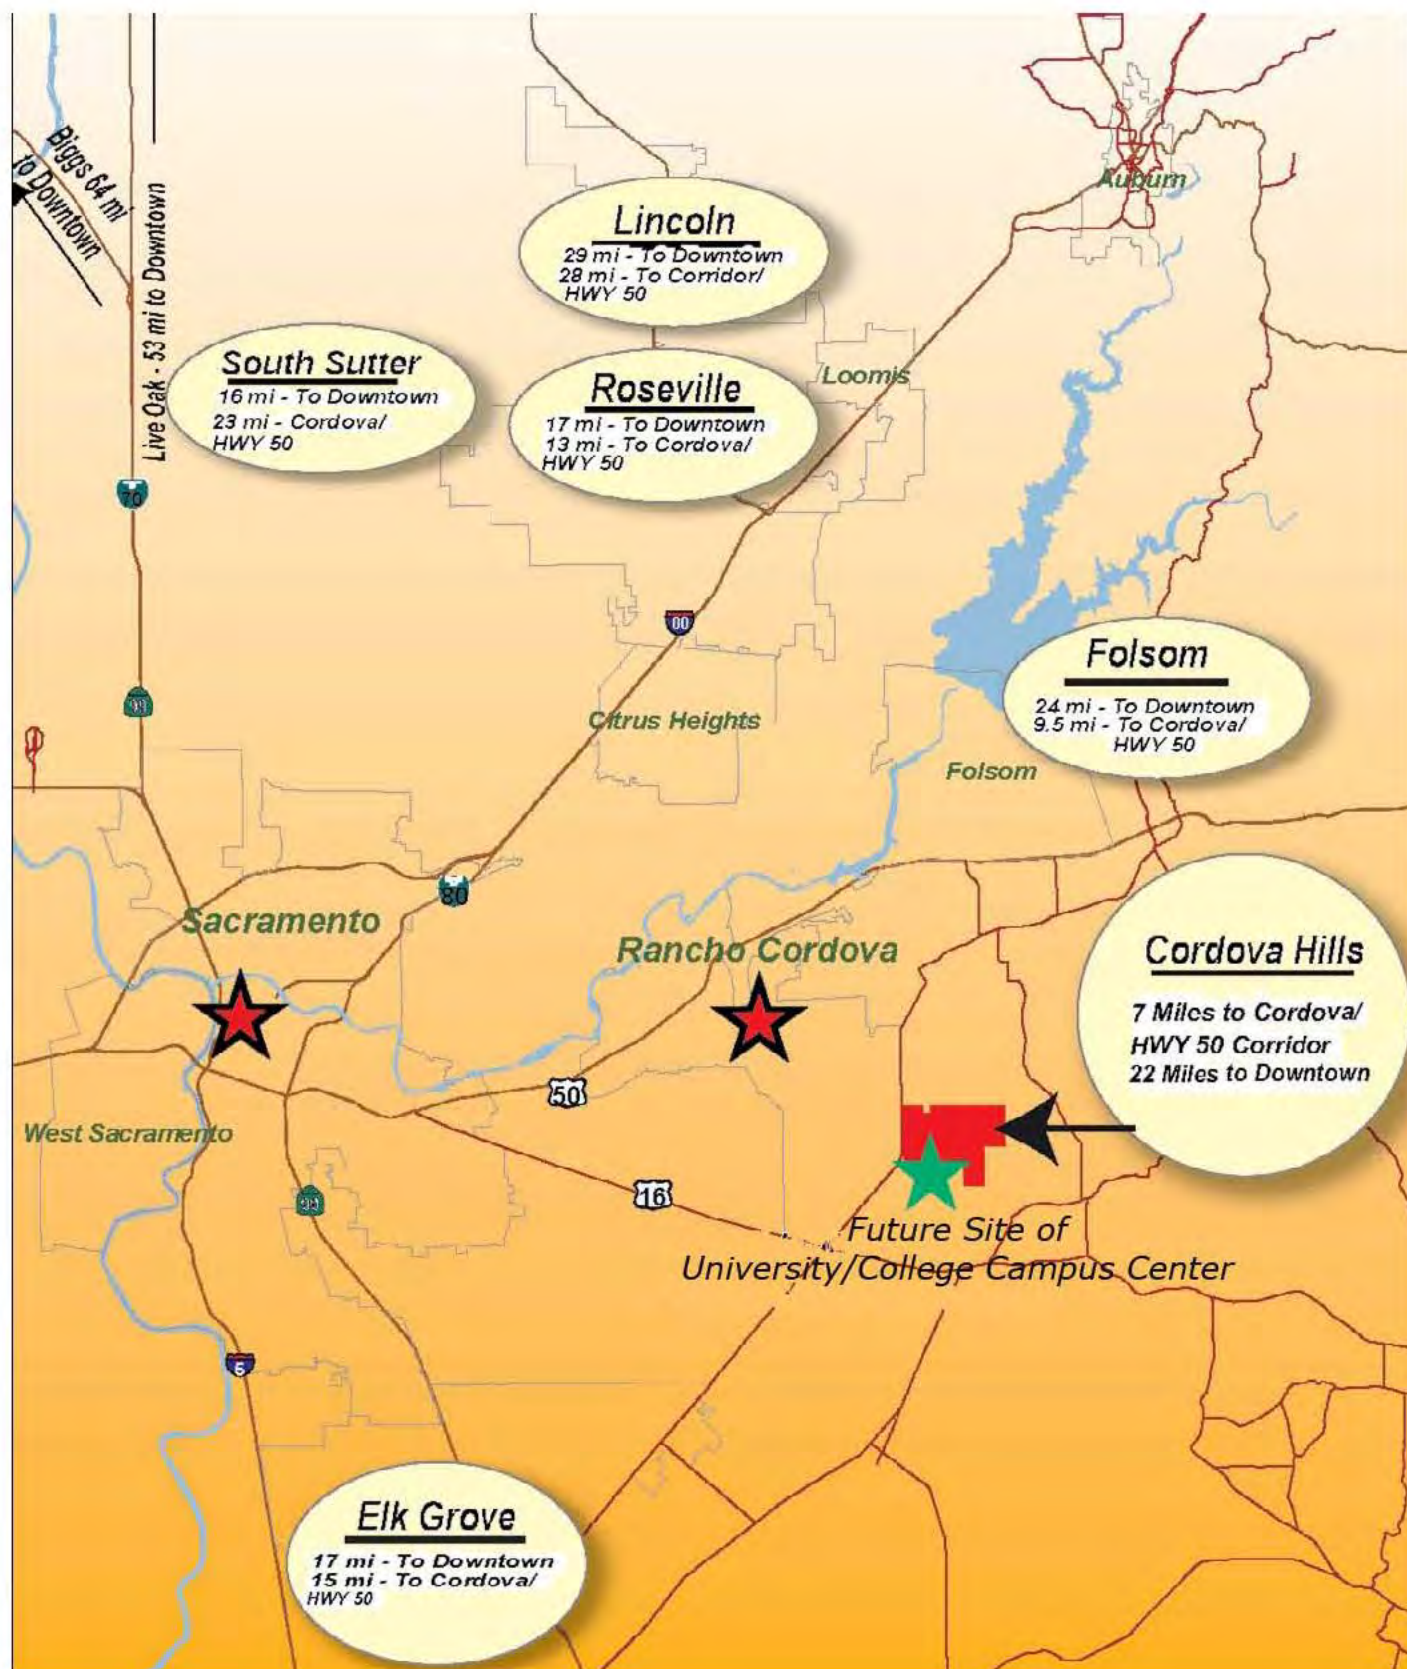

The Cordova Hills Special Planning Area (Cordova Hills or Project) is vacant and located in the unincorporated area of Sacramento County on 2,668 acres just east of the approved Sunridge Specific Plan and the proposed Suncreek Specific Plan in the City of Rancho Cordova. It is

bordered to the west by Grant Line Road, to the north by Glory Lane (about one-third mile south of Douglas Road), and to the east by Carson Creek. The Kiefer Landfill and its associated bufferlands are southwest of the Project, and the required bufferlands extend into the southwest portion of Cordova Hills. **Map 1-1** shows the regional location of the Project.

Planned development in Cordova Hills consists of a maximum of 8,000 residential units on approximately 1,089 acres, approximately 103 acres of commercial and office development, and

Map 1-1

Cordova Hills Vicinity

223 acres that will accommodate a university or other institution of higher learning (hereafter referred to as “university/college campus center”). The remaining acreage will be used for parks, recreation, open space, trails, agriculture, schools, and other public facility improvements, such as roadways. The Project is divided into six separate villages and a university/college campus center area. Development of the Town Center Village and a portion of the university/college campus center area, both located on the west side of the Project, comprise the first phase of development. The Town Center Village includes 23 percent of the proposed residential units and more than half of the commercial and office development.

Urban Service Requirements

Overview of Urban Services

The Urban Services and Governance Plan describes the urban services, service levels, and funding of the urban services that will be provided to the Project’s residents, businesses, and employees. The urban services provided in the Cordova Hills Community will include continuation or extension of existing services provided by the County and independent agencies, as well as new or enhanced services to be provided by the CHLSD. The Cordova Hills Sphere of Influence and CHLSD will be coterminous with the Cordova Hills boundary as described in the Cordova Hills Master Plan. **Table 1-1** shows the urban services to be provided by the County, independent agencies, and the CHLSD. For the services provided by the County and independent agencies, the service provider also is shown. If a CSA is formed, the County, under direction of the County BOS, will be the service administrator, although some of the services may be contracted to outside public or private entities. If a CSD is formed, the CSD will be the service administrator and, similar to the CSA, some of the services may be contracted to outside public or private entities. The County, independent agencies, and CHLSD services are detailed in **Chapters 3, 4, and 5**, respectively.

Funding of Services

The services provided by independent agencies and the County will be funded, as is the case with other urbanized portions of the unincorporated County, from the County General Fund, user fees, and property tax allocations to special districts (e.g., for fire and library services). The services provided by the CHLSD will be funded through user fees and special taxes or assessments, applied only in the CHLSD.

The introduction of urban services will generally be phased-in over time to match urban service costs with revenue sources as they increase with the Cordova Hills Community’s growth. For some services, however, a higher level of service will be necessary than can be funded by the development in the early years. An example is landscaping maintenance, which must be provided once the landscaping has been established, whether or not development is great enough to generate the necessary revenue. If available revenue from developed property is insufficient to meet minimum service levels, then special taxes/assessments will be levied against undeveloped property to pay for the service costs. It is projected, based on the phasing plan set forth in this report, that General Fund revenue, user fees, property tax allocations, and special taxes or assessments on developed property will be adequate to fund service costs before the end of the first phase of development, so the special tax/assessment on undeveloped property would no longer be needed.

Table 1-1
Cordova Hills Urban Services Plan
Organization of Urban Services

Sacramento County		Independent Agencies		Cordova Hills Local Services District (CHLSD) [1]
Service	Provider	Service	Provider	Service
Domestic Water	SCWA Zone 41	Fire Protection	Sac. Metropolitan Fire District	Recreation
Sanitary Sewer	SRCS	Electricity	SMUD	Operations and Maintenance
	SASD	Natural Gas	PG&E	Parks
Safety and Street Lighting	CSA-1	Library	Sac. Public Library Authority	Open Space and Trails
Storm Drainage	SCWA Zone 12			Habitat Maintenance
Roads within Public ROW	County Department of Transportation			Landscape Corridors
Solid Waste [2]	County Dept. of Waste Management and Recycling			Road Maintenance
Law Enforcement	County Sheriff Department			Transit
Animal Control	County Dept. of Animal Care and Regulation			Transportation Management Association
Code Enforcement	County Code Enforcement Division			Administration and Communications (Intranet site)
General Government	County			Solid Waste [2]

providers

[1] The CHLSD may contract out for some functions.

[2] The CHLSD may provide solid waste services.

Funding of Infrastructure

This report addresses only the financing of the ongoing services needed for Cordova Hills. The financing of the backbone infrastructure and other public facilities required to serve Cordova Hills is presented in the Cordova Hills Public Facilities Financing Plan (Financing Plan).

Cordova Hills Governance Plan

The Governance Plan included in this report envisions a mix of urban service providers, including the County, independent agencies, and either a proposed new dependent special district (CSA) or proposed new independent special district (CSD). In addition to describing the proposed structure of governance, the Governance Plan describes the procedures needed to implement the required urban services, including formation of the CHLSD.

The Governance Plan provides a basis for further discussions with the County, other affected public agencies, and LAFCo staff regarding the provision of urban services and governance for Cordova Hills. The formal reorganization application to LAFCo will follow County action on the Master Plan and other entitlement documents.

CHLSD

The CHLSD is proposed to provide certain urban services that are not or cannot be efficiently delivered by existing service providers. The CHLSD is envisioned for two reasons. First, there are no special districts currently providing the type or level of services the Project will require during its initial phases of development and throughout buildout. Second, and most importantly, the Cordova Hills Community is envisioned as a highly sustainable development in which water, soil, air, and habitat are carefully managed as integral components of the urban development. A locally governed entity with coordinated service responsibilities will be more efficient at achieving this sustainable vision than several overlapping single purpose districts. The CHLSD will reduce the need for citizens to coordinate with numerous organizations.

The CHLSD would provide services not provided by the County or independent agencies and enhanced levels of services from the level typically provided by the County. These services ultimately would be funded through an annual services special tax or assessment, although, initially, additional funding, such as developer funding, may be required (see discussion above).

The CHLSD will be designed to provide the following services for the residents and businesses located in Cordova Hills:

- Parks and recreation
- Open space and trails
- Habitat
- Enhanced levels of landscaping
- Road maintenance
- Transit
- Transportation systems management
- Community communications

The level of service delivered by the CHLSD will be established each year by the Advisory Board of Directors based on the goals for public services set out in the Cordova Hills Master Plan and on input from the community. The estimated total annual service costs to be funded by the special tax or assessment at the completion of Phase 1 development and at buildout are summarized below.

Development Phase	Estimated CHLSD Annual Service Costs Funded by Special Taxes/Assessments (2011\$)
Phase 1	\$1.70 Million
Buildout	\$6.75 Million

The CHLSD costs were allocated to the various land uses, and a cost per dwelling unit or per 1,000 building square feet at completion of Phase 1 and at buildout was estimated for each land use. Adjustments were made to the buildout cost allocations to arrive at maximum special tax or assessment rates by land use. The adjustments reduced the tax burden on affordable and high density housing. The estimated maximum special tax or assessment rates by land use are summarized below.

Land Use [1]	Estimated CHLSD Maximum Annual Special Tax (2011\$)	
	<i>(rounded)</i>	
Residential		
Estates Residential	\$ 1,400	per dwelling unit
Low Density Residential	\$ 1,400	per dwelling unit
Medium Density Residential	\$ 1,100	per dwelling unit
Residential 20 - Owner-Occupied	\$ 1,000	per dwelling unit
Residential 20 - Renter-Occupied	\$ 850	per dwelling unit
HDR - Owner-Occupied & Market Rate	\$ 850	per dwelling unit
HDR - Renter-Occupied & Market Rate	\$ 720	per dwelling unit
HDR - Renter-Occupied & Affordable	\$ 250	per dwelling unit
Nonresidential		
Commercial	\$ 160	per 1,000 bldg.sq.ft
Office	\$ 240	per 1,000 bldg.sq.ft

[1] No service costs have been estimated or allocated to the university/college campus center at this time, but it is possible that future draft reports will include university/college campus center cost allocations for some services.

Report Layout

The remainder of this report is organized into the following chapters:

- **Chapter 2** provides a summary of the proposed land uses and phasing plan.
- **Chapter 3** details the Cordova Hills urban services to be provided by the County.
- **Chapter 4** details the Cordova Hills urban services to be provided by independent agencies.
- **Chapter 5** details the Cordova Hills urban services to be provided by the CHLSD.
- **Chapter 6** discusses the urban services financing strategy and evaluates the financial feasibility of the services taxes/assessments.
- **Chapter 7** presents the Cordova Hills Governance Plan for providing the required urban services.

This report also contains one appendix, **Appendix A**, which provides a phasing analysis for services provided by the CHLSD.

2. CORDOVA HILLS LAND USES

Overview

The 2,668-acre Cordova Hills site is vacant. The Project will include a mix of uses consisting of residential, office, retail, university/college campus center, schools, parks, trails, open space, and public uses. As shown on **Map 2-1**, the Project includes six distinct villages, the proposed university/college campus center, a large preservation (avoided) area, and other permanent open space that serves to separate villages.

The Project includes a wide mix of residential uses, from high-density residential along the western edge, to low-density residential along the eastern edge. The majority of the commercial development is planned for the Town Center Village in the western part of the Project adjacent to Grant Line Road. A 223-acre university/college campus center is planned just southeast of the Town Center. **Map 2-2** shows the Project land use plan.

The land uses and estimated development, population, and employees in this report are obtained from the Public Review Draft Cordova Hills Public Facilities Financing Plan (Financing Plan). These estimates are detailed in the remainder of this chapter.

Development Phasing

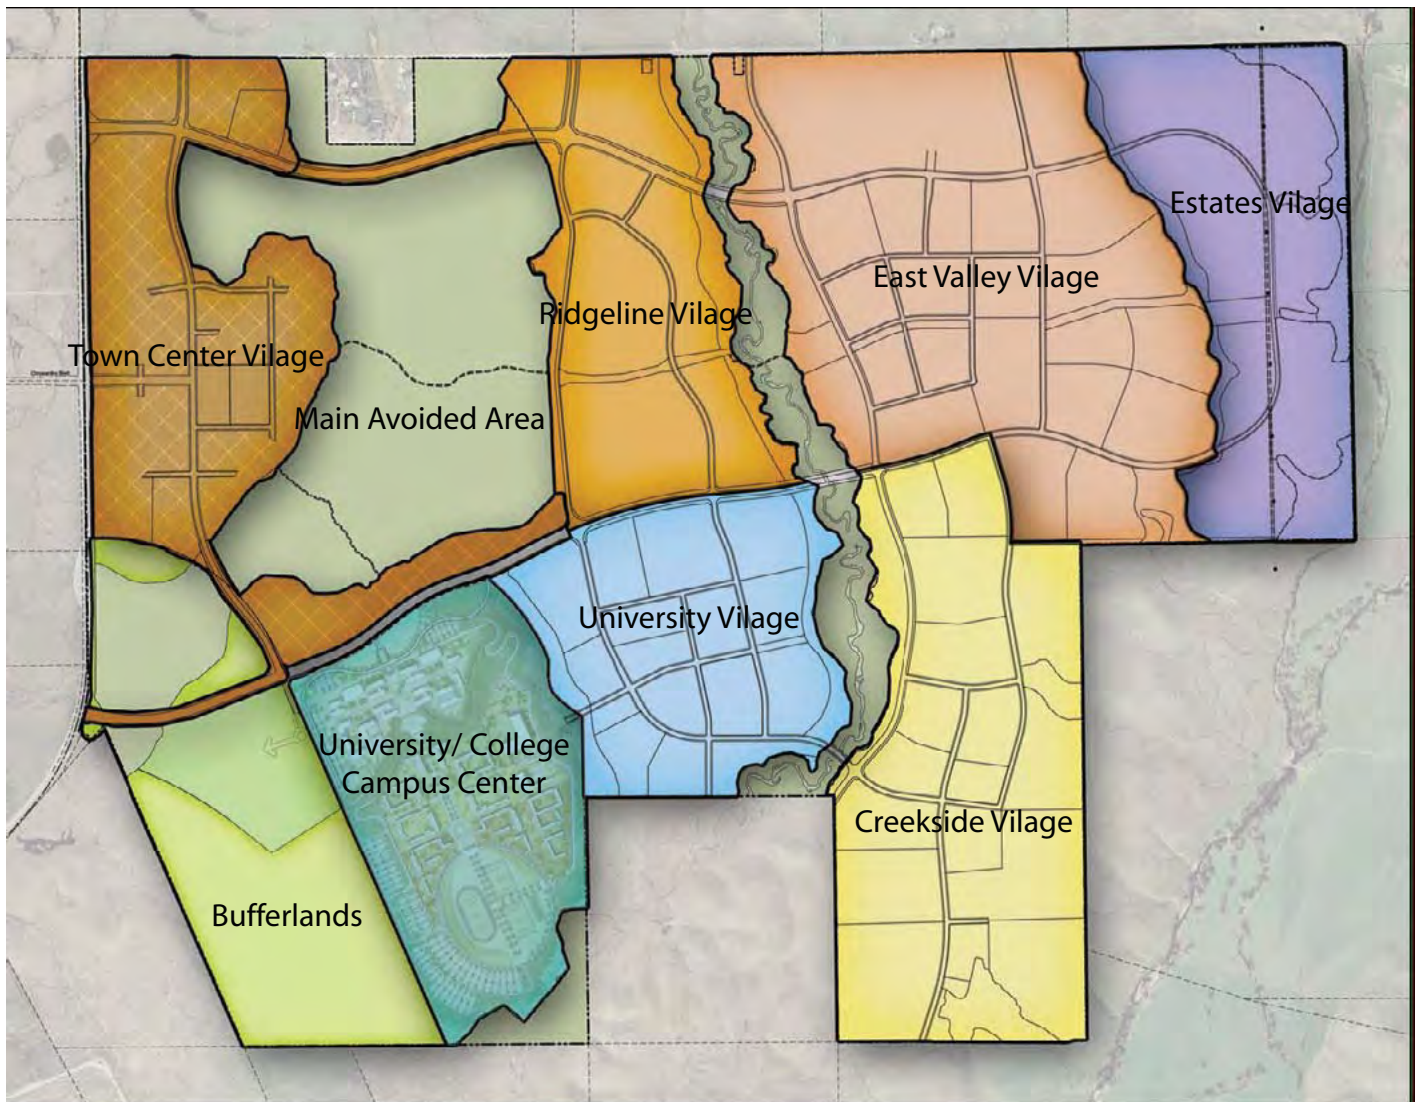

Summary

The Project is expected to develop in phases beginning in the western part of the Project and continuing eastward. **Map 2-3** shows the illustrative Project phasing. The map includes three phases. Phase 1 includes development of the Town Center and part of the university/college campus center. Phase 2 includes completion of the university/college campus center and development of Ridgeline Village and University Village, which are located in the center of the Project. Phase 3 includes development of the remaining three villages. This Urban Services Plan focuses on Phase 1 and Project buildout. Phase 1 initiates the Project and includes development of infrastructure needed to provide essential services. After initiation of the Project, development will respond to market conditions, will occur in multiple smaller phases, and will not necessarily follow the phasing shown in **Map 2-3**.

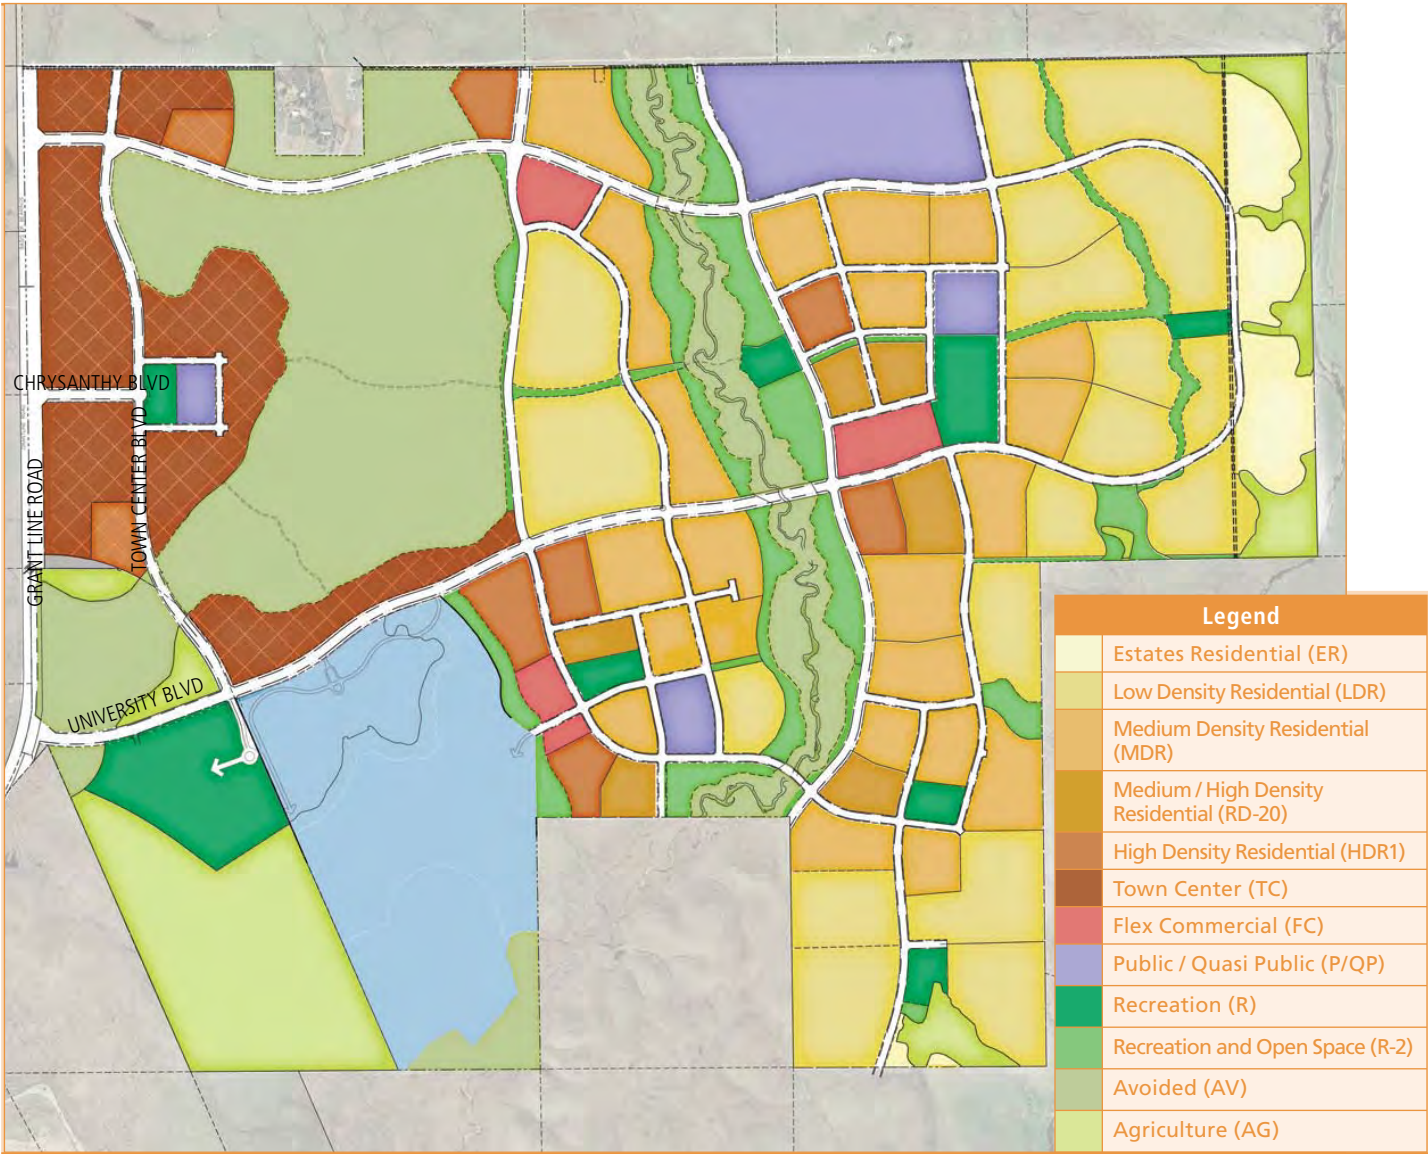

Acres

Table 2-1 summarizes the acres by land use at completion of Phase 1 and at buildout. The acres shown in **Table 2-1** are based on the March 2011 Land Use Plan, prepared by William Hezmalhalch Architects, Inc. (WHA). Please note that the acres by land use reflected in the recent April 2012 Revised Public Review Draft of the Cordova Hills Master Plan (Cordova Hills Master Plan) were modified slightly from the acres in the 2011 Land Use Plan. In particular, the April 2012 Cordova Hills Master Plan includes 3.2 fewer residential and commercial acres and 3.2 more public use acres. Because the recent acres change was so minor, and because the land

acres sum

Source: EPS and WHA Land Use Summary (6/21/10)

[1] Acres with "Town Center" and "Flex Commercial" land uses were distributed to residential and commercial uses.

[2] Phase 1 is equivalent to the Town Center, the surrounding ag and avoided area, and part of the University/College Campus Center.

use mix is likely to change again before implementation of the Project, both the Financing Plan and this Urban Services Plan continue to reflect the March 2011 Land Use Plan acres, consistent with many of the other technical studies.

Table 2-1 shows both the original acres from the 2011 Land Use Plan and the acres after distributing the mixed use acres (defined as “Town Center” and “Flex Commercial” uses) to the various residential and nonresidential uses. The mixed use acres contain a mix of residential and nonresidential uses and were distributed to residential and nonresidential uses for the purposes of properly allocating costs to the different land uses.

Development, Population, and Employees

Table 2-2 shows the projected dwelling units, building square feet, population, and employees for Phase 1 and buildout of the community portion of the Project. These development projections are equivalent to the projections in the Financing Plan and are based on estimates prepared by WHA for use in the Cordova Hills Master Plan. The university/college campus center projections are shown separately in **Table 2-3**.

The mix of Phase 1 dwelling units and nonresidential building square feet is approximate and represents a possible development scenario in the Town Center Village. There is flexibility in the mix of Town Center development, so the relative amount of commercial and residential development could be different. In addition, density bonus dwelling units could be built, increasing the amount of residential development.

In the Financing Plan (and this report), the buildout dwelling units were reduced from the maximum 8,000 dwelling units to 7,500 dwelling units, and the buildout nonresidential building square feet were reduced from 1.3 million square feet to 851,000 square feet. **Table 2-4** compares the Financing Plan and Master Plan dwelling units and building square feet at buildout. The Master Plan projections are higher because they are used to estimate maximum Project impacts. The more conservative projections used in the Financing Plan help ensure that costs per dwelling unit or building square foot are not understated if actual development occurs at levels below the maximum authorization.

In addition, for purposes of developing fair share cost allocations, the persons per household factors used in the Financing Plan (and this report) to project population are different from those used in the Master Plan. The Financing Plan differentiates between factors for different residential uses while the Master Plan assumes only two factors: one for single-family uses and one for multifamily uses. Because of the difference in assumed dwelling units, the total projected population in the Financing Plan (20,110 people) is less than in the Master Plan (21,379 people). This lower population estimate does not affect the projected requirement for parks, schools, or other population-based facilities identified in the Master Plan because these requirements were based on the Master Plan population estimate.

Source: Cordova Hills Administrative Draft Master Plan (September 2010) -- Table 3-1 and 11/20/09 Land Use Plan

- [1] Persons per household factors that differ from the factors in the Master Plan were established for use in the Financing Plan cost allocation. The average factor across all land uses and the population generated by 8,000 units remains virtually the same. The total estimated units in the Financing Plan, however, were reduced from a maximum of 8,000 to 7,500, resulting in a lower population.
- [2] Master Plan persons per household factors are from the Administrative Draft Cordova Hills Master Plan (September 2010).
- [3] For cost allocation purposes, the Financing Plan does not include separate categories for High Density (30-40 units/acre) or Flex Commercial units. High Density (30-40 units/acre) units have been included with High Density (23-30 units/acre). Flex Commercial units have been included with Medium Density.

3. COUNTY SERVICES

Introduction

This chapter summarizes the Cordova Hills urban services that will be administered by County agencies. These services and the providers are listed below:

Service	Provider
Domestic Water	Sacramento County Water Agency—Zone 41
Sanitary Sewer	Sacramento Regional County Sanitation District and Sacramento Area Sewer District
Roads in Public ROW	Sacramento County Department of Transportation
Safety and Street Lighting	Sacramento County Service Area 1
Storm Drainage	Sacramento County Water Agency—Zone 12
Solid Waste	Sacramento County Department of Waste Management and Recycling
Law Enforcement	Sacramento County Sheriff Department
Animal Control	Sacramento County Department of Animal Care and Regulation
Code Enforcement	Sacramento County Code Enforcement Division
General Government	Sacramento County

Note that although solid waste services are shown as being administered by the County, these services also could be provided by the CHLSD, as discussed later in this chapter.

Domestic Water

Potable Water

Zone 41 of the Sacramento County Water Agency (SCWA) provides potable water to its various service areas in the unincorporated County and the Cities of Elk Grove and Rancho Cordova. The majority of Cordova Hills is located in the Zone 41 service area. Only the bufferlands in the southwest area of the Project are not currently in Zone 41, and it is proposed that they be annexed into Zone 41.

Cordova Hills ultimately will be served by a conjunctive-use water system operated by Zone 41. On-site transmission mains will be connected to an extension of SCWA's existing transmission system in the Sunrise Douglas area, and a large water storage tank will be located in Cordova Hills to distribute water throughout Cordova Hills. Domestic water service is funded through user service charges.

Non-Potable Water

The Cordova Hills developer has the option of constructing a non-potable water system to provide irrigation water to parks, open spaces, schools, roadway medians, and non-residential irrigation uses. If the developer decides to construct the non-potable system, funding will be

provided to SCWA through the CHLSD for the maintenance of the non-potable water facilities in the Project. This funding will allow for appropriate maintenance of the additional, non-potable water supply infrastructure constructed by the project that is connected to the SCWA potable system. Funding through the CHLSD for reclaimed water facility maintenance in the Project will continue until such time as the non-potable water facilities are disconnected from the potable water system and concurrently connected to and operated by a non-potable water supply service provider. The Project would then be subject to the applicable rates as adopted by that non-potable water service provider.

Sanitary Sewer

Cordova Hills will be annexed into the Sacramento Area Sanitation District (SASD) and the Sacramento Regional County Sanitation District (SRCSD). SASD owns and operates sewer trunk and collection systems throughout the County. SRCSD owns and operates the Sacramento Regional Wastewater Treatment Plant (SRWTP) and interceptor system throughout the County. Sanitary sewer service is funded through user service charges.

Roads in the Public Right-of-Way

The County Department of Transportation (DOT) will maintain the roads and adjacent facilities in the public street right-of-way (ROW), consisting of paved section, curb, and gutter. The only exception is that the CHLSD will maintain all landscaping in the medians. In addition, the CHLSD may provide supplemental street sweeping and litter control on all public streets. These CHLSD road maintenance responsibilities are discussed in **Chapter 5**. County road maintenance is funded through the County General Fund.

Safety Lighting and Street Lighting

Cordova Hills will receive safety lighting and street lighting services from County Service Area 1 (CSA-1), which encompasses the entire County. For the purpose of determining benefit and the associated levy on the property tax bill, the light fixtures maintained by CSA-1 are defined as either street lights or safety lights. Safety lights are lights located at intersections on major streets and along the rear of properties that abut major streets. All other lights are designated as street lights. There are two service standards in CSA-1: enhanced and decorative. Cordova Hills will select design standard options from the decorative standards defined by CSA-1 throughout buildout of the Project.

CSA-1 will provide maintenance service to all safety lights and streets lights located along all streets and intersections that are part of the public ROW. Park-and-Ride lots also are maintained by CSA-1. Cordova Hills will pay a supplemental fee for CSA-1 to maintain the safety lights located along trails, paths, and paseos that are not adjacent to streets or intersections and are outside the public ROW.

CSA-1 levies an annual service charge for safety and street lighting maintenance. The rates on which the annual charge is based vary depending on the service standard (enhanced or decorative) and type of lights (street and/or safety) maintained. The service charge for single-

family parcels is a flat rate per parcel per year. The service charge for multifamily and nonresidential parcels is calculated by multiplying the applicable rate per frontage foot by the length of the parcel's public street frontage. **Table 3-1** estimates the CSA-1 revenue generated by Cordova Hills development assuming all development pays for decorative street and safety lights. Under these assumptions, Cordova Hills would generate an estimated annual amount of \$56,000 at the completion of Phase 1 development and \$248,000 at buildout.

Storm Drainage

Overview

Cordova Hills is in two major watersheds. The western portion of the Project (Phase 1) includes intermittent drainages tributary to the headwaters of Laguna Creek, whereas the remaining eastern portion of the Project (Phases 2 and 3) drains into the Paseo Central in the center of the Project and Carson Creek, both tributaries to Deer Creek and ultimately the Consumes River.

The SCWA currently provides drainage services to various service areas of the unincorporated County, including Cordova Hills, and will continue to provide all drainage maintenance services to Cordova Hills. There are three SCWA drainage zones that will serve Cordova Hills as summarized below:

- **Zone 12:** Provides operations and maintenance services, the subject of this report.
- **Zone 11A:** Provides funds for the construction of major drainage facilities. This zone is discussed in the Draft Financing Plan.
- **Zone 13:** Funds comprehensive long-range planning and engineering studies of flood control, water resources development, water supply management, and water conservation beneficial to the zone, which includes Cordova Hills.

Zone 12 Operations and Maintenance

The County Stormwater Utility (SWU) provides drainage operation and maintenance services in the geographic area defined by Zone 12 of the SCWA. The SWU was created to fund the operation and maintenance of storm drainage facilities, the construction of remedial storm drainage improvement projects, the preparation of storm drainage master plans, and the implementation of stormwater quality programs.

The SWU is funded through the standard collection of bimonthly fees. Cordova Hills is not in Zone 12 and will need to annex into this maintenance district for drainage maintenance of the entire Project. **Table 3-2** estimates that the Zone 12 fee revenue generated by Cordova Hills development will total \$98,000 annually at the completion of Phase 1 development and \$501,000 annually at buildout.

[1] Monthly fee per acre = \$0.30 admin. charge per parcel + (\$5.85 / 3,500 sq. ft. * 43,560 sq. ft./acre * impervious factor)
 Impervious factor from Sacramento County Storm Drainage Fee Code.

Solid Waste

Although discussed in this chapter, solid waste collection and disposal services in Cordova Hills could be provided either by the County Department of Waste Management and Recycling, the current provider for the Project area, or by the CHLSD. The County Department of Waste Management and Recycling has planned for adequate disposal capacity to account for the growth in its service area because of planned development projects, including Cordova Hills. User fees paid by new development would allow maintenance of adequate service levels throughout the service area.

The solid waste services also could be provided by the CHLSD. If the CHLSD is the provider, it would contract the services out to a third party and charge this third-party contractor a franchise fee. The franchise fee revenue could be used to expand on its services provided to the community or to reduce monthly solid waste fees to the community.

Law Enforcement

The County Sheriff's Department currently provides, and will continue to provide, law enforcement services to Cordova Hills once the community has developed. The Sheriff's Department has expressed interest in a potential substation in the Cordova Hills Town Center. It is too early to determine if a substation will be required in Cordova Hills, but if one is required, then the Sheriff's Department has indicated the Town Center would be an ideal location. Law enforcement services will include service to the university/college campus center in the initial stages of development. However, as the university/college campus center builds out, it may elect to provide its own security protection for the campus separately from, or as a supplement to, the Sheriff's Department services. The university/college campus center will provide a safety/security plan to the Sheriff's Department detailing systems that the applicant intends on installing or implementing to protect patrons, visitors, employees, students, and company property/assets on site.

Police services will be funded through the County General Fund and through the County Police Services Community Facilities District 2005-1 (CFD 2005-1) annual special tax. **Table 3-3** shows the estimated CFD 2005-1 revenue generated by Cordova Hills. This annual revenue is an estimated \$529,000 at completion of Phase 1 development and \$2.3 million at buildout.

Participation in CFD 2005-1, along with the payment of property taxes, a portion of which are allocated to the County General Fund and used for sheriff services, will fund the costs to provide Sheriff's Department patrol services to Cordova Hills, including the university/college campus center.

Animal Control

The County Department of Animal Care and Regulation currently serves the Project area and will continue to be the animal control service provider. The County will continue to provide adequate service as Cordova Hills develops.

Table 3-3

[1] Residential tax only; no tax on commercial and office uses.

Code Enforcement

The County's Code Enforcement Division currently serves the Project area and will continue to provide County code enforcement services to Cordova Hills as it develops. Cordova Hills development will require the provision of additional officers in the long term, although immediate needs can be met with existing personnel.

General Government

Cordova Hills is in the County's jurisdiction. The County will continue to provide general government services to Cordova Hills as it develops. General government services include land use planning, administrative services, and fiscal and regulatory oversight.

4. INDEPENDENT AGENCY SERVICES

Introduction

This chapter summarizes the Cordova Hills urban services that are administered by independent special districts, joint powers authorities, or private companies. These services and the providers are listed below:

Service	Provider
Fire Protection	Sacramento Metropolitan Fire District (SMFD)
Library Services	Sacramento Public Library Authority
Electricity	Sacramento Municipal Utility District (SMUD)
Natural Gas	Pacific Gas and Electric (PG&E)

Fire Protection

The SMFD is the service provider for the area and will continue to provide services once the community has developed. This service will include service to the university/college campus center in the initial stages of development. However, as the university/college campus center builds out, it may elect to provide its own fire services for the campus separately from the SMFD or to supplement the SMFD services.

The university/college campus center will be zoned to accommodate the tallest buildings in Cordova Hills, which have a maximum building height of six stories. As such, a truck company will be needed for Cordova Hills to accommodate these building heights. Cordova Hills also will require an engine company, which is required in all service areas. In addition to the engine company and truck company for fire protection services, Cordova Hills will require a medic company (an ambulance with two paramedics). The SMFD services will be funded through property tax revenue. **Table 4-1** summarizes the approximate annual costs to provide fire and medical services to Cordova Hills, annual property tax revenue available for SMFD services, and annual surplus of revenues over costs. Based on the revenue and cost estimates at buildout, there will be an approximately \$3.0 million annual surplus of revenues over costs.

The estimated annual operating costs were provided by the SMFD, and the estimated revenues are calculated in **Table 4-2** through **Table 4-4**. **Table 4-2** estimates the annual property tax allocation to the SMFD from Cordova Hills development at the completion of Phase 1 and at buildout. The SMFD will receive property tax revenues of approximately \$1.5 million annually for Phase 1 development and \$6.8 million annually at buildout. The estimates in **Table 4-2** are based on the estimated annual property taxes generated by Cordova Hills development (see **Table 4-3**) and the percentage of the property tax allocated to the SMFD from development in the Cordova Hills tax rate areas (TRAs) (see **Table 4-4**). **Map 4-1** shows the location of the TRAs in Cordova Hills.

Table 4-1
Cordova Hills Urban Services Plan
Estimated Annual Fire Services Costs and Revenues (2011\$)

Item	Annual Total (2011\$)	
	Phase 1	Buildout
Annual SMFD Fire Service Revenues

Annual SMFD Fire Service Operating Costs [3]		
Engine Company	NA	\$ 1,500,000
Truck Company	NA	\$ 2,000,000
Medic Company	NA	\$ 800,000
Subtotal Annual Fire Service Costs	NA	\$ 4,300,000
Fire Service Surplus/(Shortfall)	NA	\$ 3,001,000

fire sum

Source: SMFD; Sacramento County; EPS.

[1] Estimated in Table 4-2.

[2] Measure Q authorized a \$100 parcel tax on all parcels within the Project. For the purpose of this analysis, revenue from the Measure Q parcel tax is based on the assumption that all single-family homes (Estates Residential, Low Density Residential, and Medium Density Residential) are constructed on their own parcel. In actuality, more revenue would be generated from remaining land uses in the Project. However, it is unknown at this time how many parcels will be attributable to the High Density Residential (including Residential 20) and commercial and office land uses.

[3] Operating costs provided by the Sacramento Metropolitan Fire District (SMFD).

prop tax alloc

Source: Sacramento County Assessor's Office.

[1] This analysis uses a weighted average of the AB 8 allocation for each of the three tax rate areas (TRAs) in which the project is located based on the estimated percent of total assessed value for each TRA. These percents were estimated by estimating the assessed value by village and the percent of each village in each TRA.

[2] Based on the County's FY 2010-11 estimated ERAF share.

**Map 4-1
Cordova Hills TRAs**

With respect to capital improvements, Cordova Hills (including the university/college campus center) will be subject to the district-wide fire facilities fee to cover the cost of new fire station real property acquisition, development, and equipment. Table 8-2 of the Draft Financing Plan estimates that Cordova Hills will generate approximately \$9.7 million in fee revenue. The SMFD has indicated that development in the Cordova Hills area will require that at least one new fire station be located in the Project. In a January 14, 2011, comment letter from the SMFD regarding the Financing Plan, the SMFD noted that \$9.7 million would be adequate to construct and equip at least one fire station. An additional station could be located in Cordova Hills, depending on how stations are located to best serve both Cordova Hills and surrounding areas. In this case, the \$9.7 million in Cordova Hills fee revenue would be sufficient to fund the share of capital fire costs attributable to Cordova Hills and the university/college campus center.

Library Services

The Sacramento Public Library Authority is the fourth largest library system in California, serving the public in the City and County of Sacramento, as well as the Cities of Citrus Heights, Elk Grove, Galt, Isleton, and Rancho Cordova. The Sacramento Public Library operates 28 libraries, which includes a Central Library in downtown Sacramento. More than 600,000 residents have a library card, and more than 7 million items are circulated annually.

A branch library is planned in the Town Center to serve the Cordova Hills community, as well as residents in the surrounding area. The branch library may be phased in over time by locating first in a leased space in a commercial setting and ultimately in a permanent facility. The library will serve as a center of public activity and will be located adjacent to a public space such as a plaza and near shops, restaurants, and entertainment venues in the Town Center.

It is estimated that library services will be fully funded through property tax revenue, so an additional assessment will not be necessary. **Table 4-5** summarizes the analysis used to arrive at this conclusion. As shown in this table, Cordova Hills will require approximately 53 percent of a 15,000-square-foot branch library, using a standard of 0.4 square feet per resident. The Library Authority has estimated that a branch library of this size requires an annual operations budget of approximately \$800,000. Thus, the annual cost to serve Cordova Hills residents at buildout is approximately 53 percent of this amount, or \$427,000. Cordova Hills property tax revenue to be allocated to the Library Authority is estimated at \$495,000 at buildout.

Tables 4-2 through 4-4 (discussed above in the Fire Protection section) detail the estimate of the library property tax allocation. Because the estimated Cordova Hills property tax allocated to the Library Authority exceeds the estimated library services cost attributable to Cordova Hills, no funding in addition to property taxes will be needed for library services at buildout.

A similar analysis for Phase 1 development results in an estimated annual Cordova Hills library services cost of \$107,000 versus a property tax allocation of \$106,000. This is a breakeven situation, given the assumptions used to model costs and revenues. Thus, this analysis concludes that no funding, in addition to property taxes, will be needed for Cordova Hills library services for Phase 1. This analysis also is summarized in **Table 4-5** with details provided in **Tables 4-2 through 4-4**.

Table 4-5
Cordova Hills Urban Services Plan
Library Services Costs (2011\$)

Item	Formula	Phase 1	Buildout
Persons Served	<i>a</i>	4,567	20,110

Estimated Property Tax Revenue [2]	<i>h</i>	\$ 105,775	\$ 494,729
Surplus/(Shortfall) [3]	$h-g$	(\$ 891)	\$ 68,062
Cordova Hills Net Annual Library Services Cost to be Funded by Urban Services Fee		\$ 0	\$ 0

lib cost

Source: Sacramento County Library

[1] Buildout cost based on Sacramento County budget for large County branches that operates 6 days a week (See Table 4-5). Phase 1 cost estimated as buildout cost per sq. ft. * sq. ft. required to serve Phase 1 development.

[2] See Table 4-2.

[3] This result is essentially a breakeven position, where costs and revenues are within 1% of each other.

Electricity

SMUD is the current service provider for the area and will remain as the service provider once the Project develops. SMUD has indicated that the energy demand for Cordova Hills will require 1 to 2 neighborhood substations. Electricity service is funded through user service charges.

Natural Gas

PG&E is the current service provider for the area and will remain as the service provider once the Project develops. Natural gas service is funded through user service charges.

5. *CORDOVA HILLS LOCAL SERVICES DISTRICT URBAN SERVICES*

Introduction

This chapter focuses on estimating the costs and funding for the urban services to be provided and administered by the Cordova Hills Local Services District (CHLSD).¹ These services are divided into the following categories:

- Recreation
- Operations and Maintenance
 - Parks
 - Open Space and Trails
 - Habitat
 - Landscape Corridors
 - Road Maintenance
 - Transit
- Transportation Demand Management (TDM) Services
- Administration and Communications

These services will be funded through a combination of the following sources:

- Special taxes implemented through a Mello-Roos Community Facilities District (CFD) formed by the CHLSD to fund authorized services.
- Special taxes implemented by a CSA or CSD under the provisions of Government Code Section 25210 et. seq. or Government Code Section 50075, respectively.
- Special assessments implemented through a special assessment district formed by the CHLSD, such as a landscape and lighting assessment district.
- User charges.

If a CSA is chosen as the most effective governance option, the CSA will be created through a resolution of the County BOS. As a dependent district, the CSA also would be governed by the County BOS. The creation of a CSA also could institute a Local Advisory Board (CSA Board) comprising local representatives. This CSA Board could be endowed with management and contracting oversight and could make recommendations to the County BOS on policy and procedures; final decisions ultimately would be at the discretion of the County BOS. The CSA

¹ Refer to **Appendix A** for a listing of service levels and associated service costs for the Project by phase.

could have a permanent director or executive officer to oversee the provision of services, retain institutional memory, and represent the interests of the CSA and its constituents in interactions with service providers and other government entities.

If a CSD is chosen as the most effective governance option, LAFCo will be responsible for evaluating and approving its creation. An evaluation of a CSD using the criteria established by LAFCo to analyze proposed new special districts is provided in Chapter 7. In the event of LAFCo approval, the County BOS will serve ex officio as the CSD Board of Directors (CSD Board). As an early step, they will retain or appoint a General Manager who will be charged with establishing a budget for the CSD and beginning organizing service capabilities. As it will be several years before significant service responsibilities exist, the initial phase of the CSD will focus mainly on organizational efforts. For example, it is likely that the CSD will enter into various contracts and other institutional arrangements that define and assure the desired service levels as reflected in the Urban Services and Governance Plan, the Fiscal Impact Analysis, and the Final EIR.

Summary

CHLSD Costs

Urban services standards were researched and cost estimates were developed for each service type to be provided by the CHLSD. The Project's urban services standards were obtained from a variety of sources, including these:

- Available Project documents.
- Interviews with Project consultants.
- County staff.
- EPS's past experience on similar projects.

The service levels and cost estimates detailed in this chapter are preliminary. When necessary, EPS developed cost estimates using cost data derived in comparable past Specific Plan projects on which EPS has worked. The annual cost estimate for each service type is assumed to have an administrative component built into it that would provide funds for administration of the particular service. In addition, a separate CHLSD administration service category has been included for administration of the overall program and coordination of the various services.

Service levels are described in terms of the qualitative descriptions of services provided. As the Project moves forward in the approvals process, service level standards may be revised or more precisely defined. Estimated annual operations and maintenance costs also may be updated and refined as more detailed information becomes available.

A major update of the Urban Services and Governance Plan and estimated costs will be prepared by the CHLSD before formation of a special tax or assessment district (as discussed earlier in this chapter) or approval of special taxes or assessments. As part of this implementation update, special attention will be directed to estimating the start-up costs for administration of the CHLSD. The actual special tax rates or assessments will be finalized during the formation process for any special financing district. The Developer will be responsible for funding any shortfall in start-up costs and shortfalls in the early years that are not covered by the special

taxes or assessments. These shortfall payments may be funded through Developer advances or undeveloped land taxes as set forth in the Development Agreement (DA) between the County and Master Developer.

Table 5-1 summarizes the cost estimates for each CHLSD urban service category at the completion of Phase 1 and at buildout. For each service type, **Table 5-1** shows the Phase 1 and buildout gross annual cost, offsetting revenues such as user fees, and remaining net annual costs. This Urban Services Plan proposes the use of a CSA or CSD services special tax/assessment to cover the net annual costs.

Appendix A provides a phasing analysis for the services proposed to be provided by the CHLSD. The tables contained in the appendix demonstrate that annual development of the Project and service levels are reasonably balanced through buildout of the Project.

Maximum Special Tax/Assessment

The estimated annual maximum services special tax/assessment rates by land use are summarized in **Table 5-2**. These rates are expressed per dwelling unit for each residential use and per 1,000 building square feet for each nonresidential use. **Table 5-2** also shows the estimated Phase 1 and buildout annual revenue generated by the maximum special taxes/assessments and compares this revenue to the total annual CHLSD services cost across all service categories.

The maximum tax/assessment rates are based on the service costs and allocations detailed later in this chapter. For each land use, the total service cost per unit (per dwelling unit for residential uses and per building square foot for nonresidential units) was estimated at completion of Phase 1 and at buildout. These per unit costs were adjusted to estimate the maximum tax/assessment rates. Adjustments were necessary to reduce the tax burden on affordable and high density housing. In addition, to assure adequate funding at all Project phases, the rates were estimated so that no overall deficit occurred at completion of Phase 1 or at bailout. The rates will be subject to annual inflation adjustments.

Tables 5-3 through **5-5** provide detail for the maximum tax/assessment rates shown in **Table 5-2**. **Table 5-3** shows "persons served" on which the cost allocations were based (see discussion below). **Tables 5-4** and **5-5** summarize the cost allocation by land use and service category at completion of Phase 1 and at buildout, respectively.

Additional Funding

Initially, where possible, CHLSD services will be phased to match the special tax/assessment revenue, while increasing service levels to desired standards over time. For some services, however, a higher level of service will be necessary than can be funded by the special tax/assessment revenue in the early years of development. An example is landscaping maintenance, which must be provided once the landscaping has been established, whether or not development is great enough to generate the necessary revenue. If available special tax/assessment revenue from developed property is insufficient to meet minimum service levels, then the special tax/assessment will be levied against undeveloped property to pay for the service costs.

Table 5-1
Cordova Hills Urban Services Plan
Summary of Annual CHLSD Urban Services Costs (2011\$) [1]

Services Component	Phase 1				Buildout			
	Gross Annual Cost	Offsetting Revenue	Net Annual Cost	Percent of Total	Gross Annual Cost	Offsetting Revenue	Net Annual Cost	Percent of Total
Recreation	\$ 228,000	(\$ 114,000)	\$ 114,000	7%	\$ 1,305,000	(\$ 503,000)	\$ 802,000	12%

Costs and Cost Allocations by Service Type

Overview

As summarized in **Table 5-1** (discussed above), annual service cost estimates were developed for each service type at the completion of Phase 1 and at buildout. These cost estimates were allocated to the benefitting land uses to arrive at an annual cost per dwelling unit for each residential land use and per 1,000 building square foot for each commercial land use (where appropriate). Each service type was allocated to the benefitting land uses on the basis of persons served, with some services assumed to benefit residents only and other services assumed to benefit both residents and employees. In the cases where only residents benefit from the service (population-based services), the costs were allocated to the residential uses only, whereas in cases where both residents and employees benefit from the service (population- and employee-based services), the costs were allocated to both residential and nonresidential uses. When employees benefited from a service, their benefit level was assumed to be one-half of that for a resident. **Table 5-3** shows the persons served used to allocate costs at Phase 1 and buildout for both population-based and population- and employee-based service types. The services of each service benefit type are shown below.

Population-Based Services

Recreation

Parks

Open Space and Trails

Population- and Employee-Based Services

Habitat

Landscape Corridors

Road Maintenance

Transit

TDM Services

The cost estimates and allocations for each CHLSD service category are discussed in the remainder of this chapter. For each category, this discussion includes the following components:

- Estimated level of services and the service provider.
In some cases, operating and maintenance costs are shared between service providers. In these cases, the maintenance responsibilities are specified for each organization.
- Estimated annual cost required to meet the service standards at the completion of Phase 1 and buildout.
- Cost allocations at the completion of Phase 1 and at buildout.

Recreation Services

Elements of Service

The CHLSD will provide recreation services and programs. The programs will include traditional sports activities, such as youth and adult basketball and soccer, and coordination with other sports organizations such as Little League™. Programs also will include traditional special interest activities such as dance, music training, crafts, youth summer day camp, and others typically associated with a park district or department. The recreation service is envisioned as extending into community health and wellness education and environmental awareness and education. Thus, the recreation services might include classes on nutrition, gardening, individual wellness, walking, nature studies, and so on. In addition, the recreation services would coordinate a community gardens program and a local farmers market.

Preliminary Service Level Standards

The actual selection of programs and services will evolve and change with the needs and interests of the community and will be determined by the County BOS or CHCSD Board.

Estimated Annual Services Costs

Table 5-6 details the calculation of the estimated net annual recreation costs at completion of Phase 1 development and at buildout. The recreation services in this table include a swim center and other general recreation programs. It is assumed the swim center will not be built until after completion of Phase 1 development. The swim center service costs will be incurred only if and when the swim center is built.

All cost estimates are preliminary and are based on cost assumptions in comparable project areas. The swim center annual services cost estimate is based on annual pool maintenance costs for a comparable pool (the Arroyo Pool) in the City of Davis, California. A 50 percent cost recovery from all recreation program revenues is assumed. The recreation programs cost recovery percentage is based on a survey of recreation costs in other jurisdictions in the region.

Annual Services Cost Allocation

Table 5-7 details the allocation of the net annual recreation services cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to residential uses only.

Table 5-6
Cordova Hills Urban Services Plan

Park Maintenance

Elements of Service

Park maintenance services will be provided by the CHLSD and will comprise maintenance of park facilities and upkeep of all parklands, including turf, irrigation, playgrounds, and sports facilities. In addition, the CHLSD will be responsible for maintaining the lighting in the parks. Staff crews also will clean restrooms and repair facilities damaged by vandalism.

The park plan for Cordova Hills includes a combination of large sports facilities, a Community Park, and several neighborhood parks. In addition to the formal parks, there is an extensive network of open space areas that weave through the residential neighborhoods and along the edge of the major resource avoidance open space areas.

The Sports Park is a 50-acre complex located near the university/college campus center at the west side of Cordova Hills. This site will include soccer fields, baseball and softball fields, extensive picnic areas, and parking, among other amenities. The Sports Park is envisioned as a primary community resource that will serve much of the active sports needs, particularly for league and tournament play.

The Community Park is located adjacent to the commercial center in East Valley near the geographic center of the community. The Community Park encompasses 18 acres and will abut the commercial site to provide an opportunity for a restaurant to be located overlooking the park. The park will be distinctly urban in character and will include a community center, a village green for a farmers market and large community events, playgrounds and picnic areas, and a splash fountain, in addition to open turf and play fields.

Neighborhood parks will encompass 5 or 6 acres and will include open turf for soccer, picnic facilities, and a playground. Tot lots are not the obligation of the CHLSD but may be developed as part of subdivision development, with funding paid through a homeowners association (HOA).

Preliminary Service Level Standards

The County General Plan requires 5 acres of parkland per 1,000 residents. As detailed in the Draft Cordova Hills Master Plan, the maximum residential development of 8,000 units would generate a projected population of 21,379 at buildout. This population would create a need for a total of 106.9 acres of designated parkland in the Cordova Hills community, in addition to the avoided areas and other non-credited open space/parks. The Cordova Hills Master Plan includes 99.1 acres of active neighborhood, community, and sports parks, leaving the Project with another 7.8 acres of required active parks. Consequently, the park maintenance cost estimates assume that 7.8 acres of open space will be developed as active parkland (see discussion below).

Estimated Annual Service Costs

Table 5-8 details the calculation of the estimated net annual park costs at completion of Phase 1 development and at buildout. Separate cost estimates are shown for neighborhood parks, community parks, the sports park, and additional active parks needed to meet the required 106.9 acres of parks. As discussed above, the additional active parks will be land currently designated as open space that will be developed as active parks. The cost estimates are preliminary and are based on cost assumptions in comparable project areas. The maintenance

cost estimates per acre are somewhat higher for neighborhood parks because these parks are smaller and have relatively more facilities versus open fields to maintain.

Annual Services Cost Allocation

Table 5-9 details the allocation of the net annual park maintenance cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to residential uses only.

Table 5-8
Cordova Hills Urban Services Plan
Annual CHLSD Parks Maintenance Cost (2011\$)

Open Space and Trails Maintenance

Elements of Service

The CHLSD will maintain all open space/greenbelts, open space edge conditions, paseos, and trails outside the public ROW, as well as the lighting located in paseos and along trails.

Maintenance of the open spaces does not include maintenance of the three distinct preserves (referred to as avoided areas), which will be maintained through an endowment. The maintenance does, however, include treatment of physical edge conditions surrounding the avoided areas. All the edge conditions include a landscaped area, trail, and swale that create a hydrological barrier from urban runoff toward the avoidance area. This landscaped area would be located outside the avoidance area boundary and would serve as an additional buffer, decreasing “edge effects” on wildlife and habitat in the avoided area.

Estimated Annual Maintenance Costs

Table 5-10 summarizes the open space and trails annual maintenance cost at the completion of Phase 1 development and at buildout. Separate cost estimates are shown for maintenance of open space/greenbelts, open space edges, paseos, multi-use trails, and lighting along paseos and trails. Please note that the open space/greenbelts square feet shown at buildout include an adjustment to account for open space acres that will be developed as active parkland (see previous discussion in Park Maintenance section). The cost estimates for all items except lighting are based on the planned square feet for Phase 1 and buildout and on the estimated annual cost per square foot for the different types of open space and trails. The lighting cost estimates are based on the linear feet of paseos and trails, the number of lights required using an estimate of one light every 200 linear feet, and an estimated annual maintenance cost per light.

Table 5-11 details the calculation of the annual maintenance costs at completion of Phase 1 and buildout. Annual maintenance costs per square foot were estimated by MJS Design Group.

Annual Maintenance Cost Allocation

Table 5-12 details the allocation of the net annual open space and trails maintenance cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to residential uses only.

Habitat Operations and Maintenance

Elements of Service

Wetlands preservation will be required in the avoidance areas of the Project. Most of the avoidance areas are in the western third of the Project. In addition, offsite habitat mitigation will be required. The offsite mitigation costs will include creation, restoration, and preservation costs and are discussed in the Cordova Hills Financing Plan and proposed to be funded through the Cordova Hills Special Financing District.

The ongoing costs of operating and maintaining the onsite preserve are planned to be funded through the annual CHLSD tax or assessment. The ongoing operations and maintenance of the habitat includes legal, construction, survey, maintenance, operations, and reporting functions.

Estimated Annual Maintenance Costs

Table 5-13 summarizes the annual onsite habitat operations and maintenance costs. These costs are detailed in the Property Analysis Record (PAR) prepared to estimate annual management costs for the onsite Cordova Hills habitat preserve. The costs in **Table 5-13** are estimates for the annual costs beginning in the year after the habitat is established. The first-year costs would be somewhat higher than in the subsequent years because additional costs would be required to establish the habitat.

It is assumed that the entire required onsite preserve will be established and will need to be maintained in the first year of Cordova Hills development. Consequently, the annual Phase 1 costs are equal to the buildout costs (in 2011 dollars). The Cordova Hills developer may be required to privately fund some of the costs in the first few years of the Project until enough development occurs that the proposed tax or assessment would provide sufficient revenue.

Annual Maintenance Cost Allocation

Table 5-14 details the allocation of the net annual habitat operations and maintenance costs to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to both residential and nonresidential uses.

Table 5-13

Landscape Corridors

Elements of Service

Landscaping in the Project refers to landscaping in road medians and adjacent to roads. It will include water features, traditional landscaping, landscaping with Low Impact Development (LID) features, rain gardens, gateways, sidewalks, walls and fences, directional and project signage, and accent and signage lighting.

For the purposes of determining the landscaping that will be maintained by the CHLSD and the cost of that landscaping, the landscaping features have been divided into the following categories:

- Landscape Corridors
- Landscape Corridors with LID Features
- Median Landscaping
- Median Landscaping with LID features
- Sidewalks
- Sound Walls

The CHLSD will maintain some of these landscaping features, depending on the adjacent type of property. **Map 5-1** categorizes the roads (and subsequently the adjacent landscape corridors) by the types of property they front. The CHLSD-maintained landscaping is detailed below by landscaping category.

Landscape Corridors and Landscape Corridors with LID Features

The CHLSD will maintain the following landscape corridors:

- All landscape corridors with LID features.
- All landscape corridors without LID features that do not directly front commercial, residential, or school district properties.

All landscape corridors without LID features that front commercial, residential, or school district properties will be privately maintained by commercial property owners, home owners, or the Elk Grove Unified School District (EGUSD).

Median Landscaping and Median Landscaping with LID Features

The CHLSD will maintain all median landscaping (with and without LID features).

Sidewalks and Sound Walls

The CHLSD will maintain the following sidewalks:

- All sidewalks in single-family residential areas.
- All other sidewalks that do not front commercial, multifamily, condominium, or school district properties.

All sidewalks that front commercial, multifamily, condominium, or school district properties will be privately maintained by commercial property owners, home owners associations, or the EGUSD.

The CHLSD will maintain all sound walls.

Preliminary Service Level Standards

The landscape maintenance standards will comply with the design vision and standards established in the Cordova Hills Master Plan/Special Plan Area Ordinance. This will require a low maintenance and low water demand landscape design. Regular periodic maintenance on a weekly schedule will be required to maintain visual quality and to sustain the viability of the plantings. The maintenance also will include vandalism and graffiti abatement in all public common areas outside the public street ROW.

Estimated Annual Maintenance Costs

Table 5-15 summarizes the CHLSD landscaping maintenance cost at the completion of Phase 1 development and at buildout. Cost estimates are shown for each category of landscaping feature discussed above. These estimates are based on the planned landscaping square feet for Phase 1 and buildout and on the estimated annual cost per square foot for the different categories of landscaping features.

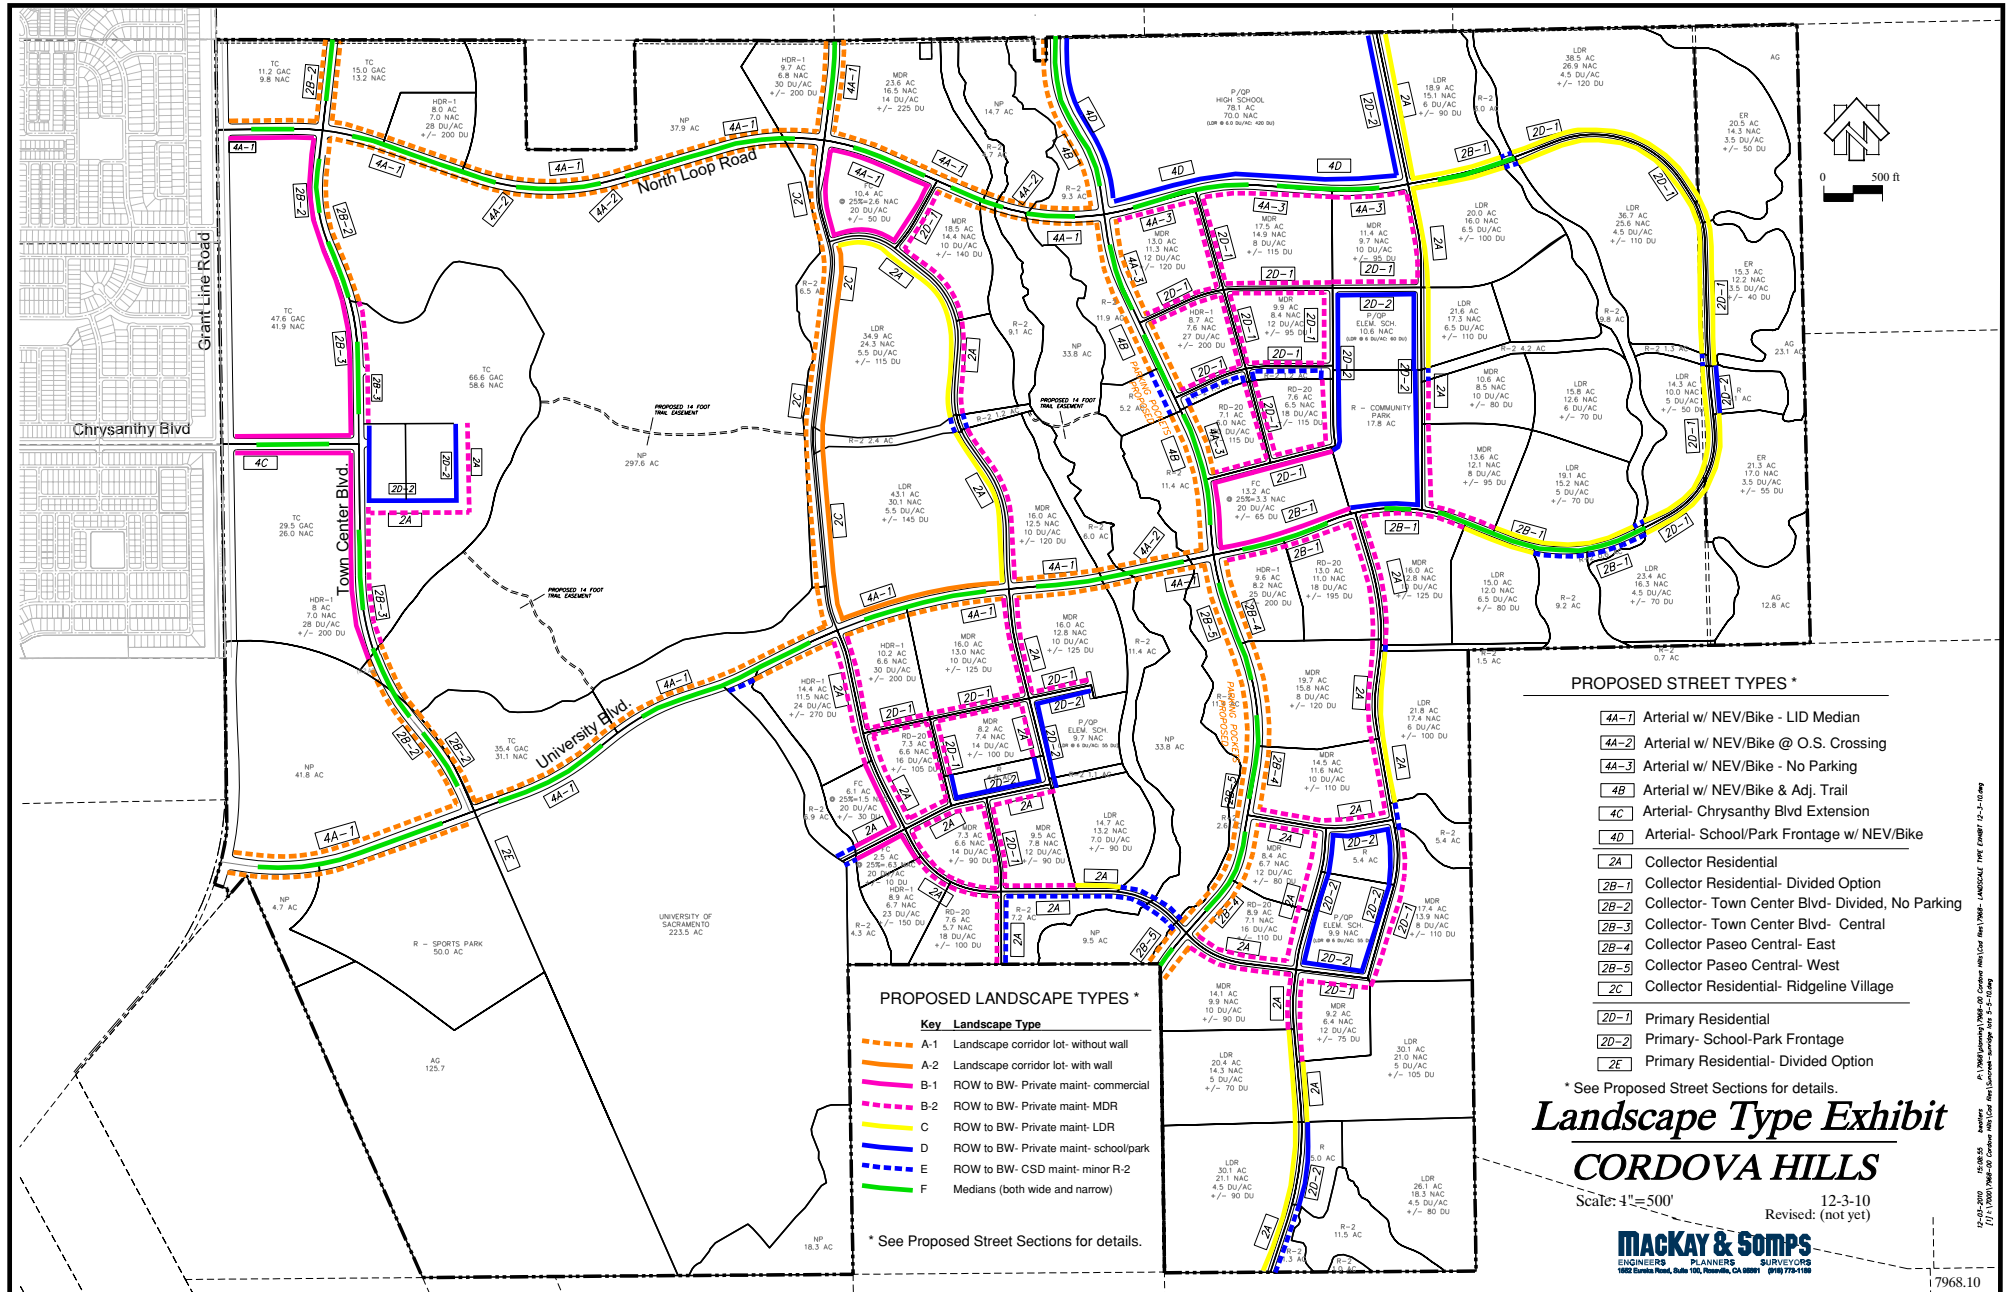

Table 5-16 details the calculation of the annual CHLSD maintenance costs for landscaping in landscape corridors and medians at completion of Phase 1 and buildout. **Table 5-17** details the calculation of the CHLSD sidewalk and sound wall maintenance costs at completion of Phase 1 and buildout. **Table 5-18** details the estimated linear feet of sidewalks that are used in **Table 5-17** to estimate the annual sidewalk maintenance cost.

Annual maintenance costs per square foot for each landscaping category except sound walls were estimated by MJS Design Group. The maintenance cost per square foot for sound walls were assumed to be equal to the maintenance costs per square foot for sidewalks.

Annual Maintenance Cost Allocation

Table 5-19 details the allocation of the CHLSD landscaping maintenance cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to both residential and nonresidential uses.

Road Maintenance

Elements of Service

The County DOT will maintain the roads and adjacent facilities in the public street ROW consisting of paved section, curb and gutter.² County DOT road maintenance services are funded through revenues recorded in the County's Road Fund (e.g., gas tax; property tax; Measure A half-cent sales tax). EPS prepared a Draft Fiscal Impact Analysis, which estimated whether Road Fund revenues generated by the Project would adequately cover the cost of the County DOT-provided road maintenance services described previously. The results of the Fiscal Impact Analysis indicated that the County Road Fund would result in an annual net deficit of \$34,000 in Phase 1 and an annual net deficit of \$201,000 at buildout of the Project. This annual deficit is anticipated to be funded by the Mello-Roos CFD special tax.

To the extent that there are surplus revenues in the County Road Fund (i.e., revenues are greater than expenditures), the CHLSD could provide supplemental road maintenance services consisting of expanded street sweeping or other on-site road maintenance.

Estimated Annual Maintenance Costs

The Draft Fiscal Impact Analysis prepared by EPS indicates an annual net fiscal deficit in the County Road Fund of \$34,000 for Phase 1 and \$201,000 at buildout of the Project. As such, this Urban Services Analysis uses these deficits as costs to allocate to development in the Project.

Annual Maintenance Cost Allocation

Table 5-20 details the allocation of the annual road maintenance cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to both residential and nonresidential uses.

² The exception is that the CHCSD will maintain the landscaping in all medians as discussed in the Landscaping section earlier in this chapter.

Transit Operations and Maintenance

Elements of Service

The Cordova Hills proponent proposes including a local transit system consisting of two distinct but coordinated bus routes. An internal route will operate around a loop in the Cordova Hills Plan Area. An external loop will provide a connection to the Mather/Mills Light Rail Transit (LRT) station. The loops can operate independently with a transfer hub in the Cordova Hills Town Center, but the routes will be coordinated so they can operate as a single continuous route with no transfers required.

The planned system will connect to Sacramento Regional Transit (RT) system but will not be part of RT. The Cordova Hills system would be operated by a service operator under contract to the County or CHLSD.

The CHLSD will lease buses and will own and manage all bus shelters, turnouts, and signage associated with the transit system. The CHLSD also would provide Transportation Management Association (TMA) services or contract with another TMA for management of TMA services (detailed later in this chapter). The internal services may include a range of rideshare initiatives, travel demand management (TDM) methods, and alternative mode promotional activities undertaken by the TMA.

Preliminary Service Level Standards

The transit system will begin with limited services that may involve only an external shuttle to the Mather/Mills LRT station. The County BOS or CSD Board and General Manager of the transit system for Cordova Hills will assess the appropriate transit routes and timing for Phase 1 and subsequent phases based on funding and actual ridership. The transit plan summarized in this report is a guide for the CHLSD to follow. As the community grows, the transit plan envisions that an internal loop system will be developed. The internal loop will expand with the community along the primary street system, a modified grid form that allows flexibility for routing to serve the greatest number of potential riders. Transit service will provide “timed transfers” or continuous loops to minimize the need for transfer between the internal shuttle and external connection to the LRT station. The transit system is planned to operate 365 days per year with a full schedule on weekdays and a reduced schedule on weekends and holidays, as detailed in the remainder of this section.

Internal Route

At buildout of the Project, the internal system would operate from 6:00 AM to 9:00 PM every day. The transit plan assumes two 2-hour peak periods on weekdays: one in the morning from 7:00 to 9:00 and one in the afternoon from 4:00 to 6:00. There would not be peak periods on weekends. Headways would be 15 minutes during peak hours and 30 minutes during all other times of the day. Routes would be run in both directions. Walk access distances to transit stops will be designed in the location of primary roads, pedestrian ways, and the location of major destinations and housing areas to achieve ¼-mile at maximum. The internal route characteristics are summarized below.

Hours of operation	6 AM–9 PM
Days of operation	Everyday
Peak Frequency	15 minutes
Off Peak Frequency	30 minutes
Percentage of Residents within ¼ Mile	84%
Average Speed (including stops)	10 miles per hour

External Route

An external shuttle loop service between the Cordova Hills Transit Center and the Mather/Mills Station on the RT Gold Line light rail line would provide a linkage to those services from Cordova Hills. The external loop would operate on weekdays only. At buildout of the Project, it would operate from 6:00 AM to 7:00 PM on weekdays only. As with the internal loop, there would be two 2-hour peak periods: one in the morning from 7:00 to 9:00 and one in the afternoon from 4:00 to 6:00. Headways would be 15 minutes during peak hours and 60 minutes during all other times of the day. The route would be run in one direction only. The external route characteristics are summarized below.

Hours of operation	6 AM–7 PM
Days of operation	Weekdays
Peak Frequency	15 minutes
Off Peak Frequency	60 minutes
Scheduling	Timed transfers with LRT and RT service at Mather/Mills LRT Station
Target Average Speed (including intermediate stops)	30 miles per hour

Estimated Annual Operations and Maintenance Costs

Table 5-21 shows the calculation of the annual transit operations and maintenance costs at the completion of Phase 1 development and at buildout. The buildout cost is estimated as the cost per revenue hour (provided by MV Transportation) multiplied by the estimated annual revenue hours. A revenue hour is equal to one hour of operation for one vehicle. The Phase 1 cost is estimated so the cost per person served is equivalent to the buildout cost per person served.

Table 5-22 details the estimated revenue hours per operation hour, which is equivalent to the number of buses required per operation hour, for the peak and non-peak periods of both the internal and external routes. These factors are used in **Table 5-21** to estimate the total annual revenue hours.

It is assumed that a portion of the transit costs will be funded through fare box recovery and a university/college campus center subsidy. The fare box recovery is assumed to account for 5 percent of the total gross costs. Fares will apply only to outside users of the transit system. Cordova Hills residents, employees, and university/college campus center students will have transit passes. The university/college campus center subsidy is assumed to be \$100 per student.³ **Table 5-21** shows both the gross annual estimated transit costs and the net annual costs after accounting for fare box recovery and the university/college campus center subsidy.

Table 5-23 provides a comparison between estimated operating transit costs, revenues, and surpluses at various stages of Project buildout.

Note that **Table 5-23** includes estimated costs at the issuance of 1,000 residential building permits. As detailed in the Development Agreement, this is the point by which the external shuttle service must commence. Initiation of the external shuttle service could be required at any point between issuance of the 500th and the 1,000th residential building permits, depending on the results of an analysis to be conducted by the CHLSD before issuance of the 500th building permit to assess whether the external shuttle service should be commenced at 500 residential building permits or at a later threshold.

Annual Operations and Maintenance Cost Allocation

Table 5-24 details the allocation of the net transit operations and maintenance costs to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to both residential and nonresidential uses.

³ In the event that a university or other institution of higher learning does not develop, the special tax on residential and non-residential development allocated to pay for transit costs would increase above what is shown in the Cordova Hills Urban Services Plan.

Table 5-21
Cordova Hills Urban Services Plan
Annual CHLSD Transit Operations and Maintenance Cost (2011\$)

Transportation Demand Management (TDM) Services

Elements of Service

The CHLSD will provide TDM services through programs serving the community residents, as well as businesses and institutions. Services to the residents, businesses, and institutions in Cordova Hills that encourage more efficient use of transportation and parking resources may include these:

- Marketing and Promotion
- Parking Management and Brokerage
- Pedestrian and Bicycle Planning
- Pedways
- Rideshare Matching and Vanpool Coordination
- Shared Parking Coordination
- Shuttle Services
- Special Event Transport Management
- Telework Support
- Transit Improvements
- Transportation Access Guides
- Wayfinding and Multi-Modal Navigation Tools

The CHLSD would implement the TDM programs for the community residents, businesses, and institutions through a TMA. The CHLSD either would establish an internal TMA or would participate in another geographically broader TMA.

TMA's are generally public-private partnerships. They provide an institutional framework for the TDM services programs and allow small employers to provide commute trip reduction services comparable to those offered by large companies.

TMA's can provide a variety of services, including these:

- Access Management
- Commute Trip Reduction
- Commuter Financial Incentives
- Flextime Support
- Guaranteed Ride Home Services

Participation in the TMA will be required for land zoned Town Center (TC), Flex Commercial (FC), and Public/Quasi Public (P/QP) in Cordova Hills through one or more of the following mechanisms: the purchase and sale agreement for individual parcels; a Master Property Owners' Association; or the Conditions, Covenants, and Restrictions (CC&R).

Estimated Annual Services Costs

Table 5-25 summarizes the estimated annual TDM services costs at completion of Phase 1 development and at buildout. The program costs include costs to serve both Cordova Hills residents and Cordova Hills businesses. The annual residential program costs are estimated using an average cost of \$50 per dwelling unit. The annual program costs to serve the business are estimated using an average cost of \$25 per employee.

Annual Services Cost Allocation

Table 5-26 details the allocation of the net annual TDM service cost to the benefitting land uses at the completion of Phase 1 development and at buildout. These costs are allocated to both residential and nonresidential uses because services will be provided both for residents and employees.

CHLSD Administration and Communications

Elements of Service

Initially, the County will administer and coordinate the activity of all services provided directly by the CHLSD and County agencies and departments. The County also will coordinate with other service providers who are not directly under the administration of the CHLSD, such as the SMFD, the County DOT and others.

If a CSA is chosen as the most efficient governance option, the County will continue to administer and coordinate these services. The County BOS could also create a Local Advisory Board (CSA Board) comprised of local representatives to administer and coordinate services. If a CSD is chosen as the most efficient governance option, a board of directors will be established to administer and coordinate these services.

The CHLSD administration activities will include overseeing the daily operations of the services, preparing and administering the annual budget, providing a liaison to other service agencies, and providing a point of contact for the residents and businesses in the service area. In addition, each individual CHLSD service type (and associated cost estimate) is assumed to include an administrative component for daily administration of the particular service.

CHLSD administration will include a core community communication network to disseminate information about community activities; to facilitate services, such as rideshare opportunities and transit schedules; and to provide emergency service information. The communication network will take the form of a community intranet that includes community and special interest Web sites, public meeting broadcasts, and such public services as may become apparent as the community grows.

Preliminary Service Level Standards

The CHLSD will provide adequate administrative support to manage all services administered and funded through the CHLSD. As development progresses and the level of demand for services increases, the level of administrative support also will increase.

To implement the community communication network aspect of the administration, the entire community will be wired with cable or wireless services that are capable of providing a communication link to all homes and businesses. This is intended to provide a public access channel that will "piggy-back" onto or supplement such commercial services that may be available in the community. The CHLSD will provide content for the network and will provide for maintenance of the system. Such maintenance may be by contract with a commercial provider.

Estimated Annual Service Costs

The annual cost relative to the number of residents and employees is anticipated to be greater for Phase 1 than at buildout for two reasons. First, initial CHLSD startup costs will be incurred in Phase 1 that will not be incurred at buildout. Second, the CHLSD will need to start with a certain base level of services that would not increase proportionately to the population increase as the community develops.

It is assumed that the annual CHLSD administration cost will be approximately \$400,000 annually at completion of Phase 1 (approximately 24 percent of the total CHLSD services costs)

and \$1 million annually at buildout (approximately 15 percent of the total CHLSD services costs). These costs are shown in **Table 5-1**.

Annual Services Cost Allocation

Tables 5-4 and **5-5** (previous summary tables) show the estimated annual CHLSD administration costs by land use at the completion of Phase 1 development and at buildout, respectively. For Phase 1, the cost by land use is equal to 15 percent of the sum of all other CHLSD service costs by land use, and for buildout, the cost by land use is equal to 10 percent of the sum of all other CHLSD service costs by land use.

6. URBAN SERVICE FINANCING STRATEGY

Urban services provided to the Cordova Hills Community will be funded with a combination of existing local tax revenues (property taxes, sales taxes, etc.) that will be generated by new development and new local development-related sources. An overarching principle of this Urban Services and Governance Plan is that the new community will not place a financial burden on the County as a whole at any phase of the Project. Because the timing of development and the exact mix of development during a given time period may be subject to variation, the urban services financing strategy will need to adapt to changing conditions. The proposed urban services financing strategy for the Project is based on the following guiding principles:

- For urban services provided by the County, traditional funding mechanisms would be used to provide service at the same levels provided for in other urbanized portions of the County. Cordova Hills also would participate in existing special financing districts that provide funding for County General Fund services, such as CFD 2005-1 for police services.
- County Special Districts (SASD, SRCSD, SCWA Zone 12, SCWA Zone 40, etc.) will provide wastewater collection and treatment, water quality, storm water, and potable water services to the Project with funding provided through their user rate structure.
- Other Special Districts (SMFD, EGUSD) will provide services with funding from property taxes, special assessments/taxes charged on a districtwide basis, and other traditional funding sources.
- The CHLSD will provide its authorized services through special taxes/assessments, user charges, and other revenues available to the CHLSD. For some services described in **Chapter 5**, the CHLSD will provide enhanced levels of services that exceed the base levels of services provide by the County or special districts.

The following sections describe potential new urban services funding mechanisms and how those mechanisms will be applied to the urban services proposed in Cordova Hills.

New Local Funding Mechanisms

Several funding mechanisms could be implemented to provide funding for urban services. The set of mechanisms implemented would depend on whether a CSA or CSD is formed. The decision on whether to form a CSA or CSD will not be decided until the Project is approved. Project-specific mitigation measures could include the special taxes or assessments described below.

Assessments

Local governments may impose assessments on benefiting property to fund construction, operations, and maintenance of street landscaping, lighting, traffic signals, parks, trees, sidewalks, recreational facilities, transit facilities, and transportation system management

activities. Formation of an assessment district requires an Engineer's Report and majority vote of the benefiting landowners.

By statutory definition, the funds generated by assessments must benefit the properties assessed and may not be used to fund services outside the special district/Special Planning Area.

Mello-Roos Community Facilities Districts for Services

Mello-Roos CFDs for Services (Services CFDs) are authorized to cover a variety of public services, as outlined below:

- Police protection services.
- Fire protection and suppression services, and ambulance and paramedic services.
- Recreation program services; library services; and the operation and maintenance of parks, parkways, open space, museums, and cultural facilities (a tax to fund these services must be for a registered-voter-approved CFD as opposed to a landowner-approved CFD).
- Maintenance and lighting of parks, parkways, streets, roads, and open space.
- Flood and storm protection services, including the operation and maintenance of storm drainage systems and sandstorm protection systems.
- Removal or remedial action for the cleanup of any hazardous substance released or threatened to be released into the environment.

It is likely that the CHLSD will form a CFD to fund some of its authorized services. This CFD would be formed before any development, and thus, the qualified voters would be the landowners/property owners.

Special Tax Authorized by Gov. Code Sec 50075

Special districts are authorized to levy a special tax under Government Code Section 50075, subject to voter approval. The special tax requires approval of 2/3 of the authorized voters. The ordinance or resolution proposing the special tax shall include the following specifications:

- The type of tax and the rate of tax to be levied.
- The method of collection.
- The date on which the election will be held.

The special tax also requires the local agency to provide accountability measures, including a statement indicating the purpose of the special tax, procedures so that the proceeds can only be used for the specific purposes identified, and the creation of a special account.

The authorization of the special tax likely will be necessary for services that cannot be funded either through the proposed Mello-Roos CFD or the special assessment district. Specifically, transit service and the transportation system management services may require implementation of the special tax.

Phasing of Services and Additional Funding

Initially, where possible, CHLSD services will be phased to match the special tax/assessment revenue, along with user fees and other revenues. Service levels will increase to meet the planned services standards over time. Minimum service levels are determined by the mitigation requirements in the EIR, tentative map conditions, and Development Agreement requirements.

For some services, however, a higher level of service will be necessary than can be funded by the special tax/assessment revenue in the early years of development. An example is landscaping maintenance, which must be provided once the landscaping has been established, whether or not development is great enough to generate the necessary revenue. If the annual special tax revenue on developed property is insufficient to meet minimum service levels, then the special tax/assessment will be levied against undeveloped property to help fund the annual services costs. The tax rate on undeveloped property will be on a per acre basis. The Draft Development Agreement proposes the following hierarchy for levying the special tax on undeveloped property if needed:

1. The special tax shall first be levied on undeveloped lots shown on recorded final small lot subdivision maps at up to 100% of the maximum special tax rate for developed property.
2. If the additional revenue from the undeveloped lots described above is insufficient to cover the funding shortfall, then a special tax shall be levied on property with approved tentative small lot subdivision maps at up to a specified percentage of the maximum special tax rate for developed property. This percentage will be determined when the funding mechanism to pay for services is adopted.
3. If the additional revenue from the two sources above still is insufficient to cover the funding shortfall, then the special tax shall be levied on property with recorded final parcel maps at up to a specified percent of the maximum special tax rate for developed property. This percentage will be determined when the funding mechanism to pay for services is adopted.

It should be noted that the estimated annual revenue from the tax on developed property is estimated to be sufficient to fully cover the annual Phase 1 services costs. Additional revenue from the tax on undeveloped property would only be needed in the event that the Phase 1 costs were higher than anticipated or Phase 1 development was less than anticipated.

Urban Services Costs and Special Tax/Assessment for Services

The proposed maximum services special tax/assessment rates by land use are summarized in **Table 6-1**. For each land use, the special tax/assessment rate by land use was estimated based on the total services cost allocation across all CHLSD services (detailed in the previous chapter). The estimated maximum rates shown in **Table 6-1** have been established based on the following objectives: to generate sufficient revenue to fund Phase 1 and buildout annual service costs and to keep total taxes and assessments within 1.8 percent of projected home sales prices. The latter objective is described in greater detail in the following section.

tax

Urban Services Funding Feasibility

Table 6-2 estimates the financial feasibility of the Cordova Hills services funding by analyzing the Project's total tax burden. One measure of feasibility is a comparison of the total annual property taxes and assessments as compared to the projected finished home sales price. Most jurisdictions prefer that this total tax burden range from 1.5 to 1.8 percent of projected home sales prices.

Table 6-2 estimates the total taxes/assessments for the different residential uses, including the types listed below and excluding the infrastructure taxes/assessments:

- Basic 1-percent property tax.
- Other general ad valorem taxes (e.g., school/other general obligation bonds).
- Maximum special taxes/assessments for services (from this report).

Table 6-2 subtotals all taxes and assessments, before consideration of special taxes and assessments for infrastructure. Assuming a maximum burden of 1.8 percent of estimated finished home sales prices, there appears to be the capacity for infrastructure special taxes/assessments ranging from \$200 per unit for affordable high-density units to \$1,530 per unit for estates residential units.⁴ The Project's Public Facility Financing Plan will identify the targeted special tax/assessment amounts that might be used to fund backbone infrastructure for the Project.

⁴ The finished home sales prices used in this analysis reflect higher prices than the current average (as of September 2012). It is presumed that these higher prices will be reflective of a "normalized" housing market several years from now when home builders are in a position to construct and sell dwelling units in the Project.

[1] The finished home sales prices used in this analysis reflect higher prices than the current average (as of February 2012). It is presumed that these higher prices will be reflective of a "normalized" housing market several years from now when homebuilders are in a position to construct and sell dwelling units in the Project.

7. CORDOVA HILLS GOVERNANCE PLAN

Introduction

Previous chapters detailed the proposed services and service providers for Cordova Hills. This chapter presents a Governance Plan for providing the services. It describes the objectives of the Governance Plan, alternatives considered for the provision of urban services, the elements of the proposed Governance Plan, and the procedures needed to create a CSA or CSD and implement the Governance Plan. The governance options have been described collectively as the CHLSD throughout this document. The Governance Plan provides a basis for further discussions with the County, other affected public agencies, and LAFCo staff regarding the provision of urban services and governance for Cordova Hills. The formal Reorganization Application to LAFCo will follow County action on the Master Plan and other entitlement documents (including environmental documents).

Cordova Hills will grow in time to a population of more than 21,000. As such, it will require construction and operation of substantial new municipal infrastructure, including water and sewer utilities, roads, drainage, parks and open spaces, and civic facilities, as described and evaluated in the Public Facilities Financing Plan. These facilities will require ongoing operations and maintenance. Meanwhile, the full range of urban services will be needed. The Governance Plan recognizes that urban services demanded must be efficient (i.e., take advantage of existing service capacities), provide enfranchisement of local residents, and have the revenue-generating capacity necessary to fund infrastructure and ongoing urban service standards and operations and maintenance costs.

Governance Objectives

The Governance Plan is intended to achieve several urban service and fiscal objectives for the Cordova Hills Community, including these:

1. Provide a high level of urban services to the Cordova Hills Community consistent with policies set forth in the County's General Plan and the Cordova Hills Master Plan.
2. Assure efficient and effective urban services at Cordova Hills by relying on the capacity of existing service providers when they offer the most efficient and cost-effective approach.
3. Establish a multi-purpose special district that (1) provides urban services not offered (or not offered effectively) by existing entities, and (2) enfranchises community residents regarding local urban service provision and future transitions.
4. Provide an adequate fiscal base for the new community so desired urban service levels can be achieved and maintained over time, while also maintaining "revenue neutrality" for the County and other urban service providers.

Governance Options

While this report proposes a certain mix of urban service providers, these services could be delivered via several governance options (how urban services are organized and governed) as outlined below. The topic of governance options has been discussed with County staff and Sacramento LAFCo staff during preparation of the Cordova Hills Master Plan over the past several years. The resulting Governance Plan is a hybrid of the available options.

Governance options considered include these:

- Continuation of services by existing agencies (e.g., County agencies, existing regional special districts).
- Annexation to an existing multi-purpose special district or city.
- Creation of a dependent special purpose special district (e.g., CSA) to provide or enhance urban service levels.
- Creation of an independent multi-purpose special district(s) (e.g., CSD).

Continued Services Provided by County Departments

The County currently provides urban services to an expansive urbanized area in the County; approximately 40 percent of the County's population of 1.4 million resides in unincorporated urban communities. Over the years, the County has established an urban service capability that is on par with a typical large suburban city. This capability is built around its line departments (e.g., Sheriff, Public Works, Planning and Development Services) but also includes several regional independent special districts and authorities.

While continuing County services is a key part of the Urban Services and Governance Plan and is thus reflected in the Governance Plan, there are several services required and proposed for Cordova Hills that are not provided by existing County departments or dependent special districts for the area. These additional services include park maintenance, open space and trails maintenance, landscape corridors maintenance, habitat restoration and management, recreation services, road maintenance (and potentially, supplemental road maintenance), transit operations, TDM programs, and general administration and community communications. For example, while Cordova Hills is within the boundary of County Service Area 4B, administered by the County Regional Parks Department, the Parks Department provides maintenance of regional parks but does not provide maintenance of local community and neighborhood parks.

Annexation to Nearby City or Special District

The Cordova Hills Master Plan Area abuts the municipal boundary of the City of Rancho Cordova. While annexation to the City of Rancho Cordova could meet the governance objectives, it would not be consistent or compatible with development objectives, as expressed in the Cordova Hills Master Plan. The City of Rancho Cordova's planning, housing, and infrastructure financing policies are not consistent with those included in the Cordova Hills Master Plan or the Public Facilities Financing Plan.

The Cordova Hills Master Plan area could annex into the Cordova Recreation and Park District (CRPD). However, the CRPD does not provide the full range of services proposed for the CHCSD. Consequently, the range of services planned for Cordova Hills would place a burden on CRPD for which there is no current staffing or facilities. The added services would create a notable differentiation in services types and levels of service in the CRPD that would likely result in difficult management and policy issues. Also, it would be difficult for the CRPD to provide the service levels prescribed for Cordova Hills because Cordova Hills would be only a small part of the CRPD service area. Moreover, it is unlikely that there would be any representation for Cordova Hills on CRPD's Board of Directors until buildout of the Project, and even then, representation on CRPD'S Board of Directors would be uncertain, thus disenfranchising local residents.

Create New County Service Area (CSA)

Counties needing to introduce or enhance urban services in unincorporated portions of the county have commonly created CSAs, dependent special districts that are budget units of the County governed by the County Board of Supervisors (BOS). A "multi-purpose" CSA could be created to provide the additional urban services required for Cordova Hills.

Create New Multi-Purpose Community Services District (CSD)

A CSD could be formed to provide an administrative and financial framework for providing the urban services required and proposed for Cordova Hills that are not provided by existing agencies. CSDs have become a common form of governance for providing urban services in unincorporated areas around the State.

Regarding the matter of municipal service efficiency (a key criterion LAFCo will use in evaluating any local agency formation or reorganization), the CSD can be highly efficient. For example, in the early years when the Cordova Hills Community is being created but has limited service demand, existing County staff can provide service, assuming excess capacity exists in the operating departments. Provision of urban services by the County during the initial years of development will need to take into consideration the Community's proximity to County facilities and staff, for example, the nearby Bradshaw Road County Center.

Over time, as service demands grow, additional staff will be required, regardless of whether they are working for existing agencies (e.g., county departments) or for a new government agency. In any case, it is assumed that cooperation between government agencies, including contracting for services, can assure efficient use of existing capacity and the most efficient way to increase staff capacity as service demands grow. It is assumed that agreements (i.e., an Urban Services Agreement or specific service contracts) between the CSD and other agencies can define and regulate what services are provided by which agency based on the most efficient approach.

Cordova Hills Governance Plan

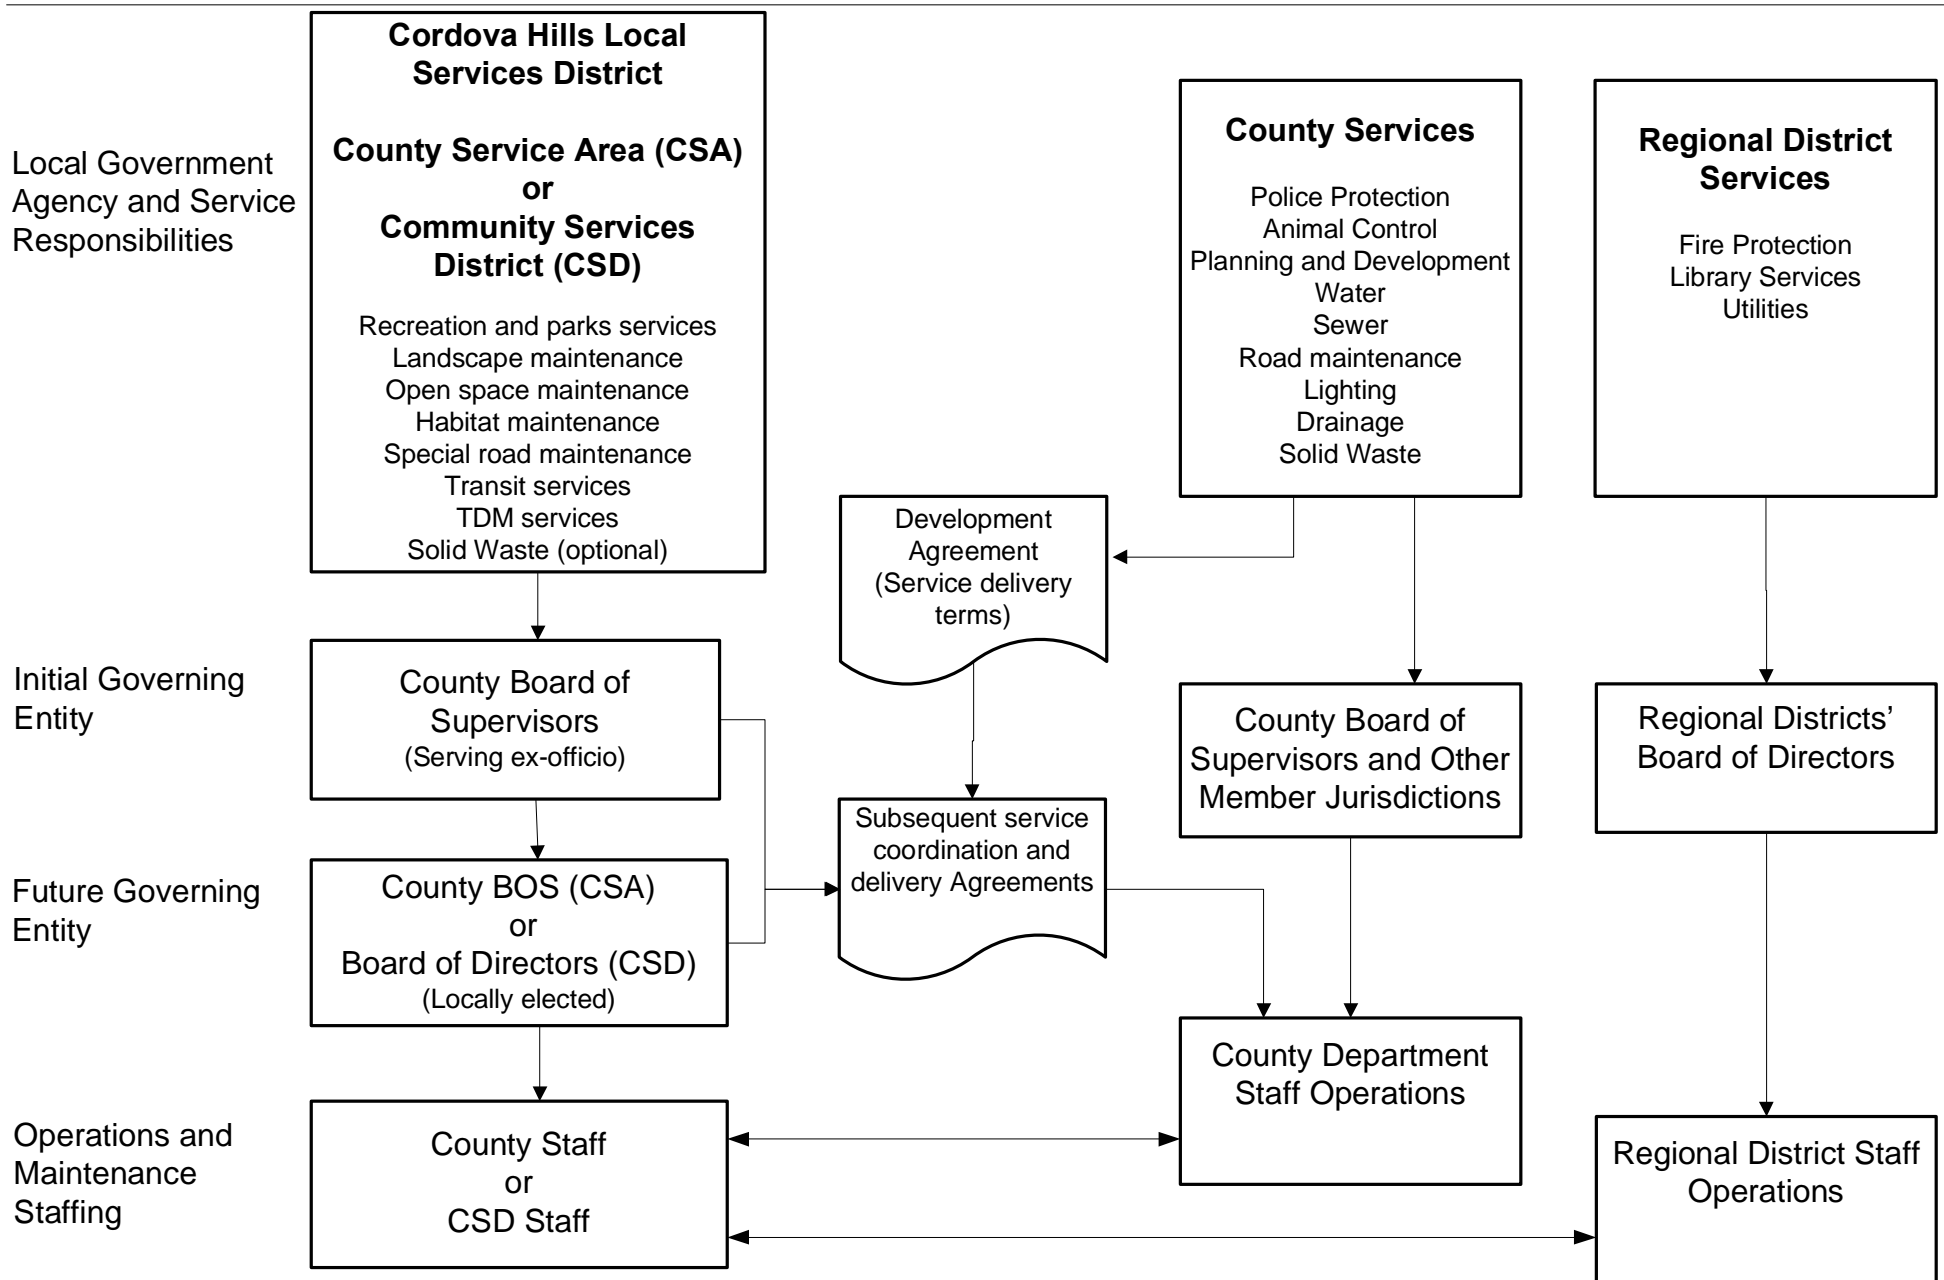

The Governance Plan for Cordova Hills reflects the urban service demands outlined in this report. It incorporates experiences from around the State in providing governance and services to unincorporated new communities, applies statutory-based forms of local governance, and reflects the unique circumstances of the Cordova Hills development. It is informed by previous analyses

of urban service demands, including environmental review, the fiscal analysis, and the design of the Project itself, which proposes several unique features that influence service demands. As part of this effort, there have been interviews and briefings with County staff (as part of developing the Urban Services and Governance Plan and the Fiscal Impact Analysis) and LAFCo staff.

The Governance Plan is summarized in **Figure 7-1**, which identifies the key local government entities, their governing bodies, and operations and maintenance staffing. Key features of the proposal are listed below:

- It has been assumed that County departments will provide urban services to Cordova Hills in a manner similar to the urban services provided to other urbanized portions of the County. Related conditions and terms that specify levels of service and other terms of service provisions can be included in the Development Agreement. Subsequent service agreements also can be entered into between the CSD (if chosen and formed) and the County.
- Regional Special Districts including the SMFD and SMUD will provide services as they do throughout the other urban portions of the County.
- Creation of a CSA or CSD. A CSA or CSD would be created to provide recreation and park services, open space and trails maintenance, enhanced levels of landscaping, road maintenance (and potentially, supplemental road maintenance), local transit service, TDM programs, habitat operations and maintenance, community communications, and related administrative services, as detailed in **Chapter 5**. The County BOS resolution (CSA) or Resolution of Application and the Terms and Conditions imposed by LAFCo as a part of special district formation (CSD) can specify desired service levels and other aspects of service delivery, as well as a means of funding.
- Contracts between the CSD (if chosen as the most effective governance option) and the County departments (or other regional service providers) can be used to specify service levels and other service requirements. These contracts would be entered into between the CSD (if chosen) and the County following CSD formation.
- If a CSA is created, the County BOS also could create a Local Advisory Board (CSA Board) comprising local representatives. This Board could be endowed with management and contracting oversight and could make recommendations to the County BOS on policy and procedures; final decisions ultimately would be at the discretion of the County BOS. The CSA could have a permanent director or executive officer to oversee the provision of services, retain institutional memory, and represent the interests of the CSA and its constituents in interactions with service providers and other government entities.
- If a CSD is created, transition of CSD governance to a locally elected Board of Directors. Initially, as provided for in the enabling statute, the CSD would be governed by the County BOS, which, serving ex officio, would serve as the Board of Directors. In both cases, the terms and conditions of district formation adopted by LAFCo would specify a point at which local residents may vote on the question of creating a locally elected Board(s) of Directors.

Figure 7-1 -- Summary of Cordova Hills Governance Proposal

LAFCo Considerations (CSD Only)

LAFCo has sole discretion regarding formation of a CSD and the related local government reorganization actions, including completing a Municipal Services Review (MSR)/Plan for Services (PFS) and establishing an SOI for the new district.⁵ As part of the MSR/PFS, LAFCo will evaluate the service delivery of the CSD and make determinations regarding the effectiveness of the service delivery program and means and timing of financing. As part of its action on the proposed CSD application, LAFCo will determine whether the proposal is financially feasible. The following items clarify the CSD proposal in a format consistent with LAFCo standards and procedures.

SOI Considerations

This section addresses each of the factors that LAFCo must consider in making its determination regarding the SOI for a CSD.

1. The maximum possible service area of the agency is based on present and possible service capabilities of the agency.

The service area proposed for the CSD is coterminous with the boundary of the Project. If, at some time in the future, the Project area is amended to include additional territory, then an SOI boundary change could be considered, before any related annexation.

2. The range of services the agency is providing or could provide.

The CSD would be authorized to provide the following services:

- Parks and recreation.
- Open space and trails.
- Habitat operations and maintenance.
- Enhanced levels of landscaping.
- Supplemental road maintenance.
- Transit operations and maintenance.
- Transportation systems management.
- Administration and community communications.

3. The projected future population growth of the area.

There is no present population within the boundaries of the Project. The maximum buildout population from the Draft Cordova Hills Master Plan is estimated at 21,379. The university/college campus center at full development in several years will have approximately 4,040 resident students out of a total student enrollment of 6,000. The student resident recreation needs will be met by on-campus sports and recreation facilities and programs.

⁵ As described by California Government Code Section 56076, a Sphere of Influence (SOI) is "a plan for the probable physical boundaries and service area of a local government agency."

4. The type of development occurring or planned for the area, including residential, commercial, and industrial development.

The land uses and projected development for the Project are detailed in **Table 2-1** and **Table 2-2**.

5. The present and probable future service needs of the area.

The service needs of the Project are fully described in this report. **Chapter 5** describes in detail the services that would be provided by a CSD.

6. Local governmental agencies presently providing services to such area and the present level, range, and adequacy of services provided by such existing local governmental agencies.

There are no urban services currently being provided to the area. Cordova Hills is within the boundary of County Service Area 4B administered by the County Regional Parks Department. The County focuses on regional park facilities and does not provide local community and neighborhood parks. A reorganization that would remove Cordova Hills from the boundary of CSA 4B is part of the proposed LAFCo action. **Chapters 3** and **4** describe the existing governmental agencies that will provide services to the area. The service providers are summarized in **Table 1-1**.

7. The existence of social and economic communities of interest between the areas within the boundaries of a local governmental agency and the area that surrounds it and that could be considered in the agency's SOI.

Cordova Hills has been designed to provide an interdependent social and economic community. The CSD would be planned to be the organizational entity that enhances the sense of community identity and provides efficient coordinated community services, with a focus on communications, recreational activities, and transportation services. These networked activities will be the backbone of community activities.

The only existing entity that might provide some of the proposed activities of the CSD is CRPD. However, the CRPD does not provide the full range of services proposed for Cordova Hills. The CRPD currently provides only recreation and park services. Cordova Hills needs not only recreation and park services, but also open space and trails maintenance, habitat maintenance, landscape corridor maintenance, road maintenance, transit operations, and transportation management services. This range of services planned for Cordova Hills would place a burden on the CRPD, which does not have the staffing or facilities to provide these services.

It would be difficult for the CRPD to provide the services levels prescribed for Cordova Hills because Cordova Hills would be only a small part of the CRPD service area and the CRPD would not be providing the same services and service levels to the existing CRPD service area. The added services provided only in Cordova Hills would create a notable differentiation in services types and levels of service in the CRPD that would likely result in difficult management and policy issues. In addition, because Cordova Hills would be only a small part of the CRPD service area, it is unlikely that there would be any representation for

Cordova Hills on CRPD's Board of Directors until buildout of the Project, and even then, representation on CPRD'S Board is uncertain.

The CSD, however, could provide all of the needed services to Cordova Hills. The CSD would establish a sense of community in Cordova Hills because it would provide services to Cordova Hills only and would serve as an organizing element to manage al of the needed services. A community communications network would be established to aid in management and administration of services.

- 8. The existence of agricultural preserves in the Project area, which could be considered in the agency's SOI, and the effect on maintaining the physical and economic integrity of such preserves in the event that such preserves are in a SOI of a local governmental agency.**

There are no agricultural preserves in Cordova Hills.

MSR Considerations

LAFCo is required to make determinations related to several specific areas. Each of these areas is addressed below. This section only discusses responsibilities that would be related to the CSD and not other municipal services provided by existing entities.

- 1. Infrastructure needs or deficiencies.**

There is no infrastructure in Cordova Hills. Construction of the infrastructure will be controlled by the Project conditions of approval, the Development Agreement with the County, and the EIR. The infrastructure funding program is detailed in the Financing Plan.

The CSD would be responsible for construction of park and recreation facilities and landscaping in the open space corridors and in certain streetscape areas outside the public ROW. This will include some signage, lighting, and transit support facilities including bus shelters and bus parking. These facilities may be funded by a variety of sources, including direct developer funding, development impact fees, and a Cordova Hills Mello-Roos CFD.

- 2. Growth and population projections for the affected area.**

There is no present population within the boundaries of the Project area. The maximum buildout population is estimated at 21,379.

- 3. Financing constraints and opportunity.**

Chapter 5 describes the funding plan for the services that would be provided by the CSD. A Mello-Roos CFD special tax is planned to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes will be established to pay for the costs of services not funded directly through user fees/charges or other revenue sources. Special taxes on undeveloped property would cover shortfalls in the early years until the tax base has grown to a sufficient level to fund needed services.

4. Cost avoidance opportunities.

The annual CSD budget would be evaluated by a County BOS-appointed advisory committee to provide the highest level of service for the least cost. Because the CSD would be a new entity, it could implement many “best practices” techniques as it begins to provide services.

5. Rate restructuring.

Because the CSD would be a new special district, it would have the opportunity to set the appropriate rate structure to pay for the necessary services. The rate structure would have a built-in cost-of-living escalation factor.

6. Opportunities for shared cost.

The goals of the Project include partnerships with other public entities. The most likely arrangement would be shared park and recreation facilities with the EGUSD. Another opportunity may be a joint partnership with the SMFD.

7. Government structure options, including advantages and disadvantages of consolidation or reorganization.

The Urban Services and Governance Plan has been designed to minimize the need for new government organizations. Many of the services are planned to be provided by existing service providers. **Chapters 3 and 4** describe the existing governmental agencies that will provide services to the area. The service providers are summarized in **Table 1-1**.

The proposed services that would be provided by the CSD are more comprehensive than the authorized services for any other service provider. The CSD would be designed to be the community organizing vehicle that brings together all elements of the community. The communication, recreation, and transportation functions of the CSD would form the basis of the community network.

One advantage of a CSD is the efficiencies in the cost of providing the multiple services proposed. Where a multitude of single-purpose agencies would have administrative and other overhead costs associated with each agency, a CSD would have a single unified administration. Where a multitude of single purpose agencies would require individual employees with limited skill sets, the CSD would facilitate use of cross-trained, multi-functional personnel who can be allocated to diverse tasks efficiently. For example, park maintenance staff also would maintain the open space and trails network, signage, streetscape, and bus shelters. The cost savings because of efficiencies in administrative overhead, continuing use of maintenance equipment, and staffing flexibility is one of the chief attributes of a multi-service CSD. In addition, the creation of a locally controlled Board of Directors would significantly rectify the limited representation that Cordova Hills residents and businesses would have in other organizations that could provide a similar set of services.

8. Evaluation of management efficiencies.

As a new entity, the CSD would be designed to promote management efficiencies. It would be funded adequately through the levy of a special tax without burdening other special districts. The CSD would have the advantage of starting out with a highly efficient network communications system, which should produce substantial savings in day-to-day operations.

The CSD services plan would provide the option of contracting out many of the maintenance functions, which could provide cost effective delivery of these services.

9. Local accountability and governance.

A CSD would be planned to start out as a dependent district governed ex-officio by the County BOS. It would be managed by a five-member advisory board of directors appointed by the County BOS. At some point in the future, the residents of Cordova Hills could decide to become an independent district and elect their own Board of Directors.

Outreach would be provided by the communications services function of the CSD. The CSD would establish and operate a communitywide intranet as the key component of a communications network that would distribute information about community activities and services and provide transportation management services such as ride-sharing bulletins, real-time bus location information, and transit system routing and schedules, as well as provide emergency information. Community meetings would be held in the CSD administrative building or other community meeting spaces.

Formation of a CSA

The specific authorized services and other features of a new CSA must be specified in the County BOS resolution. See **Chapter 5** for a full detailing of the urban services proposed for a CSA. The County will require a feasibility analysis that addresses potential effects on existing agencies and also will develop detailed terms and conditions that guide formation and operation of the new CSA.

General Specifications of the CSA

At this point it is expected that the County BOS resolution will include the following specifications.

Authorized Services

The CSA would provide recreation and park services, maintenance of open space and trails and landscape corridors, habitat operations and maintenance, supplemental maintenance of roads, transit and transportation management services, and CSA administration and communications. An additional range of "latent" services could be authorized at the formation of the CSA, such as solid waste.

Geographic Area

The CSA would encompass the boundary of the Cordova Hills Master Plan, as illustrated in previous Project maps in **Chapters 1** and **2**. The SOI would be coterminous with the proposed CSA boundary.

Formation

Formation of a CSA would be initiated by a resolution of the County BOS, along with a petition of landowners.

Reorganization

A reorganization of CSA 4B would be required to detach Cordova Hills from its boundary. A similar detachment is proposed from CSA 10, which provides transit and air quality services.

Governing Body

As a dependent district, the CSA would be governed by the County BOS. The County could institute a Local Advisory Board (CSA Board) comprising local representatives. This CSA Board could be endowed with management and contracting oversight and could make recommendations to the County BOS on policy and procedures; final decisions ultimately would be at the discretion of the County BOS. The CSA could have a permanent director or executive officer to oversee the provision of services, retain institutional memory, and represent the interests of the CSA and its constituents in interactions with service providers and other government entities.

Revenues

The CSA would be funded by special taxes, benefit assessments, and user fees and charges. The CSA is subject to a Gann Limit (Article 13B of the State Constitution), which limits the amount of proceeds from taxes that can be collected. A CSA with street-related responsibilities also is allowed to collect related franchise fees, pursuant to State law.

Capital Financing

A CSA may issue general obligation bonds in its territory for purposes of capital facilities financing; however, the total amount of outstanding indebtedness is limited to 15 percent of assessed value within the CSA boundaries. A CSA also may issue land secured bonds services by assessments or special taxes (e.g., a Mello-Roos CFD), or revenue bonds, assuming a rate base exists for services being delivered (e.g., water or sewer service charges).

Staffing and Expenditures

The County could have a permanent director or executive officer oversee the provision of services, retain institutional memory, and represent the interests of the CSA and its constituents in interactions with service providers and other government entities. However, the County BOS retains ultimate discretion.

Formation of a CSD

The specific authorized services and other features of a new CSD must be specified in the Petition or Resolution of Formation. See **Chapter 5** for a full detailing of the urban services proposed for a CSD. LAFCo, as part of its discretionary proceedings, would conduct a feasibility analysis that addressed potential effects on existing agencies and also would develop detailed terms and conditions that guide formation and operation of the new CSD.

General Specifications of the CSD

At this point it is expected that the application to Sacramento LAFCo would include the following specifications.

Authorized Services

The CSD would provide recreation and park services, maintenance of open space and trails and landscape corridors, habitat operations and maintenance, supplemental maintenance of roads, transit and transportation management services, and CSD administration and communications. An additional range of “latent” services could be authorized at formation of the CSD, such as solid waste services.

Geographic Area

The CSD would encompass the boundary of the Cordova Hills Master Plan, as illustrated in previous Project maps in **Chapters 1** and **2**. The SOI would be coterminous with the proposed CSD boundary.

Formation

Formation of a CSD would be initiated by a resolution of the County BOS, along with a petition of landowners.

Reorganization

A reorganization of CSA 4B would be required to detach Cordova Hills from its boundary. A similar detachment would be proposed from CSA 10, which provides transit and air quality services.

Governing Body

Initially, the CSD would be governed by the County BOS, serving as the CSD Directors, *ex officio*. The County BOS is required to place the question of having a locally elected board of directors when either of the following conditions occurs: the number of registered voters in the district has reached or exceeded 500 (or fewer, as may be established by LAFCo), or 10 years after the effective date of the CSD’s formation (or earlier as may be specified by LAFCo).

Revenues

The CSD would be funded by special taxes, benefit assessments, and user fees and charges. A CSD is subject to a Gann Limit (Article 13B of the State Constitution), which limits the amount of proceeds from taxes that can be collected. A CSD with street-related responsibilities also is allowed to collect related franchise fees, pursuant to State law.

Capital Financing

A CSD may issue general obligation bonds in its territory for purposes of capital facilities financing; however, the total amount of outstanding indebtedness is limited to 15 percent of assessed value within the CSD boundaries. A CSD also may issue land secured bonds services by assessments or special taxes (e.g., a Mello-Roos CFD), or revenue bonds, assuming a rate base exists for services being delivered (e.g., water or sewer service charges).

Staffing and Expenditures

The County BOS would hire or contract management and technical staff and services. It is expected that the County BOS would retain the general manager who, in turn, would hire

additional staff as necessary, or manage contracts with the County or other public or private service providers.

Implementation of the Governance Plan

Over the past 3 years, the Cordova Hills planning, environmental review, and entitlement process has integrated the following three elements:

- An evaluation of municipal service requirements and the most practical and responsive approach to providing urban services (presented in this Urban Services and Governance Plan).
- Proposing how and by whom urban services would be provided and governed (presented in this Urban Services Plan).
- Fiscal implications of new development at Cordova Hills on the County and the regional service special districts (see Draft Fiscal Impact Analysis).

Going forward, it will be important to fully integrate creation of the appropriate governing entities and provision of urban services into the ongoing entitlement process.

Table 7-1 presents a proposed time line for formation of a CSA, and **Table 7-2** presents a proposed time line for formation of a CSD. The time line begins with presentation of the Governance Plan as outlined in this report and links the process to the broader entitlement process and subsequent implementation. The main steps in the process are summarized below.

1. Complete Governance Proposal and Related Entitlement Documents and Agreements

This Urban Services Plan provides the basis of discussions with County staff, the independent special districts, and LAFCo regarding the provision of urban services to the Cordova Hills Community. While there have been ongoing conversations with these agencies as part of the planning process, it will be helpful to confirm once again that the direction, assumptions, analysis, and proposals included in this document are sound and agreeable. Regarding the County-provided urban services, it is proposed that specific terms be incorporated into the Development Agreement. The Urban Services Agreement will specify terms of continuing County urban services (e.g., law enforcement) and also establish conditions for start-up and operation of a CSA or CSD. A CSA would be a dependent special district in perpetuity, and a CSD would be a dependent special district during the early years of the community's development. It could later become an independent special district.

2. Prepare Preliminary Reorganization Application for LAFCo

While no formal application is expected until following CEQA determination and planning entitlement actions by the County BOS, preparatory work, including related briefings with County staff and the Sacramento LAFCo, will take place before the entitlement actions of the County BOS. This work can include resolving various aspects of the reorganization application, including formation/reorganization procedures, required documentation, form, and content of the required feasibility study, etc. The feasibility study and Engineer's Report

gov proc

required for consideration of the reorganization applications are LAFCo documents. Cordova Hills proposes to submit a draft feasibility study as part of the Preliminary Application, recognizing that it is LAFCo's discretion to rely on, augment, or create an independent feasibility study. The Cordova Hills team, including EPS, would appreciate the opportunity to collaborate with LAFCo staff to assure that the proposed preliminary application and feasibility study addresses issues of concern to LAFCo staff in an acceptable format.

3. Completion of Application Initiating the LAFCo review of the CSD Formation and related Reorganization

Following action by the County BOS on the Master Plan, EIR, and related entitlement documents, the LAFCo Application can be submitted (because the Certified Final EIR is a required part of the Application). As noted above, it is proposed that the Application be made by Resolution of the County BOS. The complete Application will trigger official LAFCo actions, including review of the Application, preparation of the Feasibility Study and Executive Officer's Report, and the LAFCo hearings. Regarding the Feasibility Study, while a Draft Feasibility Study will be prepared as part of the preliminary Application documentation, LAFCo staff will decide how they will make the required feasibility findings, including conducting an independent feasibility study.

4. Start-up of CSA or CSD and Initial Operations

In the event LAFCo approves the formation of a CSA, the County Board of Supervisors will govern all actions related to the CSA. The County BOS could institute a Local Advisory Board (CSA Board) comprising local representatives. This CSA Board could be endowed with management and contracting oversight and could make recommendations to the County BOS on policy and procedures; final decisions ultimately would be at the discretion of the County BOS. The CSA could have a permanent director or executive officer to oversee the provision of services, retain institutional memory, and represent the interests of the CSA and its constituents in interactions with service providers and other government entities.

In the event LAFCo approves formation of a CSD, the County Board of Supervisors would serve ex officio as the CSD Board. As an early step, they would retain or appoint a General Manager who would be charged with establishing a budget for the CSD and beginning organizing service capabilities. Because it would be several years before significant service responsibilities exist, the initial phase of the CSD would focus mainly on organizational efforts. For example, it is likely that the CSD would enter into various contracts and other institutional arrangements that would define and assure the desired service levels as reflected in the Urban Services and Governance Plan, the Fiscal Impact Analysis and the Final EIR.

APPENDIX A:

Cordova Hills Phasing Analysis

These phasing analysis tables provide a general indication of balance between the level of development over buildout of the Project and services provided to the Project.

1. *FINANCING PLAN SUMMARY*

Introduction

This Public Facilities Financing Plan (Financing Plan) sets forth a strategy to finance backbone infrastructure and other public facilities required to serve the proposed land uses in the Cordova Hills Special Planning Area (Cordova Hills or Project). The 2,668-acre Project is vacant and is located in unincorporated Sacramento County (County) just east of the City of Rancho Cordova, the approved Sunridge Specific Plan, and the proposed Suncreek Specific Plan. It is bordered to the west by Grant Line Road, to the north by Glory Lane (about one-half mile south of Douglas Road), and to the east by Carson Creek. The Kiefer Landfill and its associated bufferlands are southwest of the Project, and the required bufferlands extend into the southwest portion of Cordova Hills. **Map 1-1** shows the regional location of the Project.

Planned development in Cordova Hills consists of a maximum of 8,000 residential units on approximately 1,089 acres, approximately 103 acres of commercial and office development, and approximately 224 acres that will accommodate a university or other institution of higher learning (hereafter referred to as “university/college campus center”). The remaining acreage will be used for parks, recreation, open space, trails, agriculture, schools, and other public facility improvements, such as roadways. The Project is divided into six separate villages. Development of the Town Center village and a portion of the university/college campus center, both located on the west side of the Project, comprise the first phase of development. The Town Center Village includes 23 percent of the proposed residential units and more than half of the commercial and office development.

Purpose

This Financing Plan has been prepared to comply with requirements of the following County General Plan policies related to public facility financing:

- LU-13: A Public Facilities/Infrastructure Master Plan shall be prepared to identify the major facilities required to serve new development in urban growth areas. A Public Facilities Financing Plan shall be prepared and approved by the Board of Supervisors prior to or concurrent with the approval of any zoning for any urban uses in urban growth areas. The Financing Plan shall include a Public Facilities/Infrastructure Master Plan describing required major infrastructure improvements necessary to support proposed developments, and present a detailed plan for the phasing of capital improvements which identifies the extent, timing and estimated costs of all necessary infrastructure.

Map 1-1

Cordova Hills Vicinity Map

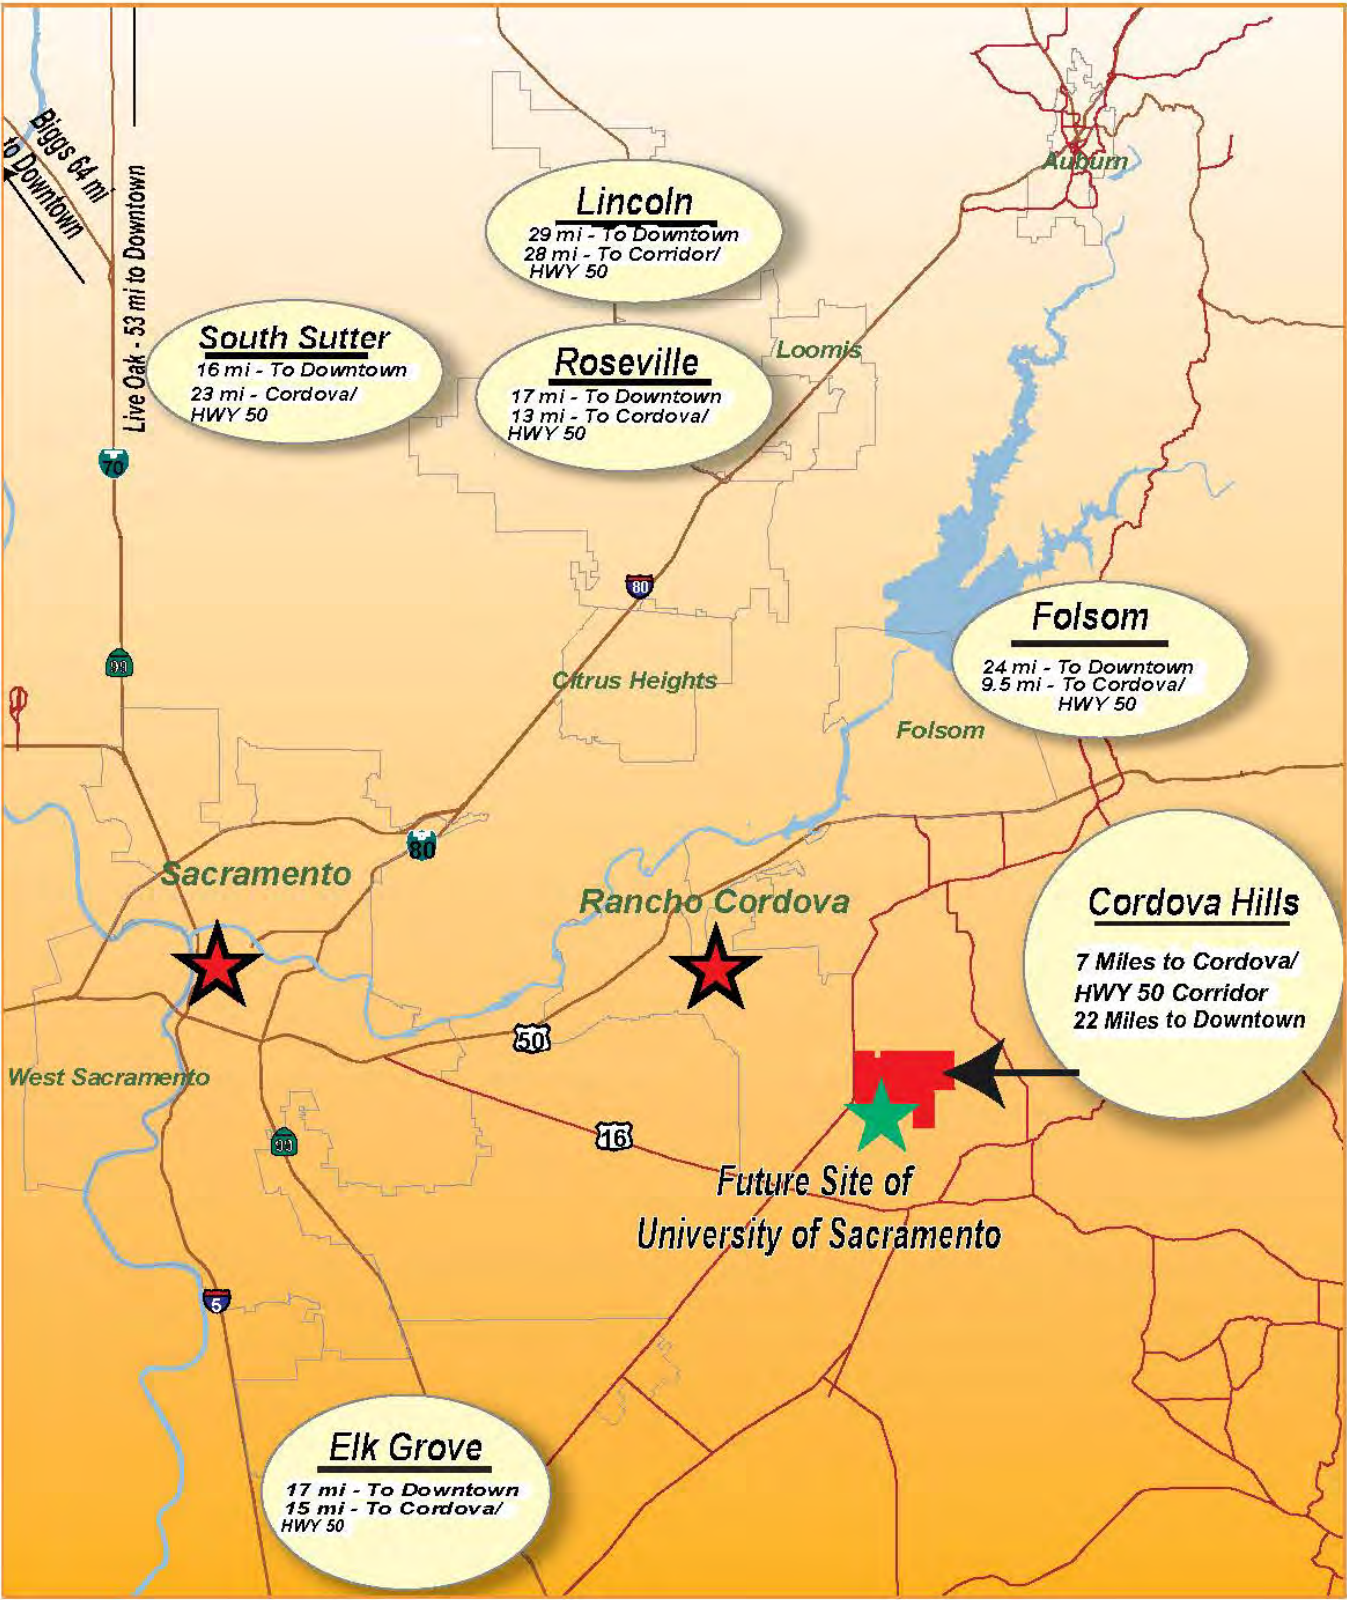

Figure 1.1: Regional Location

- LU-120: The County shall only consider approval of a proposed UPA expansion and/or Master Plan outside of the existing UPA if the Board finds that the proposed project is planned and will be built in a manner that:
 - Meets all of the requirements per PC-1 through PC-10.
 - Meets ONE of the two alternative performance metrics:
 - » Alternative #1: Criteria-based
 - » Alternative #2: VMT/Greenhouse Gas Emissions Reduction Metric.¹

In accordance with these policies, the Financing Plan provides the estimated cost and timing of backbone infrastructure and other public facilities needed to serve new development in the Project. It also provides the strategy to match the timing of when facilities are required as well as the timing of costs with the availability of probable funding sources. The Financing Plan will be submitted for approval to the Board of Supervisors as a companion document to the Cordova Hills Master Plan.

The specific purposes of the Financing Plan are listed below:

- Establish the policy framework for financing the required backbone infrastructure and other public facilities.
- Specify the backbone infrastructure and other public facilities to be constructed or acquired in association with development of the Project.
- Identify the estimated costs, constraints, and phasing requirements for required backbone infrastructure and other public facilities.
- Identify funding mechanisms, both existing and new, to fund required backbone infrastructure and other public facilities.

University/College Campus Center

The Project contains an approximately 224-acre site for a university/college campus center. Although, as of March 2013, a specific university/college campus center has not yet been identified to occupy the site, Section 2.3.1 of the Cordova Hills Development Agreement states that the site shall be used for an institute of higher education as defined in the Cordova Hills Master Plan. If an institution of higher education does not locate on the site by the end of the 30-year initial term of the Development Agreement, then the land shall be transferred at no cost to the County for use consistent with its zoning under the Cordova Hills Master Plan. In addition, at the time of the transfer, the property owners will cancel any obligation (credits/reimbursements) the land has to pay for its share of any infrastructure improvements previously constructed by the owner that benefit the university/college campus center site. Further, the

¹ Refer to the Land Use Element of the County General Plan for additional details regarding PC-1 through PC-10 requirements and the two alternative performance metrics.

property owners agree to construct the backbone infrastructure to the frontage of the university/college campus center site during the Phase 1 development of the Project, whether or not a university/college campus center has been identified by that time. Section 2.3.1 of the Development Agreement describes additional conditions related to finding a university for the site and transferring the site to the County.

Backbone Infrastructure and Public Facility Costs

Definitions

The term “backbone infrastructure” often is used to describe all publicly owned facilities. This Financing Plan will use the following definitions to more precisely define these items:

- **Backbone Infrastructure** includes most of the essential public service-based infrastructure inclusive of roadways and improvements underneath roadways (such as storm drainage, sanitary sewer, and water facilities). Backbone infrastructure is sized to serve numerous individual development projects in the Project and in some cases serves adjacent development areas.
- **Public Facilities** provide amenities to the Project (e.g., parks and libraries) or house employees and equipment providing services to the area (e.g., fire facilities, corporation yard).
- **Public Improvements (or Improvements)** is used generically in the Financing Plan to include a combination of backbone infrastructure and public facilities when a precise breakdown is not required.
- **Subdivision Infrastructure** refers to subdivision frontage improvements (e.g., outer lanes, bicycle lanes, gutters, curbs, and sidewalks along roads and landscape corridors) and in-tract improvements (e.g., mass grading, sewer, storm drainage, water, and roads) in an individual subdivision, commercial, or multifamily project. *All subdivision infrastructure is excluded from this Financing Plan and will be privately financed.*

Backbone Infrastructure

Buildout of the Project will require construction of approximately \$326 million of backbone infrastructure. *All costs in this Financing Plan are in 2011 dollars and will be subject to future updates.* The backbone infrastructure in this Financing Plan includes the following items:

- Roadways
- Sanitary Sewer Facilities—Trunk and Interceptor Systems
- Storm Drainage Facilities
- Water Facilities—Potable and Non-potable
- Earthwork

Public Facilities

Buildout of the Project will require construction of approximately \$233 million of public facilities. The public facilities in this Financing Plan include the following items:

- Fire Facilities
- Cordova Hills Local Services District (CHLSD) Facilities
- Parks
- Open Space and Trails
- Habitat and Wetlands
- Library Facilities
- Transit Facilities
- Schools
- Special Financing District Formation and Updates

Note that both earthwork and habitat and wetlands are discussed in the Financing Plan because they are significant elements of the Project. It is anticipated, however, that their costs will be funded privately.

Cost Estimate Sources

Cost estimates for required backbone infrastructure and public facility improvements have been derived from a combination of available engineering and cost estimate data from the following sources:

- MacKay & Somps Civil Engineers, Inc., (MacKay & Somps)
- MJS Design Group (MJS)
- HCM, Inc.
- Sacramento Library Authority
- MV Transportation
- ECORP Consulting, Inc. (ECORP)
- Sacramento Metropolitan Fire District (Fire District)
- Elk Grove Unified School District (EGUSD)

Cost estimates are detailed for each improvement type in **Chapters 3** through **16**. These cost estimates are based on the best information available at the time of the Financing Plan preparation. At the time of implementing the financing mechanisms and any updates thereafter, revisions will be made if descriptions of facilities and associated timing and cost estimates change.

Note that the cost estimates were developed over a two to three year period. For the purposes of consistency, the costs in all tables are identified as 2011 dollars. Due to current economic conditions, it is very difficult to estimate the costs. Stating that all costs are in 2011 dollars is a reasonable assumption. Infrastructure costs will be updated prior to implementation of the financing mechanisms.

Phase 1 and Total Cost Summary

MacKay & Somps estimated backbone infrastructure facilities requirements and costs for three development phases. Only the facilities costs at completion of Phase 1 and at buildout are included in this Financing Plan. Likewise, public facilities requirements and costs are estimated at completion of Phase 1 and at buildout. Although requirements and costs have been included only for Phase 1 and buildout, each phase of development will likely have multiple sub-phases.

Improvements will be constructed and costs incurred throughout each phase based on conditions of approval for each subdivision in the phase. Additional details such as potential funding constraints of phased improvements for each infrastructure type are summarized below and described in greater detail in subsequent chapters of this report.

- **Roads.** Cordova Hills will be required to fund both onsite and offsite backbone roadway improvements.

The onsite road improvements will be funded through the proposed Cordova Hills Special Financing District (SFD). The cost of onsite road facilities in Phase 1 exceeds the estimated revenue generated through the proposed Cordova Hills SFD based on Phase 1 development. The total deficit amount of \$14.2 million will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. At buildout, this Financing Plan indicates sufficient funding will be generated by Project development to fund onsite road facility costs.

The offsite road improvements in the Cordova Hills Offsite Roadway Capital Improvement Program (CIP) will be funded through a combination of the Cordova Hills SFD, developer advance funding, and County and other development impact fee programs. The two existing road fee programs in which Cordova Hills development must participate and pay fees are the Sacramento County Transportation Development Fee (SCTDF) Program and the Measure A Sacramento Countywide Transportation Mitigation Fee Program (SCTMFP). Some of the offsite improvements that Cordova Hills must construct are also included in these fee programs. The Cordova Hills developer will be required to provide advance funding for these offsite road improvements and will be eligible to receive fee credits and reimbursements from the fee programs. The amount and timing of reimbursements available from these fee programs, however, is difficult to determine. Both the SCTDF and SCTMFP programs have many road projects competing for available funding from these programs. It is uncertain when the fee revenue would be available in the form of reimbursements.

The amount of advance funding required by the Cordova Hills developers for road improvements is detailed in **Chapter 3**. Cordova Hills' Phase 1 roadway funding requirements will result in a shortfall of approximately \$14.2 million that will not be recouped until additional fees are collected from the Cordova Hills SFD or reimbursements made from the other fee and/or funding programs.

The most significant financial hurdle following Phase 1 will occur when the Cordova Hills development reaches 3,200 dwelling unit equivalents (DUEs). At this point, the construction cost requirement for offsite roadways could reach approximately \$55 million (\$40 million of which is triggered at 3,200 DUEs), or roughly 70 percent, of the total road construction requirement. However, only about \$13 million, or roughly 40 percent of the development fee revenue, would have been collected by this time. The resulting shortfall of approximately \$42 million occurs both because of this disparity between the percentages of costs incurred and fees collected and because the developer is constructing road improvements that are potentially eligible for reimbursement from other funding programs and thus are excluded from the Cordova Hills SFD funding program. Cordova Hills' construction cost requirement and resulting shortfall would be reduced if other regional development projects trigger and construct the roadways before Cordova Hills triggers them.

Then next significant financial hurdle will occur at 6,900 EDUs. At this point, 92 percent of the Cordova Hills construction responsibility cost might be incurred, but only about 84 percent of the Cordova Hills development will have contributed to the fee program.

At buildout, the developer could have advanced approximately \$45 million subject to future reimbursement. It is uncertain whether or not any of this reimbursement funding may be available before buildout to reduce the developer's out of pocket costs. It is also uncertain how much of this oversizing cost will ultimately be reimbursed.

- **Sanitary Sewer.** Cordova Hills' developers will construct and fund required Cordova Hills Sewer Master Plan trunk facilities, as well as participate in the Sacramento Area Sewer District (SASD) and Sacramento Regional County Sanitation District (SRCSD) fee programs. The developers will be eligible for SASD fee credits and reimbursements up to the full construction cost of the trunk facilities that they construct. Cordova Hills will provide advance-funding for these facilities and will receive full credit against all SASD fees owed. It is anticipated that the developers will still have a remaining outstanding developer advance of approximately \$21.9 million at buildout of Cordova Hills and will be eligible to receive cash reimbursements from the SASD fee revenue. The timing of the SASD reimbursements is uncertain and depends on the availability of SASD fee revenue. Full reimbursement may require a considerable time period beyond buildout of Cordova Hills, and it is possible that the Cordova Hills developers may never receive full reimbursement.
- **Storm Drainage.** Storm drainage facilities will be funded through SCWA Zone 11A development impact fee revenue and the proposed Cordova Hills SFD. Developers will construct facilities in Phase 1, which is entirely located in SCWA Zone 11A, and will be eligible to receive credits or reimbursements from the Zone 11A fee program for a portion of the facilities costs in Phase 1. Storm drainage facilities in all remaining phases are not located in any of the SCWA drainage zones and will be funded through the Cordova Hills SFD. In addition, there are some storm drainage facilities in Phase 1 that are ineligible for SCWA Zone 11A credits or reimbursements that will be funded through the proposed Cordova Hills SFD. To the extent that Cordova Hills SFD revenues are insufficient to fund phased storm drainage facilities, the master developer will provide advance-funding with reimbursement from the Cordova Hills SFD when revenue becomes available.
- **Water.** The Project will be required to pay SCWA Zone 40 development impact fees for the construction of potable water facilities. It is anticipated that SCWA Zone 40 development impact fee revenue will be available to fund potable water improvements for each phase of the Project. A potential phasing constraint concerns the availability of water for Cordova Hills from the North Douglas water storage tanks. The availability of water is dependent on the pace of development in the area surrounding these tanks (e.g., North Douglas; Sunridge). In the event development moves forward in this area, the length of time before Cordova Hills' tanks are needed could be relatively short. In an extremely conservative scenario, the Cordova Hills tanks would need to be constructed at the beginning of the Project. Advance-funding from the master development may be required and would be reimbursed through SCWA.

Non-potable water costs will be funded through the Cordova Hills SFD. The cost of non-potable facilities in Phase 1 exceeds the estimated revenue generated through the proposed Cordova Hills SFD based on Phase 1 development. The total deficit amount will be advance-

funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. At buildout, this Financing Plan indicates sufficient funding will be generated by Project development to fund non-potable facility costs.

- **Earthwork.** Earthwork is discussed in this Financing Plan because it is a significant element of the Project, but it is currently anticipated that earthwork costs will be privately funded by the developers. The developers, however, may request that earthwork for some of the following items be included in the Cordova Hills SFD funding program if they meet the construction requirements necessary for public financing mechanisms:
 - Four-lane roads
 - Drainage corridors
 - Major parks
 - School sites
- **CHLSD Facilities.** The CHLSD will provide municipal services to Cordova Hills. As detailed in the Urban Services Plan, the CHLSD could be either a County Services Area (CSA) or a Community Services District (CSD). During the Project approval hearings, it was determined that the governance structure for the CHLSD will be a CSA. This was memorialized in the Development Agreement as presented to the Sacramento County Board of Supervisors on January 29, 2013, which indicates “the governance structure utilized to provide the municipal services to the Project Area will be a county service area formed for the Project pursuant to the County Service Area Law contained in Government Code Sections 25210 et. seq.”
- A more detailed discussion of the CHLSD is provided in the Draft Cordova Hills Special Planning Area Urban Services and Governance Plan.

The cost of CHLSD facilities in Phase 1 exceeds the estimated revenue generated through the proposed Cordova Hills SFD based on Phase 1 development. The shortfall amount of \$2.6 million will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. At buildout, sufficient funding will be generated by Project development to fund CHLSD facility costs.

- **Public Safety.** Based on correspondence from the Sacramento Metropolitan Fire District (SMFD), there are too many variables to assess the precise timing of fire and medical services facilities for the Project. SMFD has agreed to assess the phasing of fire and medical service facilities at the small lot tentative map stage of the Project. As such, this Financing Plan assumes that development in the Project will pay the SMFD fee. Additional funding sources for any shortfalls will be evaluated at the time facilities are required.

The County Sheriff plans to operate a substation in the Project through a lease with Cordova Hills. Expenditures associated with leasing a substation will be covered through the fiscal impact analysis surplus estimated in EPS’s Draft Fiscal Impact Analysis.

- **Parks.** This Financing Plan includes an annual phasing schedule of park improvements compared with residential development. In each year of Project development, the percentage of total dwelling units exceeds the percentage of park development indicating

that there will be a sufficient tax base (development) available to fund facility costs. Funding shortfalls by phase are not anticipated.

- **Open Space and Trails.** The percentage of development in Phase 1 exceeds the percentage of open space and trail development in Phase 1, indicating there is a sufficient tax base (development) to fund open space and trail development costs. Indeed, there is a projected \$475,000 surplus in Cordova Hills SFD revenues in Phase 1. Remaining open space and trail facilities will be funded through the Cordova Hills SFD as well. To the extent that there is insufficient funding to cover phased costs, the master developer will provide advance-funding with reimbursement through the Cordova Hills SFD when revenues become available. However, this scenario is not anticipated.
- **Habitat and Wetlands.** On-site habitat and wetlands costs will be funded through the proposed CHLSD, as detailed in the September 2012 Public Review Draft Cordova Hills Urban Services Plan (Urban Services Plan). To the extent that on-site habitat and wetlands costs exceed revenues available through the CHLSD, the master developer will provide advance-funding. Off-site habitat and wetlands costs will be funded privately by the master developer. There is a proposed South Sacramento Habitat Conservation Plan fee program, however, which if implemented, could replace the private developer funding as the funding source of habitat mitigation costs.
- **Library.** The timing of constructing a library facility is at the discretion of the Library Authority and will be dependent on funding from Cordova Hills as well as other benefiting areas. The funding source for constructing a library facility will be the countywide library development impact fee program, if and when it is implemented. In the event the County does not implement a countywide library development impact fee program, the Project will fund its fair share of library facilities through the proposed Cordova Hills SFD.
- **Transit.** The cost of transit facilities in Phase 1 exceeds the estimated revenue generated through the proposed Cordova Hills SFD based on Phase 1 development. The total deficit amount will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. At buildout, sufficient funding will be generated by Project development to fund transit facility costs.
- **Schools.** The Elk Grove Unified School District (EGUSD) will construct the required schools. Funding will be provided by State of California school funding program and by the EGUSD Level 2 fee for school facilities in equal amounts. Cordova Hills will participate in the EGUSD fee program. The EGUSD updates its fee program annually to calculate the fee needed to provide one-half of the facilities funding. The fees are adjusted each year to account for the changing construction costs, student generation rates, and dwelling unit sizes.
- **Cordova Hills Special Financing District Formation and Updates.** The Phase 1 cost for the Cordova Hills SFD formation and updates exceeds the estimated revenue generated through the proposed Cordova Hills SFD based on Phase 1 development. The total deficit amount will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. At buildout, sufficient funding will be generated by Project development to fund the Cordova Hills SFD formation and updates costs.

Table 1-1 summarizes the costs of backbone infrastructure and public facilities required for Phase 1 and buildout of the Project. At buildout, these costs total approximately \$559 million. Phase 1 costs total approximately \$123 million. All cost estimates in this Financing Plan are in 2011 dollars. The costs and funding programs will be evaluated and updated throughout development of the Project.

Cost estimates include only improvements that are required to directly serve the Project, including on-site and, in some cases, off-site facilities. The public financing mechanisms discussed below pay for backbone infrastructure and other public facilities. The cost estimates in **Table 1-1** do not include the costs of in-tract and other subdivision-specific improvements, which the Financing Plan assumes will be privately financed. For several of the improvement types (roads, earthwork, open space and trails, and habitat and wetlands), however, some privately funded costs are identified and discussed in this report.

Financing Summary

Purpose

The purpose of the Financing Plan is to recommend the appropriate financing mechanisms to fund the necessary backbone infrastructure and other public facility costs required to serve the Project. The selected financing mechanisms must be flexible enough to provide funding for the required improvements when needed. The financing mechanisms used will depend on the type and timing of the needed facilities. Construction will be phased so facilities are available when needed.

Financing Strategy

A combination of funding sources ultimately will fund the Financing Plan costs. The Financing Plan recommends a combination of the following sources:

- Existing County and other public agency fee programs.
- A new Cordova Hills Special Financing District (SFD), which could include the following funding mechanisms:
 - Project-area development fee program.
 - Bond-funding through a Mello-Roos Community Facilities District (CFD).
 - Developer advances and reimbursements.
- EGUSD CFD funding.
- State, federal, and other funding.
- Developer funding.

Combining these funding sources will optimize the use of available revenue sources to meet the backbone infrastructure and public facilities needs of the Project. **Figure 1-1** summarizes the funding sources.

**Figure 1-1
Cordova Hills Special Planning Area Public Facilities Financing Plan
Summary of Funding Programs**

Tables 1-2 and **1-3** show the estimated backbone infrastructure and public facility costs and financing sources used to fund these costs at completion of Phase 1 and buildout of the Project, respectively. Note that these tables include costs and funding sources for the following improvements:

- All onsite backbone infrastructure and public facilities.
- Offsite backbone infrastructure that Cordova Hills is obligated to construct.

The costs and funding sources for offsite sanitary sewer infrastructure required for Cordova Hills' development but constructed by the Sacramento Regional County Sanitation District (SRCSD) are excluded from **Tables 1-2** and **1-3**. Cordova Hills' development will pay the SRCSD fees to provide funding for the construction of required offsite facilities but is not responsible for constructing the facilities. Consequently, neither the costs nor fee revenue for this program are included on **Tables 1-2** and **1-3**.

Each financing source shown on **Tables 1-2** and **1-3** is discussed below.

Existing Fee Programs

Existing fee programs include County development impact fee programs and the EGUSD School Fee Program. These fee programs are listed below. Note that the costs funded by the SRCSD Fee Program are excluded from **Table 1-2** and **Table 1-3**. As noted above, Cordova Hills will pay the SRCSD fee but will not be responsible for constructing the offsite infrastructure funded by the fee. Consequently, the cost of these offsite improvements is excluded from this report.

- Sacramento County Transportation Development Fee Program (SCTDF) District 3 Roadway and Transit Fee Program.
- Sacramento Transportation Authority (STA) Measure A Mitigation Fee Program.
- Sacramento Area Sewer District (SASD) Sewer Impact Fee and Trunk Sewer Reimbursement Program.
- Sacramento Regional County Sanitation District (SRCSD) Fee Program
- Sacramento County Water Agency (SCWA) Zone 11A Drainage Fee Program.
- SCWA Zone 40 Water Fee Program.
- Sacramento Metropolitan Fire District (SMFD) Capital Fire Facilities Fee Program.
- Sacramento Public Library Authority Development Impact Fee Program (proposed).
- EGUSD School Fee Program.

SOURCES

- [1] This table includes the costs of all onsite backbone infrastructure and public facilities and only the offsite backbone facilities that Cordova Hills is obligated to construct. Costs of offsite backbone facilities constructed by other agencies and funded through their fee programs are not included. See text for further discussion.
- [2] Could include fee or Mello-Roos CFD funding.
- [3] Existing and proposed fee programs (referenced tables show calculation of fee revenue estimates):
 Sewer: SASD (Table 4-3)
 Storm Drainage: SCWA Zone 11A (Table 5-3)
 Water: SCWA Zone 40 (Table 6-2)
 Fire: Sacramento Metropolitan Fire District Capital Fire Facilities Fee (Table 8-1)
 Library: Proposed Sacramento Public Library Authority Fee (Table 13-1)
- [4] Cordova Hills will construct road improvements and be eligible for SCTDF fee credits and cash reimbursements for some of these improvements. Cash reimbursements will be made from other development projects and from the SCTDF fee program. The timing and availability of reimbursements is uncertain.
- [5] Cordova Hills will construct SASD trunk sewer facilities and be eligible for SASD fee credits and cash reimbursements. Cash reimbursements will be made from fees collected throughout the SASD expansion areas in accordance with the SASD reimbursement policies. The reimbursement of \$27.4 M is estimated as the difference in buildout costs and Cordova Hills estimated SASD fee revenue. Given the current SASD reimbursement policies and availability of sewer impact fee revenue from expansion areas, full reimbursement to Cordova Hills may not occur for 20 years or more.

Proposed Cordova Hills Special Financing District

Summary

It is recommended that the County Special Districts Section (SDS) implement the Cordova Hills Special Financing District (SFD) to help fund construction of backbone infrastructure and public facilities. It is projected that all backbone infrastructure except sanitary sewer and potable water improvements and all public facilities, except fire facilities, libraries, and schools, will require some funding through the SFD.

As mentioned previously, the SFD could include funding through bonding mechanisms, a fee program, or a system for developer advances and reimbursements. A cost allocation of the projected SFD costs has been performed to estimate the buildout cost burden for each land use type. **Table 1-4** summarizes the estimated SFD buildout cost per dwelling unit for residential land uses and per building square foot for commercial uses and for the university/college campus center.

Table 1-5 converts the residential and commercial cost burdens from **Table 1-4** to costs per acre, allowing a comparison of cost burdens across land uses. This table also shows the total SFD cost obligation for the university/college campus center for each public facility type. The cost allocation methodology for each facility type is detailed in **Chapters 3** through **17** of this Financing Plan.

Alternative Land Uses

The SFD buildout cost allocations summarized in **Tables 1-4** and **1-5** are based on the identified land uses in the Draft Cordova Hills Master Plan. It is possible that there could be additional land uses proposed, such as age-restricted housing. If additional land uses are identified, the SFD cost allocations and possible CFD special taxes would be adjusted to account for these different uses. The adjustments would occur during the SFD formation or during implementation.

University/College Campus Center

The university/college campus center's total SFD cost obligation is estimated for each public facility type to receive funding through the SFD. This cost obligation is also estimated on a per-building square foot basis. The total building square feet for the university/college campus center reflects the current estimate from the Draft Cordova Hills Master Plan (April 2012). This estimate will be updated upon approval of a plan for the selected university/college campus center.

The university/college campus center's SFD payments will be made when building permits are issued based on the overall cost per square foot applied to the number of square feet included on the building permit. Either the master developer or the university/college campus center will be responsible for making the payment. The master developer and university/college campus center will have an agreement that details who is responsible for the SFD payment obligations.

State, Federal, and Other Funding

It is anticipated that EGUSD will be eligible for grant funding from the State School Facility Program to fund a portion of Cordova Hills' schools costs. In addition, State and federal funding may be available to help fund roadway facilities. There also may be other funding sources that

bo sum2

[1] Excludes costs funded by existing and proposed County/Regional fee programs.

[2] Zone 11A costs are fair share burden for Phase 1. Remaining costs are fair share burden for remaining phases. Total costs by phase do not match costs on Table 1-2 and Table 1-3 because of timing of construction of improvements.

could be used to help fund various items such as expanded parks amenities. One of these potential funding sources is revenue sharing through a tax sharing agreement with the County. To achieve the County's goals for the Special Planning Area, the County may allocate a certain portion of tax revenues from fiscal surpluses generated by the Project to help fund the construction of public improvements and the delivery of public services.

Developer Funding

It is anticipated that much of the required Phase 1 infrastructure will be oversized to benefit development in future phases and that Phase 1 costs will exceed revenue collected from Phase 1 development. As shown in **Table 1-2**, it is projected that developer advances may be required to finance a large portion of Phase 1 improvements.

The timing of the reimbursement for developer advances is uncertain. In the case of the developer advance funding for road construction and sanitary sewer system construction costs, it may be many years before the developer is fully reimbursed. There is also the possibility that the developer may never be completely reimbursed for advanced funding improvements required by the Project's Conditions of Approval and Development Agreement commitments. Full reimbursement may not be realized if the development impact fee programs are underfunded or the anticipated development requiring oversized facilities never materializes.

The developer will have to carry these costs until full or partial reimbursement occurs. The interest carry and unreimbursed costs are a burden of the project developer. These carry costs directly affect the developer's financial feasibility for the project. The project developer typically covers the advance funding and associated carry costs through revenues generated by land sales to builders. The larger the amount of advance funding required during the development of the project, the more difficult it is for the developer to achieve the requisite land sale revenue and associated return on investment.

As a result of the developer paying for the unreimbursed advance funding and carry costs, these costs are **not** included in the infrastructure cost burdens by land use provided in the feasibility discussion found in **Chapter 19**. The residential and commercial infrastructure cost burden tests (development fees and land secured debt burden) are established to assess the feasibility of the finished products to the home builders and the non-residential commercial builders (builders) and, therefore, do not include an allowance for the land developer carry costs. The developer carry costs are factored into the individual building projects through the land sales prices paid by the builder to the developer rather than the development impact fee and land secured debt burdens. In addition, **Chapter 19** also includes a separate analysis of the developer's infrastructure cost burden for improvements that the developer will construct and advance fund. This analysis provides one method of examining the financial feasibility of the Project to the developer.

Financing Plan Implementation

Implementation of the Financing Plan ensures that new development will be committed to pay its fair share of the cost of backbone infrastructure and public facilities required to serve the Project. Implementation will occur after Financing Plan approval. The County will administer implementation of the Financing Plan, which will require the following tasks:

- Coordinating closely with all appropriate County departments and other service providers.
- Reviewing Capital Improvement Plans (CIPs).
- Estimating fee program cash flows if it is decided to include a fee program in the Cordova Hills SFD.
- Preparing a Cordova Hills Fee Program Nexus Study to implement the fee program if established.
- Forming one or more Mello-Roos CFDs and administering subsequent bond sales and tax collection if it is decided to include CFDs in the Cordova Hills SFD.
- Monitoring identified revenue sources.
- Accounting for fee payments, fee credits, and reimbursements.

The implementation of the financing mechanisms as recommended in the Financing Plan will need to account for changes in land use, infrastructure project and cost information, and funding sources. Changes should be re-evaluated in the context of the overall financing strategy to ensure required funding is available when needed.

The infrastructure cost estimates in this report are expressed in constant 2011 dollars. They are planning level estimates and are not meant to be final estimates. The infrastructure needs and costs will continually be evaluated and updated as planning and development progresses. When costs are adjusted, the funding programs also will be adjusted to ensure adequate funding. For example, a Cordova Hills SFD development impact fee program, if established, would be updated annually for inflation and periodically for cost adjustments and land use changes.

Organization of the Report

This report is organized as follows:

- **Chapter 2** summarizes the proposed land uses in the Project.
- **Chapters 3** through **7** detail the costs and funding of each backbone infrastructure improvement type.
- **Chapters 8** through **16** detail the costs and funding for each type of Public Facility. The corporation yard and transit facility requirements and costs are uncertain and need to be refined as more information becomes available. The chapters describing the requirements, costs, and funding estimates for the other public facilities are complete and ready for review.
- **Chapter 17** discusses the proposed new Cordova Hills SFD.
- **Chapter 18** discusses implementation of the Financing Plan.
- **Chapter 19** examines the feasibility of the Financing Plan.

2. LAND USE

Overview

The 2,668-acre Cordova Hills site is presently vacant. The Cordova Hills Project will include a mix of uses consisting of residential, office, retail, university/college campus center, schools, parks, trails, open space, and public uses. As shown on **Map 2-1**, the Project includes six distinct villages, the proposed university/college campus center, a large preservation (avoided) area, and other permanent open space that serves to separate villages.

The Project includes a wide mix of residential uses, from high-density residential along the western edge, to low-density residential along the eastern edge. The majority of the commercial development is planned for the Town Center village in the western part of the Project adjacent to Grant Line Road. A 223-acre university/college campus center is planned just southeast of the Town Center. **Map 2-2** shows the Project land use plan.

Phasing

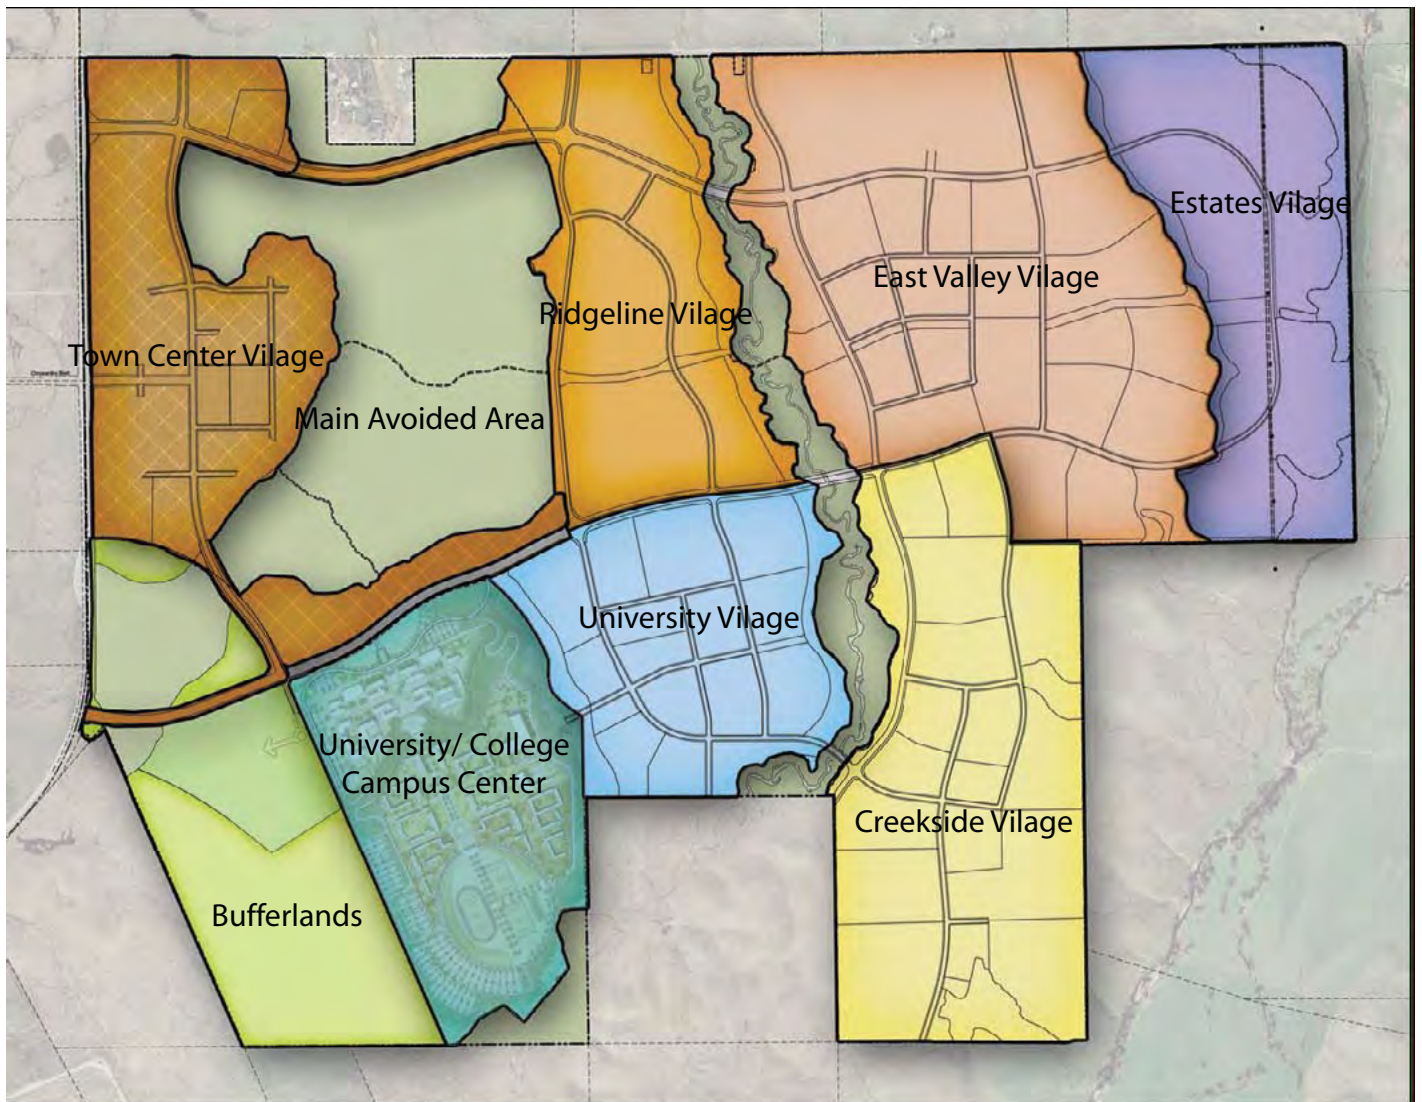

Summary

The Project is expected to develop in phases beginning in the western part of the Project and continuing eastward. **Map 2-3** shows the illustrative Project phasing. The map includes three phases. Phase 1 includes development of the Town Center and part of the university/college campus center. Phase 2 includes completion of the university/college campus center and development of Ridgeline Village and University Village, which are located in the center of the Project. Phase 3 includes development of the remaining three villages. This Financing Plan focuses on Phase 1 and Project buildout. Phase 1 initiates the Project and includes development of infrastructure needed to provide essential services. After initiation of the Project, development will respond to market conditions, will occur in multiple smaller phases, and will not necessarily follow the phasing shown in **Map 2-3**. Because the actual Project phasing is uncertain, the Financing Plan focuses on the initiation of development (Phase 1) and buildout.

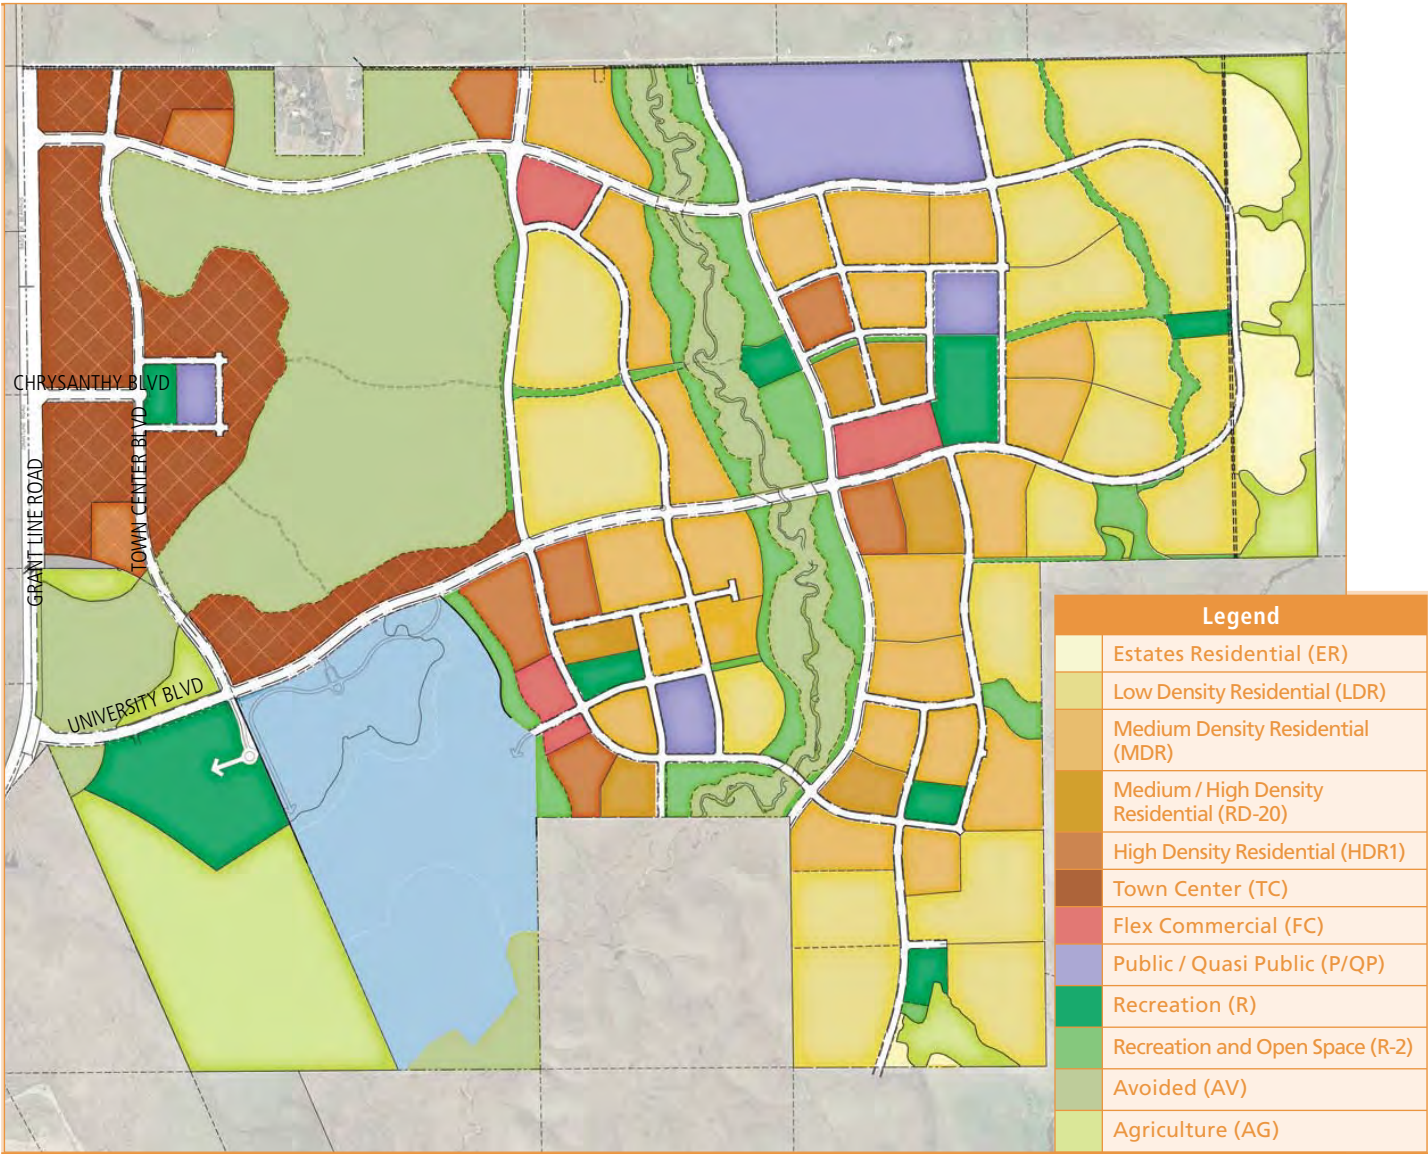

Acres

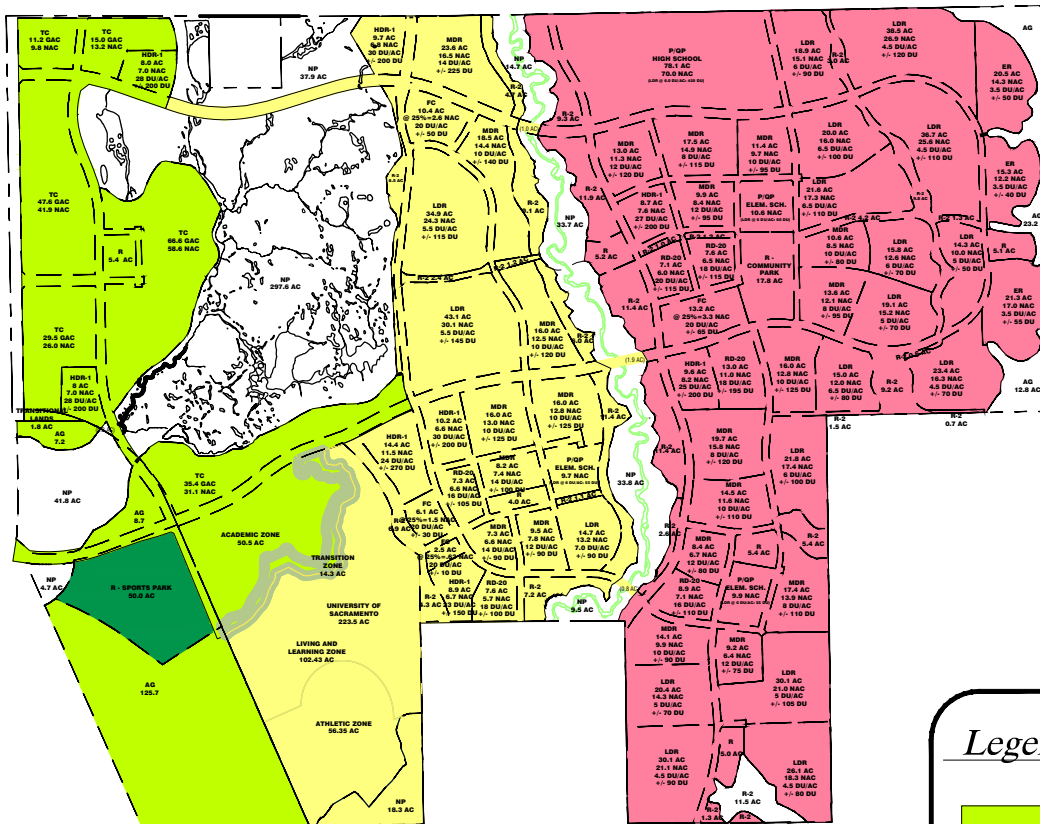

Table 2-1 summarizes the acres by land use at completion of Phase 1 and at buildout. The acres shown in **Table 2-1** are based on the March 2011 Land Use Plan prepared by William Hezmalhalch Architects, Inc. (WHA). Please note that the acres by land use reflected in the recent April 2012 Revised Public Review Draft of the Cordova Hills Master Plan (Cordova Hills Master Plan) were modified slightly from the acres shown in this Financing Plan. In particular, the April 2012 Cordova Hills Master Plan includes 3.2 fewer residential and commercial acres and 3.2 more public use acres. Since the recent acres change was so minor, and since the land use mix is likely to change again before implementation of the Project, this report continues to reflect the March 2011 Land Use Plan acres, consistent with many of the other technical studies.

acres sum

Source: EPS and WHA Land Use Plan (March 2011)

- [1] Acres with "Town Center" and "Flex Commercial" land uses were distributed to residential and commercial uses.
- [2] Phase 1 is equivalent to the Town Center, the surrounding agricultural and avoided area, and part of the university/college campus center.

Table 2-1 shows both the original acres from this Land Use Plan and the acres after distributing the mixed use acres (defined as "Town Center" and "Flex Commercial" uses) to the various residential and nonresidential uses. The mixed use acres contain a mix of residential and nonresidential uses and were distributed to these uses for the purposes of properly allocating Financing Plan costs to the different land uses.

Development, Population, and Employees

Table 2-2 shows the projected dwelling units, building square feet, population, and employees for Phase 1 and buildout of the community portion of the Project. These development projections are based on estimates prepared by WHA for use in the Cordova Hills Master Plan. The university/college campus center projections are shown separately in **Table 2-3**.

The mix of Phase 1 dwelling units and non-residential building square feet is approximate and represents a possible development scenario in the Town Center village. There is flexibility in the mix of the Town Center development, so the relative amount of commercial and residential development could be different. In addition, density bonus dwelling units could be built, increasing the amount of residential development.

For purposes of the Financing Plan, the buildout dwelling units were reduced from the maximum 8,000 dwelling units to 7,500 dwelling units, and the buildout nonresidential building square feet were reduced from 1.3 million square feet to 851,000 square feet. **Table 2-4** compares the Financing Plan and Master Plan dwelling units and building square feet at buildout. The Master Plan projections are higher because they are used to estimate maximum Project impacts. The more conservative projections in the Financing Plan help ensure that costs per dwelling unit or building square foot are not understated if actual development occurs at levels below the maximum authorization.

In addition, for purposes of developing fair share cost allocations, the persons per household factors used in the Financing Plan to project population are different from those used in the Master Plan. The Financing Plan differentiates between factors for different residential uses while the Master Plan assumes only two factors: one for single-family uses and one for multifamily uses. Because of the difference in assumed dwelling units, the total projected population in the Financing Plan (20,110 people) is less than in the Master Plan (21,379 people). This lower Financing Plan population estimate does not affect the projected requirement for parks, schools, or other population based facilities identified in the Master Plan, as these requirements were based on the Master Plan population estimate.

Source: Cordova Hills Administrative Draft Master Plan (September 2010) -- Table 3-1 and 11/20/09 Land Use Plan

- [1] People per household factors that differ from the factors in the Master Plan were established for use in the Financing Plan cost allocation. The overall population generated by 8,000 units remains virtually the same. The total estimated units in the Financing Plan, however, were reduced from a maximum of 8,000 to 7,500, resulting in a lower population.
- [2] For cost allocation purposes, the Financing Plan does not include separate categories for High Density (30-40 units/acre) or Flex Commercial units. High Density (30-40 units/acre) units have been included with High Density (23-30 units/acre). Flex Commercial units have been included with Medium Density.
- [3] For the purposes of the Financing Plan, the projected buildout residential dwelling units and nonresidential building square feet were reduced from the maximum authorized levels. These more conservative projections helps ensure that the costs per dwelling unit and building square foot are not understated if actual development occurs at levels below the maximum authorization.

3. *ROADS*

The Cordova Hills Special Planning Area (Cordova Hills) provides a comprehensive transportation network designed in accordance with anticipated traffic volumes and travel demands of the planned land uses, as well as the regional system envisioned by the County General Plan.

At the time of preparation of this Cordova Hills Financing Plan, there were certain variables present that could affect Cordova Hills's fair share allocation of certain offsite roadway costs. These variables include roadway improvements within the jurisdictional boundaries of the City of Rancho Cordova and the City of Elk Grove, as well as the impact of the proposed Capital Southeast Connector Project on Grant Line Road improvements. The analyses included in the Financing Plan are based on the best assumptions and information currently available. For the implementation of the financing mechanisms and updates thereafter, revisions will be made if assumptions change or the outcome of discussions with the cities yields a different fair share cost obligation.

The County currently requires development projects to pay their fair share of offsite road improvements in other jurisdictions. The Board of Supervisors provided further direction that if a reciprocal agreement cannot be reached by both jurisdictions at the time of fee collection, then mitigation payments for impacts wholly in the other jurisdiction will not be collected. The County intends to enter into a Cross Jurisdictional Memorandum of Understanding (MOU) with other jurisdictions to collaboratively address the impacts of its development within neighboring jurisdictions.

The proposed Capital Southeast Connector Project is another variable that may result in a need to amend the assumptions of Cordova Hills' final cost and construction responsibilities at implementation. The County General Plan calls for Grant Line Road ultimately to be improved to a 6-lane thoroughfare configuration, which this Financing Plan takes into account; however, the proposed Connector Project likely would turn Grant Line Road into a limited access 4-lane expressway. Consequently, if and when the Connector Project develops, the implementation plan would reallocate Cordova Hills' fair share funding of Grant Line Road to the Connector Project configuration of Grant Line Road (anticipated to be a 4-lane expressway with grade separated interchanges). Cordova Hills' fair share cost might be reduced if Cordova Hills' fair share funding for the Connector project is less than its fair share cost allocation for the 6 lane Grant Line Road thoroughfare configuration. Cordova Hills' fair share allocation percent will not be increased as a result of this project change because the Cordova Hills project does not require the Connector project as a mitigation measure for its traffic impacts.

Facilities

The Cordova Hills backbone roadway system includes both onsite and offsite improvements. The Onsite and Offsite Road Capital Improvement Programs are detailed in **Appendix A**. This appendix includes two preliminary cost estimate sections prepared by Mackay & Soms. The first section provides costs estimates for onsite road improvements and the second section provides cost estimates for offsite road improvements.

Onsite improvements include the following types of facilities:

- Four-lane arterial roads, including medians.
- Two-lane roads, adjacent to open spaces.
- NEV lanes, bike lanes, and trails within the road right-of-way.
- Traffic signals.
- Pedestrian signals and crossings.
- Roundabouts.
- Creek and habitat crossings.
- Separated sidewalks, street lights, and landscaping.

Offsite improvements include the following type of facilities:

- Intersection improvements.
- Four and six lane roadway improvements on major roads including, among others: Grant Line Road, Jackson Highway, and Douglas Road.
- Drainage structures/bridges associated with the expanded roadway capacity improvements and new roadways.
- Shoulder widening.
- Auxiliary lanes on Highway 50.

Facility Costs and Revenues

Summary

Table 3-1 summarizes the Cordova Hills Phase 1 and buildout onsite and offsite backbone roadway improvement costs and revenues for improvements to be funded through the proposed Cordova Hills Special Financing District (Cordova Hills SFD). As noted above, there are several actions regarding the cost responsibility for offsite road mitigation projects that will not be finalized for some time. Also, Sacramento County's and Rancho Cordova's development impact fee programs for traffic improvements may require updates in the near future. As a result, the revenue and cost estimates discussed below are preliminary.

Buildout

The total cost for the onsite and offsite backbone improvements at buildout is estimated at \$148.1 million. This cost excludes frontage improvements that are typically funded privately by developers except for areas adjacent to open spaces. The road improvements include those road projects that Cordova Hills may be required to construct as required under its mitigation requirements and projects for which Cordova Hills is required to pay a fair share through a fee program. Many of the offsite road improvements are regional roads and have funding identified from other sources, such as Sacramento County Transportation Development Fee program (SCTDF), other fee programs, other new development financing programs and quarry mitigation programs.

roads sum

- [1] Buildout amounts include Phase 1 costs.
- [2] The Phase 1 split of revenues between Fair Share Only and Construction Required improvements is estimated based on the buildout fair share percentage for each of these improvement types.
- [3] This amount is Cordova Hills' fair share of offsite road improvements that Cordova Hills will be required to construct.
- [4] Availability and timing of reimbursements from SCTDF, Measure A, and other sources are uncertain. Therefore, no amounts have been estimated
- [5] These estimates include oversizing requirements and assume that Cordova Hills must initially fully fund the offsite projects for which it has a construction responsibility. Cordova Hills may receive reimbursement for costs beyond their fair share
- [6] The cost of improvements that Cordova Hills may be required to construct is greater than Cordova Hills' fair share cost for these improvements. Reimbursements may be available from several funding sources.

Cordova Hills' fair share of the total cost at buildout is estimated at \$103.3 million and will be funded through the Cordova Hills SFD. Cordova Hills will receive credit for a portion of the fees it pays into the SCTDF for road projects that are also included in and partially funded through the Cordova Hills SFD. In addition, Cordova Hills may need to advance an estimated \$44.9 million in construction costs beyond its fair share of costs and may receive reimbursement from some of the identified funding programs in the future. However, the timing and amount of these reimbursements is uncertain. The Cordova Hills developer will be required to advance the construction costs and wait for future reimbursements based on the terms of the reimbursement agreements associated with each road construction project. The estimated \$44.9 million in advance funding could be reduced if other regional development projects trigger and construct roadways identified for funding through the Cordova Hills SFD before Cordova Hills triggers them.

Phase 1

The Phase 1 backbone roadway improvement costs shown in **Table 3-1** total \$38.6 million. This amount assumes that Cordova Hills will need to initially fully fund the offsite costs for which it has a construction responsibility (as discussed in more detail later in this chapter). Cordova Hills developers may be reimbursed for costs that exceed the Project's fair share allocation as determined by Sacramento County Department of Transportation (SACDOT) for the SCTDF and from other sources that also have a funding obligation for the improvements.

Existing Fee Programs and Other Funding Sources

Some of the offsite road improvements in the Cordova Hills Offsite Roadway CIP are included in the SCTDF, Measure A, and Rancho Cordova transportation fee programs. The amount of SCTDF funding available in assisting the Cordova Hill's road mitigation projects is difficult to determine. Both SCTDF and Measure A have many road projects competing for available funding from these programs. It is uncertain when the SCTDF funding would be available to reimburse the Cordova Hills' developers for constructing road improvements that are included in the SCTDF. Measure A funding is only available for the Capital Southeast Connector. At some point, Measure A revenues may be available, if the Grant Line Road Expressway is converted to the Connector. If the Cordova Hills developer provides for advance funding for the Connector, then there may be some reimbursements from the Measure A program. The same uncertainty applies to the availability of funding from other potential sources.

Since the timing and availability of credits and reimbursements from the SCTDF and Measure A programs is uncertain, **Table 3-1** does not include any estimates for reimbursements from these funding programs.

If there is no reimbursement or matching funding from the various funding sources during Phase 1, then there is a remaining Phase 1 estimated shortfall of \$16.7 million, which would be developer advance-funded. At buildout, the developer's reimbursable advance funding beyond Cordova Hills' fair share costs is estimated at \$44.9 million if no reimbursements are available by buildout. The Cordova Hills developer may be reimbursed for the developer advances as revenue becomes available from other sources. However as stated above, the timing of these reimbursements is unknown. The developer will need to carry these costs until reimbursements become available.

Onsite Roadway Costs

Map 3-1 shows the proposed Cordova Hills' onsite street types and locations. **Map 3-2** shows the proposed Cordova Hills' onsite street types and locations for road segments to be funded through the Cordova Hills SFD only. These roads include all four lane roads and some two lane roads. Most two lane roads, however, will be funded by private developers whose property is adjacent to the road. Funding for frontage lanes is discussed in more detail later in this chapter.

Table 3-2 summarizes the onsite backbone roadway costs that will be funded through the Cordova Hills SFD. The detailed onsite unit cost estimates for the various roadway sections are provided in Appendix A. **Table 3-2** includes the total cost of all onsite roadway improvements included in the Cordova Hills SFD, as well as the net cost after deducting estimated frontage costs. Frontage consists of the curb, gutter, sidewalk, and first 11 feet of pavement (whether a parking lane and/or portion of the outside travel lane) in each direction and is typically paid by the developers whose properties are adjacent to these lanes. Consequently, frontage costs for roads adjacent to residential or commercial development will be financed by private developer funding.

The onsite backbone roadway cost totals an estimated \$60.9 million. The net cost after deducting the frontage costs totals \$49.7 million. **Appendix A** includes the detailed unit cost estimates for all onsite road sections included in **Table 3-2**.

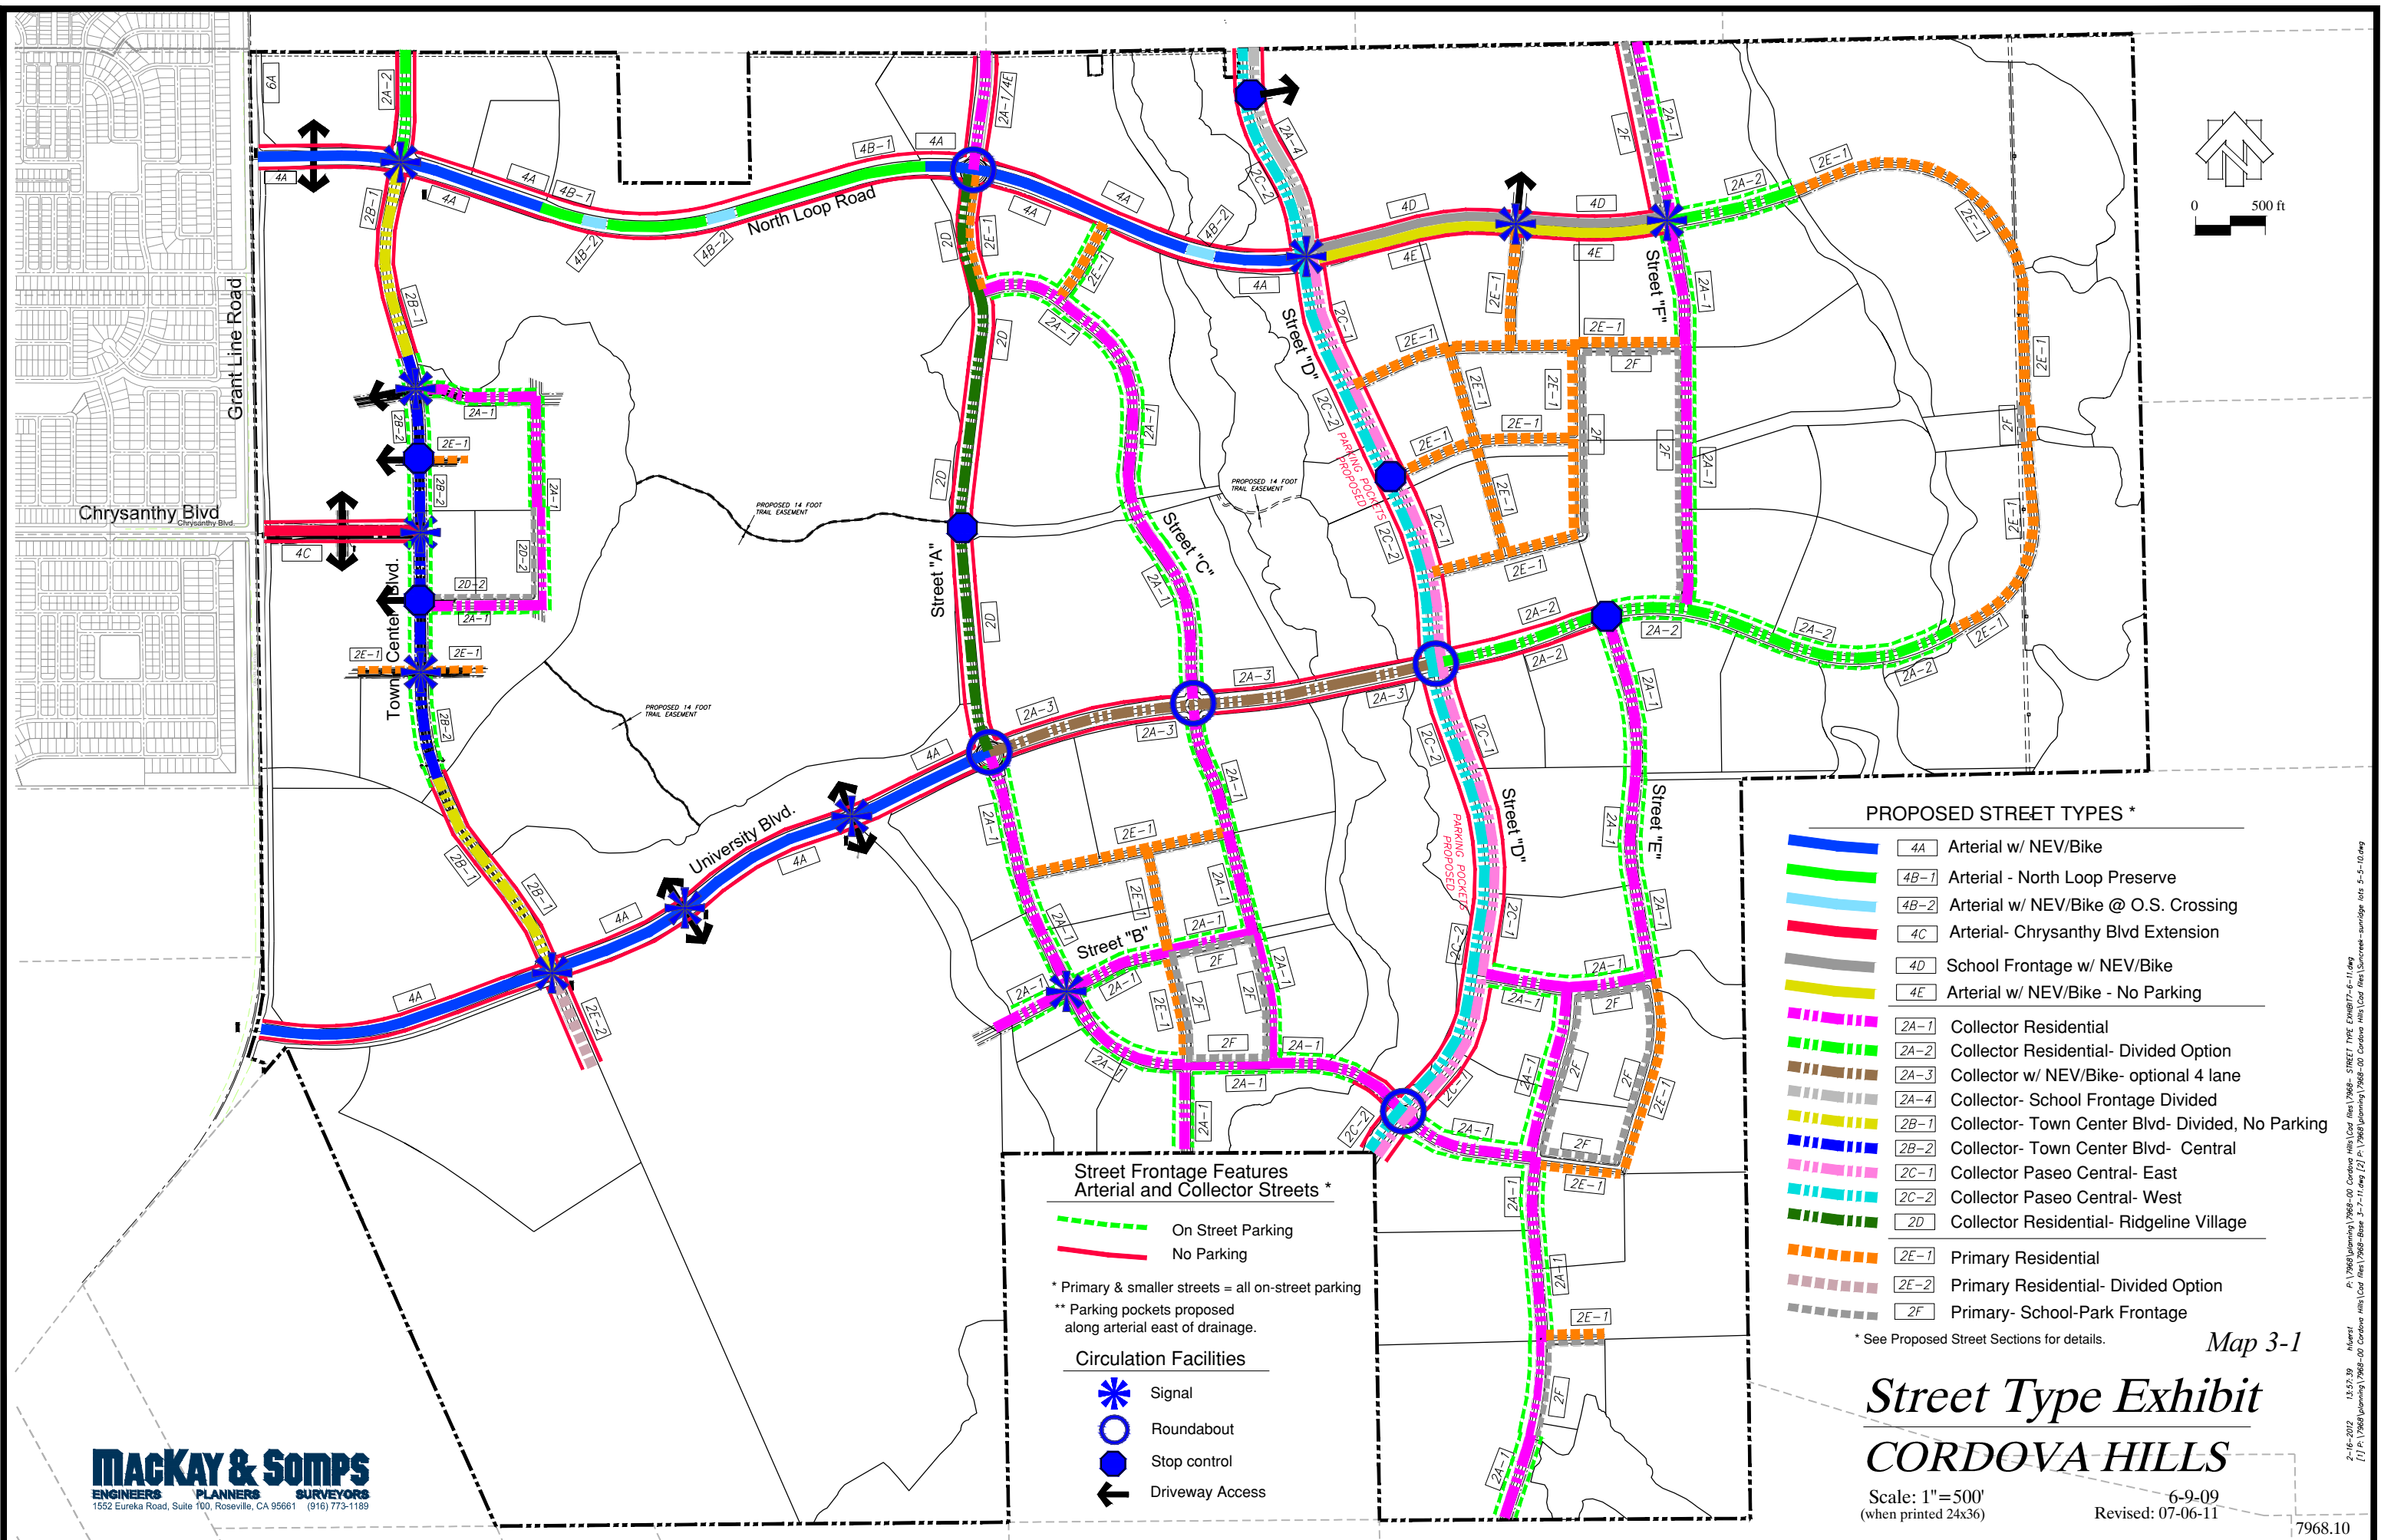

Offsite Roadway Costs

Cordova Hills has an obligation to construct many of the off-site roadways included in the Offsite Roadway CIP at various stages of development. The cost to Cordova Hills to construct these roadways would be reduced to just Cordova Hills' fair share if other regional development projects trigger and construct the roadways before Cordova Hills triggers them. In addition, Cordova Hills has a responsibility to fund its fair share of certain roadway improvements with no construction responsibility. Cordova Hills' total fair share of offsite roadway costs will be payable through the Cordova Hills SFD. The remainder of offsite Roadway CIP costs may be funded by other sources, such as County and City fee programs, state and federal funding, and other surrounding new development projects that are conditioned to participate in funding the improvements if required by California Environmental Quality Act (CEQA) mitigations prior to Cordova Hills' responsibility to construct. As noted earlier, the availability and timing of funding from other sources is uncertain.

Map 3-3 shows the location of the transportation improvement mitigation measures in the Off-site Roadway CIP. There are two types of mitigation measures shown on the map and summarized below:

- A mitigation measure with a whole number under it indicates an improvement with a construction responsibility. The number indicates the timing of the construction requirement, measured in dwelling unit equivalents (DUEs).

There are several intersection improvements that could be required earlier than stated in the mitigation measures. Intersection analyses will be required prior to issuance of the first and one-thousandth building permits to reassess the time at which various improvements will be

needed. These intersection analyses could result in changes to the required timing of the improvements. The intersection improvements to be included in the analyses are listed below:

<u>Intersection</u>	<u>Current Timing of Construction</u>
Grant Line and Jackson	500 DUEs
Grant Line and Douglas	850 DUEs
Grant Line and Douglas	1,800 DUEs
Kiefer and Grant Line	2,000 DUEs

In addition to requiring intersection analyses for these intersections, the County also accelerated the construction requirement for the Sunrise and Jackson intersection to 500 EDUs. To facilitate this early construction requirement, the County has agreed to commit \$800,000 in SCTDF revenue for funding of the intersection. SACDOT will obtain all necessary federal and state permits needed for construction, and there shall be no moratorium on Cordova Hills development if SACDOT does not obtain the permits. Although the County will obtain the permits, the Cordova Hills developer will pay the associated mitigation costs if Cordova Hills constructs the improvements. A credit and reimbursement agreement between SACDOT and the developer will govern the use of credits for the Sunrise and Jackson intersection.

- A mitigation measure with a percentage indicates an improvement that requires a fair share funding contribution but not a construction responsibility. The fair share payments for these mitigation measures will be made through the Cordova Hills SFD on a per-unit pay-as-you-go basis as building permits are issued, rather than as lump sum amounts at predetermined thresholds.

Table 3-3 summarizes the costs of the offsite roadway improvements included in the Cordova Hills Offsite Roadway CIP. This table is discussed further in the following section. **Appendix A** provides the detailed cost estimates for the Offsite Roadway CIP.

Phasing

Onsite Roadway Phasing

Phase 1 of the onsite roadway system includes onsite road improvements in the Town Center and adjacent to the university/college campus center. Phase 1 onsite roadway improvements are estimated at \$20.8 million. **Map 2-3** in **Chapter 2** shows the preliminary phasing plan for the Cordova Hills project. Roadways in Phase 1 will serve the Town Center Village and the university site. The timing of construction for remaining phases is undetermined at this time and will be based on market conditions, project conditions of approval (as noted in the Development Agreement and Rezoning Conditions), and Environmental Impact Report (EIR) mitigation measures. The remaining onsite roadway will be built incrementally as the project proceeds through buildout. There will likely be many smaller sub-phasing as development of the project responds to market conditions.

Offsite Roadway Phasing

Table 3-3 shows the Cordova Hills offsite roadway improvements in order of the DUE triggers which establish the timing for projects for which Cordova Hills has a mitigation requirement for construction of the improvements. Improvements without construction triggers will require fair share payments to meet the mitigation requirement.

Construction Responsibility Improvements

Table 3-3 includes descriptions of all offsite roadway mitigation measures that are the responsibility of the Cordova Hills project to construct. Some of these road projects may be part of EIR mitigation requirements for other nearby development projects such as Sun Creek and the Arboretum in Ranch Cordova. The actual construction responsibility will be assigned to the project that requires its construction due to its mitigation monitoring program. As a result, it is uncertain how much of the roadway construction costs identified in **Table 3-3** will actually be incurred by Cordova Hills above its fair share amount. Many of these roadway projects are included in a development impact fee program. Developers constructing these improvements may receive fee credits or reimbursements from these fee programs as discussed later in this chapter. There is also a possibility that the Capital Southeast Connector JPA will construct certain Grant Line Road improvements, if the JPA is able to secure funding prior to the development projects' construction triggers.

Many of the existing off-site rural roadway segments that are identified to be widened by Cordova Hills include existing 12 kV power poles adjacent to the existing pavement. The cost to relocate the poles typically has to be borne by the development that causes the relocation to occur. Only when a project is a public roadway improvement project will SMUD relocate such power poles at its own cost. The off-site roadway segment and intersection widening estimates that Cordova Hills will be the applicant on (vs. being a public project) thus include the costs to relocate the power poles. For certain projects on Grant Line Road, the construction cost estimates do not include the costs to relocate power poles. For the projects between Douglas Road and University Boulevard, SMUD will be constructing a new 69 kV pole line to bring power to Cordova Hills. As part of this project, the existing 12 kV pole line along this segment of Grant Line Road will be abandoned. For the segment of Grant Line Road between Douglas Road and White Rock Road, Cordova Hills has agreed to fund shoulder widening at the time that 250 DUEs are constructed onsite. Because the County Department of Transportation will be the applicant for this particular project making it a public project, the cost to relocate the power poles will be borne by SMUD.

Table 3-3 includes the fair share funding percentage for the improvements for which Cordova Hills has a construction requirement. The fair share funding amount for these improvements is the amount Cordova Hills SFD would be required to reimburse to developers of other projects or public agencies if they built the improvement instead of Cordova Hills. The fair share amounts of these road improvements are used to establish a portion of the road fee in the Cordova Hills SFD. The Cordova Hills developer will be responsible for constructing the road improvements based on the construction trigger requirement. The developer will be partially reimbursed from the Cordova Hills SFD road fee and may receive further reimbursements from other funding programs as funding becomes available with the limitation noted earlier.

The fair share funding allocations are preliminary estimates. The funding responsibilities assigned to Cordova Hills may be reviewed and updated as the various financing programs are updated and the Cordova Hills SFD is implemented or as other financing programs are implemented.

Phase 1 of Cordova Hills has an estimated 1,750 dwelling units and 120,000 commercial building square feet. Using vehicle miles traveled (VMT) factors to estimated DUEs and allocate costs (see **Table 3-8** later in this chapter), Phase 1 development results in 1,683 DUEs. Assuming that no other development projects are underway, offsite roadway improvements constructed by Phase 1 of Cordova Hills would be those projects listed below the 1,800 DUE trigger.

The most significant financial hurdle following Phase 1 will occur when the Cordova Hills development reaches 3,200 DUEs. At this point, the construction cost for offsite roadway requirements could reach approximately \$55 million. Expenditures of \$41 million fall between 2,000 and 3,200 DUEs. The \$55 million represents roughly 70 percent of the total offsite road construction requirement. However, only about \$13 million, or roughly 40 percent of the development fee revenue would have been collected by this time. The resulting shortfall of approximately \$42 million occurs both because of this disparity between the percentages of costs incurred and fees collected and because the developer is also constructing road improvements that are potentially eligible for reimbursement from other funding programs and thus are not included in the Cordova Hills SFD funding program. Cordova Hills' construction cost requirement and resulting shortfall would be reduced if other regional development projects trigger and construct the roadways before Cordova Hills triggers them.

Then next significant financial hurdle will occur at 6,900 EDUs. At this point, 92 percent of the Cordova Hills construction responsibility cost might be incurred, but only about 84 percent of the Cordova Hills development will have contributed to the fee program.

At buildout, **Table 3-1** shows that the developer could have advanced approximately \$45 million, subject to future reimbursement. It is uncertain whether or not any of this reimbursement funding may be available before buildout to reduce the developer's out of pocket costs. It is also uncertain how much of this oversizing cost will ultimately be reimbursed.

Fair Share Only Improvements

Table 3-3 also includes the offsite roadway projects for which Cordova Hills has a fair share funding obligation but no construction responsibility. The Cordova Hills' funding obligation for these offsite road costs is met through the Cordova Hills SFD.

There are no phasing requirements for the roadway projects for which Cordova Hills has a fair share funding responsibility only. The fair share funding will be provided by the funding programs discussed below.

As with the construction responsibility improvements, the fair share funding allocations assigned to Cordova Hills will be reviewed and updated as the various financing programs are updated and the Cordova Hills SFD is implemented.

Funding Strategy

Summary

Cordova Hills' onsite and offsite backbone road costs will be funded through a combination of existing and proposed funding sources. These funding sources are described below.

Onsite Funding Sources

Onsite backbone roadway costs will be funded by the proposed Cordova Hills SFD. Most frontage improvements and most two-lane roads will be funded by private developers within the Cordova Hills. There are a few cases where two lane road segments or frontage along four lane road segments (listed in **Table 3-2**) are adjacent to open spaces on one or both sides of the road. Funding for these improvements is included in the Cordova Hills SFD financing program.

Offsite Funding Sources

There are a number of different road financing plans and fee programs that have some level of financial responsibility for the offsite road projects that are part of Cordova Hill's mitigation requirements. Cordova Hills has construction responsibility and fair share funding responsibility for many of these road projects and fair share funding responsibility only for others. All of these programs include periodic updates or major updates to reflect changed land use assumptions and funding responsibilities. Several updates to each of these programs may take place during the development period of the Cordova Hills project.

Table 3-4 shows the major road projects for which Cordova Hills has been assigned construction responsibility, as defined in the EIR Mitigation Measures. **Table 3-4** shows the major road segments that are identified in the SCTDF and other funding programs. **Table 3-4** also indicates if the road project is presently identified in an existing or proposed development impact fee programs or other financing programs. If funding is available from other sources, then Cordova Hills' financial contribution for construction may be reduced to only the Cordova Hills fair share. However, there is no certainty that funding will be available to offset construction costs or when funding may be available for eventual reimbursement. Information from these other funding programs is not detailed enough to identify the availability of funding for each specific Cordova Hills mitigation measure and is considered with other priorities within each program.

There is also considerable shared funding responsibility between the Sacramento County road funding programs and the Rancho Cordova road funding programs, particularly for segments of Grant Line Road and Jackson Highway. Furthermore, the Cordova Hills project has mitigation requirements for roads that are completely within the boundaries of Rancho Cordova and currently fully or partially funded by Rancho Cordova transportation fee programs. Similarly, projects proposed in Rancho Cordova may have mitigation requirements for roadway projects within the boundaries of Sacramento County.

To provide a mechanism to assure that developments in neighboring jurisdictions mitigate for the impacts, a Cross Jurisdictional Memorandum of Understanding (MOU) or a Reciprocal Funding Agreements is proposed. Sacramento County may develop MOUs with the cities of Rancho Cordova, Folsom and Elk Grove. A similar MOU with the City of Sacramento is already in place.

fund

[1] Potential funding sources are identified as funding sources in existing County and City fee programs.

[2] Total cost is the cost identified for the segments that Cordova Hills is required to construct. These amounts do not match the cost for the road segments identified in the other listed financing programs. The Cordova Hills' costs are in 2012 dollars. Many of the other programs have costs that are several years old. Also, the portion of the road segment that Cordova Hills may be required to construct may only be part of the complete road segments in the other funding programs.

The Cross Jurisdictional MOU or Reciprocal Funding Agreement would, in general terms, describe the intentions of Sacramento County and the City of Rancho Cordova to cooperate in the funding of road projects located in each jurisdiction that are impacted by development projects approved by the respective jurisdiction. The MOU or Agreement would provide a mechanism to collect for the impacts that the Cordova Hills project would have on the roads within the cities of Rancho Cordova, Elk Grove, and Folsom. The agreement would also cover the impacts on County roads caused by development projects approved by these other cities.

The County and Rancho Cordova may also enter into an agreement related to funding of roadways located on their shared boundary, such as Grant Line Road and Jackson Highway.

Offsite costs ultimately may be funded in part by the existing and new funding programs discussed above and more fully described below. Because of EIR mitigation measures, Cordova Hills may be required to construct and/or advance fund some offsite roadway improvements that have other funding sources (such as County fee programs or Rancho Cordova Fee Programs). Cordova Hills would then be eligible for reimbursements from these other sources. The details regarding these reimbursements are typically governed by reimbursement agreements for each road improvement.

Existing Funding Sources and Fee Programs

Cordova Hills will be required to pay fees in the following two existing roadway development impact fee programs:

- Measure A Sacramento Countywide Transportation Mitigation Fee Program (SCTMFP).
- Sacramento County Transportation Development Fee (SCTDF) Program.

In addition, other funding sources or programs may provide construction funding or reimbursement for some offsite mitigation measures:

- City of Rancho Cordova Transportation System Development Impact Fee Program.
- Sunrise Douglas Community Plan (Rancho Cordova) Development Impact Fee Program.
- Teichert Quarry and Stonebridge Quarry Mitigation Programs.

The funding programs listed above are updated periodically by the responsible jurisdiction. These programs may need to be updated in the next few years with the exception of the Measure A SCTMFP, which is a voter approved fee program.

Measure A SCTMFP

Cordova Hills' development will participate in the SCTMFP. In November 2004, Sacramento County voters approved Measure A implementing a transportation development impact fee. The fee is used to fund Measure A capital projects in the local jurisdictions where the fees are generated. The only Measure A project that is also linked to the Cordova Hills Mitigation Measures is the Capital Southeast Connector which is an alternative road project for the construction of Grant Line Road as a 4 lane expressway. If Cordova Hills constructs portions of the Capital Southeast Connector, then Cordova Hills may be eligible for Measure A reimbursements. **Table 3-5** estimates the SCTMFP fee revenue generated from Cordova Hills at completion of Phase 1 development and at buildout.

SCTDF Fee Program

Cordova Hills' development is located in District 3 of the SCTDF Fee Program. **Table 3-6** estimates the SCTDF fee revenue from Cordova Hills at completion of Phase 1 development and at buildout. Cordova Hills will generate an estimated \$66.9 million in SCTDF fee revenue at buildout. **Table 3-6** assumes the estimated SCTDF fee after adjusting for potential fee credits. The fee credit is for the portion of SCTDF road costs that have also been included in the Cordova Hills SFD road program to avoid double charging for an improvement. These roadway costs and the resulting total SCTDF credit amount are detailed in **Table 3-14** at the end of this chapter. **Table 3-7** estimates the number of DUEs and calculates a fee credit per DUE as well as the percent of the SCTDF fee per DUE that the credit represents. The fees in **Table 3-6** are adjusted by this credit percentage.

The current SCTDF rates are set at one-third of the full rates. The full rates are being phased in and are planned to go into effect in March of 2013. The fee estimates in **Table 3-6** assume the 2013 implementation of the full fee adjusted by the fee credit.

The SCTDF Fee Program is scheduled for periodic updates every five years or when there is a major change in assumptions, such as a comprehensive update in the General Plan or when a large new specific plan is approved. The SCTDF was last updated in March 2010.

City of Rancho Cordova Transportation System Development Impact Fee Program

The City of Rancho Cordova's transportation system development impact fee (RCTSDIF) funds more than \$1.263 billion in needed and desired capital improvement projects through the City's 2030 General Plan buildout. Capital improvements include arterial and collector streets, bridges, intersection and interchange improvements, and other miscellaneous projects. Roughly 93 percent, or \$1.164 billion, of the total project list is designated as necessary as the result of, or to accommodate, continued residential and business development. The remaining share represents funding for existing deficiency projects that would be needed regardless of any future development.

Sunrise Douglas Community Plan (Rancho Cordova) Development Impact Fee Program

The Sunrise Douglas Community Plan (SDCP) Development Impact Fee Program (SDCP Fee Program) includes a roadway component that funds \$116.5 million in roadway improvement costs that are required to serve new development in the SDCP. The projects include widening of major onsite and offsite roadway segments, intersection improvements and signalization, median improvements, drainage culverts, landscaping, and right-of-way land acquisition. **Table B-1 of Appendix B** in the July 22, 2005, SDCP Fee Program Nexus Study identifies the 103 roadway projects in the SDCP CIP.

Sunrise Douglas development projects are subject to both the SDCP Fee Program and the RCTSDIF Program. However, the fees are not overlapping, so a Sunrise Douglas development project will pay the total amount of the citywide fee in two components—the citywide component and the Sunrise Douglas component.

Teichert Quarry and Stonebridge Quarry Mitigation Programs

Traffic mitigation programs were recently adopted for the Teichert Quarry and Stonbridge Quarry projects located in Eastern Sacramento County. These quarry projects are obligated to fund

several mitigation measures that are also included in the mitigation measures for Cordova Hills. It is uncertain when the quarry mitigation programs would construct the road projects that are mitigation requirements for both the quarry projects and Cordova Hills.

The Quarry projects are not obligated to reimburse others for improvements made towards a Quarry mitigation measure. However, it is possible that a Quarry Project may construct a common mitigation measure in advance of Cordova Hills being required to construct the same improvement thereby removing Cordova Hills' mitigation obligation.

The Teichert Quarry Roadway Mitigation Program includes \$17.2 million in fair share cost allocations. Project mitigation measures include signalization and roadway expansions. Major projects include converting Grant Line Road from White Rock Road to Douglas Road and White Rock Road from Scott Road West to Scott Road East into four lane arterials.

The Stonebridge Quarry mitigation program includes \$25.2 million in fair share cost allocations. Project mitigation measures include signalization and roadway expansions. Major projects include converting Grant Line Road from White Rock Road to Douglas Road, Grant Line Road from Douglas Road to Kiefer Road, and White Rock Road from Scott Road West to Scott Road East into four lane arterials.

Proposed Funding Programs

The following two new funding programs are proposed:

- Cordova Hills Special Financing District.
- Folsom SOI Mitigation Monitoring Program.

Proposed Cordova Hills SFD

Cordova Hills' fair share funding responsibility for road projects will be funded through the proposed Cordova Hills SFD. The Cordova Hills SFD will fund all of the major backbone road projects within the Cordova Hills' project and portions of the costs of the offsite mitigation requirement. The Cordova Hills SFD will likely include Mello-Roos Community Facilities District bond-funding or development impact fees. The Cordova Hills developer will be required to construct many of the road projects prior to the availability of revenues generated by the Cordova Hills SFD. These funding advances may be reimbursed in part through fee credits or direct reimbursements from the Cordova Hills SFD for improvements included in the Cordova Hills SFD programs.

Folsom SOI Mitigation Monitoring Program

The City of Folsom recently approved the Folsom SOI project located south of Highway 50. The Folsom SOI project has some roadway mitigation requirements for Grant Line Road. The project's financing program will include development impact fees or some other financing mechanism to fund the identified mitigation requirements. The Folsom SOI Financing Plan is being prepared by the Folsom SOI developers and the City of Folsom.

Funding For Frontage Improvements and Sawtooth Road Policy

The full completion of roadway segments is dependent on developers on both sides of the roadway completing their frontage sections. Contiguously completed segments are dependent on all property owners along the route. Thus, noncontiguous development caused by incongruent development timing and, in some cases, property owners that never plan to develop, results in roadways of varying widths and a mixture of improvement conditions that create traffic “bottlenecks” and a lack of continuity for vehicles, bicycles, and pedestrians. These non-contiguous roadway segments are commonly referred to as “sawtooth road frontage”. In addition to the aesthetic and convenience issues, these unfinished roadway segments can present safety problems for vehicles, bicycles, and pedestrians within those transportation corridors.

Onsite roadways within Cordova Hills shall be subject to the requirements of the County policy concerning discontinuous roadway frontage improvements (“sawtooth”). Unless otherwise noted, Cordova Hills shall install roadway frontage improvements along logical segments of at least one-quarter mile in length, including the project’s frontage. If the length of the project’s conditioned onsite frontage improvements on a single roadway is equal to or greater than one-quarter mile in length, then the project will be deemed to have satisfied the logical segment condition for that roadway. If the project’s onsite frontage improvements are less than one-quarter mile, the project shall install additional offsite frontage improvements in order to satisfy the logical segment condition. The location of limits of such onsite frontage improvements will be determined at the time of the improvements’ plan approval and to the satisfaction of the Department of Transportation. Onsite frontage improvements shall include the construction of the outside travel lane, bike lane or NEV lane, finished roadway edge, and a pedestrian walkway, all as per applicable Cordova Hills’ roadway cross section.

Frontage improvements adjacent to development projects are typically funded privately and the costs are not included in the development impact fee programs prior to the enforcement of the logical segment condition. Since enactment of the policy, in some County planning areas, the County has included a “frontage lane fee” component in the plan area fee. Due to the logical segment policy, fronting developments are often required to acquire right-of-way and construct frontage improvements beyond their project limits. A frontage fee helps lessen the burden on developments that have frontage construction requirements by allowing reimbursements from fees collected from the remainder of the development area. However, this is not proposed for Cordova Hills because the entire project is controlled by the master developer. As a result, the frontage improvement cost burden can be factored into the land value for the individual subdivisions. In summary, the homebuilders will be constructing the logical segments, including portions beyond their project limits, along with their subdivisions, and will not receive reimbursements from any fee—they will take this obligation into account when they purchase subdivisions from the master developer.

There are some exceptions where frontage improvements are included in the SCTDF Program. However, none of the Cordova Hills road mitigation projects have frontage funding included in the SCTDF.

Cordova Hills Special Financing District

Cost Allocation

The Cordova Hills offsite and onsite roadway costs are allocated to the various land uses based on the land uses' relative usage. **Table 3-8** shows the allocation factors used to estimate relative roadway usage and fairly allocate costs to the Cordova Hills land uses. The roadway costs are allocated based on DUEs for residential dwelling units, non-residential building square feet, and university/college campus center students. Separate buildout cost allocations are performed for the onsite and offsite roadway costs. **Table 3-9** shows the buildout onsite roadway cost allocation and the resulting cost per dwelling unit for residential land uses, per building square foot for the nonresidential land uses, and in total for the university/college campus center. **Table 3-10** shows the same information for the buildout offsite roadway costs.

Phase 1 Revenue

The cost per dwelling unit and building square foot factors at buildout from **Table 3-9** and **Table 3-10** are used to calculate the Cordova Hills SFD revenue for both Phase 1 and Buildout. The buildout cost allocations are the basis for estimating the fee revenue in the SFD for both Phase 1 and Buildout.

Table 3-11 shows the estimated Phase 1 Cordova Hills SFD revenue for onsite roadway improvements. **Table 3-12** shows the estimated Phase 1 Cordova Hills SFD revenue for offsite roadway improvements.

SCTDF Credits and Reimbursements

Cordova Hills' development must pay SCTDF fees as well as Cordova Hills SFD fees. Some offsite road improvements may be partially funded in both the SCTDF Program and the Cordova Hills SFD program. To avoid double counting of the fees collected for roadway projects, it is proposed that the Cordova Hills development will receive SCTDF credits for improvements that are included in both programs. A fee credit of 16.2 percent is estimated at this time. This estimate is preliminary and will be finalized when the Cordova Hills SFD program is implemented. As discussed previously, this fee credit is estimated in **Table 3-7** and is based on the SCTDF funding for Cordova Hills' offsite road mitigation projects shown in **Table 3-3**. The reduction in the SCTDF Fee ("fee credit") will reduce the amount of funding available for future reimbursement.

Table 3-13 shows the adjusted total roadway cost burden for a single family unit, including the SFD fee for onsite and offsite roads and the net SCTDF fee after the adjustment for road projects also funded in the SFD. This is a preliminary calculation and will be finalized when the SFD program is implemented. **Table 3-14** provides the backup detail for calculating the SCTDF credit. It includes all the road improvements included in both the SCTDF Program and the Cordova Hills SFD Program and estimates the credit to be received for each improvement. The total credit for all improvements is divided by the total number of DUEs to arrive at an estimated credit per DUE.

SCTDF cr

In addition to granting Cordova Hills the estimated SCTDF fee credit described above, the County has also committed to providing \$800,000 of SCTDF funding to facilitate the early construction of the intersection improvements at Sunrise and Jackson (as discussed earlier). The County will provide this funding in the form of full SCTDF credits until \$800,000 is reached. That is, Cordova Hills development will not be required to pay any SCTDF fees until it has used \$800,000 in fee credits.

4. *SANITARY SEWER*

In January 2012, Sacramento Area Sewer District's (SASD's) Board of Directors approved an SASD Sewer System Capacity Plan 2010 Update that outlines the District's most current mid-range and long-term plan for sewer service to the Cordova Hills area. Sacramento Regional County Sanitation District (SRCSD) is in the process of finalizing its own Interceptor Sequencing Study that will aid SRCSD in planning and implementing regional conveyance projects based on SASD's local collection plans.

SRCSD's regional Interceptor facilities will convey sewage from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) located near the Sacramento River in Elk Grove. Cordova Hills is located outside of the SASD and SRCSD service areas and will thus need to be annexed into both of these service areas through LAFCO in order to receive sewer service.

The annexation process is to be initiated by the Project applicant. Once annexed, the Project proponents will pay the applicable sewer impact fees and construct the required onsite and offsite local collection and trunk conveyance facilities in order to receive service. SRCSD constructs the regional interceptor facilities. Based on the most current planning documents, Cordova Hills will ultimately be served by the SRCSD Douglas Interceptor (DI). This Financing Plan is consistent with the most current SASD and SRCSD planning documents (SASD and SRCSD East Rancho Mid-Range Plans and SASD System Capacity Plan).

Facility Costs

Recommended Scenario

Table 4-1 details the Phase 1 and buildout backbone sanitary sewer trunk facilities and costs for a likely sewer system scenario based on the SRCSD current planning documents. This scenario is referred to in this Financing Plan as the PFFP Services Scenario.

Note that the costs in **Table 4-1** include the costs of an initial pump station with a capacity of 5.6 million gallons a day (mgd), which is sufficient to meet Cordova Hills demand through Phase 2 development. SASD's current recommendation results in the initial pump station being designed to a capacity of 7.13 mgd, which is sufficient to extend service beyond Cordova Hills Phase 2. Once the 7.13 mgd capacity is reached through partial buildout of Phase 3 of Cordova Hills or the western trunk sewer within Cordova Hills is built, the second pump station south of Cordova Hills (with a design capacity of 3.87 mgd) will need to be built.

Also, note that trunk sewer lines typically carry a flow between 1 million gallons a day (mgd) and 10 mgd, whereas local sewer collection facilities carry a flow less than 1 mgd. The backbone sewer infrastructure costs included in this Financing Plan do not include the costs of any local collection facilities.

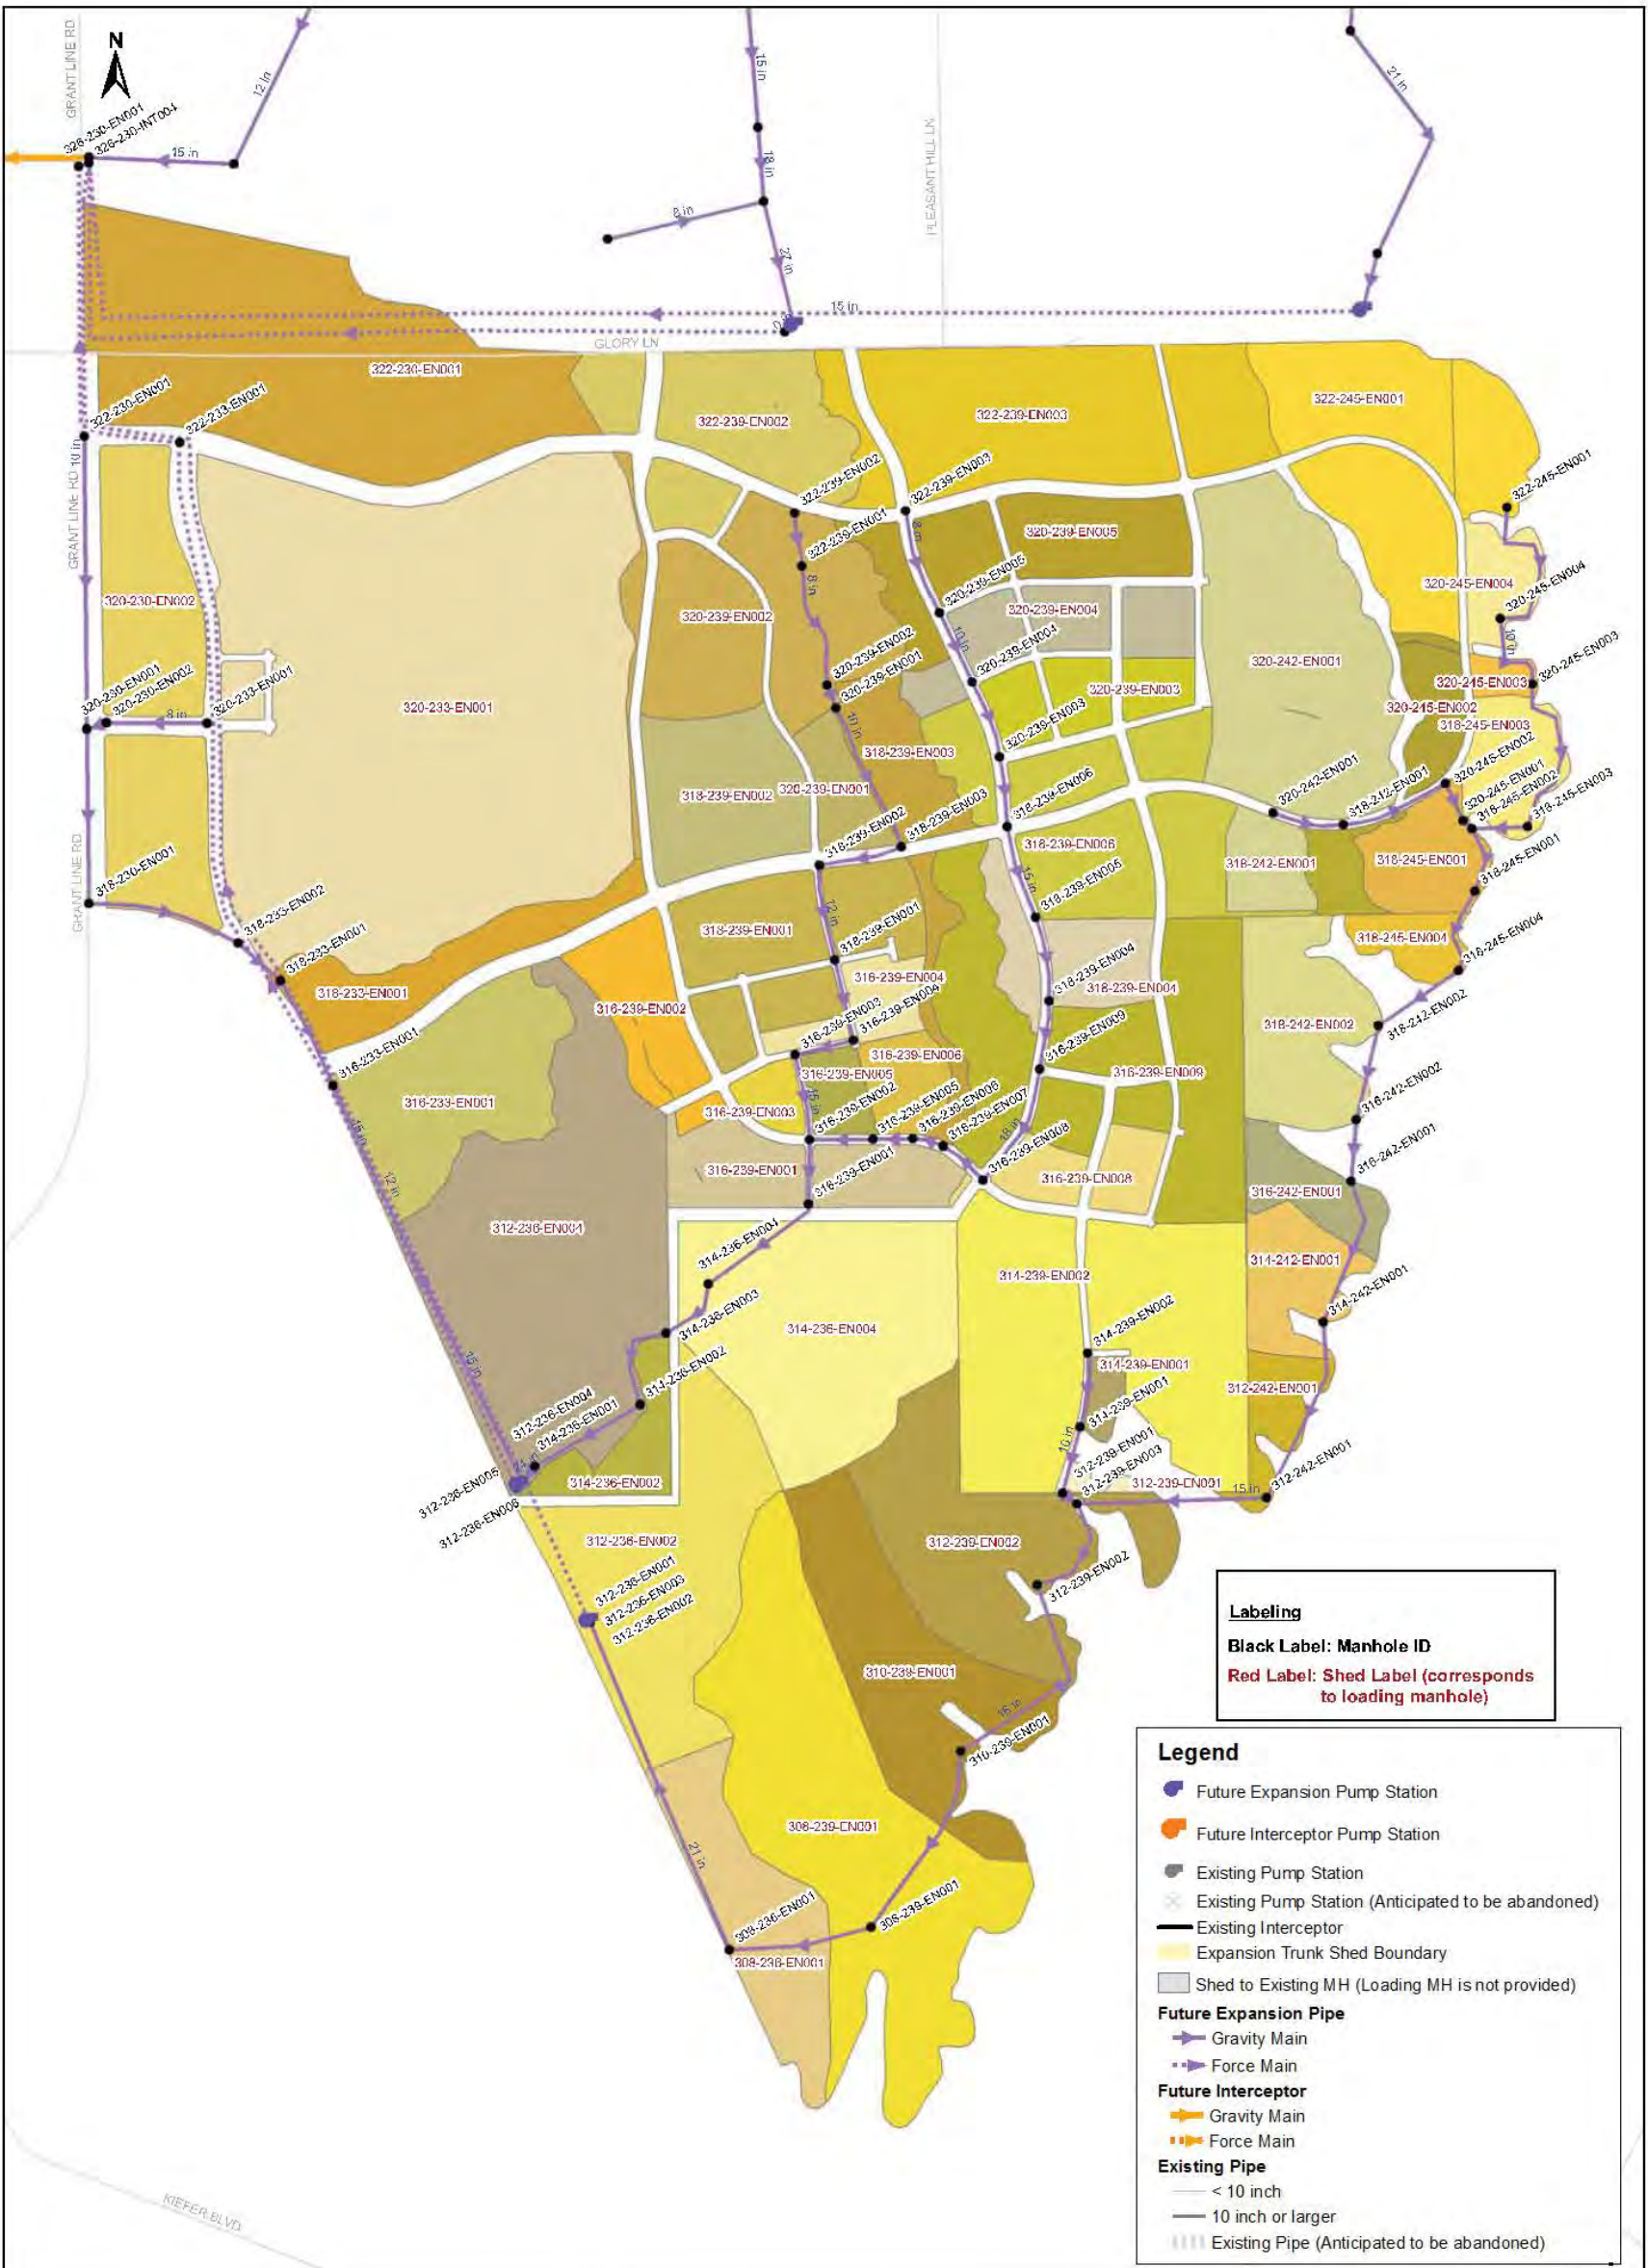

Map 4-1 shows all SASD planned trunk facilities at buildout of SASD Area 4, which includes Cordova Hills. The backup data for this map is provided in **Table 4-6** at the end of this chapter. **Map 4-2** shows the onsite and offsite infrastructure phasing plan for the PFFP Services Scenario.

2010 SASD SYSTEM CAPACITY PLAN
BR East Rancho
Sewer Shed Map - Area 4
Buildout Expansion Plan
Map 4-1

Date last revised: 10/12/2011

At buildout, the total estimated cost of the Cordova Hills backbone sewer system based on the PFFP Services Scenario is approximately \$42.3 million. Facilities include the following improvements:

- Gravity trunk sewer lines ranging from 10 to 27 inches in diameter.
- Two SASD pump stations (one on-site and one off-site).
- On-site force mains and their appurtenances.
- Off-site interim force main extensions and their appurtenances.

Alternative Sanitary Sewer Infrastructure Scenarios

Based on the draft SRCSD Interceptor Sequencing Study and SASD Sewer System Capacity Plan 2010 Update (SCP), a number of sewer service alternatives were developed in addition to the PFFP Services Scenario to address the projected timing of construction of ultimate downstream trunk and interceptor sewer facilities. The PFFP Services Scenario is based on the assumption that capacity will be available in the existing Aerojet-Sunrise Douglas (ASD) trunk sewer and Chrysanthy Pump Station to serve Phase 1 of Cordova Hills (discussed below in Phasing section). There are three other possible scenarios for Phase 1 if this capacity is not available. In addition, each of these four main scenarios contain a number of alternatives for Phases 2 and 3 of Cordova Hills development based on the availability of capacity in existing trunk facilities and on the status of construction of the planned future Aerojet-2 Interceptor and Douglas Interceptor. The actual facilities required will depend on the construction status of the planned future interceptors.

The costs for the various scenarios are summarized in **Table 4-2**. The total buildout cost estimates range from \$37.6 million to \$60.9 million. The scenarios are detailed at the end of this chapter in **Table 4-7**. **Map 4-3**, **Map 4-4**, and **Map 4-5** following **Table 4-7** graphically depict the various sewer facility scenarios for Phases 1, 2, and 3 of Cordova Hills development, respectively.

Phasing for PFFP Services Scenario

Under the PFFP Services Scenario and as projected in the SASD SCP, Cordova Hills ultimately will be served by the SRCSD Douglas Interceptor facility. Before the extension of this interceptor to the vicinity of the Project, Cordova Hills plans to pump its wastewater to the existing Aerojet-Sunrise Douglas (ASD) trunk sewer located in Douglas Road approximately 3,700 feet northwest of Cordova Hills on an interim basis. Based on email correspondence with SASD (Roy Carlson, July 13, 2010), through at least the year 2020, sewer service to the East Rancho Cordova area, including Cordova Hills, is planned to be provided by means of the existing facilities and enhancements thereof (i.e., the Chrysanthy Pump Station and associated force main system to which the ASD trunk drains).

Phase 1 proposes to tie into the existing ASD trunk sewer and send the flows to the existing Chrysanthy Pump Station. Phase 1 includes a 2 mgd SASD pump station and the gravity lines and force mains necessary to connect to the ASD trunk sewer in Douglas Road. Phase 1 sewer improvements are expected to cost approximately \$12.1 million. Additional improvements to the Chrysanthy Pump Station may be needed to serve additional new development in the eastern

Table 4-2
Cordova Hills Financing Plan
Sanitary Sewer Facilities Alternatives

Scenario	Phase 1 POC	Number of Buildout Alternatives	Estimated Cost	
			Phase 1	Buildout
PFFP Service Scenario [1]	ASD Trunk		\$ 12,090,000	\$ 42,490,000
Scenario 1: Preferred	ASD Trunk	9	\$ 12,090,000	\$ 37,630,000 to \$ 60,910,000
Scenario 2	Aerojet-2 Interceptor	2	\$ 16,820,000	\$ 42,380,000 to \$ 48,430,000
Scenario 3	Bradshaw Interceptor at Zinfandel Drive	3	\$ 21,780,000	\$ 47,340,000 to \$ 53,390,000
Scenario 4	Bradshaw Interceptor at International Drive	3	\$ 23,740,000	\$ 49,300,000 to \$ 60,910,000

alts

[1] The PFFP Service Scenario (summarized below) is considered the most likely service scenario given the current status of existing and planned facilities.

PFFP Service Scenario

Phase 1:	POC: ASD Trunk <ul style="list-style-type: none"> Onsite pump station 16" FM from pump station to ASD Trunk POC in Douglas Rd. 	\$ 12,090,000
Phase 2:	POC: Aerojet-2 Interceptor <ul style="list-style-type: none"> Upgrade onsite pump station (312-236-EN006) Extension of 16" FM from Phase 1 POC to Aerojet-2 Interceptor POC at intersection of Sunrise and Douglas 	\$ 11,530,000
Phase 3:	POC: Douglas Interceptor <ul style="list-style-type: none"> Offsite pump station 12" FM from new pump station to ultimate Douglas Interceptor POC at intersection of Grant Line and Douglas 	\$ 18,870,000
TOTAL:		\$ 42,490,000

portion of Rancho Cordova. These improvements would entail the replacement of the existing pumps with two larger pumps and the shortening of the downstream force main to tie into the Bradshaw Interceptor at a total cost of approximately \$1.24 million (cost provided by Roy Carlson, SASD). Ultimate capacity of the Chrysanthy Pump Station is just under 9 mgd. Depending on development timing and available capacity, the developers who will be using the Chrysanthy Pump Station and related sewer facilities will participate in the funding of these fee-creditable and/or reimbursable improvements.

Upgrading the on-site SASD pump station to a greater capacity, construction of a separate off-site pump station approximately 1,400 feet south of the on-site pump station, construction of additional gravity and force main sewer facilities, and construction of additional offsite permanent and interim facilities ahead of the extension of the Douglas Interceptor will be required to support remaining phases.

Installation of sewer improvements will be determined by the phasing of development projects to be served by sewer facilities. SASD does not guarantee or reserve sewer service capacity until payment of sewer impact fees. Individual projects will be required to complete sewer facility improvements as conditions of project approval. Costs for remaining phases beyond Phase 1 based on the PFFP Services Scenario total approximately \$30.4 million.

Funding Strategy

Summary

Cordova Hills developers will construct and fund the Sewer Master Plan trunk facilities, as well as participate in the SASD and SRCSD development impact fee programs. The developers will be eligible for SASD fee credits and reimbursements up to the full construction cost of the trunk facilities that they construct. In accordance with SASD policies, construction costs eligible for SASD fee credits and reimbursements will be based on low bid costs as determined through a competitive bid process with a minimum of three eligible bids.

The Cordova Hills Sewer Master Plan summarized in this report depicts SASD's current planning assumptions and fee structure. Each phase of this plan will be subject to SASD's Ordinance, Standards and Specifications, Fee Structure, and Reimbursement Policies and Procedures (including eligibility for reimbursement and reimbursement agreement requirements) in place at the time the triggering applications, studies, and submittals are approved.

Table 4-3 estimates the developer and SASD fee funding for the Cordova Hills trunk sanitary sewer facilities costs. This funding is summarized below:

- **Cordova Hills Developer Funding:** Cordova Hills developers will construct and fund all required trunk sewer facilities and be repaid through SASD fee credits and reimbursements. **Table 4-3** shows the required developer advance funding at the end of Phase 1 and at buildout.

Table 4-3
Cordova Hills Financing Plan
Summary of Sanitary Sewer Costs and Revenues (2011\$)

Item	Formula	Phase 1	Buildout
Total Backbone Sewer Costs Eligible for SASD Fee Credits [1]	a	\$ 12,090,000	\$ 42,490,000
Less Credits for SASD Fee Funded Costs [2]	b	(\$ 3,120,000)	(\$ 20,600,000)
Reimbursable Amount from Later Cordova Hills Phases and Other Projects	c=a+b	\$ 8,970,000	\$ 21,890,000
Less Estimated Reimbursements from SASD Fee Program [3]	d	unknown	unknown
Developer Advance Funding (End of Period) [4]	e=c-d	\$ 8,970,000	\$ 21,890,000
Less Future SASD Reimbursements After Buildout [5]	f	NA	(\$ 21,890,000)
Net Developer Funding After All Reimbursements	e+f	NA	\$ 0

ss sum

Source: MacKay & Soms, SASD

- [1] See Table 4-1.
- [2] Rounded. Calculated in Table 4-4.
- [3] Timing of SASD reimbursements is unpredictable, and some or all of the reimbursements may not occur until after buildout.
- [4] Estimated developer advance required by end of period. Developer may have to advance the total cost but should receive the estimated SASD fee credits shown by the end of the period to cover a portion of the advance. This table shows the maximum exposure to the developers if no reimbursements are received until after buildout.
- [5] Assumes that all Cordova Hills backbone sewer costs ultimately will be creditable/reimbursable from SASD fees. An SASD reimbursement is shown for the following three reasons:
 - (a) the sewer facilities in this Financing Plan include some oversizing to serve future development south of the Project and within the Urban Services Area
 - (b) the unit cost estimates used to derive the costs in this table are higher than the unit cost estimates on which the SASD fees are based. It is anticipated that ultimately the reimbursement will not be as high as shown because the SASD fees will be updated to reflect actual costs as facilities are constructed.
 - (c) Interim trunk facilities constructed in lieu of ultimate facilities being in place are reimbursable.

- **SASD Sewer Impact Fee and Trunk Sewer Reimbursement Program:**

- ***Credits***

Cordova Hills will receive full credits against all SASD fees paid since the developer advance funding required is greater than the SASD fee revenue generated by Cordova Hills development. **Table 4-3** shows the estimated SASD fee credits received at the completion of Phase 1 development and at buildout.

- ***Reimbursements***

Table 4-3 estimates that at the completion of Phase 1 development, after applying the fee credits, Cordova Hills developers will have an outstanding developer advance of \$9.0 million remaining to be repaid. Likewise, it is estimated that at buildout, after applying all fee credits, Cordova Hills developers will have received full credit for all SASD fees paid but may still have a remaining outstanding developer advance of \$21.9 million. Cordova Hills will be eligible to receive cash reimbursements from SASD sewer impact fee revenue to repay the remaining developer advance. Although the reimbursements likely will be made at several different times during and after completion of Cordova Hills development, **Table 4-3** shows them as occurring after buildout to depict the most conservative scenario for reimbursement.

Cordova Hills is owed reimbursements from the SASD fee program for the following three reasons:

- » The sewer facilities that Cordova Hills developers must construct include some oversizing to serve future development south of the Project.
- » The unit cost estimates used to derive the overall sewer facilities costs to be funded by Cordova Hills developers are higher than the unit cost estimates on which the SASD fees are presently based. It is anticipated that ultimately the reimbursement may be lower than estimated in **Table 4-3** because of adjustments to the SASD fee schedule to reflect actual costs as facilities are constructed.
- » The cost of interim trunk facilities constructed in lieu of the ultimate facilities being in place may be reimbursable. It is SASD'S policy to evaluate the necessity for interim facilities and approve reimbursement on a case by case basis. For the PFFP Services Scenario, the cost of the interim facilities total approximately \$6.1 million.

The sewer improvement costs to be funded through the SASD Sewer Impact Fee and Trunk Sewer Reimbursement Program will be evaluated and updated throughout development of the Project. According to the SASD Reimbursement Program, a Board-approved reimbursement agreement will identify the exact reimbursement terms including contingency, engineering, and inspection costs. In addition, the program will be periodically updated to reflect current costs.

The timing of the SASD reimbursements is uncertain and depends on the availability of SASD fee revenue. Full reimbursement may require a considerable time period and extend beyond buildout of Cordova Hills. In fact, Cordova Hills may never receive full reimbursement if other potential development projects are not built.

Existing Fee Programs

Cordova Hills will be required to participate in two existing sewer development impact fee programs in Sacramento: SASD and SRCSD.

Cordova Hills development will pay the SASD sewer development impact fees. **Table 4-4** estimates the SASD fee revenue from Cordova Hills at completion of Phase 1 development and at buildout. As discussed above, Cordova Hills will be eligible for SASD fee credits or reimbursements for the cost of the Sewer Master Plan identified facilities in accordance with the SASD Sewer Ordinance adopted to be effective on April 8, 2011.

Cordova Hills development will pay SRCSD Impact Fees, to provide funding toward regional sewer interceptor and treatment facilities. **Table 4-5** estimates the SRCSD fee revenue from Cordova Hills at completion of Phase 1 development and at buildout. Since the Cordova Hills Sewer Master Plan does not include costs for any regional interceptors or treatment facilities, Cordova Hills will not be eligible for credits or reimbursements from SRCSD fees.

Proposed Cordova Hills SFD

The developer will be responsible to construct local sewer collection facilities of less than 1 million gallons capacity to serve the individual land uses within Cordova Hills. The cost of these facilities is considered a part of standard 'in-tract' development costs and thus will not be reflected in the proposed Cordova Hills SFD.

srcsd

Source: SRCSd rate and fee schedule effective April 1, 2010. SRCSd is currently conducting a Rate and Fee Study to evaluate existing monthly rates and impact fee structures. While the study is not yet complete, preliminary findings indicate that impact fees are likely to increase within the next ten years.

[1] University/college campus center factor is the factor for colleges and universities.

Cordova Hills Financing Plan
Sewer Service
Alternatives

Current SASD Sewer Capacity Plan Update 2010 identifies ultimate downstream sewer facilities to serve Cordova Hills as the Douglas Interceptor, to be extended east on Douglas Road to the intersection of Douglas Rd. w/Grant Line Rd. some time after yr-2020; Cordova Hills is projected to break ground by yr-2015+/-

Scenario/Alternative	Phase 1 (2.02 mgd)	Phase 2 (5.60 mgd)	Phase 3 (10.14 mgd)
Preferred Scenario (in accordance w/SASD Sewer System Capacity Plan 2010 Update; assumes Cordova Hills development starting prior to completion of Douglas Interceptor)			
Alternative 1	POC-1: ASD Trunk Requires on-site PS at Node 312-236-EN006 and extension of 17,409' x 16" FM from PS to exist. ASD trunk manhole 326-227-1011 in Douglas Rd. May require Anatolia PS & FM upgrades prior to end of Phase 1 (\$1,240,000 per SASD estimates)	Douglas Interceptor (DI) (assumes Phase 1 connection to ASD Trunk and extension of DI prior to max. capacity of Anatolia PS & FM); Requires upgrades to on-site PS at Node 312-236-EN006	Douglas Interceptor (DI) (assumes extension of DI prior to max. capacity of 16" FM); Requires 2nd PS at Node 312-236-EN001 located approx. 1,400' s/e of on-site PS and extension of 15,000' x 12" FM to Douglas Interceptor at intersection of Douglas Rd./Grant Line Rd.
	\$12,070,268	\$6,690,060	\$18,872,683
Alternative 2		POC-2: Aerojet-2 Interceptor (AJ-2I) (if Phase 1 connection to ASD Trunk and no DI); Requires extension of 16" FM to Aerojet-2 Interceptor POC-2 at intersection of Sunrise Blvd. & Douglas Rd. (additional 12,230' x 16" FM from POC-1 to AJ-2I; Σ=29,639' x 16" FM from on-site PS to POC-2)	Douglas Interceptor (DI) (assumes extension of DI prior to max. capacity of 16" FM); Requires 2nd PS at Node 312-236-EN001 located approx. 1,400' s/e of on-site PS and extension of 15,000' x 12" FM to Douglas Interceptor at intersection of Douglas Rd./Grant Line Rd.
		\$11,437,133	\$18,872,683
Alternative 3			POC-2: Aerojet-2 Interceptor (AJ-2I) (if no DI); Requires extension of 12" FM to Aerojet-2 Interceptor POC-2 at intersection of Sunrise Blvd. & Douglas Rd. (additional 16,000' x 12" FM; Σ=31,000' x 12" FM from on-site PS to AJ-2I)
			\$24,920,683
Alternative 4		POC-3: Bradschaw Interceptor (BI) at Zinfandel Drive (if Phase 1 connection to ASD Trunk and no AJ-2I); Requires extension of 16" FM to BI at Zinfandel Dr./N. Mather Dr. intersection (additional 10,930' x 16" FM; Σ=23,160' x 16" FM from POC-1 to BI)	Douglas Interceptor (DI) (assumes extension of DI prior to max. capacity of 16" FM); Requires 2nd PS at Node 312-236-EN001 located approx. 1,400' s/e of on-site PS and extension of 15,000' x 12" FM to Douglas Interceptor at intersection of Douglas Rd./Grant Line Rd.
		\$17,552,431	\$18,872,683
Alternative 5			POC-2: Aerojet-2 Interceptor (AJ-2I) (if no DI); Requires extension of 12" FM to Aerojet-2 Interceptor POC-2 at intersection of Sunrise Blvd. & Douglas Rd. (additional 16,000' x 12" FM; Σ=31,000' x 12" FM from on-site PS to AJ-2I)
			\$24,920,683
Alternative 6			POC-3: Bradschaw Interceptor (BI) at Zinfandel Drive (if no AJ-2I); Requires extension of 12" FM to BI at Zinfandel Dr./N. Mather Dr. intersection (additional 10,930' x 12" FM; Σ=41,930' x 12" FM from on-site PS to BI)
			\$29,823,073
Alternative 7		POC-4: Bradshaw Interceptor (BI) at International Drive (if Phase 1 connection to ASD Trunk and no AJ-2I); Requires extension of 16" FM to BI at International Drive west of Folsom South Canal (additional 12,670' x 16" FM; Σ=24,900' x 16" FM from POC-1 to BI)	Douglas Interceptor (DI) (assumes extension of DI prior to max. capacity of 16" FM); Requires 2nd PS at Node 312-236-EN001 located approx. 1,400' s/e of on-site PS and extension of 15,000' x 12" FM to Douglas Interceptor at intersection of Douglas Rd./Grant Line Rd.
		\$18,362,836	\$18,872,683
Alternative 8			POC-2: Aerojet-2 Interceptor (AJ-2I) (if no DI); Requires extension of 12" FM to Aerojet-2 Interceptor POC-2 at intersection of Sunrise Blvd. & Douglas Rd. (additional 16,000' x 12" FM; Σ=31,000' x 12" FM from on-site PS to AJ-2I)
			\$24,920,683
Alternative 9			POC-4: Bradshaw Interceptor (BI) at International Drive (if no AJ-2I); Requires extension of 12" FM to BI at International Drive west of Folsom South Canal (additional 12,670' x 12" FM; Σ=43,670' x 12" FM from on-site PS to BI)
			\$30,480,793

5. STORM DRAINAGE

The Cordova Hills backbone storm drainage system is detailed in the Drainage Master Plan for Cordova Hills, prepared by MacKay & Soms (Drainage Master Plan). The Drainage Master Plan analyzes drainage impacts resulting from development of the proposed land uses in Cordova Hills. It conceptually defines at the master plan level how potential impacts of the proposed development on existing receiving waters can be fully mitigated to existing or better than existing conditions. It preliminarily details construction of on-site combination Flood and Flow Duration Control Detention Basins that mitigate for the development impacts. Further more detailed analysis will be required prior to the next phase of the development process, tentative map approval or improvement map approval, whichever comes first. **Map 5-1** shows the proposed storm drainage basin location plan and **Map 5-2** shows the proposed drainage trunk facilities in the Project. The backbone storm drainage system includes the following items:

- Storm drainage pipes;
- Manholes;
- Drainage inlets; and
- Flood control and water quality basin facilities and land.

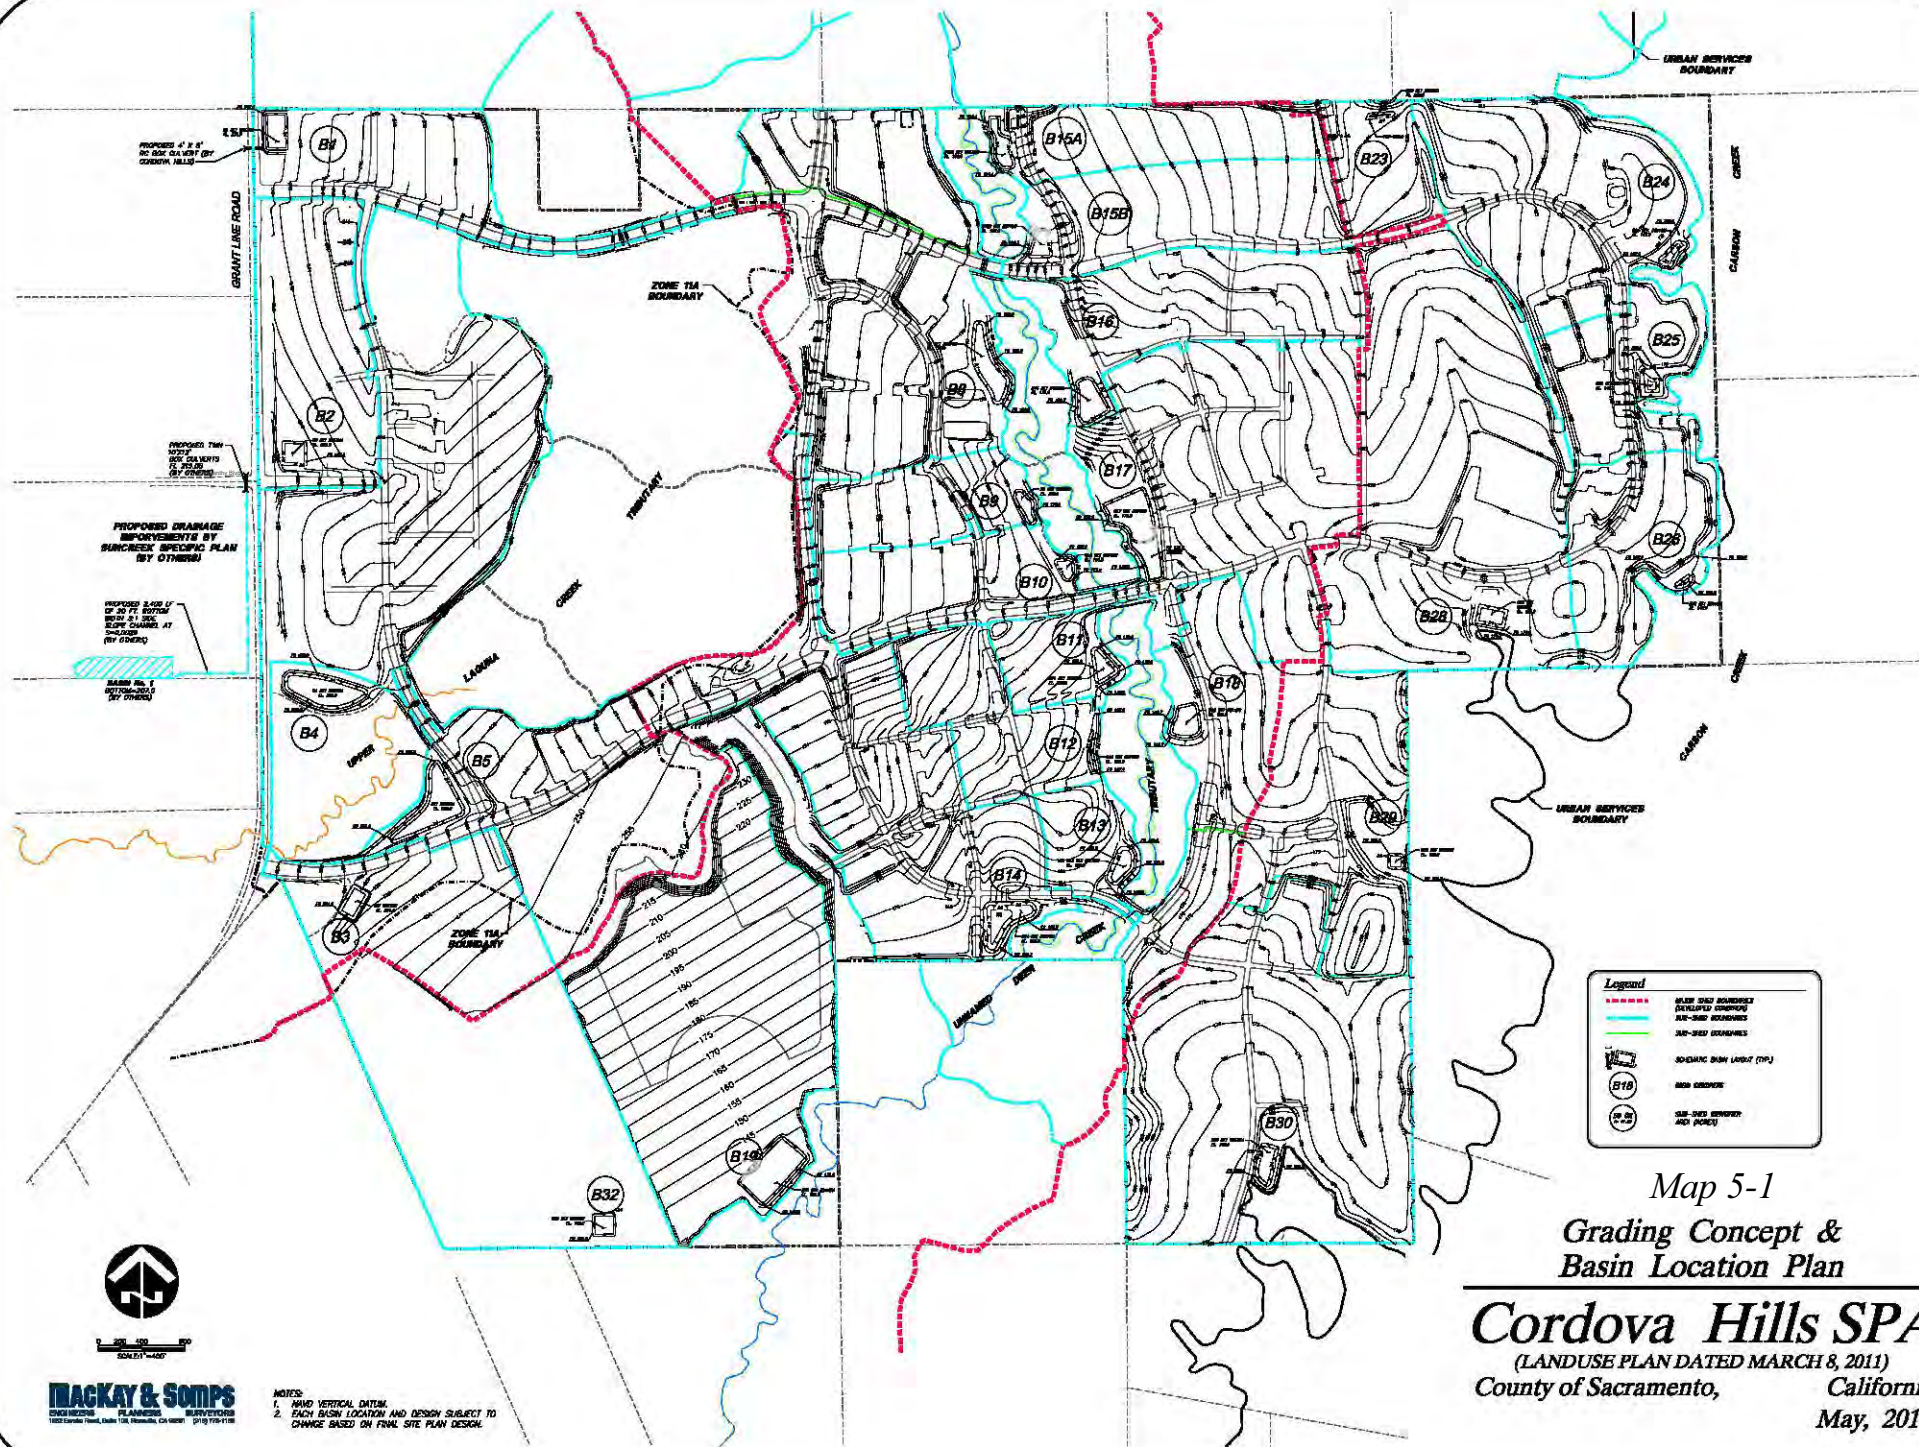

Facility Costs and Phasing

Summary

Table 5-1 summarizes Phase 1, remaining phases, and buildout storm drainage facility costs.

Phase 1 of Cordova Hills is located in the Sacramento County Water Agency (SCWA) Storm Drainage Zone 11A and will be required to pay Zone 11A development impact fees. Developers will construct and fund the Phase 1 facilities and will be eligible for credits or reimbursements from Zone 11A fees. **Table 5-1** shows the Phase 1 costs and the amount of the costs that are eligible for credits or reimbursements. The total Phase 1 storm drainage facilities cost is estimated at \$3.7 million, \$1.6 million of which is eligible for credits or reimbursements from the Zone 11A fee program. The remaining \$2.1 million is not eligible for Zone 11A credits or reimbursements. Storm drainage facilities and land that are not eligible for Zone 11A credits or reimbursements include the following items:

- 18 inch and 24 inch storm drains.
- Type B drainage inlets.
- Land for drainage basins other than regional flood basins (none of the Cordova Hills Phase 1 basins are regional basins).
- Buffer landscaping for drainage basins.
- Contingencies and soft costs in excess of the Zone 11A 8-percent engineering cost credit.

sd cost

Source: MacKay & Soms

[1] Contingencies and soft costs include 20% cost contingency, 10% for surveys & design, and 5% for inspections & materials testing.

[2] Includes basin inlet structure and combined flow duration control/flood control structure. See Table 5-2 for costs by basin.

Development phases beyond Phase 1 are not included in Zone 11A and will not participate in the Zone 11A fee program. The total storm drainage facilities cost for development in the remaining phases of the Project is estimated at \$9.4 million. The total buildout cost for all phases is estimated at \$13.1 million.

Drainage Basins

The Drainage Master Plan contains detailed cost estimates for each of the 26 proposed detention basins. These detailed estimates include both facilities and land cost estimates. The Flood Control/Water Quality Basin Facilities and the Basin Land cost items in **Table 5-1** are totals of the individual basin costs. **Table 5-2** summarizes the basin facilities and land costs by basin and Project phase. For each of the basins, it shows the total facilities and land cost and the portion of the total costs that is eligible for Zone 11A credits and/or reimbursements.

Only the Phase 1 basins are located in the Zone 11A area and eligible to receive Zone 11A credits or reimbursements. All of these basins are eligible for credits and/or reimbursements for basin facilities costs but not for the basin land and buffer landscaping costs. Documentation of the basin costs is provided in the Drainage Master Plan. The detailed cost tables for the five Phase 1 basins located in Zone 11A are included at the end of this chapter as **Table 5-10** through **Table 5-14**.

Funding Strategy

Summary

Table 5-3 summarizes the estimated Cordova Hills storm drainage facilities costs and revenues by funding source. Estimated costs and revenues are shown at completion of Phase 1 and at buildout. The funding sources are summarized below by phase.

Phase 1

The following funding sources will be used for Phase 1 development:

- SCWA Zone 11A Fee Program Credits and Reimbursements
- Cordova Hills Special Financing District

Of the \$3.7 million in Phase 1 storm drainage facilities costs, it is estimated that \$1.6 million will be funded through the Zone 11A fee program and the remaining \$2.1 million will be funded through the proposed Cordova Hills Special Financing District (SFD). Each of these funding sources is discussed below.

SCWA Zone 11A Fee Program Credits and Reimbursements

Phase 1 development is located in Zone 11A and will be required to pay Zone 11A development impact fees. The developers will construct the Phase 1 storm drainage facilities and will be eligible to receive credits or reimbursements from the Zone 11A fee program for a portion of the facilities cost in accordance with SCWA's applicable policies and allowable credit amounts for the various drainage facilities. The policies and allowable credit amounts are detailed in Title 2 of the SCWA Code.

Zone 11A Fee Program - Creditable Costs	\$ 1,670,000	\$ 0	\$ 1,670,000
Cordova Hills SFD [1]			
Costs Inside Zone 11A but Ineligible for Fee Credits	\$ 2,070,000	\$ 0	\$ 2,070,000
Costs Outside of Zone 11A	\$ 0	\$ 9,350,000	\$ 9,350,000
Total Cordova Hills SFD	\$ 2,070,000	\$ 9,350,000	\$ 11,420,000
Total	\$ 3,740,000	\$ 9,350,000	\$ 13,090,000

sd su

[1] Costs not funded through Zone 11A fee credits and reimbursements.

Developers may receive credits or reimbursements for eligible Zone 11A trunk drainage facilities that have not been financed by an assessment district, a Mello-Roos Community Facilities District, a special tax district, or any similar public infrastructure financing entity. Before issuing credits or reimbursements for the construction of eligible facilities, SCWA will require the Cordova Hills developer to provide certification that the facilities were not financed through a public financing program.

Cordova Hills Special Financing District

The facilities and land costs that are ineligible for Zone 11A fee credits and reimbursements will be funded through the proposed Cordova Hills SFD, as shown in **Table 5-3**. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program and is discussed further later in this chapter.

Buildout

The development phases after Phase 1 are not located in any of the SCWA drainage zones, so there is no existing fee program to fund the required storm drainage facilities costs. The entire estimated \$9.4 million in drainage costs for phases beyond Phase 1 will be funded through the Cordova Hills SFD.

Existing Fee Programs

Phase 1 development will participate in the SCWA Zone 11A storm drainage fee program. This development is the development shown as Phase 1 **Table 5-4** shows the estimated fee revenue.

Proposed Cordova Hills SFD

Cordova Hills proposes that all improvement costs not funded through the Zone 11A fee program be funded through the Cordova Hills SFD. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

The estimated Cordova Hills storm drainage costs to be funded through the Cordova Hills SFD are allocated to the different land uses based on the land uses' relative storm drainage usage. **Table 5-5** summarizes the costs to be funded through the Cordova Hills SFD (as well as the costs to be funded through the Zone 11A Fee Program). The costs to be funded through the Cordova Hills SFD include both Phase 1 costs ineligible for Zone 11A credits and all other storm drainage costs for the remaining phases. **Table 5-5** shows the Phase 1 costs for development in Zone 11A separately from the costs for development outside of Zone 11A. **Table 5-6** shows the allocation factors used to estimate relative storm drainage usage and fairly allocate costs to the land uses. Storm drainage costs are allocated based on impervious surface factors per acre obtained from the City and County of Sacramento Storm Drainage Manual. **Table 5-7** shows the buildout cost allocation for Zone 11A development and the resulting storm drainage cost per dwelling unit for residential land uses, per building square foot for the nonresidential land uses, and in total for the university/college campus center. **Table 5-8** shows the same information for development outside of Zone 11A.

[1] SCWA Zone 11A fee revenue estimated as fee per acre * acres.
[2] Zone 11A fees per acre are from Drainage Fee Schedule A of Appendix No. 1, Title 2 of the SCWA code (effective date: March 1, 2010). The fee estimates assume rates for each land use using the following correspondence.

[3] Fee per dwelling unit and bldg sq.ft. estimated for use in the burden analysis only. See Table 19-1.
[4] Fee per dwelling unit = total fee revenue at buildout (fee per acre * acres) divided by total dwelling units in Zone 11A area.
[5] Fee per building square foot = fee per acre/(FAR*43560).
[6] Transition zone acres excluded.

alloc sd12

[1] See Table 5-6.

[2] Since transition zone acres do not generate any storm drainage usage, they are excluded for the purposes of allocating costs to the university/college campus. To estimate a university cost per acre that can be compared and summed across improvement types, however, the university portion of costs for each improvement type is spread over all university acres. The master developers have agreed to advance the university's portion of the costs if needed and get reimbursed by the university as development occurs.

[3] See Table 5-5 for total cost.

Note that in **Table 5-7**, the commercial and office square feet represent the planned development levels in Zone 11A at buildout. Even though all Project development in the Zone 11A area is located in the Phase 1 area (see **Map 2-3**), it is assumed that only a limited amount of the non-residential development in this area will occur during Phase 1, with the remainder occurring in later phases. Thus, the buildout nonresidential development in Zone 11A is greater than the Phase 1 nonresidential development.

Phase 1 Facilities Cost vs. Allocated Cost – SFD Funded Facilities

Table 5-9 shows the estimated Cordova Hills SFD Phase 1 and buildout storm drainage facilities costs versus proportional allocated costs for development within Zone 11A. These costs apply to improvements in the Cordova Hills SFD program only and not to Zone 11A funded improvements. There is a deficit of estimated revenues in Phase 1 as compared to estimated Phase 1 facilities costs. This deficit will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project. *Note that there is no similar Phase 1 shortfall analysis for development outside of Zone 11A because none of this development occurs in Phase 1.*

6. WATER

The Cordova Hills backbone water facilities consist of both potable water and non-potable water facilities. The planned facilities are detailed in the Potable Water Master Plan for Cordova Hills and the Non-Potable Water Master Plan for Cordova Hills (including their respective Supplemental Reports), both prepared by MacKay & Somps. All new potable and non-potable water facilities will be dedicated to the Sacramento County Water Agency (SCWA).

Potable Water System

With the exception of the Bufferlands, Cordova Hills is in the Sacramento County Water Agency (SCWA) Zone 40 Service Area. Zone 40 is responsible for construction of potable water facilities within its boundaries. Limited Zone 40 water facilities will be extended into the Bufferlands. Cordova Hills ultimately will be serviced from proposed storage tanks anticipated to be located just north of the Project, east of Ridgeline Road. The Cordova Hills potable water system ultimately will be integrated into the SCWA Zone 40 North Service Area system with connections along Grant Line Road. The potable water system includes the following types of improvements:

- Onsite and offsite water transmission mains.
- Pressure reducing station.
- Above ground water storage tanks (capacity of 3.5 million gallons).
- Ground tank booster pumps.

Map 6-1 shows the proposed potable water system at buildout. The map includes water tanks with a total capacity of 5.5 million gallons. Of this total capacity, 3.5 million gallons will be used for the potable water system, and the remaining 2.0 million will be used for non-potable uses.

Note that both the storage tanks and pipeline feeding the tanks are proposed to be located off-site on land currently owned by the Project applicant. A condition of approval on the large lot map would ensure SCWA's access to and right to acquire this off-site storage site. The Project applicant proposes the following language for this condition of approval: "Prior to recordation of the large lot map, a water tank site and related water pipeline easements shall be identified to the satisfaction of the Sacramento County Water Agency. The identified water tank site shall be in a location consistent with the Cordova Hills Water Master Plan and a size and configuration that meets SCWA standards."

Also note that water main extensions to the lands located south of Cordova Hills as depicted on **Map 6-1** are shown for modeling purposes only to ensure adequate sizing of the Project pipe system to handle future demands south of Cordova Hills, should they ever materialize. Construction of these water main extensions is not required for service of Cordova Hills and thus not a part of the Project.

Facility Costs

Table 6-1 details the Phase 1 and buildout potable water facility costs as reflected in the Cordova Hills Water Capital Improvement Plan (CIP). At buildout, the total estimated cost of the potable water system is \$17.4 million. This cost includes the cost of all trunk facilities to be used for the potable water system, as well as the cost for SCWA to acquire land for potable water storage tanks used for potable water located north of the Project.

Phasing

There are two existing water storage tanks located in the North Douglas development west of Grant Line Road and north of Douglas Road. It is anticipated that Phase 1 will be serviced from these tanks until the proposed new tanks are constructed later in the development process, the timing of which will be determined by SCWA. The availability of water for Cordova Hills from the North Douglas tanks is dependent on the pace of development in the area surrounding these tanks (e.g., North Douglas; Sunridge). In the event development moves forward in this area, the length of time before Cordova Hills tanks are needed could be relatively short. In an extremely conservative scenario, the Cordova Hills tanks would need to be constructed at the beginning of the Project.

Phase 1 of the potable water system includes construction of the transmission system needed to serve Phase 1 development in Cordova Hills. The Phase 1 potable water system costs are estimated at \$7.0 million.

Funding Strategy

Summary

A majority of the Cordova Hills development is located in the SCWA Zone 40 service area and will be required to pay Zone 40 development impact fees for construction of potable water facilities. Developers will construct and advance-fund the potable water facilities. They will then be eligible to receive Zone 40 fee credits or reimbursements for all potable water trunk facilities constructed in accordance with SCWA's applicable policies. Non-trunk potable water facilities will be funded by the individual developers in Cordova Hills and are not included in this Financing Plan.

All potable water facilities shown in **Table 6-1** are eligible for Zone 40 fee credits or reimbursements.

Existing Fee Programs

Cordova Hills will be required to pay SCWA Zone 40 development impact fees for the construction of potable water facilities. **Table 6-2** estimates the Zone 40 fee revenue from Cordova Hills at completion of Phase 1 development and at buildout. As discussed above, Cordova Hills will be eligible for Zone 40 fee reimbursements in accordance with Title 4 of the Sacramento County Water Agency Code. If Mello-Roos CFD bonds are used to fund facilities that could become eligible for reimbursements under the provisions of Title 4, then the reimbursements for construction of those facilities shall be paid solely to the CFD and not to the developer facilitating construction of the Project. Reimbursements would be based on the cost of facilities at the time of construction.

water cost

Source: MacKay & Sumps (April 2010) and SCWA.

[1] Zone 40 allowable percentage.

[2] 2 MG of interim tank capacity may be needed for non-potable water storage until a non-potable regional water supply becomes available. At that time, the tanks may be converted to potable water tanks used by development north of Cordova Hills and the cost of the tanks may become reimbursable through the SCWA Zone 40 fee program.

[3] Land acquisition costs for the above ground water tanks are estimated with a placeholder value of \$75,000 per acre. Site requirements for the tanks used for potable and non-potable water storage are estimated to be between 4-11 acres; this Financing Plan assumes 8 acres. Acres have been prorated based on the relative capacity (in millions of gallons) for potable vs. non-potable storage.

Non-Potable Water System

At this time, SCWA does not provide non-potable (reclaimed) water service to the Cordova Hills area, so the Cordova Hills reclaimed water system initially could be serviced from an interim connection into the proposed potable water system. The Cordova Hills non-potable water system subsequently could connect into a future regional non-potable SCWA system along Grant Line Road.

Map 6-2 shows the proposed non-potable water system at buildout. The non-potable water system consists of a transmission system to provide irrigation water to parks, open spaces, schools, roadway medians, and nonresidential irrigation uses, including commercial and business professional development. In addition, the non-potable water system will include above ground storage tanks with a capacity of 2.0 million gallons, which will be located north of the Project and east of Ridgeline Road. Note that the map shows water storage tanks with a total capacity of 5.5 million gallons. This capacity includes the 2.0 million gallons for non-potable uses, as well as 3.5 million gallons for potable uses (as detailed in the previous Potable Water System section).

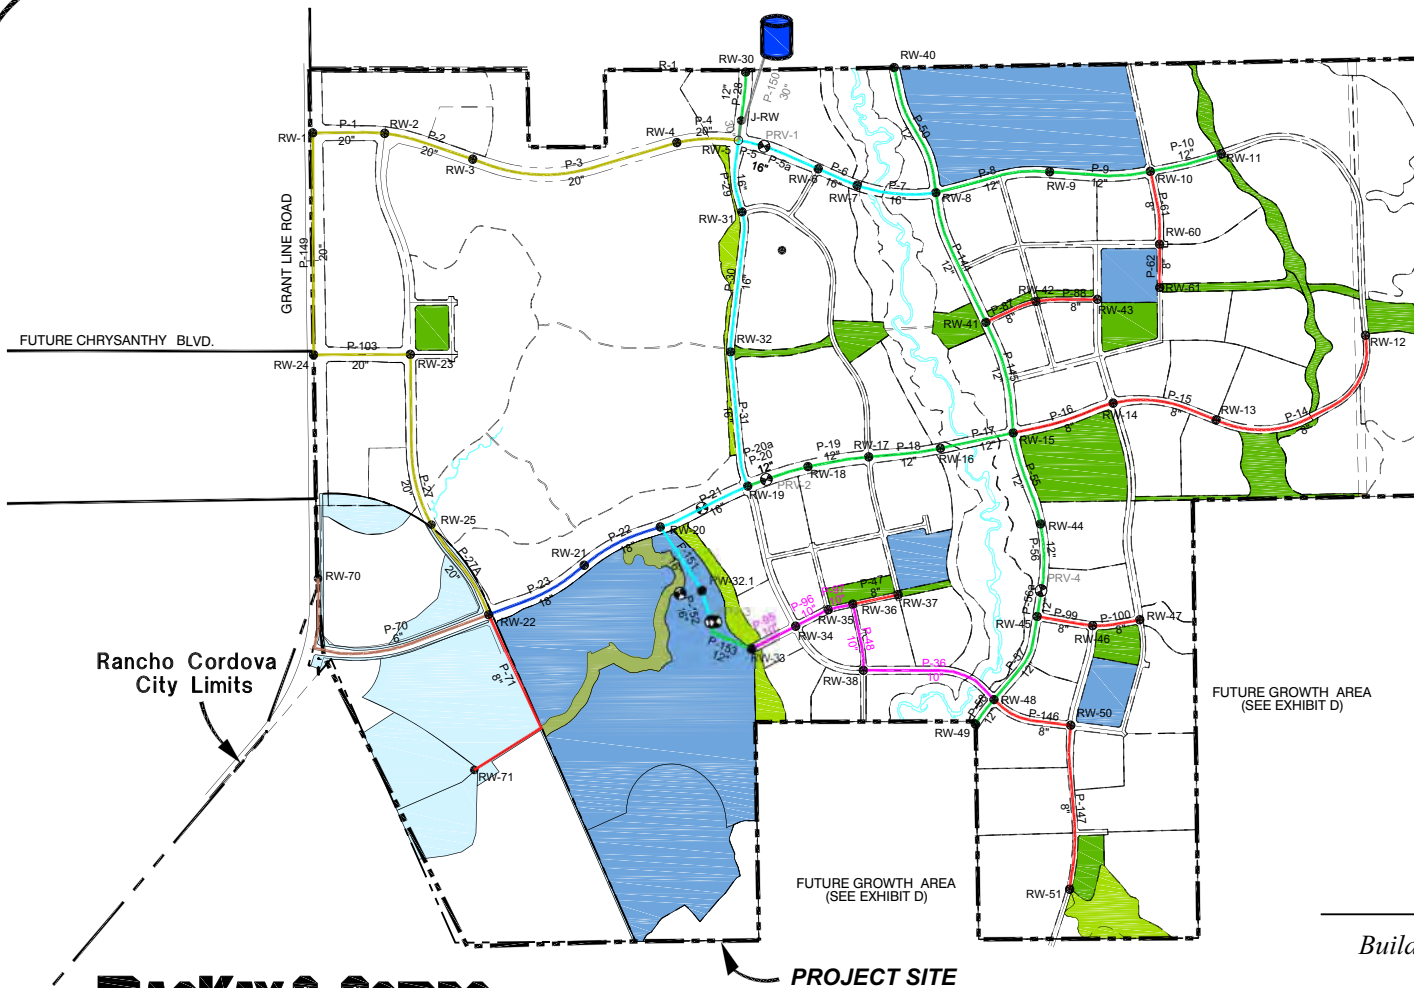

SCWA has not made any determination regarding the development of the future regional non-potable water system. The non-potable system is not a requirement of the project and the Cordova Hills developer has the option of constructing the non-potable water system.

If the non-potable system is constructed, the developer will be responsible for funding and constructing the improvements as described below. The developer will also be responsible for funding the maintenance of the non-potable water facilities within the Project. This funding will allow for appropriate maintenance of the non-potable water supply infrastructure constructed by the Project that is connected to the SCWA potable system. Funding will be provided through the CHLSD. The maintenance funding will continue until such time as the non-potable water facilities are disconnected from the potable water system and concurrently connected to and operated by a non-potable water supply service provider. The Project would then be subject to the applicable rates as adopted by that non-potable water service provider.

If the developer decides not to construct the non-potable system, the Potable Water System Master Plan will need to be updated so that the potable water distribution system is sized to meet the water supply demands (including irrigation) of the Project. The costs identified above for the potable water system will increase due to the larger water distribution pipelines. The additional cost will be funded through the Zone 40 development impact fees.

Facility Costs

Table 6-3 details the Phase 1 and buildout non-potable water facility costs. At buildout, the total estimated cost of the non-potable water system is \$8.9 million. This cost includes the cost of all trunk facilities to be used for the non-potable water system as well as the cost for the water storage tanks, which will be dedicated by the Cordova Hills master developer and funded through the Cordova Hills SFD.

np cost

Source: MacKay & Soms

[1] Contingencies and soft costs include 20% cost contingency, 10% for surveys & design, and 5% for inspections & materials testing.

[2] Land acquisition costs for the above ground water tanks are estimated with a placeholder value of \$75,000 per acre. Site requirements for the tanks used for potable and non-potable water storage are estimated to be between 4-11 acres; this Financing Plan assumes 8 acres. Acres have been prorated based on the relative capacity (in millions of gallons) for potable vs. non-potable storage.

Phasing

Before the availability of the planned future SCWA regional reclaimed water system (see discussion above), the Cordova Hills reclaimed water system will be serviced from an interim connection into the proposed potable water system. Phase 1 of the non-potable water system includes construction of the non-potable transmission system needed to serve Phase 1 development in Cordova Hills. Phase 1 non-potable water system costs are estimated at \$2.3 million.

Funding Strategy

Summary

There are existing fee programs for development of non-potable water systems in some areas of the County but not in the Cordova Hills area. Further, Cordova Hills would not be eligible to annex to any of these existing programs. Consequently, it is assumed that all non-potable water facility costs will be funded through the Cordova Hills SFD.

The non-potable water facilities include two water storage tanks. It is possible these tanks could become eligible for Zone 40 reimbursement in the future if SCWA decides to use the tanks for regional potable water storage. In that case, the cost of the tanks could be eligible for credits or reimbursements from Zone 40 fees collected from the project(s) directly benefiting from the tanks.

Existing Fee Programs

Currently, there is no fee program that serves the Cordova Hills area for development of a non-potable water system.

Proposed Cordova Hills SFD

Cordova Hills proposes that the non-potable water system be funded through the Cordova Hills SFD. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

The buildout non-potable water costs are allocated to the different land uses based on the land uses' benefit received. **Table 6-4** shows the allocation factors used to estimate benefit received and fairly allocate costs to the land uses. These factors are based on the factors that Zone 40 uses to determine its development impact fees for potable water improvements. Non-potable water is used primarily for irrigation of open spaces, parks, and nonresidential uses, including commercial and business professional development. The benefit received is related more to the general population than to the water demand of a specific land use. Thus, allocation factors based on persons per household and employees would be appropriate. The Zone 40 factors, however, are fairly representative of persons per household and employees, so these factors are used to allocate non-potable water facility costs. Non-potable water allocation factors will be finalized at the time that a Development Impact Fee Nexus Study is prepared if adjusted allocation factors are appropriate.

Table 6-4
Cordova Hills Financing Plan
Non-Potable Water Cost Allocation Factors

Item	DUEs per Dwelling Unit/Acre [1]	Dwelling Units per Acre [2]	DUEs per Acre

Office	4.00		4.00
Total Commercial			
University/College Campus Center	4.00		4.00

due water

[1] DUE factors per dwelling unit and acre are from the Sacramento County Water Agency Fee Schedule; effective March 1, 2009. DUEs for commercial and university/college campus center water use are estimated assuming 2" service; DUEs for residential water are estimated at 1" service.

[2] Dwelling units per acre are estimated as buildout units/buildout acres. These factors differ from the Phase 1 dwelling units per acre.

Table 6-5 shows the buildout cost allocation and the resulting non-potable water facilities cost per dwelling unit for residential land uses, per building square foot for nonresidential land uses, and in total for the university/college campus center.

Phase 1 Facilities Cost vs. Allocated Cost

Table 6-6 is used to estimate the Cordova Hills SFD Phase 1 and buildout non-potable water facilities costs versus proportional allocated costs. There is an estimated shortfall of allocated costs in Phase 1 as compared to estimated Phase 1 development costs. This shortfall should be recovered by buildout. The master developer will advance fund and construct non-potable water facilities until adequate revenues are collected from the Cordova Hills SFD to reimburse the master developer.

Table 6-5
Cordova Hills Financing Plan
Cordova Hills SFD Non-Potable Water Facilities Cost Allocation at Buildout (2011\$)

Item	Land Use		Cost Allocation Basis			Water Facilities Cost Allocation at Buildout

alloc water

[1] See Table 6-4.

[2] Since transition zone acres do not generate water usage, they are excluded when allocating costs to the university/college campus center.
The university/college campus center building square feet at buildout is currently estimated at approximately 1,870,000. This estimate is from the Draft Cordova Hills Master Plan (April 2012) and will be updated upon approval of a plan for a selected university/college campus center.

[3] See Table 6-3 for total cost.

7. EARTHWORK

Earthwork is necessary to prepare the Project site for development. It includes clearing and grubbing, rough grading, and erosion control of the site prior to development.

Facility Costs

Table 7-1 summarizes the Phase 1 and buildout earthwork costs. The total earthwork cost at buildout is estimated at \$96.1 million.

Phasing

Phase 1 earthwork will be performed on all of the acres to be developed in Phase 1. These acres include the Town Center, Phase 1 of the university/college campus center, and 10 acres of the Sports Park. Phase 1 earthwork costs total approximately \$10.1 million of the estimated \$96.1 million at buildout.

Funding Strategy

It is currently anticipated that the earthwork costs will be funded privately rather than through a public financing mechanism. The developers, however, may request that earthwork for some of the following items be included in the Cordova Hills SFD funding program if they meet the construction requirements necessary for public financing mechanisms:

- Four-lane roads
- Drainage corridors
- Major parks
- School sites

Table 7-1
Cordova Hills Financing Plan

8. PUBLIC SAFETY

Fire

The Sacramento Metropolitan Fire District (SMFD) is the fire protection service provider for Cordova Hills and will continue to provide services once the community has developed. The SMFD has indicated that development in the Cordova Hills area will increase the need for fire protection, including additional staffing, vehicles and equipment. Given the current mix of land uses, SMFD has indicated that one station will be adequate to serve Cordova Hills. SMFD has indicated that this station should be located in the commercial center in the East Valley Village in order to meet travel time standards. It is possible that a second station could be located in Cordova Hills if needed to serve neighboring development projects as well as Cordova Hills.

Table 8-1 shows the estimated cost to construct a fire station and provide the major equipment needed for the station. It is estimated that a fire station of approximately 6,500 square feet will be required and that an engine, a truck, a medic vehicle, and staff and support vehicles will be required to service the area. The total cost is estimated at \$5.3 million.

All new development within the SMFD will be subject to the District-wide Capital Fire Facilities fee (SMFD fee) to fund construction and equipment costs for new fire stations. **Table 8-2** shows the projected fee revenue from Cordova Hills development at completion of Phase 1 development and at buildout. The Project will generate approximately \$2.0 million in fee revenue at the end of Phase 1 and \$9.7 million at buildout. It is assumed that the total buildout fee revenue will be sufficient to fund Cordova Hills' impact on fire facilities and that no other funding sources will be necessary. Fee revenue from the other communities served by the fire station(s) sited in Cordova Hills may also be available for the construction of new station(s).

At the time of this Financing Plan, there are too many variables to assess the precise timing of fire and medical services facilities for the Project. The timing of the fire station(s) located within the adjacent Sunridge or Suncreek Specific Plans will dictate the timing of when the Cordova Hills fire station will need to be constructed. SMFD has agreed to assess the phasing of fire and medical service facilities at the small lot tentative map stage of the Project. As such, this Financing Plan assumes that development in the Project will pay the SMFD fee and additional funding sources for any shortfalls will be evaluated at the time facilities are required. As shown in **Table 8-3**, at buildout the Project will generate a surplus of SMFD fee revenues to cover the estimated facility costs of \$5.3 million.

The Cordova Hills developer will be required to dedicate land for the fire station site. Depending on the outcome of negotiations between the Cordova Hills developer and the SMFD, the developer may receive fee credits against the SMFD fee for all or a portion of the site acquisition costs.

Table 8-1
Cordova Hills Specific Plan Services Evaluation
Fire Station Costs (2011\$)

Item	Estimated Cost [1]
Fire Station Building (6,500 sq.ft. @ \$500 per sq.ft.)	\$ 3,250,000
Engine	\$ 600,000

[1] See Table 8-1.

[2] Based on correspondence from SMFD, there are too many variables to assess the precise timing of fire and medical services facilities for the Project. SMFD has agreed to assess the phasing of fire and medical service facilities at the small lot tentative map stage of the Project. As such, this Financing Plan assumes that development in the Project will pay the SMFD fee, and additional funding sources for any shortfalls will be evaluated at the time facilities are required.

Law Enforcement

The Sacramento County Sheriff's Department currently provides law enforcement services to Cordova Hills and will continue to provide services to the area. The Sheriff's Department plans to operate a substation in the Cordova Hills Town Center village through a lease with Cordova Hills. Expenditures associated with leasing a substation will be covered through the fiscal impact analysis surplus estimated in EPS's Draft Fiscal Impact Analysis. The Draft Fiscal Impact Analysis estimated that County General Fund and Police Services Community Facilities District (CFD) 2005-1 revenues would generate a fiscal surplus of \$750,000 in Phase 1 and \$2.7 million at buildout of the Project, after accounting for the cost of providing countywide and County-administered municipal services.

9. CORDOVA HILLS LOCAL SERVICES DISTRICT FACILITIES

Cordova Hills proposes to include both a corporation yard and an administrative facility within the Project area. Sites for these facilities are currently undetermined. They could be located at the same site or at separate sites.

The corporation yard will provide maintenance and service space to support the park maintenance, road maintenance, transit services, and landscape and lighting maintenance. Corporation yard facilities will include buildings for maintenance and service, storage areas for equipment and supplies, parking areas, emergency showers, and outdoor bins for materials such as decomposed granite, aggregate, and topsoil. The corporation yard size of approximately 2.4 acres and 34,000 square feet of covered areas is a preliminary estimate.

The administrative facility could house some of the service providers, as well as CHLSD administrative personnel. Preliminary estimates for the size of the administrative facility are 2,500 square feet during Phase 1 and 10,000 square feet at buildout.

After the service providers who will occupy the corporation yard space and the staff who will occupy the administrative facility have been finalized, a study will be performed to estimate the appropriate sized corporation yard and administrative facilities and the associated development costs. This study will occur prior to development of the project. Costs for the corporation yard and administrative facilities will be updated as part of the implementation of the financing mechanisms.

Facility Costs

Table 9-1 provides placeholder estimates the Phase 1 and buildout facilities costs for the corporation yard and administrative facility. The site preparation and corporation yard construction costs total an estimated \$6.9 million at buildout of Cordova Hills. Construction costs for comparable corporation yard facilities in the region range from \$5 to \$10 million. The Cordova Hills master developer will work with the County to determine the specific corporation yard requirements and further refine the cost. The administrative facility construction costs are estimated at \$2 million at buildout. This cost is based on a 10,000 square foot facility and a construction cost of \$200 per square foot.

Phasing

Phase 1 corporation yard facilities costs are estimated as half of the buildout costs, or approximately \$3.5 million, as shown in **Table 9-1**. Phase 1 administrative facility construction costs are estimated at \$500,000. The Phase 1 administrative offices could also be housed in leased space. This cost is based on a 2,500 square foot facility and a construction cost of \$200 per square foot.

- [1] Corporation yard unit costs based on the cost of comparable corporation yards in the region.
- [2] Phase 1 corporation yard construction assumed to be 50% of buildout construction.
- [3] Corporation yard size derived from Sutter Pointe Specific Plan PFFP (July 2008).
Corporation yard assumed to be approximately 1/2 the size of the Sutter Pointe corporation yard.
- [4] Instead of constructing an initial administrative facility, the Phase 1 administrative offices could be housed in leased space.

Funding Strategy

Summary

There are no existing development impact fee programs for corporation yard or administrative facilities. Therefore, Cordova Hills proposes that these costs be funded through the Cordova Hills SFD.

Existing Fee Programs

Currently, there are no fee programs in Sacramento County for construction of corporation yards or administrative facilities.

Proposed Cordova Hills SFD

Cordova Hills proposes that the corporation yard and administrative facilities costs be funded through the Cordova Hills SFD. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

The total Cordova Hills corporation yard and administrative facility costs are allocated to the different land uses based on the land uses' relative corporation yard usage. **Table 9-2** shows the allocation factors used to estimate relative usage and fairly allocate costs to the land uses. The costs are divided between residential and nonresidential uses based on developable acres. The total residential portion is then allocated to the residential uses based on population. The nonresidential portion is allocated to the nonresidential uses based on developable acres.

Table 9-3 shows the buildout cost allocation and the resulting cost per dwelling unit for residential land uses, per building square foot for nonresidential uses, and in total for the university/college campus center.

Phase 1 Facilities Cost vs. Allocated Cost

Table 9-4 shows the estimated Cordova Hills SFD Phase 1 and buildout corporation yard and administrative facilities development costs versus proportional allocated costs. There is an estimated shortfall of allocated costs in Phase 1 as compared to estimated Phase 1 construction costs. This shortfall should be recovered by buildout. The master developer(s) will advance fund and construct the corporation yard and administrative facilities until adequate revenues are collected from the Cordova Hills SFD to reimburse the developer(s).

Table 9-2
Cordova Hills Financing Plan
CHLSD Facilities Cost Allocation Factors

Item	Acres	Total Population	Percentage of Total Population	Cost Allocation Factor [1]
Residential Land Uses				
Estates Residential (1-7 units/acre)	64.7	448	2%	24.2

alloc corp

[1] See Table 9-2.

[2] Since transition and athletic zone acres do not place demand on CHLSD facilities, they are excluded when allocating costs to the university/college campus center. To estimate a university cost per acre that can be compared and summed across improvement types, however, the university portion of costs for each improvement type is spread over all university acres. The master developers have agreed to advance the university's portion of the costs if needed and get reimbursed by the university as development occurs.

[3] See Table 9-1 for total cost.

10. PARKS

Cordova Hills is located in County Service Area 4B (CSA 4b), a park district governed and administered by Sacramento County. CSA 4B currently collects an assessment for park maintenance and provides minimal park and recreation services to the Cordova Hills project area. The responsibilities for park development and maintenance are planned to be shifted to the proposed CHLSD. Recreation services also will be provided at the park sites and funded through the CHLSD. The Cordova Hills park plan currently includes the following active parks:

- A 50-acre sports park.
- An 18.5-acre community park.
- Six neighborhood parks ranging in size from 4 to 6 acres.

In addition, the Cordova Hills park plan includes a Swim Center and a Community Center that would include amenities such as a gymnasium, meeting rooms, youth center, and senior center. As the Project builds out and if additional funding is available, the Cordova Hills park plan may be updated to adjust the size and amenities of the proposed active parks, Swim Center, and Community Center. **Table 10-1** shows each of parks planned for Cordova Hills and their respective amenities. This table is included as an example of the amenities to be programmed for the various parks. It is not meant to serve as the actual programming of park improvements.

Note that the 110.7 total park acres on **Table 10-1** exceed the 99.1 active park acres on **Table 10-2** (discussed below) because **Table 10-1** includes the Creekside Ag acres. Creekside Ag is not an planned active park, so it is not included on **Table 10-2**. If the Creekside Ag acres were excluded, then the total planned park acres on **Table 10-1** would sum to 99.1 acres, consistent with the acres on **Table 10-2**.

Map 10-1 shows the proposed locations of the parks. The community park and two of the neighborhood parks are located adjacent to school sites. All planned parks will be exclusively owned and managed by the proposed CHLSD.

Facility Costs

Table 10-2 estimates the Phase 1 and buildout parks development costs. The County General Plan requires 5 acres of parkland per 1,000 residents. As detailed in Chapter 2, the maximum residential development of 8,000 units would generate a projected population of 21,379 at buildout. This population would create a need for a total 106.9 acres of active parkland within Cordova Hills. The Cordova Hills Master Plan includes 99.1 acres designated as active parks (as described above). Cordova Hills also includes 150.6 acres of land designated as Recreation-2, passive parkland that includes permanent, but not preserved, open space, greenbelts, paseos, basins, and trails. As the Project finalizes its subdivision maps, 7.8 acres of the Recreation-2 acres will be identified as active parks. Consequently, the park development costs in **Table 10-2** include 7.8 acres of the Recreation-2 land that will be developed as active parks.

parks cost

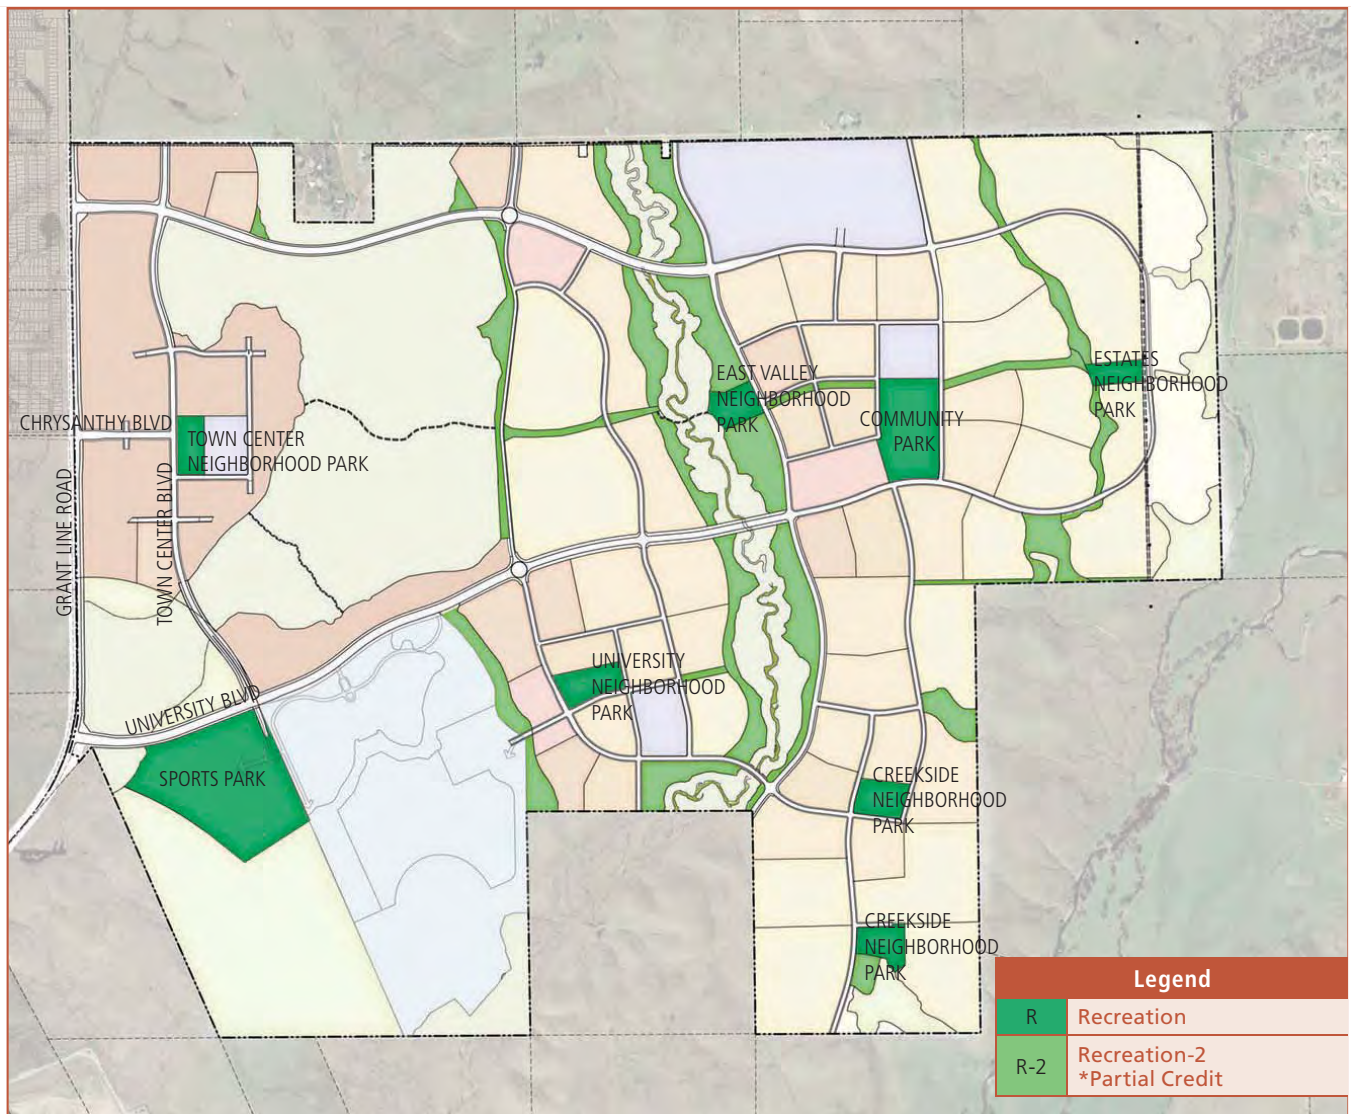

Source: EPS and Wade & Assoc.

[1] Based on survey of parks construction costs for comparable jurisdictions in the region.

[2] Swim Center and Community Center costs based on survey of costs for comparable facilities in the region.
Community center approximately 11,000 sq. ft. at a cost of \$350 per sq. ft.

[3] 7.8 Recreation-2 acres that will be identified as active parkland as the Project is mapped.

Map 10-1 Park Sites

Note: Only park sites and facilities (designated in legend as "Recreation") are addressed in this chapter. Open Space ("Recreation 2") is addressed in the "Open Space and Trails" chapter.

The total parks development cost at buildout is estimated at \$47.5 million. This cost includes general park development costs, as well as the costs of a Swim Center and a Community Center.

The general park development cost of \$39.0 million is estimated using an average cost of \$375,000 per acre. The Cordova Hills Draft Master Plan includes a list of facilities to be included at each park. Typically, the parks would include sports fields, basketball courts, picnic areas, play equipment, restrooms, drinking fountains, and furnishings (such as benches and kiosks). The average park improvement cost per acre accounts for funding of items including, but not limited to, water and sewer connection fees (including the costs of any installed water meters), design and engineering costs, drainage systems, surface improvements, restroom facilities located on park sites, sports fields, bicycle paths, play equipment, tables and benches, turf irrigation systems, fencing, paving, and lighting.

The total Swim Center construction cost estimate is for a community swim center and is estimated at \$4.5 million based on costs of other outdoor swim centers in the region. The Swim Center likely would include multiple pools, including one pool for lap swimming and smaller play and/or diving pools. The Community Center cost estimate is for an approximately 11,000 square foot community center with space for meeting rooms and senior center facilities. It also could include a gymnasium and youth center facilities, although these facilities, as well as additional meeting rooms, could be combined with a school. The total events center construction cost is estimated at \$4.0 million. This cost is also based on costs of comparable events centers in the region.

As Cordova Hills is developed, park master plans will be prepared for each park. Cost estimates will be updated as part of the park master planning process. Cordova Hills plans on developing parks using a budget based approach, with the costs adjusted for inflation. The CHLSD will have the ultimate decision on the park design and costs.

Phasing

Approximately 15 acres of park development are planned for Phase 1. Phase 1 parks include the following:

- The 5-acre neighborhood park located in the Town Center Village.
- 10 acres of the Sports Park located just west of the university/college campus center.

Phase 1 park construction totals an estimated \$5.6 million.

Table 10-3 shows the anticipated annual phasing of park development over buildout of the Project. As shown, the percentage of total dwelling units exceeds the percentage of park development indicating that there will be a sufficient tax base (development) available to fund facility costs.

Prepared by EPS 9/7/2012

Funding Strategy

Summary

There are no existing park development fee programs in which Cordova Hills would participate. Cordova Hills proposes that park development costs be funded through the Cordova Hills SFD.

Existing Fee Programs

There are no fee programs for development of County parks.

Proposed Cordova Hills SFD

Cordova Hills proposes that park development costs be funded through the Cordova Hills SFD. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

The total Cordova Hills parks costs are allocated to the different land uses based on the land uses' relative park usage. **Table 10-4** shows the allocation factors used to estimate relative parks usage and fairly allocate costs to the land uses. Parks costs are allocated based on persons per household and employees per acre. **Table 10-5** shows the buildout cost allocation and the resulting park cost per dwelling unit by residential land use and nonresidential building square foot.

Park improvement costs associated with approved park plans are eligible for fee credits pursuant to the provisions of the proposed Cordova Hills fee program.

Phase 1 Facilities Cost vs. Allocated Cost

Table 10-6 shows the estimated Cordova Hills SFD Phase 1 and buildout park development costs versus proportional allocated costs. There is an estimated surplus of allocated park costs in Phase 1 as compared to estimated Phase 1 park development costs.

Table 10-4

11. OPEN SPACE AND TRAILS

Cordova Hills contains an extensive open space and trail system that includes the following features:

- 4.0 million square feet of open space and greenbelts.
- 1.7 million square feet of trails and landscaping in the edges around the avoidance areas.
- 2.1 million square feet (20 miles) of paseos, including trails and adjacent landscaping.
- 284,000 square feet of multi-use trails.

Note that the avoidance area edges are included as open space, but the avoidance area preservation costs are included in the Habitat and Wetlands chapter. In addition, on-street bicycle trails and multi-use trails within the road right of way are included in the Roads chapter.

Map 11-1 shows the location of the open space and greenbelts (parcels identified as “Recreation-2” on the map). **Map 11-2** shows the proposed trails system. The trails on this map that are discussed in this chapter are identified as “Cordova Hills Community Trails (Off Street)” and “Community Trails Thru Main Preserve.” These trails include multi-use trails throughout the community, the trails contained in the avoidance areas edges, and the trails that cross the main avoidance area. There are two types of community multi-use trails as defined below.

- 10-foot wide trails with 2-foot decomposed granite shoulder on either side.
- 10-foot wide trails without the decomposed granite shoulders.

In the cost estimates, the trails that cross the main avoidance area are 10-foot wide trails with decomposed granite shoulders, while all other community trails are 10-foot wide trails without decomposed granite shoulders.

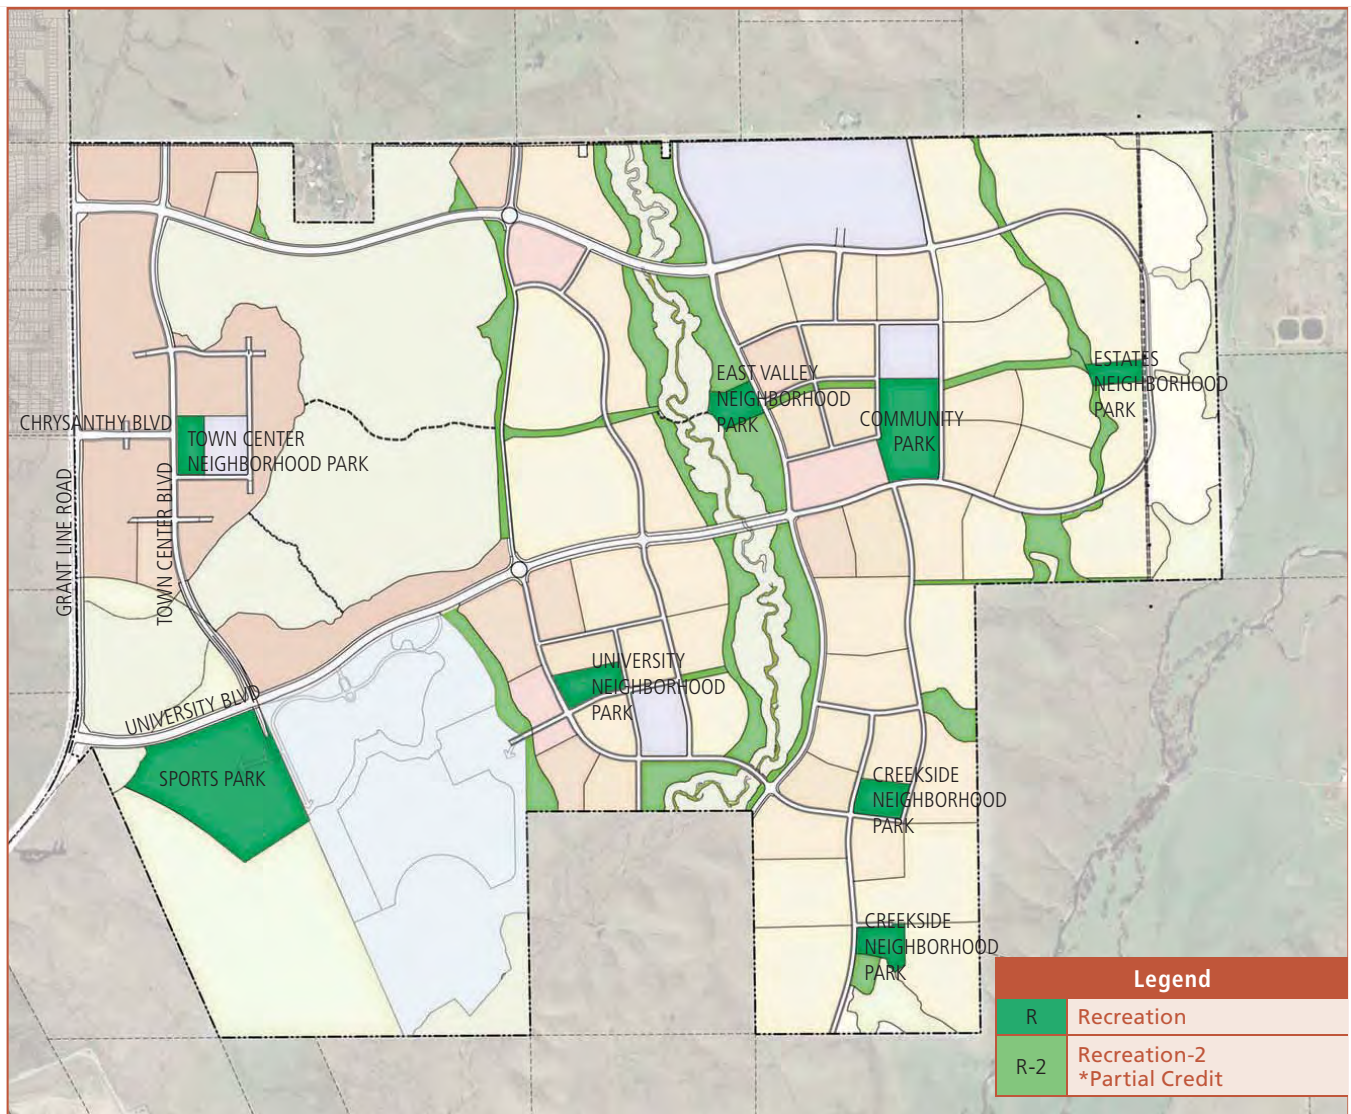

The 20 miles of paseos are not shown on **Map 11-2** because their exact locations are unknown at this time. More precise mapping of the paseos will occur as part of the tentative map approval process.

Facility Costs

Table 11-1 estimates the Phase 1 and buildout open space and trails development costs. These costs were provided by MJS Design Group and HCM, Inc. The total open space and trails development cost at buildout is estimated at \$19.6 million. Note that the open space/greenbelts square feet shown at buildout include an adjustment to deduct open space acres that will be developed as active parkland (see previous discussion in Parks chapter).

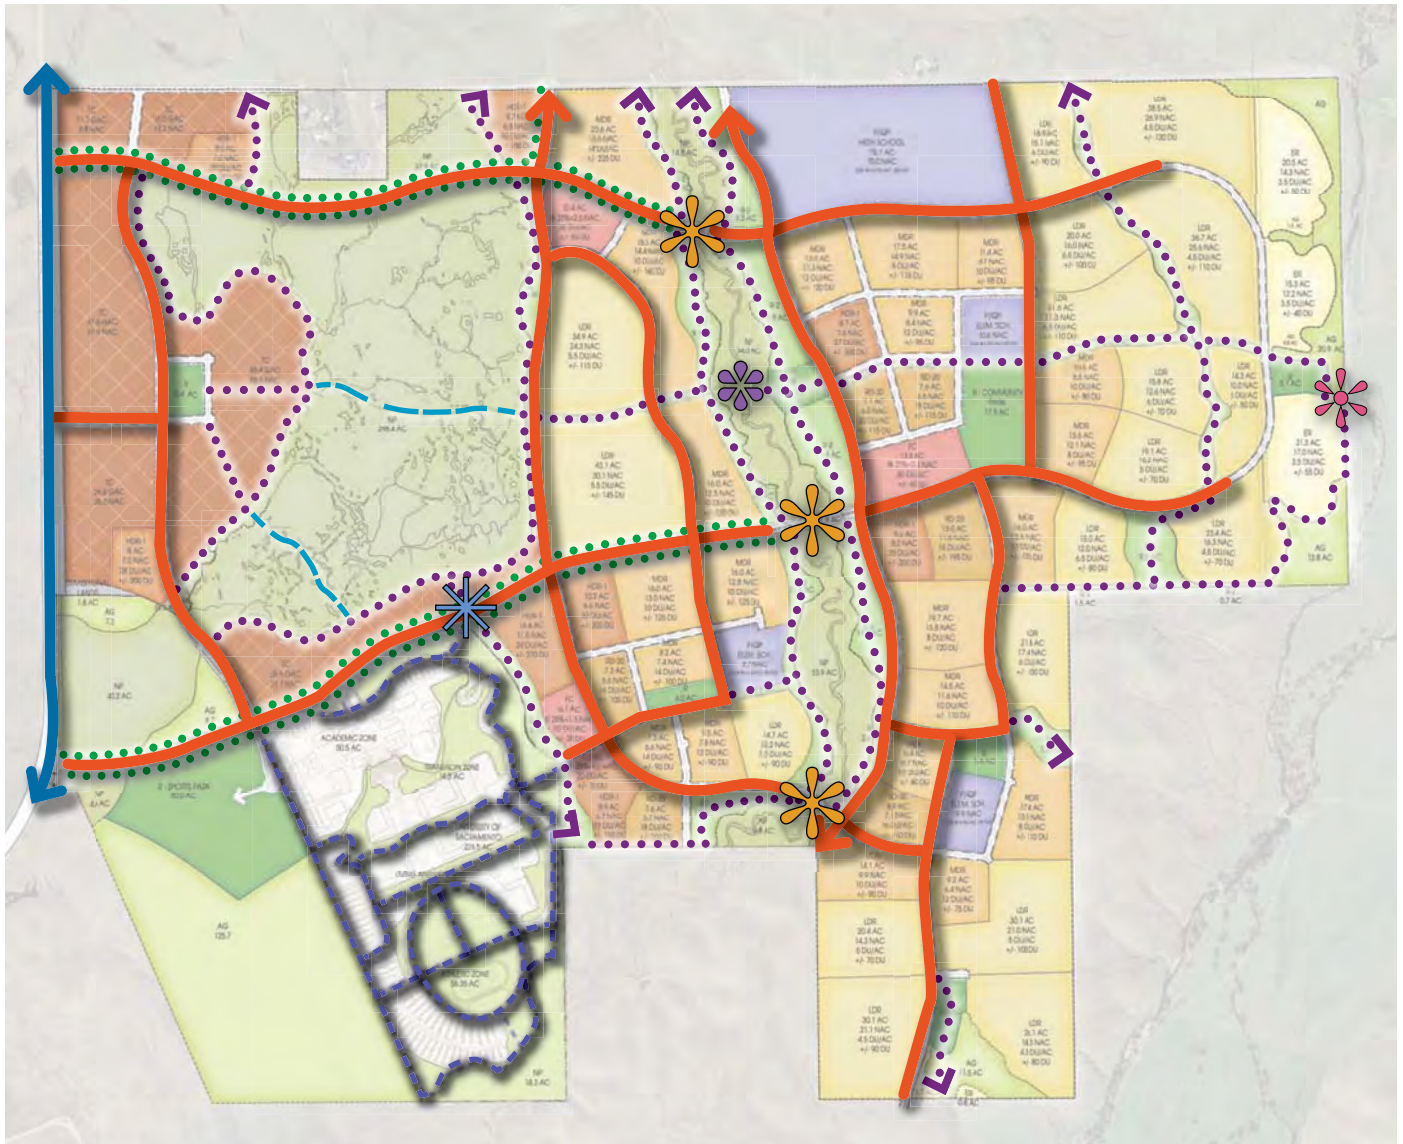

The open space and greenbelts listed on **Table 11-1** are shown on **Map 11-1**. All of the trails listed on **Table 11-1**, with the exception of the paseo trails (see previous discussion), are shown on **Map 11-2**.

Map 11-1 Open Space

Note: Only open space (designated in legend as "Recreation-2") is addressed in this chapter. Park sites and facilities ("Recreation") are addressed in the "Parks" chapter.

OS cost

[1] Open space that will be developed and maintained as active parks. See Table 10-2.

11-4

Phasing

The Phase 1 trails and open space planned development includes the following features:

- 569,000 square feet of edges around the avoidance areas.
- 211,000 square feet of paseos (approximately 2 miles).
- 34,000 square feet of multi-use trails.

Phase 1 open space and trails construction totals an estimated \$2.0 million.

Table 11-2 shows the anticipated phasing of open space and trail development for Phase 1 and buildout of the Project. As shown, the percentage of residential development in Phase 1 exceeds the percentage of open space and trail development in Phase 1, indicating there will be sufficient development to fund open space and trail development costs. Indeed, there is a projected \$475,000 surplus in Cordova Hills SFD revenues in Phase 1, as shown in **Table 11-6**. Funding for open space and trail facilities at buildout of the Project is discussed in the following section.

Funding Strategy

Summary

There are no existing open space and trails development impact fee programs in the County. Cordova Hills proposes that the open space and trails development cost be funded through the following two sources:

- Cordova Hills SFD.
- Private Developer Funding.

All open space and trails costs, with the exception of the paseos costs, will be funded through the Cordova Hills SFD. Paseos costs will be funded by private developers as site development costs because the paseos will be located in or adjacent to the subdivisions throughout the Project.

Table 11-3 summarizes the costs and funding sources. Of the total buildout costs, an estimated \$10.5 million will be funded through the Cordova Hills SFD and \$9.1 million by private developers.

Existing Fee Programs

Currently, there are no fee programs for development of County open space and trails.

Proposed Cordova Hills SFD

As discussed above, approximately \$10.5 million of the total open space and trails development costs are planned to be funded through the Cordova Hills SFD. The SFD could include advance developer funding and reimbursements, bond-funding, and/or funding through a fee program. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

os_su_bo

The Cordova Hills open space and trails costs are allocated to the different land uses based on the land uses' relative open space and trails usage. **Table 11-4** shows the allocation factors used to estimate relative usage and fairly allocate costs to the land uses. Open space and trails costs are allocated based on persons per household and nonresidential developable acres.

Table 11-5 shows the buildout cost allocation and the resulting open space and trails development cost per dwelling unit by residential land use and nonresidential building square foot.

Phase 1 Facilities Cost vs. Allocated Cost

Table 11-6 shows the estimated Cordova Hills SFD Phase 1 and buildout open space and trails development costs versus proportional allocated costs. There is an estimated surplus of Cordova Hills SFD revenues in Phase 1 as compared to estimated Phase 1 development costs. This surplus could be used to fund any potential shortfalls incurred in later phases of the Project.

12. HABITAT AND WETLANDS

Wetland preservation will be required in the avoidance areas of the Project. Most of the avoidance areas are in the western third of the project. In addition, off-site habitat mitigation will be required. **Map 12-1**, prepared by ECORP Consulting Inc., shows the Project avoidance areas and the wetland features. It summarizes the impacts of the Project on the habitat and the Project avoided area acres as a result of creating the on-site preserve. These amounts are used to determine the habitat mitigation requirements for the Project, the credits granted for establishment of the on-site preserve, and the remaining off-site requirements. The map provides preliminary estimates that are currently being updated. The on-site and off-site habitat requirements and costs will be updated following completion of the environmental review process.

Facility Costs

Table 12-1 estimates the Phase 1 and buildout habitat mitigation costs. These costs, totaling approximately \$15.3 million are the costs for off-site mitigation only. The on-site and off-site costs are discussed further below.

On-site Costs

The on-site mitigation costs include annual legal, construction, survey, maintenance, operations, and reporting costs. The on-site costs would be somewhat higher in the first year of habitat establishment than in the subsequent years since additional costs would be required to establish the habitat. On-site costs do not reflect any construction costs (i.e., habitat creation or restoration costs) since the proposed on-site preserve location exists on undisturbed land. The on-site costs are included in the Urban Services Plan and are planned to be funded through an annual tax levied through the proposed CHLSD. The Cordova Hills developer may be required to privately fund some on-site costs in the first few years of the Project until enough development occurs that the proposed tax would provide sufficient revenue.

The on-site costs are detailed in the Property Analysis Record (PAR) prepared to estimate annual management costs for the on-site Cordova Hills habitat preserve. The final determination of the funding of ongoing maintenance costs for the on-site preserve will be detailed in the Habitat Management Plan for Cordova Hills.

Table 12-1
Cordova Hills Financing Plan
Estimated Habitat Mitigation Costs (2011\$)

Item	Formula	Phase 1	Buildout
On-Site Habitat Mitigation [1]		N/A	N/A
Off-Site Habitat Mitigation			
Creation/Restoration Acres [1]	a	17.79	39.63
Subtotal Creation/Restoration Cost	$b=a*\$250,000$	\$ 4,446,500	\$ 9,907,500
Preservation Acres [2]	c	32.26	65.14
Less Preservation Credits [3]	d	(31.15)	(37.93)
Net Preservation Requirement	$e=\max\text{ of }0\text{ and }(c-d)$	1.11	27.21
Subtotal Preservation Cost	$f=e*\$200,000$	\$ 222,800	\$ 5,441,600
TOTAL HABITAT MITIGATION COSTS	$g=b+f$	\$ 4,669,300	\$ 15,349,100

hab

Source: Conwy, LLC and ECORP.

- [1] One creation acre required for each impact acre. Maintenance of the onsite preserve is discussed in the Urban Services Plan and will be funded through a CHCSD special tax.
- [2] Two preservation acres required for each vernal pool, seasonal wetland, and seasonal wetland swale acre impacted.
- [3] Credits given for vernal pool, seasonal wetland, and seasonal wetland swale avoided acres.

Off-Site Costs

The off-site habitat mitigation costs will include creation, restoration, and preservation costs. The Project developer anticipates that it will be required to create and restore one acre of habitat for each acre of habitat disturbed and to preserve two acres of habitat for each acre disturbed. Credits for on-site habitat mitigation will be granted against these costs. **Table 12-1** shows the habitat mitigation creation/restoration and preservation acres requirement after netting out the acres requirement satisfied through on-site mitigation. The required creation and restoration acres and preservation acres are multiplied by an average cost per acre to arrive at a total off-site mitigation cost.

Phasing

Phase 1 habitat mitigation costs total approximately \$4.7 million of the estimated \$15.3 million at buildout.

Funding Strategy

The habitat and wetlands are a significant element of the Project, so they are included in this Financing Plan. It is currently anticipated, however, that the habitat mitigation costs will be funded privately rather than through a public financing mechanism.

There are no existing habitat mitigation fee programs in which the Project area is included that could be used to fund the off-site habitat costs. There is a proposed South Sacramento Habitat Conservation Plan fee program, however, which if implemented, could replace the private developer funding as the funding source of habitat mitigation costs.

13. LIBRARY

Library services for Cordova Hills are provided by the Sacramento Public Library Authority (Library Authority). Cordova Hills will be required to contribute toward the provision of library services for its residents.

The County is in the process of implementing a countywide library development impact fee program. Cordova Hills will participate in this fee program if and when it is implemented. The estimated fee rates proposed for the program are \$827 for single-family detached dwelling units; \$643 for 2-4 units attached; \$537 for 5+ units attached; and \$530 for mobile homes and second residential units, based on this proposed fee level. **Table 13-1** shows the projected fee revenue from Cordova Hills development at completion of Phase 1 development and at buildout. At buildout, the Project will generate approximately \$5.5 million in fee revenue. In the event that the County does not implement a countywide library development impact fee program, the Project will fund its fair share of library facilities through the proposed Cordova Hills SFD.

The Library Authority plans a 15,000 square foot library to serve Cordova Hills and adjacent areas. Cordova Hills could provide an appropriate library facility in the Town Center and lease the facility to the Library Authority. The development impact fee that Cordova Hills pays ultimately could be adjusted if this arrangement was established. However, it should be noted that the Cordova Hills developers are not required to construct a library facility.

As of the end of 2010, the Library Authority considered the estimated \$5.5 million from potential library fees adequate to fund the Cordova Hills' portion of construction, furnishing, and materials acquisitions for a 15,000 square foot library facility. Sufficiency of funding, however, is entirely dependent on economic conditions at the time of construction. The timing of constructing a library facility is at the discretion of the Library Authority and will be dependent on funding from all benefiting areas.

Further, no operating funds have been allocated to the Library Authority to support the opening and annual operation of a new library facility. Annual operations include staffing, collections, maintenance and security, and utilities. These additional costs are currently estimated at \$800,000 annually and would need to be budgeted and allocated to the Library Authority prior to construction. The operating costs and funding of these costs are discussed further in the Urban Services Plan.

14. TRANSIT

Cordova Hills proposes to develop a local transit shuttle system within the Project area with an initial connection to the Sacramento Regional Transit (RT) station at Mather Field Road.

Map 14-1 shows the proposed internal bus routes, and **Map 14-2** shows the proposed external bus route.

The transit system would feed to RT services but would not be part of RT. The system would be operated by the proposed CHLSD. As detailed in the Urban Services Plan, Cordova Hills would contract out to provide the transit service, which would likely include the leasing of buses. The transit service provider would be paid through revenue generated from a Cordova Hills services tax and a university/college campus center subsidy. There would be no additional costs to the transit users except for a fare charged for non-residents of Cordova Hills.

Facility Costs

Table 14-1 estimates the Phase 1 and buildout transit facilities costs. Based on the Cordova Hills Transit Plan Summary (March 26, 2010) and a letter from MV Transit (April 28, 2010), it is estimated that Cordova Hills will require the following facilities and equipment:

- 20 bus stop shelters
- A transit center

The transit center, which is envisioned as a small information center/kiosk, will be located on the north side of the future extension of Chrysanthy Boulevard and will share parking with the Town Center commercial land uses. In addition, an onsite bus storage facility may be needed. Since it is currently undetermined if it will be needed, it is included in **Table 14-1** in the event that it is required, but no cost is shown.² Further, it is assumed that buses will be leased from the service provider and paid for through the proposed Cordova Hills services tax, so no buses will need to be purchased. The total construction cost at buildout for the transit facilities is estimated at \$495,700.

Phasing

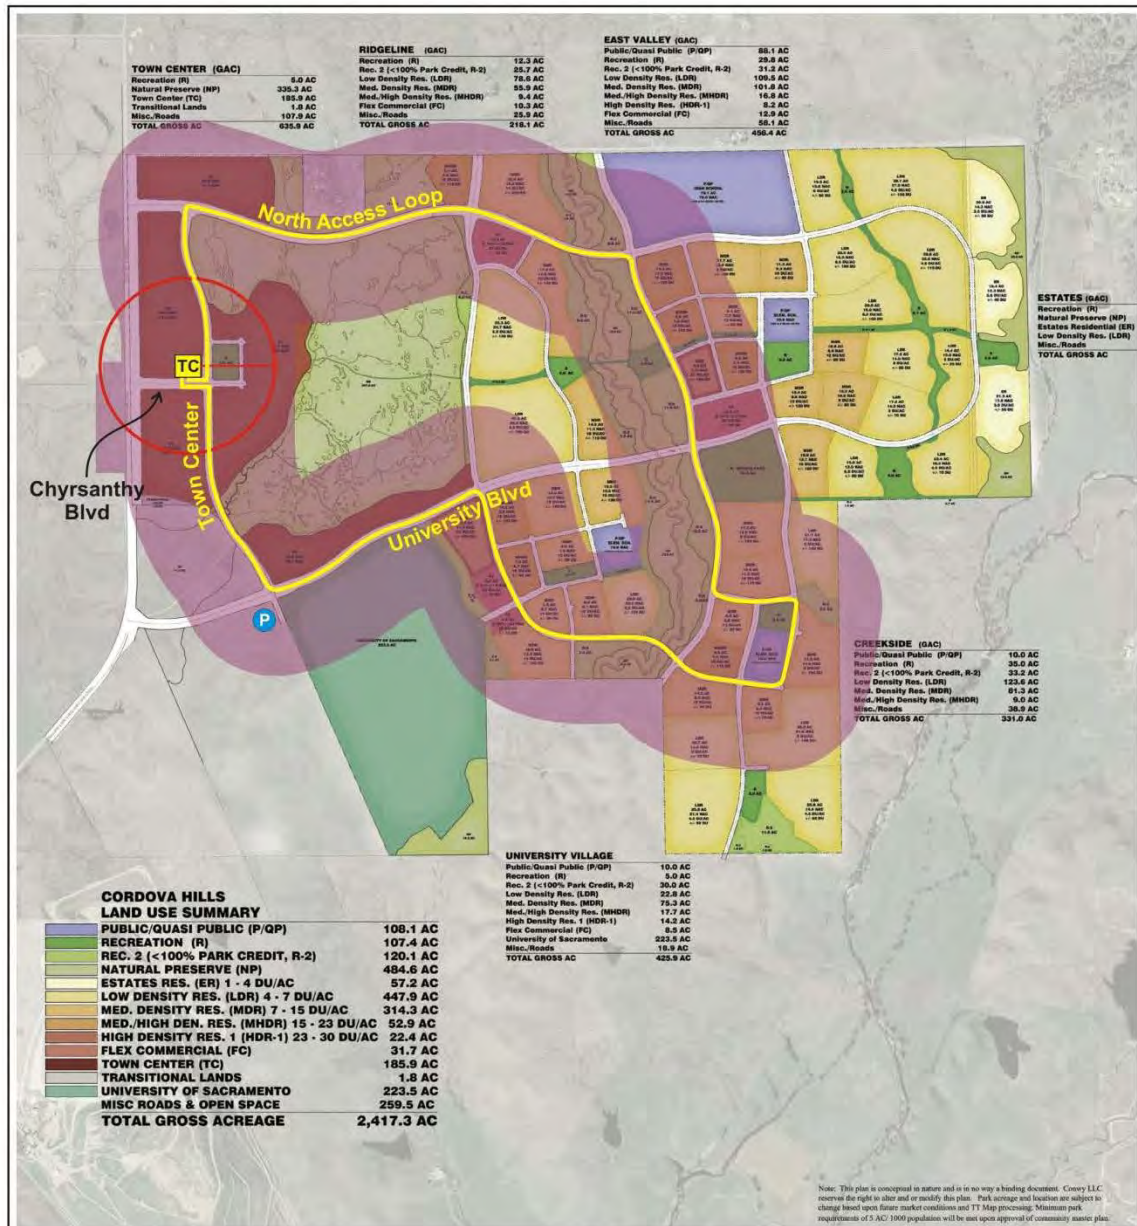

The Phase 1 transit services will consist of an initial external transit shuttle service from the Project to the Mather Field Road Light Rail Station. Thus, Phase 1 transit facilities costs comprise construction of the transit center and the four external bus stop shelters. The remaining bus

² A bus storage facility, either onsite or offsite, will be determined at the time a bus operator is selected. It is likely the operator will have their own maintenance facilities and funding will not be required from the Project.

Source: EPS, Cordova Hills Transit Plan Summary (March 26, 2010), MV Transportation memorandum (April 28, 2010), and Regional University/College Campus Center Specific Plan PFFP (Sept. 2008). *transit cost*

[1] Unit costs of transit center from the Regional University/College Campus Center Specific Plan PFFP (Sept. 2008). Unit cost of bus shelters provided by RT. Costs have been increased by the percent change in the ENR CCI 20-City Index for January of the cost estimate year through January 2011, as shown below:.

Item	Year of Cost Est.	Unit Cost	Pct. Change in Jan. CCI Index	2011 Est. Unit Cost (Rounded)
Bus Shelter Unit Cost	2010	\$ 12,520	3.52%	\$ 13,000
Transit Center Unit Cost	2007	\$ 212,000	11.19%	\$ 235,700

[2] Phase 1 costs estimated as buildout costs * Phase 1 percent of total population.

[3] The internal bus route is not triggered until after Phase 1 (at the issuance of the 3,000th residential building permit). Thus no costs are estimated. At buildout, the internal 6.1-mile route will accommodate one shelter every 0.375 miles.

[4] The transit center is envisioned as a small information center/kiosk.

stop shelters will be needed for the Project's internal transit service, which will not be initiated until after completion of Phase 1 development. Phase 1 transit costs shown in **Table 14-1** total approximately \$288,000.

The transit services will be phased in over time, as detailed in the Development Agreement. This phasing is summarized below:

- Before the issuance of the 500th residential building permit, the CHLSD should perform an analysis to assess whether the external shuttle service should be commenced at 500 residential building permits or at a later threshold. Depending on the results of the analysis, initiation of the shuttle service could be required at any time between issuance of the 500th and 1,000th building permit.
- Before the issuance of the 1,000th residential building permit, the Project shall initiate an external transit shuttle service that will provide direct service between the Cordova Hills park-and-ride lot and Mather Field Road Light Rail Station.
- Before the issuance of the 3,000th residential building permit, the Project shall expand the external shuttle service between the Cordova Hills park-and-ride lot and Mather Field Road Light Rail Station to operate at greater frequencies during peak periods. At the same time, the Project shall also initiate an internal shuttle service between the Project's Transit Center and the developed portions of Phases 1 and 2.
- Before the issuance of the 5,000th residential building permit, the Project shall increase the length of the internal shuttle service to the final planned internal route.
- Before the issuance of the 7,500th residential building permit, the Project shall expand the internal shuttle service to run vehicles in both directions of the internal loop.

Funding Strategy

Summary

There are no existing development impact fee programs for transit facilities. Therefore, Cordova Hills proposes that transit facilities costs be funded through the Cordova Hills SFD.

Existing Fee Programs

Currently, there are no fee programs for construction of transit facilities.

Proposed Cordova Hills SFD

Cordova Hills proposes that transit facilities costs be funded through the Cordova Hills SFD. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program. This report includes facilities cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities.

The allocation process for transit facilities consists of two steps:

- First, the transit costs are divided between the Cordova Hills community and the university/college campus center. **Table 14-2** shows this cost distribution. The university/college campus center is allocated approximately 16 percent of the transit costs, and the community is allocated the remainder. The 16 percent factor is based on the university/college campus center's percent of total person trips for Cordova Hills. The person trips are obtained for DKS Associates Draft Cordova Hills Traffic Model (July 2010). The person trips represent potential transit trips because all people from the community and the university/college campus center have the opportunity to use the transit system for their trips.
- Second, the Cordova Hills community costs are allocated to the various land uses in the Community based on the land uses' relative usage. **Table 14-3** shows the allocation factors used to estimate relative transit usage and fairly allocate costs to the land uses. Transit costs are allocated based on peak hour transit trips per acre. **Table 14-4** shows the buildout cost allocation and the resulting transit cost per dwelling unit for residential land uses, per building square foot for nonresidential uses, and in total for the university/college campus center.

Phase 1 Facilities Cost vs. Allocated Cost

Table 14-5 shows the estimated Cordova Hills SFD Phase 1 and buildout transit facilities costs versus proportional allocated costs. There is a deficit of estimated revenues in Phase 1 as compared to estimated Phase 1 facilities costs. This deficit will be advance-funded by the master developer and reimbursed through the Cordova Hills SFD in subsequent phases of the Project.

15. SCHOOLS

Cordova Hills is within the boundaries of the Elk Grove Unified School District (EGUSD). Information regarding school costs was obtained from the EGUSD Development fee Justification Study/school facilities Needs Analysis (SFNA) dated June 2010.

Proposed Facilities

Cordova Hills contains three elementary school sites and one combination middle and high school site (see **Map 15-1**). Based on the number of units expected in Cordova Hills, student yield factors from the SFNA, and EGUSD typical school sizes, Cordova Hills will generate the need for approximately 3 elementary schools but only about 62 percent of a middle/high school. The students and funding for the portion of the high school not attributable to Cordova Hills will come from other nearby areas outside of Cordova Hills.

Facility Costs

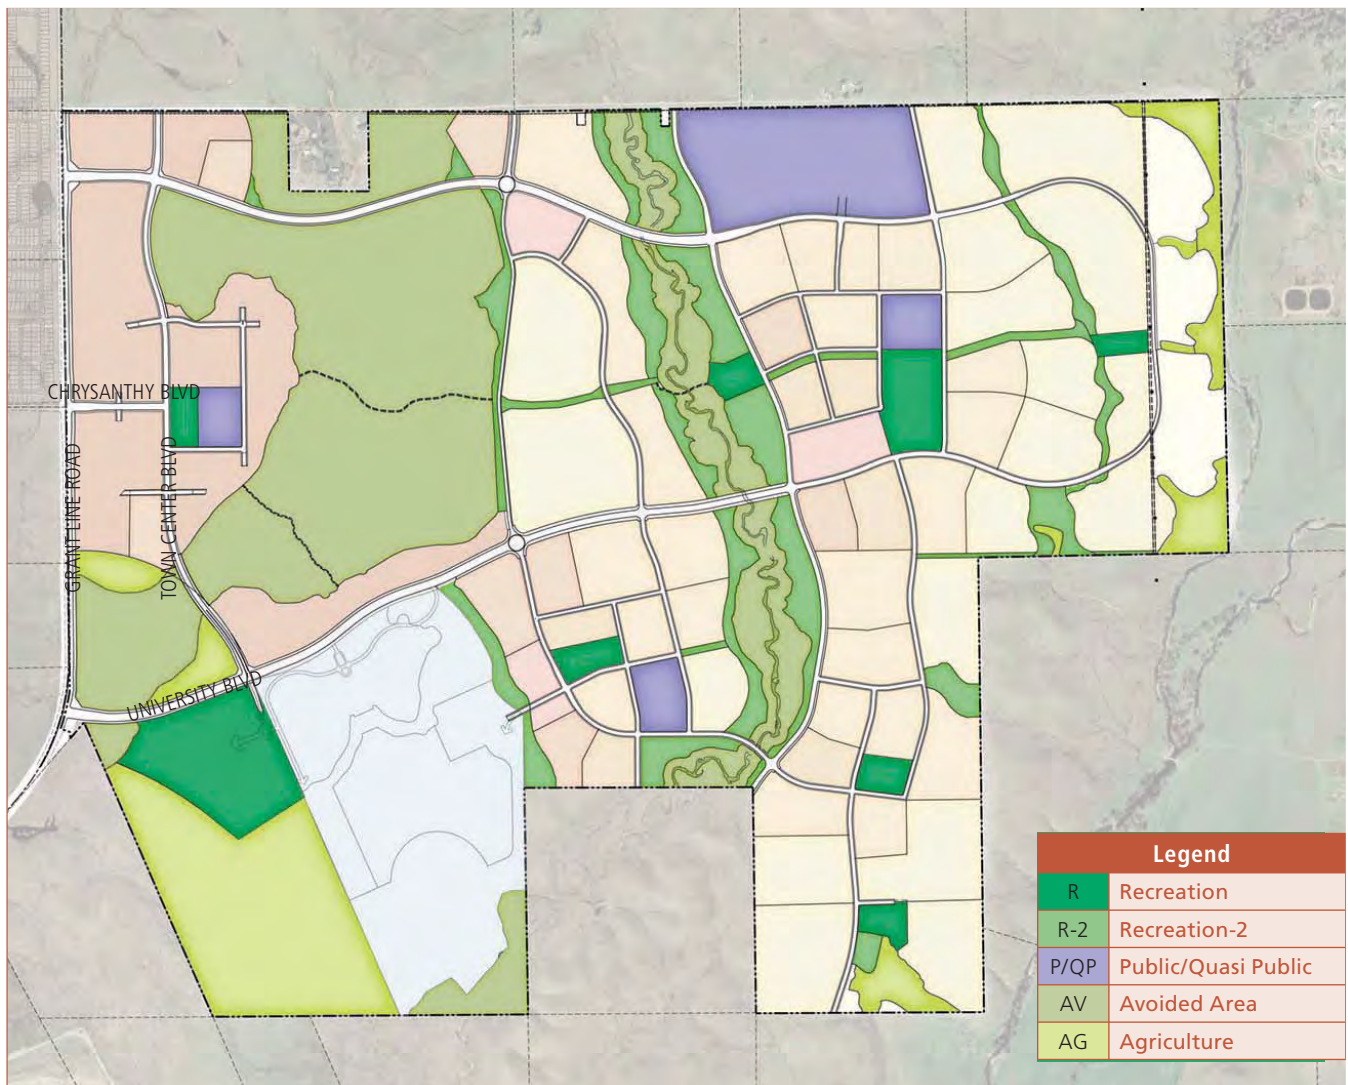

The EGUSD estimates school facility costs by using student generation rates per dwelling unit and average costs per student as quantified in the SNFA. **Table 15-1** shows the current student generation rates, total projected students, school facility costs per student by grade level, and projected total costs at completion of Phase 1 development and buildout. The cost of required school facilities to serve the estimated number of students is approximately \$28.1 million for Phase 1 development and \$123.4 million at buildout.

The method used by the EGUSD to estimate costs determines the cost of school facilities attributable to Cordova Hills development based on demand for facilities rather than on the actual cost of school facilities planned for construction in Cordova Hills. As discussed previously, Cordova Hills students will not require an entire high school although one is planned for construction in Cordova Hills. **Table 15-2** compares the school costs attributable to Cordova Hills development with the costs of building the planned schools. At buildout, the total estimated school construction cost of the planned schools in Cordova Hills is \$38.3 million greater than the estimated costs attributable to Cordova Hills students. This \$38.3 million will be funded by other areas whose students may attend the Cordova Hills schools.

Phasing

The EGUSD will manage the construction of school facilities. At this time planning information is not available. Phasing for schools will depend on availability of State funding and the timing and location of development.

Map 15-1 School Sites

Note: Only school sites and facilities (designated in legend as "Public/Quasi Public") are addressed in this chapter. Open space ("Recreation-2"), parks ("Recreation"), and habitat and wetlands ("Avoided Area") are addressed in other chapters.

comp

[1] Capacity required to serve Cordova Hills project.

[2] Total elementary students at the three planned schools set equal to the number of projected students (2,554), which is roughly equivalent to the capacity of 3 850-student schools (2,550).

Funding Strategy

Summary

Table 15-3 summarizes the proposed funding of Cordova Hills school facilities costs. The funding will be provided by the following two sources:

- State of California Funding
- EGUSD Level 2 Fee

Each of these two funding sources provides funding for one-half of the allowable school facilities costs, as estimated using State standards and formulas. The State updates its cost factors every two years. The EGUSD updates its fee program annually to calculate the fee needed to provide one-half of the facilities funding. The fees are adjusted each year to account for the changing construction costs, student generation rates, and dwelling unit sizes.

State Funding

The State of California (State) will provide qualifying districts with funding for school facilities. The amount of funding is based on allowable amounts of site acquisition, site development and building construction costs per student according to State standards. **Table 15-4** estimates the Phase 1 and buildout State funding for Cordova Hills based on the projected number of students and the State funding per student amounts. State funding will provide revenues of approximately one-half of the allowable costs, or \$61.7 million at buildout of the Project.

Existing Fee Programs

The EGUSD has adopted a Level 2 school development fee program, as detailed in the SFNA. This fee program will provide funding for one-half of the allowable schools costs, or approximately \$61.7 million.

EGUSD CFD

Developing properties within the boundaries of the EGUSD are required to participate in the District's Mello-Roos CFD No. 1 annual special tax. The EGUSD Board of Education approved a local bond plan effective 1998-2010 on October 20, 1997. It is anticipated that the annual tax for CFD No. 1 will be collected until fiscal year 2038-2039. All currently remaining CFD bonding capacity, however, has been designated for projects in the District not directly associated with future development.

16. SPECIAL FINANCING DISTRICT FORMATION AND UPDATES

Summary

Sacramento County Public Works Special Districts Section (SDS), in cooperation with the service providing agencies, will administer the formation and updates of the Cordova Hills SFD. This administration will include the following tasks:

- Development of infrastructure master plans and associated environmental review work.
- Initial implementation of the Financing Plan.
- Formation of the Cordova Hills SFD. Depending on the final funding mechanisms decided upon, this task may include these:
 - Implementation of a Cordova Hills fee program.
 - Formation of a land-based financing district (e.g., Mello-Roos CFD), issuance of bonds, and collection of annual special taxes.
- Monitoring the infrastructure CIP and development activities.
- Periodic updating of the implementation program to ensure the necessary infrastructure is constructed as required to serve the Cordova Hills development.

Estimated Cost

Table 16-1 shows the Phase 1 and buildout Cordova Hills SFD formation and updates cost. The estimated costs total \$2.0 million at buildout of Cordova Hills. Additional costs of 3 to 4 percent will be included in the administration component of Cordova Hills SFD program. These costs will be required to provide day to day administration of the Cordova Hills SFD.

Phasing

The Phase 1 Cordova Hills SFD formation and updates cost is estimated at \$1.5 million, as shown in **Table 16-1**.

Funding Strategy

Cordova Hills proposes that the Cordova Hills SFD formation and updates cost be funded through the Cordova Hills SFD. The SFD could include developer funding and reimbursements, bond-funding, or funding through a fee program. This report includes cost allocations to the various uses that would be needed if developer or fee funding were established to fund the facilities. As necessary, the Cordova Hills developers will advance-fund the cost of the Cordova Hills SFD formation and updates and will be reimbursed through the Cordova Hills SFD when funds become available.

Table 16-1
Cordova Hills Financing Plan
Estimated Special District Formation and Updates Costs (2011\$)

Item	Phase 1	Buildout
Special District Formation and Updates Costs	\$ 1,500,000	\$ 2,000,000

form cost

The total Cordova Hills SFD formation and updates cost is allocated to the different land uses based on percentage of total developable acres for each land use. **Table 16-2** shows the developable acres by land use.

Table 16-3 shows the buildout cost allocation and the resulting Cordova Hills SFD formation and updates cost per dwelling unit for residential land uses and per building square foot for nonresidential uses.

Phase 1 Cost vs. Allocated Cost

Table 16-4 shows the estimated Phase 1 and buildout Cordova Hills SFD formation and updates cost versus proportional allocated costs. There is an estimated shortfall of allocated costs in Phase 1 as compared to estimated costs that will be needed for the Financing Plan administration and updates. This shortfall, estimated at \$1.2 million, should be recovered by buildout. The master developer(s) will advance-fund the costs until adequate revenues are collected from the Cordova Hills SFD to reimburse the developer(s).

Table 16-2

17. CORDOVA HILLS SPECIAL FINANCING DISTRICT

Construction of all backbone infrastructure and public facilities in Cordova Hills not financed through existing County, regional and school district fees and taxes will be financed through the proposed Cordova Hills Special Financing District (SFD). Cordova Hills plans to form the CHLSD to administer and finance the required urban services and construction of the backbone infrastructure and public facilities. The County will implement the financing mechanisms for funding construction of the backbone infrastructure and public facilities.

Formation of the CHLSD

Formation of the CHLSD is detailed in the Cordova Hills Special Planning Area Urban Services and Governance Plan. It is expected that, following consideration of the entitlement documents by the Sacramento County (County) Board of Supervisors, application will be made to the Sacramento Local Agency Formation Commission (LAFCo). The Urban Services and Governance Plan contains information needed to support this LAFCo application and the related technical studies that will be required, including completion of a Municipal Services Review, creation of a coterminous sphere of influence for the CHLSD, and other documentation deemed appropriate by the LAFCo Executive Officer.

Cordova Hills Special Financing District

The County Special Districts Section (SDS) will implement the financing mechanisms to be included in the Cordova Hills SFD. These financing mechanisms could include a Cordova Hills fee program and bond funding through a Mello-Roos Community Facilities District.

Cordova Hills Fee Program

A Cordova Hills fee program would fund improvements not already included in the capital improvement programs of existing fee programs. The fee program would be administered through the CHLSD. The fee by land use would be based on the cost allocation methodology presented in this report and would contain components for each backbone infrastructure and public facility type. Typically, the fee would be collected at the issuance of a building permit.

Developers may be required to construct facilities before sufficient fee revenue is available, so the fee program would include a provision for issuing fee credits and reimbursements to repay developers for advance funding for construction of facilities.

Mello-Roos Community Facilities Districts

One or more Mello-Roos Community Facilities Districts (CFDs) could be established to provide bond financing. Bond financing could provide funding for infrastructure improvements needed during the initial phases of development before the collection of sufficient fees or other sources of revenue. The bonds would be repaid through special taxes levied on property through the CFDs.

The special tax rates, eligible facilities, bond debt authorization, and property included in each CFD will be determined in the CFD formation process for each CFD. The initial bond issue will be constrained by the appraised value of land in the CFD at the time bonds are sold. The final bond sale will be limited by the maximum annual special tax.

EPS estimated maximum annual special tax rates that could be levied for each land use type with a target for total taxes and assessments of 1.8 percent of home value (see **Chapter 19**). This target rate is typical in the Sacramento region and is below the guideline of 2 percent of home value. **Table 17-1** shows these tax rates and estimates the maximum annual special tax revenue that could be generated by Cordova Hills development at buildout. This maximum annual special tax revenue is estimated at \$5.9 million. **Table 17-2** estimates that this annual tax revenue would result in a total bonding capacity of approximately \$79.0 million. After netting out the amounts needed for capitalized interest, the bond reserve fund, and issuance costs, there would be approximately \$62.3 million that could be used to finance infrastructure construction. This revenue estimate is preliminary. The special tax proceeds available to secure bonds issued to pay for public infrastructure will be estimated again after determining the actual special tax rates needed to pay for public services and operations and maintenance costs. As set forth in the Urban Services Plan, these estimates will be developed when a detailed budget is prepared for the CHLSD.

Table 17-1

18. IMPLEMENTATION

Implementation of the Financing Plan strategies will require the following steps:

- Approval of the Development Agreement between the developer and the County. This approval will occur with the Special Planning Area and Environmental Impact Report approvals.
- Updating existing development impact fee programs to include Cordova Hills land uses and eligible infrastructure projects if necessary. These fee programs include:
 - SCTDF (Roadways).
 - STA Measure A (Roadways).
 - SRCSD and SASD (Sewer).
 - SCWA Zone 11A (Storm Drainage).
 - SCWA Zone 40 (Water).
- Formation of the Cordova Hills SFD. Depending on the final funding mechanisms decided upon, this task may include the following items:
 - Implementation of a Cordova Hills fee program.
 - Formation of a land-based financing district (e.g., Mello-Roos CFD), issuance of bonds, and collection of annual special taxes.
- Formation of CFDs or Assessment Districts to fund public services.
- Creating other potential regional fee programs as needed.

Developers who construct or pay for backbone infrastructure or public facilities specified in the Financing Plan that are eligible for credit or reimbursement will be required to adhere to the credit and reimbursement provisions specified in the existing fee programs

Changes in the Capital Improvement and Financing Programs

It is anticipated that as the Financing Plan is implemented, the infrastructure costs and available funding sources will change as development occurs. As a result, the Financing Plan must be flexible enough to accommodate these changes appropriately. Changes in the actual or assumed facilities cost estimates or funding of the facilities should be re-evaluated in the context of the overall financing strategy to ensure required funding is available when needed.

Possible refinements are listed below:

- New or revised infrastructure projects.
- New cost information based on actual construction costs, updated engineering estimates, or changes in the land use plan.
- New funding source data.
- Inflation adjustments to cost and funding data.
- Land use changes for the Project.

Changes in the financing program could include higher or lower cost estimates, as well as changes in funding sources. Costs and funding sources also will need to be adjusted annually to reflect inflation costs because information in the Financing Plan is shown in 2011 dollars.

Fee Credits and Reimbursements

The County will require developers to advance fund or construct certain infrastructure and other associated costs contained in the Project. The improvements that are advance funded may be backbone infrastructure or other public facilities programmed for funding using existing fee programs, the proposed Cordova Hills SFD, bond proceeds, or private financing.

If the master developer is required to advance fund or provide shortfall funding for improvements for areas outside of the Project, the master developer also likely will be entitled to future reimbursements from those development areas generating fees for those facilities.

Fee credit/reimbursement programs for existing and proposed development fee programs will require agreement between the developers, the County, and any other applicable agencies who will administer the fee programs, such as the school district. The policies and procedures for providing fee credits and reimbursements will be set forth in the implementing documents for the fee programs or CFD(s).

19. DEVELOPMENT FEASIBILITY

This chapter assesses the financial feasibility of the Cordova Hills Project. There are the two components of this feasibility as summarized below:

- Feasibility of the finished products to the home builders and non-residential commercial builders (builders).
- Potential additional cost burden that may be carried by the land developer.

The feasibility of the finished products to the builders can be assessed by examining the total infrastructure cost burden and the total taxes and assessments for each developable land use. The Infrastructure Cost Feasibility Test and the Two-Percent Test provide guidelines for the maximum cost burden and maximum taxes that can be assessed without placing too much of a burden on the development.

It is common for developers of major development projects to advance fund and carry infrastructure costs for some time frame. The potential developer cost burden indicates the amount of infrastructure costs that may be carried prior to receiving potential reimbursements. The impact of the land developer's cost burden depends on a number of factors including the time frame for the reimbursements and the extent to which full reimbursement is received, either through public funding programs or through adjustments in land sales prices.

Infrastructure Cost Feasibility Test

Summary

The infrastructure cost burden of development to a builder can be used to assess the financial feasibility for development of the finished products of a project. The total infrastructure cost burden consists of all backbone infrastructure and public facilities costs allocated to the development plus applicable fees, including building permit processing fees, County and regional fees, and school district fees.

The Infrastructure Cost Burden Feasibility Test provides a performance indicator of project feasibility. In general, for each residential land use, if the total cost burden per dwelling unit is less than 15 to 20 percent of the finished home price, then a project is considered to be financially feasible:

- Residential units with a cost burden percentage below 15 percent clearly are financially feasible.
- Residential units with a cost burden percentage between 15 to 20 percent probably are financially feasible.
- Residential units with a cost burden percentage above 20 percent may be financially feasible.

These feasibility benchmarks are based on EPS's experience in conducting financial feasibility analyses for numerous projects throughout the Sacramento Region and Central Valley over the last two decades. The 15- to 20-percent test is merely a tool that can be used—along with other tools—as a general measure of financial feasibility. This measure should not be taken to mean that if one land use type exceeds the threshold, the project is definitely infeasible. There are ways in which a development project can mitigate against a high cost burden, such as reallocating some of the cost burden to other land uses. In addition, the infrastructure costs will be fine-tuned and possibly reduced as engineering studies are completed closer to actual construction. Also, future development projects could be required to contribute to funding offsite costs presently assigned to Cordova Hills, thus reducing Cordova Hills' obligation.

Cordova Hills Infrastructure Cost Burden Summary

Tables 19-1 and **19-2** show the total infrastructure cost burden by land use for development in Cordova Hills. The cost burden is shown per dwelling unit for residential units and per building square foot for nonresidential uses. **Table 19-1** shows the cost burden for development located in SCWA Drainage Zone 11A, and **Table 19-2** shows the cost burden for development located outside of SCWA Drainage Zone 11A. The cost burdens differ somewhat for these two development areas because development located in SCWA Zone 11A participates in the Zone 11A fee program.

The cost burden per dwelling unit ranges from 18.1 percent to 21.2 percent of the home sales price for all owner-occupied residential land uses. All of these percentages indicate probable financial feasibility. This analysis assumes that the Sacramento economy returns to normal market conditions and home prices. It is unlikely that the Cordova Hills project would begin construction until economic conditions improve.

The cost burden for multifamily rental units (Residential 20 and High Density Residential) is slightly higher, ranging from 21.7 percent to 23.7 percent of the estimated finished values. Although exceeding the 20 percent threshold, these product types may be feasible particularly considering other Project land uses are within the feasible range.

One exception is the cost burden for affordable units, which is well outside of the affordability range, at around 37.8 percent of estimated finished values. This finding is typical given the constrained values associated with affordable housing. In most cases, it is common for affordable units to be subsidized by a variety of sources to help offset development costs, including backbone infrastructure cost burdens. The subsidy will be the responsibility of the land developer and the builders as specified in buy/sell agreements between the developer and builders.

The cost burden percent for the majority of the Project residential unit types is within the general feasible range of 15 percent to 20 percent. The cost burden percent is just one measure of feasibility. Ultimately, a variety of Project circumstances will determine feasibility. Also, as discussed previously, the cost burden could be reduced for a number of reasons, including a reallocation of costs among land uses and cost reductions resulting from fine-tuning the estimates as engineering studies are completed and the Project becomes closer to implementation. The cost burden estimates will be further refined as the Project is implemented.

burden 12

Two-Percent Test

The Two-Percent Test is another measure of the financial feasibility to the project builders of developing the finished products. The Two-Percent Test is a general rule for the feasibility of proposed annual special taxes and assessments. In general, if the sum of property taxes, other ad valorem taxes, and all annual special taxes and assessments is less than 2 percent of the average finished home sales price, then the burden of annual taxes and assessments is considered financially feasible. In the Sacramento region, there is generally a target rate for the total of these taxes to be less than 1.8 percent of the finished home sales price.

Table 19-3 summarizes the Two-Percent Test for the various residential and non-residential developable land uses in Cordova Hills. The maximum annual special tax rates for services are estimated and detailed in the Cordova Hills Urban Services and Governance Plan prepared by EPS (July 2011). After accounting for all other taxes on **Table 19-3**, the maximum annual special tax rates for infrastructure were estimated so that the total tax burden, including these special taxes, did not exceed 1.8 percent of the sales price. Thus, each land use type has a total tax burden less than 1.8 percent and would be considered feasible under the guideline of the Two-Percent Test.

Land Developer Cost Burden

The Cordova Hills Project has a number of extraordinary costs that will be carried by the land developer. These costs are for improvements to be privately funded by the land developer and for improvements for which the landowner will advance funds and await reimbursement from other sources. In addition, the developer may assume the university/college campus center's cost burden until the campus is developed or may provide advance funding for that campus project to facilitate its creation. One way to examine the financial feasibility of the Project is to estimate the additional cost burden to the land developer for the improvements that the developer must privately fund or advance fund.

Table 19-4 estimates these additional landowner costs, both in total and per developable acre. At buildout, these costs could total an estimated \$167,000 per developable acre if the developer is required to advance all identified costs. Note that for several of the improvement types (Non-potable Water, Transit, CHLSD facilities, and Special District Formation and Updates), the developer will provide advance funding in Phase 1 but will be fully reimbursed through the Cordova Hills SFD by buildout of the Project.

The total cost at buildout for the improvement types in **Table 19-4** represents a high estimate and could be substantially less than shown for the following major reasons.

- The earthwork costs could be much lower than shown. The estimates are preliminary. As grading plans are developed, cost estimates may be adjusted. Actual costs will be determined based on final grading plans and construction bids.
- The improvements in the top Developer Funding section of **Table 19-4** include both improvements that are planned for funding through the Cordova Hills SFD and improvements that are not planned for funding through the Cordova Hills SFD but rather will be privately funded by the developer.

University Burden	\$ 2,340,000	\$ 12,300,000	\$ 1,963	\$ 10,320
TOTAL	\$ 49,350,000	\$ 199,620,000	\$ 41,404	\$ 167,480

burden dev

[1] Maximum estimated developer costs that would occur under a worst case scenario.

[2] Both the Phase 1 and buildout acres costs are divided by the total Project developable acres to estimate the developer's cost burden per developable acre for the entire Project.

[3] These costs are for improvements that are either included in the Cordova Hills SFD funding program or are to be privately funded. For the improvements in the Cordova Hills SFD program, the developer will be reimbursed from the SFD, so there is \$0 estimated developer cost at buildout. The cost of the remaining improvements at buildout could be recovered through land sales.

[4] The developer may not incur some of these costs if another regional development project triggers and constructs the improvements first. In addition, the developer may receive reimbursements from other public funding programs for some of these costs.

The improvements planned for funding through the Cordova Hills SFD have no outstanding developer costs at buildout. The developer may have to provide advance funding for these improvements but will be reimbursed through the Cordova Hills SFD.

The improvements to be privately funded do have estimated outstanding developer costs at buildout. A portion of these estimated costs could be recovered through adjusted land sales prices to the builders or factored into the purchase price that the developer paid for the land. Thus, the net amount of these outstanding developer costs at buildout would likely be lower than shown in **Table 19-4**.

- The proposed Capitol Southeast Connector project, if implemented, could eliminate much of the developer advance funding required for the Grant Line Road projects. This project would turn Grant Line Road from a planned six lane thoroughfare into a limited access four lane expressway, thus eliminating the advance funding required to expand Grant Line Road to six lanes.
- The estimated costs for road and sanitary sewer improvements in **Table 19-4** are for improvements that the Cordova Hills developer may be required to construct and await reimbursements from other regional funding programs. Other projects in the region, however, may trigger and be required to construct the improvements prior to Cordova Hills triggering the improvements. Thus, the required construction costs that Cordova Hills must advance for the road and sanitary sewer improvements could be substantially less than shown in **Table 19-4**. Even if the developer has to construct all of the improvements, reimbursements from public funding programs may be available to reduce the developer's actual costs. The timing and amount of reimbursements is uncertain, so **Table 19-4** represents the worst case for the developer assuming that there are no reimbursements.
- If the university/college campus center develops as planned, then the developer will not need to assume its cost burden.

While all of the factors above could result in lower costs than shown in **Table 19-4**, there also is potential for cost increases at the time of construction for several reasons as summarized below.

- Due to current economic conditions, it is very difficult to estimate the infrastructure costs, and the actual construction costs could be higher than estimated.
- There are a number of offsite sewer construction scenarios. Depending on the sewer extensions built by other projects, the advance funding for sewer facilities could be greater than the advance funding for the PFFP Sewer Service Scenario identified in the Sanitary Sewer chapter of this report.
- The timing of the construction of the water storage tanks is uncertain and could be early in the Project's development.

Before purchasing property, the land developer will analyze many of the extraordinary burdens on the property, such as those in **Table 19-4**, and adjust the land price to account for these burdens and maintain project feasibility.

APPENDIX A:

Cordova Hills Onsite and Offsite Roadway Capital Improvement Programs

Onsite Roads Cost Estimate	A-1
Offsite Roads Cost Estimate	A-32

NOTE: Offsite intersection exhibits to be included pending completion.

PRELIMINARY
ONSITE ROADS COST ESTIMATE

CORDOVA HILLS SPA

Preliminary Cost Estimate
Cordova Hills SPA
Proposed Project Roadway Cross Sections

7968.10
prepared by: HF
updated on: 03/22/12

NOTES

1. This estimate is prepared as a guide only and is subject to possible change. It has been prepared to a standard of accuracy which, to the best of our knowledge and judgment, is sufficient to satisfy our understanding of the purpose of this estimate. MacKay & Soms makes no warranty, either expressed or implied, as to the accuracy of this estimate.
2. This estimate is based on Cordova Hills Street Sections dated March 21, 2012.
3. This estimate does not consider the following:
 - a. Cost associated with environmental (wetland) mitigations or biological surveys
 - b. Phased construction or out-of-regular-sequence construction
 - c. Costs associated with ground water or inclement weather conditions
 - d. Financial Charges
 - e. Bonds
 - f. Land costs, acquisition of right of way, easements, and/or rights of entry
 - g. Assessments from assessment, lighting & landscaping, Mello-Roos districts or the like
 - h. Relocation of existing above- or underground utilities
4. Costs presented herein represent an opinion based on historical information. No provision has been made for inflation.
5. The "cash flow" situation may be different than the fees, credits, and reimbursements itemized in this estimate.
6. Interim improvements may be required depending on development timing of individual units.
7. Cost for unsuitable material removal is not included in this estimate.
8. Costs are preliminary and subject to change upon more detailed design and analysis.
9. Cost for rock excavation is not included in this estimate.
- 10. This estimate does not reflect soft cost and construction cost contingencies, typically ranging from 15 to 40% of hard construction costs.**
11. Cost of local drainage, sewer, and water facilities are accounted for in respective infrastructure estimates and thus are not reflected in the roadway estimates.
12. Rough grade excavation costs are not a part of this estimate, as they are included in the master grading quantities.
13. This estimate does not include the cost of top soil import that may potentially be required for viable median and frontage landscaping and LID bio swales.

Cordova Hills SPA
Proposed Project Roadway Cross Sections

7968.10
 prepared by: HF
 rev.: 09/05/12

Preliminary Cost Per Linear Foot
"Connectorized" Grant Line Road Improvements
 Cordova Hills Frontage - 4-Lane Section using exist pavement

	<u>ITEM</u>	<u>QUANTITY</u>	<u>UNIT</u>	<u>UNIT PRICE</u>	<u>PER FT COST</u>
1.	Clear and Grub (including subgrade preparation)	72.0	s.f	\$0.18	\$12.96
2.	Roadway Excavation (section plus median, as required)	2.5	c.y.	\$30.00	\$75.00
3.	Pavement Removal (including saw cut)	5	s.f.	\$1.70	\$8.50
4.	5.5" Asphaltic Concrete Paving	28.5	s.f.	\$3.85	\$109.73
5.	20.5" Aggregate Base	28.5	s.f.	\$5.75	\$163.88
6.	Curb & Gutter, Type 2 (Vertical Curb & Gutter)	1	l.f.	\$25.00	\$25.00
7.	Conc. Curb, Type 4	2	l.f.	\$10.00	\$20.00
8.	Median landscaping (shrubs - water truck irrigation)	11.0	s.f.	\$6.00	\$66.00
9.	Planting Strip/LID Swale & Irrigation	19	s.f.	\$6.00	\$114.00
10.	Root Barrier	3	l.f.	\$24.00	\$72.00
11.	PCC Sidewalk w/ 6" AB	10	s.f.	\$6.00	\$60.00
12.	Signing & Striping	3	l.f.	\$2.00	\$6.00
13.	Erosion Control	1	LS	\$6.00	\$6.00
14.	Street Lights - Major Road, Type A 220' spacing	1	l.f.	\$13.00	\$13.00
15.	Traffic Signal Interconnect	1.0	l.f.	\$13.00	\$13.00
16.	Joint Trench (one side only)	1.0	l.f.	\$75.00	\$75.00
	Subtotal				\$840.06
	35% (surveys, design, inspection and contingency)				\$294.02
	(ROW to be dedicated)				\$0.00
	Grand Total per Foot				\$1,134.08
Note:	Assumes utility pole relocation as part of SMUD 69 kV utility bringup to project			Use	\$1,135.00

Preliminary Cost Per Linear Foot
"Connectorized" Grant Line Road Improvements
 4-Lane Section using exist pavement (off-site)

	ITEM	QUANTITY	UNIT	UNIT PRICE	PER FT COST
1.	Clear and Grub (including subgrade preparation)	52	s.f	\$0.18	\$9.36
2.	Roadway Excavation (section plus median, as required)	2.3	c.y.	\$30.00	\$69.00
3.	Pavement Removal (including saw cut)	4.0	s.f.	\$1.70	\$6.80
4.	5.5" Asphaltic Concrete Paving	29.5	s.f.	\$3.85	\$113.58
5.	20.5" Aggregate Base	29.5	s.f.	\$5.75	\$169.63
6.	Conc. Curb, Type 4	2	l.f.	\$10.00	\$20.00
7.	Median landscaping (shrubs - water truck irrigation)	11.0	s.f.	\$6.00	\$66.00
8.	Local Drainage - Roadside Ditch	1	l.f	\$17.00	\$17.00
9.	Root Barrier	0	l.f.	\$24.00	\$0.00
10.	2" Asphaltic Concrete Paving	6	s.f.	\$1.40	\$8.40
11.	4" Aggregate Base	6	s.f.	\$1.12	\$6.72
11.	Signing & Striping	3	l.f.	\$2.00	\$6.00
13.	Erosion Control	1	LS	\$6.00	\$6.00
13.	Utility Pole Relocation	1	l.f.	\$50.00	\$50.00
14.	Street Lights - Major Road, Type A 220' spacing	0	l.f.	\$13.00	\$0.00
16.	Traffic Signal Interconnect	1.0	l.f.	\$13.00	\$13.00
17.	Joint Trench (one side only)	0.0	l.f.	\$75.00	\$0.00
Subtotal					\$561.48

35% (surveys, design, inspection and contingency)

\$196.52

10% (Right-of-Way Acquisition)

\$56.15

Grand Total per Foot

\$814.15

Use

\$815.00

For reaches of Grant Line Rd. located within Kiefer Landfill Bufferlands (County-owned), no ROW acq. Req'd

Use

\$760.00

 re.: 05/21/12

Preliminary Cost Per Linear Foot
"Connectorized" Grant Line Road Improvements

Cordova Hills Frontage - 6-Lane widening of exist 4-lane "Connectorized" Section (frontage)

	<u>ITEM</u>	<u>QUANTITY</u>	<u>UNIT</u>	<u>UNIT PRICE</u>	<u>PER FT COST</u>
1.	Clear and Grub (including subgrade preparation)	83.5	s.f	\$0.18	\$15.03
2.	Roadway Excavation (section plus median, as required)	3.8	c.y.	\$30.00	\$114.00
3.	Pavement Removal (including saw cut)	31	s.f.	\$1.70	\$52.70
4.	5.5" Asphaltic Concrete Paving	51.5	s.f.	\$3.85	\$198.28
5.	20.5" Aggregate Base	51.5	s.f.	\$5.75	\$296.13
6.	Curb & Gutter, Type 2 (Vertical Curb & Gutter)	0	l.f.	\$25.00	\$0.00
7.	Median Curb, Type 5 (6" Barrier Curb)	2	l.f.	\$18.00	\$36.00
8.	Median landscaping (shrubs - water truck irrigation)	25.0	s.f.	\$6.00	\$150.00
9.	Planting Strip/LID Swale & Irrigation	0	s.f.	\$6.00	\$0.00
10.	Root Barrier	2	l.f.	\$24.00	\$48.00
11.	PCC Sidewalk w/ 6" AB	0	s.f.	\$6.00	\$0.00
12.	Signing & Striping	4	l.f.	\$2.00	\$8.00
13.	Local Drainage - Roadside Ditch	1	l.f.	\$17.00	\$17.00
14.	Erosion Control	1	LS	\$6.00	\$6.00
15.	Street Lights - Major Road, Type A 220' spacing	0	l.f.	\$13.00	\$0.00
16.	Traffic Signal Interconnect	0	l.f.	\$13.00	\$0.00
17.	Joint Trench (one side only)	0	l.f.	\$75.00	\$0.00
Subtotal					\$941.13

35% (surveys, design, inspection and contingency)

\$329.40

10% (Right-of-Way Acquisition)

\$94.11

Grand Total per Foot

\$1,364.64

Note: Assumes utility pole relocation as part of SMUD 69 kV utility bringup to project

Use

\$1,365.00
