Global Precipitation Trend for 1900–2000 **Exhibit 3A.4-2**

Former State Climatologist James Goodridge compiled an extensive collection of longer-term precipitation records from throughout California. These data sets were used to evaluate whether there has been a changing trend in precipitation in the state over the past century (DWR 2006). Long-term runoff records in selected watersheds in the state were also examined. Based on a linear regression of the data, the long-term historical trend for statewide average annual precipitation appears to be relatively flat (no increase or decrease) over the entire record. However, an upward trend in precipitation during the latter portion of the record has been noted, but is not conclusive.

When these same precipitation data are sorted into three regions—northern, central, and southern California—trends show that precipitation in the northern portion of the state appears to have increased slightly from 1890 to 2002, and precipitation in the central and southern portions of the state show slightly decreasing trends. All changes were in the range of 1–3 inches annually (DWR 2006). Thus although existing data indicate some level of change in precipitation trends in California, more analysis is likely needed to determine whether changes in California's regional annual precipitation totals have occurred as the result of climate change or other factors (DWR 2006).

Projections

The IPCC predicts that increasing global surface temperatures are very likely to result in changes in precipitation. Global average precipitation is expected to increase during the 21st century as the result of climate change, based on global climate models for a wide range of greenhouse gas emission scenarios. However, global climate models are generally not well suited for predicting regional changes in precipitation because of the large scale of global projections relative to the small scale of regionally important factors that affect precipitation (e.g., maritime influences, effects of mountain ranges) (IPCC 2001a, 2007).

Therefore, while precipitation is generally expected to increase on a global scale as a result of climate change, significant regional variations in precipitation trends can be expected. Some recent regional modeling efforts conducted for the western United States indicate that overall precipitation will increase (Kim et al. 2002, Snyder et al. 2002), but considerable uncertainty remains because of differences among larger-scale GCMs. Where precipitation is projected to increase in California, the increases are mostly in northern California (Kim et al. 2002, Snyder et al. 2002) and in the winter months.

Various California climate models provide mixed results regarding changes in total annual precipitation in the state through the end of this century. Models predicting the greatest amount of warming generally predict moderate decreases in precipitation, while models projecting smaller increases in temperature tend to predict moderate increases in precipitation (Dettinger 2005b). In addition, an IPCC review of multiple global GCMs indicates that fewer than 66% of the models evaluated agree on whether annual precipitation would increase or decrease for much of the State's area. Therefore, no conclusion on an increase or decrease can be provided (IPCC 2007). Considerable uncertainties about the precise effects of climate change on California (and more specifically Sacramento River hydrology and water resources will remain until there is more precise and consistent information about how precipitation patterns, timing, and intensity will change.

Effect on the Project

Although global climate change models generally predict an increase in overall precipitation on a worldwide scale, there is no such consistency among the results of regional models applied to California. Based on the models used and the input assumptions, both increases and decreases in annual precipitation are projected. There is also variability in the results for different parts of the state. Given the uncertainty associated with projecting the amount of annual precipitation, any conclusion regarding significance of potential effects of climate change on precipitation volumes as they relate to reasonably foreseeable direct effects on physical conditions in the project vicinity would be too speculative to be meaningful.

Type of Precipitation – Snowpack

Status and Trends

California's annual snowpack, on average, has the greatest accumulations from November though the end of March. The snowpack typically melts from April through July. Snowmelt provides significant quantities of water to streams and reservoirs for several months after the annual storm season has ended. The length and timing of each year's period of snowpack accumulation and melting varies based on temperature and precipitation conditions (DWR 2006).

California's snowpack is important to the state's annual water supply because of its volume and the time of year that it typically melts. Average runoff from melting snowpack is usually about 20% of the state's total annual natural runoff and roughly 35% of the state's total usable annual surface water supply. The state's snowpack is estimated to contribute an average of about 15 million acre-feet (maf) of runoff each year, about 14 maf of which is estimated to flow into the Central Valley. In comparison, total reservoir capacity serving the Central Valley is about 24.5 maf in watersheds with significant annual accumulations of snow (DWR 2005b).

California's reservoir managers (including State Water Project [SWP] and Central Valley Project [CVP] facilities) use snowmelt to help fill reservoirs once the threat of large winter and early spring storms and related flooding risks have passed. These systems include water management infrastructure within the Sacramento River watershed, where additional water is stored in reservoirs and used to help meet downstream water demands after flows from snowmelt begin to recede. Some of the annual runoff collected in California's reservoirs is held from one year to the next because California's annual precipitation and snowpack can vary significantly from year to year. There may also be decade-scale variation in precipitation over the Sierra Nevada (Freeman 2002), and possibly other parts of California. Carryover storage can help meet water demand in years when precipitation and runoff is low.

Because the importance of the Sierra Nevada snowpack is tied to both the volume of water it holds and the timing of water releases (spring and early summer), simply assessing the amount of precipitation that falls as snow does not convey the full value of the snowpack and the potential effects of climate change on water supply. Measurements of the amount of Sierra Nevada runoff occurring from April to July are a better indicator of the combined interaction between the volume of the snowpack and the time of year that it melts.

Changes in patterns of runoff reveal declining water storage in the form of snowpack. Between 1906 and 2005, the total water year runoff in the Sacramento Valley rivers (including the Sacramento, Feather, Yuba, and American Rivers) has remained about the same (DWR 2006). However, runoff volume for April–July has declined from approximately 43% of total water-year runoff to approximately 34% of total water year runoff (i.e., has declined about 9% as compared to total year runoff). These values represent "unimpaired" runoff, meaning that the effects of runoff detention in reservoirs are removed. These data indicate that although overall precipitation volumes (represented by runoff amounts) showed no change, more runoff occurred as a result of rain during the winter months, and less runoff could be attributed to the melting of accumulated snowpack during the spring and early summer. These trends suggest less accumulation of snowpack and earlier runoff of snow melt.

Projections

As early as the mid-1980s and early 1990s, regional hydrologic modeling of global warming impacts has suggested with increasing confidence that higher temperatures will affect the timing and magnitude of snowmelt and runoff in California (Gleick 1986, 1997; Lettenmaier and Gan 1990; Lettenmaier and Sheer 1991; Nash and Gleick 1991a, 1991b; Hamlet and Lettenmaier 1999). Over the past two decades, this has been one of the most persistent and well-established findings on the impacts of climate change for water resources in the United States and elsewhere, and it continues to be the major conclusion of regional water assessments (Knowles and Cayan 2002, Barnett et al. in prep.).

By delaying runoff during the winter months when precipitation is greatest, snow accumulation in the Sierra Nevada acts as a massive natural reservoir for California. Despite uncertainties about how increased concentrations of greenhouse gases may affect precipitation, there is very high confidence that higher temperatures will lead to dramatic changes in the dynamics of snowfall and snowmelt in watersheds with substantially more snowfall (Kiparsky and Gleick 2005, DWR 2006). An analysis of the impact of rising temperatures on snowpack conducted by DWR (2006) shows that a 3°C (5.4°F) rise in average annual temperature would likely cause snowlines to rise approximately 1,500 feet. This would result in an annual loss of approximately 5 maf of water storage in snowpack. Simulations conducted by N. Knowles and D. R. Cayan (Knowles and Cayan 2002) project a loss in April snowpack in the Sierra Nevada of approximately 5% with a 0.6°C (1.1°F) increase in average annual temperature, an

approximately 33% loss with a 1.6°C (3.4°F) rise, and an approximately 50% loss in April snowpack with a 2.1°C (4.9°F) average annual temperature rise. Loss of snowpack was projected to be greater in the northern Sierra Nevada and the Cascades than in the southern Sierra Nevada because of the greater proportion of land at the low and mid-elevations in the northern ranges. With a temperature increase of 2.1°C, the northern Sierra Nevada and the Cascades were projected to lose 66% of their April snowpack, while the southern Sierra Nevada was projected to lose 43% of its April snowpack (Knowles and Cayan 2002).

Future predictions confirm that not only will snowpack form a smaller portion of overall precipitation but it will also melt and runoff earlier in the year in the Sacramento watershed and its constituent subbasins (Gleick and Chalecki 1999). This change will occur as overall precipitation will likely increase slightly. These two trends will most likely cause reduced summer flows in the Sacramento River, reduced summer soil moisture and increased winter flows and flood potential. Higher snowlines will cause a greater proportion of winter runoff and earlier snowmelt times will lengthen the duration of peak winter flows and flood potential.

Effect on the Project

Based on the results of a variety of regional climate models and literature, it is reasonably foreseeable that snowpack will be reduced and/or will melt earlier or more rapidly in watersheds that feed the Sacramento River. The SPA is located in the foothills east of the Sacramento Valley and receives snow very rarely. Consequently, changes in snowfall patterns would not directly affect precipitation in the SPA.

However, changes in snowpack could affect the project indirectly by altering the timing and volume of runoff that eventually feeds into the SPA and into waterways supplying water to the project. The primary water supply alternatives under consideration would rely on Natomas Central Mutual Water Company (NCMWC) surface water rights in the Sacramento River, that would be withdrawn at the Freeport Project diversion. Therefore, impacts to snowpack and associated runoff affecting the Sacramento River watershed are the most salient to proposed land uses in the project vicinity. The runoff sources can be divided into two categories: (1) direct rainfall-fed surface runoff accumulating in channels; and (2) released water from upstream reservoirs that is conveyed by the channels and will be used for groundwater recharge. The first source, direct surface runoff, will vary with large-scale regional changes in precipitation patterns. Because much of the naturally occurring runoff relevant to water supplies for the project originates as rainfall rather than snowfall (much of the Sacramento River watershed occurs in the Sacramento Valley itself and thus below the snowline), changes to the timing and magnitude of naturally occurring rainfall patterns will follow regional changes associated with climate change in the central and northern Sierra Nevada. The second source, released and/or purchased waters stored in upstream reservoirs, will largely depend on regional annual average precipitation accumulations. The management of upstream reservoirs may need to be altered to account for seasonal variations in precipitation type and intensity. However, the total water volumes stored in upstream reservoirs is largely tied to regional trends of annual average precipitation amounts. The predicted shift towards greater precipitation with a larger proportion of rainfall relative to snow will require greater upstream management in reservoirs and other flood control devices to maintain the current level of flood protection. Given the complex system of upstream water management, the impact of predicted climate changes on the project is speculative, but flood potential will probably increase if water management strategies remain the same. However, given that the magnitude and timing of the increase in winter runoff and the associated changes in reservoir use that may occur, the exact impact on the Proposed Project Alternative is speculative. Based on the uncertainty of projected changes it is not feasible or useful to mitigate anticipated changes in current planning.

Timing and Intensity of Precipitation Events

Status and Trends

Variability and extreme weather events are a natural part of any climatic system. The extent of climatic stability or variability is dependent in large part on the time frame examined. Climatic conditions may be characterized as relatively stable over periods of hundreds or thousands of years, but within that time frame there may be severe

droughts or flood events that vary widely beyond the overall average condition. Paleoclimatic evidence from tree rings, buried stumps, and lakebed sediment cores suggests that in California the past 200 years have been relatively wet and relatively constant when compared with older records (DWR 2006). These older records reveal greater variability than the historical record, in particular in the form of severe and prolonged droughts, but are not likely to be as reliable as more recent records. Most identified climatic averages and extremes for California are based on the historical climate record since 1900, and cannot be considered fully representative of past or future conditions (DWR 2006).

Extreme weather events are expected to be one of the more important indicators of climate change. Phenomena such as the El Niño/Southern Oscillation, which is the strongest natural interannual climate fluctuation, affect the entire global climate system and the economies and societies of many regions and nations. Direct effects of this climate fluctuation occur in California. The El Niño/Southern Oscillation phenomena for example, strongly influences storms and precipitation patterns. It is unclear how increases in global average temperatures associated with global warming might affect the El Niño cycles. However, the strong El Niños of 1982–83 and 1997–98 and associated flood events, along with the more frequent occurrences of El Niños in the past few decades, have forced researchers to try to better understand how human-induced climate change may affect interannual climate variability (Trenberth and Hoar 1996, Timmermann et al. 1999).

In addition to possible long-term changes in precipitation trends, increased variability of annual precipitation is a possible outcome of climate change. Based on a statistical analysis of California precipitation records, there appears to be an upward trend in the variability of precipitation over the 20th century, with variability values at the end of the century about 75% larger than at the beginning of the century. This indicates that there tended to be more extreme wet and dry years at the end of the century than there were at the beginning of the century (DWR 2006). However, as stated above, paleoclimatic evidence suggests that weather patterns in California have been relatively constant over the last 200 years, which identifies the variable weather patterns toward the latter part of this period as more pronounced. As identified previously in the “Amount of Precipitation” discussion, there has been little change in the average amount of annual precipitation in California over the last 100 years. Therefore, the increased variability between wet and dry years in recent decades appears to oscillate around the same annual average established over a longer time frame.

Projections

While variability is not well modeled in large-scale GCMs, some modeling studies suggest that the variability of the hydrologic cycle increases when mean precipitation increases, possibly accompanied by more intense local storms and changes in runoff patterns (DWR 2006). However, the results of another long-standing model point to an increase in incidents of drought, resulting from a combination of increased temperature and evaporation along with decreased precipitation (DWR 2006). Based on the first model mentioned, this decrease in precipitation would lead to reduced variability in hydrologic cycles.

A study that analyzed 20 GCMs currently in use worldwide suggests that the West Coast may be less affected by extreme droughts than other areas; instead, the region would experience increased average annual rainfall (Meehl et al. 2000). A separate study that reviewed several GCM scenarios showed increased risk of large storms and flood events for California (Miller, Kim, and Dettinger 1999). Conflicting conclusions about climatic variability and the nature of extreme weather events (e.g., droughts, severe storms, or both) support the need for additional studies with models featuring higher spatial resolution (Kiparsky and Gleick 2005, DWR 2006).

Effect on the Project

Although various climate change models predict some increase in variability of weather patterns and an increasing incidence of extreme weather events, there is no consistency among the model results, with some predicting increased incidents of droughts and others predicting increased frequency of severe storm events. Given the uncertainty associated with projecting the type and extent of changes in climatic variability and the

speculative nature of predicting incidents of extreme weather events, the effect on the project of changing patterns of storms and other extreme weather remains unclear, and the attempt to reach a significance conclusion would be speculative.

Runoff

Status and Trends

Runoff is directly affected by changes in precipitation and snowpack (see discussions above). Changes in both the amount of runoff and in seasonality of the hydrologic cycle have the potential to greatly affect the heavily managed water systems of the western United States.

As described in the previous discussion of snowpack, data indicate that although overall precipitation volumes (represented by runoff amounts) showed no change, more runoff occurred as a result of rain during the winter months, and less runoff could be attributed to the melting of accumulated snowpack during the spring and early summer (DWR 2006).

Projections

Detailed estimates of changes in runoff as a result of climate change have been produced for California using regional hydrologic models. With input of anticipated, hypothetical, and/or historical changes in temperature and precipitation in to models that include realistic small-scale hydrology, modelers have consistently seen substantial changes in the timing and magnitude, which can be attributed to runoff resulting from projected changes in climatic variables (Kiparsky and Gleick 2005). Model results indicate that as temperatures rise, a declining proportion of total precipitation falls as snow, more winter runoff occurs, and remaining snow melts sooner and faster in spring (Miller, Kim, and Dettinger 1999, Knowles and Cayan 2002, Gleick and Chalecki 1999). In some basins, spring peak runoff may increase; in others, runoff volumes may shift to earlier in the spring and winter months (Kiparsky and Gleick 2005, DWR 2006). If snowpack declines, it is also possible that the incidence or severity of flood events resulting from “rain on snow” conditions could also decline.

As indicated above, hydrology in the lower reaches of the Sacramento Valley is highly dependent on the interaction between Sierra Nevada snowpack, runoff, and management of reservoirs. Potential changes made to the amount of reservoir space retained for flood storage, retained annual carryover volumes, and other reservoir management factors in response to altered Sierra Nevada runoff patterns could substantially alter how those runoff patterns are experienced in downstream in the vicinity of the project vicinity. It is also possible that as climate change continues to progress over the next 50–100 years, new water storage projects (e.g., on-stream or off-stream storage reservoirs, expanding capacity at existing reservoirs) may be put in place to capture additional Sierra runoff. Additional storage capacity could assist in buffering runoff patterns in the lower river reaches from altered flow regimes in higher elevations.

Effect on the Project

Although various climate change models consistently predict reduced spring/summer runoff in the Sierra Nevada as a result of altered snowpack conditions, there is a great deal of uncertainty regarding how these changes would affect runoff patterns in the Sacramento Valley and consequently water dependent land uses in the Sacramento Valley and foothills. Potential modifications in management regimes of existing reservoirs, such as reducing retained annual carryover volumes to increase space available for flood storage, could buffer the Sacramento River and adjacent land uses from changes to runoff patterns at higher elevations. The potential for creation of new water storage capacity, such as on- or off-stream storage reservoirs or expanding capacity at existing reservoirs could also reduce the effects of altered runoff patterns. Given the integrated nature of the water system in California, even increased storage capacity in southern California could benefit the region by allowing reservoirs in northern California to hold less water for domestic or agriculture use and retain more capacity for flood control. Given the uncertainty associated with projecting changes in runoff patterns in water bodies at and

upstream of the project vicinity (the Sacramento River watershed is approximately 27,000 square miles, most of which occurs upstream of the project vicinity, and contains numerous subbasins, see also Section 3A.9, "Hydrology and Water Quality – Land") this potential climate change effect is too speculative to reasonably draw a meaningful conclusion regarding the significance of foreseeable direct effects on physical conditions in the project vicinity.

Sea Level

Status and Trends

One of the major areas of concern related to global climate change is rising sea level. Worldwide average sea level appears to have risen about 0.4 to 0.7 foot over the past century based on data collected from tide gauges around the globe, coupled with satellite measurements taken over approximately the last 15 years (IPCC 2007). Various gauge stations along the coast of California show an increase similar to the global trends. Data specific to the San Francisco tide gauge near the Golden Gate Bridge shows that the 19-year mean tide level (the mean tide level based on 19-year data sets) has increased by approximately 0.5 foot over the past 100 years (Exhibit 3A.4-3). Rising average sea level over the past century has been attributed primarily to warming of the world's oceans and the related thermal expansion of ocean waters, and the addition of water to the world's oceans from the melting of land-based polar ice. Some researchers have attributed most of the worldwide rise to thermal expansion of water, although there is some uncertainty about the relative contributions of each cause (Munk 2002).

Effect on the Project

Projections

Various global climate change models have projected a rise in worldwide average sea level of 0.3 to 2.9 feet by 2100 (IPCC 2001a). Updated model results provided by the IPCC in 2007 put the range at 0.6–1.9 feet by 2099 (IPCC 2007). The ranges are narrower than in the Third Assessment Report (IPCC 2001a) mainly because of improved information about some uncertainties in the projected contributors to sea level rise (IPCC 2007).

Although these projections are on a global scale, the rate of relative sea level rise experienced at many locations along California's coast is consistent with the worldwide average rate of rise observed over the past century. Therefore, it is reasonable to expect that changes in worldwide average sea level through this century will also be experienced by California's coast (DWR 2006).

A consistent rise in sea level has been recorded worldwide over the last 100 years. Recorded rises in sea level along the California coast correlate well with the worldwide data. Based on the results of various global climate change models, sea level rise is expected to continue. Based on the consistency in past trends, the consistency of future projections, and the correlation between data collected globally and data specific to California, it is reasonably foreseeable that some amount of sea level rise will occur along the California coast over the next 100 years. Although sea level rise is expected to occur, the amount and timing of the increase is uncertain. Predictions published by the IPCC in 2007 indicate an increase in elevation in the range at 0.6–1.9 feet by 2099 (IPCC 2007).

While sea level rise induced by climate change is reasonably certain, the SPA is located far above (over 100 feet above) sea level, and thus sea level rise would not directly affect proposed land uses within the SPA.

Water Supply

Status and Trends

Several recent studies have shown that existing water supply systems are sensitive to climate change (Wood 1997). Potential impacts of climate change on water supply and availability could directly and indirectly affect a wide range of institutional, economic, and societal factors (Gleick 1997). Residential, industrial, and agricultural land uses all are affected by the cost and security of water supply. Much uncertainty remains, however, with respect to the overall impact of global climate change on future water supplies. For example, models that predict drier conditions (i.e., parallel climate model [PCM]) suggest decreased reservoir inflows and storage and decreased river flows, relative to current conditions. By comparison, models that predict wetter conditions (i.e., HadCM2) project increased reservoir inflows and storage, and increased river flows (Brekke et al. 2004). Both projections are equally probable based on which model is chosen for the analyses (Ibid.). Much uncertainty also exists with respect to how climate change will affect future demand on water supply (DWR 2006). Still, changes in water supply are expected to occur and many regional studies have shown that large changes in the

reliability of water yields from reservoirs could result from only small changes in inflows (Kiparsky and Gleick 2005; see also Cayan et al. 2006).

Little work has been performed on the effects of climate change on specific groundwater basins or groundwater recharge characteristics (Kiparsky and Gleick 2005). Changes in rainfall and changes in the timing of the groundwater recharge season would result in changes in recharge. Warmer temperatures could increase the period where water is on the ground by reducing soil freeze. Conversely, warmer temperatures could lead to higher evaporation or shorter rainfall seasons, which could mean that soil deficits would persist for longer time periods, shortening recharge seasons. Warmer, wetter winters would increase the amount of runoff available for groundwater recharge. This additional winter runoff, however, would be occurring at a time when some basins, particularly in Northern California, are being recharged at their maximum capacity. Reductions in spring runoff and higher evapotranspiration, on the other hand, could reduce the amount of water available for recharge. However, the specific extent to which various meteorological conditions will change and the impact of that change on groundwater are both unknown. A reduced snowpack, coupled with increased rainfall, could require a change in the operating procedures for California's existing dams and conveyance facilities (Kiparsky and Gleick 2005).

Projections

DWR's *Progress on Incorporating Climate Change into Management of California's Water Resources, Technical Memorandum Report* (2006) focused on climate change impacts on CVP and SWP operations and on the Delta. The results of that analysis suggest several impacts of climate change on overall CVP and SWP operations and deliveries. In three of the four climate scenarios simulated, CVP reservoirs north of the Delta experienced shortages during droughts. DWR (2006) recommends that future studies examine operational changes that could avoid these shortages. At present, DWR concludes, it is not clear whether such operational changes would be insignificant or substantial. Changes in annual average CVP deliveries south of the Delta ranged from increases of about 2.5% for the wetter scenario to decreases of up to 10% for drier scenarios. Future studies will have to address how shortages north of the Delta could affect CVP deliveries south of the Delta. Carryover storage (i.e., water from one year stored into the next year) for the CVP was negatively affected in the drier scenarios and beneficially affected (slightly increased) in the wetter scenario.

The modeling conducted by Gleick and Chalecki (1999) on the Sacramento River Basin strongly suggests that annual levels of water moving through the Sacramento River watershed would increase. While annual volumes of water would increase, summer flows would decrease as a result of projected reductions in snowpack and earlier seasonal melting. Absent any intervention this would result in lower summer surface water flows and higher winter flows. Groundwater recharge may be adversely impacted by lower summer flows, without a commensurate increase because winter recharge rates are already at maximum. Upstream water management structures such as reservoirs could mitigate this by retaining greater winter flows to be released during the summer, thus making for a more constant level of surface water in the Sacramento. The need for adaptive changes in water management infrastructure use suggested by Gleick and Chalecki is confirmed by more recent research.

Tanaka et al. (2006) explored the ability of California's water supply system to adapt to long-term climatic and demographic changes using the California Value Integrated Network (CALVIN), a statewide economic-engineering optimization model of water supply management. The results show agricultural water users in the Central Valley are the most sensitive to climate change, particularly under the driest and warmest scenario (i.e., PCM 2100) predicting a 37% reduction of Central Valley agricultural water deliveries and a rise in Central Valley water scarcity costs by $1.7 billion. Although the results of the study are only preliminary, they suggest that California's water supply system appears "physically capable of adapting to significant changes in climate and population, albeit at a significant cost" (Tanaka et al. 2006). Such adaptation would entail changes in California's groundwater storage capacity, water transfers, and adoption of new technology.

VanRheenen et al. (2004) studied the potential effects of climate change on the hydrology and water resources of the Sacramento-San Joaquin River Basin using five PCM scenarios. The study concluded that most mitigation alternatives examined satisfied only 87 to 96% of environmental targets in the Sacramento system, and less than 80% in the San Joaquin system. Therefore, system infrastructure modifications and improvements could be necessary to accommodate the volumetric and temporal shifts in flows predicted to occur with future climates in the Sacramento-San Joaquin River Basins.

Zhu et al. (2005) studied climate warming impacts on water availability derived from modeled climate and warming streamflow estimates for six index California basins and distributed statewide temperature shift and precipitations changes for 12 climate scenarios. The index basins provide broad information for spatial estimates of the overall response of California's water supply and the potential range of impacts. The results identify a statewide trend of increased winter and spring runoff and decreased summer runoff, as previously indicated by Gleick and Chalecki (1999). Approximate changes in water availability are estimated for each scenario, though without operations modeling. Even most scenarios with increased precipitation result in a decrease in available water. This result is due to the inability of current storage systems to catch increased winter streamflow to offset reduced summer runoff.

Medellin et al. (2006) used the CALVIN model under a high emissions "worst case" scenario, called a dry-warming scenario. The study found that climate change would reduce water deliveries by 17% in 2050. The reduction in deliveries was not equally distributed, however, between urban and agricultural areas. Agricultural areas would see their water deliveries drop by 24% while urban areas would only see a reduction of 1%. There was also a geographic difference: urban scarcity was almost absent outside of southern California.

In 2003, CEC's Public Interest Energy Research (PIER) program established the California Climate Change Center (CCCC) to conduct climate change research relevant to the state. Executive Order S-3-05 called for the California Environmental Protection Agency (CalEPA) to prepare biennial science reports on the potential impact of continued climate change on certain sectors of California's economy. CalEPA entrusted PIER and its CCCC to lead this effort. The climate change analysis contained in its first biennial science report concluded that major changes in water management and allocation systems could be required in order to adapt to the change. As less winter precipitation falls as snow, and more as rain, water managers would have to balance the need to construct reservoirs for water supply with the need to maintain reservoir storage for winter flood control. Additional storage could be developed, but at high environmental and economic costs.

Lund et al. (2003) examined the effects of a range of climate warming estimates on the long-term performance and management of California's water system. The study estimated changes in California's water availability, including effects of forecasted changes in 2100 urban and agricultural water demands using a modified version of the CALVIN model. The main conclusions are summarized below.

- A broad range of climate warming scenarios show significant increase in wet season flows and significant decreases in spring snowmelt. The magnitude of climate change effects on water supplies is comparable to water demand increases from population growth in 21st century.

- California's water system would be able to adapt to the severe population growth and climate change modeled. This adaptation would be costly, but it would not threaten the fundamental prosperity of the state, although it could have major impacts on the agricultural sector. The water management costs represent only a small proportion of California's current economy.

- Under the driest climate warming scenarios, Central Valley agricultural users could be especially vulnerable to climate change. Wetter hydrologies could increase water availability for these users. The agricultural community would not be compensated for much of its loss under the dry scenario. The balance of climate change effects on agricultural yield and water use is unclear. While higher temperatures could increase

evapotranspiration, longer growing seasons and higher carbon dioxide concentrations could increase crop yield.

- Population growth is expected to be more problematic than climate change in Southern California. Population growth, conveyance limits on imports, and high economic value of water in Southern California, could lead to high use of wastewater reuse and substantial use of seawater desalination along the coast. Due to the integrated nature of water management and competition for water resources this could impact water supply in the Sacramento region.

- Under some wet warming climate scenarios, flooding problems could be substantial. In certain cases, major expansions of downstream floodways and alterations in floodplain land use could become desirable.

- California's water system could economically adapt to all the climate warming scenarios examined in the study. New technologies for water supply, treatment, and water use efficiency, implementation of water transfers and conjunctive use, coordinated operation of reservoirs, improved flow forecasting, and the cooperation of local regional, state and Federal government can help California adapt to population growth and global climate change. However, if these strategies are implemented, the costs of water management are expected to be high and there is likely to be less "slack" in the system compared to current operations and expectations.

Effect on the Project

As described by the projections above, overall, climate change is expected to have a greater effect in Southern California and on agricultural users than urban users in the Central Valley, which includes both the San Joaquin and Sacramento Valleys. For example, for 2020 conditions, where optimization is allowed (i.e., using the CALVIN model), scarcity is not expected to be an issue in the Sacramento Valley for both urban and agricultural users, and generally not an issue for urban users in the San Joaquin and Tulare Basins. Rather, most water scarcity will be felt by agricultural users in Southern California. However, it is expected that Southern California urban users, especially Coachella urban users, will also experience some scarcity. By the year 2050, urban water scarcity there will be almost no water scarcity north of the Tehachapi Mountains, although agricultural water scarcity could increase in the Sacramento Valley to about 2% (Medellin et al. 2006; see also Tanaka et al. 2006 and Lund et al. 2003 for further discussion of global climate change impacts on agricultural uses).

Based on the conclusions of current literature regarding California's ability to adapt to global climate change, it is reasonably expected that over time, the state's water system will be modified to be able to address the projected climate changes, e.g., under dry and/or warm climate scenarios (DWR 2006). Although coping with climate change effects on California's water supply could come at a considerable cost, based on a thorough investigation of the issue, it is reasonably expected that statewide implementation of some, if not several, of the wide variety of adaptation measures available to the state, will likely enable California's water system to reliably meet future water demands. For example, traditional water supply reservoir operations may be used, in conjunction with other adaptive actions, to offset the impacts of global warming on water supply (Medellin et al. 2006; see also Tanaka et al. 2006 and Lund et al. 2003). Other adaptive measures include better urban and agricultural water use efficiency practices, conjunctive use of surface and ground waters, desalination, and water markets and portfolios (Medellin et al. 2006; see also Lund et al. 2003, Tanaka et al. 2006). More costly statewide adaptation measures could include construction of new reservoirs and enhancements to the state's levee system (CEC 2003).
As described by Medellin et al. 2006, with adaptation to the climate, the water deliveries to urban centers are expected to decrease by only 1%, with Southern California shouldering the brunt of this decrease.

Given these projections it is difficult to scale regional and state trends down to predict specific impacts in the project vicinity. The project would rely upon surface water rights to the Sacramento River with groundwater pumping within the City of Rancho Cordova area providing backup for dry and critically dry years. As described above for the discussions of snowpack and runoff, the effect of climate change on the Sacrament River watershed

remains uncertain. Different models suggest either an increase or decrease in precipitation. While an increase in precipitation may increase potential water supply, existing storage facilities may need to be expanded to effectively capture and transfer such supplies. Additionally, an increase in precipitation may not effectively increase groundwater recharge if the increase occurs during seasons when aquifers are recharging at maximum capacity. Because there is uncertainty with respect to impacts of climate change on future water availability in California, in terms of whether and where effects will occur, and the timing and severity of any such potential effect, conclusions regarding significance would therefore be too speculative for meaningful consideration.

Water Quality

Status and Trends

Water quality depends on a wide range of interacting variables, such as water temperatures, flows, runoff rates and timing, waste discharge loads, and the ability of watersheds to assimilate wastes and pollutants. Surface water quality in the Sacramento Valley has experienced substantial adverse affects from human activities, including contaminant inputs from urban, industrial, and agricultural sources; and increased temperature from removal of shading vegetation. Historic activities such as gold mining in the nineteenth century created long-term impacts on regional water quality by contributing massive quantities of silt, minerals, and, notably, mercury that has settled into river bottom sediments.

Projections

Climate change could alter numerous water quality parameters in a variety of ways. Higher winter flows could reduce pollutant concentrations (through dilution) or increase erosion of land surfaces and stream channels, leading to higher sediment, chemical, and nutrient loads in rivers (DWR 2006). Increases in water flows could also decrease chemical reactions in streams and lakes, reduce the flushing time for contaminants, and increase export of pollutants to coastal areas (Jacoby 1990, Mulholland et al. 1997, Schindler 1997). Decreased summer flows can exacerbate increases in temperature, increase the concentration of pollutants, increase flushing times, and increase salinity (Schindler 1997, Mulholland et al. 1997). Decreased surface-water flows can also reduce nonpoint-source runoff (Mulholland et al. 1997). Increased water temperatures can enhance the toxicity of metals in aquatic ecosystems (Moore et al. 1997). Increases in water temperature alone are often likely to lead to adverse changes in water quality, even in the absence of changes in precipitation (Kiparsky and Gleick 2005).

A review of potential impacts of climate change on water quality concludes that significant changes in water quality are known to occur as a direct result of short-term changes in climate (Murdoch, Baron, and Miller 2000). The review notes that water quality in ecological transition zones and areas of natural climate extremes is vulnerable to climate changes that increase temperatures or change the variability of precipitation. However, it is also argued that changes in land and resource use will have comparable or even greater impacts on water quality than changes in temperature and precipitation. A separate study concluded that changes in land use resulting from climatic changes, together with technical and regulatory actions to protect water quality, can be critical to future water conditions (Kiparsky and Gleick 2005). The net effect on water quality for rivers, lakes, and groundwater in the future is dependent not just on how climatic conditions might change, but also on a wide range of other human actions and management decisions. The most recent studies identify the likelihood that decreased runoff will interact with higher stream temperatures to exacerbate decreases in water quality (Backlund et. al. 2008:8).

Effect on the Project

Although there are various ways in which climate change could affect water quality, effects could be positive or negative depending on a variety of conditions. In addition, current water quality conditions in regional surface waters depend in large part on human activities, and this would continue into the future. The effects of climate change on water quality could be alleviated by, exacerbated by, or overwhelmed by effects directly related to localized human actions. Given the uncertainty associated with projecting the type and extent of changes in water quality attributable to climate change, including trying to project human activities, this potential climate change

effect is too speculative to draw a conclusion regarding the significance of any direct effect on physical conditions in the project vicinity.

Agriculture

Status and Trends

Numerous studies indicate that climate change may have a profound effect on agriculture in California. The different climate change forecasting models predict a variety of direct and indirect effects to the sector's agronomic and economic conditions (Tanaka et al. 2006; Howitt, Tauber, and Pienaar 2003). The degree to which climate change will affect agriculture depends on a variety of factors. While there remains uncertainty about what form of climate change will occur in California, the majority of research on the subject has focused on the likelihood that a climate warming pattern will occur (DWR 2006, Lund et al. 2003). While both dry-warm or wet-warm forms of climate warming would affect Californian agriculture, dry-warm climate scenarios are expected to be the most problematic (Tanaka et al. 2006). Dry-warm climate scenarios are expected to affect agriculture at both statewide and regional scales, with the most pronounced effects occurring in the Central Valley (Zhu et al. 2006).

Potential effects include reductions in water supply and water supply reliability, increased evapotranspiration, changes in growing season, and altered crop choices (DWR 2006). As discussed in the previous sections, substantial changes may occur in terms of water supply. As a primary consumer of surface and ground water, the agricultural sector will be faced with significant challenges in the event of supply reductions. Higher levels of evapotranspiration would result from the increased temperatures and decreased humidity of a dry-warm climate scenario (Hildalgo, Cayan, and Dettinger 2005). In turn, evapotranspiration would cause increases in water demand, salt accumulation on plants, soil salinity, and additional water use for reducing saline soils (DWR 2006). Such effects could reduce productivity and create adverse economic repercussions for farmers and ranchers in the State (DWR 2006). Changes to the growing season and altered crop choices may negatively or positively affect productivity, water supply, and profitability, depending on the adaptations farmers choose (Tanaka et al. 2006). For example, the viability and profitability of different crops may change as a result of altered climate, thus changing land use patterns and water demands associated with cover crops, and total revenues.

Projections

Tanaka et al. (2006) demonstrates that agricultural water supplies in the Central Valley are expected to be affected by climate change. In the driest, warmest climate scenario (PCM2100), Central Valley water users would be adversely affected and agricultural water deliveries could be expected to decrease by approximately 24% and water scarcity costs would be $1.7 billion. (Tanaka et al. 2006).

Water scarcity is expected to increase due to both the effects of global climate change and by the effects of population growth and associated increased water consumption. One model (CALVIN) used a dry and warm form of climate change and 2050 population projections. This model determined that water scarcity north of the Tehachapi Mountains (San Joaquin and Sacramento Valleys) was demonstrated to be predominately driven by climate change effects. (Tanaka et al. 2006, Zhu et al. 2006.)

A 15% increase in land fallowing is expected to occur under a dry and warm climate scenario. Land fallowing would reduce agricultural productivity and affect the agricultural economy as well as the rural support economies. Financial implications for individual farm owners would depend on whether compensation was provided for land becoming fallow (Howitt, Tauber, and Pienaar 2003; Tanaka et al. 2006).

Most year 2100 models indicate increased market water transfers from agriculture to urban users (Tanaka et al. 2006). Sector productivity could be maintained if water transfers were balanced with irrigation efficiency improvements.

Though a dry-warm climate scenario would reduce agricultural water deliveries (24% statewide and 26% in the San Joaquin Valley), models demonstrate that agricultural income will only be reduced by 6% and irrigated lands will only be reduced by 15%. It is expected that farmers will adopt changes in crop mix, cropping systems, and irrigation technology. These adaptations are likely to reduce the effect of reduced water deliveries on agriculture (Tanaka et al. 2006).

Increased evapotranspiration rates could have a considerable effect on agricultural water demand in the State (DWR 2006). The International Panel on Climate Change expects a 3 degree Celsius increase in temperature over the next century (IPCC 2007). Research demonstrates that such an increase in temperature will likely result in a 5% increase in plant transpiration, assuming no change in solar radiation (cloudiness) levels and other related variables including wind, humidity, and minimum temperature (Hildalgo, Cayan, and Dettinger 2005). Therefore, evapotranspiration alone could create a 5% increase in agricultural water consumption over the next 100 years or a 0.5% increase per decade. Projected increases in carbon dioxide concentrations are expected to increase plant growth by up to 20% and in turn lead to increased evapotranspiration (Long et al. 2004). A caveat to this is that increased atmospheric carbon dioxide concentrations may work to decrease plant stomatal transpiration rates and thus reduce overall evapotranspiration rates (Ibid).

Effect on the Project

The Proposed Project and action alternatives, with the exception of the No Project Alternative would not contain any agricultural uses. For this reason it is assumed that future climate change impacts on agriculture would not be directly relevant to the project. While the SPA contains grazing land that would be converted to urban uses, this land is not designated as Important Farmland, and therefore mitigation is not required. Because no comparable lands would be protected by conservation easements as mitigation, the impact of climate change on agricultural land uses would not be relevant to the efficacy of mitigation for project impacts. With regard to the No Project Alternative, while effects may occur, adaptation is also expected to allow farmers and ranchers to minimize any potential negative effect on agricultural incomes. Again, the SPA is used for grazing; the site does not contain Important Farmland. Because the potential effects of global climate change on agricultural production are highly speculative at this time, it is not possible to reach a meaningful conclusion regarding significance related to the No Project Alternative.

CONCLUSION

Seven general categories of potential effects of climate change were evaluated in this section:

- increased temperature;
- precipitation volume, type, and intensity;
- runoff volume and timing;
- water supply;
- sea level rise;
- water quality; and
- agriculture.

This analysis concludes that (1) either the climate change effect would not have the potential to substantially affect the project vicinity, or (2) because of significant uncertainty in projecting future conditions related to the climate change effect, it would be too speculative to reach a meaningful conclusion regarding the significance of any reasonably foreseeable direct impact on physical conditions in the project vicinity. Therefore, impacts are too speculative for meaningful consideration.

3B.4 CLIMATE CHANGE – WATER

3B.4.1 AFFECTED ENVIRONMENT

GREENHOUSE GASES

Some gases in the atmosphere affect the Earth's heat balance by absorbing infrared radiation. These layers of gas in the atmosphere can prevent the escape of heat much the same as glass in a greenhouse. Thus, climate change is often referred to as the "greenhouse effect." The gases most responsible for climate change are carbon dioxide (CO_2) and methane. Other greenhouse gases (GHG) include, but are not limited to nitrous oxide, sulfur hexafluoride, hydrofluorocarbons, perfluorocarbons, and chlorofluorocarbons. It is becoming more widely accepted that continued increases in greenhouse gases will contribute to climate change, although there is uncertainty concerning the magnitude and time of the trend.

Energy-related CO_2 emissions, resulting from petroleum and natural gas, represent 82% of total United States anthropogenic GHG emissions. Another GHG, methane, comes from landfills, coal mines, oil and gas operations, and agriculture; it represents 9% of total emissions. Nitrous oxide totals about 5% of United States emissions, and is emitted from burning fossil fuels and through the use of certain fertilizers and industrial processes. Anthropogenic gases make up about 2% of United States emissions that are released as byproducts of industrial processes and other minor sources (http://www.eia.doe.gov/oiaf/1605/ggccebro/chapter1.html).

GLOBAL CLIMATE CHANGE EFFECTS ON WATER RESOURCES

In July 2006, the California Department of Water Resources (DWR) released the report, "Progress on Incorporating Climate Change into Management of California's Water Resources" (DWR 2006). This report responds to the Governor's Executive Order S-3-05 requiring biennial reports on climate change impacts to various areas, including state water resources. DWR has concluded that future hydrologic conditions in California will likely change when compared to the patterns observed over the last century (DWR 2006). Although a full understanding of water resources changes associated with climate change is not yet possible, there is a general consensus among recent investigations that the following effects are likely to occur within the next 50 to 100 years: (1) increases in air temperature; (2) reductions in Sierra Nevada snowpack; (3) earlier snowmelt; and, (4) a rise in sea level (DWR 2006; California Energy Commission [CEC] 2005). These changes could have significant implications for water resources within California.

A major portion of California's annual water storage is held within the Sierra Nevada snowpack. At present, snowmelt provides most of the average 14 million acre-feet of runoff water from the Sierra Nevada during April–July period. DWR estimates that, by 2060, April–July runoff could be reduced by 36% (DWR 2006). These changes, along with anticipated changes in the timing of snowfall, could reduce reservoir refilling during late spring and early summer. In addition, computer models estimate that global climate change could lead to a sea level rise of 0.6 to 1.9 feet over the next 100 years (Intergovernmental Panel on Climate Change [IPCC] 2007). This rise in sea level would increase the frequency of existing 100-year peak high tides in the western Delta to about once in ten years. Salt water intrusion from the ocean into the Delta could also increase, potentially resulting in degradation of freshwater supplies pumped from the Delta.

Further discussion of existing hydrology with the "Water" Study Area is provided in Section 3B.9, "Hydrology and Water Quality - Water."

3B.4.2 REGULATORY FRAMEWORK

The regulatory framework relevant to analysis of climate change impacts is the same for the Off-site Water Facilities as for the Land Use portion of the project. Please refer to Section 3A.4.2 for a discussion of the regulatory framework pertaining to climate change analysis.

3B.4.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, climate change impacts would be considered significant if construction and operation of the Off-site Water Facilities would:

- generate greenhouse gas emissions, either directly or indirectly, that may have a significant impacts on the environment; or
- conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

SIGNIFICANCE CRITERIA FOR EVALUATING CLIMATE CHANGE

There are no formally adopted thresholds for measuring the significance of a project's impact on the creation of GHG emissions or the project's cumulative contribution to global climate change. For a detailed discussion of significance thresholds for GHG emissions, please refer to Section 3A.4.3 in Section 3A.4, "Climate Change – Land."

ANALYSIS METHODOLOGY

The climate change analysis presented in this section is comprehensive in that it accounts for direct and indirect sources of GHG emissions resulting from the collective construction and operation of Off-site Water Facility Alternatives. The sources include, indirect emissions of GHGs resulting from the new electrical load requirements for conveyance pumping from the Freeport Project to the Folsom SPA, indirect emissions from new electrical load requirements for local water distribution and treatment facilities, and direct GHG emissions from construction- and operational-related vehicle trips. Indirect emissions associated with energy consumption for off-site conveyance pumping were estimated by converting the pump station's horsepower requirements to kilowatt-hours and multiplying these values by Utility Specific Verified Electricity CO_2 Emission Factors provided in Table G.5 and G.6 of the Local Government Operations Protocol, September 2008. Electrical consumption factors from Exhibit 3-10, Electrical Consumption for Surface Water Treatment Plants (ICF International 2008, Local government Operations Protocol 2008) were used to obtain estimates of electrical demand for water treatment and local distribution pumping. The estimates were then subsequently converted to pounds of CO_2 per day using Utility Specific Verified Electricity CO_2 Emission Factors.

Direct emissions of CO_2 from mobile sources form construction and operation were quantified using URBEMIS, 2007 and SMAQMD's Roadway Construction Model and then converted to metric tons. Because the use of back-up generators would be infrequent and secondary to emissions generated during electrical generations, these emissions were not quantified as part of the GHG analysis. Similarly, the City did not attempt to quantify the "bound" energy used in the production and manufacturing of durable goods (e.g., electrical panels) and raw materials (e.g., steel) used in the construction of the Off-site Water Facility Alternatives.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.4-1 Generation of Short- and Long-term Increases in Greenhouse Gases. *Construction and operation of the Off-site Water Facility Alternatives would result in a net increase in greenhouse gas emissions, which would contribute considerably to cumulative GHG emissions.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

The potential effect of GHG emissions on global climate change is an emerging issue that warrants discussion under CEQA. Unlike the pollutants discussed previously that may have regional or local adverse effects, GHGs have the potential to contribute to global changes in the environment. In addition, GHG emissions do not directly produce a localized impact, but may cause an indirect impact if the local climate is adversely changed by its cumulative contribution to a change in global climate. Individual public infrastructure projects contribute relatively small amounts of GHGs that when added to all other GHG producing activities around the world result in increases in these emissions that have led many to conclude that these emissions are contributing to global changes in climate. However, at the time of preparation of this EIR/EIS, ARB has not adopted a formal threshold for what would constitute a cumulatively considerable increase in GHG for individual public infrastructure projects.

In 2006, the California State Legislature adopted AB 32, the California Global Warming Solutions Act of 2006. The impacts of global climate change described in AB 32 include changing sea levels, changes in snow pack and availability of potable water, changes in storm flows and flood inundation zones, and other impacts.

At minimum, the Off-site Water Facilities improvements would be required to comply with Title 24 energy efficiency standards (2007), to the extent applicable; however, the extent to which these standards would help the individual improvements in achieving the goals outlined in AB 32 is unknown. In response to this uncertainty and to provide clarification to lead agencies for assessing GHG impacts, ARB and local air districts have began developing thresholds of significance for common project types that, collectively, are responsible for substantial GHG emissions. As part of updating its CEQA Guidelines, BAAQMD has proposed a threshold of 10,000 metric tons of CO_2 equivalent per year ($MTCO_2e/yr$) for operational increases in GHG emissions from stationary sources and a separate threshold of 1,100 $MTCO_2e/yr$ for operational sources other than stationary sources (i.e., mobile vehicle trips). However, no construction threshold is currently proposed by BAAQMD. Nevertheless, at the State-level, ARB is considering the inclusion of mandatory performance standards for construction-related GHGs.

The Off-site Water Facilities would emit GHGs during construction from combustion of fuels in worker vehicles and material product delivery and removal accessing the site as well as the off-road construction equipment. Off- and on-road construction GHG emissions were calculated using URBEMIS2007 for the WTP and SMAQMD's Roadway Construction Model (2007) for linear pipeline construction. These models cover the CO_2 emission estimates for the readily quantifiable construction sources, but do not cover the quantities of indirect CO_2 emissions that go into the manufacturing/processing of steel pipe, construction aggregate, etc. In the absence of an significance threshold for construction-related CO_2-emissions, but in acknowledging that the State is considering mandatory performance measures for construction, without the inclusion of any performance measures for construction, the resulting CO_2 emissions would be greater than if no performance measures were incorporated. Based on these considerations, short-term emissions of CO_2 resulting from the construction of the Off-site Water Facility Alternatives could result **potentially significant direct** and **indirect** impacts. ***[similar]***

Following construction, the operation of the Off-site Water Facilities is expected to contribute to regional GHG emissions over the long-term. The primary sources of GHG emissions would be associated with daily vehicle trips to and from the WTP along with indirect emissions from new electrical loads associated with the booster pump station, water treatment operations, and distribution of treated water to users within the Folsom SPA. Based on the methodology employed in Section 3A.2.3, quantification of GHG for the Off-site Water Facilities was focused to the CO_2 outputs generated for off-site conveyance pumping, water treatment (On- or Off-site), distribution pumping within the Folsom SPA, and mobile sources. To estimate emissions generated from these sources, emission factors derived from the California Climate Action Registry Power/Utility Protocol Public Reports (as of September 2008)[1] where used in combination with the base electrical usage requirements for the booster pumping station, 1,700 HP, and 1,406 kWh/MG for treatment and local distribution pumping (including those facilities within the Folsom SPA) (ICF International 2008). Assuming the most-conservative operational scenario in which the booster pumping station is operated 24 hours a day, 7 days a week, at an average of 6.5 mgd, Table 3B.2-3 provides the GHG emissions in $MTCO_2e$/year for each of the Off-site Water Facility Alternatives. As shown in Table 3B.2-3, the GHG estimates calculated for each of the Off-site Water Facility Alternatives is substantially higher than the applied threshold for stationary sources as proposed by BAAQMD and, therefore, this **indirect** impact is considered **significant**. As shown in Table 3B.2-3, non-stationary sources of GHGs would not be significant. ***[similar]***

[1] Offsite electricity generation emissions are based on SMUD's utility specific verified electricity CO2 Emissions factors for 2006. These calculations, presented in Appendix M-VI, are estimates of expected GHG emissions from carbon dioxide, methane, and nitrous oxide generation, the combination of which are representative of CO2 equivalent emissions.

Table 3B.4-1
Off-site Water Facility Operational Greenhouse Gas Emission Estimates

Off-site Water Facility Alternative	Emission Source	MT CO_2e/yr	Total	BAAQMD Thresholds	Significant?
No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Alternatives 1, 1A, 3, 3A, 4, and 4A	Construction (2011)	<1,296		--[1]	No
	Construction (2012)	<1,807			
	Off-site Pumping	2,748	**22,725**	10,000	Yes
	Local Treatment and Distribution	19,978			
	Mobile Sources	759	759	1,100	No
Off-site Water Facility Alternatives 2 and 2A	Construction (2011)	<931		--[1]	No
	Construction (2012)	<930			
	Off-site Pumping	2,667	**22,504**	10,000	Yes
	Local Treatment and Distribution	19,837			
	Mobile Sources	0	0	1,100	No
Off-site Water Facility Alternative 2B	Construction (2011)	666		--[1]	No
	Construction (2012)	666			
	Off-site Pumping	1,778	**21,615**	10,000	Yes
	Local Treatment and Distribution	19,837			
	Mobile Sources	0	0	1,100	No

Notes:
MT CO_2e/yr = metric tones of carbon dioxide equivalent per year.
Appendix M-VI provides additional detail regarding assumptions and emission factors used in the analysis.
[1] No significance threshold is proposed by BAAQMD for construction-related GHG emissions; however, to enable for evaluation of construction-related mobile source emissions, a threshold of 1,100 MT CO_2e/yr has been used.
Source: RMC 2010, ICF International 2008, URBEMIS 2007, Local Government Operations Protocol 2008

Given the overwhelming scope of global climate change, it is not anticipated that a single public infrastructure project would have an individually discernable effect on global climate change (e.g., that any increase in global temperature or rise in sea level could be attributed to the emissions resulting from one single development project). Rather, it is more appropriate to conclude that the GHG emissions generated by the Off-site Water Facilities would combine with emissions across the state, nation, and globe to cumulatively contribute to global climate change. Based on the nature and size of the Off-site Water Facilities components, without mitigation, the construction and operation of the Off-site Water Facilities could contribute to the State's inability to reach the emission reduction limits/standards set forth by the State of California by Executive Order S-3-05 and AB 32. For these reasons, the construction and operation of the Off-site Water Facility Alternatives could result in a substantial contribution to global climate change and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Similar]***

Mitigation Measure 3B.4-1a: Implement GHG Reduction Measures during Construction.

The bid specifications for construction of the Off-site Water Facilities shall require that bidders demonstrate how they will comply with each of the following measures during all construction and demolition activities:

1) Construction vehicles and equipment will be properly maintained at all times in accordance with manufacturer's specifications, including proper tuning and timing of engines. Equipment maintenance records and equipment design specification data sheets shall be kept on-site during construction and demolition activities and subject to inspection by the SMAQMD.

2) Operators will turn off all construction vehicles and equipment and all delivery vehicles when not in use, and not allow idling for more than 5 minutes or for such other more restrictive time as may be required in law or regulation.

3) On-site construction vehicles and equipment will use ARB-certified biodiesel fuel if available (a minimum of B20, or 20 percent of biodiesel) except for those with warranties that would be voided if B20 biodiesel fuel were used. Prior to issuance of grading or demolition permits, the contractor shall provide documentation to the City that verifies whether any equipment is exempt; that a biodiesel supply has been secured; and that the construction contractor is aware that the use of biodiesel is required.

4) A City-approved Solid Waste Diversion and Recycling Plan (or such other documentation to the satisfaction of the City) will be in place for the Off-site Water Facilities that demonstrates the diversion from landfills and recycling of all nonhazardous, salvageable and re-useable wood, metal, plastic and paper products during construction and demolition activities. The Plan or other documentation shall include the name of the waste hauler, their assumed destination for all waste and recycled materials, and the procedures that will be followed to ensure implementation of this measure.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.4-1b: Prepare and Implement an Off-site Water Facilities Climate Action Plan.

Prior to operation, the City shall have in place a Off-site Water Facilities Climate Action Plan and Greenhouse Reduction Strategy (Plan) that has been adopted by the City following an opportunity for review and recommendation by the SMAQMD. At a minimum, the Plan shall include:

- **Designation of Person Responsible for Implementation.** The Plan shall designate the name and contact information of the person(s) responsible for ensuring continuous and on-going implementation of the Plan.

- **GHG Inventory and Reduction Target.** The City shall prepare a complete GHG Inventory for the Off-site Water Facilities components within one year following occupancy and a GHG reduction target based on State guidance.

- **Off-site Water Facilities Design Features.** The Off-site Water Facilities shall include design features to reduce operational GHG emissions, as well as an estimate of the reduction in GHG emissions that is expected to result from each facility. Initial measures that may be considered include, but are not limited to:

    - Design all conditioned occupancies with "cool roofs" using products certified by the Cool Roof Rating Council, and other exposed roof surfaces coated with "cool paints";

    - Design all conditioned occupancies to take advantage of shade through the planting of deciduous canopy-type trees and/or prevailing winds to reduce energy use;

    - Make maximum use of EnergyStar-qualified energy efficient appliances, heating and cooling systems, office equipment and lighting products;

    - Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy that has been generated by renewable sources to meet a portion of the electricity needs of the Off-site Water Facilities;

    - In an effort to reduce GHG emissions from transportation sources, the bid specifications for the Off-site Water Facilities should require that bidders demonstrate that they have given preference to local sources of building materials or offer evidence to support why such local sources have not been used.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

2, 2A, and 2B

Under the Off-site Water Facility Alternatives 2, 2A, and 2B, no WTP would be constructed. Rather, water treatment under these alternatives would be provided at the Vineyard SWTP. Consolidation of treatment processes at the Vineyard SWTP could result in the SWTP operating closer to its peak capacity and, therefore, at a higher efficiency. However, increased operations at the Vineyard SWTP would still require an increased electrical load with the operational emissions comparable to the previous alternatives over the longer term. However, with the integration of the Off-site Water Facilities into the Vineyard SWTP, these alternatives would experience a substantial decrease in the amount of bound energy used during construction. However, without the inclusion of any performance standards, **direct** and **indirect** construction and operational-related GHG impacts could be **potentially significant**. ***[Lesser]***

Further, under Off-site Water Facility Alternative 2B and with the shortened distance of the conveyance alignment (e.g., from the North Douglas Tanks), the electrical load required for new pumping facilities would be lowered to 1,765 $MTCO_2e$/year; less than the other conveyance alternatives. However, given that when this

estimate is combined with new electrical demands for treatment at the Vineyard SWTP and local distribution pumping, the total indirect GHG estimate remains substantially higher than the applied threshold, and, therefore, this **indirect** impact is considered **potentially significant**. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.4-1a and 3B.41b.

With implementation of the measures listed above, Off-Site Water Facility construction-related impacts to global climate change from GHG emissions would be reduced to the extent feasible through the inclusion of mandatory performance standards for Off-Site Water Facility construction. However, given the quantities of GHGs indirectly produced by all the Off-site Water Facility Alternatives greatly exceeds the applied operational threshold of 10,000 $MTCO_2e/yr$ for stationary sources, and the range of feasible mitigation measures available for reducing these emissions, the City does not expect that it would be able to reduce these emissions to a less-than-significant level. For this reason, this impact is considered **significant and unavoidable**.

IMPACT 3B.4-2 Effects of Climate Change on the Off-site Water Supply Facilities. *Global climate change could result in effects on water quality or water supplies proposed as part of the Off-site Water Facility Alternatives.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Effects of Climate Change on Water Quality

Global climate change could produce a rise in sea level and reduced freshwater runoff in the Sacramento River system, resulting in an increase of salt water intrusion into the Delta and potentially degrading water supplies pumped from the Delta. Although it would be speculative to estimate the specific changes in salt water intrusion or the reduced amount of freshwater runoff that might result from climate change, it is not anticipated that salt water intrusion would reach the location of the Freeport Project's intake due to its inland location. In this context, under the Off-site Water Facilities, no changes or potential impacts to operations are anticipated because of increased salt water intrusion resulting from global climate change. This **direct** impact is considered less than significant. **No indirect** impacts would occur. ***[Similar]***

In the future, greater saltwater intrusion into the Delta, combined with reduced runoff from the Sacramento and San Joaquin River systems, may require altering releases from reservoirs, including CVP reservoirs to maintain Delta water quality objectives, comply with Delta export-inflow ratio[2], or maintain water quality at Delta diversions. These effects could reduce the amount of surface water available to the City under the Off-site Water Facility Alternatives. Under these conditions, the City may be required to blend groundwater supplies with surface water to meet demands within the Folsom SPA. However, it is not possible to accurately estimate more-specific changes to water quality that would result from climate change and, therefore, these **direct** impacts as attributable to the Off-site Water Facilities are considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Effects of Climate Change on Future Water Supply

Global climate change may ultimately affect the amount of water stored within the California Sierra Nevada snowpack, alter the amount of precipitation in the Sacramento River watershed, and increase temperatures. Because the snowpack acts as additional water storage, a reduced snowpack or reduced total precipitation may affect the amounts of water stored in reservoirs, including CVP reservoirs, the timing of reservoir releases, and

[2] The Delta export-inflow ratio restrictions limit the combined export rate of the SWP and CVP to a specified percentage of the total Delta inflow. The export-inflow ratio values are used to set a maximum export flow in the model. When D-1641 standards are specified the February value is computed based on the January eight river index, while all other months have a specific maximum EI ratio. If export-inflow ratio limits total project exports, the export capacity is shared equally between the SWP and CVP. Unused share of the export capacity by one party can be used by the other party.

the total water volumes available for spring and summer diversion and use. However, given that the City would acquire CVP contract water from a senior water rights holder and that contract water is subject only to limited potential reductions based on low- to very-low storage conditions within Shasta Reservoir, the **direct** implications of such a change would have **less-than-significant** impact on the Off-site Water Facilities. **No indirect** impacts would occur. ***[Similar]***

The increased frequency of drier conditions could also increase the demand for water transfers from entities, including NCMWC, thereby cumulatively adding to the types of effects to the Sacramento River analyzed in this section of this EIR/EIS. However, it is not possible to accurately estimate the specific changes to water supplies and the duration over which these changes may occur because of climate change. For this reason, potential **direct** and **indirect** impacts are considered **too speculative for meaningful evaluation**. ***[Unknown]***

Mitigation Measure: No mitigation measures are required.

3B.4.4 RESIDUAL SIGNIFICANT IMPACTS

Based on a quantification of the Off-site Water Facility Alternatives' energy requirements to support construction, conveyance, treatment, and local distribution operations at build-out of the Folsom Specific Plan, the Off-site Water Facility Alternatives are expected to generate substantial emissions of GHGs. Even with the application of the prescribed mitigation, the Off-site Water Facilities-related GHG emissions would not be reduced to a less-than significant level. Therefore, Impact 3B.4-1 would remain significant and unavoidable.

This page intentionally left blank.

3A.5 CULTURAL RESOURCES – LAND

This section contains a program-level evaluation of cultural resources. However, impacts to cultural resources would be the same under each individual development phase as under the program (entire SPA) analysis.

3A.5.1 AFFECTED ENVIRONMENT

ARCHAEOLOGICAL SETTING

The earliest well-documented entry and spread of humans into California occurred at the beginning of the Paleo-Indian Period (10,000–6,000 years Before Present [B.P.]). Social units are thought to have been small and highly mobile. Known sites have been identified within the contexts of ancient pluvial lake shores and coastlines, as evidenced by the presence of such characteristic hunting implements as fluted projectile points and chipped stone crescent forms. Prehistoric adaptations over the ensuing centuries have been identified in the archaeological record by numerous researchers working in the area since the early 1900s, as summarized by Fredrickson (1974) and Moratto (1984). Because of the Central Valley's plentiful resources and temperate climate, the valley was well populated prehistorically and served as the location for some of the more substantial village sites known in California.

Lillard et al. (1939) and others conducted numerous studies that form the core of the current state of knowledge about early archaeology of the upper Central Valley. Little has been found archaeologically that dates to the Paleo-Indian or the Lower Archaic time periods (6000–3000 B.P.); however, archaeologists have recovered a great deal of data from sites occupied by the Middle Archaic period (3000–1000 B.P.). The lack of sites from earlier periods may be because of high sedimentation rates that have left the earliest sites deeply buried and inaccessible. During the Middle Archaic Period, the broad regional patterns of foraging subsistence strategies gave way to more intensive procurement practices. Subsistence economies were more diversified, possibly including the introduction of acorn processing technology. Human populations were growing and occupying more diverse settings. Permanent villages that were occupied throughout the year were established, primarily along major waterways. The onset of status distinctions and other indicators of growing sociopolitical complexity mark the Upper Archaic Period (1000–500 B.P.). Exchange systems become more complex and formalized. Evidence of regular, sustained trade between groups was seen for the first time.

Several technological and social changes characterized the Emergent Period (1800–200 B.P.). The bow and arrow were introduced, ultimately replacing the dart and atlatl. Territorial boundaries between groups became well established. It became increasingly common that distinctions in an individual's social status could be linked to acquired wealth. Exchange of goods between groups became more regularized with more goods, including raw materials, entering into the exchange networks. In the latter portion of this period, exchange relations became highly regularized and sophisticated. The clamshell disk bead became a monetary unit for exchange, and increasing quantities of goods moved greater distances. Specialists arose to govern various aspects of production and exchange.

Three specific cultural manifestations are well represented in archaeological assemblages in the general vicinity of the SPA. These assemblages are discussed in detail in Moratto (1984) and summarized here:

The Windmiller Pattern (3,000–1,000 B.P.) of archaeological assemblages included an increased emphasis on acorn use as well as a continuation of hunting and fishing activities. Ground and polished charmstones, twined basketry, baked-clay artifacts, and worked shell and bone were hallmarks of Windmiller culture. Widely ranging trade patterns brought goods in from the Coast Range and trans-Sierran sources as well as from closer trading partners. Distinctive burial practices identified with the Windmiller Pattern also appeared in the Sierra Nevada foothills, indicating possible seasonal migration into the Sierra Nevada.

The Berkeley Pattern (1,000–500 B.P.) represented a greater reliance on acorns as a food source than was seen previously. Distinctive stone and shell artifacts distinguished this pattern from earlier or later cultural expressions. The Berkeley Pattern appears to have developed in the San Francisco Bay Area and was spread through the migration of Plains Miwok groups. The later Augustine Pattern (500 B.P. to Historic Era) may have been stimulated by the southern migration of Wintuan people from north of the Sacramento Valley. Their culture was marked by a population increase resulting from more intensive food procurement strategies, as well as by a marked change in burial practices, increased trade activities, and a well-defined ceramic technology.

ETHNOGRAPHIC SETTING

By virtue of its geographic position, the SPA lies within traditional Nisenan (sometimes referred to as the Southern Maidu) territory. The Nisenan belong to the Penutian linguistic family within which Kroeber (1925) recognized three Nisenan dialects—Northern Hill Nisenan, Southern Hill Nisenan, and Valley Nisenan. The Nisenan territory included the drainages of the Yuba, Bear, and American Rivers, and the lower drainages of the Feather River. The Nisenan ranged from the Sierra Nevada crest to nearly sea level at the Sacramento River.

Native Americans, including the Nisenan, of the western Sierra Nevada foothills lived in relatively permanent settlements, visiting the higher reaches primarily during the summer months (Moratto 1984). Permanent settlements ranged from a handful of people to several hundred, and tended to be situated near water, preferably on slightly raised ground. A major village might include dwellings, granaries, sweat houses, a headman's house, and dance house, or other ceremonial structures. The people of the villages would gather a wide variety of fruits, nuts, greens, bulbs, roots, and seeds, processing and storing many of them for winter. Fish, birds, deer, small game, and many other animals were hunted.

Sustained Nisenan contact with Euro-American groups came late in the vicinity of the SPA. Limited encounters with explorers and trappers during the late 18th and early 19th centuries left the Nisenan social, political, and economic systems relatively unaffected (Wilson and Towne 1978). Their lifeways remains largely intact until the 1833 "malaria" epidemic that swept through many Central Valley tribes including the Valley Nisenan. This was one of several major events to impact the tribe with another of the most significant being the discovery of gold and the start of the Gold Rush in 1848–1849. By 1860, disease, violence, forced relocation, and environmental destruction had greatly affected Nisenan populations and traditional cultural systems. For the remainder of the 19th century and well into the 1900s the Nisenan people were largely a marginalized population. However, during the latter decades of the 20th century the Nisenan began to revitalize their culture. Through new-found economic, political, and social influence the Nisenan once again constitute a thriving native community reinvesting in traditional lifeways and culture.

HISTORIC SETTING

Early Settlement

The earliest Euro-Americans to venture into the project region included Gabriel Moraga and a group of Spanish explorers in 1806–1808 who ventured into the vicinity of Sacramento, and fur trappers and explorers associated with the Hudson's Bay Company in the 1820s. Jedediah Smith, also with Hudson's Bay Company at the time led a group of trappers along the edge of the foothills to the American River in search of a pass over the Sierra Nevada in 1826. Kit Carson and John C. Fremont crossed the mountains near Lake Tahoe and descended to Sutter's Fort traveling along the South Fork of the American River in 1844. These expeditions, however, had little lasting impression on the landscape or the native inhabitants of the region.

Historic-era developments in the SPA vicinity appear to have been few prior to the discovery of gold at Sutter's Mill in El Dorado County and the ensuing Gold Rush. The western portion of the SPA was originally part of the *Rancho Rio de los Americanos* Mexican land grant—more than eight leagues (about 35,500 acres) granted to William Leidesdorff and purchased by Joseph L. Folsom in 1848 after Leidesdorff's death (Hoover et al.

1990:288). This grant extended from the eastern border of John Sutter's New Helvetia settlement (east of Sacramento) along the south bank of the American River to the western edge of present-day Folsom. (EDAW 2006: 6)

Gold Rush Period

During the Gold Rush of 1848–1849 and the following years, local settlement and development activity skyrocketed and rich mining districts such as Folsom, Coloma, Shingle Springs, and Placerville were heavily worked and gave rise to thriving communities still in existence today. Following the discovery of gold at Coloma in January 1848, mining camps along the American River sprang up as numerous fortune-seekers traversed the area between Sacramento and the Sierra Nevada foothills. Additional gold discoveries in spring 1848, including at Mormon Island (in the northeast corner of Sacramento County), fueled the early, rapid, and diverse settlement of the foothill region.

Early mining focused on the gravels and sands of the American River, Alder Creek, and numerous waterways within the SPA. Mining camps arose along these waterways and river bars including "Negro Bar" where African-American miners settled and started working local gravels as early as 1849. By 1850 the population of Negro Bar had reached 336 only to double again by the following year. However, flooding in 1852 forced the settlement to move east and above the river on bluffs at the site of present-day Folsom (Gudde 1975; Hoover et al. 1990:289). Just south of town was a north-south trending ridge of particularly rich gravels referred to as Willow Springs Hill at the south of which ran Alder Creek. It was along this creek and within the SPA that John P. Rhodes established his claim in 1848 after arriving in California via the "northern" route in 1846; having avoided the southern route from Salt Lake, Utah that proved longer and ultimately disastrous for the Donner-Reed party that same year. John Rhodes would eventually help organize the first relief party that rescued several members of the ill-fated group (Wilson 1986:86). Rhodes only arrived in the Folsom area in 1848 after purchasing a portion of the *Rancho Omochumnes* on the Cosumnes River with the intention of establishing a farm and ranch. However, once gold was discovered on his property he filed a claim on Alder Creek after which time the general area became known as Rhoad's Diggings (Wilson 1986:84).

Rhoad's diggings, however, suffered from only a seasonal availability of enough water to work large claims and wash the placer gold from the local gravels. Although small individual operators could profitably work their claims in the area early on, large-scale mining had to wait until an extensive water-conveyance system could be built. This finally occurred in 1851 with the establishment of the Natoma Water Company (reorganized as the Natoma Mining Company in 1852) by Amos P. Catlin, an attorney from New York and a small group of investors. Although their chief aim was to "drain the lower end of Mormon Island and the upper end thereof by means of a race on the southern side of said island" (Castenada et al. 1984:28,30) for the purposes of supplying water to claims in Folsom, the company eventually branched out. In doing so, part of their system extended to Rhoad's Diggings with the Rhoads Branch Ditch that was completed by the summer of 1853 (Wilson 1986:84). With a reliable large source of water being transported to the Rhoad's Diggings, miners rushed into the area and by late 1853 the new town of Prairie City boasted a population of somewhere between 2,500 and 3,500 and over 100 buildings including 15 stores, 10 boarding houses, a school, and an express office (Hatheway and McKenna 1987:11–12).

By the mid-1850s, mining operations had expanded well beyond simple small-scale operations to placer mining on an industrial scale and the exploitation of rich quartz veins also present in the Rhoad's Diggings area. In 1855 John Gass and a Colonel Hagan constructed the first steam-powered stamp mill at the diggings and two years later a second, and larger, mill was established by a French company at a cost of $50,000 (Wilson 1986:84, 88). However, as the easiest placer deposits began to diminish, most of the initial group of miners to arrive in the area began to move away; most returning to farming or other endeavors that many of them left at home in a search of easy riches. As their numbers decreased, the population of Chinese miners in particular began to rise as they started to work less accessible claims and the piles of tailings that still held a considerable amount of gold. By

1866, there were only 48 independent miners still working in the Prairie City Mining District (adjacent to Rhoad's Diggings) with 35 of them being of Chinese descent (Werner et al. 1994:57).

Later Period: Large-Scale Mining

As individual miners and small operations began to be phased out with large companies consolidating multiple claims in and around the Alder Creek area, access to the deeper and/or more extensive gold deposits required the use of ground sluicing, low and high-pressure "hydraulicking", and drifting, all of which required the movement of large quantities of water. (Detailed information on these techniques including associated archaeological manifestations can be found in Lindstrom 1988, and 1989, and Maniery 1992. The most prominent firm working in the SPA and vicinity following the initial "rush" was The Natoma Mining Company whose ditch systems provided steady water supplies from the American River to the mining districts in and around present-day Folsom including those at Alder Creek. Also in the Folsom area, another large-scale mining technique commonly used originated fairly early on in the region. Miners, many probably Chinese (June Chan, personal communications with Mary Maniery, 1993: Crawford 1894:226 in Maniery 1994), began excavating deep tunnels and shafts into the banks of the American River in order to follow potentially rich gravel deposits. By the 1860s to the 1870s this practice was in common usage and shafts and tunnels extended throughout the river terrace where the town of Folsom is located.

Drift and ground sluicing operations continued along with large-scale hydraulic and tunneling operations well into the 1890s. However, smaller drift and sluicing claims were still being worked by both Euro-American and Chinese miners employed by smaller independent companies. The Natoma Mining Company also employed Chinese on their lands during the mid-late 1800s. This included their operations on Mississippi Bar (north of the SPA), which they acquired in 1864 (Castenada et al. 1984). The Natoma Mining Company, through persistent claim acquisition and consolidation efforts, effectively ended small, independent mining company operations in the Folsom area. By the turn of the century the smaller drift and ground sluicing operations in the Folsom area had been primarily replaced by the larger dredging operations. The first mention of large scale dredging was the Doan Mining Dredger that operated near Mississippi Bar in 1894. However, this operation was apparently short-lived (Crawford 1894:226 and 1896:316–318 in Maniery 1992:25). W. P. Bonright and Company was the first to establish a successful dredging operation at their newly acquired property at Mississippi Bar. This steam powered bucket line dredge manufactured by the Risdon Iron Works of San Francisco was constructed in 1898 and began operations in 1899.

The Natoma Mining Company, reorganized as Natomas Consolidated of California, acquired all of the smaller dredging operations by 1916 and operated until 1962, with a short period during World War II when operations were suspended. A 1950 aerial photograph depicts one of their dredges working the river gravels at the base of the bluffs, just north of Mississippi Bar. Other operations in the SPA and vicinity included those of Folsom #2 in the vicinity of the town of Folsom in the early 1900s, and those of the General Dredging company that operated a small "doodlebug" drag line dredge between 1938 and 1942, north of Willow Creek and south of Folsom.

Agriculture and Transportation

The low, well-watered foothills of the SPA and vicinity were also the focus of ranching activities that supported the booming towns in the eastern Sacramento and western El Dorado County areas. When many of the early small-scale mining opportunities began to drop off in the late 1800s, disenchanted miners of the region turned to agriculture. To a certain extent, the small communities such as Clarksville, to the east of the SPA, White Rock, located to the south, and Prairie City to the west, served as support centers for local miners, ranchers, and farmers and as stops along Sacramento-Placerville Road (present White Rock Road) that extended from Sacramento to Placerville and the gold fields.

The early-to-mid 20th century saw relatively little change to the rural agricultural character of the area with the exception of some improved transportation elements (U.S. Highway 50 [U.S. 50]), regional mining (conversion

from placer to dredge mining), and commercial development including that of Aerojet General Corporation that manufactured liquid and solid propellant rocket engines on their property west of the SPA beginning in the early 1950s (ECORP Consulting [ECORP] 2007:8). White Rock Road, which forms the southern boundary of the SPA, was designated as a portion of the Lincoln Highway, the nation's first interstate automobile route, in the early decades of the 20th century and thus established the roadways of the area as some of the most traveled in the nation. (EDAW 2006: 6). The development of such transportation routes and the growth of Sacramento and its environs, however, are rapidly changing the character of the Folsom area from rural to suburban with residential and commercial development increasing throughout the region.

DOCUMENTED CULTURAL RESOURCES

Methodology for Identifying Documented Resources

In order to determine if any potentially significant cultural resources are present within or in the immediate vicinity of the SPA, AECOM cultural resources specialists conducted a records search through the North Central Information Center (NCIC) of the California Historical Resources Information System at California State University, Sacramento (record search retrieved May 14, 2007). ECORP also consulted with the Native American Heritage Commission (NAHC) to determine if any sites or properties of particular cultural significance to the Native American community were present that could be affected by the project. The NAHC response indicated that there were no sites found in the Sacred Lands file. The NAHC included a list of five individuals and organizations that might have information on or concerns with the project. On November 17, 2008 and January 5, 2009 contact letters were sent to the individuals and groups on the NAHC list, along with maps of the SPA and requests for information (Appendix E1). Follow-up telephone calls were conducted in December 2008 and January 2009. As a result of this effort, Rose Enos of Auburn, California responded and requested that she be notified if Native American burial sites are discovered.

The NCIC records search indicates that the entire SPA has been inventoried previously for cultural resources (Table 3A.5-1) and that approximately 260 prehistoric and historic-era districts, sites, features, and isolated artifacts have been identified (Appendix E2). The density of identified historic and prehistoric resources suggests that the entire SPA is also sensitive for additional undiscovered prehistoric and historic cultural resources. Thus, the SPA is considered highly sensitive for historic and prehistoric resources.

Identified Resources

Cultural resources identified within the SPA include: (1) traces of early Native American habitation including lithic artifact scatters and bedrock mortars; and (2) the remains of historic-era activities, in particular, those related to Gold Rush-era and later mining operations. The latter consist of the remains of small placer and quartz mines, numerous ditches and remains of similar water conveyance infrastructure, cabin sites, and other structure foundations, tailings piles, and refuse scatters.

Historic Gold Rush-Era Resources

The largest single documented "site" consists of CA-Sac-308H; a landscape encompassing several historic mining districts containing the remnants of mining operations ranging from the earliest days of the Gold Rush to mid-20th century dredges. The densest portion of the mining remains (including those within CA-Sac-308H) is found in the northwest corner of the SPA and includes portions of historic mining landscapes referred to as the Alder Creek Historic Placer Mining District, the Natomas-Aerojet Dredge Field District, the Prairie Diggings Placer Mining District, the American River Mining District, and individual loci, features, and sites related to these districts. Although this "site" is well documented in the archaeological literature (see Lindstrom 1989; PAR 1991; Tordoff 1994; and Windmiller 2005) it has been recorded in a somewhat piecemeal fashion in response to various development projects over the past 20 years. This repeated partial documentation has lead to an unsynthesized documentation of the site as a single complex and cultural landscape. However, it is clear that this "site"

Table 3A.5-1
Summary of Previous Cultural Resource Investigations

Report Title	NCIC File No.	Author and Date	Resources Identified
Sacramento Country Day School, Folsom Campus, Archaeological Resources Inventory, Folsom, Sacramento County, California	5871	Windmiller (2005)	Twelve historic archaeological resources related to early homesteading and mining
A Cultural Resource of Aerojet General Corporation, Sacramento Plant, Sacramento County, California	4519	Lindstrom (1989)	Two mining districts, two historic home sites, one historic refuse scatter, and six isolated historic features
Determination of Eligibility and Effect for the Sunridge Park Project Area, Sacramento County, California	5850	Peak et. al. (2004)	None
Archaeological Inventory Survey, Folsom South Development Project, 1,443 acres on White Rock Road, Sacramento County, California	6997	Genesis (2006)	Three prehistoric sites, mortar groups and mortar sites with middens, 14 historic sites related to mining and ranching, and one multi-component site
Historic Study Report, Proposed Interchange and Auxiliary Lanes on Highway 50, Eastern Sacramento County, California	3840	Tordoff (1994)	Evaluations of five historic archaeological resources, including two mining districts, three segments of a water conveyance system, and two homestead-related sites
Historic Property Survey Report, Proposed Interchange and Auxiliary Lanes on Highway 50, Eastern Sacramento County, California	4521 A & B	Noble (1994)	Twelve historic archaeological resources related to the American River Placer Mining District
Archaeological Survey Report for the East Bidwell Street/ Scott Road Interchange Project on Route 50, Sacramento, California	3749	Jones & Stokes (1995)	None, though previously recorded sites were visited and updated
Historic Property Survey Report for the State Route 50/Empire Ranch Road Interchange Project	8119	LSA (2006)	None
Cultural Resource Assessment of the Proposed White Rock Springs Golf Course, Sacramento County, California	4479	Peak et. al. (1993)	Three archaeological resources: prehistoric mortar site CA-Sac-222, the White Rock Springs Ranch site, and a rock wall
Cultural Resource Assessment of the Proposed White Rock Springs Golf Course, Sacramento County, California-revised final report	4480	Peak et. al. (1994)	Same as above
Positive Historic Property Survey Report for the U.S. Highway 50 HOV Lanes Project, Sunrise Boulevard to El Dorado Hills Boulevard, Sacramento and El Dorado Counties, California	3636	PAR (1998)	Two historic archaeological resources related to ranching
CA-0578A/US 50, 14751 White Rock Road, Sacramento County, California	4470	Earth Tech (2000)	None
Pacific Bell Mobile Services, 14751 White Rock Road, Folsom, Sacramento County: Site # SA-065-C3	1907	Derr (1997)	None
Historic Study Report and Historic Resource Evaluation Report for 16 Sites, Highway 50 Interchange Project, Post Mile 15.8 to 23.1, Sacramento County, California	4520	PAR (1992)	Evaluation of 16 historical and archaeological resources all related to ranching, mining, and transportation from 1848-present

Table 3A.5-1
Summary of Previous Cultural Resource Investigations

Report Title	NCIC File No.	Author and Date	Resources Identified
Archaeological Survey Report, Highway 50 Interchange Project, Post Mile 15.8 to 23.1, Sacramento County, California	4525	PAR (1991)	17 historical and archaeological resources all related to ranching, mining, and transportation from 1848-present
Carpenter Ranch Cultural Resources inventory, Folsom, Sacramento County, California	-----	Windmiller (2006)	129 Archaeological sites (52 possibly eligible) and two potential historic districts
Cultural Resources Survey Report, Folsom Area South Group-30 acre parcel, Sacramento County, California	-----	ECORP (2006)	Five historic archaeological resources related to early homesteading and mining
Folsom Heights Property Development Project, Sacramento County, California	-----	EDAW (2006)	Two historic archaeological resources related to homesteading, and a segment of White Rock Road/Lincoln Highway

Source: NCIC 2007, data compiled by EDAW/AECOM (now AECOM) in 2008

represents a unique landscape exhibiting the full range of placer mining techniques in use in California from the earliest days of the Gold Rush up until the early 1960s when the last of the gold dredges ceased operations in this area. As such many of the constituent elements of the landscape may be eligible for the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR), and some of the elements have already been recommended as NRHP-eligible (and thus CRHR-eligible).

Apart from consideration of CA-Sac-308H as a unique site (cultural landscape) with many contributing elements, numerous other mining-related sites and features have been identified within the SPA. These include stone and earth dams, ground sluice remains, prospect pits, placer tailings, and mine shafts. One of the most prominent types of mining-related features situated within the SPA consists of water conveyance ditches associated with the Alder Creek and Rhoads Diggings historic mining districts (contained within CA-Sac-308H). Although relating many early individual mining features or structures to specific individuals or mining firms can be difficult, many of these ditches were mapped and constructed in the 1850s by mining companies such as the Natomas Company. Other well-dated mining-related sites include the remains of a house constructed in 1855 (temporary site number CR-82) and the site of the 1855 Gass and Hagan steam mill in the Rhodes Diggings historic mining district (temporary site number CR-97).

In addition to water conveyance ditches, mine tailings, and prospect pits, another class of feature situated within the SPA has potential for providing extensive historical information on the ethnicity and daily lives of early Gold Rush-era miners. A number of possible residences or small cabin remains are found throughout and near the CA-Sac-308H landscape area. These often consist of rough stone footings or foundations or, more commonly, the collapsed remains of stone fireplace chimneys. These cabin sites are often closely associated with small placer diggings and many may date to the earliest period of Gold Rush mining in the Folsom area. Although many similar cabin sites and small-scale diggings probably existed in the vicinity prior to dredge mining in the late 19th century, relatively few now remain and most appear to be in excellent and relatively undisturbed condition. While much is known regarding the grand scheme of mining developments in the Folsom area during the 19th and early 20th centuries, little has been recorded on the early lifeways of the individual miners. These cabin sites, given their spatial association with early mining sites and landscapes, are almost certainly related to gold mining activities and may represent an unusual resource capable of providing detailed information on the Gold Rush miner's lifeways.

Other Historic-Era Resources

Other historic-era resources within the SPA include the remains of ranch and farm complexes, refuse scatters, ranch fences, stone walls, and roadways. Some sites not directly related to mining can also be dated to specific periods and/or associated with known individuals. These include the 1870s Goulinson homestead (CA-Sac-739H), the (probable) Grover Russi homestead and ranch complex (CA-Sac-606H), and the Cecil Brown residence (CA-Sac-682H).

Two major historic transportation routes, a segment of the Southern Pacific Railroad (SPRR), and White Rock Road either pass directly through the SPA (the SPRR) or form a portion of its boundary (White Rock Road). The SPRR is eligible for NRHP listing as a system, but the segment of lines situated within the SPA has not been formally evaluated for potential eligibility for NRHP listing. However, White Rock Road, aside from having been established and used heavily during the Gold Rush period, was also designated as a portion of the Lincoln Highway. The Lincoln Highway, the nation's first interstate automobile route was designated in the early decades of the 20th century. The Lincoln Highway, consisting of a route patched together from pre-existing roads and newly built "seedling miles" intended to spur economic growth, started in Times Square, New York City, and ended in Jack London Square in Oakland. At the time, the Federal government had nothing to do with the designation and construction of the route. Henry Joy, President of the Packard Motor Car Company, and Carl Fisher, owner of the Indianapolis Motor Speedway were primarily responsible for the establishment of the Lincoln Highway Association in 1913 and all its activities. Mr. Joy and Mr. Fisher, and other automobile manufacturers and industrialists of the day, had a vested interest in the growth and improvement of roadways in the United States; a better and more extensive road network meant increased sales.

Prior to the construction of U.S. 50, White Rock Road was part of the main west-east route extending from Sacramento into the Sierra Nevada foothills. White Rock Road represents a portion of the original 1913-designated route and remained part of this privately-designated and maintained road system until the 1920s. In 1921 the Federal government passed the Federal Highway Act which, like a similar act passed in 1916, provided $75 million of matching funds to the states for highway construction. However, unlike the 1916 act, the 1921 act required the states to identify 7% of its total mileage as "primary;" only these roads would be eligible for Federal funds. The Lincoln Highway, already an established and maintained route, was prime for designation as a primary road worthy of Federal funding. By the late 1920s, the Lincoln Highway in California was no longer a private enterprise and had been fully absorbed into the Federal highway system with the exception of many local segments one of which was White Rock Road. Although this portion of the old Lincoln Highway has been repaved repeatedly over time, much of the general setting of the roadway has changed little from the early decades of the 20th century. Much of the surrounding land is still devoted to ranching and agriculture and many period culverts, bridges, and associated features such as drainage ditches likely dating to the teens and twenties are still in place. Consequently, portions of White Rock Road retain enough integrity to the Lincoln Highway period to be considered potentially eligible for NRHP listing.

Identified Prehistoric Resources

In addition to the dense cluster of historic-era sites within and near the SPA, clear evidence of early Native American occupation has also been documented in the form of numerous prehistoric sites and features within the SPA. Within the northwest portion of the SPA in particular, which was heavily disturbed by mining, numerous prehistoric sites likely once existed. The potential that "significant" (under CEQA) remnants of these sites occur within the SPA is high. Generally, Native American populations tended to settle in the vicinity of perennial water sources such as those found in the northwest portion of the SPA. With fewer such water sources and drainages documented elsewhere in the SPA, such locales are somewhat sparse. However, several prehistoric sites consisting of lithic artifact scatters and bedrock or boulder mortars have been recorded. The most important of these (CA-Sac-222) exists in the southeast portion of the SPA and consists of the actual "white rocks" after which White Rock Road was named. Noted in early historic accounts of the region, this unusual white quartzite outcrop also exhibits a series of deep mortar holes resulting from extensive early Native American processing of plant

foods, almost certainly acorn. In addition, scatters of lithic artifacts have been documented in the immediate vicinity of the boulder outcrop, suggesting that important subsurface remains may be present. Consequently, due to a direct association with an important historic-era roadway (White Rock Road), their status as an important local landmark, and the likelihood that important deposits of early prehistoric materials are present, this site was recommended eligible for NRHP listing (Solano Archaeological Services 2008).

Summary of Identified Resources

Regardless of their type and cultural/temporal associations, research has demonstrated that numerous cultural sites, features, artifacts, and landscapes are situated within the SPA. While the highest density of recorded resources occurs in the northwest corner of the SPA, the overall density of identified cultural resources suggests that the entire SPA is highly sensitive for historic and prehistoric resources. The number of identified resources indicates a strong likelihood that additional undiscovered resources occur within the SPA.

Identified resources constitute the remains of a long series of human activities from prehistoric habitation and resource processing, to early historic mining, ranching, and transportation. Although the entire SPA has been subjected to detailed archaeological surveys and historical investigations, much of this research has been conducted in a piecemeal fashion and to date no consideration has been given to the documentation and interpretation of the most notable "site" documented in the area—the historic mining landscape presently labeled CA-Sac-308H. This landscape, along with most of the other prehistoric and historic-era resources documented within the SPA, has not been formally evaluated for significance per NRHP/CRHR criteria. Regardless of their association or eligibility, the large number of cultural resources documented indicates that the SPA has long been the focus of intensive activity for thousands of years and due to its largely intact nature, is unique in the Sacramento/Folsom region.

3A.5.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Section 106 of the National Historic Preservation Act

Section 106 of the National Historic Preservation Act (NHPA or "Section 106") and its implementing regulations require Federal agencies to consider the effects of their undertakings on cultural resources that are listed on or eligible for listing on the NRHP. These resources are defined as "historic properties" in the Section 106 process. For this project, the U.S. Army Corps of Engineers (USACE) must also satisfy the requirements of Section 106 because permitting under the Clean Water Act (CWA) is an undertaking as defined in the Section 106 regulations (36 Code of Federal Regulations [CFR] Part 800.16[y]). Other Federal permits and authorizations that are necessary, such as a take permit under the Federal Endangered Species Act (ESA), also require compliance with the requirements of Section 106. Accordingly, all five action alternatives under consideration require compliance with Section 106 because these alternatives (the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit [no USACE 404 permitting] alternatives) would require some level of Federal authorization and permitting. To determine whether these undertakings could affect historic properties, cultural resources (including archaeological, historical, and architectural properties) must be identified, inventoried, and evaluated for listing in the NRHP.

Federal agencies typically perform four primary steps to satisfy the requirements of Section 106. These steps consist of the following actions:

1. Initiate the Section 106 process by consulting with the state historic preservation officer (SHPO) (36 CFR Part 800.3). Determine the area of potential effects (APE) and perform an inventory of cultural resources within the APE and evaluate those resources for the NHRP to determine which resources constitute historic properties subject to management under Section 106 (36 CFR Part 800.4).

2. Identify other consulting parties such as Native American tribes that attach cultural religious significance to resources within the APE, and interested members of the public (36 CFR 800.3[f]).

3. Assess the effects of the undertaking on identified historic properties within the APE (36 CFR Part 800.5).

4. Resolve adverse effects on historic properties, if any (36 CFR Part 800.6).

Because Section 106 only requires that Federal agencies manage cultural resources eligible for, or listed in the NRHP, it is useful to review the criteria for NRHP listing. The NRHP is a register of districts, sites, buildings, structures, and objects of significance in American history, architecture, archaeology, engineering, and culture. The regulations provided in 36 CFR Part 60.4 describe the criteria to evaluate cultural resources for inclusion in the NRHP. Cultural resources can be significant on the national, state, regional, or local level. Properties may be listed in the NRHP if they possess integrity of location, design, setting, materials, workmanship, feeling, and association, and:

a) are associated with events that have made a significant contribution to the broad patterns of our history;

b) are associated with the lives of persons significant in our past;

c) embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess a artistic value, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

d) have yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting the significance criteria, potentially historic properties must possess integrity to be considered eligible for listing in the NRHP. Integrity refers to a property's ability to convey its historic significance (National Park Service 1991). Integrity is a quality that applies to historic resources in seven specific ways: location, design, setting, materials, workmanship, feeling, and association. A resource must possess two, and usually more, of these kinds of integrity, depending on the context and the reasons the property is significant.

Integrity is the ability of a resource or a group of resources to convey a sense of the past as it relates to one or more areas of significance. If significance has been established, it is necessary to determine if the resource retains the qualities for which it is significant. The evaluation of integrity is often subjective, but it must be grounded in an understanding of a resource's physical features and how they relate to its significance. Resources that have been substantially altered may not retain sufficient integrity to reflect their original character. Integrity may be diminished by a single major change or a cumulative effect of numerous minor changes.

There are seven aspects or qualities that in various combinations define integrity. A resource that retains its integrity will possess several, and usually most, of the following aspects: location, setting, design, materials, workmanship, feeling, and association.

Phased Identification, Evaluation, and Management of Cultural Resources under Section 106

Because intensive cultural resources surveys have not been conducted on the entire site, and because the project would involve phased development which has not yet been finalized, USACE has determined that cultural resources would be managed under a Programmatic Agreement (PA), the execution of which satisfies the requirements of Section 106 sufficiently for other Federal actions to proceed (Appendix E3 contains correspondence between USACE and SHPO concerning the use of a PA for this project). USACE under the authority of Section 404 of the Clean Water Act (33 USC Section 1344), may issue permits for subsequent projects within the proposed SPA and for permit applicants that have submitted or will submit applications to USACE for a Section 404 permit for their respective individual projects within the SPA. The PA will be executed before a Record of Decision (ROD) is issued for this EIS.

These applicants are expected to proceed with project-specific development independently of one another with a potential build-out timeframe of 20 years within the SPA. Because USACE has determined that subsequent projects within the SPA may have an effect on Historic Properties that are either included in, or are eligible for inclusion in the NRHP, USACE, in consultation with SHPO, has determined that compliance with Section 106 will be achieved through the execution of a PA pursuant to 36 CFR Section 800.14. Phased identification, evaluation, treatment, and mitigation for projects within the SPA (and infrastructure such as the off-site water alignment and water treatment plant) will occur under the PA in the following manner:

- USACE has defined the Specific Plan's Area of Potential Effect (APE) which includes all areas where effects could occur from construction of the individual projects within the SPA, and associated infrastructure. Future project design changes may require redefining the SPA APE and the development projects within it. Each Section 404 permit application will have its own project-specific APE designated by USACE and approved by SHPO. If some of the projects are merged or segregated, a project will be defined as the area to which a specific Section 404 permit application applies.

- Because each project will require an individual Section 404 permit and the projects will be independent of one another, management steps required for historic properties (e.g., historic districts) that span more than one individual 404 permit must be completed before all affected Section 404 permits are executed. Therefore, USACE will ensure that such steps be conducted prior to the issuance of separate Section 404 permits for each applicant in order to separate the projects from one another.

- Using the existing research conducted on SPA historic districts to date, the evaluation of significance, a portion of the resolution of adverse effect (the archival research and documentation), and the development of a work plan for the remaining identification and evaluation will be carried out in advance of Section 404 permit approval. The work will be conducted at a level (determined adequate by USACE and SHPO) that will allow the remaining resolution of adverse effects (data recovery plan [DRP]/historic property treatment plan [HPTP] of archaeological features and mapping) to be carried out on a project-specific basis by individual applicants independently of one another. A "Preliminary Historic Properties Synthesis" will result from this work. The Preliminary Historic Properties Synthesis will also form the basis for a Historic Properties Synthesis for resources of the historical period that will serve as a mitigation document (Historic Properties Synthesis) for the SPA and will be reviewed and approved by the SHPO.

- After the initial synthesis is prepared and approved, all applications for project-specific 404 permits in the SPA will require that the APE for that permit area be drawn (or re-drawn) by USACE and approved by the SHPO as a subset of the larger SPA APE and USACE will acquire an updated records and literature search. Field survey work will commence as required by USACE in consultation with the SHPO.

- SHPO and USACE will complete and report the results of all required intensive surveys of the undertaking's APE in a manner consistent with applicable federal standards and guidelines.

- Evaluation Plans (EPs) will be prepared to guide evaluation of cultural resources within the APE of each development project that have not been previously evaluated and USACE will submit the EP for concurrent review to the SHPO, and appropriate Native American tribes.

- USACE, in consultation with SHPO, will ensure that determinations of eligibility are made in accordance with the NRHP eligibility criteria set forth in 36 CFR 60.4 for all resources within the APE. All cultural resources determined eligible are Historic Properties as defined in 36 CFR 800.16(l)(1).

- USACE will apply the Criteria of Adverse Effect pursuant to 36 CFR 800.5(a)(1) to all Historic Properties within the APE that will be affected by the project. Determinations of Effect (DoE) will be made in consultation with the SHPO and other interested parties.

- USACE, in consultation with SHPO, will ensure that a Memorandum of Agreement (MOA) is developed, signed, and implemented for each development project where there will be adverse effects to Historic Properties (eligible resources). The MOA will contain stipulations to mitigate anticipated effects on Historic Properties that will result from a specific project and will require compliance with the work plan in the Preliminary Historic Properties Synthesis. The MOA for a specific development project will require development of an HPTP for Historic Properties that will be avoided and for Historic Properties that cannot be avoided and were determined eligible under criteria (a) through (c) (36 CFR 60.4). The MOA will require development of a DRP as required.

- USACE will ensure that draft HPTPs and DRPs are submitted to the SHPO, and appropriate Native American tribes and individuals for review and comment. USACE may also request comment by the ACHP.

- The results of the implementation of the MOA, HPTP, and DRP will be documented in a comprehensive confidential technical report(s) that follow the guidelines of the Secretary of the Interior and the California Office of Historic Preservation. USACE will ensure that draft mitigation documents and the revised Historic Properties Synthesis are submitted to the SHPO and appropriate individuals for review and comment.

- In consultation with the appropriate Native American tribes, USACE will identify Historic Properties of traditional religious and cultural importance. USACE will seek comments from all potentially interested Native American tribes. The interested public, including Native American tribes, will be invited to provide input on the identification, evaluation, and proposed treatment of Historic Properties. Depending on the specific nature of the undertaking, this will be done through letters of notification, public meetings, and site visits.

- Notices to Proceed (NTP) with construction may be issued by USACE for individual development projects, under any of the following conditions: 1) USACE and the SHPO have determined that there are no cultural resources within the APE for a particular Section 404 permit; and 2) USACE and SHPO have determined that there are no Historic Properties within the APE for a particular Section 404 permit; or 3) USACE, after consultation with the SHPO and interested persons, has implemented an adequate treatment plan for Historic Properties in the development project that will be adversely affected, and the fieldwork stipulated in the HPTP and/or DRP(s) has been completed; the Historic Properties Synthesis document has been updated and modified; USACE has accepted a summary of the fieldwork performed and a schedule for completing the reports for that work. USACE will not issue an NTP for a development project that includes a portion of a NRHP-eligible district that will be adversely affected until all development projects that include a portion of that district have completed the preparation of the Historic Properties Synthesis.

- If potentially NRHP-eligible resources are discovered during construction, ground disturbing activities will cease until the provisions of 36 CFR 800.13(b) (discoveries without prior planning) are met. USACE will provide the SHPO and the ACHP an opportunity to review and comment on proposed treatment in accordance with Stipulation 7.

The SHPO will consult with the ACHP on the intent to develop and execute the PA as described above. In the event that the ACHP does not join in the consultation, USACE will proceed the requirements set forth in 36 CFR Section 800.6(b)(1).

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

California Environmental Quality Act

The requirements of CEQA apply to all action alternatives that require discretionary action by local agencies (the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit [no USACE Section 404-permitting] alternatives). CEQA requires that state and local

agencies consider impacts on historical resources, unique archaeological resources, and interred human remains. The State CEQA Guidelines define a "historical resource" to include more than one category of resources. The first category is "resource(s) listed or eligible for listing on the CRHR." (California Code of Regulations [CCR] Section 15064.5[a][1]; see also California Public Resources Code [California PRC] Sections 5024.1 and 21084.1.) A historical resource may be eligible for inclusion in the CRHR, as determined by the State Historical Resources Commission or the lead agency, if the resource:

- is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage; or
- is associated with the lives of persons important in our past; or
- embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- has yielded, or may be likely to yield, information important in prehistory or history.

In addition, a resource is presumed to constitute a "historical resource" if it is included in a "local register of historical resources" unless "the preponderance of evidence demonstrates that it is not historically or culturally significant." (CCR Section 15064.5[a][2].)

Another category of "historical resources" is those deemed significant pursuant to criteria set forth in California PRC Section 5024.1(g), as follows:

[a] resource identified as significant in an historical survey may be listed in the California Register if the survey meets all of the following criteria:

(1) The survey has been or will be included in the State Historic Resources Inventory.

(2) The survey and the survey documentation were prepared in accordance with…procedures and requirements [of the State Office of Historic Preservation].

(3) The resource is evaluated and determined by the [State Office of Historic Preservation] to have a significance rating of Category 1 to 5 on [the California Department of Parks and Recreation Historic Resources Inventory Form].

(4) If the survey is five years or more old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historic resources which have become eligible or ineligible due to changed circumstances or further documentation and those which have been demolished or altered in a manner that substantially diminishes the significance of the resource.

Resources identified by such surveys are presumed to be historically or culturally significant unless the preponderance of the evidence demonstrates otherwise.

The final category of "historical resources" is an optional one, which a lead agency may opt to consider or not consider. According to the State CEQA Guidelines (CCR Section 15064.5[a][3]):

> Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be an historical resource, provided the

lead agency's determination is supported by substantial evidence in light of the whole record.

In addition to the obligation to consider impacts on "historical resources," CEQA and the State CEQA Guidelines require consideration of unique archaeological sites (California PRC Section 21083.2, 14 CCR Section 15064.5). A "unique archaeological resource" is defined in CEQA (California PRC Section 21083.2[g]) as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

(1) contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information,

(2) has a special and particular quality such as being the oldest of its type or the best available example of its type, or

(3) is directly associated with a scientifically recognized important prehistoric or historic event or person.

If data recovery through excavation is the only feasible mitigation, a DRP that makes provisions for adequately recovering the scientifically consequential information from and about the historical resource shall be prepared and adopted before any excavation is undertaken (CCR Section 15126.4[b][3][C]). Other acceptable methods of mitigation under the State CEQA Guidelines (CCR Section 15126.4) include excavation and curation or study in place without excavation and curation (if the lead agency determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource).

The State CEQA Guidelines Section 15064.5[e] and the California Health and Safety Code Section 7050.5 require that excavation activities be stopped whenever human remains are uncovered and that the county coroner be called in to assess the remains. If the county coroner determines that the remains are those of Native Americans, the NAHC must be contacted within 24 hours. The NAHC will designate a Most Likely Descendant (MLD) who is empowered to dispose of the remains with appropriate dignity as provided for in California Public Resources C Section 5097.98.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND ORDINANCES

Sacramento County General Plan

The following goals and policies of the Sacramento County General Plan (1993) are applicable only to the proposed off-site detention basin east of Prairie City Road under all five action alternatives. There are no Sacramento County goals and policies that are applicable to the No Project Alternative.

Objective: Comprehensive knowledge of archeological and historic site locations.

- **Policy CO-155:** Utilize the California Archaeological and Sacramento History and Science Division to assist in determining need for survey.

- **Policy CO-158:** Native American burial sites encountered during preapproved survey or during construction shall, whenever possible, remain *in situ*. Excavation and reburial shall occur when in situ preservation is not possible or when the archaeological significance of the site merits excavation and recording procedure. On-site re-interment shall have priority. The project developer shall provide the burden of proof that off-site re-interment is the only feasible alternative. Re-interment shall be the responsibility of local tribal representatives.

- **Policy CO-159:** The cost of all excavation conducted prior to completion of the project shall be the responsibility of the project developer.

- **Policy CO-160:** Monitor projects during construction to ensure crews follow proper reporting, safeguards, and procedures.

- **Policy CO-161:** As a condition of approval of discretionary permits, a procedure shall be included to cover the potential discovery of archaeological resources during development or construction.

- **Policy CO-162:** As a condition of approval for discretionary projects which are in areas of cultural resource sensitivity, the following procedure shall be included to cover the potential discovery of archaeological resources during development or construction:

  > Should any cultural resources, such as structural features, unusual amounts of bone or shell, artifacts, human remains, or architectural remains be encountered during any development activities, work shall be suspended and the Sacramento County Department of Environmental Review and Assessment shall be immediately notified. At that time, the Department of Environmental Review and Assessment will coordinate any necessary investigation of the site with appropriate specialists, as needed. The project proponent shall be required to implement any mitigation deemed necessary for the protection of the cultural resources. In addition, pursuant to Section 5097.98 of the State Public Resources Code and Section 7050.5 of the State Health and Safety Code, in the event of the discovery of human remains, all work is to stop and the County Coroner shall be immediately notified. If the remains are determined to be Native American, guidelines of the Native American Heritage Commission shall be adhered to in the treatment and disposition of the remains.

El Dorado County General Plan

The following goal and policies of the El Dorado County General Plan (2004) are applicable only to the two proposed local roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goal and policies that are applicable to the No Project Alternative or other four action alternatives.

Lane Use Element

- **Policy 7.5.1.3:** Cultural resource studies (historic, prehistoric, and paleontological resources) shall be conducted prior to approval of discretionary projects. Studies may include, but are not limited to, record searches through the North Central Information Center at California State University, Sacramento, the Museum of Paleontology, University of California, Berkeley, field surveys, subsurface testing, and/or salvage excavations. The avoidance and protection of sites shall be encouraged.

- **Policy 7.5.1.6:** The County shall treat any significant cultural resources (i.e., those determined California Register of Historical Resources/National Register of Historic Places eligible and unique paleontological resources), documented as a result of a conformity review for ministerial development, in accordance with CEQA standards (El Dorado County General Plan 2004:154).

City of Folsom General Plan

The City of Folsom (City of Folsom 1993) General Plan is focused on resources currently located within the downtown Historic District. There are no City of Folsom goals and policies that are applicable to the Proposed Project or the alternatives under consideration.

3A.5.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines and Section 106 of the NHPA. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to cultural resources if they would do any of the following:

- cause a substantial adverse change in the significance of a unique archaeological resource or an historical resource as defined in Section 21083.2 of CEQA and Section 15064.5 of the State CEQA Guidelines, respectively. The State CEQA Guidelines (CCR Section 15064.5) define "substantial adverse change" as physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings;

- disturb any human remains, including those interred outside of formal cemeteries; or

- result in adverse effects on a historic property as defined per the Section 106 regulations. An adverse effect is found under Section 106 if a Federal action would "alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association (36 CFR 800.5[a][1])."

Under CEQA, a substantial adverse change in the significance of a historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of the historical resource would be materially impaired. Under Section 106, adverse effects are effects that damage the qualities that make an historic property eligible for the NRHP, or the ability of that property to convey the significance that makes it eligible.

Paleontological resources are addressed in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources - Land," of this EIR/EIS.

ANALYSIS METHODOLOGY

Investigations into potential cultural resources issues for the project included a review of materials provided by a record search conducted by the NCIC of the California Historical Resources Information System. Other referenced materials included site documents, maps, and survey and evaluation reports archived at AECOM's Sacramento office and ECORP's Rocklin office (see Appendix E2).

Research also consisted of consultation with the Native American community through the NAHC to determine if any sites or other properties of cultural significance to local native peoples were within or in the immediate vicinity of the SPA. In general, few of the cultural resources documented in the SPA have been evaluated for inclusion in the NRHP or the CRHR. However, in some cases preliminary statements of potential eligibility can be made. For example, presently unevaluated historic-era cabin sites located within documented Gold Rush-era mining districts may retain important archaeological data that could provide new information on the lifeways and ethnicity of early miners. Generally, and for the purposes of this EIR/EIS, such sites are considered to be potentially significant per NRHP/CRHR criteria and are considered as such for the impact analysis presented below.

Using the available information on known cultural resources and significance considerations described above, an assessment of development activities related to the Proposed Project and the alternatives under consideration were evaluated for their potential to disturb these resources through direct action (e.g., development of roads and utility

lines through known site areas) or indirect activity (e.g., increasing visibility of and access to sensitive cultural resources that could lead to vandalism or looting).

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). Impacts that are significant under CEQA are also considered adverse effects under the NHPA. The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.5-1 **Possible Destruction of or Damage to Known Prehistoric and Historic-Era Cultural Resources from Ground-Disturbance or Other Construction-Related Activities.** *Construction activities during project implementation could result in the destruction of or damage to known prehistoric and historic-era cultural resources that are potentially eligible for or listed on the CRHR or NRHP.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, up to 44 rural residences could be developed and agricultural activities could continue under the existing AG-80 land use and zoning designation. Existing agricultural activities would also continue in the Water Study Area, since no off-site water facilities would be constructed in this alternative. Agricultural production could damage or destroy cultural resources that occur within the SPA or the Water Study Area. The policies in the Sacramento County General Plan that would protect cultural resources under a tentative subdivision map do not apply to private land that is zoned for agricultural use, because they are generally mutually exclusive. Because agricultural activities could encounter and potentially destroy known prehistoric and historic-era cultural resources, this **direct** impact is **potentially significant**. **No indirect** impacts would occur. ***[Greater]***

NCP, PP, CD, RHD

The SPA and areas where off-site elements would be constructed contain numerous identified prehistoric and historic-era cultural resources as documented in Appendix E2. While the densest concentration of resources occur in the northwest corner of the SPA, documented prehistoric and historic cultural resources occur throughout the SPA. Many of these resources have not been specifically evaluated for eligibility for listing on the NRHP or the CRHR, but the quality and range of identified resources as described in Appendix E2 suggests that many of these resources are likely eligible for listing in these registers. Construction that would be implemented as part of the No USACE Permit, Proposed Project, Centralized Development, Reduced Hillside Development, and Alternatives would likely result in direct adverse impacts to these resources. These **direct** impacts are considered **significant. No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.5-1a: Prepare, Execute, and Implement a Programmatic Agreement.

For all action alternatives that require Federal permitting and authorization, USACE shall satisfy the requirements of Section 106 of the NHPA. A PA shall be prepared that requires the following measures:

- For each development phase of the specific plan and associated Federal permits and authorizations, USACE, as the Federal Section 106 lead (or USACE designee) shall prepare an APE map and shall consult with the SHPO on the APE, as described above.

- Once SHPO, USACE, and other consulting parties agree on the project-specific APE, USACE or permit applicant (or designee, as directed by USACE) shall perform an inventory for cultural resources in the phase-specific APE consistent with the Secretary of the Interior's Standards and Guidelines for Identification (48 Federal Register [FR] 44720-23) and submit this inventory to the SHPO and any other relevant consulting parties for review as required under the PA. The same document shall evaluate identified resources for listing on the NRHP per the criteria provided above and the Secretary of the Interior's Standards and Guidelines for Evaluation (48 FR 44723-26).

- Once the inventory is complete, USACE (or designee, as directed by USACE) shall prepare a Finding of Effect (FOE) to assess the effect of the buildout of the individual development phase upon identified historic properties by applying the Criteria of Adverse Effect pursuant to 36 CFR 800.5(a)(1). If the FOE identifies adverse effects, the project applicant or USACE, or designee) shall prepare treatment measures and protocols to minimize these impacts to the extent possible. These treatment measures shall be appended to the PA in a treatment plan prepared for the specific project development phase. Treatment measures may include, but are not limited to, avoidance and preservation in places where possible. Where avoidance is not possible or feasible, treatment shall consist of either: 1) recovery of a suitable sample of material from archaeological sites that have the potential to contribute to research, or 2) documentation of historic resources to capture their significance and relationship to important historical themes. Documentation of historical resources shall be performed according to the Historic American Building Survey or Historic American Engineering Record (HABS/HAER) specifications or an equivalent standard when existing architecture or engineered features are subject to adverse effects. Where appropriate, treatment plans may specify the preparation and circulation of interpretive brochures, narrative descriptions, and photographic documentation for the general public.

- A geoarchaeological overview of the SPA may be stipulated and implemented in the PA, as determined by USACE, in order to assess the likelihood for buried cultural deposits. Focused geoarchaeological studies may be subsequently required for portions of the SPA and vicinity of off-site elements that are considered highly sensitive to determine if additional inventory or monitoring should be performed during construction as determined by USACE.

- Resources that may be discovered inadvertently during construction will be handled pursuant to 36 CFR Part 800.13(b) (discoveries without prior planning).

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, and Caltrans) in coordination with USACE and the SHPO to ensure that mitigation is consistent with the PA.

Implementation: USACE (or designee) and the project applicant(s) of all project phases (as directed by USACE)

Timing: The PA shall be prepared and executed (signed) prior to issuance of any Federal permit or authorization for any aspect or component of the specific plan project. Preparation of the phase-specific APE and inventory and evaluation of properties within the APE shall be performed prior to any ground-disturbing work in the APE for any Federal permitting or authorization of individual development phases. Implementation of treatment measures for identified historic properties may be performed during construction and ground-disturbing work provided that no ground-disturbing work is performed in the vicinity of resources subject to adverse effects and within an appropriate radius of the resource as determined by USACE, prior to completion of all treatment measures. The exact radius in which construction shall

not occur shall be determined based upon the nature of the resource the potential for outlying undiscovered elements of that resource.

Enforcement: USACE and the project applicant(s) of all project phases (as directed by USACE), with oversight by the SHPO.

Mitigation Measure 3A.5-1b: Perform an Inventory and Evaluation of Cultural Resources for the California Register of Historic Places, Minimize or Avoid Damage or Destruction, and Perform Treatment Where Damage or Destruction Cannot be Avoided.

Management of cultural resources eligible for or listed on the CRHR under CEQA mirrors management steps required under Section 106. These steps may be combined with deliverables and management steps performed for Section 106 provided that management documents prepared for the PA also clearly reference the CRHR listing criteria and significance thresholds that apply under CEQA. Prior to ground-disturbing work for each individual development phase or off-site element, the applicable oversight agency (City of Folsom, El Dorado County, Sacramento County, or Caltrans), or the project applicant(s) of all project phases, with applicable agency oversight, shall perform the following actions:

- Retain the services of a qualified archaeologist to perform an inventory of cultural resources within each individual development phase or off-site element subject to approval under CEQA. Identified resources shall be evaluated for listing on the CRHR. The inventory report shall also identify locations that are sensitive for undiscovered cultural resources based upon the location of known resources, geomorphology, and topography. The inventory report shall specify the location of monitoring of ground-disturbing work in these areas by a qualified archaeologist, and monitoring in the vicinity of identified resources that may be damaged by construction, if appropriate. The identification of sensitive locations subject to monitoring during construction of each individual development phase shall be performed in concert with monitoring activities performed under the PA to minimize the potential for conflicting requirements.

- For each resource that is determined eligible for the CRHR, the applicable agency or the project applicant(s) of all project phases (under the agency's direction) shall obtain the services of a qualified archaeologist who shall determine if implementation of the individual project development phase would result in damage or destruction of "significant" (under CEQA) cultural resources. These findings shall be reviewed by the applicable agency for consistency with the significance thresholds and treatment measures provided in this EIR/EIS.

- Where possible, the project shall be configured or redesigned to avoid impacts on eligible or listed resources. Alternatively, these resources may be preserved in place if possible, as suggested under California Public Resources Code Section 21083.2.

- Where impacts cannot be avoided, the applicable agency or the project applicant(s) of all project phases (under the applicable agency's direction) shall prepare and implement treatment measures that are determined to be necessary by a qualified archaeologist. These measures may consist of data recovery excavations for resources that are eligible for listing because of the data they contain (which may contribute to research). Alternatively, for historical architectural, engineered, or landscape features, treatment measures may consist of a preparation of interpretive, narrative, or photographic documentation. These measures shall be reviewed by the applicable oversight agency for consistency with the significance thresholds and standards provided in this EIR/EIS.

- To support the evaluation and treatment required under this mitigation measure, the archaeologist retained by either the applicable oversight agency or the project applicant(s) of all project phases shall prepare an appropriate prehistoric and historic context that identifies relevant prehistoric,

ethnographic, and historic themes and research questions against which to determine the significance of identified resources and appropriate treatment.

- These steps and documents may be combined with the phasing of management and documents prepared pursuant to the PA to minimize the potential for inconsistency and duplicative management efforts.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: The applicable oversight agency and the project applicant(s) (at the agency's direction) of all project phases

Timing: Before issuance of building permits and ground-disturbing activities.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.

RIM

The Resource Impact Minimization Alternative was designed to avoid construction or development activities within the dense cluster of cultural resources that occurs in the northwest portion of the SPA. Thus, adverse impacts to the majority of the known cultural resources in the SPA would be avoided under this alternative. However, documented cultural resources occur throughout the SPA, both within the SPA and in the vicinity of off-site elements. The quality and range of identified resources as described in Appendix E2 suggests that some of these resources that would be adversely affected by the Resource Impact Minimization Alternative are likely eligible for listing on the NRHP or CRHR. Because construction activity under the Resource Impact Minimization Alternative could result in damage or destruction of these resources, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.5-1a and 3A.5-1b.

Implementation of Mitigation Measures 3A.5-1a and 3A.5-1b would substantially reduce the level of direct impacts on identified cultural resources under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives, but not to a less-than-significant level. Because this potential impact would not be fully reduced and because it would not be feasible to avoid all direct impacts to identified resources, ground-disturbing work could still result in direct impacts to cultural resources, some of which are likely to be eligible for listing on the CRHR and NRHP. Additionally, some of the off-site elements (two roadway connections in El Dorado County and detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Even if the affected county(ies) cooperate in allowing and enforcing the mitigation, the impacts to the off-site elements would not be fully reduced to a less-than-significant level. Therefore, under all alternatives, impacts to identified cultural resources are considered **potentially significant and unavoidable**.

IMPACT 3A.5-2 **Possible Destruction of or Damage to Previously Undiscovered Cultural Resources from Ground-Disturbance or Other Construction-Related Activities.** *Construction activities during project implementation could result in the destruction of or damage to "significant" (under CEQA) undiscovered cultural resources.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, existing patterns of agricultural land use would continue under the AG-80 zoning and land use designation in the SPA, and would also continue in the Water Study Area because no off-site water facilities would be constructed. Because agricultural production and construction of rural residences include ground-disturbing work, these activities could potentially damage or destroy previously unknown and undiscovered cultural resources. If these resources were determined to be "significant" under CEQA, any damage or destruction would be considered a significant impact. Because there are no Sacramento County General Plan policies that would protect these cultural resources on private land that is zoned for agricultural use, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Greater]***

NCP, PP, CD, RHD

The density of documented resources within the SPA and in the vicinity of the off-site elements suggests that the entire project footprint is also sensitive for previously unidentified and currently unknown cultural resources. These resources may be obscured by surface vegetation or thin overlying strata of culturally sterile soils, with little surface manifestation; thus, it is unlikely that a surface inventory effort would not identify all cultural resources that could be disturbed or destroyed by ground-disturbing construction activities associated with the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development Alternatives. If these resources were determined to be "significant" under CEQA, disturbance or destruction would be a significant impact. Therefore, **direct** impacts to previously undiscovered cultural resources are considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.5-2: Conduct Construction Personnel Education, Conduct On-Site Monitoring if Required, Stop Work if Cultural Resources are Discovered, Assess the Significance of the Find, and Perform Treatment or Avoidance as Required.

To reduce potential impacts to previously undiscovered cultural resources, the project applicant(s) of all project phases shall do the following:

- Before the start of ground-disturbing activities, the project applicant(s) of all project phases shall retain a qualified archaeologist to conduct training for construction workers, to educate them about the possibility of encountering buried cultural resources, and inform them of the proper procedures should cultural resources be encountered.

- As a result of the work conducted for Mitigation Measures 3A.5-1a and 3A.5-1b, if the archaeologist determines that any portion of the SPA or the off-site elements should be monitored for potential discovery of as-yet-unknown cultural resources, the project applicant(s) of all project phases shall implement such monitoring in the locations specified by the archaeologist.

- Should any cultural resources, such as structural features, unusual amounts of bone or shell, artifacts, or architectural remains be encountered during any construction activities, work shall be suspended in the vicinity of the find and the appropriate oversight agency(ies) (identified below) shall be notified immediately. The appropriate oversight agency(ies) shall retain a qualified archaeologist who shall conduct a field investigation of the specific site and shall assess the significance of the find by

evaluating the resource for eligibility for listing on the CRHR and the NRHP. If the resource is eligible for listing on the CRHR or NRHP and it would be subject to disturbance or destruction, the actions required in Mitigation Measures 3A.5-1a and 3A.5-1b shall be implemented. The oversight agency shall be responsible for approval of recommended mitigation if it is determined to be feasible in light of the approved land uses, and shall implement the approved mitigation before resuming construction activities at the archaeological site.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before and during ground-disturbing activities.

Enforcement:

1. For actions taken to satisfy the requirements of Section 106: the SHPO and USACE.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
5. For the U.S. 50 interchange improvements: Caltrans.

RIM

Because buildout of the specific plan under the Resource Impact Minimization Alternative would avoid most of the known cultural resources in the SPA, it is probable that potential impacts to many of the previously unknown cultural resources would be avoided or minimized as well. However, because previously unknown cultural resources could be encountered anywhere in the SPA or within the off-site elements, ground-disturbing activities under the Resource Impact Minimization Alternative may still adversely affect unknown cultural resources. If these resources were determined to be "significant" under CEQA, disturbance or destruction would be a significant impact. Therefore, **direct** impacts to previously undiscovered cultural resources are considered **potentially significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.5-2.

Implementation of Mitigation Measure 3A.5-2, and Mitigation Measures 3A.5-1a and 3A.5-1b if required, would reduce the potentially significant impacts from possible damage or destruction of previously unknown cultural resources under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives, but not to a less-than-significant level. Although construction worker personnel training would be conducted, construction monitoring would occur (if determined to be necessary by the qualified archaeologist), and evaluation and treatment of resources after they are discovered as required under Section 106 and CEQA would occur, the potential remains that "significant" (under CEQA) cultural deposits could be disturbed during construction and other ground-disturbing activities before they can be identified and protected under all action alternatives. Additionally, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Even if the affected county(ies)/Caltrans

cooperate in allowing and enforcing the mitigation, the impacts to the off-site elements would not be fully reduced to a less-than-significant level. Therefore, under all of the action alternatives, potential impacts to previously unknown cultural resources are considered **potentially significant and unavoidable.**

IMPACT 3A.5-3 Possible Destruction of or Damage to Interred Human Remains during Construction. *Ground-disturbing activities could inadvertently disinter and/or destroy buried human skeletal remains.*

On-Site and Off-Site Elements

NP, NCP, PP, RIM, CD, RHD

Under the No Project Alternative, existing agricultural land uses and construction of up to 44 rural residences consistent with the AG-80 zoning under the Sacramento County General Plan would continue, but no off-site facilities would be constructed. These activities could inadvertently disinter and destroy interred human remains. Under the five action alternatives, while no documented prehistoric or historic burial sites occur within the SPA or in the vicinity of the off-site elements, the density and number of identified resources suggests that there is at least the potential that interred human remains exist in the project footprint. Ground-disturbing activities associated with the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives may inadvertently disinter or destroy these remains. Therefore, this **direct** impact is considered **potentially significant**. No indirect impacts would occur. ***[Similar]***

Mitigation Measure 3A.5-3: Suspend Ground-Disturbing Activities if Human Remains are Encountered and Comply with California Health and Safety Code Procedures.

In accordance with the California Health and Safety Code, if human remains are uncovered during ground-disturbing activities, including those associated with off-site elements, the project applicant(s) of all project phases shall immediately halt all ground-disturbing activities in the area of the find and notify the applicable county coroner and a professional archaeologist skilled in osteological analysis to determine the nature of the remains. The coroner is required to examine all discoveries of human remains within 48 hours of receiving notice of a discovery on private or public lands (California Health and Safety Code Section 7050.5[b]). If the coroner determines that the remains are those of a Native American, he or she must contact the NAHC by phone within 24 hours of making that determination (California Health and Safety Code Section 7050[c]).

After the coroner's findings are complete, the project applicant(s), an archaeologist, and the NAHC-designated MLD shall determine the ultimate treatment and disposition of the remains and take appropriate steps to ensure that additional human interments are not disturbed. The responsibilities for acting on notification of a discovery of Native American human remains are identified in Section 5097.9 of the California Public Resources Code.

Upon the discovery of Native American remains, the procedures above regarding involvement of the applicable county coroner, notification of the NAHC, and identification of an MLD shall be followed. The project applicant(s) of all project phases shall ensure that the immediate vicinity (according to generally accepted cultural or archaeological standards and practices) is not damaged or disturbed by further development activity until consultation with the MLD has taken place. The MLD shall have at least 48 hours after being granted access to the site to inspect the site and make recommendations. A range of possible treatments for the remains may be discussed: nondestructive removal and analysis, preservation in place, relinquishment of the remains and associated items to the descendants, or other culturally appropriate treatment. As suggested by Assembly Bill (AB) 2641 (Chapter 863, Statutes of 2006), the concerned parties may extend discussions beyond the initial 48 hours to allow for the discovery

of additional remains. AB 2641(e) includes a list of site protection measures and states that the project applicant(s) shall comply with one or more of the following requirements:

- record the site with the NAHC or the appropriate Information Center,
- use an open-space or conservation zoning designation or easement, or
- record a document with the county in which the property is located.

The project applicant(s) or its authorized representative of all project phases shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the NAHC is unable to identify an MLD or if the MLD fails to make a recommendation within 48 hours after being granted access to the site. The project applicant(s) or its authorized representative may also reinter the remains in a location not subject to further disturbance if it rejects the recommendation of the MLD and mediation by the NAHC fails to provide measures acceptable to the landowner. Ground disturbance in the zone of suspended activity shall not recommence without authorization from the archaeologist.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Upon the discovery of suspected human remains.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measure 3A.5-3 would reduce the potentially significant impact associated with the possible destruction of human remains under the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level by immediately suspending work in the vicinity of the discovery and complying with state laws requiring contact with the applicable county coroner and a professional archaeologist to determine the nature of the find, and subsequent contact with the NAHC and appropriate treatment if the remains are determined to be those of a Native American. However, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

3A.5.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of Mitigation Measure 3A.5-3, potential impacts to previously unknown human remains would be reduced to a **less-than-significant** level. Implementation of Mitigation Measures 3A.5-1a, 3A.5-1b, and 3A.5-2 would minimize significant and potentially significant impacts to cultural resources to the extent feasible. These mitigation measures require that for each individual development phase dependent on Federal and local permitting and authorization, cultural resources must be inventoried, evaluated, and avoided where feasible (Mitigation Measures 3A.5-1a, 3A.5-1b). When resources cannot be avoided, appropriate documentation or data

recovery excavation must be performed. Locations of known cultural resources must be monitored for the potential discovery of cultural resources under Mitigation Measure 3A.5-2. Beyond the inventory, evaluation, treatment, and monitoring required in this document, there are no other feasible mitigations measures that may be performed to minimize potentially significant impacts on cultural resources. Therefore, impacts on identified and previously undiscovered cultural resources would be potentially **significant and unavoidable**.

In addition, some of the off-site elements fall under the jurisdiction of El Dorado County, Sacramento County, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these interchange improvements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of these other agencies, Impacts 3A.5-1 through 3A.5-3 are considered potentially significant and unavoidable for off-site improvements which would be located in the jurisdiction of El Dorado County, Sacramento County, or Caltrans.

3B.5 CULTURAL RESOURCES – WATER

3B.5.1 AFFECTED ENVIRONMENT SETTING

As provided in Chapter 2, "Alternatives," the placement of new structural facilities as part of the Off-site Water Facility Alternatives would be limited to Zone 4 of the "Water" Study Area and, therefore, the description of the affected environment for cultural resources is focused to Zone 4. No new facilities are proposed within Zones 1, 2, and 3 and, therefore, no additional description of Zones 1, 2, and 3 is necessary to support the analysis of potential impacts to historical and archaeological resources.

PREHISTORIC BACKGROUND

There is substantial evidence that much of the Great Valley and the riverine environments surrounding the meandering San Joaquin and Sacramento Rivers have been occupied throughout most of the Holocene – or last 10,000 years. The reconstruction of pioneering cultures predating 5,000 years has proven difficult given the rapid erosional patterns of the Central Valley. These processes have redeposited or deeply buried the evidence of much of these previous cultures. However, much of what is known has been assembled from the paleo-environmental context of the region and through theoretical explanations for predicting human behavior in specific environmental settings.

In addition, a number of human occupation sites have revealed artifact assemblages that have shaped much of the ethno-archaeological knowledge of the region. Lillard, Heizer, and Fenenga (1939) were the first to describe a sequence of prehistoric cultures in Central California, and defined three successive phases of cultural patterns, which they called the Early, Middle, and Late Horizons. By and large, a transition from one phase to another was marked by changes in the archaeological record, such as change in subsistence practices, disposition of burials, social organization, and related artifact assemblages. Unfortunately, by placing numerous cultures into a temporal horizon, the inherent cultural variation of a region is sometimes lost. In order to address this issue, Ragir (1972) suggested that the relatively uniform periods of Early, Middle, and Late Horizons be substituted for the Windmiller, Cosumnes, and Hotchkiss Cultures, respectively. In so doing, research developments could be incorporated into each culture and allow for a greater degree of variability in the archaeological record.

ETHNOGRAPHIC SETTING

Before the influx of Euro-American populations to the region on a large scale beginning in the 1840s and 1850s, Native American groups identified as the Southern Maidu or Nisenan inhabited Zone 4 of the "Water" Study Area and continue to do so today. Ethnographically, the southern boundary of Nisenan territory was to the south of present-day Highway 50 and in prehistoric and ethnographic times, there likely would have been extensive contact with the neighboring Miwok groups. Although cultural group boundaries were almost never as well-defined as depicted in historic references and today's literature, in general, Zone 4 of the "Water" Study Area was likely more closely associated with the Nisenan than the Miwok at least at the time of sustained Euro-American contact (Sacramento Country 2008a).

HISTORICAL BACKGROUND

Historic-era settlement and activities appear to have been sparse within and near Zone 4 of the "Water" Study Area prior to the discoveries of gold in the region and the ensuing Gold Rush beginning in 1849. Commonly, one of the most influential events to have occurred in many parts of California was the granting of large tracts of land by the Mexican government during the 1830s and 1840s. The nearest such grant was the Rancho Rio de los Americanos within which a portion of Zone 4 of the "Water" Study Area is situated. This rancho originally consisted of thirty five thousand acres (Barrows 1999) and extended from the eastern border of new Helvetia (east

of Sacramento) along the south bank of the American River, to the eastern end of present day Folsom (Sacramento County 2008a).

Organized in 1851 by A.P. Catlin, the Natoma Water and Mining Company provided water via canal from the American River to miners in the Folsom area. By 1853 the canal reached Prairie City, which was located near the northeastern Off-site Water Facilities Study Area boundary where U.S. 50 crosses Prairie City Road. Later known as the Natomas Company, it also operated dragline and bucket-line gold dredges along the American and Cosumnes Rivers from 1900 through the 1950s, producing the largest amount of gold in the county. The dredge fields, located mainly within the northern half of Zone 4, were created with heavy equipment by the Natomas Company and the General Dredging Company, which likely destroyed most of the evidence of earlier types of small mining operations that occurred prior to the 1900s.

A subsidiary of GenCorp, Aerojet-General purchased land from the Natomas Company and opened their plant in Sacramento in the early 1950s. Aerojet then began developing, testing, and building liquid and solid propellant rocket systems for national space and defense programs, using the dredge tailings as natural barriers for rocket testing and a buffer for the nearby communities. The Aerojet administration complex on the west and east sides of Aerojet Road was mainly constructed between 1955 and 1962; their industrial complex on Tennessee Avenue to the west of Prairie City Road was built primarily in the 1960s (Sacramento County 2008b).

Further to the south, agriculture was the main industry in the region during the late 19th and the early 20th centuries. The City of Rancho Cordova is named after the Cordova Vineyard, which was located in the center of the Rancho Rio de los Americanos land grant (Miller 1990). The property was used primarily for wheat cultivation or grazing until the 1920s (Sacramento County 2008a). By 1923, most of the property was owned by the Natomas Company. This area is generally identified for future urban growth under the County General Plan.

RESEARCH AND SURVEY METHODOLOGY

Archival

Tremaine and Associates conducted a cultural resources records search of pertinent survey and site data at the North Central Information Center (NCIC) of the California Historical Resources Information System at the California State University Sacramento, in January 2009 (Tremaine and Associates 2009). Tremaine and Associates then accessed the records for previous surveys and recorded sites within a 1/2 mile of Zone 4 of the "Water" Study Area. The records search included a review of the Directory of Properties in the Historic Property Data File for Sacramento County (Tremaine and Associates 2009) for information on sites of recognized historical significance in the National Register of Historic Places, California Register of Historical Resources, California Inventory of Historic Resources, California Historical Landmarks, and California Points of Historical Interest.

Results

The records search revealed a total of 83 sites that have been previously recorded within a 1/2-mile radius of Zone 4 of the "Water" Study Area. These sites are all listed in Appendix M-VI. Of the 83 sites, 19 are situated within various portions of the "Water" Study Area. Many of these sites are potentially associated with the American River (Folsom) Placer Mining District (CA-SAC-308-H; NRHP# 90000682), which encompasses entire portions of Zone 4. In addition, the records search revealed that a total of 96 surveys/studies have been conducted within, adjacent to, or within a 1/2-mile radius of Zone 4.

Table 3B.5-1 provides a summary of the historical and archaeological resources identified within Zone 4. In addition to the sites identified in the records search, Zone 4 of the "Water" Study Area also includes portions of White Rock Road (CA-SAC-1555H), which at one time was part of the Lincoln Highway; a major overland transportation route between Carson City and Sacramento during the Gold Rush era (Sacramento County 2008a).

3B.5.2 REGULATORY FRAMEWORK

The following regulatory framework identifies the national, state, and local criteria applicable to the study area.

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to cultural resources are relevant to the Off-site Water Facilities Alternatives, and are described in detail in Section 3A.5, "Cultural Resources – Land:"

- Section 106 of the National Historic Preservation Act
- Phased Identification, Evaluation, and Management of Cultural Resources under Section 106 of the National Historic Preservation Act

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to cultural resources are relevant to the Off-site Water Facilities Alternatives, and are described in detail in Section 3A.5, "Cultural Resources – Land:"

- California Environmental Quality Act

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County

Although Sacramento County does not currently have an historic preservation ordinance, the Sacramento County General Plan (General Plan) (1993) Conservation Element states the following goal:

> Promote the inventory, protection and interpretation of the cultural heritage of Sacramento County, including historical and archaeological settings, sites, building, features, artifacts and/or areas of ethnic, historical, religious or socio-economical importance.

The General Plan sets forth policies and programs under the following six objectives:

- **Objective:** Attention and care during project review and construction to ensure that cultural resource sites, either previously known or discovered on the project area, are properly protected with sensitivity to Native American values.
- **Objective:** Structures with architectural or historical importance preserved to maintain exterior design elements.
- **Objective:** Known archaeological and historic sites are protected from vandalism, unauthorized excavation, or accidental destruction.
- **Objective:** Comprehensive knowledge of archaeological and historic site locations.
- **Objective:** Properly stored and classified artifacts for ongoing study.
- **Objective:** Public awareness and appreciation of both visible and intangible historic and cultural resources.

City of Rancho Cordova

The following goals and policies of the City of Rancho Cordova's General Plan related to the protection of historical and archaeological resources and applicable to one or components of the Off-site Water Facilities Alternatives are as follows.

GOAL CHR.1: Identify and preserve the history of Rancho Cordova for future generations.

- **Policy CHR.1.1:** Establish, support, and fund programs that enhance Rancho Cordova's sense of community and identity, such as the collection of oral histories; genealogical research; and the acquisition of collections of historic artifacts, photographs, memorabilia, or other information relevant to the history of the City.

- **Policy CHR.1.3:** Establish review procedures for development projects that recognize the history of the area in conjunction with State and federal laws.

  - **Action CHR.1.3.1 –** Require historic resources and paleontological studies (e.g., archaeological and historical investigations) for all applicable discretionary projects, in accordance with CEQA regulations. The studies should identify paleontological, historic, or cultural resources in the project area, determine their eligibility for inclusion in the California Register of Historical Resources, and provide mitigation measures for any resources in the project area that cannot be avoided.

  - **Action CHR.1.3.2 –** Incorporate the following two conditions in applicable permits for all discretionary projects.

    The Planning Department shall be notified immediately if any cultural resources (e.g., prehistoric or historic artifacts) or paleontological resources (e.g., fossils) are uncovered during construction. All construction must stop in vicinity of the find and an archaeologist that meets the Secretary of the Interior's Professional Qualifications Standards in prehistoric or historical archaeology or a paleontologist shall be retained to evaluate the finds and recommend appropriate action.

    The Planning Department shall be notified immediately if any human remains are uncovered and all construction must stop in vicinity of the find. The Planning Division shall notify the County Coroner according to Section 7050.5 of California's Health and Safety Code. If the remains are determined to be Native American, the procedures outlined in CEQA Section 15064.5 (d) and (e) shall be followed.

3B.5.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines and Section 106 of the NHPA. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, an impact to cultural and historical resources would be considered significant if the Off-site Water Facilities would:

- cause a substantial adverse change in the significance of a historical resource;

- cause a substantial adverse change in the significance of an archaeological resource;

- disturb any human remains, including those interred outside of formal cemeteries, or;

- cause an adverse effect to a historic property as defined in the implementing regulations to Section 106 of the NHPA as described above (36 CFR Part 800.5[a][1]).

ANALYSIS METHODOLOGY

This programmatic analysis presents an evaluation of potential, adverse changes to the significance of local cultural resources based on the implementation of the Off-site Water Facility Alternatives as described in Chapter 2, "Alternatives." Section 3B.5.3 provides the standards for determining what constitutes a "substantial adverse change" when considering whether an impact on archaeological or historic resources is significant. Based on the results of the records search and as outlined in the setting description, portions of Zone 4 of the "Water" Study Area contain previously recorded historical and archaeological resources.

For those facilities whose specific locations cannot be identified now, including the WTP and pump station site(s), this assessment identifies what mitigation requirements would be required once project-specific site plans become available.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.5-1 Possible Destruction of or Damage to Known Prehistoric and Historic-Era Cultural Resources from Ground-Disturbance or Other Construction-Related Activities. *Construction activities associated with the Off-site Water Facility Alternatives could result in the destruction of or damage to known prehistoric and historic-era cultural resources that are potentially eligible for or listed on the CRHR or NRHP.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, and 3A

As provided in Table 3B.5-1, portions of the historic alignment of White Rock Road are listed as a historical resource and are located within or immediately adjacent to the conveyance alignment for these alternatives. This historical roadway is potentially subject to disturbance as a result of Off-site Water Facilities construction; especially if constructed within the roadway. However, the County is currently planning to realign and widen portions White Rock Road within Zone 4 of the "Water" Study Area, which is further described in the White Rock Road Widening EIR and incorporated by reference into this EIR/EIS. Based on this circumstance, it is possible that installation of the conveyance portion of these Off-site Water Facility Alternatives could occur concurrently with the widening project thereby minimizing potential impacts to this historical resource. However, in addition to White Rock Road, other historic-era resources have also been identified on portions of the White Rock WTP site and in close proximity to White Rock Road [see Appendix M–VI]. In addition, the On-Site WTP is located in an area potentially containing historical resources. As a result, construction-related direct impacts to these previously-documented resources could be **potentially significant**. **No indirect** impacts would result. ***[Similar]***

Construction-related excavation for the conveyance pipeline and other above-ground facilities under these alternatives carries to the potential to adversely affect previously recorded archaeological sites, as identified in Table 3B.5-1. As a result, potential construction-related impacts to these previously documented archaeological resources could be potentially significant if these resources qualify as unique archaeological resource or historical resources within the meaning of CEQA or historic properties within the meaning of Section 106 of the NHPA.

Mitigation Measure: Implement Mitigation Measures 3A.5-1a and 3A.5-1b.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of final design and start of construction

Enforcement:

1. For actions taken to satisfy the requirements of Section 106: the SHPO and USACE.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For off-site improvements within unincorporated Sacramento County and the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

4 and 4A

These alternatives would involve physical ground disturbance during construction; but would avoid White Rock Road. Instead, the alignment for these alternatives traverses through the Alder Creek Corridor Mining District (CA-SAC-1008H) along the alignment of the planned Easton Valley Parkway. This district represents a lengthy period of mining from 1849 to 1945, and entails numerous loci of gold mining activity. In addition to the established mining district, numerous historic-era sites are identified along the planned Easton Valley Parkway. Although construction of this alignment could occur concurrent with the planned Easton Valley Parkway, there is a potential for encountering previously recorded historic-era historical resources during construction. If these

resources qualify as historical resources per CEQA criteria or historic properties per Section 106 and ground-disturbing construction disturbed or altered the characteristics of these resources that contribute to their significance, this impact would be significant. Thus, the construction of these alternatives could result in **potentially significant** direct impacts on cultural resources. **No indirect** impacts would result. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3A.5-1a and 3A.5-1b.

Implementation of Mitigation Measures 3A.5-1a and 3A.5-1b would substantially reduce the level of direct impacts on identified cultural resources under the No USACE Permit, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A, but not to a less-than-significant level. Because this potential impact would not be fully reduced and because it would not be feasible to avoid all direct impacts to identified resources, ground-disturbing work could still result in direct impacts to historic and cultural resources. Additionally, portions of the off-site water facilities fall under the jurisdiction of Sacramento County and the City of Rancho Cordova; therefore, neither the City nor the project applicant(s) would have control over timing or implementation of mitigation measures. Even if the affected jurisdictions cooperate in allowing and enforcing the mitigation, the impacts would not be fully reduced to a less-than-significant level. Therefore, under all alternatives, impacts to identified cultural resources are considered **potentially significant and unavoidable**.

IMPACT 3B.5-2 Possible Destruction of or Damage to Previously Undiscovered Cultural Resources from Ground-Disturbance or Other Construction-Related Activities. *Construction activities during project implementation could result in the destruction of or damage to "significant" (under CEQA) undiscovered cultural resources.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Although the Off-site Water Facilities conveyance routes would generally be constructed within existing roadway right-of-way, this design feature would not completely avoid the potential for encountering previously unidentified archaeological resources. A similar situation could exist for the pump station and WTP sites. Given that traditional survey methods are constrained along roadways due to the presence of pavement, thick annual grasslands along roadway shoulders and WTP sites and the presence of fill materials, buried or previously unidentified resources can be easily obscured. As a result, construction could inadvertently unearth and damage previously unidentified archaeological resources that could qualify as unique archaeological resources or historical resources under CEQA or historic properties within the meaning of Section 106. For the above reasons, this direct impact could be **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.5-2.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of final design and start of construction

Enforcement:

1. For actions taken to satisfy the requirements of Section 106: the SHPO and USACE.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For off-site improvements within unincorporated Sacramento County and the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Implementation of Mitigation Measure 3A.5-2 would substantially reduce the level of direct impacts on previously unknown cultural resources under the No USACE Permit, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A, but not to a less-than-significant level. Because this potential impact would not be fully reduced and because it would not be feasible to avoid all direct impacts to resources, ground-disturbing work could still result in direct impacts to historic and cultural resources. Additionally, portions of the off-site water facilities fall under the jurisdiction of Sacramento County and the City of Rancho Cordova; therefore, neither the City nor the project applicant(s) would have control over timing or implementation of mitigation measures. Even if the affected jurisdictions cooperate in allowing and enforcing the mitigation, the impacts would not be fully reduced to a less-than-significant level. Therefore, under all alternatives, impacts to identified cultural resources are considered **potentially significant and unavoidable**.

IMPACT 3B.5-3 Possible Destruction of or Damage to Interred Human Remains during Construction. *Ground-disturbing activities could inadvertently disinter and/or destroy buried human skeletal remains.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

While no evidence exists to indicate that human burials occurred within the Off-site Water Facilities Study Area, the Off-site Water Facilities alignments may cross areas that could contain buried prehistoric or historic-era human remains that may not be identified in preconstruction inventories required above. Unidentified buried human remains that were not identified during field investigations could be inadvertently unearthed during construction-related activities, which could result in damage to these remains. Damage would be considered a **direct significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.5-3.

Implementation: City of Folsom Utilities Department

Timing: Before issuance of building permits and ground-disturbing activities.

Enforcement:

1. For actions taken to satisfy the requirements of Section 106: the SHPO and USACE.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For off-site improvements within unincorporated Sacramento County and the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

With the application of the proposed mitigation, disturbances to previously undocumented human interments would be minimized. In addition and specifically in the case of the discovery of Native American human remains, as long as the MLD and the property owner can reach an agreement as to the ultimate treatment and disposition of the remains, this impact would be reduced to a **less-than-significant** level.

3B.5.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of Mitigation Measure 3A.5-3, potential impacts to previously unknown human remains would be reduced to a less-than-significant level. Implementation of Mitigation Measures 3A.5-1a, 3A.5-1b, and 3A.5-2 would minimize significant and potentially significant impacts to cultural resources to the extent feasible. These mitigation measures require that cultural resources must be inventoried, evaluated, and avoided where feasible (Mitigation Measures 3A.5-1a, 3A.5-1b). When resources cannot be avoided, appropriate documentation

or data recovery excavation must be performed. Locations of known cultural resources must be monitored for the potential discovery of cultural resources under Mitigation Measure 3A.5-2. Beyond the inventory, evaluation, treatment, and monitoring required in this document, there are no other feasible mitigations measures that may be performed to minimize potentially significant impacts on cultural resources. Therefore, impacts on identified and previously undiscovered cultural resources would be potentially significant and unavoidable.

In addition, some of the off-site water facilities fall under the jurisdiction of Sacramento County or the City of Rancho Cordova; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these interchange improvements. Because the City does not control implementation of mitigation measures in areas under the jurisdiction of these other agencies, Impacts 3A.5-1 through 3A.5-3 are considered potentially significant and unavoidable for off-site improvements which would be located in the jurisdiction of Sacramento County or the City of Rancho Cordova.

3A.6 ENVIRONMENTAL JUSTICE – LAND

This section contains a program-level evaluation of environmental justice issues. However, environmental justice impacts would be the same under each individual development phase as under the program (entire SPA) analysis.

3A.6.1 AFFECTED ENVIRONMENT

RACIAL DISTRIBUTION

Table 3A.6-1 shows the racial and ethnic composition of the population in Folsom, Sacramento County, and El Dorado Hills, which is a census designated place (CDP) within unincorporated El Dorado County. El Dorado Hills data is included because, under the Proposed Project Alternative, there would be off-site roadway connections into El Dorado Hills to connect with existing roadways. It should be noted that the data presented in Table 3A.6-1 includes the racial and ethnic characteristics of Folsom Prison and California State Prison Sacramento population. In general, the population of Folsom Prison and California State Prison Sacramento affect the statistics for the City as a whole because the prison population is more racially and ethnically diverse (City of Folsom 2008:10).

The populations of the City of Folsom, Sacramento County, and El Dorado Hills are predominantly white. The white population in the City of Folsom accounted for 77.9% of the population in 2000 and 74.7% in 2007. Similarly, Sacramento County's white population accounted for 64.0% of the population in 2000, and 61.4% in 2007. El Dorado Hills' white population accounted for 90.1% in 2000 and 81.5% in 2007. The white population decreased in Folsom, Sacramento County, and El Dorado Hills between 2000 and 2007 while the Black/African American, Asian, and Latino populations increased during the same period. However, the populations of Folsom, Sacramento County, and El Dorado Hills remained predominantly white.

The Black/African American population in Folsom increased from 6.0% to 6.5% between 2000 and 2007. The Black/African American population in Sacramento County generally remained the same. The Black/African American population of El Dorado Hills increased approximately 1% from 0.8% in 2000 to 1.9% in 2007.

For Folsom, Sacramento County, and El Dorado Hills, the American Indian/Alaskan Native and Native Hawaiian/ Pacific Islander populations generally remained the same between 2000 and 2007, comprising approximately 1% or less of the total population in each location.

The Asian population in Folsom and El Dorado Hills grew substantially between 2000 and 2007, increasing from 7.2% to 10.5% in Folsom and from 4.1% to 12.3% in El Dorado Hills. Sacramento County's Asian population also increased from 11.0% to 13.4% between 2000 and 2007.

Folsom's Hispanic/Latino population increased slightly from 9.5% to 10.1% between 2000 and 2007. Sacramento County had a larger population of Hispanic/Latino residents than Folsom, and the Hispanic/Latino population increased from 16.0% to 19.2% during the same period. The Hispanic/Latino population also increased in El Dorado Hills from 5.0% in 2000 to 8.4% in 2007.

Table 3A.6-2 shows the racial composition of the population in Folsom excluding persons in Folsom Prison and California State Prison Sacramento. When compared to Table 3A.6-1 above, the racial composition of Folsom is less racially and ethnically diverse. The white population in the City increases from 77.9% to 81.0%. The largest decrease was shown in the Black/African American population, which decreased from 6% to 3.8%, followed by the Hispanic/Latino population, which decreased from 9.5% to 8.2%. The percentage of American Indian/Alaskan Native, Asian, and Native Hawaiian/other Pacific Islander populations generally remains the same. (City of Folsom 2008:11.)

Table 3A.6-1
Population Distribution by Race and Ethnicity for the City of Folsom, Sacramento County, and El Dorado Hills

Race/Ethnicity [1]	2000		2007[1]	
	Population	Percent of Total [2]	Population	Percent of Total [2]
City of Folsom				
White (non-Hispanic)	40,415	77.9	53,085	74.7
Black or African American	3,108	6.0	4,650	6.5
American Indian or Alaskan Native	302	0.6	300	0.4
Asian	3,731	7.2	7,475	10.5
Native Hawaiian or other Pacific Islander	100	0.2	33	0.0
Other [3]	4,227	8.1	5,551	7.8
Hispanic or Latino [4]	4,914	9.5	7,208	10.1
Sacramento County				
White (non-Hispanic)	783,240	64.0	842,858	61.4
Black or African American	121,804	10.0	138,501	10.1
American Indian or Alaskan Native	13,359	1.1	12,680	0.9
Asian	134,899	11.0	184,209	13.4
Native Hawaiian or other Pacific Islander	7,264	0.6	10,731	0.8
Other [3]	162,933	13.3	184,794	13.4
Hispanic or Latino [4]	195,890	16.0	263,610	19.2
El Dorado Hills				
White (non-Hispanic)	16,234	90.1	26,434	81.5
Black or African American	139	0.8	604	1.9
American Indian or Alaskan Native	83	0.5	126	0.4
Asian	740	4.1	3,992	12.3
Native Hawaiian or other Pacific Islander	30	0.2	0	0
Other [3]	247	1.4	852	2.6
Hispanic or Latino [4]	896	5.0	2,717	8.4

Notes:
The percent of total may add to more than 100% because individuals may report more than one race.

[1] The U.S. Census Bureau's 2007 data is based on data collected over a 3-year time period and represents the average characteristics of Folsom and Sacramento between 2005 and 2007.

[2] Includes the Folsom Prison population.

[3] Includes the "other" racial category and "two or more races."

[4] The U.S. Census Bureau considers Hispanic and Latino as an ethnicity, not a race. Consequently, a person of Hispanic or Latino descent could identify racially as White, Black/African American, Native American, Asian, or other.

Sources: U.S. Census Bureau 2000, 2007

Table 3A.6-2
2000 Population Distribution by Race and Ethnicity for the City of Folsom Excluding the Prison Population

Race/Ethnicity	Population	Percent of Population[1]
White (non-Hispanic)	39,533	81.0
Black or African American	1,832	3.8
American Indian or Alaskan Native	290	0.6
Asian	3,701	7.6
Native Hawaiian or other Pacific Islander	100	0.2
Other[2]	3,358	6.9
Hispanic or Latino (of any race)[3]	4,006	8.2

Notes:
[1] The percent of total may add to more than 100% because individuals may report more than one race.
[2] Includes the "other" racial category and "two or more races."
[3] The U.S. Census Bureau considers Hispanic and Latino as an ethnicity, not a race. Consequently, a person of Hispanic or Latino descent could identify racially as White, Black/African American, Native American, Asian, or other.
Source: City of Folsom 2008

INCOME CHARACTERISTICS

Median household income and per capita income represent widely used indicators of social well-being. Table 3A.6-3 shows the 1999 and 2007 median household income and per capita income in the City of Folsom, Sacramento County, and El Dorado Hills. In 1999, the City of Folsom's median income was $73,175 and its per capita income was $30,210, compared to a median income of $43,816 and a per capita income of $21,142 in Sacramento County. El Dorado Hills had the highest median income and per capita income, $93,483 and $40,239, respectively. Median income and per capita income increased in Folsom, Sacramento County, and El Dorado Hills between 1999 and 2007; however, Folsom's income remained greater than the county's income and El Dorado Hills remained the highest. In 2007, Folsom's median income was $89,865 and its per capita income was $36,207; the county's median income was $55,882 and its per capita income was $26,405; and El Dorado Hills' median income $113,927 and per capita $44,878.

Table 3A.6-3
Median Household Income and Per Capita Income for the City of Folsom, Sacramento County, and El Dorado Hills

Community	Median Household Income		Per Capita Income[1]	
	1999	2007[2]	1999	2007[2]
City of Folsom	$73,175	$89,865	$30,210	$36,207
Sacramento County	$43,816	$55,882	$21,142	$26,405
El Dorado Hills	$93,483	$113,927	$40,239	$44,878

Notes:
[1] Per capita income is the mean income computed for every man, woman, and child residing in Folsom, Sacramento County, and El Dorado Hills, respectively.
[2] The U.S. Census Bureau's 2007 data is based on data collected over a 3-year time period and represents the average characteristics of Folsom and Sacramento between 2005 and 2007.
Sources: U.S. Census Bureau 2000, 2007; Sacramento County 2008

The City of Folsom's and El Dorado Hills' median household income and per capita income are substantially greater than the county's median household income and per capita income. This difference can be accounted for in part because patterns of household income in Sacramento County vary by geography. The highest income communities, such as Folsom, Rancho Murieta, Gold River, and Wilton, had incomes that were twice or more than the lowest income communities, such as Parkway-South, Foothill Farms, and the City of Sacramento (Sacramento County 2008:5-8).

POVERTY LEVEL

Poverty rates represent the percentage of an area's total population living at or below the poverty threshold established by the U.S. Census Bureau. Table 3A.6-4 shows the 1999 and 2007 percent of persons below poverty level in Folsom, Sacramento County, and El Dorado Hill. In 1999, approximately 7.3% of Folsom's residents, 14.1% of Sacramento County's residents, and 1.7% of El Dorado Hills' residents were below poverty level. Poverty levels have declined in Folsom and Sacramento County between 1999 and 2007, to 3.3% and 12.5%, respectively. In El Dorado Hills, the percentage of residents below the poverty level increased to 3.5% in 2007. The poverty levels in El Dorado Hills and Folsom are substantially less than that of Sacramento County. This difference is a result of the variation in poverty rates among communities in Sacramento County. Poverty rates among higher income communities, such as such as Folsom, Rancho Murieta, Gold River, and Wilton, ranged from 2% or less while poverty rates among the lowest income communities, such as Parkway-South, Foothill Farms, and the City of Sacramento, ranged from 19% or more (Sacramento County 2008:5-9).

Table 3A.6-4
Poverty Level for the City of Folsom, Sacramento County, and El Dorado Hills

Community	Percent of Persons Below Poverty Level	
	1999	2007[1]
City of Folsom	7.3	3.3
Sacramento County	14.1	12.5
El Dorado Hills	1.7	3.5

Notes:
[1] The U.S. Census Bureau's 2007 data is based on data collected over a 3-year time period and represents the average characteristics of Folsom and Sacramento between 2005 and 2007.
Sources: U.S. Census Bureau 2000, 2007; Sacramento County 2008

3A.6.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

National Environmental Policy Act, Section 1502

Provisions in NEPA found in Section 1502.16(c) of the Code of Federal Regulations (CFR) (40 CFR 1502.16[c]) require Federal agencies to identify potential conflicts between a proposed action and the related plans and policies of Federal, State, and local agencies and Native American tribes. This requirement helps Federal agencies identify potential conflicts that may cause adverse effects on the social and economic environment of a study area because many agencies' and tribes' plans and policies are designed to protect the people residing within their jurisdictions and/or the local economy they depend upon for their economic livelihoods (NEPAnet 2008).

Council on Environmental Quality

The Council on Environmental Quality's (CEQ) Regulations for Implementing the Procedural Provisions of NEPA (40 CFR 1500–1508) provide guidance related to social and economic impact assessments by noting that the "human environment" assessed under NEPA is to be "interpreted comprehensively" to include "the natural and physical environment and the relationship of people with that environment" (40 CFR 1508.14). Furthermore, these regulations require agencies to assess "aesthetic, historic, cultural, economic, social, or health" effects, whether direct, indirect, or cumulative (40 CFR 1508.8).

Executive Order 12898

In 1994, President Bill Clinton issued Executive Order 12898 regarding environmental justice. This order requires Federal agencies to identify and address disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States. Two documents provide some measure of guidance to agencies required to implement this executive order: *Environmental Justice: Guidance under the National Environmental Policy Act* (CEQ 1997) and *Final Guidance for Incorporating Environmental Justice Concerns in EPA's NEPA Compliance Analysis* (U.S. Environmental Protection Agency [EPA] 1998). Both serve as guides for incorporating environmental justice goals into preparation of environmental impact statements under NEPA. These documents provide specific guidelines for determining whether there are any environmental justice issues associated with a proposed Federal project.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

California Environmental Protection Agency

The California Environmental Protection Agency (Cal/EPA) adopted an environmental justice policy in 2004 (Cal/EPA 2004). Pursuant to California Public Resources Code Sections 71110–71113, Cal/EPA developed this policy to provide guidance to its resource boards, departments, and offices. The policy is intended to support the state's goal of "achieving fair treatment of people of all races, cultures and incomes with respect to the development, adoption, implementation and enforcement of environmental laws and policies."

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no regional or local plans, policies, regulations, or laws related to environmental justice that are applicable to the Proposed Project or alternatives under consideration.

3A.6.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Based on CEQ and EPA guidelines (CEQ 1997, EPA 1998), the Proposed Project or alternatives under consideration were determined to result in a violation of Federal environmental justice principles if the Proposed Project or alternatives under consideration would cause impacts that are disproportionately high and adverse, either directly, indirectly, or cumulatively. To make a finding that disproportionately high and adverse impacts would likely fall on a minority or low-income population, three conditions must be met simultaneously:

- a minority or low-income population must reside in the impact zone,
- a high and adverse impact must exist, and
- the impact on the minority or low-income population must be disproportionately high and adverse.

The CEQ guidance indicates that, when determining whether the effects are high and adverse, agencies are to consider whether the risks or rates of impact are "significant" (as defined by NEPA) or above generally accepted norms.

ANALYSIS METHODOLOGY

According to CEQ and EPA guidelines, a minority population is present in a study area if the minority population of the affected area exceeds 50%, or if the minority population percentage of the affected area is meaningfully greater than the minority population percentage in the general population or other appropriate unit of geographic analysis. Under the same guidelines, a low-income population exists if the project study area is composed of 50% or more people living below the poverty threshold, as defined by the U.S. Census Bureau, or if the percentage of people living below the poverty threshold in the study area is substantially greater than the poverty percentage of the general population or other appropriate unit of geographic analysis.

For the purposes of an environmental justice screening, race, ethnic origin, income characteristics, and poverty status were obtained from the City of Folsom Draft Housing Element Background Report (2008), the Housing Element of the Sacramento County General Plan (2008), and the U.S. Census Bureau (2000, 2007) for the City of Folsom, Sacramento County, and El Dorado Hills. The City of Folsom and Sacramento County boundaries represent the primary area that is appropriate for consideration of environmental justice issues pursuant to EPA guidelines. El Dorado Hills is included in the area of consideration for environmental justice issues only for the Proposed Project Alternative, because it is the only alternative that would include off-site facilities (two roadway connections) in El Dorado Hills. The residential portions of the City of Folsom which are most immediately adjacent to the SPA (north of U.S. Highway 50) do not include concentrations of racial or ethnic groups compared to the City as a whole; similarly, household incomes and poverty rates are comparable to the entire city. Census data for this smaller area are only available from 2000, not 2007 because Census data is collected every 10 years. For this reason, 2007 Citywide data were used in this analysis.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.6-1 Potential Effects on Minority Populations. *Project implementation would not create a disproportionate placement of adverse environmental impacts on minority communities.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. The small amount of scattered rural residences would have no impact on a minority population; thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

As discussed above and shown in Table 3A.6-1, no minority population exceeds 50% in Folsom, Sacramento County, or El Dorado Hills. In 2000, the white population in Folsom (including persons in Folsom Prison),

Sacramento County, and El Dorado Hills was approximately 77.9%, 64%, and 90.1%, respectively. Although the white population decreased in Folsom, Sacramento County, and El Dorado Hills between 2000 and 2007 and the Black/African American, Asian, and Latino populations increased during the same period, these minority populations did not exceed 50% and the populations of Folsom, Sacramento County, and El Dorado Hills remained predominantly white.

Because the minority populations of Folsom, Sacramento County, and El Dorado Hills are less than 50%, implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would not cause a disproportionately high and adverse impact on minority populations. This would be a **less-than-significant**, **direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, roadway connections into El Dorado Hills, sewer force main, and the detention basin would occur within Folsom, Sacramento County, and El Dorado Hills. Because the minority populations of Folsom, Sacramento County, and El Dorado Hills are less than 50%, implementation of the off-site improvements would not cause a disproportionately high and adverse impact on minority populations. Therefore, this would be a **less-than-significant direct** impact. N**o direct** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.6-2 Potential Effects on Low-Income Populations. *Project implementation would not create a disproportionate placement of adverse environmental impacts on low-income populations.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. No off-site water facilities would be constructed under this alternative. No development would occur under the No Project Alternative that could have a potential impact on a low-income population; thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RDH

When compared, the median household incomes and per capita incomes of the City of Folsom and El Dorado Hills are substantially greater than that of Sacramento County (Table 3A.6-3). In 1999, Folsom's median income was $73,175 and its per capita income was $30,210. In 1999, El Dorado Hills' median income was $93,483 and its per capita income was $40,239. However, in 1999, Sacramento County's median household income was $43,816 and its per capita income was $21,142. In 2007, Folsom's median household income was $89,865 and its per capita income was $36,207 and El Dorado Hills' median household income was $113,927 and its per capita income was $44,878. These are both greater than Sacramento County's 2007 median household income of $55,882 and its per capita income of $26,405.

Table 3A.6-4 shows the 1999 and 2007 percent of persons below poverty level in Folsom, Sacramento County, and El Dorado Hills. The percent of persons below poverty level in Folsom and El Dorado Hills was less than the

county's percentage in 1999 and 2007. In 1999, approximately 7.3% of Folsom's residents and 1.7% of El Dorado Hills' residents were below poverty level, while approximately 14.1% of Sacramento County's residents were below poverty level. In 2007, approximately 3.3% of Folsom's residents and 3.5% of El Dorado Hills' residents were below poverty level, compared to approximately 12.5% of Sacramento County's residents below poverty level.

Because the median household and per capita income and the poverty rate in Folsom and El Dorado Hills is less than that of Sacramento County, the Folsom and El Dorado Hills median household and per capita income and poverty rate is not meaningfully greater than the county's rate. Therefore, project implementation would not cause a disproportionately high and adverse impact on low-income populations. This would be a **less-than-significant**, **direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, roadway connections into El Dorado Hills, the sewer force main, and the drainage basin would occur within Folsom, Sacramento County, and El Dorado Hills. Because the median household and per capita income and the poverty rate in Folsom and El Dorado Hills is less than that of Sacramento County, the Folsom and El Dorado Hills median household and per capita income and poverty rate is not meaningfully greater than the county's rate. Therefore, implementation of off-site improvements would not cause a disproportionately high and adverse impact on low-income populations. This would be a **less-than-significant**, **direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3A.6.4 RESIDUAL SIGNIFICANT IMPACTS

Impacts associated with environmental justice are considered less than significant. Therefore, there would be no residual significant impacts.

This section was prepared by RMC Water and Environment.

3B.6 ENVIRONMENTAL JUSTICE – WATER

3B.6.1 AFFECTED ENVIRONMENT

The U.S. Environmental Protection Agency (EPA) defines environmental justice as: "The fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment means no group of people, including racial, ethnic, or economic groups should bear a disproportionate share of the negative environmental consequences resulting from industrial, municipal, and commercial operations or the execution of Federal, state, local, and tribal programs and policies.

The description of the affected environment as provided in Section 3A.6 "Environmental Justice – Land," for racial distribution, income characteristics, and poverty levels within Sacramento County would be applicable to Zone 4 of the "Water" Study Area. A review of minority and low-income housing data for Sacramento County produced as part of the 2035 Sacramento Metropolitan Transportation Plan (MTP), indicates that the conveyance alignments for Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A cross through an area identified as a low-income community; south of Mather Airport (SACOG 2008). This area includes census blocks: 1075, 1078–1080, 1083–1085, 1087, 1091–1097, and 1110–1115. No other low-income or minority communities are located within a half mile of Zone 4 of the "Water" Study Area.

3B.6.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to environmental justice are relevant to the Off-site Water Facility Alternatives, and are described in detail in 3A.6, "Environmental Justice – Land:"

- National Environmental Policy Act, Section 1502
- The Council on Environmental Quality's (CEQ) Regulations for Implementing the Procedural Provisions of NEPA
- Executive Order 12898

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to environmental justice are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.6, "Environmental Justice – Land:"

- California Environmental Protection Agency – California Public Resources Code Sections 71110–71113

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no regional or local plans, policies, regulations, or laws related to environmental justice that are applicable to the Off-site Water Facility Alternatives under consideration.

3B.6.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Based on CEQ and EPA guidelines (CEQ 1997, EPA 1998), the Off-site Water Facility Alternatives under consideration were determined to result in a violation of Federal environmental justice principles if the alternatives under consideration would cause impacts that are disproportionately high and adverse, either directly, indirectly, or cumulatively. To make a finding that disproportionately high and adverse impacts would likely fall on a minority or low-income population, three conditions must be met simultaneously:

- a minority or low-income population must reside in the impact zone,
- a high and adverse impact must exist, and
- the impact on the minority or low-income population must be disproportionately high and adverse.

The CEQ guidance indicates that, when determining whether the effects are high and adverse, agencies are to consider whether the risks or rates of impact are "significant" (as defined by NEPA) or above generally accepted norms.

ANALYSIS METHODOLOGY

To determine if a project could disproportionately affect a high-minority or low-income population, it must also be determined how the project would affect other segments of the population. For example, if there are more high-income populations affected by a project than low-income populations, then the potential for disproportionate impacts to the low-income population, and thus the potential for environmental justice impacts, is low. If the proportion of low-income and high-minority populations impacted by a project is greater than either the middle or high-income populations or the middle- or low-minority populations, then there is more of a potential for an environmental justice impact.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.6-1 Potential Effects on Minority Populations. *Implementation of the Off-site Water Facility Alternatives would not create a disproportionate placement of adverse environmental impacts on minority communities.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Construction of the Off-site Water Facility Alternatives would occur within unincorporated portions of Sacramento County and the City of Rancho Cordova. Because the minority populations of portions of unincorporated Sacramento County and the City of Rancho Cordova are less than 50%, implementation of the off-site Water Facility Alternatives would not cause a disproportionately high and adverse impact on minority populations. Therefore, this would be a **less-than-significant direct** impact. **No direct** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.6-2 Potential Effects on Low-Income Populations. *Project implementation would not create a disproportionate placement of adverse environmental impacts on low-income populations.*

NCP, PA, 1, 1A, and 2B

These alternatives would not involve the placement of any of the Off-site Water Facilities within or in close proximity to low-income populations. Based on the absence of low-income pollutions (> 50%) within portions of Zone 4 of the "Water" Study Area traversed by these alternatives, no **direct** or indirect disproportionate construction or operational impacts to low-income populations would occur under these Off-site Water Facility Alternatives. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2, 2A, 3, 3A, 4, and 4A

Implementing these above alternatives would involve the construction and operation of a new water conveyance facility that crosses communities south of Mather Airport identified as a low-income (>50%). Normal operation of the pipeline would not generate significant air quality, traffic, noise, or aesthetic impacts once in place because it would be buried. The incremental long-term impact on adjacent land uses would be the low-level risk of an accidental pipe breakage with minor flooding and traffic disruption and routine maintenance activities. Because operation itself would not result in significant impacts, there is no reason to expect that high-minority and/or low-income populations would be affected disproportionately by operation of the Off-site Water Facilities. This **direct** impact would be **less than significant**. There would be **no indirect** impacts. ***[Greater]***

An analysis of construction impacts in all other disciplines analyzed in this EIR/EIS is presented in other applicable "Water" sections of Chapter 3, and mitigation measures are presented in each section to reduce construction-related impacts to less-than-significant levels. The only construction-related impacts identified that cannot be fully reduced to a less-than-significant level are construction-related emissions and noise (see Impact

3B.11-1 in Section 3B.11, "Noise – Water"). Construction-related emissions would exceed emission standards set by the Sacramento Metropolitan Air Quality Management District (SMAQMD) and contribute to the SMAQMD's emissions inventory within the SVAB (see Impact 3B.2-1 in Section 3B.2, "Air Quality - Water"). However, these short-term effects would be dispersed throughout the conveyance alignment and not focused to any one location with the exception of the WTPs for the applicable alternatives. Because no low-income populations are located in close proximity to the WTP sites and the impacts would be distributed along the entirety of the pipeline route, impacts to low-income populations along the route would be similar to other affected census block groups. Therefore, identified areas of low-income populations, would not be, overall, disproportionately affected by construction or operation of the Off-site Water Facility Alternatives. **Direct** and **indirect** environmental justice-related impacts would therefore be **less than significant**. ***[Greater]***

Mitigation Measure: No mitigation measures are required.

3B.6.4 RESIDUAL SIGNIFICANT IMPACTS

The implementation of Off-site Water Facility Alternatives would not cause a disproportionately high and adverse impact on low-income or minority populations. Potential impacts to existing low-income and minority populations would be less than significant and, therefore, no residual significant impact would occur.

3A.7 GEOLOGY, SOILS, MINERALS, AND PALEONTOLOGICAL RESOURCES – LAND

This section contains a program-level evaluation of geology, soils, minerals, and paleontological resources. However, impacts to these resources would be the same under each individual development phase as under the program (entire SPA) analysis.

3A.7.1 AFFECTED ENVIRONMENT

GEOLOGY

Regional Geology

The SPA is located along the western margin of the Sierra Nevada Mountain Range (in the Sierra Nevada geomorphic province). The Sierra Nevada trends north-northwest from Bakersfield to Lassen Peak, and includes the Sierra Nevada mountain range and a broad belt of western foothills. The Sierra Nevada block is composed of northwest-trending belts of metamorphic, volcanic, and igneous rocks that have undergone intense deformation, faulting, and intrusion. Active faults that mark the eastern edge of the Sierra Nevada have resulted in upthrusting and tilting of the entire Sierra Nevada block in the last 5 million years—steeply on the eastern edge (adjacent to the Mono Basin), and gently along the western edge (where the SPA is located). The gently rolling Sierra Nevada foothills are comprised of metamorphosed sedimentary rocks that have been intruded by igneous rocks. The rock formations that make up the western edge of the Sierra Nevada block likely originally formed as a volcanic arc that was later accreted (added) to the western margin of the continent during the Jurassic period (Day 1992).

Local Geology

The SPA is located within the following U.S. Geological Survey (USGS) 7.5-Minute Quadrangles: Folsom SE, Clarksville, Folsom, and Buffalo Creek. The topography is gently rolling over most of the SPA, varying from approximately 245 feet above mean sea level (msl) in the northwestern portion of the SPA to approximately 400 feet above msl in the central portion of the SPA. However, the eastern portion of the SPA, located in the low foothills of the Sierra Nevada, contains steeper terrain that ranges from 500 feet to 810 feet above msl.

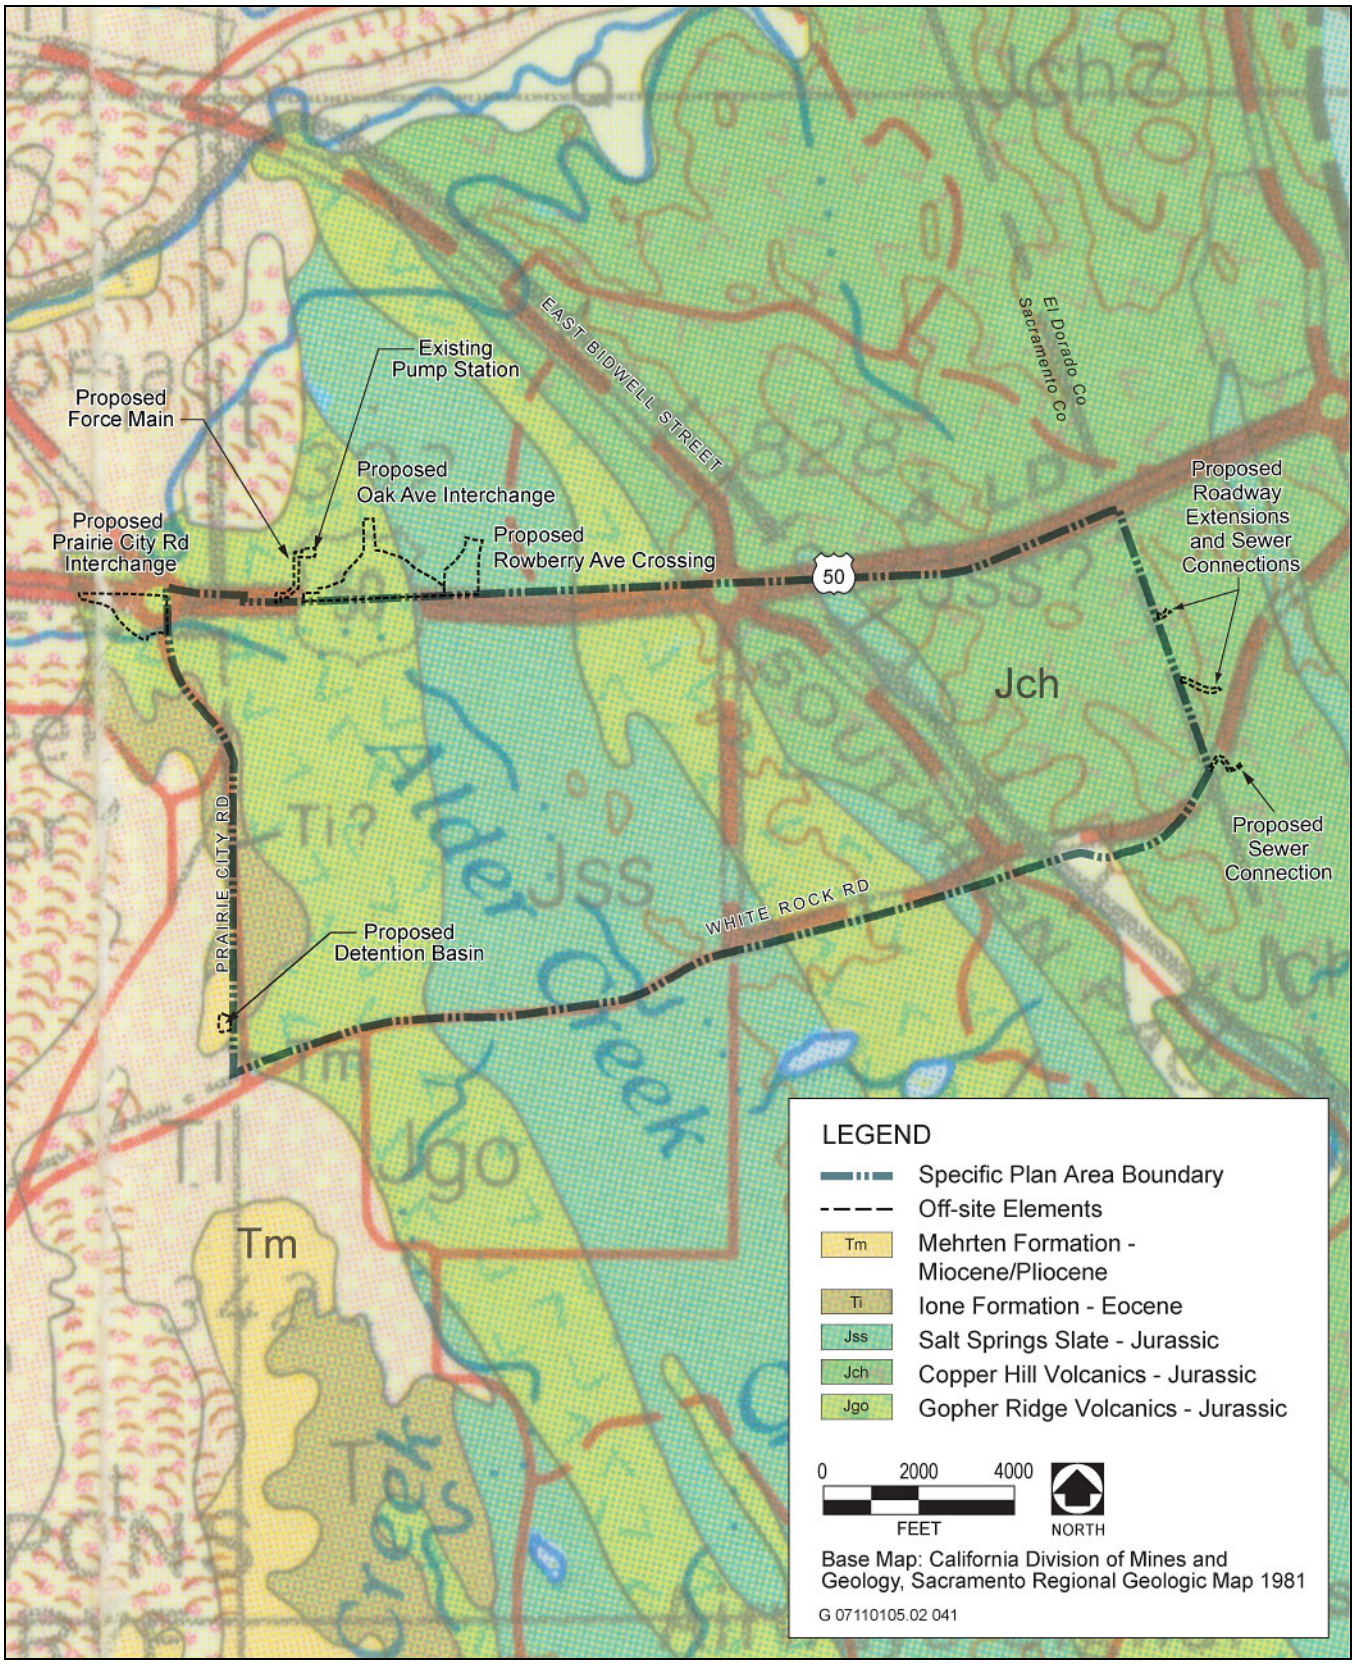
The SPA lies within the Western Sierra Metamorphic Belt, which contains primarily volcanic and sedimentary rocks that were added to the continental margin during the Jurassic period. These rocks are overlain by younger upper Cretaceous and Tertiary sedimentary rocks of the Central Valley. Exhibit 3A.7-1 shows the geologic formations in the SPA, discussed in detail below, based on the *Geologic Map of the Sacramento Quadrangle* (Wagner et al. 1987).

Mehrten Formation

The Mehrten Formation is of Pliocene-Miocene age (approximately 9 million year ago). It consists of sandstone, siltstone, and conglomerate that are interbedded with andesitic breccia from volcanic lava flows that occurred in the Sierra Nevada mountains and foothills.

Ione Formation

The Ione Formation occurs as a 200-mile-long series of isolated exposures along the western foothills of the Sierra Nevada, from Oroville south to Friant in Fresno County. The Ione was formed from fluvial, estuarine, and shallow marine deposits of Eocene age (approximately 35 to 55 million years ago). It consists of quartzose sandstone, conglomerate, and claystone. This formation is generally soft and deeply eroded. It occurs only in a small area of southwestern portion of the SPA.



Source: Wagner et al. 1987

Geologic Formations in the SPA and Vicinity **Exhibit 3A.7-1**

Salt Springs Slate, Copper Hill Volcanics, Gopher Ridge Volcanics

These formations are believed to have originated near an oceanic island volcanic arc that was later accreted (added) to the continental margin during the Jurassic period (approximately 150-200 million years ago) and subsequently deformed. Springer and Day (2005) believe that the Copper Hill and Gopher Ridge Volcanics are the same formations, and have also postulated a sequence of deposition, erosion, and burial of the volcanic arc.

Salt Springs Slate—This sedimentary/metasedimentary formation consists mainly dark gray slate, with some mica schist. The rocks originally consisted of shale, which was metamorphosed into slate approximately 159–151 million years ago.

Copper Hill Volcanics/Gopher Ridge Volcanics—These formations consist of metamorphosed pyroclastic rocks, pillow lava, and minor felsic porphyrite that may be 162 million years or older.

REGIONAL SEISMICITY AND FAULT ZONES

Potential seismic hazards resulting from a nearby moderate to major earthquake can generally be classified as primary and secondary. The primary effect is fault ground rupture, also called surface faulting. Common secondary seismic hazards include ground shaking, liquefaction, and subsidence. Each of these potential hazards is discussed below.

Fault Ground Rupture

Surface rupture is an actual cracking or breaking of the ground along a fault during an earthquake. Structures built over an active fault can be torn apart if the ground ruptures. Surface ground rupture along faults is generally limited to a linear zone a few yards wide. The Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act) (see Section 3A.7.3, "Regulatory Framework," below) was created to prohibit the location of structures designed for human occupancy across the traces of active faults, thereby reducing the loss of life and property from an earthquake. The SPA is not located in an Alquist-Priolo Earthquake Fault Zone (California Geological Survey [CGS] 2007, Hart and Bryant 1999). The nearest fault zoned under the Alquist-Priolo Act is the northern segment of the Cleveland Hills Fault, located near Lake Oroville, approximately 50 miles north of the SPA. Research conducted by the California Department of Water Resources (DWR) indicates that the magnitude 5.7 earthquake that occurred on August 1, 1975 along the Cleveland Hills Fault mostly likely resulted from reservoir-induced stress (DWR 1979).

Seismic Ground Shaking

Ground shaking, motion that occurs as a result of energy released during faulting, could potentially result in the damage or collapse of buildings and other structures, depending on the magnitude of the earthquake, the location of the epicenter, and the character and duration of the ground motion. Other important factors to be considered are the characteristics of the underlying soil and rock and, where structures exist, the building materials used and the workmanship of the structures.

Faults in the Project Region

The West Branch of the Bear Mountains fault, within the Foothills fault system, is located approximately 5 miles east of the eastern property boundary; however, Jennings (1994) does not indicate that fault activity has occurred within the last 11,000 years, and the slip rate of the Foothills fault system is extremely low (0.05 millimeters per year), which is well below the planning threshold for major earthquakes (USGS 2000). With the exception of the Dunnigan Hills fault, located in the Woodland area, the Sacramento Valley has generally not been seismically active in the last 11,000 years (Holocene time). Faults with known or estimated activity during the Holocene are generally located in the San Francisco Bay Area to the west, or in the Lake Tahoe area to the east, as shown in

Table 3A.7-1. In addition, Table 3A.7-1 identifies the faults' approximate distance from the SPA, fault type, and maximum moment magnitude.

Table 3A.7-1
Faults with Evidence of Activity During Holocene Time in the Project Region

Fault Name	Approximate Distance from SPA (miles)	Fault Type[1]	Maximum Moment Magnitude[2]	Regional Location
Dunnigan Hills	40	NA	NA	Western Sacramento Valley
Cleveland Hills/Swain Ravine	50	N/A	6.5	Sierra Nevada Foothills
Great Valley Fault Zone Segment 4	60	B	6.6	Margin between Sacramento Valley and Coast Range
Great Valley Fault Zone Segment 5	65	B	6.5	Margin between Sacramento Valley and Coast Range
Green Valley	65	B	6.2	Coast Range
Greenville Fault Zone (includes Clayton and Marsh Creek sections)	65	B	6.6	Coast Range
Concord	70	B	6.2	Coast Range
West Tahoe/Dollar Point Fault Zone	60	NA	7.2	Lake Tahoe
North Tahoe/Incline Village Fault Zone	60	B	7.0	Lake Tahoe

Notes:
NA = not available or not known

[1] Faults with an "A" classification are capable of producing large magnitude (M) events (M greater than 7.0), have a high rate of seismic activity (e.g., slip rates greater than 5 millimeters per year), and have well-constrained paleoseismic data (e.g., evidence of displacement within the last 700,000 years). Class "B" faults are those that lack paleoseismic data necessary to constrain the recurrence intervals of large-scale events. Faults with a "B" classification are capable of producing an event of M 6.5 or greater.

[2] The moment magnitude scale is used by seismologists to compare the energy released by earthquakes. Unlike other magnitude scales, it does not saturate at the upper end, meaning that there is no particular value beyond which all earthquakes have about the same magnitude, which makes this scale a particularly valuable tool for assessing large earthquakes.

Source: Cao 2002, Jennings 1994, Mualchin 1996, Petersen et al. 1996, Ichinose et al. 1999, data compiled by AECOM in 2009

The intensity of ground shaking depends on the distance from the earthquake epicenter to the site, the magnitude of the earthquake, site soil conditions, and the characteristics of the source. Ground motions from seismic activity can be estimated by probabilistic method at specified hazard levels and by site-specific design calculations using a computer model. The CGS Probabilistic Seismic Hazards Assessment Model indicates a minimum horizontal acceleration of 0.109 g for soft rock and 0.1 g for firm rock conditions (where g is the percentage of gravity) in the SPA with a 10% probability of earthquake occurrence in a 50-year timeframe (also known as the "Design Basis Earthquake" [DBE]) for use in earthquake-resistant design (CGS 2008). Stated another way, these calculations indicated there is a 1-in-10 probability that an earthquake will occur within 50 years that would result in a peak horizontal ground acceleration exceeding 0.109 or 0.1*g*.

The California Building Standards Code (CBC) specifies more stringent design guidelines where a project would be located adjacent to a Class A or B fault as designated by the California Probabilistic Seismic Hazard Maps. As shown in Table 3A.7-1, the SPA is located approximately 60 miles from the nearest Class A or B fault.

Seismic Seiches

Earthquakes may affect open bodies of water by creating seismic sea waves and seiches. Seismic sea waves (often called "tidal waves") are caused by abrupt ground movements (usually vertical) on the ocean floor in connection with a major earthquake. Because of the long distance of the SPA from the Pacific Ocean, seismic sea waves would not be a factor in the SPA. A seiche is a sloshing of water in an enclosed or restricted water body, such as a basin, river, or lake, which is caused by earthquake motion; the sloshing can occur for a few minutes or several hours. Although an 1868 earthquake along the Hayward fault in the San Francisco Bay Area is known to have generated a seiche along the Sacramento River, the affected area was located in the Sacramento–San Joaquin River Delta. Seiches are not likely to occur in the vicinity of the SPA.

Ground Failure/Liquefaction

Soil liquefaction occurs when ground shaking from an earthquake causes a sediment layer saturated with groundwater to lose strength and take on the characteristics of a fluid, thus becoming similar to quicksand. Factors determining the liquefaction potential are soil type, the level and duration of seismic ground motions, the type and consistency of soils, and the depth to groundwater. Loose sands and peat deposits are susceptible to liquefaction, while clayey silts, silty clays, and clays deposited in freshwater environments are generally stable under the influence of seismic ground shaking.

Liquefaction poses a hazard to engineered structures. The loss of soil strength can result in bearing capacity insufficient to support foundation loads, increased lateral pressure on retaining or basement walls, and slope instability.

Based on a review of information contained in (1) the Preliminary Geotechnical Engineering Reports prepared by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting Group (2003), (2) published geological maps and literature, and (3) a telephone conference with Wallace Kuhl & Associates (French, pers. comm., 2009), it unlikely that on- or off-site soils would be subject to liquefaction in the event of an earthquake because the SPA located in stable soil underlain at shall depths by bedrock, the potential seismic sources are a relatively long distance away, and the groundwater table is at least 100 feet below the ground surface.

Subsidence, Settlement, and Soil Bearing Capacity

Subsidence of the land surface can be induced by both natural and human phenomena. Natural phenomena that can cause subsidence can result from tectonic deformations and seismically induced settlements; from consolidation, hydrocompaction, or rapid sedimentation; from oxidation or dewatering of organic-rich soils; and from subsurface cavities. Subsidence related to human activity can result from withdrawal of subsurface fluids or sediment. Pumping of water for residential, commercial, and agricultural uses from subsurface water tables causes more than 80% of the identified subsidence in the United States (Galloway et al. 1999). Lateral spreading is the horizontal movement or spreading of soil toward an open face, such as a streambank, the open side of fill embankments, or the sides of levees. The potential for failure from subsidence and lateral spreading is highest in areas where the groundwater table is high, where relatively soft and recent alluvial deposits exist, and where creek banks are relatively high. Soil bearing capacity is the ability of soil to support the loads applied to the ground; where the bearing capacity is too low to support proposed structures, subsidence and settlement may occur.

Based on a review of Natural Resource Conservation Service (NRCS) (2009) soil survey data and the Preliminary Geotechnical Engineering Reports prepared by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting Group (2003), SPA soils would not be subject to hazards from subsidence or settlement, because the groundwater table is at least 100 feet below the SPA and because the SPA soils generally consist of older bedrock materials of adequate bearing strength.

SLOPE STABILITY

A landslide is the downhill movement of masses of earth material under the force of gravity. The factors contributing to landslide potential are steep slopes, unstable terrain, and proximity to earthquake faults. This process typically involves the surface soil and an upper portion of the underlying bedrock. Movement may be very rapid, or so slow that a change of position can be noted only over a period of weeks or years (creep). The size of a landslide can range from several square feet to several square miles.

The eastern portion of the SPA contains steep slopes; however, no landslides have been recorded in the SPA and vicinity. Preliminary grading plans (MacKay & Somps 2008) indicate that steep cuts and fills would be necessary in the eastern foothills, necessitating the construction of slopes that would vary from 16–32%. Without proper engineering controls, SPA soils could be subject to landslide potential during or after construction activities.

SOILS

Table 3A.7-2 summarizes the generalized characteristics and Exhibit 3A.7-2 shows the locations of the soil types of the on- and off-site facilities.

Subsurface Conditions

Based on data contained in the Preliminary Geotechnical Engineering Reports prepared by Wallace Kuhl & Associates (2004, 2005, and 2008) and Youngdahl Consulting Group (2003), the SPA is generally underlain by near surface soils that consist of sandy silts, silty clays, and sandy clays, and underlain at shallow depths by soft or firm bedrock. The groundwater table is at least 100 feet below the ground surface. Perched shallow water and seepage conditions are expected in the SPA, particularly during the winter months.

Naturally Occurring Asbestos

Asbestos is a term applied to several types of naturally occurring fibrous materials found in rock formations throughout California. Exposure and disturbance of rock and soil that contains asbestos can result in the release of fibers to the air and consequent exposure to the public. All types of asbestos are now considered hazardous and pose public health risks. Asbestos is commonly found in ultramafic rock, including serpentine. Two forms of asbestos are associated with serpentinite: chrysotile asbestos and tremolite/actinolite asbestos. In 2000, CGS published a report entitled *Areas more Likely to contain Natural Occurrences of Asbestos in Western El Dorado County, California* (Open-File Report 2000-002), following environmental concerns raised about potential exposures to airborne asbestos near areas where serpentinite was being disturbed in El Dorado County. The map contained in Open-File Report 2000-002 indicates that the proposed off-site roadways into El Dorado Hills from the Folsom Heights Property are located within an area called “Undesignated Map Areas that Probably Do Not Contain Asbestos.”

In 2004, after the Sacramento Metropolitan Air Quality Management District (SMAQMD) determined that naturally occurring asbestos (NOA) was present in the Folsom area, SMAQMD issued Advisory 04-05(2) and commissioned the CGS to perform a study published in 2006 entitled *Relative Likelihood for the Presence of Naturally Occurring Asbestos in Eastern Sacramento County, California* (Special Report 192). The map contained in Special Report 192 indicates that most of the SPA, as well as the proposed off-site Oak Avenue Interchange, Rowberry Drive Overcrossing, East Bidwell/Scott Road Interchange, and Empire Ranch Interchange, are designated “Areas Moderately Likely to Contain NOA.” These areas include metamorphic and igneous rocks. Therefore, the potential exists for NOA to be encountered in rocks of the Copper Hill Volcanics and the Gopher Ridge Volcanics geologic formations, which are present in the SPA.

Soil Types of On- and Off-Site Project Elements **Exhibit 3A.7-2**

Table 3A.7-2
On- and Off-Site Soil Characteristics

Soil Map Unit Name	Shrink-Swell Potential[1]	Permeability[2]	Water Erosion Hazard[3]	Wind Erosion Hazard[4]	Drainage	Concrete Corrosivity	Steel Corrosivity	Limitations
Argonaut gravelly loam, 2–15% slopes	Moderate	Moderately high	Moderate	6	Well drained	Moderate	High	**Buildings:** severe due to shrink-swell and steep slopes **Roads:** severe due to low soil strength, high shrink swell, and steep slopes **Septic Systems:** severe due to slow permeability, shallow depth to bedrock, slopes
Argonaut-Auburn complex, 3–8% slopes	Moderate	Moderately high	Moderate	5	Well drained	Moderate	High	**Buildings:** severe due to shallow bedrock, shrink-swell, and steep slopes **Roads:** severe due to shrink-swell and shallow, hard bedrock **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock
Auburn silt loam, 2–30% slopes	Low	Moderately high	Moderate	5	Well drained	Moderate	Moderate	**Buildings and Roads:** severe due to steep slopes and shallow, hard bedrock **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock, steep slopes
Auburn very rocky silt loam, 2–30% slopes	Low	Moderately high	Moderate	5	Well drained	Moderate	Moderate	**Buildings and Roads:** severe due to steep slopes and shallow, hard bedrock **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock, steep slopes
Auburn-Argonaut-Rock outcrop complex, 8–30% slopes	Low	High	Moderate	5	Well drained	Moderate	Moderate	**Buildings and Roads:** severe due to shallow bedrock, shrink-swell (in the Argonaut soils), and steep slopes **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock, steep slopes
Fiddyment fine sandy loam, 1–8% slopes	Low	Moderately high	Moderate	3	Well drained	Moderate	High	**Buildings:** moderate due to slopes **Roads:** severe due to low soil strength **Septic Systems:** severe due to slow permeability, shallow depth to hardpan, shallow depth to bedrock
Hadselville-Pentz complex, 2–30% slopes	Low	Moderately high	Moderately low	3	Moderately well drained	Moderate	Moderate	**Buildings and Roads:** severe due to steep slopes and shallow, soft bedrock **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock, steep slopes, seepage in bottom layer
Hicksville sandy clay loam, 0–2% slopes	Moderate	Moderately high	Moderately low	5	Moderately well drained	Moderately well drained	Moderate	**Buildings:** severe due to water saturation and moderate shrink-swell **Roads:** severe due to saturation, flooding **Septic Systems:** severe due to flooding, low permeability, shallow depth to bedrock, saturation at shallow depths
Orangevale coarse sandy loam, 2-5% slopes	Moderate	High	Moderately low	3	Well drained	Low	Moderate	**Buildings and Roads:** moderate due to shrink-swell and slopes **Septic Systems:** severe due to low permeability, seepage in bottom layer
Pits	--	--	--	--	--	--	--	**Buildings and Roads:** no limitations **Septic Systems:** no limitations
Red Bluff loam, 2–5% slopes	Moderate	Moderately high	Moderate	5	Well drained	High	High	**Buildings and Roads:** moderate due to shrink-swell and slopes
Red Bluff-Redding complex, 0–5% slopes	Moderate	Moderately high	Moderate	5-6	Well drained	High	High	**Buildings and Roads:** moderate due to shrink-swell and slopes **Septic Systems:** severe due to low permeability
Red Bluff-Xerorthents complex dredge tailings, 2–50% slope	Moderate	Moderately high	--	--	Well drained	--	--	**Buildings and Roads:** severe due to high shrink-swell, steep slopes **Septic Systems:** severe due to low permeability (in the Red Bluff soils), steep slopes (in the Xerorthents soils
Redding gravelly loam, 0–8% slopes	Moderate	Moderately high	Moderately low	6	Moderately well drained	Moderate	High	**Buildings and Roads:** moderate due to shrink-swell and slopes **Septic Systems:** severe due to low permeability, shallow depth to hardpan
Vleck gravelly loam, 2–15% slopes	Moderate	Moderately high	Moderate	6	Moderately well drained	Moderate	High	**Buildings:** severe due to shallow bedrock, shrink-swell, and steep slopes **Roads:** severe due to low soil strength and shrink-swell **Septic Systems:** severe due to low permeability, shallow depth to hardpan, shallow depth to bedrock, slopes
Whiterock loam, 3–30% slopes	Low	High	Moderate	5	Somewhat excessively drained	High	High	**Buildings and Roads:** severe due to shallow bedrock and steep slopes **Septic Systems:** severe due to restricted permeability, shallow depth to bedrock, steep slopes
Xerorthents dredge tailings, 2–50% slopes	Low	Very high	--	--	Somewhat excessively drained	--	--	**Septic Systems:** severe due to extremely high permeability and poor filter, steep slopes, seepage in bottom layer

Notes: Because the dredge tailings are disturbed and reworked, representative characteristics are not available.

[1] Based on percentage of linear extensibility. Shrink-swell potential ratings of “moderate” to “very high” can result in damage to buildings, roads, and other structures.

[2] Based on standard U.S. Department of Agriculture (USDA) saturated hydraulic conductivity (Ksat) class limits; Ksat refers to the ease with which pores in a saturated soil transmit water.

[3] Based on the erosion factor “Kw whole soil,” which is a measurement of relative soil susceptibility to sheet and rill erosion by water.

[4] The soils assigned to group 1 are the most susceptible to wind erosion, and those assigned to group 8 are the least susceptible.

Source: NRCS 2009

Based on Special Report 192, SMAQMD issued Advisory 06-03 declaring that "Areas Moderately Likely to Contain NOA" are subject to the requirements of California Code of Regulations (CCR) Section 93105 (Asbestos Airborne Toxic Control Measure [ATCM] for Construction, Grading, Quarrying, and Surface Mining Operations.) NOA is regulated by the California Air Resources Board (ARB), and concentrations of NOA above 0.25% are considered by ARB as hazardous levels for residential development. The ATCM contains specific requirements for projects where NOA is located, including a Dust Mitigation Plan that must be approved by SMAQMD prior to the start of construction activities. If a registered geologist establishes that asbestos is not present in concentrations above 0.25%, a request for waiver from the ATCM requirements may be submitted to SMAQMD.

Six soil samples from the Sacramento Country Day School property were analyzed for the presence of NOA by Youngdahl Consulting (2003). The Sacramento Country Day School property lies within the Salt Springs Slate geologic formation, and is within an "Area Moderately Likely to Contain NOA" based on Special Report 192. Asbestos was not detected in any of those six samples. However, the remainder of the SPA (approximately 3,420 acres) and the off-site elements have not been sampled for NOA. Therefore, NOA in the SPA could pose a health hazard to construction workers and future residents if present in concentrations above 0.25%, when fragments could become airborne and inhaled. (See also Section 3A.2, "Air Quality – Land," for additional discussion and mitigation measures regarding NOA.)

Expansive Soils

Expansive soils are composed largely of clays, which greatly increase in volume when saturated with water and shrink when dried. Because of this effect, building foundations may rise during the rainy season and fall during the dry season. If this expansive movement varies underneath different parts of a single building, foundations may crack, structural portions of the building may be distorted, and doors and windows may become warped so that they no longer function properly. The potential for soil to undergo shrink and swell is greatly enhanced by the presence of a fluctuating, shallow groundwater table. Changes in the volume of expansive soils can result in the consolidation of soft clays after the lowering of the water table or the placement of fill.

Based on a review of NRCS (2009) soil survey data and the Preliminary Geotechnical Engineering Reports prepared by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting Group (2003), near-surface soils in the SPA have a moderate to high shrink-swell potential, meaning that they have a high clay content and therefore would be capable of exerting substantial expansion pressures on structural foundations and exterior flatwork. These soils would be expected to undergo volume changes with increasing or decreasing soil moisture content.

Soil Limitations for Septic Systems

For a septic system to function properly, soils must "perc" – that is, a certain volume of water must flow through the soil in a certain time period, as determined by a licensed soils or geotechnical engineer. Wastewater is "treated" as soil bacteria feed on the waste material and in the process, break down the material into more basic elements that are dispersed into the lower layers of the soil horizon. If wastewater percolates through the soil too quickly, the bacteria do not have enough time to digest the material. On the other hand, if wastewater percolates through the soil too slowly, the bacteria are killed by the lack of oxygen. Most of the SPA soils consist of a shallow layer of silt, sand, or clay, underlain by bedrock. Most of the shallow soils have a low permeability and are subject to water seepage (a high water holding capacity) and thus tend to "perc" too slowly, rendering them unsuitable for septic systems. Most of the bedrock soils have extremely high permeability (a low water holding capacity) and thus tend to "perc" too quickly, rendering them unsuitable for septic systems. Based on a review of NRCS soil data (see Table 3A.7-2), the entire SPA rated with a severe limitation because the soils are unsuitable for conventional septic systems. Neither the Proposed Project nor any of the action alternatives would require the use of septic systems. However, continued development under the existing Sacramento County Ag-80 zoning would require the use of septic systems under the No Project Alternative.

MINERAL RESOURCES

Under the Surface Mining and Reclamation Act (SMARA), the State Mining and Geology Board may designate certain mineral deposits as being regionally significant to satisfy future needs. The Board's decision to designate an area is based on a classification report prepared by CGS and on input from agencies and the public. The SPA lies within the designated Sacramento-Fairfield Production-Consumption Region for Portland cement concrete aggregate, which includes all designated lands within the marketing area of the active aggregate operations supplying the Sacramento-Fairfield urban center.

In compliance with SMARA, the California Division of Mines and Geology (CDMG) has established the classification system shown in Table 3A.7-3 to denote both the location and significance of key extractive resources.

Table 3A.7-3
California Division of Mines and Geology Mineral Land Classification System

Classification	Description
MRZ-1	Areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence
MRZ-2	Areas where adequate information indicates that significant mineral deposits are present or where it is judged that a high likelihood for their presence exists
MRZ-3	Areas containing mineral deposits, the significance of which cannot be evaluated from existing data
MRZ-4	Areas where available data are inadequate for placement in any other mineral resource zone

Note: MRZ = Mineral Resource Zone
Source: Dupras 1999

The northwestern portion of the SPA is located in the Alder Creek watershed, adjacent to an ancient channel of the American River. Over many thousands of years, weathering eroded various auriferous (gold-bearing) formations in the Sierra Nevada, thus allowing gold flakes, nuggets, and gold-bearing rocks to be carried along in glacial meltwater and in river channels. Depending on the volume of water and the rate of flow, the gold was eventually deposited on the surfaces of ancient river channels. Auriferous rocks eventually became deposited at the mouths of rivers as alluvial fans. Areas around Folsom, Prairie City, and Rancho Cordova, where the American River emptied into the Sacramento Valley, eventually became well known locations for gold miners.

Within weeks after gold was found at Sutter's Mill on the South Fork of the American River in 1848, Mormon Island (now buried underneath Folsom Lake) was being mined. Subsequent gold discoveries and mining operations developed at Beal's Bar, Rattlesnake Bar, Negro Bar, Whiskey Bar, and Prairie City. When the Natomas Water and Mining Company began supplying water to the area around Prairie City in 1853, miners began staking claims along the company's canal. When those claims were exhausted, the Natomas Company (as it was later called) began dredging the nearby ancient American River deposits. Dredging operations in the SPA occurred between 1915 and 1962. Today, as mentioned above, dredge tailings are located along Alder Creek. (See Section 3A.5, "Cultural Resources – Land," for a more detailed discussion of historical mining operations.)

The piles of cobbles deposited during dredging operations in the Rancho Cordova area have proved to be a valuable source of sand and gravel. Nearby aggregate deposits in Rancho Cordova were addressed in the Sacramento County General Plan as the county's "primary remaining aggregate deposits."

Sand and gravel mined in Sacramento County and in Rancho Cordova is used for construction. Construction aggregates are an important building material used in Portland cement concrete, asphalt concrete, plaster, and stucco, and as a road base material. In terms of volume and price, there is no economically feasible substitute for

aggregate products in the construction industry. However, the City and County General Plans also recognize that aggregate mining is an interim land use rather than a final use, and recognize the importance of balancing aggregate-mining needs with those of urban development.

As shown in Exhibit 3A.7-3, a small portion of the extreme western edge of the SPA is classified by CDMG as MRZ-1, areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence. However, the majority of the SPA is classified by CDMG as MRZ-3, "areas containing mineral deposits, the significance of which cannot be evaluated from existing data." Based on a site visit performed by EDAW/AECOM (now AECOM) in 2007, information contained in the preliminary geotechnical engineering reports, and conversation with the project engineer (MacKay & Somps), the only area of the SPA that contains any substantial amount of aggregate resources (cobbles from dredger mining operations) is located in and around the Alder Creek drainage.

Land immediately east of the SPA (in El Dorado County), which is also within the Sacramento-Fairfield Production-Consumption Region, is zoned MRZ-3 and has already been developed with residential housing. Land north of the SPA consists of U.S. Highway 50 (U.S. 50) and the urbanized City of Folsom.

Land immediately west of the SPA, adjacent to Prairie City Road, is owned by Aerojet General Corporation. The northern portion of this land, near U.S. 50, is part of the Easton Project and is planned for residential/commercial development. As shown in Exhibit 3A.7-3, the land on the west side of Prairie City Road is classified by CDMG with the same mineral resource zones as the SPA: MRZ-1 and MRZ-3.

Land south of the SPA, south of White Rock Road, is currently undeveloped and is outside of the Sacramento County Urban Services Boundary. As shown on Exhibit 3A.7-3, land south of the SPA is zoned MRZ-3. The Teichert and Walltown hard rock quarries have been proposed in this area at two locations approximately 2.3 miles south of the SPA. Those quarry proposals are currently undergoing environmental review. There is an existing Granite Construction Company aggregate operation approximately 0.5 southwest of the SPA, immediately south of White Rock Road. Both Teichert and Granite own and operate several aggregate mining and processing facilities in the Rancho Cordova area.

As also shown in Exhibit 3A.7-3, the western edge of the SPA is zoned MRZ-3 for kaolin clay. This zoning was assigned by CDMG because of the presence of the Ione Formation, which does contain kaolin clay in other locations in the state. Kaolin clay is formed from weathering of aluminous minerals such as feldspar with kaolinite as its principal constituent. Kaolin is used as an anti-caking agent in processed foods and an additive to cosmetics, toiletries, and health products. It is also used as an "inert" carrier in some pesticides, and enhances the performance of some microbial products. The geotechnical reports prepared for the project to date do not cover the area of the SPA that is designated MRZ-3 for kaolin clay. Therefore, it cannot be ascertained at this time whether or not a valuable deposit of kaolin clay is present in the SPA.

PALEONTOLOGICAL RESOURCES

Paleontological Resource Inventory Methods

A stratigraphic inventory was completed to develop a baseline paleontological resource inventory of the SPA and surrounding area by rock unit and to assess the potential paleontological productivity of each rock unit. Research methods included a review of published and unpublished literature and a search for recorded fossil sites at the University of California Museum of Paleontology (UCMP). These tasks complied with Society of Vertebrate Paleontology guidelines (1995).

Stratigraphic Inventory

Geologic maps and reports covering the geology of the SPA and surrounding area were reviewed to determine the exposed rock units and to delineate their respective aerial distributions in the project area.

Paleontological Resource Inventory

Published and unpublished geological and paleontological literature were reviewed to document the number and locations and previously recorded fossil sites from rock units exposed in and near the SPA and vicinity, as well as the types of fossil remains each rock unit has produced. The literature review was supplemented by an archival search conducted at the UCMP in Berkeley, California, on August 12, 2009.

Paleontological Resource Field Survey

Portions of the ground surface were completely obscured by vegetation; in those areas where the ground surface was visible, no evidence of paleontological resources was present during a reconnaissance-level field survey conducted by EDAW/AECOM (now AECOM) in June 2007.

Paleontological Resource Assessment Criteria

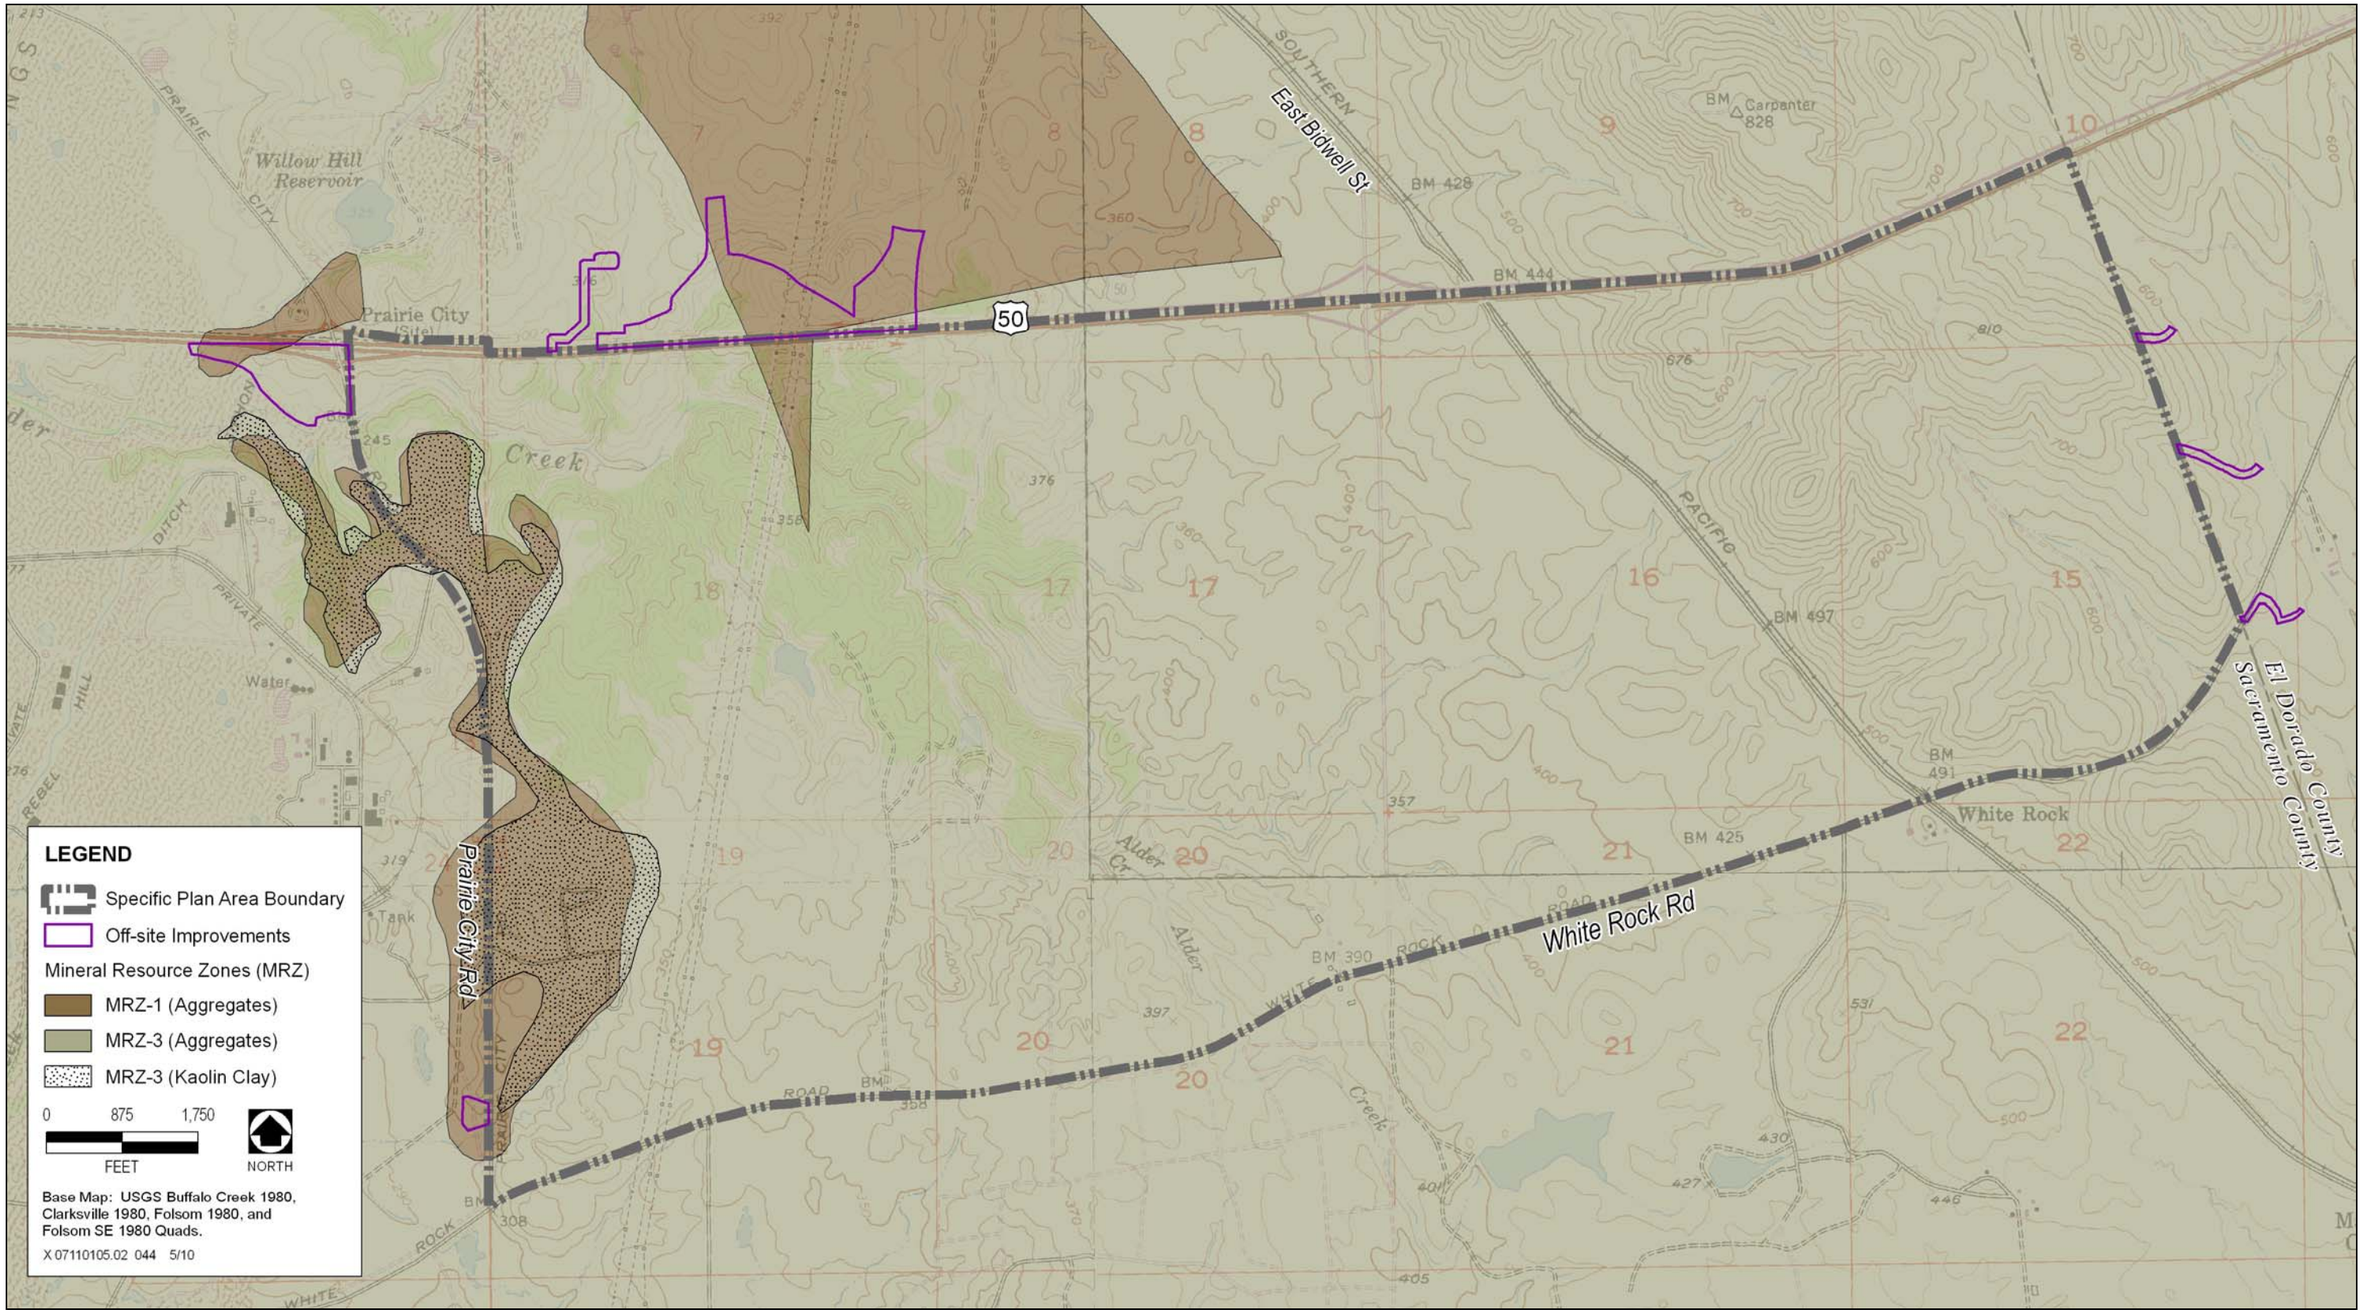
The potential paleontological importance of the SPA can be assessed by identifying the paleontological importance of exposed rock units within the SPA. Because the areal distribution of a rock unit can be easily delineated on a topographic map, this method is conducive to delineating parts of the SPA that are of higher and lower sensitivity for paleontological resources and to delineating parts of the SPA that may require monitoring during construction.

A paleontologically important rock unit is one that has a high potential paleontological productivity rating and is known to have produced unique, scientifically important fossils. The potential paleontological productivity rating of a rock unit exposed in the SPA refers to the abundance/densities of fossil specimens and/or previously recorded fossil sites in exposures of the unit in and near the SPA. Exposures of a specific rock unit in the SPA are most likely to yield fossil remains representing particular species in quantities or densities similar to those previously recorded from the unit in and near the SPA.

An individual vertebrate fossil specimen may be considered unique or significant if it is identifiable and well preserved and it meets one of the following criteria:

- a type specimen (i.e., the individual from which a species or subspecies has been described);
- a member of a rare species;
- a species that is part of a diverse assemblage (i.e., a site where more than one fossil has been discovered) wherein other species are also identifiable, and important information regarding life history of individuals can be drawn;
- a skeletal element different from, or a specimen more complete than, those now available for its species; or
- a complete specimen (i.e., all or substantially all of the entire skeleton is present).

For example, identifiable vertebrate marine and terrestrial fossils are generally considered scientifically important because they are relatively rare. The value or importance of different fossil groups varies, depending on the age and depositional environment of the rock unit that contains the fossils, their rarity, the extent to which they have already been identified and documented, and the ability to recover similar materials under more controlled conditions, such as part of a research project. Marine invertebrate fossil specimens are generally common, well developed, and well documented. They would generally not be considered a unique paleontological resource.



Source: Dupras 1999

Mineral Resource Zones of On- and Off-Site Project Components **Exhibit 3A.7-3**

The tasks listed below were completed to establish the paleontological importance of each rock unit exposed at or near the SPA.

- The potential paleontological productivity of each rock unit was assessed, based on the density of fossil remains previously documented within the rock unit.
- The potential for a rock unit exposed in the SPA to contain a unique paleontological resource was considered.

Paleontologic Resource Inventory Results

Stratigraphic Inventory

Regional and local surficial geologic mapping and correlation of the various geologic units in the SPA and vicinity have been provided at a scale of 1:48,000 by Loyd (1984) and 1:250,000 by Wagner et al. (1987).

Paleontological Resource Inventory and Assessment by Rock Unit

Based on a record search conducted at UCMP (UCMP 2009), there are no previously recorded fossil localities within the SPA or the off-site elements.

Mehrten Formation

Vertebrate mammal and plant fossils have been reported from the Mehrten Formation throughout the Sierra Nevada foothills and the eastern margin of the Central Valley. The closest recorded vertebrate fossil locality within the Mehrten Formation to the SPA (V-76050) is near Camanche Reservoir, approximately 25 miles south of the SPA, where a specimen of Pliohippus (horse) was recovered. Other vertebrate fossils have been recovered from the Mehrten Formation from over 40 locations in Calaveras, San Joaquin, Stanislaus, Tuolumne, and Merced Counties (UCMP 2009). In addition, several specimens of plant fossils have been recovered locally from the Mehrten Formation in Granite Bay, Roseville, and Rocklin (Sierra College Natural History Museum 2009). Because of the large number of fossils that have been recovered from the Mehrten Formation, it is considered a paleontologically sensitive rock unit under the Society of Vertebrate Paleontology guidelines (1995).

Ione Formation

Vertebrate mammal, plant, and invertebrate fossils have been reported from the Ione Formation throughout the Central Valley. The closest recorded vertebrate fossil locality within the Ione Formation to the SPA (V-6823 through 6833) is located in Pittsburg, approximately 48 miles southwest of the SPA. This locality yielded over 20 specimens of cartilaginous fish (such as skates and rays), bony fish, birds, and cetacea (dolpins, porpoises, and whales). However, numerous plant fossils have been recovered from the Ione Formation at locations closer to the SPA, including Ione (P-43,), Iowa hill (P-43, PA-84, PA-289, and PA-523), and Camanche Reservoir (P-332). Other vertebrate mammal, plant, and invertebrate fossils have been recovered from the Ione Formation from over 300 locations in Nevada, Contra Costa, Placer, Amador, Butte, Alameda, Merced, Tuolumne, Sutter, Sierra, Plumas, Calaveras, Kern, and Stanislaus Counties (UCMP 2009). Because of the large number of fossils that have been recovered from the Ione Formation, it is considered a paleontologically sensitive rock unit under the Society of Vertebrate Paleontology guidelines (1995).

Salt Springs Slate, Copper Hill Volcanics, Gopher Ridge Volcanics

These formations consist of Jurassic-age rocks that formed at depth beneath the earth's surface and have since been deformed and metamorphosed. The UCMP database does not contain any records of vertebrate or plant fossils within these formations. Because of the nature of these rock formations and the lack of previously recorded vertebrate or plant fossil localities, these formations are not considered to be paleontologically sensitive rock units under the Society of Vertebrate Paleontology guidelines (1995).

3A.7.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Earthquake Hazards Reduction Act

In October 1977, the U.S. Congress passed the Earthquake Hazards Reduction Act to reduce the risks to life and property from future earthquakes in the United States through the establishment and maintenance of an effective earthquake hazards reduction program. To accomplish this goal, the act established the National Earthquake Hazards Reduction Program (NEHRP). This program was substantially amended in November 1990 by the National Earthquake Hazards Reduction Program Act (NEHRPA), which refined the description of agency responsibilities, program goals, and objectives.

The mission of NEHRP includes improved understanding, characterization, and prediction of hazards and vulnerabilities; improved building codes and land use practices; risk reduction through post earthquake investigations and education; development and improvement of design and construction techniques; improved mitigation capacity; and accelerated application of research results. The NEHRPA designates the Federal Emergency Management Agency as the lead agency of the program and assigns several planning, coordinating, and reporting responsibilities. Other NEHRPA agencies include the National Institute of Standards and Technology, National Science Foundation, and USGS.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act) (California Public Resources Code [PRC] Sections 2621–2630) was passed in 1972 to mitigate the hazard of surface faulting to structures designed for human occupancy. The main purpose of the law is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. The law addresses only the hazard of surface fault rupture and is not directed toward other earthquake hazards. The Alquist-Priolo Act requires the State Geologist to establish regulatory zones known as Earthquake Fault Zones around the surface traces of active faults and to issue appropriate maps. The maps are distributed to all affected cities, counties, and state agencies for their use in planning efforts. Before a project can be permitted in a designated Alquist-Priolo Earthquake Fault Zone, cities and counties must require a geologic investigation to demonstrate that proposed buildings would not be constructed across active faults.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (California PRC Sections 2690–2699.6) addresses earthquake hazards from nonsurface fault rupture, including liquefaction and seismically induced landslides. The act established a mapping program for areas that have the potential for liquefaction, landslide, strong ground shaking, or other earthquake and geologic hazards. The act also specifies that the lead agency for a project may withhold development permits until geologic or soils investigations are conducted for specific sites and mitigation measures are incorporated into plans to reduce hazards associated with seismicity and unstable soils.

National Pollutant Discharge Elimination System Permit

In California, the State Water Resources Control Board (SWRCB) administers regulations promulgated by the U.S. Environmental Protection Agency (55 Code of Federal Regulations [CFR] 47990) requiring the permitting of stormwater-generated pollution under the National Pollutant Discharge Elimination System (NPDES). In turn, the SWRCB's jurisdiction is administered through nine regional water quality control boards. Under these Federal regulations, an operator must obtain a general permit through the NPDES Stormwater Program for all construction activities with ground disturbance of 1 acre or more. The general permit requires the implementation

of best management practices (BMPs) to reduce sedimentation into surface waters and to control erosion. One element of compliance with the NPDES permit is preparation of a storm water pollution prevention plan (SWPPP) that addresses control of water pollution, including sediment, in runoff during construction. (See Section 3A.9, "Hydrology and Water Quality – Land," for more information about the NPDES and SWPPPs.)

California Building Standards Code

The California Building Standards Commission (BSC) is responsible for coordinating, managing, adopting, and approving building codes in California. In July 2007, the BSC adopted and published the 2006 International Building Code as the 2007 CBC. This new code became effective on January 1, 2008, and updated all the subsequent codes under the California Code of Regulations (CCR) Title 24. Sutter County has adopted the 2007 CBC. The State of California provides minimum standards for building design through the 2007 CBC (CCR, Title 24). Where no other building codes apply, Chapter 29 of the 2007 CBC regulates excavation, foundations, and retaining walls. The CBC applies to building design and construction in the state and is based on the Federal Uniform Building Code (UBC) used widely throughout the country (generally adopted on a state-by-state or district-by-district basis). The CBC has been modified for California conditions with numerous more detailed or more stringent regulations.

The state earthquake protection law (California Health and Safety Code Section 19100 et seq.) requires that structures be designed to resist stresses produced by lateral forces caused by wind and earthquakes. The 2007 CBC replaces the previous "seismic zones" (assigned a number from 1 to 4, where 4 required the most earthquake-resistant design) with new Seismic Design Categories A through F (where F requires the most earthquake-resistant design) for structures designed for a project site. With the shift from seismic zones to seismic design, the CBC philosophy has shifted from "life safety design" to "collapse prevention," meaning that structures are designed for prevention of collapse for the maximum level of ground shaking that could reasonably be expected to occur at a site. Chapter 16 of the CBC specifies exactly how each seismic design category is to be determined on a site-specific basis through the site-specific soil characteristics and proximity to potential seismic hazards.

Chapter 18 of the CBC regulates the excavation of foundations and retaining walls. This chapter regulates the preparation of a preliminary soil report, engineering geologic report, geotechnical report, and supplemental ground-response report. Chapter 18 also regulates analysis of expansive soils and the determination of the depth to groundwater table. For Seismic Design Category C, Chapter 18 requires analysis of slope instability, liquefaction, and surface rupture attributable to faulting or lateral spreading. For Seismic Design Categories D, E, and F, Chapter 18 requires these same analyses plus an evaluation of lateral pressures on basement and retaining walls, liquefaction and soil strength loss, and lateral movement or reduction in foundation soil-bearing capacity. It also requires addressing mitigation measures to be considered in structural design. Mitigation measures may include ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements, or any combination of these measures. The potential for liquefaction and soil strength loss must be evaluated for site-specific peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration must be determined from a site-specific study, the contents of which are specified in CBC Chapter 18.

Finally, Appendix Chapter J of the 2007 CBC regulates grading activities, including drainage and erosion control and construction on unstable soils, such as expansive soils and areas subject to liquefaction.

California Surface Mining and Reclamation Act

SMARA (California PRC Section 2710 et seq.) was enacted by the California Legislature in 1975 to regulate activities related to mineral resource extraction. The act requires the prevention of adverse environmental effects caused by mining, the reclamation of mined lands for alternative land uses, and the elimination of hazards to public health and safety from the effects of mining activities. At the same time, SMARA encourages both the

conservation and the production of extractive mineral resources, requiring the State Geologist to identify and attach levels of significance to the state's varied extractive resource deposits. Under SMARA, the mining industry in California must plan adequately for the reclamation of mined sites for beneficial uses and provide financial assurances to guarantee that the approved reclamation will actually be implemented. The requirements of SMARA must be implemented by the local lead agency with permitting responsibility for the proposed mining project.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

The following goals and policies of the Sacramento County General Plan (1998) are applicable to the No Project Alternative, and only to the proposed off-site detention basin east of Prairie City Road under all five action alternatives.

Safety Element

GOAL: Minimize the loss of life, injury, and property damage due to seismic and geological hazards.

- **Policy SA-1:** The County shall require geotechnical reports and impose the appropriate mitigation measures for new development located in seismic and geologically sensitive areas.

Conservation Element

Objective: Orderly extraction of minerals and subsequent reclamation of mined areas with minimal adverse impacts on aquifers, streams, scenic values, and surrounding residential uses.

- **Policy CO-43:** Surface mining operations shall be subject to appropriate mitigation measures and shall avoid creating any significant nuisances, hazards, and adverse environmental impacts unless the Board of Supervisors makes the findings to override as required by CEQA Guidelines Section 15091.

Objective: Sequential timing for mining of aggregate areas linked to the timing of urban development.

- **Policy CO-48:** Due to predicted shortages of aggregates in Sacramento County, mining of mineral resources within the Urban Services Boundary (USB) is encouraged, where consistent with Habitat Conservation Plans or other County initiated conservation programs and where such mining does not preclude successful completion of these plans, to avoid the potential loss of these mineral resources as a result of potential urban development. This policy is not intended to preclude mining outside of the USB.

Objective: Appropriate soil conservation practices regularly used by farmers and ranchers.

Objective: Widespread farmer participation in Resource Conservation District programs.

- **CO-58:** Work with rural landowners and existing Resource Conservation Districts to promote soil conservation practices.

Sacramento County Zoning Code Title II, Article 4, Surface Mining

The County has adopted its own SMARA ordinance, which is modeled after the state's SMARA guidelines (see above). The County's SMARA ordinance is designed to protect mineral resources from incompatible land uses, to manage the mineral resources, to assure the County of an adequate supply of these resources with due consideration for the environment, and to provide for the restoration of mined lands for future use. A Conditional Use Permit is required for surface-mining operations in Sacramento County.

Sacramento County Grading Ordinance

The County's Land Grading and Erosion Control Ordinance (County Code, Title 16, Chapter 16.44) was enacted for the purpose of minimizing damage to surrounding properties and public rights-of-way; limiting degradation of the water quality of watercourses; and curbing the disruption of drainage system flow caused by the activities of clearing, grubbing, grading, filing, and excavating land. The ordinance includes administrative procedures, minimum standards of review, and implementation and enforcement procedures for the control of erosion and sedimentation that are directly related to land-grading activities.

El Dorado County General Plan

The following goals and policies of the El Dorado County General Plan (2004) are applicable only to the two local roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goals and policies that are applicable to the No Project Alternative or the other four action alternatives.

Public Health, Safety, and Noise Element

GOAL 6.3: Geologic and Seismic Hazards. Minimize the threat to life and property from seismic and geologic hazards.

- **Policy 6.3.1.1:** The County shall require that all discretionary projects and all projects requiring a grading permit, or a building permit that would result in earth disturbance, that are located in areas likely to contain naturally occurring asbestos (based on mapping developed by the California Department of Conservation [DOC]) have a California-registered geologist knowledgeable about asbestos-containing formations inspect the project area for the presence of asbestos using appropriate test methods. The County shall amend the Erosion and Sediment Control Ordinance to include a section that addresses the reduction of thresholds to an appropriate level for grading permits in areas likely to contain naturally occurring asbestos (based on mapping developed by the DOC). The Department of Transportation and the County Air Quality Management District shall consider the requirement of posting a warning sign at the work site in areas likely to contain naturally occurring asbestos based on the mapping developed by the DOC.

- **Policy 6.3.1.2:** The County shall establish a mandatory disclosure program, where potential buyers and sellers of real property in all areas likely to contain naturally occurring asbestos (based on mapping developed by the California Department of Conservation [DOC]) are provided information regarding the potential presence of asbestos subject to sale. Information shall include potential for exposure from access roads and from disturbance activities (e.g., landscaping).

Conservation and Open Space Element

GOAL 7.1: Soil Conservation. Conserve and protect the County's soil resources.

- **Policy 7.1.2.2:** Discretionary and ministerial projects that require earthwork and grading, including cut and fill for roads, shall be required to minimize erosion and sedimentation, conform to natural contours, maintain natural drainage patterns, minimize impervious surfaces, and maximize the retention of natural vegetation. Specific standards for minimizing erosion and sedimentation shall be incorporated into the Zoning Ordinance.

- **Policy 7.1.2.3:** Enforce Grading Ordinance provisions for erosion control on all development projects and adopt provisions for ongoing, applicant-funded monitoring of project grading.

El Dorado County Grading Ordinance

This ordinance was enacted for the purpose of regulating grading within the unincorporated area of El Dorado County to safeguard life, limb, health, property, and public welfare; to avoid pollution of watercourses; and to ensure that the intended use of a graded site is consistent with the El Dorado County General Plan, any specific plans adopted thereto, the adopted Storm Water Management Plan, California Fire Safe Standards and applicable El Dorado County ordinances including the Zoning Ordinance and the CBC. A project applicant must submit grading plans and other pieces of information required by Grading, Erosion and Sediment Control Chapter of the Design and El Dorado County Improvement Standards Manual.

City of Folsom General Plan

There are no goals or policies of the City of Folsom General Plan (1993) that are applicable to the Proposed Project or any of the alternatives under consideration.

City of Folsom Hillside Development Guidelines

On February 14, 1995, the City of Folsom Planning Department adopted Resolution No. 4604—Hillside Development Guidelines—the purpose of which is to illustrate key design principles and issues that City staff will use in evaluating applications for development of any site within hillside areas of the City. The guidelines address street design, grading, site design, parking, drainage, architecture, landscaping, visual impact, and preservation of natural features, and are based on the City's Hillside Development Procedures and Standards Ordinance (Ordinance No. 798).

Professional Paleontological Standards

The Society of Vertebrate Paleontology (1995, 1996), a national scientific organization of professional vertebrate paleontologists, has established standard guidelines that outline acceptable professional practices in the conduct of paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, specimen preparation, analysis, and curation. Most practicing professional paleontologists in the nation adhere to the Society of Vertebrate Paleontology assessment, mitigation, and monitoring requirements, as specifically spelled out in its standard guidelines.

3A.7.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

Geology, Soils, and Minerals

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to geology, soils, or mineral resources if they would do any of the following:

- expose people, property, or structures to potential substantial adverse impacts, including the risk of loss, injury, or death involving:

    - rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault;

- strong seismic ground shaking;
- seismic-related ground failure, including liquefaction; or
- landslides.

- result in substantial soil erosion or the loss of topsoil.
- be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.
- be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.
- have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.
- result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state or a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

Paleontological Resources

Based on the environmental checklist in Appendix G of the State CEQA Guidelines, a project would have a significant impact on paleontological resources if it would directly or indirectly destroy a unique paleontological resource or site. For the purposes of this EIR/EIS, this threshold also encompasses the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts and applies to the Proposed Project and alternatives under consideration. A "unique paleontological resource or site" is one that is considered significant under the professional paleontological standards described below.

An individual vertebrate fossil specimen may be considered unique or significant if it is identifiable and well preserved, and it meets one of the following criteria:

- a type specimen (i.e., the individual from which a species or subspecies has been described);
- a member of a rare species;
- a species that is part of a diverse assemblage (i.e., a site where more than one fossil has been discovered) wherein other species are also identifiable, and important information regarding life history of individuals can be drawn;
- a skeletal element different from, or a specimen more complete than, those now available for its species; or
- a complete specimen (i.e., all or substantially all of the entire skeleton is present).

The value or importance of different fossil groups varies depending on the age and depositional environment of the rock unit that contains the fossils, their rarity, the extent to which they have already been identified and documented, and the ability to recover similar materials under more controlled conditions (such as for a research project). Marine invertebrates are generally common; the fossil record is well developed and well documented, and they would generally not be considered a unique paleontological resource. Identifiable vertebrate marine and terrestrial fossils are generally considered scientifically important because they are relatively rare.

ANALYSIS METHODOLOGY

Evaluation of potential geology, soils, and minerals impacts for the Proposed Project and alternatives under consideration relied in part on the following five reports:

- Youngdahl Consulting Group, Inc. 2003 (August). *Preliminary Geotechnical Engineering Study, Sacramento Country Day School.*
- Youngdahl Consulting Group, Inc. 2007 (May). *Preliminary Geotechnical Engineering Study, White Rock Road/Scott Road 1,440 Acres.*
- Wallace Kuhl & Associates, Inc. 2004 (August). *Preliminary Geotechnical Engineering Report, Folsom 138 Property.*
- Wallace Kuhl & Associates, Inc. 2005 (August). Preliminary Geotechnical Engineering Report, *Folsom Heights.*
- Wallace Kuhl & Associates, Inc. 2008 (January). *Preliminary Geotechnical Engineering Report, Gencorp South Folsom Sphere of Influence Property.*

Approximately 65% of the SPA is covered by these five reports (see Exhibit 3A.7-4), which are included as Appendix F1 through Appendix F5 of this EIR/EIS. The remainder of the SPA, and the off-site elements, have not been evaluated by a geotechincal engineer. The analysis prepared for this EIR/EIS also relied on NRCS soil survey data ("Web Soil Survey"), and published geologic literature and maps. The information obtained from these sources was reviewed and summarized to present the existing conditions and to identify potential environmental impacts, based on the thresholds of significance presented in this section. Impacts associated with geology, soils, and mineral resources that could result from project construction and operational activities were evaluated qualitatively based on site conditions; expected construction practices; materials, locations, and duration of project construction and related activities; and a field visit. Conceptual grading exhibits for the SPA (MacKay and Somps 2008) were also used to evaluate potential impacts. These conceptual exhibits are provided in Appendix F6.

In its standard guidelines for assessment and mitigation of adverse impacts on paleontological resources, the Society of Vertebrate Paleontology (1995) established three categories of sensitivity for paleontological resources: high, low, and undetermined. Areas where fossils have been previously found are considered to have a high sensitivity and a high potential to produce fossils. Areas that are not sedimentary in origin and that have not been known to produce fossils in the past typically are considered to have low sensitivity. Areas that have not had any previous paleontological resource surveys or fossil finds are considered to be of undetermined sensitivity until surveys and mapping are performed to determine their sensitivity. After reconnaissance surveys, observation of exposed cuts, and possibly subsurface testing, a qualified paleontologist can determine whether the area should be categorized as having high or low sensitivity. In keeping with the significance criteria of the Society of Vertebrate Paleontology (1995), all vertebrate fossils are generally categorized as being of potentially significant scientific value.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Risks to people or structures caused by surface fault rupture—The SPA is located approximately 50 miles from the nearest Alquist-Priolo Earthquake Fault Zone, and the SPA is not underlain by or adjacent to any known faults. Because the damage from surface fault rupture is generally limited to a linear zone a few yards wide, the potential for surface fault rupture to cause damage to proposed structures is negligible and this impact is not evaluated further in this EIR/EIS.

Site Coverage under Existing Geotechnical Reports **Exhibit 3A.7-4**

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.7-1 Possible Risks to People and Structures Caused by Strong Seismic Ground Shaking. *The SPA is located in an area of generally low seismic activity; however, structures in the SPA could be subject to seismic ground shaking from an earthquake along active faults in Lake Tahoe.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, up to 44 rural residences could be developed and agricultural activities could continue under the existing AG-80 land use and zoning designation, and no off-site water facilities would be constructed. The SPA is not located within a known fault zone, or within any faults known to be active during Holocene time. The West Branch of the Bear Mountains Fault is located approximately 5 miles east of the eastern property boundary (Wallace Kuhl & Associates 2005); however, Jennings (1994) does not indicate that fault activity has occurred within the last 11,000 years, and the slip rate of the Foothills fault system is extremely low (0.05 millimeters per year), which is well below the planning threshold for major earthquakes (USGS 2000). As shown in Table 3A.7-1, the Dunnigan Hills fault in Woodland, approximately 40 miles west of the SPA, is the nearest fault that is known to have been active within the last 11,000 years (Holocene time). Other faults that have been zoned as "active" by the CGS are located in the Coast Range (approximately 60 miles west of the SPA) or in the vicinity of Lake Tahoe (approximately 60 miles east of the SPA). Because structures in the SPA could be subject to seismic ground shaking and because geotechnical reports have not been prepared for the entire SPA, the potential for damage from strong seismic ground shaking is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

NCP, PP, RIM, CD, RHD

As described above under the No Project Alternative, the SPA and off-site elements are not located within a known fault zone, or within or adjacent to any faults known to be active during Holocene time. Other faults that have been zoned as "active" by the CGS are located in the Coast Range or in the vicinity of Lake Tahoe (see discussion above under the No Project Alternative for distances). However, geotechnical reports have only been prepared for five of the properties within the SPA. Furthermore, three of those reports evaluated the site using the older CBC criteria (before 2008). As stated above in the "Regulatory Framework" section, the 2007 CBC (adopted in 2008) replaced the previous "seismic zones" (assigned a number from 1 to 4, where 4 required the most earthquake-resistant design) with new Seismic Design Categories A–F (where F requires the most earthquake-resistant design) for structures designed for a project site. Chapter 16 of the CBC specifies exactly how each seismic design category is to be determined on a site-specific basis through the site-specific soil characteristics and proximity to potential seismic hazards. Therefore, because structures in the SPA could be subject to seismic ground shaking, because geotechnical reports have not been prepared for the entire SPA, and because three of the extant reports do not conform to the current CBC criteria, the potential for damage from strong seismic ground shaking is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.7-1a: Prepare Site-Specific Geotechnical Report per CBC Requirements and Implement Appropriate Recommendations.

Before building permits are issued and construction activities begin any project development phase, the project applicant(s) of each project phase shall hire a licensed geotechnical engineer to prepare a final geotechnical subsurface investigation report for the on- and off-site facilities, which shall be submitted for review and approval to the appropriate City or county department (identified below). The final geotechnical engineering report shall address and make recommendations on the following:

- site preparation;
- soil bearing capacity;
- appropriate sources and types of fill;
- potential need for soil amendments;
- road, pavement, and parking areas;
- structural foundations, including retaining-wall design;
- grading practices;
- soil corrosion of concrete and steel;
- erosion/winterization;
- seismic ground shaking;
- liquefaction; and
- expansive/unstable soils.

In addition to the recommendations for the conditions listed above, the geotechnical investigation shall include subsurface testing of soil and groundwater conditions, and shall determine appropriate foundation designs that are consistent with the version of the CBC that is applicable at the time building and grading permits are applied for. All recommendations contained in the final geotechnical engineering report shall be implemented by the project applicant(s) of each project phase. Special recommendations contained in the geotechnical engineering report shall be noted on the grading plans and implemented as appropriate before construction begins. Design and construction of all new project development shall be in accordance with the CBC. The project applicant(s) shall provide for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the geotechnical report.

Mitigation Measure 3A.7-1b: Monitor Earthwork during Earthmoving Activities.

All earthwork shall be monitored by a qualified geotechnical or soils engineer retained by the project applicant(s) of each project phase. The geotechnical or soils engineer shall provide oversight during all excavation, placement of fill, and disposal of materials removed from and deposited on both on- and off-site construction areas.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before issuance of building permits and ground-disturbing activities.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department.

3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

4. For the U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measures 3A.7-1a and 3A.7-1b would reduce the potentially significant impact of possible damage to people and structures from strong seismic ground shaking under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level by requiring that the design recommendations of a geotechnical engineer to reduce damage from seismic events be incorporated into buildings, structures, and infrastructure as required by the CBC, and that a geotechnical or soils engineer provide on-site monitoring to ensure that earthwork is being performed as specified in the plans. However, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.7-2 Seismically-Induced Risks to People and Structures Caused by Liquefaction. *Construction activities would not occur in areas subject to liquefaction.*

On-Site and Off-Site Elements

NP, NCP, PP, RIM, CD, RHD

Based on a review of information contained in (1) the Preliminary Geotechnical Engineering Reports prepared by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting Group (2003), (2) published geological maps and literature, and (3) a telephone conference with Wallace Kuhl & Associates (French, pers. comm., 2009), it is unlikely that on- or off-site soils would be subject to liquefaction in the event of an earthquake, for the following reasons:

- the SPA and areas of proposed off-site activities are underlain by small amounts of Pleistocene-age alluvium and primarily by Jurassic-age bedrock formations, which generally are not susceptible to liquefaction;
- the SPA and areas of proposed off-site activities are underlain by a moderately deep groundwater table that is at least 100 feet below the ground surface; and
- the potential sources of seismic activity are a relatively long distance away (approximately 50 miles).

Therefore, **direct** impacts related to potential damage to structures from seismically-induced liquefaction under the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternative are considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.7-3 Construction-Related Erosion. *Construction activities during project implementation would involve grading and movement of earth in soils subject to wind and water erosion hazard and on steep slopes.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be

constructed. Construction activities would occur in soils that have moderate wind and water erosion hazard potential. Conducting these activities would result in the temporary disturbance of soil and would expose disturbed areas to winter storm events. Rain of sufficient intensity could dislodge soil particles from the soil surface. If the storm is large enough to generate runoff, localized erosion could occur. On the steeper eastern slopes, severe erosion could occur as a result of project development. In addition, soil disturbance during the summer as a result of construction activities could result in soil loss because of wind erosion. Therefore, **direct** impacts associated with construction-related erosion are **potentially significant. Indirect** impacts from soil erosion, such as sediment transport and potential loss of aquatic habitat, are evaluated in Sections 3A.3, "Biological Resources – Land," and 3A.9, "Hydrology and Water Quality – Land," respectively. ***[Lesser]***

NCP, PP, RIM, RHD

Project implementation would involve intensive grading and construction activities for infrastructure and building and road foundations over more than 3,500 acres of varied terrain, ranging from relatively flat, to gently rolling, to steeply sloped (in the eastern portion of the SPA). Construction activities would occur in soils that have moderate wind and water erosion hazard potential. Conducting these activities would result in the temporary disturbance of soil and would expose disturbed areas to winter storm events. Rain of sufficient intensity could dislodge soil particles from the soil surface. If the storm is large enough to generate runoff, localized erosion could occur. On the steeper eastern slopes, severe erosion could occur as a result of project development. In addition, soil disturbance during the summer as a result of construction activities could result in soil loss because of wind erosion. Therefore, **direct** impacts associated with construction-related erosion are **potentially significant. Indirect** impacts from soil erosion, such as sediment transport and potential loss of aquatic habitat, are evaluated in Sections 3A.3, "Biological Resources – Land," and 3A.9, "Hydrology and Water Quality – Land," respectively. ***[Similar]***

Mitigation Measure 3A.7-3: Prepare and Implement the Appropriate Grading and Erosion Control Plan.

Before grading permits are issued, the project applicant(s) of each project phase that would be located within the City of Folsom shall retain a California Registered Civil Engineer to prepare a grading and erosion control plan. The grading and erosion control plan shall be submitted to the City Public Works Department before issuance of grading permits for all new development. The plan shall be consistent with the City's Grading Ordinance, the City's Hillside Development Guidelines, and the state's NPDES permit, and shall include the site-specific grading associated with development for all project phases.

For the two off-site roadways into El Dorado Hills, the project applicant(s) of that phase shall retain a California Registered Civil Engineer to prepare a grading and erosion control plan. The grading and erosion control plan shall be submitted to the El Dorado County Public Works Department and the El Dorado Hills Community Service District before issuance of grading permits for roadway construction in El Dorado Hills. The plan shall be consistent with El Dorado County's Grading, Erosion, and Sediment Control Ordinance and the state's NPDES permit, and shall include the site-specific grading associated with roadway development.

For the off-site detention basin west of Prairie City Road, the project applicant(s) of that phase shall retain a California Registered Civil Engineer to prepare a grading and erosion control plan. The grading and erosion control plan shall be submitted to the Sacramento County Public Works Department before issuance of a grading permit. The plan shall be consistent with Sacramento County's Grading, Erosion, and Sediment Control Ordinance and the state's NPDES permit, and shall include the site-specific grading associated with construction of the detention basin.

The plans referenced above shall include the location, implementation schedule, and maintenance schedule of all erosion and sediment control measures, a description of measures designed to control dust and stabilize the construction-site road and entrance, and a description of the location and methods of

storage and disposal of construction materials. Erosion and sediment control measures could include the use of detention basins, berms, swales, wattles, and silt fencing, and covering or watering of stockpiled soils to reduce wind erosion. Stabilization on steep slopes could include construction of retaining walls and reseeding with vegetation after construction. Stabilization of construction entrances to minimize trackout (control dust) is commonly achieved by installing filter fabric and crushed rock to a depth of approximately 1 foot. The project applicant(s) shall ensure that the construction contractor is responsible for securing a source of transportation and deposition of excavated materials.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties).

Implementation of Mitigation Measure 3A.9-1 (discussed in Section 3A.9, "Hydrology and Water Quality – Land") would also help reduce erosion-related impacts.

Implementation: Project applicant(s) of all project phases.

Timing: Before the start of construction activities.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department.
3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

CD

Under the Centralized Development Alternative, most of the residential housing and commercial development currently planned for the steep eastern slopes would not occur; instead, that development would be relocated within the gently rolling terrain in the central portion of the SPA. Construction activities for infrastructure and building and road foundations under the Centralized Development Alternative would be reduced by approximately 387 acres as compared to the Proposed Project Alternative; however, construction activities throughout the remaining 3,113-acre SPA would expose soils to erosion hazards from wind and water. Furthermore, the proposed commercial development would still occur along U.S. 50 under this alternative, within the steep terrain of the eastern foothills, where severe erosion could occur. Therefore, **direct** impacts associated with construction-related erosion under the Centralized Development Alternative are **potentially significant**. **Indirect** impacts from soil erosion, such as sediment transport and potential loss of aquatic habitat, are evaluated in Sections 3A.3, "Biological Resources – Land," and 3A.9, "Hydrology and Water Quality – Land," respectively. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.7-3.

Implementation of Mitigation Measure 3A.7-3 along with Mitigation Measure 3A.9-1 (discussed in Section 3A.9, "Hydrology and Water Quality – Land"), would reduce potentially significant construction-related erosion impacts under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because grading and erosion control plans with specific erosion and sediment control measures such as those suggested above or listed in Mitigation Measure 3A.9-1 would be prepared, approved by the appropriate City or county department, and implemented. However, some of the off-site elements (two roadway connections in El Dorado County and

detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.7-4 **Potential Geologic Hazards Related to Construction in Bedrock and Rock Outcrops, and Unstable Soils.** *Development in the eastern portion of the SPA would occur in steep slopes underlain by bedrock at shallow depths and rock outcrops that could result in geologic hazards during construction.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Depending on the how the parcels are split, it is possible that several of these rural residences could be built within the eastern foothills. Based on a review of the *Preliminary Geotechnical Engineering Report* prepared by Wallace Kuhl & Associates (2005), the SPA soils are generally stable and suitable for the proposed hillside grading; however, the geotechnical engineer recommended that a seismic refraction survey be performed for the Folsom Heights property to determine which areas can be graded using a large bulldozer/excavator, and which areas may require blasting in order to excavate the materials. Therefore, potential geologic hazards from construction in bedrock/rock outcrops/unstable soils are considered a **direct, potentially significant** impact. The **indirect** impact from project-related construction in bedrock/rock outcroppings is creation of a public safety hazard from blasting operations, which is evaluated in Section 3A.8, "Hazards and Hazardous Materials – Land." ***[Similar]***

NCP, PP, RIM, CD, RHD

The implementation of all five action alternatives would result in construction on slopes in the eastern portion of the SPA, although less development on the slopes would occur under the Centralized Development Alternative. Based on a review of the Conceptual Grading Plans prepared by MacKay & Somps (2008), several areas of steep slopes would need to be created, ranging from approximately 16% to 32%. The *Folsom Plan Area Specific Plan* Section A.4 establishes grading standards for the SPA. The SPA consists of two distinct topographic areas: The eastern region includes all of the property east of Placerville Road and consists of hilly terrain located where the lower foothills of the Sierra Nevada join the Sacramento Valley floor. Elevations vary from 440 feet above mean sea level at the valley floor (along Placerville Road), to 800 feet above mean sea level in the foothills adjacent to the existing communication towers. The hilltop terrain is plateau-like and extends in a gentle slope from U.S. 50 to White Rock Road. On the east side of this area, the topography slopes gradually from the plateau to the El Dorado County line. Existing slopes range from 5%, to small areas in excess of 30%. The majority of slopes in this area average 15%.

The topography of the western region of the SPA consists of gently rolling terrain located on the valley floor between Placerville Road on the east, U.S. 50 on the north, White Rock Road on the south, and Prairie City Road on the east. The majority of slopes in this zone range between 0% and 15%; however, isolated steeper slopes exist along the edges of Alder Creek tributaries and existing seasonal drainages in the western sections of this zone.

Development of the SPA would entail the use of convential, contour, and landform grading, as described below:

- Conventional grading is characterized by uniform slope gradients with angular slope intersections and pad configurations that are rectangular. In the SPA, conventional grading would be mostly associated with non-hillside commercial building pads, homebuilding sites, school sites, municipal uses, parks, and other areas where uniform site grading is the primary consideration.

- Contour grading slopes are curvilinear in plan rather than linear as in conventional grading. Transition zones and slope intersections generally have some rounding applied and the resultant pad configurations are mildly curvilinear. In the SPA, contour grading would most likely occur in hillside-graded slope transition areas as well as highly visible areas where visual aesthetics are an important consideration.

- Landform grading replicates the irregular shapes of natural stable slopes. Landform-graded slopes are characterized by a continuous series of concave and convex forms interspersed with swales and berms that blend into the existing slopes, and thus the resultant pad configurations are irregular. In the SPA, landform grading would most likely occur in hillside areas where the natural blending of slopes is important, including transitions to oak woodlands, natural drainages, and open space.

The specific policies that would govern grading in the SPA, as fully detailed in Section A4 of *Folsom Plan Area Specific Plan*, have been designed to comply with the City's Hillside Grading Ordinance. In some cases, policies in the Ordinance have been refined for use specifically within the SPA. As stated in Folsom Municipal Code Section 17.37.010:

> The purpose of the SP, specific plan district is to provide a vehicle for implementing the city's general plan on an area-specific basis. A specific plan prepared in accordance with the standards set forth in this chapter is intended to serve as a regulatory document, consistent with the General Plan. In the event there is an inconsistency or conflict between an adopted specific plan and comparable regulations of this code, the specific plan will prevail.

In other words, if there is an inconsistency or conflict between the specific plan and other provisions of the Folsom Municipal Code, the specific plan governs.

As shown in Exhibit 3A.7-3, the eastern foothills are underlain by the Copper Hill Volcanics, which consist of weathered and fractured metavolcanic rocks. Rock outcroppings are present throughout the eastern slopes. Based on a review of the *Preliminary Geotechnical Engineering Report* prepared by Wallace Kuhl & Associates (2005), the SPA soils are generally stable and suitable for the proposed hillside grading; however, the geotechnical engineer recommended that a seismic refraction survey be performed for the Folsom Heights property to determine which areas can be graded using a large bulldozer/excavator, and which areas may require blasting in order to excavate the materials.

Potential geologic hazards from construction in bedrock/rock outcroppings within the eastern foothills are considered a **direct, potentially significant** impact. The **indirect** impact from project-related construction in bedrock/rock outcroppings is creation of a public safety hazard from blasting operations, which is evaluated in Section 3A.8, "Hazards and Hazardous Materials – Land." ***[Similar]***

> Mitigation Measure: Implement Mitigation Measure 3A.7-1a.
>
> Mitigation Measure 3A.7-4: Prepare a Seismic Refraction Survey and Obtain Appropriate Permits for all On-Site and Off-Site Elements East of Old Placerville Road.
>
> Before the start of all construction activities east of Old Placerville Road, the project applicant(s) of all project phases shall retain a licensed geotechnical engineer to perform a seismic refraction survey. Project-related excavation activities shall be carried out as recommend by the geotechnical engineer. Excavation may include the use of heavy-duty equipment such as large bulldozers or large excavators, and may include blasting. Appropriate permits for blasting operations shall be obtained from the relevant City or county jurisdiction prior to the start of any blasting activities.
>
> Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases for on-site and off-site elements east of Old Placerville Road.

Timing: Before or during earthmoving activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department.

Implementation of Mitigation Measures 3A.7-1a and 3A.7-4 would reduce potential geologic hazards from construction in bedrock/rock outcroppings under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternative to a **less-than-significant** level because a seismic refraction survey would be performed to determine which areas of the eastern foothills required blasting and which could be excavated using conventional methods, and appropriate permits would be obtained for blasting activities. However, the two roadway connections in El Dorado County fall under the jurisdiction of El Dorado County; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.7-5 Potential Geologic Hazards Related to Seasonal Subsurface Water Flows from Surface Infiltration. *SPA excavation is not expected to encounter groundwater, but seasonal subsurface flows due to surface infiltration, as well as surface infiltration from shallow wells, could adversely affect some of the building foundations in the SPA.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. According to the results from text pits excavated by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting (2003) groundwater was not encountered in any test pit to a maximum of 9.5 feet bgs. However, infiltrated seasonal runoff, and water from several shallow wells in the eastern foothills, can be expected to flow underneath the SPA along the soil/bedrock interface, which may create or increase shallow seasonal groundwater conditions. Furthermore, perched groundwater conditions during the winter months and water seepage conditions may be encountered throughout the SPA. Without proper design techniques, such as installation of French drains, this could result in adverse impacts to building foundations constructed at or near the interface of soil and rock. Therefore, this **indirect** impact is considered **potentially significant**. **No direct** impact would occur. ***[Similar]***

NCP, PP, RIM, CD, RHD

According to the results from text pits excavated by Wallace Kuhl & Associates (2004, 2005, 2008) and Youngdahl Consulting (2003) groundwater was not encountered in any test pit to a maximum of 9.5 feet bgs. However, infiltrated seasonal runoff, and water from several shallow wells in the eastern foothills, can be expected to flow underneath the SPA along the soil/bedrock interface, which may create or increase shallow seasonal groundwater conditions. Furthermore, perched groundwater conditions during the winter months and water seepage conditions may be encountered throughout the SPA. Without proper design techniques, such as installation of French drains, this could result in adverse impacts to building foundations constructed at or near the interface of soil and rock. Therefore, this **indirect** impact is considered **potentially significant**. **No direct** impact would occur. ***[Similar]***

Mitigation Measure 3A.7-5: Divert Seasonal Water Flows Away from Building Foundations.

The project applicant(s) of all project phases shall either install subdrains (which typically consist of perforated pipe and gravel, surrounded by nonwoven geotextile fabric), or take such other actions as recommended by the geotechnical or civil engineer for the project that would serve to divert seasonal flows caused by surface infiltration, water seepage, and perched water during the winter months away from building foundations.

Implementation: Project applicant(s) of all project phases.

Timing: Before and during earthmoving activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Public Works Department.

Implementation of Mitigation Measures 3A.7-5 and would reduce the potential impacts from seasonal subsurface water flows, flows from existing shallow wells, water seepage, and perched winter shallow groundwater conditions under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because subsurface drains, or another methodology recommended by the project geotechnical engineer (and approved by the relevant City or county department), would be installed to channel seasonal water flows away from building foundations. However, two roadway connections in El Dorado County fall under the jurisdiction of El Dorado County; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.7-6 Potential Damage to Structures and Infrastructure from Construction in Expansive Soils. *Portions of the SPA are underlain by soils that have a moderate to high potential for expansion when wet and may result damage to structures.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Expansive soils shrink and swell as a result of moisture change. These volume changes can result in damage over time to building foundations, underground utilities, and other subsurface facilities and infrastructure if they are not designed and constructed appropriately to resist the damage associated with changing soil conditions. Volume changes of expansive soils also can result in the consolidation of soft clays following the lowering of the water table or the placement of fill. Placing buildings or constructing infrastructure on or in unstable soils can result in structural failure. Based on a review of NRCS soil survey data as shown in Table 3A.7-2, most of the on- and off-site project elements consists of soils with a moderate to high shrink-swell potential, indicating the soils are expansive. Soil expansion, including volume changes during seasonal fluctuations in moisture content, could adversely affect road surfaces, interior slabs-on-grade, landscaping hardscapes, and underground pipelines. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

NCP, PP, RIM, CD, RHD

Expansive soils shrink and swell as a result of moisture change. These volume changes can result in damage over time to building foundations, underground utilities, and other subsurface facilities and infrastructure if they are not designed and constructed appropriately to resist the damage associated with changing soil conditions. Volume changes of expansive soils also can result in the consolidation of soft clays following the lowering of the water table or the placement of fill. Placing buildings or constructing infrastructure on or in unstable soils can result in structural failure. Based on a review of NRCS soil survey data as shown in Table 3A.7-2, most of the on- and off-site project elements consists of soils with a moderate to high shrink-swell potential, indicating the soils are expansive. Soil expansion, including volume changes during seasonal fluctuations in moisture content, could adversely affect road surfaces, interior slabs-on-grade, landscaping hardscapes, and underground pipelines. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur.

Mitigation Measure: Implement Mitigation Measures 3A.7-1a and 3A.7-1b.

Implementation of Mitigation Measures 3A.7-1a and 3A.7-1b would reduce the potentially significant impact of damage to people and structures from construction in expansive soils under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level by requiring that the design recommendations of a geotechnical engineer to reduce damage from expansive soils be incorporated into buildings, structures, and infrastructure as required by the CBC, and that a geotechnical or soils engineer provide on-site monitoring to ensure that earthwork is being performed as specified in the plans. However, some of the off-site elements (two roadway connections in El Dorado County and detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.7-7 Suitability of Soils for Use with Septic Systems. *The SPA is underlain by soils that are unsuitable for use with conventional septic systems.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, up to 44 rural residences could be developed under the existing Sacramento County AG-80 zoning, and no off-site water facilities would be constructed. These residences would require the use of on-site septic systems. Most of the shallow on-site soils have a low permeability and are subject to water seepage (a high water holding capacity) and thus tend to "perc" too slowly, rendering them unsuitable for conventional septic systems. Most of the bedrock on-site soils have extremely high permeability (a low water holding capacity) and thus tend to "perc" too quickly, also rendering them unsuitable for conventional septic systems. Based on a review of NRCS soil data (see Table 3A.7-2), the entire SPA is rated with a severe limitation because the soils are unsuitable for conventional septic systems. Therefore, the unsuitability of SPA soils for septic systems would have a **direct, significant** impact related to lack of treatment capability, and an **indirect, potentially significant** impact related to water quality. ***[Greater]***

NCP, PP, RIM, CD, RHD

Because the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development Alternatives would use piped sewer service from Sacramento Regional County Sanitation District and/or El Dorado Irrigation District, septic systems would not be required and there would be **no direct** or **indirect** impact. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.7-8 Possible Loss of Mineral Resources–Construction Aggregate. *The SPA is located within the Sacramento-Fairfield Production-Consumption Region designated by CDMG and contains dredge tailings that could provide a source of construction aggregate.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Construction of these scattered rural residences would not impede mining of any construction aggregate located in the SPA. There would be no off-site water facilities constructed under this alternative. Therefore, there would be **no direct** or **indirect impact**. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

The western third of the SPA is located within the Sacramento-Fairfield Production-Consumption Region, a mineral resources area designated by CDMG as containing "regionally significant" mineral deposits that may be needed to meet future demand. As shown in Exhibit 3A.7-3, the western edge of the SPA is classified by CDMG as MRZ-1 for construction aggregate, "areas where adequate information indicates that no significant mineral deposits are present or where it is judged that little likelihood exists for their presence." However, the majority of the SPA is classified by CDMG as MRZ-3 for construction aggregate, "areas containing mineral deposits, the significance of which cannot be evaluated from existing data." Based on site visits performed by EDAW/AECOM (now AECOM) in 2007, information contained in the geotechnical reports, and conversations with the project engineer (MacKay & Somps), portions of the western third of the SPA contain piles of cobbles deposited during dredger gold mining operations in the 1800s and early 1900s. Similar piles of dredge tailings are present in nearby areas of Rancho Cordova, and south of White Rock Road in Sacramento County, and those areas are actively being mined or are proposed for mining as an aggregate sand and gravel resource. However, the dredge tailings present within the SPA are located primarily within the Alder Creek drainage. Alder Creek is a perennial watercourse, and its drainage and riparian resources are protected by both Sacramento County and City of Folsom General Plan policies and ordinances. Furthermore, in 2003, the City of Folsom determined that because it did not have any active mining operations, and because none were expected in the future, that it would not update its SMARA ordinance. The SPA is not delineated as an area of known mineral resources in either the City of Folsom or Sacramento County General Plans. Finally, based on conversations with the project engineer (MacKay & Somps), even if it were permissible to mine the Alder Creek dredge tailings, they are not present in a large enough concentration that would warrant an economically viable on-site mining operation. Therefore, this **direct** impact would be **less than significant. No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

The off-site elements are located in areas that are either zoned MRZ-1 for construction aggregate (where no mineral resources are present) or are located in MRZ-3 construction aggregate areas that have already been developed with urban uses (where any resources that may have been present have been covered over by development and are no longer available for extraction). Therefore, there would be **no direct** or **indirect** impact related to loss of mineral resources from construction of the off-site elements. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.7-9 Possible Loss of Mineral Resources–Kaolin Clay. *The SPA is located within the Sacramento-Fairfield Production-Consumption Region designated by CDMG and may contain a deposit of kaolin clay.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Construction of these scattered rural residences would not impede mining of any kaolin clay located in the SPA. There would be no off-site water facilities constructed under this alternative. Therefore, there would be **no direct** or **indirect** impact. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

As shown on Exhibit 3.8-3, the western edge of the SPA is zoned MRZ-3 for kaolin clay. This classification was applied by CDMG because that area roughly corresponds to the location of the Ione Formation in the SPA. The Ione Formation is known to contain kaolin clay in other locations in northern California. None of the five geotechnical reports prepared for the SPA included an investigation of this area. Therefore, it is currently unknown whether or not an economically valuable deposit of kaolin clay is present. If it were present, the deposit would be unavailable for mining following project implementation, because urban development is planned throughout the area where the Ione Formation occurs in the SPA. Because the potential presence of this valuable mineral resource cannot be ruled out at this time, and because the resource would be lost as a result of project implementation, this **direct** impact is considered **potentially significant. No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.7-9: Conduct Soil Sampling in Areas of the SPA Designated as MRZ-3 for Kaolin Clay and if Found, Delineate its Location and Notify Lead Agency and the California Division of Mines and Geology.

The project applicant(s) of all applicable project phases shall retain a licensed geotechnical or soils engineer to analyze soil core samples that shall be extracted from that portion of the SPA zoned MRZ-3 for kaolin clay, as shown on Exhibit 3A.7-3. In the event that kaolin clay is discovered, the City of Folsom, Sacramento County, and CDMG shall be notified. In addition, the approximate horizontal and vertical extent of available kaolin clay shall be delineated by the geotechnical or soils engineer.

Implementation: Project applicant(s) of all project phases in the Ione Formation.

Timing: Before issuance of building permits for development within the Ione Formation as shown in Exhibit 3A.7-1.

Enforcement: City of Folsom Community Development Department, Sacramento County Planning and Community Development Department, California Division of Mines and Geology.

Implementation of Mitigation Measure 3A.7-9 would provide data that would allow the project applicant(s) and the lead agencies to determine whether or not economically valuable mineral resources are present in the MRZ-3 kaolin clay area of the SPA. However, if economically valuable mineral resources were found to be present, they would be covered over as a result of SPA development with urban land uses, and would no longer be available for

mining. Therefore, this impact is considered **potentially significant** and **unavoidable**, because there are no feasible mitigation measures available to avoid or reduce this impact to a less-than-significant level.

Off-Site Elements

The off-site elements are located in areas that are not zoned for kaolin clay and are not located within the Ione Formation. Therefore, there would be **no direct** or **indirect** impact related to loss of kaolin clay mineral resources from construction of the off-site elements. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.7-10 Possible Damage of or Destruction to of Previously Unknown Unique Paleontological Resources during Construction-Related Activities. *Portions of the SPA and the off-site detention basin are underlain by paleontologically sensitive rock formations. Therefore, construction activities could damage or destroy previously unknown, unique paleontological resources in the SPA.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Construction of any residence within the Ione Formation could damage or destroy unknown, unique paleontological resources that occur within the SPA. The policies in the Sacramento County General Plan that would protect paleontological resources under a tentative subdivision map do not apply to private land that is zoned for agricultural use, because they are generally mutually exclusive. Because earthmoving activities within the Ione Formation could encounter and potentially destroy previously unknown unique paleontological resources, this **direct** impact is **potentially significant**. **No indirect** impacts would occur. ***[Greater]***

NCP, PP, RIM, CD, RHD

As shown in Exhibit 3A.7-1, most of the SPA and the off-site elements are underlain by the Salt Springs Slate, Copper Hill Volcanics, and Gopher Canyon Volcanics. Because of the way in which these rocks formed, they would not contain vertebrate fossils or fossil plant assemblages. Therefore, construction activities that occur in these rock formations would have no impact on unique paleontological resources.

However, the western edge of the SPA (see Exhibit 3A.7-1) is underlain by Eocene-age sediments of the Ione Formation. Vertebrate mammal, plant, and invertebrate fossils have been recovered from the Ione Formation from over 300 locations in Nevada, Contra Costa, Placer, Butte, Alameda, Merced, Tuolumne, Sutter, Sierra, Plumas, Calaveras, Kern, Stanislaus, and Amador counties, including the town of Ione (about 16 miles south of the SPA) (UCMP 2009).

The off-site detention basin west of Prairie City Road would be located within the Mehrten Formation. Vertebrate fossils have been recovered from the Mehrten Formation from over 40 locations in Calaveras, San Joaquin, Stanislaus, Tuolumne, and Merced Counties (UCMP 2009). In addition, several specimens of plant fossils have been recovered locally from the Mehrten Formation in Granite Bay, Roseville, and Rocklin (Sierra College Natural History Museum 2009).

Because of the large number of fossils that have been recovered from the Mehrten and Ione Formations throughout the Central Valley, they are considered paleontologically sensitive rock units under the Society of Vertebrate Paleontology guidelines (1995), thus suggesting that there is a potential for uncovering additional similar fossil remains during construction-related earthmoving activities in these formations in the SPA.

Therefore, the potential for damage to previously unknown unique paleontological resources during earthmoving activities in the SPA and the off-site detention basin is considered a **potentially significant, direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.7-10: Conduct Construction Personnel Education, Stop Work if Paleontological Resources are Discovered, Assess the Significance of the Find, and Prepare and Implement a Recovery Plan as Required.

To minimize potential adverse impacts on previously unknown potentially unique, scientifically important paleontological resources, the project applicant(s) of all project phases where construction would occur in the Ione and Mehrten Formations shall do the following:

- Before the start of any earthmoving activities for any project phase in the Ione or Mehrten Formations, the project applicant(s) shall retain a qualified paleontologist or archaeologist to train all construction personnel involved with earthmoving activities, including the site superintendent, regarding the possibility of encountering fossils, the appearance and types of fossils likely to be seen during construction, and proper notification procedures should fossils be encountered.

- If paleontological resources are discovered during earthmoving activities, the construction crew shall immediately cease work in the vicinity of the find and notify the appropriate lead agency (identified below). The project applicant(s) shall retain a qualified paleontologist to evaluate the resource and prepare a recovery plan in accordance with Society of Vertebrate Paleontology guidelines (1996). The recovery plan may include, but is not limited to, a field survey, construction monitoring, sampling and data recovery procedures, museum storage coordination for any specimen recovered, and a report of findings. Recommendations in the recovery plan that are determined by the lead agency to be necessary and feasible shall be implemented before construction activities can resume at the site where the paleontological resources were discovered.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County).

Implementation: Project applicant(s) of all project phases within the Ione and Mehrten Formations.

Timing: During earthmoving activities in the Ione and Mehrten Formations as shown in Exhibit 3A.7-1.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Implementation of Mitigation Measure 3A.7-10 would reduce potentially significant impacts related to damage or destruction of unique paleontological resources within the Ione and Mehrten Formations to a **less-than-significant** level under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives because construction workers would be alerted to the possibility of encountering paleontological resources, and in the event that resources were encountered, fossil specimens would be recovered and recorded and would undergo appropriate curation. However, the off-site detention basin in Sacramento County falls under the jurisdiction of Sacramento County; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation.

3A.7.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of Mitigation Measures 3A.7-1, 3A.7-3, 3A.7-4, 3A.7-5, and 3A.7-7, impacts related to strong seismic ground shaking, construction-related erosion, construction in bedrock/rock outcrops and landslides, subsurface water flows, and unsuitability for septic systems would be reduced to less-than-significant levels. Implementation of Mitigation Measure 3A.7-9 would provide data that would allow the project applicant(s) and the lead agencies to determine whether or not economically valuable mineral resources are present in the MRZ-3 kaolin clay area of the SPA. However, if economically valuable kaolin clay deposits were found to be present, they would be covered over as a result of SPA development with urban land uses, and would no longer be available for mining. Therefore, this impact is considered potentially significant and unavoidable under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives.

In addition, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, and Caltrans; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these off-site elements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of El Dorado and Sacramento Counties, and Caltrans, Impacts 3A.7-1, 3A.7-3, 3A.7-4, 3A.7-5, 3A.7-6, and 3A.7-10 are considered potentially significant and unavoidable for off-site improvements which would be located in Sacramento or El Dorado County, or Caltrans jurisdiction.

This section was prepared by RMC Water and Environment.

3B.7 GEOLOGY, SOILS, AND PALEONTOLOGICAL RESOURCES – WATER

3B.7.1 AFFECTED ENVIRONMENT

Similar to other resource sections, the description of the affected environment is focused on Zone 4 of the "Water" Study Area where existing geology and/or soil conditions could influence the design of physical underground and above-ground improvements. No physical improvements are proposed within Zones 1, 2, and 3, and, therefore, detail discussion for this area was determined unnecessary to support the impact analysis.

TOPOGRAPHY

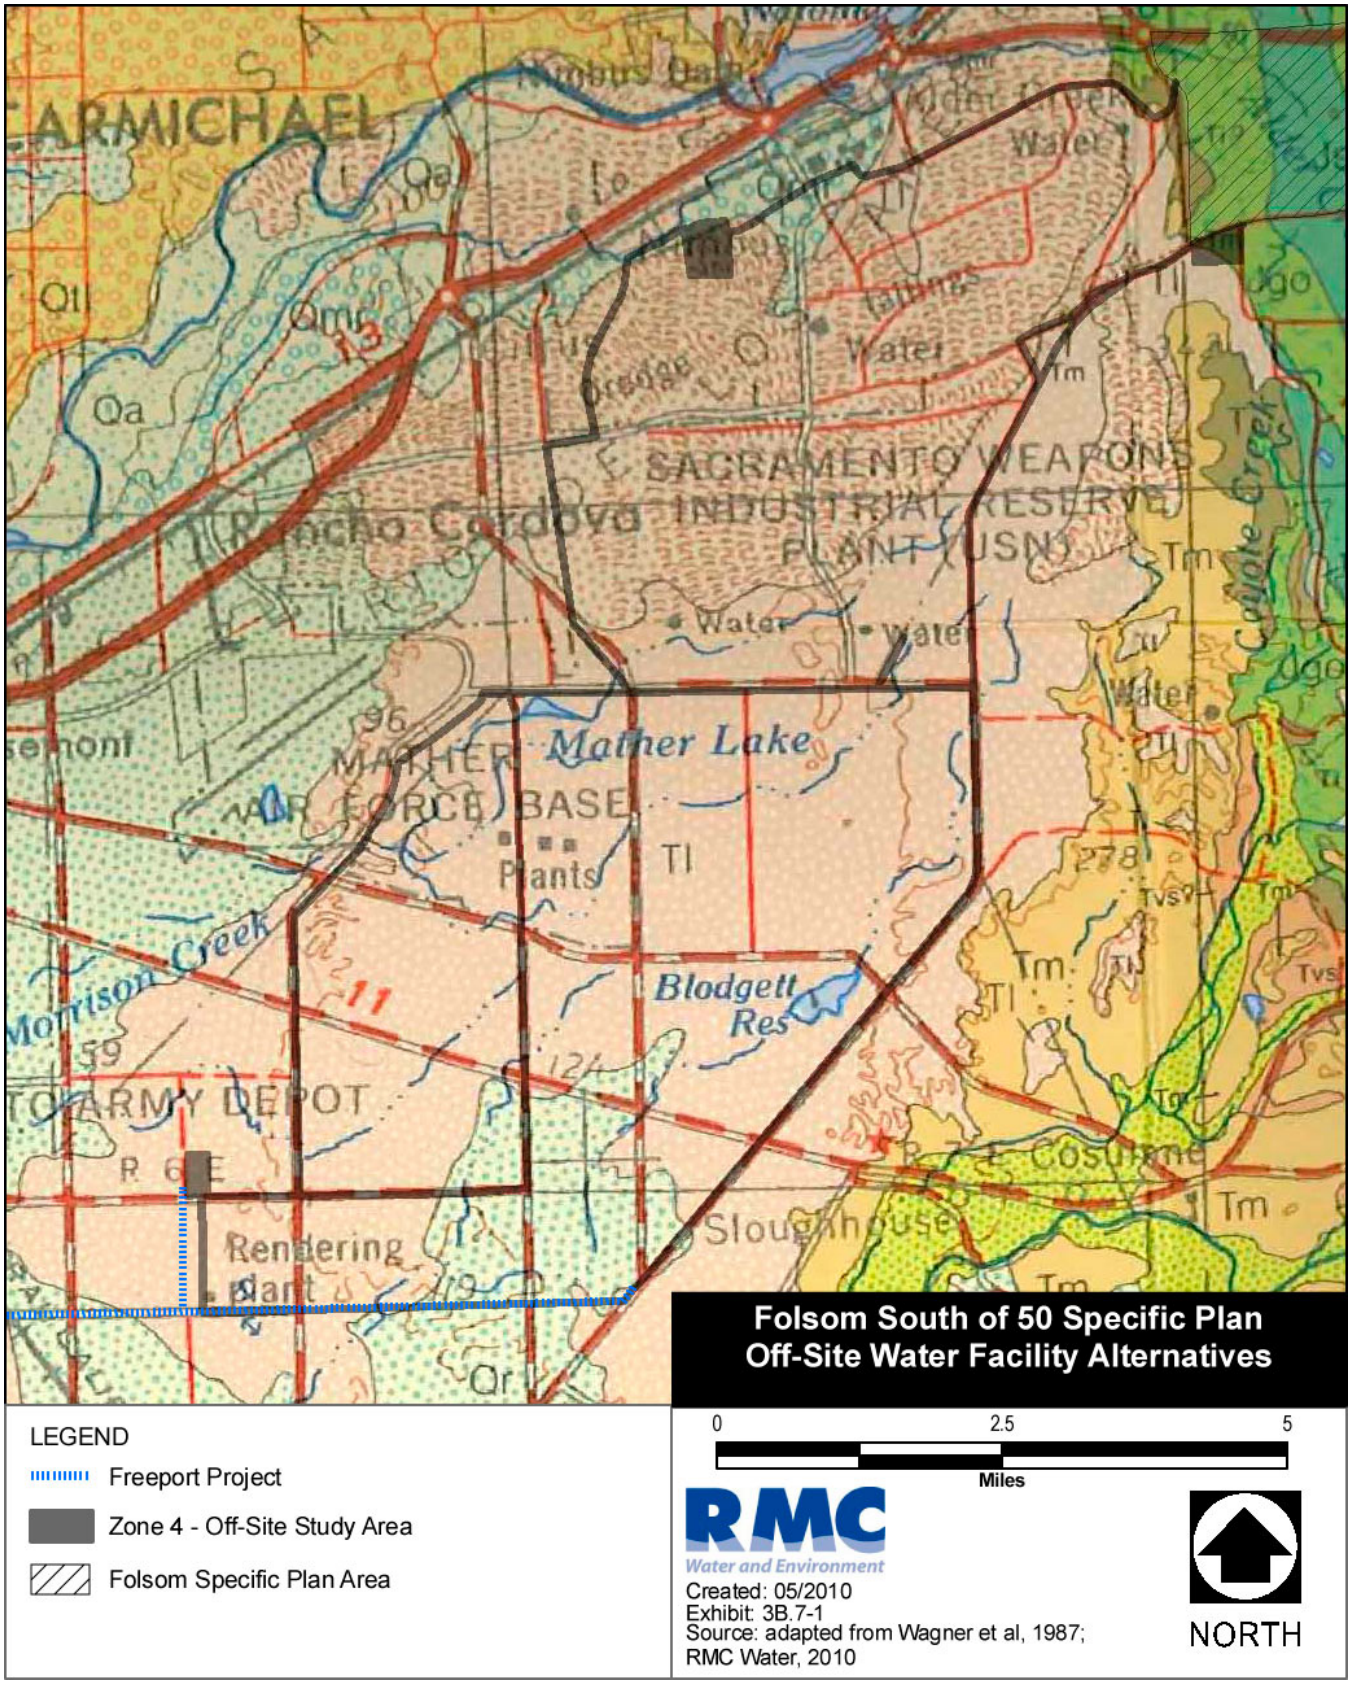
The topography within Zone 4 of the Off-site Water Facilities Study Area grades from the southeast to the northwest towards the Sacramento-San Joaquin Delta (Delta). Maximum elevations within the Zone 4 reach approximately 330 feet mean sea level (msl) on the eastern extent of the Off-site Water Facilities Study Area near the intersection of White Rock and Prairie City Roads. Topographic elevations then transition gently to the west reaching a minimum elevation of approximately 15 feet msl along the Sacramento River. This gentle transition results in a total topographical change of approximately 300 feet.

REGIONAL GEOLOGY

The "Water" Study Area is located in the central portion of the Great Valley geomorphic province of California. The Great Valley lies between the Sierra Nevada Mountain Range to the east and the California Coast Ranges to the west. The geologic formations of the Great Valley are typified by thick sequences of sedimentary materials of Jurassic through Holocene age. The California Geological Survey (CGS) and U.S. Geological Survey (USGS) have mapped portions of Zone 4 of the "Water" Study Area as being underlain by younger alluvium (consisting of flood basin deposits, dredge tailings and Holocene stream channel deposits), older alluvium, such as the Laguna Formation, and Miocene/Pliocene volcanics (DWR, 2004b). These geologic formations are illustrated in Exhibit 3B.7-1. A generalized cross-section of these geologic formations is provided in Exhibit 3B.17-2 of Section 3B.17, "Groundwater Resources – Water."

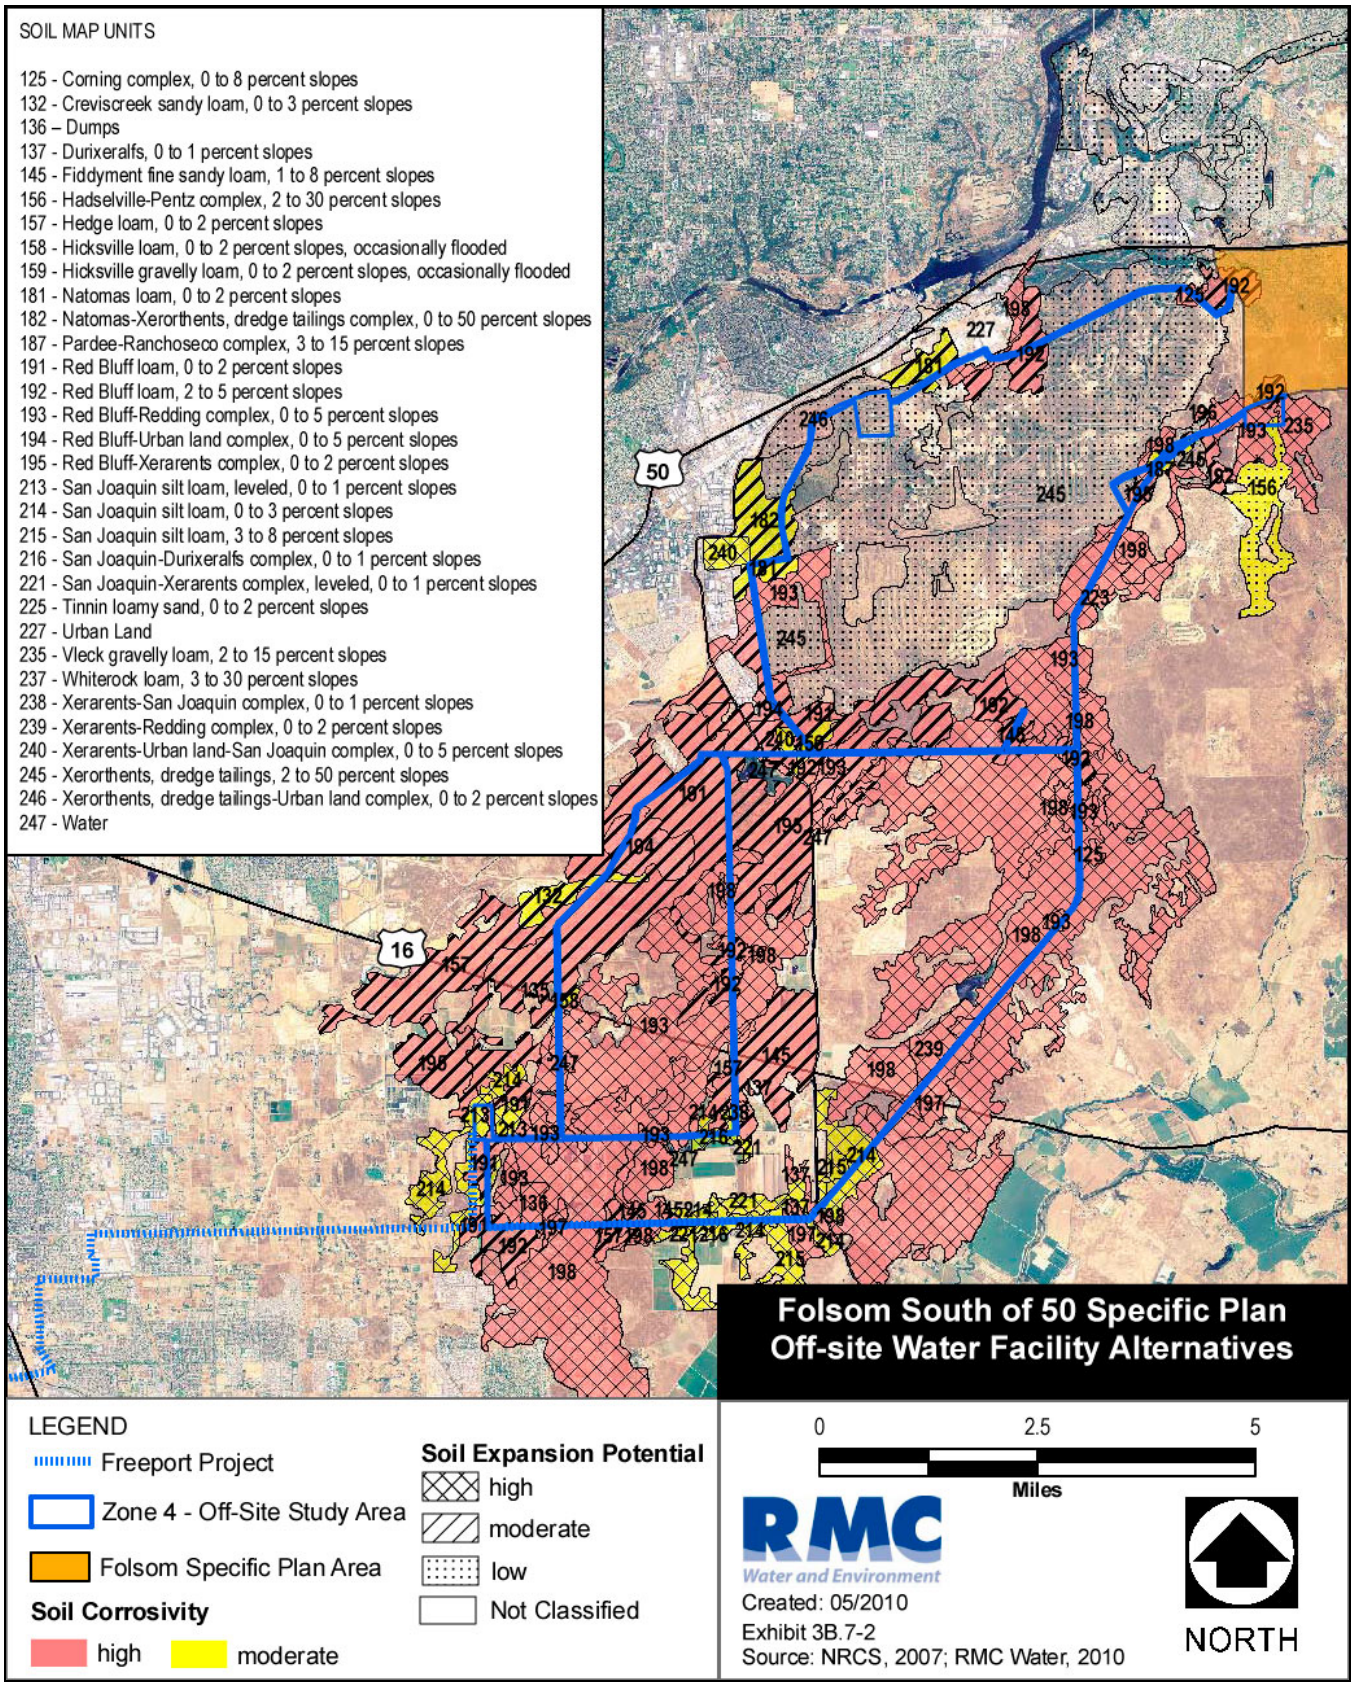
Holocene-aged flood basin and stream channel deposits occur along the western margin of Sacramento County and along the channels of active streams within Zone 4 of the "Water" Study Area. Stream channel deposits consist primarily of unconsolidated silt, fine- to medium-grained sand, and gravel. These recently deposited alluvial materials overlay a layer of loosely to moderately compacted sand, silt, and gravel deposited in alluvial fans during the Pliocene and Pleistocene is present. This older alluvium consists of the Riverbank Formation, which is widely exposed at the surface in areas to the west of Zone 4 of the "Water" Study Area. The older Laguna Formation consisting of consolidated alluvial gravel, sand, and silt underlies much of the Zone 4 between Eagles Nest Road and the Sierra Nevada foothills further east (Wagner et al, 1987). The thickness of the older alluvium is estimated to range between 100 to 650 feet (DWR, 2004b). Within the vicinity of White Rock Road, the Laguna Formation is overlain by extensive deposits of mine and dredge tailings consisting of small to large-sized rock fragments.

The eastern edge of Zone 4 extends into the lower foothills of the Sierra Nevada, which is marked by a transition from the alluvial materials associated with the Laguna Formation to older surface lithologies. Areas along Prairie City Road and to the south are underlain by the Miocene-aged, Mehrten Formation, and Eocene-aged, Ione Formations. Further east, the Jurassic-aged, Gopher Ridge Volcanics and Salt Springs Slate Formations, are expressed at the surface. (Wagner et al, 1981.) These four geologic formations underlie western portions of the Folsom SPA and are described in more detail in the Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land."



Geologic Formations within Zone 4 of the Off-site Water Facilities Study Area

Exhibit 3B.7-1



Soil Limitations within Zone 4 of the Off-site Water Facilities Study Area

Exhibit 3B.7-2

REGIONAL FAULTING AND SEISMICITY

The "Water" Study Area is situated 40–60 miles away from faults that have been zoned as "active" by the California Division of Mines and Geology (CDMG). Refer to Table 3A.7-1 for a discussion of these faults.

Areas bordering the Central Valley region to the east and west contain both active and potentially active faults; however, the Sacramento Valley has historically experienced a very-low level of seismic activity. The procedures and limitations for design of structures in accordance with the California Building Code (CBC) consider seismic zoning, site characteristics, occupancy, configuration, structural system, and height.

The CGS has determined the probability of earthquake occurrences and their associated peak ground accelerations throughout the State of California. The probabilistic seismic hazard assessment determines the earthquake hazard that geologists and seismologists agree could occur in California. It is probabilistic in the sense that the analysis takes into consideration the uncertainties in the size and location of earthquakes and the resulting ground motions that can affect a particular site. The probabilistic seismic hazard assessment maps are typically expressed in terms of probability of exceeding a certain ground motion. Current maps produced by the CGS are based on 10% exceedance in 50 years. This probability level allows engineers to design buildings for larger ground motions than those that geologists and seismologists think will occur during a 50-year interval. These levels of ground-shaking are used primarily for formulating building codes and for designing buildings. The maps can also be used for estimating potential economic losses and preparing for emergency response (Peterson, et. al, 1999). The peak ground acceleration based on a 10% exceedance in 50 years within the region could range between 0.10 g to 0.20 g (Peterson, et. al, 1999).

SOIL RESOURCES

Soil resources found across portions of Zone 4 of the "Water" Study Area are generally associated with one of two geomorphic surfaces: low-lying, late Pleistocene–age terraces that are often referred to as alluvial plains or old alluvial fans; and intermediate terraces of mid-Pleistocene age (NRCS 1993). These surfaces are formed in primarily fine grained, fluvial and glacial alluvium derived from mixed rock sources, including granite in most areas (NRCS 1993). Zones of sedimentary and metamorphic rocks are also mixed with the granitic rocks. Exhibit 3B.7-2 illustrates the soil mapping units identified by NRCS for Zone 4 of the "Water" Study Area.

Portions of Zone 4 of the "Water" Study Area also consist of terrace despots that are dominated by the well-drained soils (e.g., Red Bluff series) and are comprised of gravelly alluvium derived from fluvial and glacial sources laid down by an ancestral channel of the American River (NRCS 1993). These areas to the south of the American River and within the northern sections of Zone 4 of the "Water" Study Area form part of an intermediate terrace remnant associated with channel deposits; however, most of the soils of this terrace were removed by gold-dredging activities. Large linear rows of tailings now line these areas north of Douglas Road and east of Sunrise Boulevard.

Certain soil formations, particularly the Redding series, contain an accumulation of fine grained materials (e.g., clays) at depth that contribute to the formation of a claypan layer, which is generally impervious to water penetration. These surface conditions facilitate the capture and retention of water during winter and spring rains leading to perched groundwater conditions. Where depressions occur on these soils, rainwater tends to pond, ultimately forming vernal pools and swales. These soil types are extensive throughout the southern and eastern portions of Zone 4.

GEOLOGIC AND SOIL-RELATED HAZARDS

Fault Rupture

Surface rupture is an actual cracking or breaking of the ground along a fault during an earthquake. Structures built over an active fault can be torn apart if the ground ruptures. Surface ground rupture along faults is generally limited to a linear zone a few yards wide. No faults mapped under the Alquist-Priolo Earthquake Fault Zone Act (Alquist-Priolo Act) are within the "Water" Study Area (Hart 1997), nor is there evidence of known active faults within the County. Therefore, surface rupture due to faulting in Zone 4 of the "Water" Study Area is not expected to occur and, therefore, hazards related to rupture along a known earthquake fault are considered negligible.

Liquefaction

Liquefaction is the sudden temporary loss of shear strength in saturated, loose to medium dense, granular sediments subjected to ground shaking. It generally occurs when seismically induced ground shaking causes pore water pressure to increase to a point equal to the overburden pressure. Liquefaction can cause foundation failure of buildings and other facilities due to the reduction of foundation bearing strength.

Areas at risk due to the effects of liquefaction are typified by a high groundwater table and underlying loose to medium-dense, granular sediments, particularly younger alluvium and artificial fill. Within the County, two possible liquefaction areas exist: City of Sacramento's downtown area and the Delta area, which are approximately 20 and 47 miles from the Off-site Water Facilities Study Area, respectively (Sacramento County 1993). Because Zone 4 of the "Water" Study Area is not located within the vicinity of these areas, the risks of liquefaction occurring during a seismic event is considered low.

Slope Instability and Landslides

The landslide potential for native and engineered slopes depends on the gradient, localized geology and soils, amount of rainfall, amount of excavation, and seismic activity. Only a narrow strip along the County's eastern boundary, from the Placer County line to the Cosumnes River, is considered to have landslide potential at specific locations (Sacramento County 1993). These landslide areas are approximately three to four miles east of the Off-site Water Facilities Study Area and, therefore, would present minimal hazards to the Off-site Water Facilities Study Area.

Total and Differential Settlement

Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different rates). Typically, areas underlain by artificial fills, unconsolidated alluvial sediments, and slope wash, and areas with improperly engineered construction fills are susceptible to this type of settlement. Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, non-compacted, and variable sandy sediments) due to the rearrangement of soil particles during prolonged ground shaking. Given the extensive development within Zone 4 of the "Water" Study Area, transitions between compacted and non-compacted surfaces could present implications for pipeline structures and is discussed further in the impact analysis.

Subsidence

Subsidence of the land surface resulting from compaction of underlying formations affected by head (groundwater level) decline is a well-documented concern throughout much of the Central Valley. During a typical pumping season, changes in land surface elevation can be observed as a result of both elastic and inelastic subsidence in the underlying basin. Elastic subsidence results from the reduction of pore fluid pressures in the aquifer, and typically rebounds when pumping ceases or when groundwater is otherwise recharged resulting in increased pore fluid

pressure. Inelastic subsidence occurs when pore fluid pressures decline to the point that fine-grained sediments such as clays consolidate, resulting in permanent compaction and reduced ability to store water in that portion of the aquifer. Other side effects may include damaged levees, canals, or pipes.

While some land surface subsidence is known to have occurred as a result of groundwater extraction west of the Sacramento River, the extent of subsidence east of the Sacramento River has been minimal (Central Sacramento County Groundwater Management Plan [CSCGMP] 2006). Historical benchmark elevation data for the period from 1912 through the late 1960s to evaluate land subsidence in north Sacramento County. From 1947 to 1969, the magnitude of land subsidence measured at benchmarks north of the American River ranged from 0.13 feet to 0.32 feet, with a general decrease in subsidence in a northeastward direction (CSCGMP 2006). This decrease was determined to be consistent with the geology of the area whereby formations along the eastern side of the Sacramento Valley are older than those on the western side and are subject to a greater degree of pre-consolidation, making them less susceptible to subsidence. Based on these findings and the consolidated nature of the alluvial formations underlying Zone 4, hazards to the Off-site Water Facility Alternatives as they related to subsidence are expected to be low.

Volcanic Hazards

The "Water" Study Area is located approximately 165 miles from Lassen Peak and approximately 100 miles from Mono Lake/Long Valley volcanic areas. Therefore, the risk to the "Water" Study Area from volcanic hazards is extremely low. For this reason, this issue is not discussed further in this EIR/EIS.

Expansive/Corrosive Soils

Expansive soils are largely comprised of clays, which greatly increase in volume when water is absorbed and shrink when dried. This movement may result in the cracking of foundations for above-ground, paved roads, and concrete slabs. Clayey and silty clay soils occur throughout Zone 4 of the "Water" Study Area and have a high to very-high expansion potential. These clayey materials are generally comprised within one or more soil horizons within the upper five feet of the soil profile. Aggregate and sands associated with the dredge tailings generally exhibit a low expansion potential. As shown in Exhibit 3B.7-2, expansive soil materials are extensive throughout Zone 4 of the "Water" Study Area.

Corrosive Soils can damage underground utilities including pipelines and cables, and can weaken roadway structures. Soils within Zone 4 of the "Water" Study Area are classified as moderately to highly corrosive to concrete and steel (NRCS 1993). Exhibit 3B.7-2 illustrates the locations where soils have been determined to be moderately to highly corrosive to uncoated steel.

Naturally Occurring Asbestos

Naturally occurring asbestos (NOA) has been identified in proximity to the Bear Mountain Fault Zone within El Dorado County (Wagner et al. 1981, Churchill et al. 2000). The closest outcrop of these asbestos-bearing rocks to the "Water" Study Area is located more than four miles east (Wagner et al. 1981, Churchill et al. 2000). Based on this distant proximity, hazards related to naturally-occurring asbestos are not applicable to the Off-site Water Facility Alternatives and not discussed further in this section.

PALEONTOLOGICAL RESOURCES

The closest recorded paleontological resource to the "Water" Study Area is approximately 8 miles to the north near the City of Roseville (Sacramento County 2008a). Vertebrate fossils have been documented from nine different locations within the County, encompassing several hundred specimens, and all within the Riverbank Formation (University of California Museum of Paleontology, UCMP 2009). The Riverbank formation extends into the southern end of Zone 4, near Gerber and Florin Roads (see Exhibit 3B.7-1). Because of the large number of vertebrate fossils that have been recovered from the Riverbank Formation from the County and throughout the

Central Valley, this formation is considered to have high sensitivity under criteria established by the Society of Vertebrate Paleontology (1995).

The Pliocene-aged Laguna Formation, which underlies much of Zone 4 east of Excelsior Road, includes only one reference to a vertebrate fossil specimen in Northern California (City Rancho Cordova 2006), which was discovered in a well near the City of Galt. Based on these findings, the Laguna Formation has a generally low probability of containing paleontological resources. Other geologic formations occurring at the surface within Zone 4 include mine/dredge tailings and Holocene alluvium along local drainage features. Because of the nature of dredge mining activities, any fossil specimens that may have been preserved in the underlying Laguna Formation soils would have been destroyed at the time of the mining operations, and thus the existing dredge tailings would not be expected to contain fossils (City of Rancho Cordova 2006). Since sediments surrounding local drainage features, including Morrison Creek, are less than 11,000 years old, and by definition, to be considered a fossil, a specimen must be more than 11,000 years old, and these sediments would not contain paleontological resources.

As provided in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land," because of the way in which the rocks formed within the Salt Springs Slate, Copper Hill Volcanics, and Gopher Canyon Volcanics, it is unlikely that they would contain vertebrate fossils or fossil plant assemblages. However, as provided in Section 3A.7.1, vertebrate fossils have been recovered from both the Mehrten and Ione Formations. Given potential for encountering paleontological resources within the Riverbank, Mehrten, and Ione Formations this issue is evaluated in this EIR/EIS.

3B.7.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS AND LAWS

The following Federal plans, policies, regulations, and laws related to geology, soils, and seismicity are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land:"

- Earthquake Hazards Reduction Act

There are no Federal plans, policies, regulations, and laws related to paleontological resources that apply to the Off-site Water Facility Alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS AND LAWS

The following state plans, policies, regulations, and laws related to geology, soils, and seismicity are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land:"

- Alquist-Priolo Geologic Hazards Zone Act (Alquist-Priolo Act)
- Seismic Hazards Mapping Act
- National Pollutant Discharge Elimination System Permit
- California Building Standards Code

No state or local agencies have specific jurisdiction over paleontological resources on private lands. No state agency requires a paleontological collecting permit to allow for the recovery of fossil remains discovered as a result of construction-related earthmoving on state or private land at a project site.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following local and regional plans, policies, regulations, and laws related to geology, soils, and seismicity are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land:"

- Sacramento County General Plan
- Sacramento County Grading Ordinance (adopted by City of Rancho Cordova)
- Professional Paleontological Standards

Rancho Cordova General Plan

Applicable policies of the City of Rancho Cordova's General Plan relating to geology, soils, and mineral resources are provided below.

- **Policy S.1.1:** Maintain acceptable levels of risk of injury, death, and property damage resulting from reasonably foreseeable safety hazards in Rancho Cordova.

- **Policy S.3.2:** Ensure that new structures are protected from damage caused by geologic and/or soil conditions to the greatest extent feasible.

3B.7.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, an impact related to local geologic and/or soil conditions would be considered significant if the Off-site Water Facilities would:

- expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:

    i. rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault (Refer to CDMG Special Publication 42),

    ii. strong seismic ground shaking,

    iii. seismic-related ground failure, including liquefaction, or

    iv. landslides.

- result in substantial soil erosion or the loss of topsoil;

- be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse;

- be located on expansive soil, as defined in Table 18-1-B of the UBC (2000), creating substantial risks to life or property; or

- have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.

Based on the environmental checklist in Appendix G of the State CEQA Guidelines, a project would have a significant impact on paleontological resources if it would directly or indirectly destroy a unique paleontological resource or site. A "unique paleontological resource or site" is one that is considered significant under the professional paleontological standards described below.

An individual vertebrate fossil specimen may be considered unique or significant if it is identifiable and well preserved, and it meets one of the following criteria:

- a type specimen (i.e., the individual from which a species or subspecies has been described);
- a member of a rare species;
- a species that is part of a diverse assemblage (i.e., a site where more than one fossil has been discovered) wherein other species are also identifiable, and important information regarding life history of individuals can be drawn;
- a skeletal element different from, or a specimen more complete than, those now available for its species; or
- a complete specimen (i.e., all or substantially all of the entire skeleton is present).

The value or importance of different fossil groups varies depending on the age and depositional environment of the rock unit that contains the fossils, their rarity, the extent to which they have already been identified and documented, and the ability to recover similar materials under more controlled conditions (such as for a research project). Marine invertebrates are generally common; the fossil record is well developed and well documented, and they would generally not be considered a unique paleontological resource. Identifiable vertebrate marine and terrestrial fossils are generally considered scientifically important because they are relatively rare.

ANALYSIS METHODOLOGY

This analysis evaluates the potential for Off-site Water Facility Alternatives (described in Chapter 2, "Alternatives") to interact with the localized geologic conditions to produce conditions that will exceed the applied significance criteria as identified below.

In its standard guidelines for assessment and mitigation of adverse impacts on paleontological resources, the Society of Vertebrate Paleontology (1995) established three categories of sensitivity for paleontological resources: high, low, and undetermined. Areas where fossils have been previously found are considered to have a high sensitivity and a high potential to produce fossils. Areas that are not sedimentary in origin and that have not been known to produce fossils in the past typically are considered to have low sensitivity. Areas that have not had any previous paleontological resource surveys or fossil finds are considered to be of undetermined sensitivity until surveys and mapping are performed to determine their sensitivity. After reconnaissance-level surveys, observation of exposed cuts, and possibly subsurface testing, a qualified paleontologist can determine whether the area should be categorized as having high or low sensitivity. In keeping with the significance criteria of the Society of Vertebrate Paleontology (1995), all vertebrate fossils are generally categorized as being of potentially significant scientific value.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Alquit-Priolo Fault Zones—The Off-site Water Facilities Study Area would not cross any mapped fault traces or delineated fault ruptures zones according to the most recent Alquist-Priolo Earthquake Fault Zoning Maps issued

by the State Geologist. For this reason, the Off-site Water Facilities would not expose people or structures to potential substantial adverse effects as they relate to fault rupture. Therefore, this issue is not discussed further in this EIR/EIS.

Landslides—As described in the setting section, the Off-site Water Facilities Study Area is characterized by level to undulating topography and does not contain slopes in excess of 10 percent. In this context, the potential for a landslide to occur as a result of activities proposed in Chapter 2, "Alternatives" is remote and no impact is expected. Therefore, this issue is not discussed further in this EIR/EIS.

Septic Tanks—The Off-site Water Facilities would not include the use of septic tanks or alternative waste water disposal systems. During construction portable toilets and water treatment units would be used. Development of up to 44 rural residential units could be constructed on 80-acre parcels within the SPA under the No Project Alternative. Under the No Project Alternative, construction of on-site septic tanks could be required. This issue is analyzed in Section 3A.7, "Geology, Soils, Minerals, and Paleontological Resources – Land". Therefore, this issue is not discussed further in this section.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.7-1 Possible Risks to People and Structures Caused by Strong Seismic Ground Shaking. *Zone 4 of the "Water" Study Area is located in an area of generally low seismic activity; however, structures constructed as part of the Off-site Water Facility Alternatives could be subject to seismic ground shaking from an earthquake along active faults in the Sierra Nevada.*

NCP, PA 1, 1A, 3, 3A, 4, and 4A

As described in the affected environment section, the localized geologic conditions characterizing Zone 4 of the "Water" Study Area are not conducive to hazards associated with rupture of an active fault or slope failure. For this reason, this discussion places emphasis on those hazards that relate to ground motion resulting from a seismic event and potential secondary effects based on the geologic conditions present within Zone 4 of the "Water" Study Area.

The Sacramento Valley has historically experienced very low seismic activity. Therefore, there is a low probability for disruption of water supply service through a pipeline breakage or damage to the WTP. Seismic design consistent with current professional engineering and industry standards would be used in construction for resistance to strong ground motion, especially for lateral forces.

However, without site-specific geotechnical information and interpretation, the City is unable to accurately pinpoint if and where these types of techniques would be required. As a result, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.7-1a: Prepare Geotechnical Report(s) for the Off-site Water Facilities and Implement Required Measures.

Facility design for all Off-site Water Facility components shall comply with the site-specific design recommendations as provided by a licensed geotechnical or civil engineer to be retained by the City. The final geotechnical and/or civil engineering report shall address and make recommendations on the following:

- site preparation;
- soil bearing capacity;
- appropriate sources and types of fill;
- potential need for soil amendments;
- road, pavement, and parking areas;
- structural foundations, including retaining-wall design;
- grading practices;
- soil corrosion of concrete and steel;
- erosion/winterization;
- seismic ground shaking;
- liquefaction; and
- expansive/unstable soils.

In addition to the recommendations for the conditions listed above, the geotechnical investigation shall include subsurface testing of soil and groundwater conditions, and shall determine appropriate foundation designs that are consistent with the version of the CBC that is applicable at the time building and grading permits are applied for. All recommendations contained in the final geotechnical engineering report shall be implemented by the City.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of engineering plans for all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure 3B.7-1b: Incorporate Pipeline Failure Contingency Measures Into Final Pipeline Design.

Isolation valves or similar devices shall be incorporated into all pipeline facilities to prevent substantial losses of surface water in the event of pipeline rupture, as recommended by a licensed geotechnical or civil engineer. The specifications of the isolation valves shall conform to the CBC and American Water Works Association standards.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of engineering plans for all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

2, 2A, and 2B

Under the Off-site Water Facility Alternatives 2, 2A, and 2B, a new WTP would not be constructed and therefore, issues related to potential geologic hazards and the potential effects on the WTP would not be applicable. However, these alternatives would still involve the construction of a treated-water conveyance pipeline that, if damaged during a seismic event, could disrupt potable water service. As a result, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.7-1a and 3B.7-1b.

With the implementation of the above mitigation, potential impacts from strong seismic ground-shaking would be reduced to a **less-than-significant** level through the implementation of recommendations made by a licensed geotechnical engineer in compliance with the CBC prepared as part of a formal geotechnical investigation.

IMPACT 3B.7-2 Construction-Related Erosion. *Construction activities during implementation of the Off-site Water Facility Alternatives would involve grading and movement of earth in soils subject to wind and water erosion hazard.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Construction of the various Off-site Water Facility components would expose bare soil to precipitation and wind erosion, thereby potentially resulting in increased sedimentation of local waterways. Ground-disturbing activities, including removal of vegetation, could cause increased water runoff rates and concentrated flows, thereby potentially leading to accelerated erosion. In agricultural areas, this could result in measurable losses to soil productivity. In addition, because construction would occur in close proximity to local waterways, such effects to water quality and aquatic habitat could be considerable if proper erosion control measures are not implemented. Dewatering operations used during pipeline installation and the installation of sub-grade structures associated

with the WTP or storage tanks also carries the potential for increased sedimentation of local waterways. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.9-1a, 3B.9-1b, 3B.9-1c, 3B.9-3a, and 3B.9-3b.

Implementation: City of Folsom Utilities Department

Timing: Prior to start of construction

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

With implementation of the mitigation measures listed above, erosion from construction activities related to the off-site water facilities would be reduced to a **less-than-significant** level because a SWPPP would be prepared and BMPs would be implemented to reduce erosion along the pipeline alignment, and a drainage plan would be prepared and implemented to reduce erosion at the WTP.

IMPACT 3B.7-3 Unstable Geologic Conditions. *The Off-site Water Facility Alternatives could be located on a geologic unit or soil that is unstable, or that could become unstable as a result of the Off-site Water Facilities.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Based on the discussions provided for geologic hazards within the setting description, the primary concerns related to local geologic conditions is related to settlement and differential settlement. Settlement could potentially occur from the placement of new static loads with possibly half of the settlement taking place during construction or shortly thereafter. Differential settlement could occur between foundation blocks or slabs due to variability in underlying soil conditions. Total and differential settlement could therefore damage proposed foundations, structures, and pipelines. Additionally, although unlikely, regional subsidence could cause potential damage or rupture to the buried pipelines and other associated structures designed with minimal tolerance for settlement. Therefore, these **direct** and **indirect impacts** is considered **potentially significant**. ***[similar]***

Mitigation Measure: Implement Mitigation Measures 3B.7-1a and 3B.7-1b.

With implementation of the mitigation measures listed above, geologic hazards in terms of total and differential settlement would be reduced to a less-than-significant level, because a licensed geotechnical or soils engineer would investigate the site-specific soil conditions and design the facilities to withstand settlement in accordance with the CBC.

IMPACT 3B.7-4 Exposure to Potential Hazards from Problematic Soils. *The Off-site Water Facility Alternatives could encounter expansive or corrosive soils thereby subjecting related structures to potential risk of failure.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

As provided in Exhibit 3B.7-2, soils within Zone 4 generally exhibit a moderate to high potential for shrink-swell. Unless properly mitigated, shrink-swell soils could exert additional pressure on buried pipelines producing shrinkage cracks that would allow water infiltration and compromise the integrity of backfill material. Depending on the depth of the buried pipeline, soil expansion or contraction could lead to undue lateral pipeline stress and

stress of structural joints. Over time, lateral stresses could lead to pipeline rupture or leaks in the coupling joints. Likewise, structural facilities, including the WT and pump station, could be subjected to hazards from expansive soils is constructed directly on expansive soil materials. This **direct** impact would be a **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

As illustrated in Exhibit 3B.7-2 soil materials encountered within Zone 4 of the Off-site Water Facilities Study Area exhibit a moderate to high potential for corrosion to uncoated steel. Corrosive soil materials could lead to pipe corrosion, potentially resulting in pipe failure and localized surface flooding of water or localized settlement of surface soils in the location of the failure. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3B.7-1a.

Mitigation Measure 3B.7-4: Implement Corrosion Protection Measures.

As determined appropriate by a licensed geotechnical or civil engineer, the City shall ensure that all underground metallic fittings, appurtenances, and piping include a cathodic protection system to protect these facilities from corrosion.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of engineering plans for all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

With implementation of the mitigation measure listed above, soil-related hazards in terms of expansive and corrosive soils would be reduced to a **less-than-significant** level because a licensed geotechnical or soils engineer would investigate the site-specific soil conditions and design the facilities to withstand expansive soil pressures and soil corrosivity.

IMPACT 3B.7-5 Possible Damage of or Destruction to of Previously Unknown Unique Paleontological Resources during Construction-Related Activities. *Construction of the Off-site Water Facility Alternatives could directly or indirectly destroy a unique paleontological resource or site.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Fossil remains of vertebrates that existed during the Pleistocene have been encountered during excavation activities within the Riverbank, Mehrten, and Ione geologic formations, as shown in Exhibit 3B.7-1 underlie the southern and northeastern portions of Zone 4 of the Off-site Water Facilities Study Area. The remaining portions of Zone 4 are generally underlain by the Laguna Formation, mine/dredge tailings, or Holocene-aged channel deposits. As provided in the discussion of the affected environment, these formations are generally devoid of significant vertebrate fossils, and no previously recorded fossil sites from this formation are known from either Zone 4 or the surrounding area (City of Rancho Cordova 2006). Furthermore, the conveyance pipeline would be constructed within existing roadways or along the shoulder and, therefore, has a low likelihood for disturbing native ground surfaces.

Nevertheless, each of the Off-site Water Facility Alternatives along one or more portions of each respective alignment has the potential to encounter the sensitive geologic formations identified above. The conveyance alignment for the Proposed Off-site Water Facility Alternative and Offsite Water Facility Alternatives 1 and 1A, would traverse cross-county east of Gerber Road, which as shown in Exhibit 3B.7-1, is underlain by the Riverbank Formation. In addition, all the conveyance alignments would traverse areas in the vicinity of Prairie City Road, which are underlain by the Mehrten and Ione Formations, thereby creating the potential for encountering paleontological resources during construction-related excavation/trenching.

Since fossils have been discovered within the Mehrten, Ione, and Riverbank Formations throughout the Central Valley, these formations are considered paleontologically sensitive. As a result, the potential for encountering and potentially damaging or destroying unique paleontological resources during construction activities within these sensitive geologic formations is considered a **potentially significant direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.7-5: Conduct Construction Personnel Education, Stop Work if Paleontological Resources are Discovered, Assess the Significance of the Find, and Prepare and Implement a Recovery Plan as Required.

To minimize potential adverse impacts on previously unknown potentially unique, scientifically important paleontological resources, the City shall implement appropriate measures during construction of the Offsite Water Facility improvements. These measures shall be required for construction activities at the following locations: (1) Grant Line Road, south of SR 16; (2) Florin road, east of Excelsior Road; (3) Gerber Road, east of Excelsior Road; (4) White Rock Road, east of Prairie City Road; and (5) Prairie City Road and shall include:

- Before the start of any earthmoving activities for any project phase in the Riverbank Formation, the project applicant(s) shall retain a qualified paleontologist or archaeologist to train all construction personnel involved with earthmoving activities, including the site superintendent, regarding the possibility of encountering fossils, the appearance and types of fossils likely to be seen during construction, and proper notification procedures should fossils be encountered.

- If paleontological resources are discovered during earthmoving activities, the construction crew shall immediately cease work in the vicinity of the find and notify Sacramento County Planning and Community Development Department. The project applicant(s) shall retain a qualified paleontologist to evaluate the resource and prepare a recovery plan in accordance with Society of Vertebrate Paleontology guidelines (1996). The recovery plan may include, but is not limited to, a field survey, construction monitoring, sampling and data recovery procedures, museum storage coordination for any specimen recovered, and a report of findings. Recommendations in the recovery plan that are determined by the County to be necessary and feasible shall be implemented before construction activities can resume at the site where the paleontological resources were discovered.

Implementation: City of Folsom Utilities Department

Timing: During earthmoving activities in the Roverbank, Ione, and Mehrten Formations as shown in Wagner et al, 1981.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Implementation of Mitigation Measure 3B.7-5 would reduce potentially significant impacts related to damage or destruction of unique paleontological resources within the Riverbank Formation to a less-than-significant level because construction workers would be alerted to the possibility of encountering paleontological resources, and in the event that resources were encountered, and fossil specimens would be recovered and recorded and would undergo appropriate curation.

3B.7.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of Mitigation Measures 3B.7-1a, 3B.7-1b, 3B.9-1a, 3B.9-1b, and 3B.9-1c, 3B.7-4, and 3B.7-5, impacts related to strong seismic ground-shaking, construction-related erosion, soil hazards related to settlement and corrosion, and the potential for encountering previously undiscovered paleontological resources would be reduced to less-than-significant levels. Based on these circumstances, the Off-site Water Facility Alternatives would not result in residual significant and unavoidable impacts related to geology, soils, or paleontological resources.

3A.8 HAZARDS AND HAZARDOUS MATERIALS - LAND

This section contains a program-level evaluation of hazards and hazardous materials. However, impacts related to hazards and hazardous materials would be the same under each individual development phase as under the program (entire SPA) analysis.

3A.8.1 AFFECTED ENVIRONMENT

TERMINOLOGY

For purposes of this section, the term "hazardous materials" refers to both hazardous substances and hazardous wastes. A "hazardous material" is defined by Federal regulations as "a substance or material that … is capable of posing an unreasonable risk to health, safety, and property when transported in commerce" (49 Code of Federal Regulations [CFR] 171.8). California Health and Safety Code Section 25501 defines a hazardous material as follows:

> Hazardous material means any material that, because of its quantity, concentration, or physical, or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

Hazardous wastes are defined in California Health and Safety Code Section 25141(b) as wastes that:

> …because of their quantity, concentration, or physical, chemical, or infectious characteristics, [may either] cause, or significantly contribute to an increase in mortality or an increase in serious illness [, or] pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

Soil that is excavated from a site containing hazardous materials is a hazardous waste if it exceeds specific criteria listed in the California Code of Regulations (CCR) Title 22. Cleanup requirements are determined on a case-by-case basis by the agency with lead jurisdiction over the project.

A few of the specific terms related to cleanup activities are defined below:

- **Remedial Investigation**—An in-depth study designed to determine the nature and extent of contamination at a site (e.g., what hazardous substances are present, how much there is, where it is).
- **Baseline Risk Assessment**—A study performed to provide risk managers with an understanding of the actual and potential risks to human health and the environment posed by the site, and any uncertainties associated with the assessment.
- **Feasibility Study**—An in-depth study designed to evaluate the effectiveness and costs of various remedial alternatives for the conditions defined by the Remedial Investigation and Baseline Risk Assessment.
- **Remedial Action Plan**—A plan, approved by the California Department of Toxic Substances Control (DTSC), that outlines a specific program leading to the remediation of a contaminated site. Once the draft Remedial Action Plan is prepared, a public meeting is held and comments from the public are solicited for a period of no less than 30 days. After the public comment period has ended and public comments have been

responded to in writing, DTSC will generally approve the final remedy for the site (the final Remedial Action Plan). This plan is generally used for large, long-term projects.

- **Removal Action Workplan—**A plan that is similar to the Remedial Action Plan described above, but that is generally used for small, short-term projects.

- **Certificate of Completion**—A DTSC document that confirms that the Remedial Action Plan has been completed.

- **No Further Action**—The decision by DTSC that remedial actions are not necessary because environmental contamination is not present at a site.

Remedial investigations provide information related to current site conditions, wastes found on site, human health and ecological risks, and evaluation of potential treatment technologies. The feasibility study is the mechanism for the development, screening, and detailed evaluation of alternative remedial actions. Remedial actions may include:

- institutional controls (e.g., deed restrictions);
- monitoring;
- physical containment; and
- mass reduction (e.g., biological or chemical treatment).

REGULATORY AND ENVIRONMENTAL HISTORY

Historical land uses include agricultural activities (primarily livestock grazing) and mining activities. (Sacramento Local Agency Formation Commission [LAFCo] 1998.) During the 1960s and 1970s, a portion of the southeastern corner of the SPA was used to separate and burn chemicals associated with aerospace activities conducted by the Aerojet-General Corporation (Aerojet). This portion of the site is currently undergoing remediation (see discussion below). The Aerojet Superfund site is located immediately west of the SPA. One portion of the Aerojet Superfund site (Area 40) is located in the SPA itself, in the Island Operable Unit (OU) (see discussion below). An approximately 54-acre area at the northwest corner of the SPA was formerly included in the Aerojet Superfund site, but is part of a "carve-out" area that has been removed from the site by regulatory agencies. The proposed off-site detention basin (located west of Prairie City Road) would be located within the Eastern OU of the Aerojet site.

Aerojet Superfund Site

Aerojet has owned and operated a facility for aerospace testing activities in Rancho Cordova since the early 1960s. The facility consists of approximately 8,500 acres, approximately 5,900 of which were designated as a Superfund site in 1983 by the U.S. Environmental Protection Agency (EPA). Previous activities conducted at the site included solid rocket motor manufacturing and testing, liquid rocket engine manufacturing and testing, chemical manufacturing, and disposal of materials. During the development of rocket propulsion systems, various chemicals were used at the Aerojet facility, including solvents, propellants, fuels, oxidizers, metals, and explosives. In addition to the use of these chemicals, Aerojet operated two chemical plants at the facility, which manufactured various herbicides, pesticides, and pharmaceutical-related compounds. Historical disposal methods included burning, landfilling, surface impoundment, and deep well injection. Several plumes of contaminated groundwater have been identified. The major contaminants found in the groundwater and vadose zone (the area between the land surface and the water table) include n-nitrosodimethylamine (NDMA), perchlorate, and trichloroethylene (TCE). In 1989, Aerojet, EPA, the Central Valley Regional Water Quality Control Board (RWQCB), and DTSC entered into a Partial Consent Decree, which established specified procedures and obligations to achieve the goals delineated in the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA, generally referred to as Superfund) and the National Oil and Hazardous Substances Pollution Contingency Plan. One such requirement included performing Remedial Investigations/Feasibility Studies (RI/FSs) on the entire 8,500-acre facility. In July 1998, the Partial Consent

Decree was modified to include removal of certain areas (referred to as "carve-out" lands) from the Aerojet Superfund site and division of the site into OUs to facilitate completion of the RI/FSs. An approximately 53-acre area at the northwest corner of the SPA (Prairie City Business Park, illustrated in Exhibit 3A.8-1) is included in this carve-out area (Area 40), which is no longer a part of the Superfund site.

Before any portion of the Aerojet Superfund site can be made available for new uses, EPA must issue a record of decision (ROD) or similar certification indicating that remedial actions have been completed, and that no unacceptable risks would be posed to human health or the environment.

Area 40

Area 40, which is part of the Island OU of the Aerojet Superfund site, is located in the SPA, a short distance east of Prairie City Road, approximately half way between U.S. 50 and White Rock Road. The RI/FS prepared by Aerojet (Aerojet General Corporation 2007, included as Appendix G1) discusses the site history, sources of hazardous materials, and field sampling activities, and site management. The contents of the RI/FS are summarized briefly below.

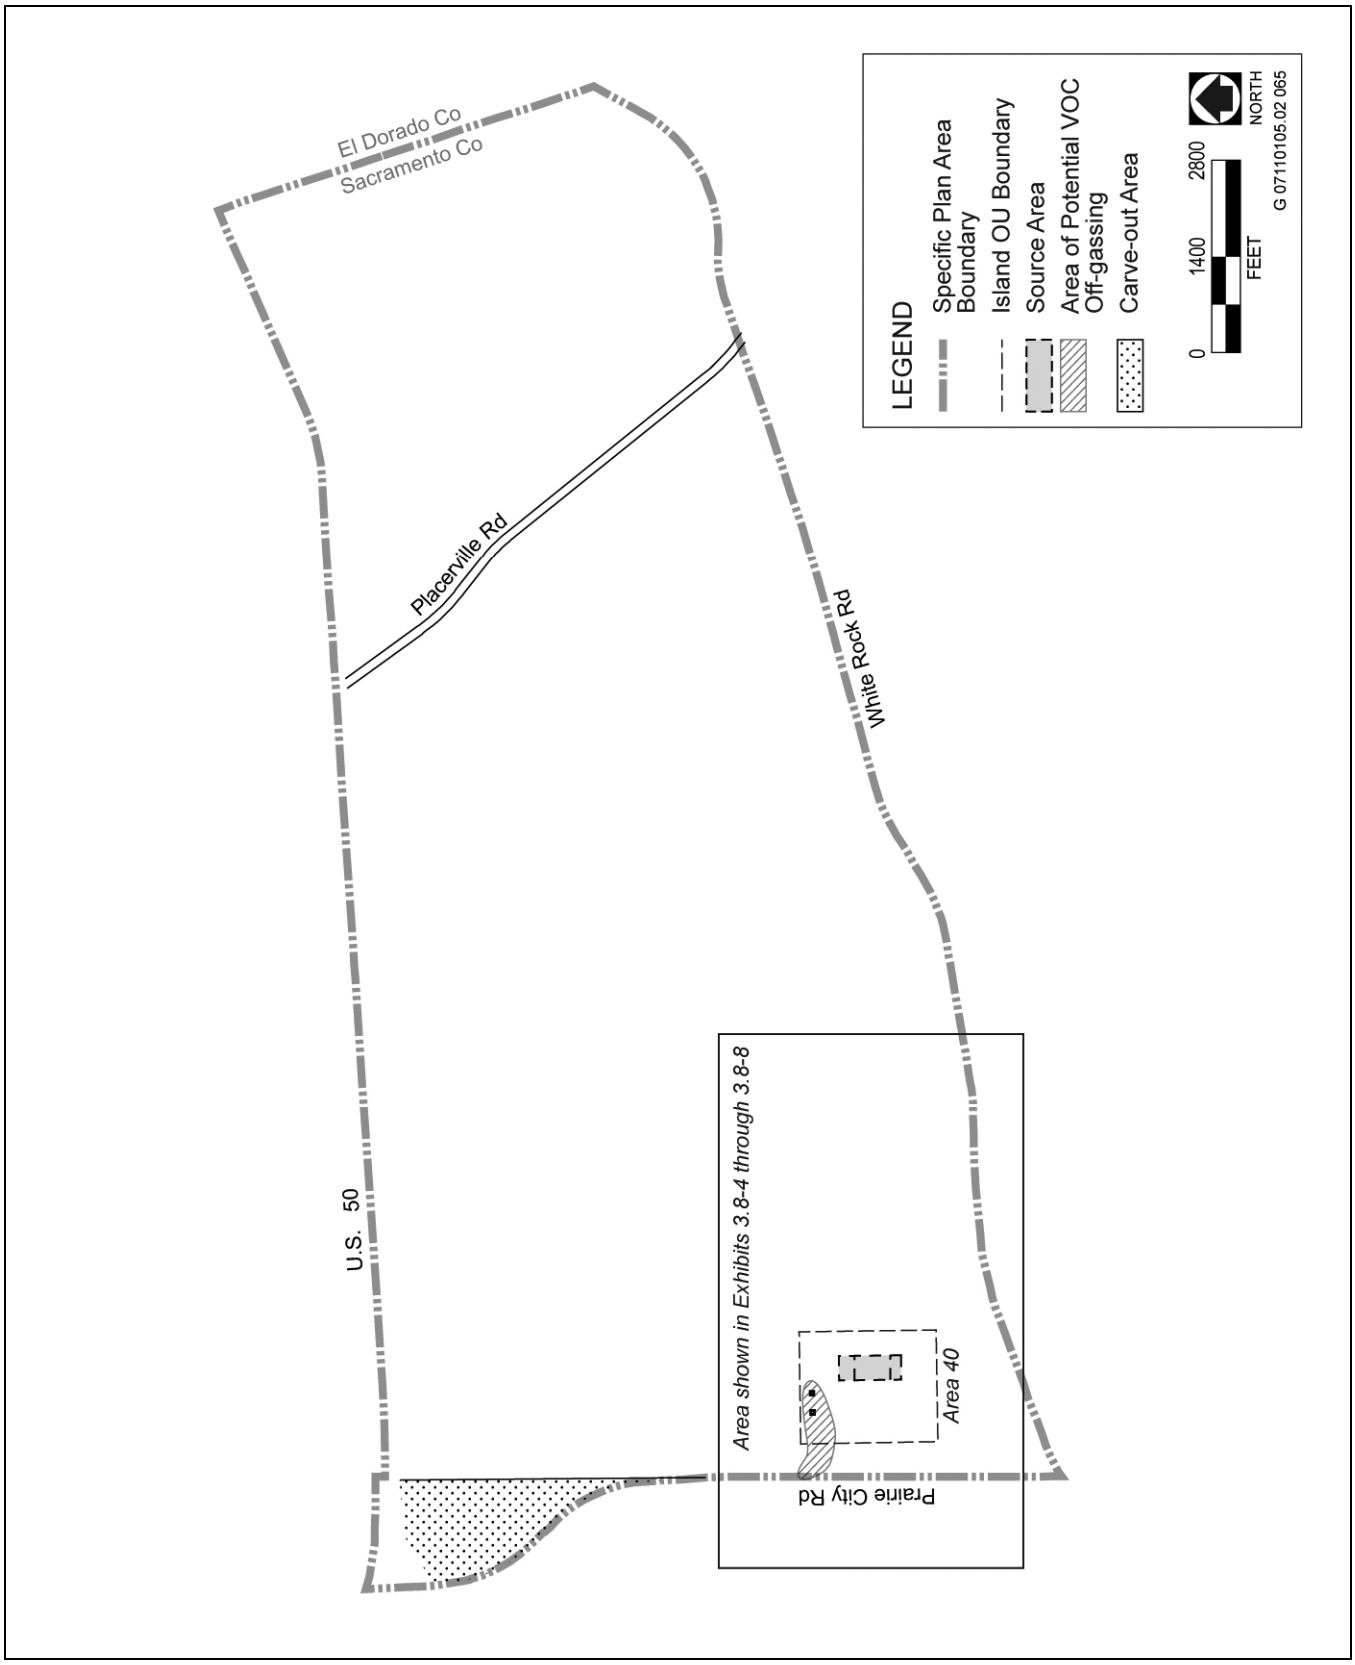
Aerojet leased Area 40 from 1960 to the early 1970s and used the land as a waste disposal site. There are five "source areas" (locations where toxic substance entered the environment), which are identified as 36B –40B, located within Area 40. Exhibit 3A.8-2 illustrates the Area 40 boundary, and the locations of all five source areas in the SPA, which are discussed separately below.

Source Areas 36B and 37B consist of chemical management sumps. These are composed of two gunite-lined sumps where solvents, including TCE, were separated from rocket propellant (see Exhibit 3A.8-2). Following separation, TCE was shipped to another facility for reprocessing. Before final abandonment, the sumps were filled with waste propellant, the propellant was burned, and then the sumps were buried. A groundwater plume containing volatile organic compounds (VOCs), metals, and perchlorate at concentrations in excess of human health screening levels extends from the sump location west underneath Prairie City Road towards the main Aerojet facility.

Source Areas 38B, 39B, and 40B are located within the Eastern Burn Area (see Exhibit 3A.8-2). Each location was used for disposal (i.e., burning) of test lab waste, propellant, and flammable liquids. Soil from the Eastern Burn Area has been removed and disposed of within the main Aerojet facilities, west of Prairie City Road. However, VOCs and perchlorate concentrations that could potentially pose a risk to human health and ecological receptors may be present in the soil and bedrock at two locations within the Eastern Burn Area, as shown in Exhibit 3A.8-2 (ERM 2008).

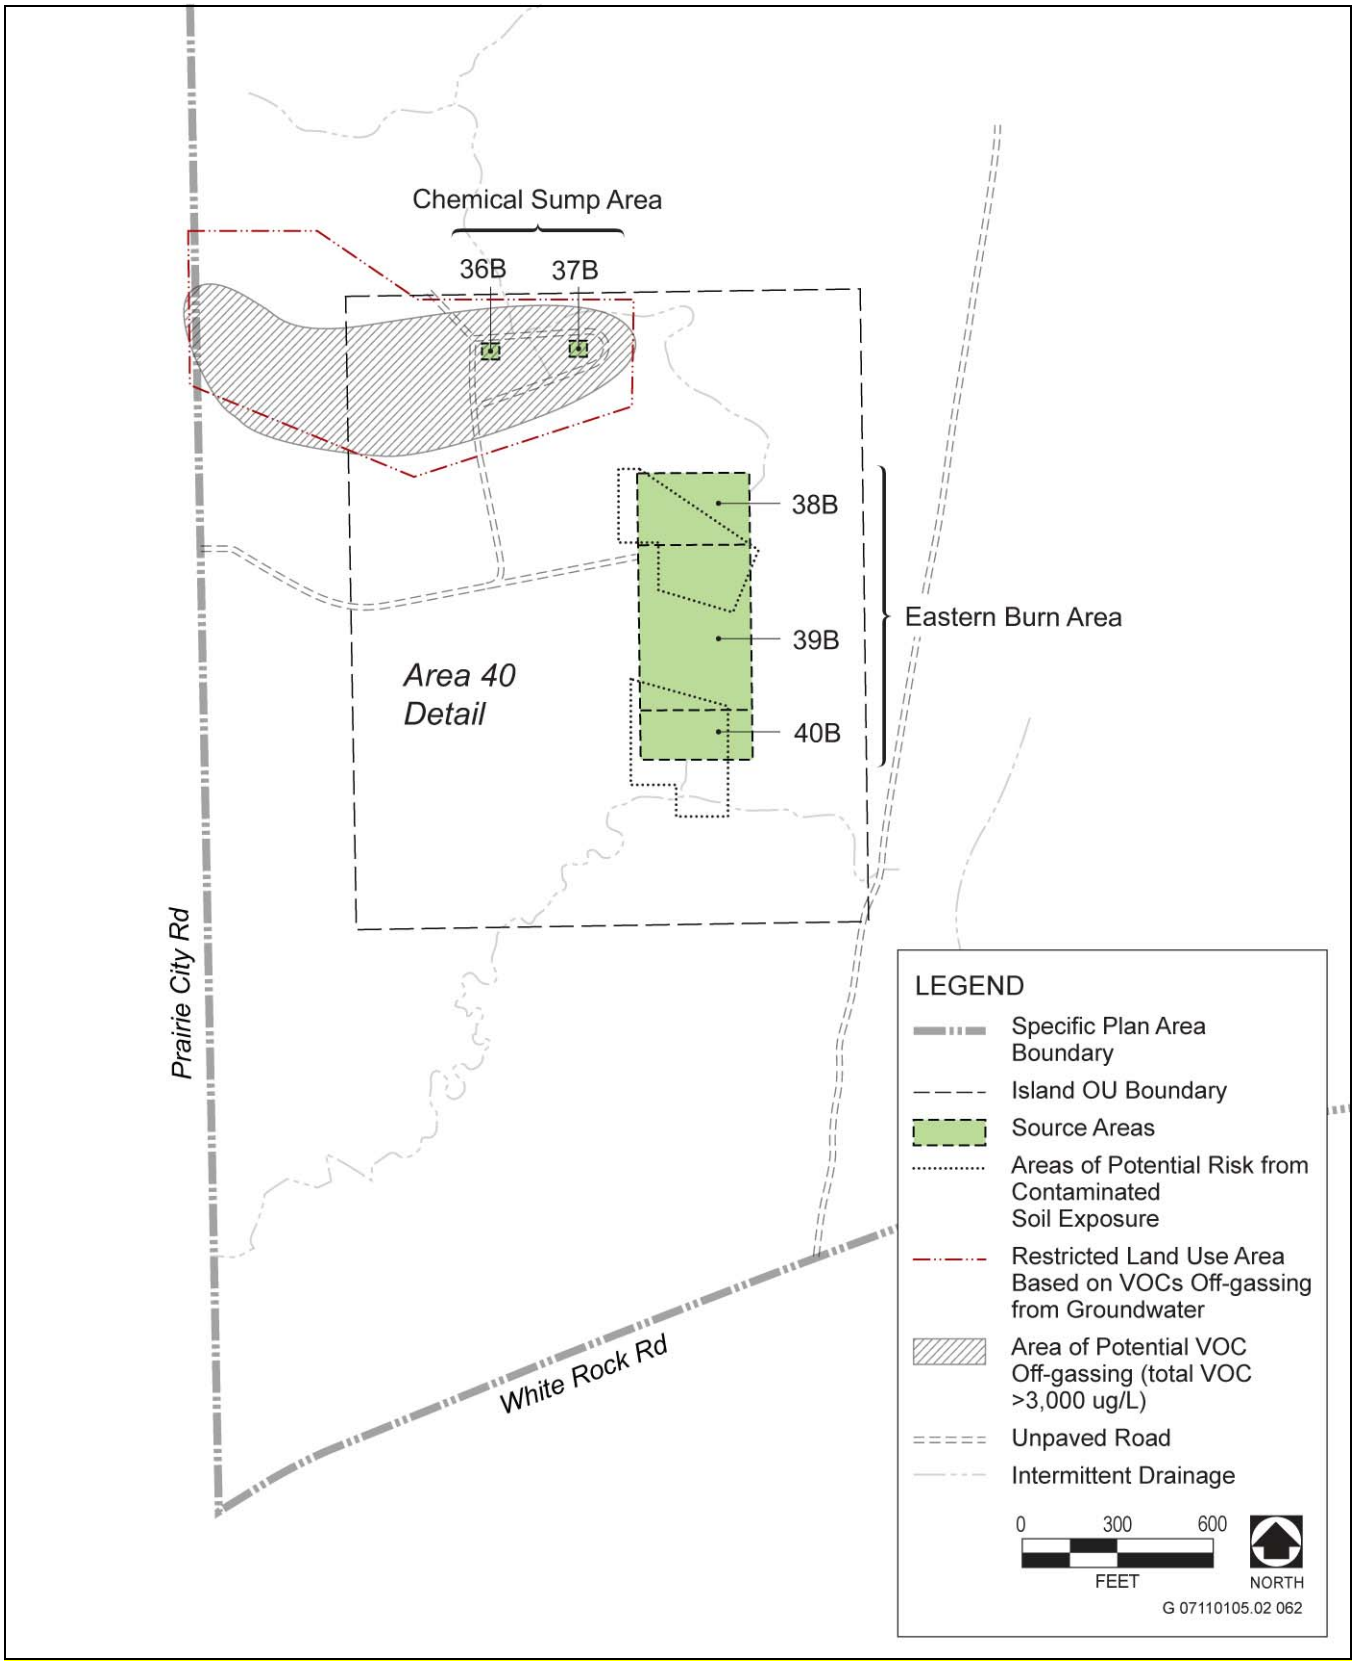
In 2007, Aerojet released a RI/FS for the Island OU, which includes scattered sites across the Aerojet facility, including Area 40. The RI/FS summarizes data from monitoring wells installed in 1985 and 1992. This report discloses that levels of VOCs, metals, and perchlorate in the groundwater plume associated with the chemical management sumps exceed human health screening levels. Aerojet delineated areas where VOC concentrations in soil and/or groundwater pose the potential for off-gassing of VOCs into ambient air (these areas are shown in Exhibit 3A.8-2, and overlaid on the land use plans for the project alternatives in Exhibits 3A.8-4 through 3A.8-8 in the "Impact Analysis" subsection below) (Aerojet General Corporation 2007, included as Appendix G2). Health effects associated with VOC exposure range from short-term effects such as headaches, dizziness, memory impairment, and eye and respiratory tract irritation, to long-term effects such as cancer. Off-gassing from contaminated soils and groundwater is of particular concern in areas where buildings are constructed, because studies have concluded that many VOCs will accumulate in indoor air at concentrations up to five times higher than the ambient outdoor conditions (EPA 2009).

In 2007, Arcadis evaluated existing groundwater data from Area 40 to determine probable human health risks associated with the potential land uses in the vicinity of Area 40. The groundwater data were provided by Aerojet, and included only data collected since 2006, and excluded samples from bedrock. The purpose of the evaluation was to determine probable human health risks associated with the potential land uses in the vicinity of Area 40.



Source: Aerojet General Corporation 2007, Adapted by AECOM in 2009

Area 40 and Carve-Out Area **Exhibit 3A.8-1**



Source: Aerojet General Corporation 2007, Adapted by AECOM in 2009

Area 40 Detail **Exhibit 3A.8-2**

Arcadis concluded that development of the area of potential VOC off-gassing into ambient air (as shown in Exhibit 3A.8-2) as parks or open space would not pose a substantial risk to human health. These conclusions were based on an understanding that the EPA would ensure that contaminated soils are remediated appropriately in accordance with future land use designations (ARCADIS 2007, included as Appendix G3).

Eastern Operable Unit

An off-site detention basin is proposed east of Prairie City Road. This detention basin would be located within the Eastern OU of the Aerojet Superfund site. The Eastern OU includes 91 source areas on approximately the eastern one-third of the Aerojet facility, and generally includes Aerojet's liquid rocket test areas.

The land identified for the proposed detention basin is not within an identified source area as defined in the Partial Consent Decree (Partial Consent Decree entered June 23, 1989 [and modifications thereto] in the consolidated actions Nos. CIVS-86-0063-EJG and CIVS-86-0064-EJG) and was not identified as an area of concern in the Eastern Operable Unit Sampling Plan (Aerojet General Corporation 2008).

PHASE 1 ENVIRONMENTAL SITE ASSESSMENTS

The Phase I Environmental Site Assessments discussed below were prepared following the requirements of ASTM Standard E 1527-05, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*. Phase I Environmental Site Assessments within the project that have been completed at the time of release of this EIS/EIR include:

- *Phase I Environmental Site Assessment, Folsom Sphere of Influence , Northern and Southern Lots, Folsom, CA* (ERM 2008, included as Appendix G4).
- *Phase I Environmental Site Assessment, Approximate 80-Acre Property Portion of APN 072-0060-029, White Rock Road, East of Prairie City Road. Sacramento County, California* (Ramcon 2003a, included as Appendix G5).
- *Addendum – Prospect Pit Investigation, Phase I Environmental Site Assessment Approximate 80-Acre Property Portion of APN 072-0060-029, White Rock Road, East of Prairie City Road. Sacramento County, California* (Ramcon 2003b, included as Appendix G6).
- *Phase I Environmental Site Assessment, Carpenter Ranch, Three Additional Parcels, US Highway 50 and Scott Road, Sacramento County, California* (Versar 2006, included as Appendix G7). This area is referred to as "Carpenter Ranch East" below.
- *Environmental Site Assessment Folsom 138 Property* (Wallace, Kuhl & Associates 2004, included as Appendix G8).
- *Environmental Site Assessment Folsom Heights Property* (Wallace, Kuhl & Associates 2005, included as Appendix G9).
- *Phase I Environmental Site Assessment for Russell Ranch South El Dorado Hills Area* (Youngdahl & Associates, Inc. 1995, included as Appendix G10). The Russell Ranch property is a portion of the Folsom South property.
- *Phase I Environmental Site Assessment, Carpenter Ranch, Sacramento County, California* (Versar 2005, included as Appendix G11). This area is referred to as "Carpenter Ranch West" below.
- *Phase I Environmental Site Assessment for Mangini Property* (Youngdahl Consulting Group, Inc., 2007, included as Appendix G12). The Mangini property is a portion of the Folsom South property.

The purpose of a Phase I Environmental Site Assessment is to evaluate and identify recognized environmental conditions (RECs), which are the presence or likely presence of petroleum products or hazardous substances on the property under conditions that indicate an existing release, a past release, or a material threat of a release into structures on the property, or into the ground, groundwater, or surface water of the property. The Phase I Environmental Site Assessments base their site evaluations on sources including site reconnaissance, interviews, database searches, and evaluation of aerial photographs. Portions of the SPA that were evaluated in the Phase I Environmental Site Assessment are illustrated on Exhibit 3A.8-3.

Carpenter Ranch (East)

Carpenter Ranch (east) consists of undeveloped land used for agricultural purposes (Assessor Parcel Numbers (APNs) 072-0270-129, 072-0270-133, and 072-0270-147). It is bisected by Old Placerville Road and a decommissioned Southern Pacific Railroad track. A search of relevant agency databases, including the Cortese List maintained by DTSC, did not include records associated with this property. Based on this finding, and in combination with personal interviews and site reconnaissance, Versar concluded that there were no RECs with respect to this site, and no further investigation was recommended (Versar 2006).

Folsom 138 Property

The Folsom 138 property, APN 072-0070-006, is used as rangeland. This site is not listed on relevant agency databases, including the Cortese List, EPA, or the State Water Resources Control Board (SWRCB). In addition, there was no indication of potentially hazardous conditions discovered during field reconnaissance. No RECs were identified for this property and no further investigation was recommended. (Wallace, Kuhl & Associates 2004.)

Folsom Heights Property

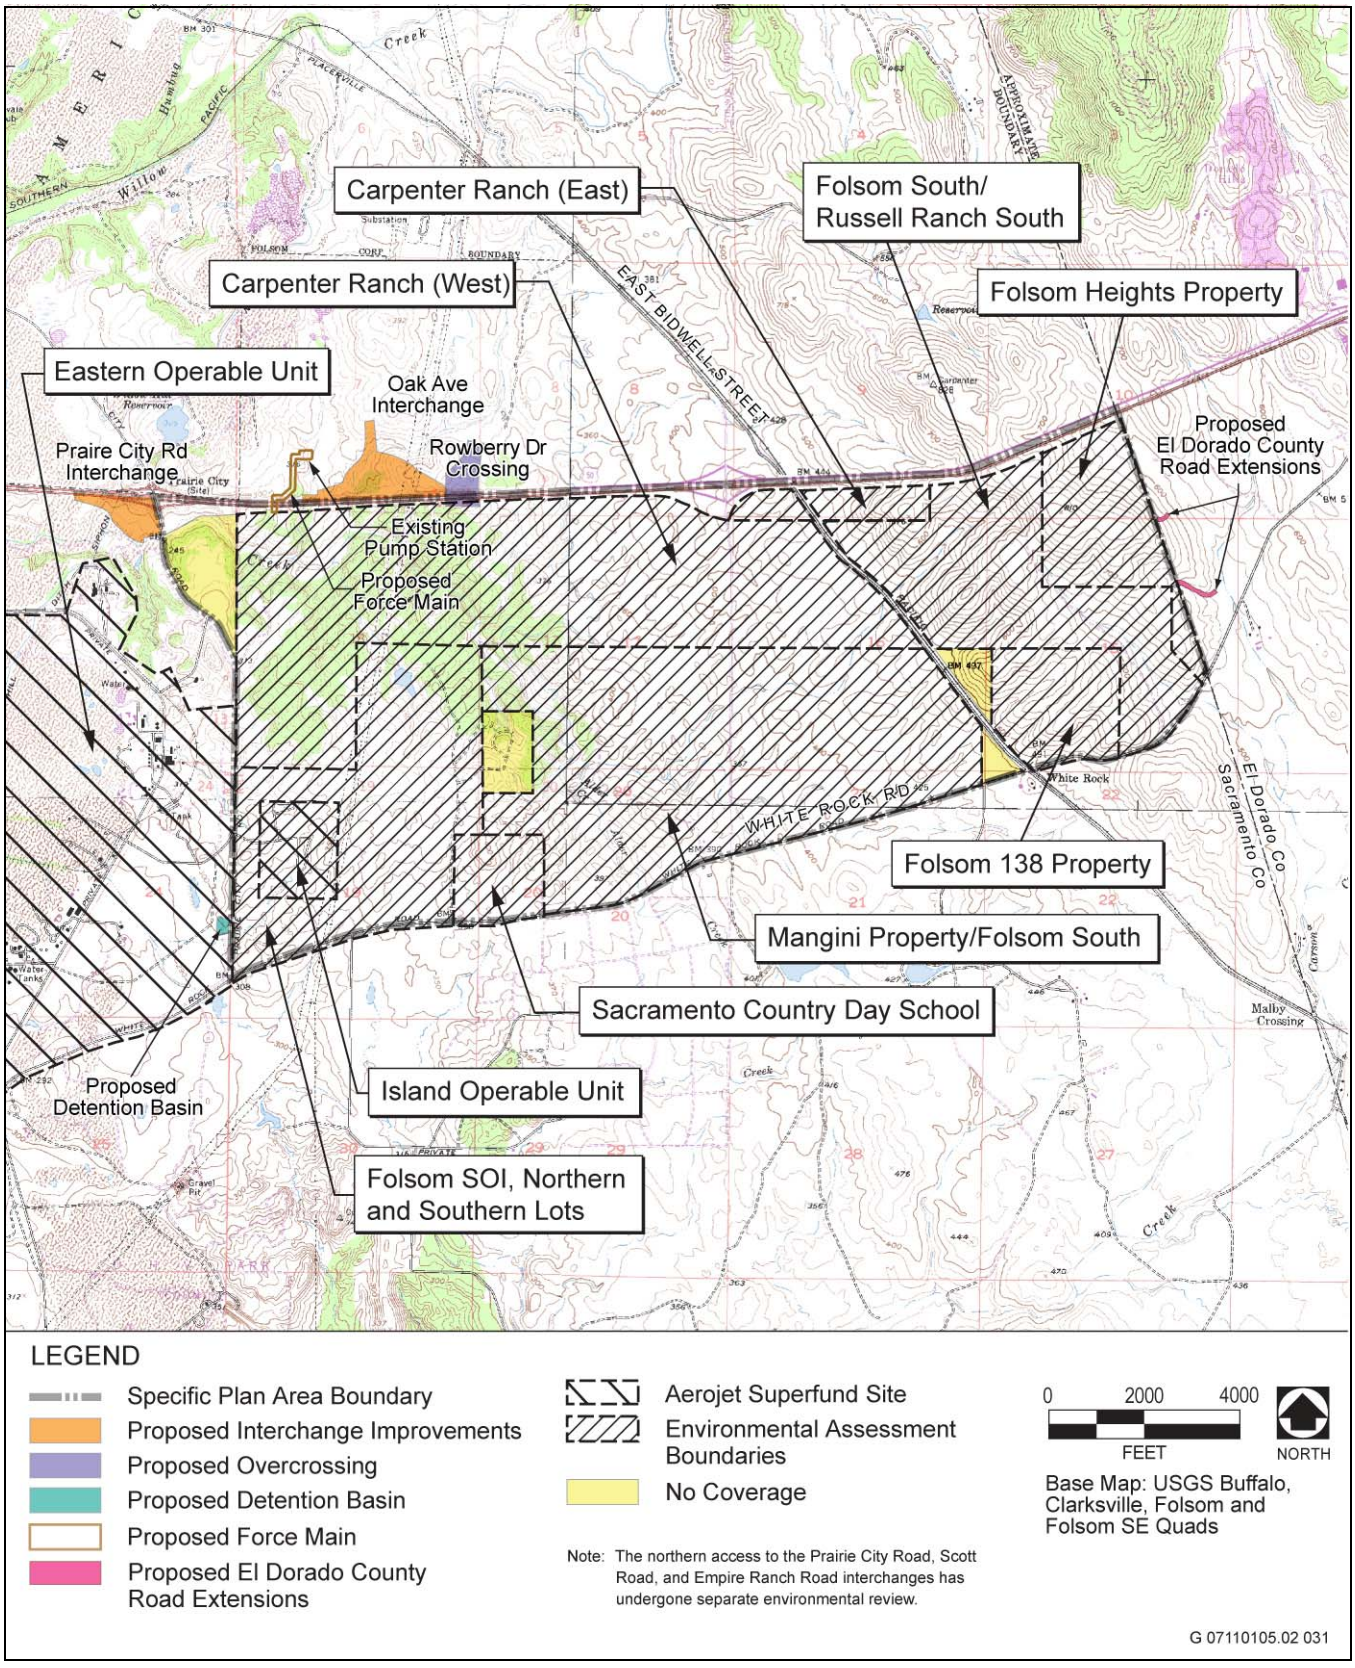
The Folsom Heights property consists of undeveloped land used for cattle grazing land (APNs 072-0070-001 and 072-0270-028). A review of agency databases, including the Cortese List, did not identify any records associated with this property. There was no evidence of RECs for this site and no further investigation was recommended. (Wallace, Kuhl & Associates 2005.)

Russell Ranch South

Russell Ranch South, which is primarily used for cattle grazing purposes, is located in the eastern portion of the SPA. This property (which is the eastern portion of the Folsom South property) consists of three parcels: 072-0070-032, 072-0270-070, and 072-0272-071. There are five large radio/utility towers with associated buildings and chain-link fencing in addition to electrical power poles and lines located in the northern portion of the site. Database searches, including the National Priorities List, Cortese List, and Sacramento County Environmental Health Department lists, did not identify records related to this property. Although no RECs were identified, Youngdahl & Associates did recommend a further investigation of potential electromagnetic fields (EMFs) from the radio towers and asbestos within the associated buildings. (Youngdahl & Associates 1995.)

Sacramento Country Day School

The Sacramento Country Day School parcel is currently used for cattle grazing, and has historically been used for this purpose. The Phase I Environmental Site Assessment reported that there is a potential for “prospect pits” from historic mining activities on this parcel. Ramcon (2003a) recommended additional limited testing for mercury within the soil due to possible presence of the prospect pits and suggested that since the property is proposed for use as a school site, a Phase I Environmental Site Assessment that meets the requirements of the California Education Code should be completed and submitted to DTSC (Ramcon 2003a). Ramcon then performed further testing of soil for mercury related to previous mining activities, and their results indicated that residual mercury levels were below levels that would pose a risk to human health (Ramcon 2003b).



Source: Arcadis 2007; ERM 2008; Wallace, Kuhl & Associates 2004, 2005; Versar 2006; Youngdahl & Associates 1995; Adapted by AECOM in 2009

Environmental Site Assessment Coverage **Exhibit 3A.8-3**

Carpenter Ranch (West)

Carpenter Ranch (west) consists of 1,005 acres of dry grassland currently used for cattle grazing, with several high-voltage power lines bisecting the property from north to south. This property includes parcels 072-0060-048 and 072-0060-045. Versar observed a limited area of apparent mining activity (piles of gravel and cobbles and an old cable) on the property, on the south side of Alder Creek west of the power lines. There was no evidence of RECs for this site, and no further investigation was recommended. (Versar 2005.)

Mangini Property

The Mangini Property includes the western portion of the Folsom South property (parcels 072-0060-038 and 072-0060-069). Youngdahl & Associates identified the potential for adverse impacts from gold processing chemicals as a REC for this property based on identified past mining uses of the property. A total of four open, vertical mine shafts were identified on the northwest portion of the property (near Alder Creek, west of Scott Road). Waste rock tailing piles and hummocky land were observed near the open mine shaft. Stamp mills were not likely used at the site. Youngdahl & Associates recommended that the four mine shafts and mine features should be properly mitigated, and an abandoned well should be properly destroyed and abandoned. Debris piles located near the exploration holes should be removed and properly disposed of. (Youngdahl & Associates 2007.)

ABANDONED MINE SHAFTS

In spring 2009, AECOM surveyed the SPA for biological resources. While conducting these surveys, it was noted that an abandoned mine shaft and associated barbed wire fencing are located on the northwest portion of the SPA. (Youngdahl & Associates also identified four abandoned mine shafts on the Mangini Property.) Improper closure of mine shafts can result in hazards from accidents such as cave-ins or exposure to toxic gases. Similar structures, which may not have been abandoned in accordance with Federal, state, and local regulations, may be located in the SPA.

ASBESTOS AND LEAD

An existing on-site residence and auxiliary buildings associated with radio/utility towers on the eastern portion of the SPA may have been constructed when asbestos-containing materials (ACMs) and lead-based paints were used. Asbestos is designated as a hazardous substance when the fibers have potential to come in contact with air because the fibers are small enough to lodge in the lung tissue and cause health problems. The presence of ACMs in existing buildings poses an inhalation threat only if the ACMs are found to be in a friable state. If the ACMs are not friable, there is no inhalation hazard because asbestos fibers remain bound in the material matrix. Emissions of asbestos fiber to the ambient air, which can occur during activities such as renovation or demolition of structures made with ACMs (e.g., insulation), are regulated in accordance with Section 112 of the Federal Clean Air Act.

Human exposure to lead has been determined by EPA and the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) to be an adverse health risk, particularly to young children. Demolition of structures containing lead-based paint requires specific remediation activities regulated by Federal, state, and local laws.

PCBs

Electrical transformers that could contain polychlorinated biphenyls (PCBs) may be associated with the electrical power lines. PCBs are considered hazardous materials and have been banned because of their toxicity. Although PCBs are no longer manufactured or used, release into the environment can occur from leaks or releases from pre-1979 electrical transformers. They have been shown to cause cancer in animals, along with effects on the immune,

reproductive, nervous, and endocrine systems, and studies have shown evidence of similar effects in humans (EPA 2009).

MOSQUITO/VECTOR CONTROL

All species of mosquitoes require standing water to complete their growth cycle; therefore, any body of standing water represents a potential mosquito breeding area. Water quality also affects the productivity of a potential mosquito breeding areas. Typically, greater numbers of mosquitoes are produced in water bodies with poor circulation, higher temperatures, and higher organic content (i.e., poor water quality) than in water bodies having good circulation, lower temperatures, and lower organic content. In addition, irrigation and flooding practices may influence the level of mosquito production associated with a water body. Typically, greater numbers of mosquitoes are produced in water bodies with water levels that slowly increase or recede than in water bodies with water levels that are stable or that rapidly fluctuate. Mosquito larvae prefer stagnant water and the protected microhabitats provided by stems of emergent vegetation (U.S. Army Corps of Engineers [USACE] 1998).

The SPA contains natural mosquito breeding habitat, including cattails, tree holes, woodland pools, intermittent streams, vernal pools, and ponds. In addition to being a nuisance pest, mosquitoes are vectors (i.e., carriers) of many diseases, including West Nile virus, malaria, and dengue. West Nile virus, which can cause symptoms ranging from fever to paralysis and death, is considered to be the most prevalent mosquito-borne disease in the United States (Sacramento-Yolo Mosquito and Vector Control District 2009). In 2008, Sacramento County reported West Nile Virus cases in 13 humans, 9 horses, 130 dead birds, 277 mosquito samples, 7 sentinel chickens, and 1 squirrel (California Department of Public Health 2009).

The SPA is located in the Sacramento-Yolo Mosquito Abatement District. Although the off-site roadway connections in El Dorado County are outside the District's jurisdiction, no water or drainage features are planned in this area, and therefore the project would not affect mosquito breeding habitat in El Dorado County.

The Sacramento-Yolo Mosquito Abatement District (District) applies chemicals at extremely low rates, as recommended by EPA. Pesticides in use include biological controls, such as *Bacillus* sp.; methoprene, an insect growth regulator; and pyrethrins and pyrethroids, all of which have been evaluated and are regulated by EPA. Biological larvicides include *Bacillus thuringiensis israelensis (Bti)* and *Bacillus sphaericus (B)*, which are naturally occurring bacteria. EPA indicates that the microbial pesticides *Bti* and *B. sphaericus* have undergone extensive testing before registration. They are essentially nontoxic to humans, so there are no concerns about human health effects with *Bti* or *B. sphaericus* when they are used according to label directions. EPA testing also indicates that there are no risks to wildlife, nontarget species, or the environment associated with these microbial pesticides, when used according to label directions (EPA 2007a). Only mosquitoes, black flies, and certain midges are susceptible to these bacteria. Other aquatic invertebrates and nontarget insects are unaffected. Larvicidal oils and monomolecular films are used to drown the mosquito larvae in their later aquatic stages, when they are not feeding, by forming a thin coating on the surface of the water. For example, methoprene is an insect growth regulator that is target-specific and is designed not to harm mammals, waterfowl, or beneficial predatory insects.

According to the EPA, pyrethroids can be used for public health mosquito control programs without posing unreasonable risks to human health when applied according to the label. They also do not pose unreasonable risks to wildlife or the environment, although pyrethroids are toxic to fish and to bees. For that reason, EPA has established specific precautions on the label to reduce such risks, including restrictions that prohibit the direct application of products to open water or within 100 feet of lakes, streams, rivers, or bays (EPA 2002). The District uses pyrethrins and pyrethroids for its adult mosquito fogging program in and around populated areas. Pyrethrins are insecticides that are derived from an extract of chrysanthemum flowers, and pyrethroids are synthetic forms of pyrethrins. These are generally applied by truck-mounted or handheld foggers. These materials used to control both adult and larval mosquitoes are registered with EPA, which evaluates safe use by assessing potential human health and environmental effects associated with use of each product (EPA 2007b).

ELECTROMAGNETIC FIELDS

EMFs are invisible energy fields that surround any electrical device, including electrical transmission lines. Electric fields may be shielded or weakened by materials that conduct electricity, such as trees, buildings, and human skin. However, magnetic fields are more difficult to shield because they pass through most materials. Both electric and magnetic fields decrease rapidly as the distance from the source increases. The frequency of the electrical field is usually expressed in terms of a unit called a hertz (Hz), while the strength of the magnetic field is often expressed in terms of a unit called the gauss (G). A milligauss (mG) is 1/1,000 of a gauss. Different forms of EMFs are produced by different sources, including electrical energy facilities such as substations and power transmission lines, as well as common household appliances and office equipment.

Most public attention and scientific research has been focused on EMFs generated by electric energy transmission facilities, partially because some studies have reported an increased cancer risk associated with exposure to these types of magnetic fields. These facilities generate power frequencies in the range of 50 to 60 Hz (referred to as extremely low frequency [ELF]), and may generate magnetic fields that range from 86 mG to 0.2 mG, depending on the type of power line and the distance from the line. The National Institute of Environmental Health Sciences (NIEHS) summarized the results of monitoring studies that indicate most people in the United States are exposed to magnetic fields that average less than 2 mG (NIEHS 2002).

A variety of epidemiological and laboratory studies, including those sponsored and funded by international, Federal, and state organizations and agencies, have been carried out regarding EMF exposure and its potential human health risks. (For a summary of some of these studies, see NIEHS 2002 and National Cancer Institute 2005.) Some of these studies have concluded that there is a weak link between the development of childhood leukemia and proximity to EMFs generated by electric power transmission facilities, while other studies have concluded there is no direct link. Scientific research in this area is ongoing in various countries throughout the world. Because of the potential that there may be a relationship between cancer and EMFs among children, the California Department of Education (CDE) has taken the position that K–12 schools may not be constructed within 150 feet of an easement for a 230-kilovolt (kV) transmission line (approximately 200 feet from the power line itself). However, because so many studies have concluded that evidence for a direct link is "weak," the state of California has not adopted any laws or regulations requiring an additional setback from electric power transmission facilities beyond the utility right-of-way easement, which is generally 50 feet on either side of a 230-kV line.

Both the Sacramento Municipal Utility District (SMUD) and Pacific Gas and Electric Company (PG&E) operate electrical transmission lines in the SPA. There are four high-voltage transmission lines (one 69 kV, one 115 kV, and two 230 kV) that run in an approximate north to south direction through the western portion of the SPA, within an approximately 400-foot-wide easement (Capitol Utility Specialists 2009, included as Appendix G13).

The eastern edge of the SPA contains cell phone towers registered with the Federal Communications Commission (FCC) by Verizon Wireless and AT&T Mobility, LLC, and antenna towers registered with the FCC by Spectrasite Communications, Inc. and American Towers, Inc. Registration with the FCC requires compliance with FCC maximum exposure limits for EMF protective of human safety.

3A.8.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Hazardous Materials Handling

At the Federal level, the principal agency regulating the generation, transport, and disposal of hazardous substances is EPA, under the authority of the Resource Conservation and Recovery Act (RCRA). RCRA established an all-encompassing Federal regulatory program for hazardous substances that is administered by

EPA. Under RCRA, EPA regulates the generation, transportation, treatment, storage, and disposal of hazardous substances. RCRA was amended in 1984 by the Hazardous and Solid Waste Amendments of 1984, which specifically prohibits the use of certain techniques for the disposal of various hazardous substances. The Federal Emergency Planning and Community Right to Know Act of 1986 imposes hazardous-materials planning requirements to help protect local communities in the event of accidental release of hazardous substances. EPA has delegated many of the RCRA requirements to DTSC. Use and safety considerations related to blasting activities are regulated by OHSA under the Construction Safety and Health Outreach Program. Storage or explosives and blasting agents is regulated by the Bureau of Alcohol, Tobacco, and Firearms (27 CFR Part 55, *Commerce in Explosives*).

Worker Safety Requirements

OSHA is responsible at the Federal level for ensuring worker safety. OSHA sets Federal standards for implementation of workplace training, exposure limits, and safety procedures for the handling of hazardous substances (as well as other hazards). OSHA also establishes criteria by which each state can implement its own health and safety program.

Comprehensive Environmental Response, Compensation, and Liability Act

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) created a trust fund to provide broad Federal authority for releases or threatened release of hazardous substance that could endanger public health or the environment.

Superfund Amendments and Reauthorization Act

The CERCLA Act of 1980 created the Superfund hazardous substance cleanup program (CERCLA, Public Law [PL] 96-510, enacted December 11, 1980). It was enlarged and reauthorized by the Superfund Amendments and Reauthorization Act of 1986 (SARA, PL 99-499). EPA compiles a list of national priorities among the known releases or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories, known as the National Priorities List. These locations are commonly referred to as "Superfund sites."

National Oil and Hazardous Substances Pollution Contingency Plan

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) is the Federal plan for responding to oil spills and hazardous substances releases. The NCP establishes the National Response Team and its roles in the National Response System, which include planning and coordinating response to major discharges of oil or hazardous waste, providing guidance to Regional Response Teams, coordinating a national program of preparedness planning and response, and facilitating research to improve response activities.

Clean Air Act

The Federal Clean Air Act (CAA) was enacted in 1970. The most recent major amendments made by Congress were in 1990. The CAA required EPA to establish primary and secondary national ambient air quality standards. The CAA also required each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). Section 112 of the CAA defines hazardous air pollutants and sets threshold limits. As discussed above in Section 3A.8.1, "Affected Environment," asbestos-containing substances are regulated by the EPA under the CAA. Additional information about CAA is contained in Section 3A.4, "Air Quality - Land."

Electromagnetic Field Exposure Limits

The FCC adopted the National Council of Radiation Protection's recommendations for human exposure to radio-frequency EMFs in 1996. These regulations provide a maximum permissible exposure level to the general public.

The FCC also provides guidelines for evaluating compliance with FFC exposure limits, methods for controlling exposure, and information on EMF measurement techniques.

Regulation of Polychlorinated Biphenyls

The Toxic Substances Control Act of 1976 (Title 15 of the United States Code [USC], Section 2605) banned the manufacture, processing, distribution, and use of PCBs in totally enclosed systems. The EPA Region 9 PCB Program regulates remediation of PCBs in several states, including California. Title 40 of CFR, Section 761.30(a)(1)(vi)(A) states that all owners of electrical transformers containing PCBs must register their transformers with EPA. Specified electrical equipment manufactured between July 1, 1978 and July 1, 1998 that does not contain PCBs must be marked by the manufacturer with the statement "No PCBs" (Section 761.40[g]). Transformers and other items manufactured before July 1, 1978 and containing PCBs, must be marked as such.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

Hazardous Materials Handling

The California Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act) requires preparation of hazardous materials business plans and disclosure of hazardous-materials inventories. A business plan includes an inventory of hazardous materials handled, facility floor plans showing where hazardous materials are stored, an emergency response plan, and provisions for employee training in safety and emergency response procedures (California Health and Safety Code, Division 20, Chapter 6.95, Article 1). Statewide, DTSC has primary regulatory responsibility for management of hazardous materials, with delegation of authority to local jurisdictions that enter into agreements with the State. Local agencies, including the Sacramento County Environmental Health Department, administer these laws and regulations.

The California Education Code contains various provisions governing the siting of new public schools (e.g., California Education Code Sections 17211, 17212, and 17212.5). In addition, to help focus and manage the site selection process, CDE's School Facilities and Planning Division has developed screening and ranking procedures based on criteria commonly affecting school selection (California Education Code Section 17251[b], 5 CCR Section 14001[c]). The foremost consideration in the selection of school sites is safety. Certain health and safety requirements are governed by state statute and CDE regulations. In selecting a school site, a school district should consider the factors including proximity to airports, proximity to high-voltage power transmission lines, presence of toxic and hazardous substances, hazardous air emissions, and facilities within one-quarter mile, and proximity to railroads.

CDE requires that any school district that plans to purchase property using state funds must obtain a Phase I Environmental Site Assessment evaluating the suitability of the soil on that site for use as a school. The Phase I Environmental Site Assessment must be submitted to DTSC for review and approval before CDE will approve purchase of the site. If toxic or hazardous substances, including pesticides, naturally occurring asbestos, or other regulated hazardous materials, are found to be present, DTSC will require the school district to perform a Phase II Preliminary Endangerment Assessment to determine the level of risk and identify procedures for limiting the risk and/or cleaning up the contamination. In instances of substantial contamination, a Phase III remedial action may be required before the property is deemed safe for use as a school site.

Sections 12101 through 12103 of the California Health and Safety Code require that permits be obtained by those manufacturing, transporting, possessing, or using explosives, and endorsed by the jurisdiction(s) in which the transportation or use would occur.

Worker Safety Requirements

California OSHA (Cal-OSHA) assumes primary responsibility for developing and enforcing workplace safety regulations within California. Cal-OSHA regulations pertaining to the use of hazardous materials in the workplace

(Title 8 of the CCR) include requirements for safety training, availability of safety equipment, accident and illness prevention programs, hazardous substance exposure warnings, and preparation of emergency action and fire prevention plans. Cal-OSHA enforces hazard communication program regulations that contain training and information requirements, including procedures for identifying and labeling hazardous substances, communicating hazard information related to hazardous substances and their handling, and preparation of health and safety plans to protect workers and employees at hazardous-waste sites. The hazard communication program requires that employers make Material Safety Data Sheets available to employees and document employee information and training programs.

Emergency Response to Hazardous Materials Incidents

California has developed an emergency response plan to coordinate emergency services provided by Federal, state, and local governments and private agencies. Response to hazardous-material incidents is one part of this plan. The plan is managed by the Governor's Office of Emergency Services (OES), which coordinates the responses of other agencies, including Cal-EPA, California Highway Patrol (CHP), California Department of Fish and Game, Central Valley RWQCB, and the City of Folsom Fire Department.

Hazardous Materials Transport

The U.S. Department of Transportation (USDOT) regulates transportation of hazardous materials between states. State agencies with primary responsibility for enforcing Federal and state regulations and responding to hazardous materials transportation emergencies are CHP and the California Department of Transportation (Caltrans). Together, these agencies determine container types used and license hazardous-waste haulers for transportation of hazardous waste on public roads, including explosives that may be used for blasting.

The USDOT Federal Railroad Administration (FRA) enforces the Hazardous Materials Regulations, which are promulgated by the Pipeline and Hazardous Materials Safety Administration for rail transportation. These regulations include requirements that railroads and other transporters of hazardous materials, as well as shippers, have and adhere to security plans and also train their employees involved in offering, accepting, or transporting hazmat on both safety and security matters.

Government Code Section 65962.5 (Cortese List)

The provisions of Government Code Section 65962.5 are commonly referred to as the "Cortese List" (after the Legislator who authored the legislation that enacted it). The Cortese List is a planning document used by the State and local agencies to comply with CEQA requirements in providing information about the location of hazardous materials release sites. Government Code Section 65962.5 requires Cal-EPA to develop an updated Cortese List annually, at minimum. DTSC is responsible for a portion of the information contained in the Cortese List. Other California state and local government agencies are required to provide additional hazardous material release information for the Cortese List.

Asbestos Abatement

The California Air Resources Board (ARB) Asbestos Program oversees implementation of and compliance with the National Emission Standard for Hazardous Air Pollutants (NESHAP) for asbestos, and investigates all related complaints, as specified by the California Health and Safety Code Section 39658(b)(1). The Sacramento Metropolitan Air Quality Management District enforces Rule 902 which regulates asbestos abatement in commercial structures, and enforces NESHAP for asbestos.

Mosquito Abatement

The Mosquito Abatement Act, passed in 1915, allowed local governments the authority to obtain revenues and form special districts to protect the public from mosquito-related hazards (i.e., West Nile Virus) (see California Health and Safety Code Sections 2000-2805, 2877-2878, 106925, 116110-116112, and 116175-116183).

The SPA is located within the Sacramento-Yolo Mosquito and Vector Control District. The District employs technicians certified by the Vector-Borne Disease Section of the California Department of Health Services (DHS) in pesticide usage, and mosquito and vector identification. The District solves mosquito problems using Integrated Pest Management techniques, which include surveillance and monitoring of mosquito breeding sources, reduction of mosquito breeding sites, community outreach and public education, and the use of chemical and biological methods to control both mosquito larvae and adult mosquitoes. The District's mosquito control program is contained in its *Mosquito and Mosquito-Borne Disease Management Plan* (Sacramento-Yolo Mosquito and Vector Control District 2005).

California Public Resources Code Section 21151.4

School-aged children are considered to be particularly sensitive to adverse effects resulting from exposure to hazardous materials, substances, or waste. For this reason, California PRC Section 21151.4 requires that lead agencies evaluate projects proposed within a quarter-mile of a school to determine whether release of hazardous air emissions or hazardous substances, resulting from implementation of any of the action alternatives, would pose a human health or safety hazard.

Electromagnetic Field Exposure Limits

As described above in Section 3A.8.1, "Affected Environment," the State of California has not established standards for EMF exposure related to high-voltage power transmission. However, CDE, in consultation with DHS has established siting policies for school property lines near the edge of easements of high-voltage power transmission lines. These separation distances, which assume that the easements themselves provide an additional 50 feet of separation from the lines, are intended to be protective with respect to EMF exposure:

- 100 feet from the edge of an easement for a 50-133 kV line (150 feet from the line itself),
- 150 feet from the edge of an easement for a 220-230 kV line (200 feet from the line itself), and
- 350 feet from the edge of an easement for a 500-550 kV line (400 feet from the line itself).

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND ORDINANCES

Sacramento County General Plan

The following goals and policies of the Sacramento County General Plan (Sacramento County 2007) are applicable only to the No Project Alternative. There are no goals or policies that would apply to the Proposed Project or the other four action alternatives.

Emergency Response Goal: An Emergency Preparedness System that can effectively respond in the event of a natural or manmade disaster.

Public Health and Safety Objective: Protect the residents of Sacramento County from the effects of a hazardous material incident via the implementation of various public health and safety programs.

- **Policy HM-4:** The handling, storage, and transport of hazardous materials shall be conducted in a manner so as not to compromise public health and safety standards.

- **Policy HM-8:** Continue the effort to prevent ground water and soil contamination.

- **Policy HM–9:** Continue the effort to prevent surface water contamination.

- **Policy HM-10:** Reduce the occurrences of hazardous material accidents and the subsequent need for incident response by developing and implementing effective prevention strategies.

- **Policy HM-11:** Protect residents and sensitive facilities from incidents which may occur during the transport of hazardous materials in the County.

Enforcement Objective: Enforce all Federal, state, and local regulations and if necessary prosecute those cases involving the mismanagement of hazardous materials.

Sacramento County Multi-Hazard Mitigation Plan

The Sacramento County Multi-Hazard Mitigation Plan (MHMP) is designed to meet the requirements of the Disaster Mitigation Act of 2000, which allows for eligibility for certain Hazard Mitigation (i.e., disaster loss reduction) programs for the Federal Emergency Management Agency (FEMA). Formulation of the MHMP was based on: hazard identification and risk assessment of potential natural hazards that could impact Sacramento County, a review of the County's capability to reduce hazards impacts, and recommendations to further reduce vulnerability to potential disasters. On March 21, 2005, FEMA approved the current MHMP, and on May 24, 2005 it was adopted by Sacramento County.

El Dorado County General Plan

The following goals and policies of the El Dorado County General Plan (2004) are applicable only to the two roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goals and policies that are applicable to the No Project Alternative or the other four action alternatives.

Health, Safety and Noise Element

- **Policy 6.1.1.1**: The El Dorado County Operational Area Multi-Hazard Emergency Operations Functional Plan shall serve as the implementation program for the coordination of hazard planning and disaster response efforts within the County. The County will ensure that the El Dorado County Operational Area Multi-Hazard Emergency Operations Functional Plan is updated on a regular basis to keep pace with the growing

- **Policy 6.2.1.1:** Implement Fire Safe ordinance to attain and maintain defensible space through conditioning of tentative maps and in new development at the final amp and/or building permit stage

- **Policy 6.2.3.2:** As a requirement of new development, the applicant must demonstrate that adequate access exists, or can be provided to ensure that emergency vehicles can access the site and private vehicle can evacuate the area.

- **Policy 6.2.3.4:** All new development and public works projects shall be consistent with applicable State Wildland Fire Standards and other relevant State and Federal fire requirements.

- **Policy 6.6.1.1:** The Hazardous Waste Management Plan shall serve as the implementation program for management of hazardous waste in order to protect the health, safety, property of residents and visitors, and to minimize environmental degradation while maintaining economic viability.

- **Policy 6.6.1.2:** Prior to the approval of any subdivision of land or issuing of a permit involving ground disturbance, a site investigation, performed by a Registered Environmental Assessor or other person experienced in identifying potential hazardous wastes, shall be submitted to the County for any subdivision or parcel that is located on a known or suspected contaminated site included in a list on file with the

Environmental Management Department as provided by the State of California and Federal agencies. If contamination is found to exist by the site investigations, it shall be corrected and remediated in compliance with applicable laws, regulations, and standards prior to the issuance of a new land use entitlement or building permit.

El Dorado County Blasting Ordinance

Chapter 8.56 of the El Dorado County Code regulates blasting activities within El Dorado County. Blasting operations within the County require permits issued by the El Dorado County Sheriff's Department, and notification to that department prior to detonations.

City of Folsom General Plan

The following goals and policies of the City of Folsom General Plan (1993) are applicable to the Proposed Project and the other four action alternatives under consideration. There are no City of Folsom goals and policies that are applicable to the No Project Alternative, since under the No Project alternative the SPA would remain under the jurisdiction of Sacramento County.

Safety Element

- **Policy 29.5:** The City shall prepare, publish, and coordinate an emergency response plan which addresses medical care, escape routes, mutual aid agreements, temporary housing and communications.

Hazardous Materials Element

- **Policy 41.7:** The City shall support a household hazardous waste disposal program.

Sacramento Local Agency Formation Commission Regulations

Sacramento Local Agency Formation Commission Resolution 1196:

- 10: Any application to annex Aerojet General Corporation property, or a portion of such property, within the Sphere of Influence Amendment area, must include information sufficient to demonstrate the on-site surface contamination has been remediated to standards determined to be acceptable by Federal and state regulatory agencies and that either the groundwater contamination has been remediated or that measures to remediate the contamination are in place and working satisfactorily. In addition, the City of Folsom shall provide evidence of any covenants and restrictions limiting the surface or subsurface use of the property.

3A.8.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The proposed project or alternatives under consideration were determined to result in a significant impact related to hazards and hazardous materials if they would do any of the following:

- create a significant hazard to the public or the environment through routine transport, use or disposal of hazardous materials;

- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials to the environment;

- emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment;
- for a project located within an airport land use plan or within two miles of a public airport, result in a safety hazard for people residing or working in the project area;
- for a project located in the vicinity of a private air strip, result in a safety hazard for people residing or working in the project area;
- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
- expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or residences are intermixed with wildlands;
- create a significant hazard to the public through use of explosive materials in grading or earth-moving activities;
- create public health hazards from increased exposure to mosquitoes by providing substantial new habitat for mosquitoes or other vectors; or
- expose project residents to excessive electrical or magnetic fields.

ANALYSIS METHODOLOGY

This analysis is based primarily on review of the Phase 1 Environmental Site Assessment conducted by ERM (2008), Wallace Kuhl & Associates (2004, 2005), Versar 2006, and Youngdahl & Associates (1995); review of a Supplemental RI/FS prepared for the Island OU of the Aerojet Superfund site (Aerojet General Corporation 2007); review of a site remediation feasibility study of the Island OU of the Aerojet Superfund site (ARCADIS 2007); a site visit conducted by EDAW/AECOM (now AECOM) in 2007; a review of aerial photographs of the SPA; and a review of the State Water Resources Board Geotracker online database. Site-specific documents used in the impact analysis are included in Appendix G1 through Appendix G11 of this EIR/EIS.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Hazards within Two Miles of an Airport: The SPA is not located within 2 miles of a public, public-use, or private airport. The nearest airport, Sacramento Mather Airport, is located approximately 7 miles southwest of the SPA. Therefore, impacts related to airport or private airfield safety are not discussed further in this EIS/EIR.

Wildland Fire Hazards: California PR Code Sections 4201-4204 and Government Code 51175-51189 require identification of fire hazard severity zones within the state of California. Fire hazard severity zones are measured qualitatively, based on: vegetation, topography, weather, crown fire potential (a fire's tendency to burn upwards into trees and tall brush), and ember production and movement within the area of question. Fire prevention areas considered to be under state jurisdiction are referred to as "state responsibility areas." In state responsibility areas, the California Department of Forestry and Fire Protection is required to delineate three hazard ranges: moderate, high, and very high "local responsibility areas," which are under the jurisdiction of local entities (e.g., cities, counties), are required to only identify very high fire hazard severity zones. The SPA is located within a state responsibility area designated as a moderate fire hazard severity zone. It is not near an area of high or extremely high fire hazard severity. Therefore, project implementation would not expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or

residences are intermixed with wildlands. Therefore, this issue area is not discussed further in this EIR/EIS. Should future surveys identify a portion or portions of the SPA in a very high fire hazard severity zone, the Wildland-Urban Interface building code regulations would be imposed in accordance with State law.

Safety Hazards Related to Private Airstrips: The SPA is not in the vicinity of a private airstrip, within an airport land use plan, or within two miles of a public airport or public use airport; thus, project implementation would not result in a safety hazard for people residing or working in the project area. Therefore, this issue is not discussed further in this EIR/EIS.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.8-1 Accidental Spill from Routine Transport, Use, or Disposal of Hazardous Materials. *Accidental spills of hazardous materials in the SPA could result during routine transport, use, or disposal activities.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Construction of these rural residences, and the related transport, use, and disposal of hazardous materials, would be required to conform with existing regulations. Transport of hazardous materials is regulated by the CHP and Caltrans, and use of hazardous materials is regulated by DTSC (Title 22 of the CCR). No off-site water facilities would be constructed. **Direct** and **indirect** impacts related to transport, use, and disposal of hazardous substances would be **less than significant** because the regulations have been designed to include steps that substantially reduce the risk of accidental hazardous materials release. ***[Lesser]***

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

Increased residential development would result in increased use, storage, and disposal of household hazardous materials within the SPA. Increased commercial and industrial development may result in increased use, storage, and/or disposal of hazardous materials during routine operations. Of particular concern are facilities with USTs or other methods of storage that could accidentally leak into the soil, water, or air. Such facilities include gas stations, automotive repair shops, and dry cleaners. Groundwater could become contaminated from these impairments. In addition, construction of the Proposed Project Alternative would involve the storage, use, and transport of hazardous materials (e.g., asphalt, fuel, lubricants, paint) during construction activities.

The amount of hazardous materials transported through the SPA on major arterials and regional highways is likely to increase as a result of development of the SPA. The project applicant(s), builders, contractors, business owners, and others would be required to use, store, and transport hazardous materials in compliance with local, state, and Federal regulations during project construction and operation. Transportation of hazardous materials on area roadways is regulated by CHP and Caltrans, and use of these materials is regulated by DTSC, as outlined in Title 22 of the CCR. Facilities that would use hazardous materials on-site after the project is constructed would be required to obtain permits and comply with appropriate regulatory agency standards designed to avoid hazardous waste releases. Because the project is required by law to implement and comply with existing hazardous material

regulations, **direct** and **indirect** impacts related to the creation of significant hazards to the public through routine, transport, use, disposal, and risk of upset are considered **less-than-significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.8-2 Potential Human Health Hazards from Possible Exposure of Existing On-site Hazardous Materials. *Construction workers and future residents could be exposed to hazardous materials known to exist within the SPA.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. As discussed above in Section 3A.8.1, "Affected Environment," potential sources of hazards and hazardous materials include structures that may contain ACM and lead paint, PCBs, and chemicals from mining activities. Hazards associated within Area 40 are discussed separately in Impact 3.5-3 below.

Because no existing structures would be demolished under the No Project Alternative, alteration of existing electric distribution lines would not be expected, and no off-site water facilities would be constructed, the **direct** impact related to ACM, lead paint, and PCBs would be **less than significant**. **No indirect** impacts would occur. However, at least one mine shaft exists on site, and others are suspected to exist. It is unknown whether mines located within the SPA have been properly abandoned in accordance with Federal, state and local regulations. Because future residents in the SPA under the No Project Alternative could be exposed to hazards related to open mine shafts or chemicals such as mercury related to past mining activities, this **direct** impact would be **potentially significant. No indirect** impacts would occur. ***[Greater]***

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

As discussed above in Section 3A.8.1, "Affected Environment," potential sources of hazards and hazardous materials include structures that may contain ACM and lead paint, PCBs, abandoned mine shafts, and chemicals from mining activities. Hazards associated with development of Area 40 and the Aerojet Superfund site (including the proposed off-site detention basin) are discussed separately in Impact 3.5-3 below.

The Russell Ranch South Phase I Environmental Site Assessment detailed concerns related to radio/utility towers and associated buildings that may contain asbestos (Youngdahl & Associates 1995). Demolition activities can cause asbestos fibers to become airborne and potentially inhaled, which can lead to a variety of health problems. However, demolition and removal of these structures is not defined as part of the Proposed Project or action alternatives. Because there is no project-related mechanism for exposure to potential sources of asbestos within the structures, there would be no impact associated with project implementation.

Because the existing on-site residence could contain ACM and lead paint, demolition activities could expose construction workers to asbestos fibers and lead particles. In addition, electrical transformers are likely to be located within the SPA. If not properly dismantled, transported, and disposed, PCBs could be released into the environment during potential removal of these transformers.

Completed Phase I Environmental Site Assessments within the SPA cover the majority of the total area (Exhibit 3A.8-3) and do not include the full extent of an abandoned railroad track that runs parallel to Old Placerville

Road. According to Geotracker and the Federal Railroad Administration, no accidental releases of petroleum products or other hazardous materials associated with the railroad track have been reported (SWRCB 2008).

As discussed above in Section 3A.8.1.2, "Phase I Environmental Site Assessments," dredger mining activities have historically occurred in the SPA. Mercury and other metals are often associated with mining activities, and may exist in areas that would require earthmoving activities, which could expose construction workers to hazardous materials (Ramcon 2003a). In addition, at least one mine shaft exists on site, and others may be present. It is unknown whether mines located within the SPA have been properly abandoned in accordance with Federal, state and local regulations.

Four small areas of the SPA were not assessed through the Phase I Environmental Site Assessment process, and information about former land uses or potential hazardous materials use or disposal is not available for these areas (see Exhibit 3A.8-3). In the absence of this information, it is possible that former land uses may have resulted in a release of hazardous materials onto the SPA. Therefore, for the reasons stated above, this **direct** impact is considered to be **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.8-2: Complete Investigations Related to the Extent to Which Soil and/or Groundwater May Have Been Contaminated in Areas Not Covered by the Phase I and II Environmental Site Assessments and Implement Required Measures.

The project applicant(s) of all project phases shall conduct Phase I Environmental Site Assessments (where an Phase I has not been conducted), and if necessary, Phase II Environmental Site Assessments, and/or other appropriate testing for all areas of the SPA and include, as necessary, analysis of soil and/or groundwater samples for the potential contamination sites that have not yet been covered by previous investigations (as shown in Exhibit 3A.8-1) before construction activities begin in those areas. Recommendations in the Phase I and II Environmental Site Assessments to address any contamination that is found shall be implemented before initiating ground-disturbing activities in these areas.

The project applicant(s) shall implement the following measures before ground-disturbing activities to reduce health hazards associated with potential exposure to hazardous substances:

- Prepare a plan that identifies any necessary remediation activities appropriate for proposed on- and off-site uses, including excavation and removal of on-site contaminated soils, redistribution of clean fill material in the SPA, and closure of any abandoned mine shafts. The plan shall include measures that ensure the safe transport, use, and disposal of contaminated soil and building debris removed from the site. In the event that contaminated groundwater is encountered during site excavation activities, the contractor shall report the contamination to the appropriate regulatory agencies, dewater the excavated area, and treat the contaminated groundwater to remove contaminants before discharge into the sanitary sewer system. The project applicant(s) shall be required to comply with the plan and applicable Federal, state, and local laws. The plan shall outline measures for specific handling and reporting procedures for hazardous materials and disposal of hazardous materials removed from the site at an appropriate off-site disposal facility.

- Notify the appropriate Federal, state, and local agencies if evidence of previously undiscovered soil or groundwater contamination (e.g., stained soil, odorous groundwater) is encountered during construction activities. Any contaminated areas shall be remediated in accordance with recommendations made by the Sacramento County Environmental Management Department, Central Valley RWQCB, DTSC, and/or other appropriate Federal, state, or local regulatory agencies.

- Obtain an assessment conducted by PG&E and SMUD pertaining to the contents of any existing pole-mounted transformers located in the SPA. The assessment shall determine whether existing on-site electrical transformers contain PCBs and whether there are any records of spills from such equipment. If equipment containing PCB is identified, the maintenance and/or disposal of the transformer shall be

subject to the regulations of the Toxic Substances Control Act under the authority of the Sacramento County Environmental Health Department.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County).

Implementation: Project applicant(s) of all project phases.

Timing: Before and during earthmoving activities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Environmental Management Department.
3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate.

Mitigation Measure: Implement Mitigation Measure 3A.9-1.

Implementation of Mitigation Measure 3A.8-2 would reduce significant impacts from potential human health hazards from possible exposure to hazardous materials under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because the entire SPA would be evaluated through the Phase I and/or Phase II Environmental Site Assessment processes, a site plan identifying remediation activities and setting forth procedures to appropriately handle hazardous materials (if any are encountered) would be prepared, and hazardous substances that are encountered would be removed and properly disposed of by a licensed contractor in accordance with Federal, state, and local regulations. Implementation of Mitigation Measure 3A.9-1 would require use of erosion- and sediment-control best management practices, reducing the potential for runoff and release of soils, including legacy sources of mercury from project-related construction sites. However, the off-site detention basin in Sacramento County falls under the jurisdiction of Sacramento County; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation.

IMPACT 3A.8-3 Potential Development Constraints Due to the Listing on the Cortese List. *The SPA contains Area 40, part of the Aerojet Superfund site, which has the potential to create a hazard to public health or the environment. Ongoing remediation activities could delay or limit project development on or near the site of those remediation activities.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. A portion of the Aerojet Superfund site (Area 40) is located in the SPA, and is undergoing investigation and remediation under the direction of EPA and DTSC. An approximately 54-acre portion of the SPA is part of a larger carve-out area that has been removed from the Superfund site. This carve-out area is no longer a Cortese-listed site. Area 40 and the carve-out area are illustrated on Exhibits 3A.8-1 and 3A.8-2.

Restrictions imposed by EPA, DTSC, and other regulatory agencies related to the Superfund listing of Area 40 require that remedial actions be completed prior to release of any portion of Area 40 for development. Because of these restrictions, development of land uses other than open space or recreational uses would not occur within the Cortese-listed site; furthermore, no off-site water facilities would be constructed. Thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

A portion of the Aerojet Superfund site (Area 40) is located in the SPA, and is undergoing investigation and remediation under the direction of EPA and DTSC. An approximately 54-acre portion of the SPA is part of a larger carve-out area that has been removed from the Superfund site. This carve-out area is no longer a Cortese-listed site. Area 40 and the carve-out area are illustrated on Exhibit 3A.8-1 and 3A.8-2.

Soil and groundwater investigations have been conducted at Area 40 since 1985. These investigations have identified the presence of soil and groundwater contamination in the SPA, including VOCs, metals, and perchlorate. Area 40 includes two areas of soil where concentrations of VOCs, metals, perchlorate, dioxins, and furans exceed human health or ecological screening levels (identified in Exhibit 3A.8-2). Compliance with Sacramento LAFCo Resolution 1196 would require demonstration that the on-site surface contamination has been remediated to standards determined to be acceptable by Federal and state regulatory agencies before Area 40 could be annexed into the City of Folsom.

Groundwater contamination at Area 40 includes VOCs, metals, and perchlorate at concentrations in excess of human health screening levels. Exhibit 3A.8-2 illustrates the location of an area where total VOC concentrations in the surface groundwater layer are more than 3,000 micrograms per liter (ug/L). In this area, off-gassing of VOCs from groundwater could result in soil vapor concentrations above health-based risk standards in indoor air. As illustrated in Exhibits 3A.8-4 through 3A.8-8, this area is proposed for park and open space use in the Proposed Project and the action alternatives.

A memorandum from Arcadis to the City of Folsom, in 2007 (ARCADIS 2007), discussed probable human health effects associated with land uses within the northern portion of Area 40 in response to concerns related to potential ambient air exposures associated with park and recreation use. No buildings are proposed for this area, resulting in no potential indoor air exposure. The memorandum indicated that the concentration of ambient VOCs resulting from off-gassing of contaminated groundwater would not be high enough to create an unacceptable risk to children or adults using the area for outdoor recreational activities (ARCADIS 2007). Arcadis concluded that park or open space land uses would be acceptable on this portion of Area 40. Arcadis' conclusions were limited to risks posed by off-gassing of groundwater, and were based on an understanding that the EPA would ensure that contaminated soils are remediated appropriately in accordance with future land use designations.

The land identified for the proposed off-site detention basin is also located on the Aerojet Superfund site, in the Eastern OU. The proposed detention basin is not within an identified source area as defined in the Partial Consent Decree (Partial Consent Decree entered June 23, 1989 [and modifications thereto] in the consolidated actions Nos. CIVS-86-0063-EJG and CIVS-86-0064-EJG) and was not identified as an area of concern as identified in the Eastern Operable Unit Sampling Plan (Aerojet General Corporation 2008). The detention basin would be required to adhere to deed restrictions pertaining to recharge and infiltration.

Area of Potential VOC Off-gassing in No USACE Permit Alternative **Exhibit 3A.8-8**

Although enforcement of LAFCo resolution 1196 would ensure that the proposed land use plans would not pose a risk to human health, ongoing remediation at this Federally listed site may delay or limit the availability of some development, including parks and open space at or near the contaminated sites. The level of remediation effort at these sites may limit future development to open space uses on a portion of Area 40. Ongoing regulatory review and approvals required by EPA, DTSC, and the Central Valley RWQCB would ensure that any site-specific land use limitations are identified and required when the land is made available for development. Aerojet will also retain right of access to certain properties to operate and maintain the monitoring wells or to conduct other remediation activities. This **direct** impact is considered **potentially significant**. There would be **no indirect** impacts. ***[Similar]***

Mitigation Measure 3A.8-3a: Require the Project Applicant(s) to Cooperate with Aerojet and Regulatory Agencies to Preserve, Modify, or Close Existing Groundwater Monitoring Wells.

The project applicant(s) for all project phase(s) that would occur in or adjacent to the Area 40 boundary shall submit copies of tentative maps for residential subdivisions and for nonresidential uses to Aerojet, DTSC, and the Central Valley RWQCB or any successor in interest for review and approval. Aerojet, DTSC, and the Central Valley RWQCB or any successor shall work with the project applicant(s) to establish the preservation, modification, or closure of existing groundwater monitoring wells. If necessary, Aerojet, or any successor may purchase lots from the project applicant(s) to maintain access to monitoring wells. Development shall not proceed within the Area 40 boundary or on lands used for groundwater monitoring and other remediation activities until DTSC and the Central Valley RWQCB have approved Aerojet's or a successor's plan for well preservation, modification, or closure.

The project applicant(s) for activities related to the off-site detention basin located outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) with Sacramento County.

Implementation: Project applicants(s) for activities that would occur in the Area 40 boundary or on areas used for groundwater monitoring and other remediation activities.

Timing: Ongoing to the satisfaction of DTSC and the Central Valley RWQCB.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.8-3b: Coordinate Development Activities to Avoid Interference with Remediation Activities.

The project applicant(s) for all project phases that would occur in or adjacent to the Area 40 boundary shall provide notice to Aerojet or any successor in interest and DTSC, the Central Valley RWQCB, and the City of Folsom of the location, nature, and duration of construction activities least 30 days before construction activities begin in areas on or near property with current or planned remediation activities (Area 40). Remedial actions, as required by DTSC, RWQCB, and/or the EPA, may include, but are not limited to:

- deed restrictions on land and groundwater use;
- requirements for building ventilation, heating, and air conditioning design;
- monitoring;
- installation of vertical barriers;
- biological, chemical, and/or physical treatment;
- extraction, and/or
- pump and treat activities.

Before the approval of grading plans which include areas within the Area 40 boundary or the off-site detention basin, the project applicant(s) shall work with Aerojet, DTSC, and the Central Valley RWQCB or any successor to schedule the timing of construction activities to prevent potential conflicts with remediation activities.

The project applicant(s) for activities related to the off-site detention basin located outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) with Sacramento County.

Implementation: Project applicant(s) for activities within the Area 40 boundary or on lands used for monitoring or other remediation-related activities.

Timing: Before the approval of grading plans and during construction activities within the Area 40 boundary, off-site detention basin, or on lands used for monitoring or other remediation-related activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

3. California Department of Toxic Substances Control, Central Valley Regional Water Quality Control Board, Aerojet General Corporation, as appropriate.

Mitigation Measure 3A.8-3c: Provide Written Notification to the City that DTSC-Required Notification Obligations and/or Easements Have Been Fulfilled to Ensure that Construction Activities Do Not Interfere with Remedial Actions.

Pursuant to its oversight over investigations of hazardous substances and determination of remedial action, DTSC establishes, as appropriate, deed restrictions (e.g., restrictions on future groundwater uses or future land uses) or easements (e.g., continued access to groundwater wells and pipelines) on property with associated notice requirements. The project applicant(s) for all such affected project activities, located within the Area 40 boundary, the off-site detention basin, or lands subject to monitoring or other remediation activities shall provide notification in writing to the City (or Sacramento County for the off-site detention basin) that said required DTSC notification obligations have been fulfilled. Evidence of the method of notification required by DTSC shall be submitted to the City before approval of tentative maps or improvement plans.

The project applicant(s) for such affected project activities shall coordinate with the City to include this provision as part of tentative map approval within the Area 40 boundary or lands subject to monitoring or other remediation activities. The project applicant(s) shall coordinate with Sacramento County for such affected project activities pertaining to the off-site detention basin.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County).

Implementation: Project applicant(s) for activities that would occur in the Area 40 boundary or on areas used for groundwater monitoring and other remediation activities.

Timing: Before approval of final maps and/or issuance of permits for sales trailers and model homes within the Area 40 boundary, the off-site detention basin, or lands subject to monitoring or other remediation activities.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Implementation of Mitigation Measures 3A.8-3a, 3A.8-3b, and 3A.8-3c would reduce significant potential development constraints due to site listing on the Cortese List under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because remediation activities, implementation of deed restrictions, and other actions required prior to implementation of the project would be required by DTSC and other agencies as part of the Superfund investigation and remediation activities. However, the off-site detention basin falls under the jurisdiction of Sacramento County; therefore, neither the City nor the project applicant(s) would have control over its timing or implementation.

IMPACT 3A.8-4 Potential Interference with an Adopted Emergency Response or Emergency Evacuation Plan. *Development of the SPA could interfere with adopted emergency plans.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. The construction of these residences would not result in substantial volumes of construction that would substantially increase traffic on existing roadways. Furthermore, no off-site water facilities would be constructed. Therefore, this alternative would not conflict with any adopted emergency response or evacuation plans. **Direct** impacts would be **less than significant. No indirect** impacts would occur. ***[Similar]***

NCP, PP, RIM, CD, RHD

Implementation of the project would require permits from the City of Folsom to ensure that the project provides sufficient hydrant locations, street width, circulation, and project access for fire and emergency response units. Implementation of the project would not conflict with any adopted emergency response or evacuation plans. Furthermore, the circulation plans for the Proposed Project and the other four action alternatives would include sufficient ingress and egress routes to ensure public safety in the event to an emergency. Finally, the Proposed Project and the other four action alternatives would be subject to the Sacramento County MHMP. Therefore, direct impacts would be **less than significant. No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.8-5 Potential for Blast-Related Injury to Construction Workers and the General Public. *Development in the SPA would entail the use of explosive materials as part of grading activities in the eastern portion of the SPA that could result in injury to construction workers and the general public.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, up to 44 individual dwelling units could be constructed in the SPA, although no off-site water facilities would be constructed. As part of the construction of individual dwelling units or agricultural operations at the site, blasting could occur as part of excavation and removal of rock from the eastern slopes of the SPA. Blasting entails the placement of explosive materials into a borehole, which is then ignited. The subsequent explosion generates air blasts and seismic waves that fracture the surrounding rock. Reasonably foreseeable accidents associated with blasting include accidental discharge and expulsion of materials beyond the expected distance (i.e., flyrock).

OSHA's Construction Safety and Health Outreach Program sets standards for blaster qualifications, transportation, storage, and loading, execution, and post-explosion requirements. However, accidental discharge or materials or production of flyrock remains possible. Sources of electricity, including radio towers and power lines, are located within the eastern slopes and could cause injury or fatalities to construction workers or the general public. Therefore, **direct** impacts associated with blasting activities are considered to be **potentially significant**. There would be **no indirect** impacts. ***[Similar]***

Blasting may be required for excavation and removal of rock from the eastern slopes of the SPA. Blasting entails the placement of explosive materials into a borehole, which is then ignited. The subsequent explosion generates air blasts and seismic waves that fracture the surrounding rock. Generally, explosives used for construction purposes consist of ammonium nitrate and fuel oil (Centers for Disease Control and Prevention [CDC] 2004). Reasonably foreseeable accidents associated with blasting include accidental discharge and expulsion of materials beyond the expected distance (i.e., flyrock).

Explosive materials are ignited from sources of energy. During construction-related blasting activities, materials are ignited from the controlled used of electricity. Accidental discharge of explosive materials can also occur from extraneous sources of electricity. Sources of electricity within the SPA include power lines, radio transmitters, and electrical storms. Depending on the amount of material and method of storage, the size and extent of an accidental discharge could cause extensive destruction. Injuries and fatalities could result from the initial explosion and/or secondary effects such as fires and flyrock.

Flyrock is a potential hazard from blasting that could occur under accidental and planned ignition. Flyrock is defined as mud, water, or fragments of rock that accidently travel outside of the expected blast area. Creation of flyrock can be the result of many factors, including anomalies in the geology and rock structure, poor communication, and incorrect blast hole layout and loading (CDC 2004). Blasting-induced flyrock can travel up to one-half mile at a rate of 400 miles per hour (recorded at 200 feet from the blast site) (CDC 2008). There are numerous documented cases of flyrock causing bodily harm to construction workers and the general public, sometimes leading to fatalities (CDC 2004).

Section 12101 through 12103 of the California Health and Safety Code describe permit requirements for manufacturing, possession, transportation, and use of explosives, which would apply to blasting activities in the SPA, and these permits must be issued or endorsed by the jurisdiction in which blasting would take place.

OSHA's Construction Safety and Health Outreach Program sets standards for blaster qualifications, transportation, storage, and loading, execution, and post-explosion requirements. However, accidental discharge or materials or production of flyrock remains possible. Sources of electricity, including radio towers and power lines, are located within the eastern slopes and could cause injury or fatalities to construction workers or the general public. Therefore, **direct** impacts associated with blasting activities are considered to be **potentially significant**. There would be **no indirect** impacts. ***[Similar]***

Mitigation Measure 3A.8-5: Prepare and Implement a Blasting Safety Plan in Consultation with a Qualified Blaster.

To reduce the potential for accidental injury or death related to blasting, contractors whose work in the SPA will include blasting shall prepare and implement a blasting safety plan. This plan shall be created in coordination with a qualified blaster, as defined by the Construction Safety and Health Outreach Program, Subpart U, Section 1926.901, and distributed to all appropriate members of construction teams. The plan shall apply to project applicant(s) of all project phases in which blasting would be employed. The plan shall include, but is not limited to:

- storage locations that meet ATF standards contained in 27 CFR Part 55;
- safety requirements for workers (e.g., daily safety meetings, personal protective equipment);
- an accident management plan that considers misfires (i.e. explosive fails to detonate), unexpected ignition, and flyrock; and

- measures to protect surrounding property (e.g., netting, announcement of dates of expected blasting, barricades, and audible and visual warnings).

Upon completion of a blasting safety plan, the project applicant(s) shall secure any required permits from the City of Folsom Fire Department and the El Dorado County Sheriff's Department for blasting activities in Sacramento County and El Dorado County, respectively.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado County).

Implementation: Project applicant(s) and contractor(s) of all project phases in which blasting would be employed.

Timing: At the submission of tentative map applications.

Monitoring:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Fire Department.
2. For the off-site roadway connections in El Dorado County: El Dorado County Sheriff's Department.

Implementation of Mitigation Measure 3A.8-5 would reduce potential impacts related to blasting activities because a blasting safety plan would be prepared and implemented that would include protection measures for construction workers and the general public, and the proper permits would be secured by the project applicant(s) of all affected project phases. Because these actions would substantially diminish the probability of accidents involving the production of flyrock and accidental ignition, this impact would be reduced to a **less-than-significant** level. However, some of the off-site elements (two roadway connections) fall under the jurisdiction of El Dorado County; therefore, neither the City nor the project applicant(s) would have control over its timing or implementation.

IMPACT 3A.8-6 Possible Exposure of People to Electric and Magnetic Fields. *Residential developments and/or schools would be located near high voltage transmission lines and radio towers, which could expose the general public to EMFs.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. The SPA is traversed by two 230-kV, one 115 kV, and one 69-kV electrical transmission lines on steel lattice towers. The 80-acre minimum lot size under the existing designation would result in large individual parcels; a standard, 40-acre parcel would be 1,320 feet on a side. These large parcels would permit siting of individual residential units more than 200 feet from any electrical transmission line, although it is possible that individual property owners would choose not to do so. Futhermore, no off-site water facilities would be constructed. This **direct** impact would be **less than significant. No indirect** impact would occur. ***[Lesser]***

The SPA is traversed by two 230-kV, one 115 kV, and one 69-kV electrical transmission lines on steel lattice towers within a single 400-foot-wide right-of-way, with lines spread throughout the easement to approximately 50 feet from the edges of the right-of-way. Under the Proposed Project and the other four action alternatives, the transmission line easement would be developed into open space, which would be approximately 400 feet wide. Additional 69-kV transmission lines extend westward from this right-of-way towards Prairie City Road, and a 69-kV transmission line dead-ends in the SPA just east of Placerville Road. (Capitol Utility Specialists 2009.)

Common utility line setbacks generally incorporate a distance of approximately 50 feet on each side of the high-tension power lines; the open space area in the SPA would be 400 feet wide because three separate lines are present. California does not require additional housing setback requirements from electrical transmission lines that would take into account the generation of EMFs. However, ongoing research shows that once emitted from the source, an EMF dissipates rapidly in a circular pattern and weakens with distance from the emitting source. For instance, at a distance of 200 feet from a 230 kV line, the EMF drops to a level of 1.8 mG (NIEHS 2002).

A few organizations have taken active steps to limit exposure to EMFs, while other organizations have issued guidelines to reduce EMF exposure. For example, the National Association of Certified Home Inspectors cites the Office of Technology Assessment of the U.S. Congress, which recommends a policy of "prudent avoidance" with respect to EMFs. "Prudent avoidance" means to measure fields, determine the sources, and act to reduce exposure. The National Association of Certified Home Inspectors suggests that exposure to EMFs should be limited to 2.5 mG or less. CDE has taken the position that K–12 schools may not be constructed within 150 feet of an easement for a 230-kV transmission line (approximately 200 feet from the power line itself). This effectively reduces school-site exposures to 2 mG or less. Since new schools constructed on the project site would require CDE approval, no schools could be constructed within 150 feet of a 230-kV transmission line easement, and no school-site exposures in excess of 2 mG would occur.

Under the Proposed Project and action alternatives, residential developments are planned adjacent to the 400-foot-wide easement, which could place houses within 200 feet of the 230-kV transmission line and within 150 feet of a 69 kV or 115 kV transmission line.

The radio towers located in the eastern portion of the SPA are registered with the FCC, and must conform with rules and regulations involving exposure of the general public to EMFs. Tower operators must comply with Federal regulations for continued registration of these radio towers. By complying with the FCC's safety standards, the general public would not be exposed to unacceptable EMF levels from the towers.

Because the Proposed Project and the four action alternatives would not provide at least 200 feet of separation between 230-kV transmission lines (and 150 feet of separation between any 69 kV or 115 kV transmission lines) and any residential developments, the **direct** impact of exposure of the general public to EMFs would be **potentially significant**. There would be **no indirect** impacts. ***[Similar]***

Mitigation Measure 3A.8-6: Prudent Avoidance and Notification of EMF Exposure.

A policy of "prudent avoidance" to EMF exposure shall be incorporated into planning activities for residential developments near the transmission lines, which shall include consideration of up-to-date information on potential hazards of EMF, especially information from the California Public Utilities Commission.

In addition, potential purchasers of properties near the transmission lines shall be made aware of the controversy surrounding EMF exposure. The California Department of Real Estate shall be requested to insert an appropriate disclosure statement into the applicant's final Subdivision Public Report application,

which shall be provided to purchasers of properties within 100 feet from the 100-115kV power line easement, or within 150 feet from the 220-230 kV power line easement.

Implementation: Project applicant(s) of all project phases in the vicinity of high-tension transmission lines.

Timing: At the submission of tentative map applications.

Enforcement: 1. City of Folsom Community Development Department.

2. Folsom Cordova Unified School District.

Implementation of Mitigation Measure 3A.8-6 would reduce the potentially significant impact related to adverse health effects from the possible exposure to EMFs to a **less-than-significant** level because prudent avoidance of high tension power lines would result in residential housing being relocated where possible, and disclosure would be required for any residences which were less than 200 feet from the 230-kV transmission line and 150 feet from the 69-kV and 115-kV transmission lines.

Off-Site Elements

NCP, PP, RIM, CD, RHD

The off-site elements would not include construction of sensitive land uses that could be affected by EMFs. Therefore, **no direct** or **indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.8-7 Potential for Public Health Hazards from Mosquitoes Associated with Project Water Features. *Project implementation would include construction of 16 on-site detention basins and 1 off-site detention basin, which could attract mosquitoes and other waterborne vectors, thereby potentially creating a public health hazard.*

On-Site Elements

NP

Under the No Project Alternative, no new detention facilities or off-site water facilities would be constructed, resulting in no increase in mosquito habitat. In addition, potential development of up to 44 rural residences under the existing AG-80 zoning would not result in a concentration of a large new human population in close proximity to mosquito habitat; thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

The Sacramento-Yolo Mosquito and Vector Control District recognizes a variety of stormwater-related structures to be common mosquito development sites. Implementation of the Proposed Project and the four action alternatives includes a variety of features that are considered to be mosquito attractants, including 16 detention basins, storm drains, and roadside ditches. Typical stormwater facilities create habitat for mosquitoes that are attracted to above-ground, clean water sources, and underground, polluted (nutrient rich) sources. Because stormwater infrastructure would be located in close proximity to proposed development, diseases, such as West Nile Virus, could be easily spread within the population through mosquito vectors (Sacramento-Yolo Mosquito and Vector Control District 2008).

To reduce the threat from mosquito-borne threats to human health, the District maintains a best management practices manual (Sacramento-Yolo Mosquito and Vector Control District 2008). This manual details preventive measures to reduce mosquito populations, production rates, or the timing of mosquito hatching. However, the project does not incorporate BMPs that would control mosquitoes. Because the potential for mosquito-borne health hazards would occur with development of the project and the project currently does not include any mosquito prevention BMPs, this **direct** impact would be **potentially significant**. **No indirect** impacts would occur ***[Similar].***

Mitigation Measure 3A.8-7: Prepare and Implement a Vector Control Plan in Consultation with the Sacramento-Yolo Mosquito and Vector Control District.

To ensure that operation and design of the stormwater system, including multiple planned detention basins, is consistent with the recommendations of the Sacramento-Yolo Mosquito and Vector Control District regarding mosquito control, the project applicant(s) of all project phases shall prepare and implement a Vector Control Plan. This plan shall be prepared in coordination with the Sacramento-Yolo Mosquito and Vector Control District and shall be submitted to the City for approval before issuance of the grading permit for the detention basins under the City's jurisdiction. For the off-site detention basin, the plan shall be submitted to Sacramento County for approval before issuance of the grading permit for the off-site detention basin. The plan shall incorporate specific measures deemed sufficient by the City to minimize public health risks from mosquitoes, and as contained within the Sacramento-Yolo Mosquito and Vector Control District BMP Manual (Sacramento-Yolo Mosquito and Vector Control District 2008). The plan shall include, but is not limited to, the following components:

- Description of the project.
- Description of detention basins and all water features and facilities that would control on-site water levels.
- Goals of the plan.
- Description of the water management elements and features that would be implemented, including:
    - BMPs that would implemented on-site;
    - public education and awareness;
    - sanitary methods used (e.g., disposal of garbage);
    - mosquito control methods used (e.g., fluctuating water levels, biological agents, pesticides, larvacides, circulating water); and
    - stormwater management (consistent with Stormwater Management Plan).
- Long-term maintenance of the detention basins and all related facilities (e.g., specific ongoing enforceable conditions or maintenance by a homeowner's association).

  To reduce the potential for mosquitoes to reproduce in the detention basins, the project applicant(s) shall coordinate with the Sacramento-Yolo Mosquito and Vector Control District to identify and implement BMPs based on their potential effectiveness for SPA conditions. Potential BMPs could include, but are not limited to, the following:

    - build shoreline perimeters as steep and uniform as practicable to discourage dense plant growth;

- perform routine maintenance to reduce emergent plant densities to facilitate the ability of mosquito predators (i.e., fish) to move throughout vegetated area;

- design distribution piping and containment basins with adequate slopes to drain fully and prevent standing water. The design slope should take into consideration buildup of sediment between maintenance periods. Compaction during grading may also be needed to avoid slumping and settling;

- coordinate cleaning of catch basins, drop inlets, or storm drains with mosquito treatment operations;

- enforce the prompt removal of silt screens installed during construction when no longer needed to protect water quality;

- if the sump, vault, or basin is sealed against mosquitoes, with the exception of the inlet and outlet, submerge the inlet and outlet completely to reduce the available surface area of water for mosquito egg–laying (female mosquitoes can fly through pipes); and

- design structures with the appropriate pumping, piping, valves, or other necessary equipment to allow for easy dewatering of the unit if necessary (Sacramento Yolo Mosquito and Vector Control District 2008).

The project applicant(s) of the project phase containing the off-site detention basin shall coordinate mitigation for the off-site with the affected oversight agency (i.e., Sacramento County).

Implementation: Project applicant(s) of all project phases containing water features.

Timing: Before issuance of grading permits for the project water features.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site detention basin west of Prairie City Road: Sacramento-Yolo Mosquito and Vector Control District.

Implementation of Mitigation Measure 3A.8-7 would reduce significant impacts related to potential public health hazards from mosquitoes under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because a site plan, which would require identification of remediation activities, implementation of BMPs to reduce mosquito breeding habitats, and coordination with the District to ensure that mosquito attractants are avoided to the extent possible, would be developed and implemented. However, the off-site detention basin would fall under the jurisdiction of Sacramento County; therefore, neither the City nor the project applicant(s) would have control over its timing or implementation.

3A.8.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of mitigation measures contained in this section would reduce all impacts to a less-than-significant level for the Proposed Project and all action alternatives. Therefore, project implementation would not result in any residual significant impacts related to hazards and hazardous materials. However, some of the off-site elements (two roadway connections in El Dorado County and detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these off-site

elements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of El Dorado and Sacramento Counties, Impacts 3A.8-2, 3A.8-3, 3A.8-5, and 3A.8-7 are considered potentially significant and unavoidable for off-site improvements that would be located in Sacramento or El Dorado County jurisdiction.

This section was prepared by RMC Water and Environment.

3B.8 HAZARDS AND HAZARDOUS MATERIALS – WATER

3B.8.1 AFFECTED ENVIRONMENT

As provided in Chapter 2, "Alternatives," the placement of new structural facilities as part of the Off-site Water Facility Alternatives would be limited to Zone 4 of the "Water" Study Area and, therefore, the description of the affected environment for hazards and hazardous materials is focused to Zone 4. No new facilities are proposed within Zones 1, 2, and 3 and, therefore, no additional description of Zones 1, 2, and 3 is necessary to support the analysis of potential impacts to hazards and hazardous materials.

A material is considered hazardous if it appears on a list of hazardous materials prepared by a Federal, state, or local agency, or if it has characteristics defined as hazardous by such an agency. Title 22 of the CCR defines a hazardous material as:

> A substance that, because of physical or chemical properties, quantity, concentration, or other characteristics, may either (1) cause an increase in mortality or an increase in serious, irreversible, or incapacitating illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported or disposed of, or otherwise managed" (CCR, Title 22, Division 4.5, Chapter 10, Article 2, Section 66260.10).

Hazardous wastes are defined in the same manner. Hazardous wastes are hazardous materials that no longer have practical use, such as substances that have been discarded, discharged, spilled, contaminated, or are being stored prior to proper disposal. According to Title 22 of the CCR, hazardous materials and hazardous wastes are classified according to four properties: toxic, ignitable, corrosive, and reactive (CCR, Title 22, Chapter 11, Article 3). Toxicity, ignitability, corrosivity, and reactivity are defined in the CCR, Title 22, Sections 66261.20 through 66261.24, as summarized below:

- Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or death. For example, toxic substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels that depend on the substances in question. Carcinogens (substances known to cause cancer) are a special class of toxic substances (e.g., pesticides, heavy metal ions).

- Ignitable substances (e.g., gasoline and methane gas) are hazardous because of their ability to burn.

- Corrosive materials (e.g., chlorine gas, sulfur dioxide gas, and strong acids and bases) can cause severe burns or damage materials.

- Reactive materials (e.g., dynamite and pressurized gases) may cause explosions or generate toxic gases.

Toxic, ignitable, corrosive, and reactive materials are types of hazardous materials. A chemical that poses a significant hazard upon a single exposure is considered acutely hazardous if it is so designated by a regulatory agency (California Health and Safety Code, Section 25531). A hazardous waste is any hazardous material that is discarded, abandoned, or to be recycled. The criteria that render a material hazardous also make a waste hazardous (California Health and Safety Code, Section 25117).

Factors that influence the health effects of exposure to a hazardous material include the dose to which the person is exposed, the frequency of exposure, the exposure pathway, and individual susceptibility.

HAZARDS AND HAZARDOUS MATERIAL DATABASE SEARCH

Agency Database Search

As part of this EIR/EIS, the City completed an agency database search to identify known areas containing hazardous materials or waste within portions of Zone 4 of the "Water" Study Area where ground disturbance is proposed as part of the Off-site Water Facility Alternatives. The Federal database search included a review of the U.S. Environmental Protection Agency's (EPA) National Priorities List (NPL), EPA's Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS), EPA's Resource Conservation and Recovery Act (RCRA) Information System, and EPA's Emergency Response Notification System (ERNS) database. Additionally, the review included various state hazardous material databases including, but not limited to, Office of Environmental Health Hazard Assessment's (OEHHA) Hazardous Waste and Substances List (Cal SITES), the RWQCB Central Valley Tank Tracking System database, and the Cal-EPA's Active Annual Workplan Sites list.

A review of these databases identified numerous sites within 1/4 mile of the alternative alignments and WTP facilities (TrackInfo Services 2008). Table 3B.8-1 provides more detailed information for each of the Off-site Water Facility Alternatives. Of all the sites identified, two are listed on the National Priorities List (NPL) for groundwater contamination associated with past operations at the Aerojet Property and Mather Airport, respectively (TrackInfo Services 2008). These regional sources of groundwater contamination are discussed in more detail in Section 3B.9, "Hydrology and Water Quality – Water." Additionally, the database search revealed the presence of several solid waste handling facilities, leaking underground storage tanks, and registered above or underground storage tanks (AST/USTs) located within Zone 4 of the "Water" Study Area. A complete summary of the database search is provided in Appendix M-VII. The complete Database Report covering each of the Off-site Water Facility Alternatives can be reviewed at the City's Community Development Department office at 50 Natoma Street in Folsom during business hours.

Table 3B.8-1
Hazardous Materials Database Search Results – Zone 4 of the Off-site Water Facility Study Area

Alternative	Number of Site(s) Within ¼ Mile						
	NPL	RCRA	Cal SITES	LUST	ERNS	AST/UST	SWL
Proposed Off-site Water Facility Alternative	1	--	--	1	1	1	2
Off-site Water Facility Alternative 1	1	--	--	1	1	1	2
Off-site Water Facility Alternative 1A	1	--	--	1	1	1	2
Off-site Water Facility Alternative 2	2	12	1	--	3	6	2
Off-site Water Facility Alternative 2A	2	12	1	--	3	6	2
Off-site Water Facility Alternative 2B	1	3	1	--	1	1	0

Aerojet Superfund Site and Landfill

A detailed description of the Aerojet Superfund site, listed on the NPL, is provided in Sections 3A.8, "Hazards and Hazardous Materials – Land," of this EIR/EIS. In the mid-1960s, Aerojet developed a landfill to dispose of non-hazardous waste (office waste and construction debris) and a small amount of asbestos waste. The landfill is located on a 234-acre parcel within the Aerojet property. More specially, the landfill is situated on the north side of Aerojet Road south of U.S. 50 and west of Prairie City Road. The treated-water pipeline alignment under Off-site Water Facility Alternative 4 and 4A would be constructed just to the north of the existing landfill. Aerojet has proposed removal and clean closure of the landfill and has completed a Closure Modification Plan (Sacramento County 2008a). Sacramento County prepared a Mitigated Negative Declaration to implement the removal and clean closure of the landfill.

Kiefer Landfill

Kiefer Landfill is located east of the intersection of Kiefer Road and Grant Line Road. The Kiefer Landfill is classified as a "major landfill," which is defined as a facility that receives more than 50,000 tons of solid waste per year. The landfill is over a quarter mile to the east of the Proposed Off-site Water Facility Alternative conveyance pipeline alignment.

Underground Storage Tanks

No underground storage tanks are known to exist at the two WTP sites under consideration. One documented leaking underground storage tank (LUST) is identified along the Off-site Water Facility Alternatives 1, 1A, 4, and 4A alignments; the specific location of these sites are provided in Appendix M-VII. No other LUST locations are identified within Zone 4 of the "Water" Study Area.

Past Agricultural Uses within Zone of the "Water" Study Area

The agricultural history of Zone 4 of the "Water" Study Area consists of rural residential and fallow land, hay crop, and grazing land. Given this agricultural history, surficial soils are unlikely to contain any significant residual concentrations of persistent pesticides based on the historic land use of the site. Hay cropland, dry-farmed grain sites, grazing and fallow lands, as well as hobbyist-size (homestead) orchards typically do not require applications of environmentally persistent pesticides.

High-Pressured Natural Gas Pipelines

Pacific Gas and Electric Company (PG&E) distributes natural gas to urban centers within the "Water" Study Area. There are high pressure natural gas pipelines housed within major thoroughfares that run parallel and cross the Off-site Water Facility Alternative alignments. Specific roadways containing high-pressured natural gas pipelines include Sunrise Boulevard, Folsom Boulevard, Douglas Road, and Florin Road.

Serpentine Rock/Asbestos

Sacramento County's geology is generally associated with alluvial processes and not an asbestos-bearing geologic formation, such as that identified in the Bear Mountain Fault Zone east of the Sacramento County. Based on maps produced by the California Geological Survey, Zone 4 of the "Water" Study Area does not intersect with an asbestos-containing geologic formation (Churchill et al., 2000).

Radon Potential

Radon isotope-22 is a colorless, odorless, tasteless radioactive gas that is a natural decay product of uranium. Uranium and radon are present in varying amounts in rocks and soil, and radon is present in background concentrations in the atmosphere. Current evidence indicates that increased lung cancer risk is directly related to

radon-decay products. At this time, the EPA has recommended an "action" level for indoor radon concentrations at or exceeding 4 pico-curies per liter of air (pCi/l). Because the Off-site Water Facility Alternatives would not include structures for human habitation, this issue is not discussed further.

Wildland Fires

Zone 4 of the "Water" Study Area includes urbanized areas, urbanizing rural areas, and rural agricultural areas. Based on fire severity zone maps prepared by the California Department of Forestry and Fire Protection, Zone 4 of the Off-site Water Facility Study Area is located within a Local Responsibility Area (LRA) and within a moderate fire hazard severity zone (FRAP 2008). Given that the Off-site Water Facility Alternatives would involve the use of construction equipment in close proximity to areas containing large quantities of fuels (e.g., dry grasslands), this issue is discussed further in this EIR/EIS.

Public/Private Airports

The "Water" Study Area is situated to the south and east of the Planning Area boundary of the Airport Land Use Plan (ALUP) for Mather Field. The Off-site Water Facility Alternatives would not involve the erection of any structures within the ALUP planning area that could interfere with existing air traffic patterns or place sensitive land uses (e.g., single-family residential) within a flight hazard zone. For these reasons, no additional discussion of this issue is provided.

DRINKING WATER QUALITY AND PUBLIC HEALTH

Contaminants in drinking water can be benign or harmful to human health, depending on their chemical properties and the concentrations at which they are present. Many contaminants that present a known adverse risk to public health in drinking water are regulated at the Federal and state levels. There are many other contaminants without drinking water regulations, and the EPA has ongoing studies of certain contaminants to determine if health standards for them are warranted in the future (EPA 2001). However, the total removal of harmful contaminants from sources of drinking water normally is infeasible or impossible (EPA 2001).

The ability to detect trace levels of contaminants is improving with the advancement of analytical techniques. At this time, most contaminants are measured at the parts-per-million (ppm) level, However, the scientific community is discovering and detecting more contaminants in drinking water supplies at trace amounts, often at the parts-per-billion (ppb) or parts-per-trillion (ppt) level. Many of these contaminants are a result of a combination of agricultural, municipal wastewater, urban runoff, and industrial sources. Quantifying the threat posed to a population by any single contaminant (a health risk assessment) relies on substantial amounts of data from epidemiological and toxicological studies, and may take years, sometimes decades to develop.

Water Quality of the Sacramento River

Untreated water quality at the Bryte Bend WTP, located on the Sacramento River and approximately 8 miles upstream from the Freeport Project diversion is generally good, as indicated in Table 3B.9-2 in Section 3B.9, "Hydrology and Water Quality – Water" of this document. The untreated water routinely meets all municipal drinking water maximum concentration levels (MCLs), as established by Federal and state regulations, except for turbidity and odor. These latter constituents are reduced to below MCLs during water treatment. Sacramento River water is also expected to contain elevated bacterial counts, as is typical in a non-disinfected surface water source. Bacterial levels at the Bryte Bend WTP are reduced to acceptable levels during water treatment. No regulated volatile organic chemicals or synthetic organic chemicals were detected. For additional information about the water quality of the Sacramento River, refer to Section 3B.9, "Hydrology and Water Quality – Water."

Water Quality Parameters of Concern and Potential Treatment Solutions

Although Sacramento River water quality is generally good, the water may contain numerous contaminants pertinent to human health if used as a drinking water supply. This section summarizes known contaminant levels in Sacramento River water that may present potential health risks to end users within the City's service area. This section also summarizes the conventional drinking water treatment processes that would be needed to reduce specific contaminants or groups of contaminants. The following drinking water treatment processes are considered to be conventional: pH adjustment and disinfection; conventional sedimentation, filtration, pH adjustment, and disinfection for surface water. Other treatment processes required to treat certain contaminants, above and beyond these basic steps, are discussed later in this section.

Table 3B.9-2 in Section 3B.9, Hydrology and Water Quality – Water," shows the primary water quality constituents that may pose a public health threat if present at excessive levels, and their sources. The importance of each of these drinking water constituents is discussed further in this section.

Turbidity

Turbidity is a Measurement of the degree to which light is obstructed by substances in water. It is used as a surrogate Measurement for the concentration of particulate matter in water. Turbidity occurs in surface waters, and often spikes in concentration as a consequence of surface runoff from storm events.

Turbidity is a problem for treated water because high levels may shield microorganisms from disinfectants. To ensure adequate disinfection, turbidity of treated water must never exceed one turbidity unit (NTU), and may not exceed 0.3 NTU in at least 95% of daily samples in any month. Turbidity is also a secondary standard for aesthetic reasons, and is limited to 5 NTU in treated water.

Elevated turbidity levels require higher coagulant doses at WTPs and result in greater sludge production, with increased operating costs and potentially reduced treatment capacity.

Total Organic Carbon

Total Organic Carbon (TOC) occurs naturally in Sacramento River waters and groundwater, and is derived from plant, animal, and microorganism decomposition or excretion. TOC does not directly affect health, but instead combines with chlorine during the drinking water disinfection process, creating byproducts that are carcinogenic (Dunnick & Melnick 1993). These disinfection byproducts include trihalomethanes (THMs) and haloacetic acids (HAAs). While there is no specific maximum contaminant level (MCL) for TOC, EPA's Enhanced Surface Water Treatment Rule (ESWTR) requires that conventional WTPs remove a percentage of the TOC present in the water supply. The percentage required for removal varies, with higher TOC levels requiring higher removal percentages. Municipal WTPs with more than 4 mg/L TOC in their source water are required to utilize enhanced coagulation in their treatment process.

Trihalomethanes, specifically chloroform, bromodichloromethane, and dibromochloromethane, have been detected within treated Sacramento River water from the Bryte Bend WTP (see Table 3B.9-2). However, total trihalomethanes did not exceed the MCL of 80 µg/L.

TOC can also indirectly affect the formation of an inorganic disinfection by-product (DBP), bromate, at WTPs that utilize ozone and have sufficient levels of bromide in the source water. However, bromide concentrations in the Sacramento River average 18 µg/L (CALFED 2000), which is well below levels expected to form disinfection by-products (e.g., approximately 100 µg/L; Huang et al., 2003). Water treatment plants receiving water with higher TOC concentrations may require treatment process improvements or incur greater operating costs to produce water that provides an equivalent level of public health protection.

Nitrates

Nitrogen not used up by plants or returned to the atmosphere is converted to nitrate in the soil, which is highly soluble in water and can easily leach into the water table. Nitrates in drinking water supplies are commonly derived from agricultural chemicals such as inorganic fertilizer and animal manure, but are also released into the atmosphere by automobiles and industrial plants that burn fossil fuels. While some amount of nitrate is present within surface water from the Sacramento River, levels are typically much lower than groundwater, primarily because nitrates originate with agriculture and remain on land as water infiltrates, are very diluted if discharged to surface waters, or are naturally attenuated in surface waters. The Federal MCL for nitrate is 10 mg/L.

Typical water treatment processes for surface water do not remove nitrate. If nitrate is a significant concern (i.e., if it is above or approaching regulatory limits), ion exchange or granular activated carbon filtration may be required at a substantial cost.

Chromium-6

Chromium is a naturally occurring element found in soils. Chromium-6 can be found in the environment, or more commonly in waste generated by industries, such as metal finishing, dying, electronics, metallurgy, and others. Chromium-6 may also be found naturally in groundwater. Chromium-6 is a suspected carcinogen and is regulated as total chromium in drinking water, with an MCL of 50 µg/L. Health concerns have prompted the CDPH to pursue an MCL that is specific for chromium-6, and the process is currently underway. Sacramento River water does not contain chomium-6 levels high enough to affect public health.

Selenium

Naturally occurring selenium is released through both natural processes (selenium deposits within soils are regional) and anthropogenic activities. Used mainly in the electronics and glass industries, selenium is also added as a trace nutrient in phosphate fertilizers. Selenium is toxic at high concentrations, and is therefore regulated, with a state MCL of 50 ppb in drinking water. Sacramento River water does not contain selenium levels high enough to affect public health.

Mercury

Historic gold mining practices in the 1850's to 1880's released substantial amounts of mercury into California waterways. Some of this mercury was carried to downstream environments, while more leaked from the manmade recovery troughs into the soils, leaving a legacy of water quality contamination in many watersheds. It has been estimated that 1,000 tons of mercury were lost in the mining processes in the gold rush, mostly in the Sierra Nevada (Alpers 2005). Localized areas of high concentration still exist today, with drainage and runoff contributions causing over 20 water bodies to have fish consumption advisories. However, in the Sacramento River, in the vicinity of the proposed Off-site Water Facilities, mercury concentrations are within applicable water quality standards (see Table 3B.9-2).

Agriculture-Related Constituents

Agriculture in the Sacramento River watershed is common, with irrigated agriculture covering a total area greater than 2 million acres, and livestock operations with more than 570,000 cattle and calves. Drainage and runoff from agriculture can be a source of pesticides, TOC, Cryptosporidium spp. bacteria, and other compounds.

Agricultural pesticides are synthetic chemicals often used in large-scale agricultural applications. Due to the prevalence of agriculture within the Sacramento River watershed, there is potential for pesticide contamination of surface water and groundwater. Although pesticides are typically designed to target the function of only specific pests, they may still have a range of effects on human health. Because agricultural pests develop pesticide resistance over time, and because regulations have required discontinuation of specific pesticides, the suite of

pesticides applied by the farm industry changes over time. Potential effects to human health are therefore difficult to quantify, and the health effects of many newer pesticides remain largely unknown. Pesticides in natural waters are minimized with Best Management Practices and other regulatory and voluntary measures (EPA 2005).

Major pesticides and herbicides that have been detected in the Sacramento River watershed at trace concentrations include those listed below (Domagalski 2000). Some concentrations were so low that the analytical methods used could not definitively quantify the levels detected. Both sampling sites considered in compiling the following list were along the Sacramento River, near the Yolo Bypass.

- Thiobencarb
- Carbofuran
- Diazinon
- Dacthal
- Ethyl dipropylthiolocarbamate (EPTC)
- Malathion
- Metribuzin
- Napropamide
- Pronamide
- Trifluralin
- Carbaryl
- Metolachlor
- Simazine
- Historical pesticides that have been restricted or eliminated (e.g., DDT, molinate)

Annual monitoring at the Bryte Bend WTP checks for dozens of pesticides. Although some were detected at low levels, all were below MCLs (City of West Sacramento 2007 and 2008). Typical drinking water treatment practices do not target pesticides for removal. Activated carbon or reverse osmosis filters can be effective at removing most pesticides from water at moderate to high additional costs.

Industrial Organic Pollutants

Industrial wastes can contain a broad range of chemicals such as petroleum-based contaminants, solvents, dry cleaning chemicals, chlorinated hydrocarbons, and many others. These compounds occur at hazardous levels more frequently in groundwater, where they accumulate and spread as a result of industrial seepage and groundwater flow.

Industrial wastes are a concern in groundwater because they have been detected in various portions of the South American Subbasin. These compounds can be detrimental to human health, and may or may not be regulated as constituents in drinking water supplies. Surface waters may also be susceptible to contamination by industrial organic pollutants. Industrial organic pollutants however, have not been detected in the Sacramento River, as indicated by water quality sampling at the Bryte Bend WTP (City of West Sacramento 2007 and 2008).

Typical treatment processes do not remove industrial organic pollutants, but they can be removed through granular activated carbon filtration or reverse osmosis at a significant cost. A more common approach to reducing industrial organic pollutants from groundwater used for drinking water supply is to remove contaminated wells from service.

Urban Runoff Contaminants

Urban runoff consists of water that has drained from non-porous surfaces in densely populated areas. Any form of precipitation and/or irrigation can wash away materials from these impervious surfaces, since urban terrain is non-porous and does not have the ability to filter or biodegrade contaminants like natural soil. Suspended sediment is the primary pollutant in urban runoff, and may contain oil, grease, pesticides, road salts, metals, bacteria and

viruses, and toxic chemicals from automobiles. While urban runoff contaminants are likely to be present in Sacramento River water at trace concentrations, as indicated by water quality sampling at the Bryte Bend WTP (City of West Sacramento 2007 and 2008).

Urban Wastewater Effluent-Related Constituents

There are at least eight major urban areas upstream of the Freeport Project: Redding, Red Bluff, Chico, Oroville, Yuba City/Marysville, Woodland, Sacramento, and West Sacramento. These urban areas represent potential sources of treated wastewater effluent in the Sacramento River. All wastewater effluent discharged to surface waters is regulated by the Central Valley RWQCB and must be adequately treated and monitored to minimize impacts to the receiving water. Permits are renewed periodically to ensure that they remain protective in the face of changing knowledge and regulations. Therefore, for conventional toxic compounds, treated wastewater contributions to surface water do not typically present a risk to human health, especially when combined with the surface water treatment process prior to human consumption.

Many constituents, however, that are commonly found within treated wastewater effluent, including pharmaceuticals and personal care products (PPCPs) and endocrine disrupting compounds (EDCs) are still not regulated. Typical examples of these compounds found at trace levels in wastewater effluent include:

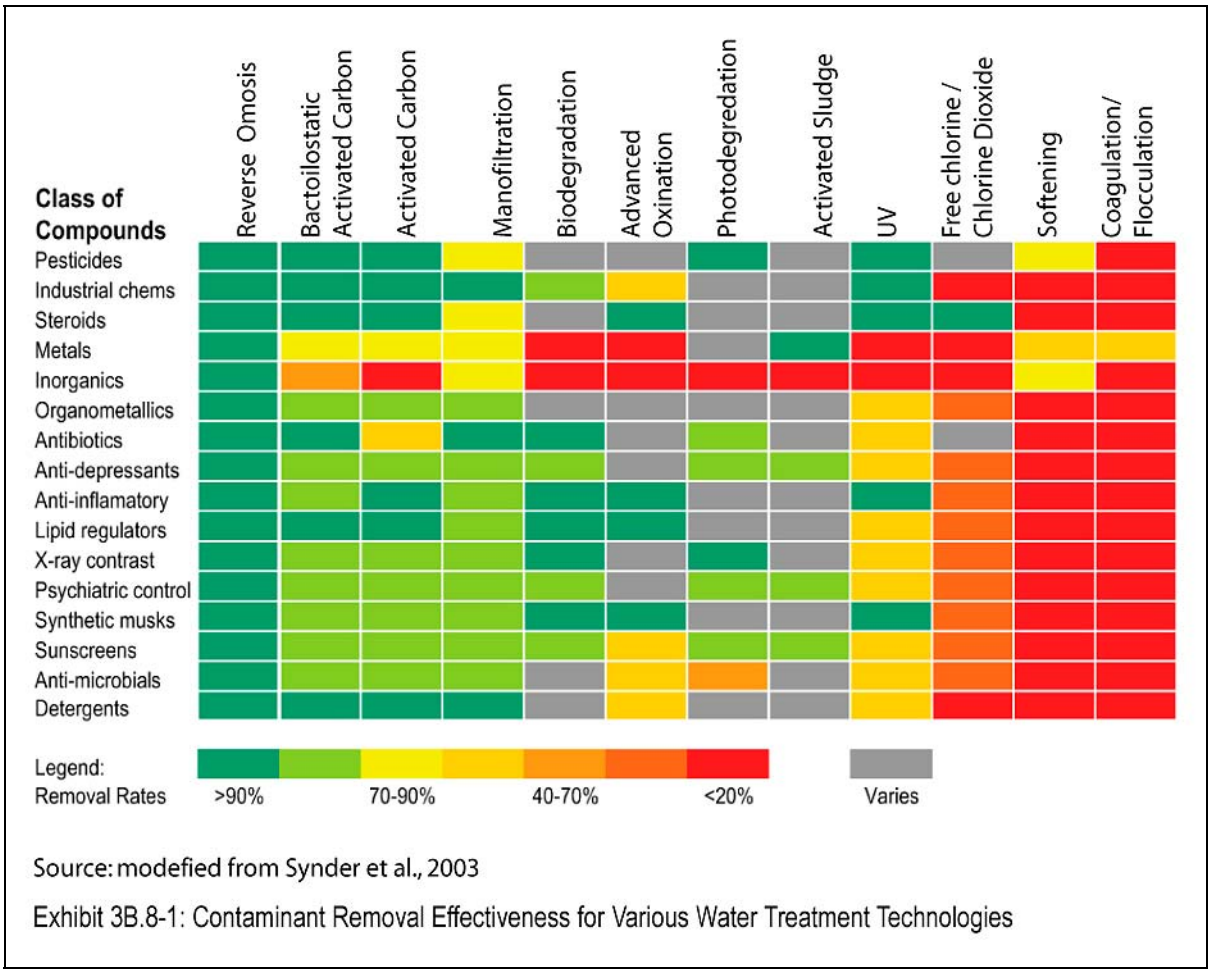
- veterinary and human antibiotics;
- prescription drugs (e.g., antacids, analgesics, antidepressants);
- nonprescription drugs (e.g., caffeine, acetaminophen);
- personal care products (e.g., fragrances, antioxidants);
- household products (e.g., solvents, disinfectants, detergents);
- industrial products in the household (e.g., plasticizers, fire retardants, insecticides); and
- steroids and hormones.

The USGS completed a water quality survey in 1999–2000 to study the levels of pharmaceuticals, hormones, and other organic wastewater contaminants in surface waters across the United States subject to the treated wastewater discharges of urban areas (Kolpin, et al., 2002). In this study, 95 compounds were analyzed, representing a wide range of compounds likely to be present in treated wastewater effluent, including those groups listed above. One of the sampling sites was on the Sacramento River, near the discharge from the Sacramento Regional Wastewater Treatment Plant located downstream of the Freeport Project diversion. Trace concentrations of three PPCPs (acetaminophen, cholesterol, and mestranol) were detected in the samples from the Sacramento River. The other 92 compounds tested were not detected at levels the USGS was capable of measuring. Concentrations of acetaminophen, cholesterol, and mestranol were very low, and would have required ingestion of 1,200 to over 5 million gallons of untreated wastewater to amount to the equivalent of a single dose of mestranol or acetaminophen, respectively.

Typical water treatment processes for surface water are not designed to remove EDCs and PPCPs, although some incidental removal does take place. To target their removal, reverse osmosis is considered the best available technology, but can only be implemented at a high cost.

Water Treatment Options for Water Pollutants

Exhibit 3B.8-1 below outlines potential treatment measures for several classes of compounds considered in this EIR/EIS. Typical water treatment processes may include pH adjustment, chlorine disinfection, sedimentation, and filtration. Of the treatments shown on Exhibit 3B.8-1, UV and Coagulation/Flocculation would be present at the WTP. Advanced technologies such as activated carbon filtration and reverse osmosis are generally not applied because of high cost.



Source: Modified from Synder et al., 2003

Contaminant Removal Effectiveness for Various Water Treatment Technologies **Exhibit 3B.8-1**

Hazardous materials presently used at the City's existing WTPs include those common to water treatment processes. The use of these hazardous materials would also be expected at the new WTP, if constructed. The Hazardous Material Management Plan (HMMP) for the WTPs lists all hazardous materials located and used on-site. Such materials include: Aluminum Sulfate, Aluminum Sulfate Acidized, Argon, Polymer, Diesel Fuel, Non Ionic Polymer, Sodium Ortho/Polyphosphate, Sodium Hydroxide, and Sodium Hypochlorite. Each of these materials is described in more detail below.

- **Aluminum Sulfate, or Liquid Alum** is used in the water and waste treatment industry, and the production of aluminum chemicals. Liquid Alum is generally used in soaps, greases, drugs, cosmetics, some food additives, and fire extinguisher compounds. Mist inhalation of Liquid Alum may irritate the nose, throat, and lungs. Ingestion of Liquid Alum may irritate the gastrointestinal tract and cause nausea, vomiting, and purging.

- **Argon Gas** is used in critical industrial processes such as the manufacturing of high quality stainless steels and production of impurity-free silicon crystals for semi-conductor manufacture. Argon is also used as an inert filler gas for light bulbs and as a dry, heavier-than-air-or-nitrogen filler for the space between glass panels in high-efficiency multi-pane windows. Inhalation of high concentrations of Argon gas may cause asphyxiation. Symptoms may include loss of mobility and consciousness.

- **Polymer (CAT-FLOC)** is a commercially available flocculating agent used in many settings because it is a highly effective polymer. It acts in much the same way that Alum does, except that it is faster. Water Polymer is made up of cations, and since most suspended particles are negatively charged, Cat-Floc neutralizes these negative-repulsive forces and allows the suspended particles to flocculate together (forming larger, denser particles) which settle more quickly. This agent creates a gel like web that, as it settles, traps small suspended particles, and forces them to settle with the gel. The primary routes of exposure to polymer are through the eyes and the skin. Prolonged contact may cause irritation in both the eyes and the skin. Ingestion and inhalation are not likely routes of exposure.

- **Diesel Fuel No. 2** is a colorless to brown liquid with a kerosene-like odor. Diesel is a central nervous system depressant. Chronic dermal exposure may result in dermatitis, erythema (reddening of the skin), and eczematous lesions. Diesel fuel causes an aspiration hazard if swallowed and can cause damage if it gets in the lungs. In addition to diesel fuel's health hazards it is highly flammable in the liquid and vapor form.

- **Non-ionic Polymer** is a flocculation and filter aid in the water treatment process. The primary routes of exposure are through the eyes and skin. Prolonged exposure may cause irritation to the eyes and the skin. Inhalation of non-ionic polymer can occur by breathing in the dust. Ingestion is not a likely route of exposure.

- **Sodium Ortho/Polyphosphate** is used in potable water and industrial water treatment for corrosion control, lead and copper control, scale control and sequestering. They are generally effective in the pH range of 6.0 to 8.5. Blends improve the range and reliability of phosphate based inhibitors and represent the most vigorous growth opportunities. Ingestion may cause irritation to the mouth and throat, or cause nausea and vomiting. Contact with the skin and eyes may also cause irritation. If inhaled irritation to the respiratory tract may occur.

- **Sodium Hydroxide or Caustic Soda Liquid** is used in industry to neutralize acids; to precipitate alkaloids; in metal finishing; in cleaners; and to precipitate most metals as hydroxides from aqueous solutions. Inhalation of mists may be severely irritating or corrosive to the nose, mouth, throat, and lungs. Exposure may cause burns to the respiratory tract with the production of lung edema, which can result in shortness of breath, sneezing, choking, chest pain, and impairment of lung function. Exposure to the skin or eyes may cause severe irritation or burns characterized by redness, swelling, and pain. Ingestion can cause severe irritation or burns to the entire gastrointestinal tract, including the stomach and intestines.

- **Sodium Hypochlorite or bleach** is used as a disinfectant in the treatment process. A major drawback to using chlorine gas or sodium hypochlorite, however in the disinfection process is that they react with organic compounds in the water to form potentially harmful levels of the chemical by-products THMs and HAAs, both of which are carcinogenic and regulated by the EPA. Mist inhalation can irritate the nose and throat. Chemical burns may result from exposure of the skin to sodium hypochlorite. In addition, exposure of the eyes can cause severe irritation. Ingestion may cause irritation, pain, and inflammation of the mouth and stomach, vomiting, shock, confusion, delirium, coma and in severe cases death.

3B.8.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to hazards and hazardous materials are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.8, "Hazards and Hazardous Materials – Land:"

- Hazardous Materials Handling Resource Conservation and Recovery Act (RCRA),
- Worker Safety Requirements,
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA),

- Superfund Amendments and Reauthorization Act,
- National Oil and Hazardous Substances Pollution Contingency Plan, and
- Clean Air Act.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following state plans, policies, regulations, and laws related to hazards and hazardous materials are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.8 "Hazards and Hazardous Materials – Land:"

- Hazardous Material Handling – California Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act);
- Worker Safety Requirements, California OSHA (Cal-OSHA);
- Hazardous Materials Transport, California Department of Transportation (Caltrans);
- Government Code Section 65962.5 (Cortese List);
- Asbestos Abatement, Sacramento Metropolitan Air Quality Management District, Rule 902; and
- California Public Resources Code Section 21151.4.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following regional and local plans, policies, regulations, and laws related to hazards and hazardous materials are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.8 "Hazards and Hazardous Materials – Land:"

- Sacramento County Multi-Hazard Mitigation Plan

Unified Hazardous Waste and Hazardous Management Regulatory Program

The Unified Hazardous Waste and Hazardous Management Regulatory Program (SB 1082, 1993) is a state and local effort to consolidate, coordinate, and make consistent existing programs regulating hazardous waste and hazardous materials management. Cal/EPA adopted implementing regulations for the Unified Program (CCR, Title 27, Division 1, Subdivision 4, Chapter 1) in January 1996. The Unified Program is implemented at the local level by Certified Unified Program Agencies (CUPAs).

Sacramento County General Plan

The Sacramento County General Plan Hazardous Materials Element (Sacramento County 1993) provides a hazardous materials policy plan to manage hazardous materials and minimize their effects on humans and the environment. The General Plan policies include measures to educate and inform the public about hazardous waste management, implement public health and safety programs, and coordinate with other agencies to enforce hazardous materials regulations. The General Plan also provides details on emergency response plans for responding to hazardous material spills and other emergency actions.

In addition to the County General Plan policies identified in Section 3A.8, "Hazards and Hazardous Materials – Land," the following General Plan policies, are relevant to the Off-site Water Facilities alternatives:

- **Policy SA-22:** The County shall require that all new development meets the local fire district standards for adequate water supply and pressure, fire hydrants, and access to structures by fire fighting equipment and personnel.

- **Policy SA-23:** The County shall require, unless it is deemed infeasible to do so, the use of mechanical vegetation control in lieu of burning or the use of chemicals in areas where hazards from natural cover must be eliminated, such as levees and vacant lots.

- **Policy SA-25:** During the Development Plan Review process, the County shall require, where appropriate, the use of fire resistant landscaping and building materials for new developments that are cost effective.

- **Policy SA-26:** The County shall require, to the maximum extent feasible, on-site fire suppression systems for all new commercial and industrial development to reduce the dependence on fire department equipment and personnel.

- **Policy SA-28:** The County shall continue its coordinative efforts, including evacuation planning, with service agencies, the cities within the County, and cities within surrounding counties.

Area Plan for Emergency Response to Hazardous Materials Incidents in Sacramento County

In 2003, the County adopted the Area Plan for Emergency Response to Hazardous Materials Incidents in Sacramento County (Sacramento County 2003). This plan provides information on the response protocol by governmental agencies and other response organizations in a hazardous materials incident and provides details on the hazardous materials response plans in the County.

Sacramento County Environmental Management Department

The Sacramento County Environmental Management Department (EMD) is responsible for enforcing state regulations governing hazardous waste generators, hazardous waste storage, hazardous waste disposal, and underground storage tanks. The Sacramento County Department of Waste Management and Recycling is responsible for implementing the County's solid waste management and recycling programs.

City of Rancho Cordova

Applicable policies of the City of Rancho Cordova's General Plan relating to hazards and hazardous materials are provided below.

- **Policy S.1.5:** The City shall require written confirmation from applicable local, regional, state, and federal agencies that known contaminated sites have been deemed remediated to a level appropriate for land uses proposed prior to the City approving site development or provide an approved remediation plan that demonstrates how contamination will be remediated prior to site occupancy. This documentation will specify the extent of development allowed on the remediated site as well as any special conditions and/or restrictions on future land uses.

- **Policy S.5.2:** Consider the potential impact of hazardous facilities on the public and/or adjacent or nearby properties posed by reasonably foreseeable events. The City considers an event to be "reasonably foreseeable" when the probability of the event occurring is greater than one in one million per year.

- **Policy S.5.3:** Regulate the storage of hazardous materials and waste consistent with State and Federal law.

- **Policy S.5.5:** Separate hazardous or toxic materials from the public.

- **Policy S.5.6:** Ensure that procedures are in place to reduce the chance of accidents in the transport of hazardous materials.

- **Policy S.9.1:** Cooperate with the Sacramento Metropolitan Fire District (SMFD) to reduce fire hazards, assist in fire suppression, and ensure efficient emergency medical response.

Drinking Water Regulations

Enhanced Surface Water Treatment Rule

The Enhanced Surface Water Treatment Rule (ESWTR) is an EPA regulation that protects against microbial organisms in drinking water, particularly Cryptosporidium, and health threats from disinfection by-products. This rule includes a set of requirements aimed at reducing effects from these threats. Specifically, the rules address acceptable limits for Cryptosporidium methods for reducing potential for presence of Cryptosporidium, and techniques to reduce risks associated with disinfection byproducts. Implementation of the Rule was required by January 1, 2002 (EPA 2007b).

California Department of Health Services' Drinking Water Program

The California Department of Public Health's (CDPH) Drinking Water Program regulates public water systems, provides permits for water treatment devices, certifies drinking water treatment and distribution operators, and supports and promotes water system security. CDPH enforces the California Safe Drinking Water Acts including field inspections of water systems, issuance of operating permits, reviewing plans and specifications for new facilities, taking enforcement actions for non-compliance, and reviewing water quality results.

Local

The Sacramento County Health and Human Services Department is responsible for implementing policies and procedures within Sacramento County related to drinking water quality. These include: (1) oversight of groundwater well construction and abandonment in order to prevent groundwater contamination, (2) water quality testing and regulation of procedures to remove coliform bacteria from public and private water supplies, (3) oversight of sewage disposal in order to prevent water contamination and the spread of disease, and underground/aboveground storage tank permitting, inspection, and compliance.

3B.8.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, an impact related to hazards and hazardous materials would be considered significant if the Off-site Water Facilities would:

- create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;

- create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment;

- create a significant public health risk through the introduction of contaminants to the drinking water supply at concentrations with known adverse effect;

- emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;

- be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;

- for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working the project area;

- for a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area;

- impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or

- expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands.

ANALYSIS METHODOLOGY

To evaluate the potential for encountering existing hazards and hazardous waste, this analysis used a combination of field reconnaissance of Zone 4 by RMC Water and Environment in November 2008, a review of aerial photographs for Zone 4, and a search of state and Federal databases TrackInfo Services (TrackInfo Services 2008). Site-specific documents used in the impact analysis are included in Appendix M-VII of this EIR/EIS. Issues related to existing hazards within the SPA, include the Island Operating Unit (OU) of the Aerojet Superfund site are discussed in Section 3A.8, "Hazards and Hazardous Materials – Land," of this EIR/EIS.

In order to evaluate the use of water supplies from the Sacramento River as a public drinking water supply and determine whether the use of this supply could result in a significant impact to public health, numerous surface water constituents were considered within this analysis. These include compounds for which primary or secondary MCLs have been established, total organic carbon, agriculture-related constituents including pesticides, industrial organic pollutants, chemicals derived from urban runoff, and endocrine disrupting compounds and pharmaceuticals/personal care products found in urban wastewater effluent.

Concentrations of regulated constituents from treated water from the Bryte Bend WTP in West Sacramento, located upstream of, but in the same vicinity of, the Off-site Water Facilities was compared to applicable drinking water standards. Until operation of the Freeport Project, West Sacramento's WTP raw and treated water provides the best characterization as to the quality of this surface water supply. For the purposes of this analysis, it was assumed that the Off-site Water Facilities WTP would operate similar to or better than the Bryte Bend WTP. This analysis also considers the potential for unregulated constituents to occur at levels relevant to human health within the proposed water supplies.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Safety Issues Related to Proximity to Airports—The Off-site Water Facilities would not involve the construction of habitable structures within an adopted ALUP or within two miles of a public airport or public use airport. Although NCMWC's service area includes lands within the Sacramento International Airport ALUP boundary, the Off-site Water Facility Alternatives would not involve physical changes to NCMWC's service area (or Zone 1 of the Off-site Water Facilities Study Area) and, therefore, would not increase or create new safety hazards for people residing or working the ALUP area. Similarly, Zone 4 of the "Water" Study Area is located to the south of the Mather Airfield and borders the southern portion of that airfield's ALUP area.

Only underground facilities (e.g., pipeline) would be installed within the vicinity of the ALUP. The locations of the two WTP under evaluation are both situated at distances of greater than 2 miles from the ALUP and, based on these findings, it is reasonable to conclude that all the Off-site Water Facility Alternatives would have no impacts on existing and future airport operations. For reasons identified above, the Off-site Water Facility Alternatives would not be expected to result in an increased or new safety hazard for people residing or working within the vicinity of a private airstrip. No impact is expected. Therefore, this issue area is not discussed further this EIR/EIS.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.8-1 **Accidental Spill from Routine Transport, Use, or Disposal of Hazardous Materials.** *Accidental spills of hazardous materials could result during routine transport, use, or disposal activities as part of the implementation of the Off-site Water Facility Alternatives.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

Construction of the Off-site Water Facilities would routinely involve the use of fuels, oils, and/or solvents, which could be accidentally spilled or released from containment. Such release could expose individuals and the environment to hazardous materials. During excavation and construction activities, it is anticipated that gasoline, diesel fuel, and hydraulic fluid would be handled on the construction site. Equipment fueling and maintenance requirements would likely use temporary aboveground bulk storage tanks as well as storage in sheds or trailers.

The potential for an accidental release exists during handling and transfer of these materials. If a significant spill were to occur, the accidental release could pose a hazard both to construction employees and the environment, depending on the relative hazard of the material released. Although typical construction management practices limit and often eliminate the impact of such accidental releases, there is a possibility of a spill or a release with the temporary on-site storage of hazardous materials. Therefore, construction-related **direct** and **indirect** impacts are considered **potentially significant**. ***[Similar]***

Operation of the proposed WTP would involve routine transport, use, or disposal of hazardous or potentially hazardous materials. The materials described in the setting discussion would be utilized at the WTP to help remove suspended solids, control and adjust pH, and disinfect untreated surface water, in order to consistently achieve mandated drinking water limitations (primary and secondary drinking water standards) and provide customers with a quality drinking water product. In addition to the chemicals listed in the setting discussion, paints, paint thinners, waste oils, miscellaneous lubricating oils, laboratory solvents, compressed acetylene and oxygen gas, and diesel fuel would be stored in various small quantities at the WTP site. Additionally, proprietary polymers would be stored in bulk and may include: cationic polymer used as a coagulation agent, anionic polymer used as a flocculation agent, and nonionic polymer used as a filter aid.

Chlorine or liquid sodium hypochlorite would be used for disinfection of the drinking water and to comply with state laws requiring residual chlorine within water distribution systems. Identical to common household bleach except with regards to concentration of the active ingredient (sodium hypochlorite), liquid sodium hypochlorite would be delivered to the site in tank trucks as a 12.5% (trade) solution. Liquid sodium hypochlorite is inherently safer and far less hazardous than compressed chlorine gas, commonly used in the drinking water treatment industry. Liquid sodium hypochlorite is moderately corrosive. However, liquid sodium hypochlorite in its natural liquid state poses far less severe inhalation hazard than chlorine gas.

Because there is a possibility of a spill or a release with the on-site storage of hazardous materials, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

> Mitigation Measure 3B.8-1a: Transport, Store, and Handle Construction-Related Hazardous Materials in Compliance with Relevant Regulations and Guidelines.
>
> The City shall ensure, through the enforcement of contractual obligations, that all contractors transport, store, and handle construction-related hazardous materials in a manner consistent with relevant regulations and guidelines, including those recommended and enforced by Caltrans, Central Valley RWQCB, local fire departments, and the County environmental health department.
>
> Recommendations shall include as appropriate transporting and storing materials in appropriate and approved containers, maintaining required clearances, and handling materials using applicable Federal, state and/or local regulatory agency protocols. In addition, all precautions required by the Central Valley RWQCB-issued NPDES construction activity stormwater permits shall be taken to ensure that no hazardous materials enter any nearby waterways.
>
> In the event of a spill, the City shall ensure, through the enforcement of contractual obligations, that all contractors immediately control the source of any leak and immediately contain any spill utilizing appropriate spill containment and countermeasures. If required by the local fire departments, the local environmental health department, or any other regulatory agency, contaminated media shall be collected and disposed of at an off-site facility approved to accept such media.
>
> The storage, handling, and use of the construction-related hazardous materials shall be in accordance with applicable Federal, state, and local laws. Construction-related hazardous materials and hazardous wastes (e.g., fuels and waste oils) shall be stored away from stream channels and steep banks to prevent these materials from entering surface waters in the event of an accidental release. These materials shall be kept

at sufficient distance (at least 500 feet) from nearby residences or other sensitive land uses. This includes materials stored for expected use, materials in equipment and vehicles, and waste materials.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction and operation of all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Environmental Management Department.

3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate.

Mitigation Measure 3B.8-1b: Prepare and Implement a Hazardous Materials Management Plan.

The City shall prepare a Hazardous Materials Management Plan (HMMP) for the proposed WTP. The HMMP shall provide for safe storage, containment, and disposal of chemicals and hazardous materials related to WTP operations, including waste materials. The plan shall include, but shall not be limited to, the following:

- a description of hazardous materials and hazardous wastes;
- a description of handling, transport, treatment, and disposal procedures, as relevant for each hazardous material or hazardous waste;
- preparedness, prevention, contingency, and emergency procedures, including emergency contact information;
- A description of personnel training including, but not limited to: (1) recognition of existing or potential hazards resulting from accidental spills or other releases; (2) implementation of evacuation, notification, and other emergency response procedures; (3) management, awareness, and handling of hazardous materials and hazardous wastes, as required by their level of responsibility;
- Instructions on keeping Materials Safety and Data Sheets (MSDS) on-site for each on-site, hazardous chemical;
- Identification of the locations of hazardous material storage areas, including temporary storage areas, which shall be equipped with secondary containment sufficient in size to contain the volume of the largest container or tank; and
- A description of equipment maintenance procedures.

The HMMP shall be made a condition of contractual obligation and shall be available for review by construction inspectors and implementation compliance shall be monitored.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction and operation of all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Environmental Management Department.

3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate.

2, 2A, and 2B

Construction-related impacts associated with Off-site Water Facility Alternatives 2, 2A, and 3B would be similar to the alternatives listed above. Although typical construction management practices limit and often eliminate the impact of such accidental releases, there is a possibility of a spill or a release with the temporary on-site storage of hazardous materials. Therefore, construction-related **direct** and **indirect** impacts are considered **potentially significant**. ***[Similar]***

The main difference between Off-site Water Facility Alternatives 2, 2A, and 2B is relation to those listed above is that these alternatives would involve the purchasing of capacity within SCWA's Vineyard SWTP and, therefore, would not require the construction of a new WTP. For this reason, the operational impacts identified for the alternatives listed above would not apply to Off-site Water Facility Alternatives 2, 2A, and 2B and a **less-than-significant direct** operational impact would occur. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3B.8-1a.

Implementation of Mitigation Measure 3B.8-1a would reduce potentially significant impacts under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A to a **less-than-significant** level by ensuring the transport, storage, and use of construction-related hazardous materials complies with applicable Federal, state, and local regulations. Implementation of Mitigation Measure 3B.8-1b would reduce potentially significant impacts under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A to a **less-than-significant** level through preparation of an HMMP for the WTP.

IMPACT 3B.8-2 Create Accident Conditions Involving Potential Release of Hazardous Materials. *Construction and operation of the Off-site Water Facilities could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

As previously indicated in Impact 3B.8-1, construction and operation of the proposed WTP under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A would involve the use of a variety of hazardous materials such as fuels, motor oils, paints, compressed gases, and chemicals. In addition, construction of the Off-site Water Facilities has the potential to disrupt existing utilities and infrastructure (e.g., natural gas). As provided in Section 3B.16, "Utilities and Service Systems – Water," high-pressure natural gas pipelines are housed in major roadways including Mather Boulevard, Sunrise Boulevard, Douglas Road, and Florin Road. Because there is a possibility of a hazardous spill or a release of hazardous substances (e.g., natural gas) during the construction and on-site storage of hazardous materials at the WTP, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.8-1b, 3B.16-3a, and 3B.16-3b.

2, 2A, and 2B

Under Alternatives 2, 2A, and 2B, the Off-site Water Facilities would likely involve a minor increase in the use and transport of hazardous materials at the Vineyard SWTP. However, this increase is not considered to be significant in relation to existing conditions and this **direct** impact would be **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

However, similar, to the Proposed Alternative, these alternatives could result in a hazardous spill or release during construction, and therefore, these **direct** impacts could be **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.8-1b, 3B.16-3a, and 3B.16-3b.

Implementation of Mitigation Measure 3B.8-1b would reduce potentially significant impacts under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A to a **less-than-significant** level through preparation of an HMMP for the WTP and coordination with utility providers. Implementation of Mitigation Measures 3B.16-3a and 3B.16-3b would minimize risks related to the potential for rupturing high-pressure natural gas lines during construction and, therefore, this impact would be reduced to a **less-than-significant** level following mitigation implementation.

IMPACT 3B.8-3 Introduction of Drinking Water Contaminants. *Operation of the Off-site Water Facility Alternatives would not create a significant public health risk through the introduction of contaminants into a drinking water supply at concentrations with known adverse health effects.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Surface Water Supplies

A review of water data from West Sacramento's Bryte Bend WTP, which treats Sacramento River water upstream of the Freeport Project intake, shows no exceedance of drinking water standards. Table 3B.9-2 in Section 3B.9, "Hydrology and Water Quality – Water," shows the water quality parameter concentrations grouped by regulations, along with primary and secondary MCLs. At Bryte Bend WTP, the concentration of regulated constituents in treated water has not exceeded the applicable MCLs. None of the regulated or unregulated VOCs or synthetic organic chemicals were detected in treated water. While the THMs bromodichloromethane and chloroform were detected, the concentrations detected were low ($\leq$ 20 µg/L), and did not exceed the applicable MCL. Similarly, pesticides were not detected within treated water from the Bryte Bend WTP.

The primary water quality constituents of concern in the untreated Sacramento River water were turbidity and TOC, and only turbidity exceeded the State Primary MCL. EDCs and PCPPs are not commonly measured constituents, and have not been measured by the City of West Sacramento at the Bryte Bend WTP. It is therefore unknown to what extent EDCs and PCPPs would be present within treated Sacramento River water. However, because the three EDC/PCPP compounds that have been detected in untreated water in the Sacramento River were at levels far below their effective doses (Table 3B.11-3), their effects on public health would be very limited, if any. The issue of emerging contaminants in drinking water has received increasing attention nationally; however, given that these constituents are not routinely tested and, that even if they were, there is no formal Federal or state standard for the City to consider the data against.

The concentrations of other non-regulated chemical compounds, including agricultural, industrial, and urban-related pollutants, remain largely unknown. It is also unknown to what extent these chemicals could affect human

health. However, treated Sacramento River water from the Bryte Bend WTP does not exceed any MCLs. Therefore, adverse impacts to public health and safety resulting from the introduction of a new drinking water supply source are not anticipated to occur. This **indirect** impact is considered **less than significant**. **No direct** impact would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.8-4 Use of Hazardous Materials within One-Quarter Mile of Schools. *Operation of the Off-site Water Facilities could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.*

NCP, PA, 1, and 1A

The proposed WTP site under these alternatives would be sited to the south of White Rock Road and would be located over 3/4 mile to the south of an elementary school and Country Day School planned within the southern portion of the SPA. Similarly, the On-site WTP would be sited according to the requirements of the Folsom Specific Plan, which is required to comply with state law. Likewise, the conveyance pipeline alignment under these alternatives would not be constructed within a quarter mile of an existing or planned school facility. Based on these findings, **no direct** or **indirect** impacts associated with the handling of hazards or acutely hazardous materials, substances, or wastes near a school would occur under these alternatives. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2, 2A, 2B, 3, and 3A

Under these alternatives, the City would either construct a new WTP at the same location as the White Rock WTP or purchase capacity within the Vineyard WTP. **No direct** or **indirect** impact would be expected in relation to water treatment facilities for any of these alternatives.

In relation to the conveyance pipeline alignments for these alternatives, the portion of the alignments along Douglas Road would be constructed within one quarter of a mile of the Sunrise Elementary School. Additionally, the conveyance pipeline alignments for Off-site Water Facility Alternatives 2A and 3A would pass within a quarter mile of the Mather Youth Academy and Mather Heights Elementary Schools along Excelsior Road. As previously indicated in Impact 3B.8-1, construction activities would involve the routine use of fuels, oils, and solvents which could be accidentally spilled or released from containment. Although unlikely, if any of these materials were accidentally released, they could pose a hazard to the nearby school. Therefore, this **indirect** impact is considered **potentially significant**. **No direct** impact would occur. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3B.8-1a and 3B.8-1b.

4 and 4A

Under Off-site Water Facility Alternatives 4 and 4A, the WTP would be located at a location south of Folsom Boulevard, east of Sunrise Boulevard. No existing or planned educational facilities are located within a quarter mile of the Folsom Boulevard WTP site. Therefore, **no direct** or **indirect** impact from the WTP would occur. ***[Similar]***

Off-site Water Facility Alternative 4A would follow the same initial route as Off-site Water Facility Alternative 2A and 3A, and therefore, carries the potential to release hazardous materials or substances during construction within 1/4 mile of the Mather Youth Academy and Mather Heights Elementary Schools. Therefore, this **indirect** impact is considered **potentially significant**. **No direct** impact would occur. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3B.8-1a and 3B.8-1b.

Implementation of Mitigation Measures 3B.8-1a and 3B.8-1b would reduce potentially significant impacts under Off-site Water Facility Alternatives 2, 2A, 3, 3A, and 4A to a **less-than-significant** level by ensuring the transport, storage, and use of construction-related hazardous materials complies with applicable Federal, state, and local regulations.

IMPACT 3B.8-5 Create a Significant Hazard to the Public or the Environment. *Construction of the Off-site Water Facilities could encounter one or more sites listed as containing hazardous materials or wastes and, as a result, could create a significant hazard to the public or the environment.*

NCP, PA, 1, and 1A

The Off-site Water Facility Alternatives 1 and 1A would be constructed in a rural portion of the County where the conveyance pipeline alignment would not directly cross a site which is known to be included on a list of hazardous materials sites compiled pursuant to California Government Code Section 65962.5 (TrackInfo Services 2008). As indicated in Table 3B.8-1, six listed sites were identified within a quarter-mile of the alignment in the database search; however, these sites are located at a sufficient distance (e.g., greater than 100 feet) away from the actual roadway where construction activities would occur. Nonetheless, as Off-site Water Facilities construction commences, it is possible that contaminated soil or groundwater could be encountered during excavation thereby posing a health threat to construction workers, the public, and the environment. Therefore, this **indirect** impact is considered **potentially significant**. **No direct** impact would occur. ***[Similar]***

Mitigation Measure 3B.8-5a: Conduct Phase 1 Environmental Site Assessment for Selected Alignment.

Prior to construction, the City shall conduct a Phase 1 Environmental Site Assessment according to American Society for Testing and Materials (ASTM) protocol for the selected conveyance pipeline alignment, pump station, well, and WTP site. If any hazardous materials or waste sites are identified during the Phase 1 Environmental Site Assessment, the City shall implement Mitigation Measure 3.8-5b.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction of all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Environmental Management Department.
3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate

Mitigation Measure 3B.8-5b: Develop and Implement a Remediation Plan.

If determined necessary to mitigate for potential hazards resulting from disturbance of existing contaminated areas based on the results of the Phase 1 Environmental Site Assessment, the extent of contamination from hazardous materials sites within or adjacent to the Off-site Water Facilities construction area shall be delineated during final design. Disturbance to contaminated areas during Off-site Water Facilities construction shall be avoided, or any work done within contaminated areas shall be undertaken in compliance with standards approved by the DTSC or Sacramento County Department of

Environmental Health to ensure that hazardous materials will not be released as a result of the ground disturbance.

Additionally, if unidentified contaminated soil or groundwater are encountered, or if suspected contamination is encountered during any construction activities, work shall be halted in the area of potential exposure, and the type and extent of contamination shall be identified. A qualified professional, in consultation with appropriate regulatory agencies, will then develop and implement a plan to remediate the contamination and properly dispose of the contaminated material.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction of all Off-site Water Facilities

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Environmental Management Department.

3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate

2, 2A, 2B, 3, 3A, 4, and 4A

Construction of the conveyance pipelines under each of these alternatives would involve excavation, soil stockpiling, grading, installation of the pipelines, and backfilling. These alternatives would be constructed in urbanizing portions of Rancho Cordova and along developing roadway corridors. Various forms of soil and groundwater contamination have been documented along portions of Florin, Excelsior, and Douglas Roads, Sunrise Boulevard, and Folsom Boulevard. Table 3B.8-1 provides a summary of the listed sites for each alternative. The types of contamination along these roadways range from minor spills of gasoline or diesel to more extensive spills of industrial chemicals, including PAHs, polychlorinated by-phenols (PCBs), and VOCs. In addition, agricultural uses of Sunrise Avenue and, Douglas Boulevard could have also resulted in soil or groundwater contamination from pesticides or other chemicals extending beneath the portions of the construction area.

If contaminated soil and groundwater were encountered without taking proper precautions, construction workers could be exposed to hazards that would potentially cause significant adverse health effects. Further, dewatering during construction would lead to extraction of contaminated groundwater. The quality of the groundwater would pose a concern if the water were discharged into a storm drain, sanitary sewer system, or surface water without treatment. Section 3B.17, "Groundwater Resources – Water," provides a further discussion of discharged groundwater. Human health risks include exposure of on-site workers to chemicals in surface soil through incidental contact with the skin, ingestion of soil, inhalation of soil particles, or fumes during construction activities at contaminated sites, or adjacent property occupants or trespassers who come in contact with contaminated soil. This would be a **potentially significant indirect** impact. **No direct** impact would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.8-5a and 3B.8-5b.

Implementation of Mitigation Measures 3B.8-5a and 3B.8-5b would reduce potentially significant impacts associated with the accidental discovery of hazardous materials or wastes under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A,

2B, 3, 3A, 4, and 4A to a **less-than-significant** level through preparation of an environmental site assessment and development and implementation of a remediation plan, where appropriate.

IMPACT 3B.8-6 Impair or Interfere with an Adopted Emergency Response Plans or Emergency Evacuation Plans. *Implementation of the Off-site Water Facilities would impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.*

NCP, PA 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

The Sacramento Metropolitan Fire District provides fire protection and emergency medical services to 417 square miles of Sacramento County, including the Off-site Water Facilities Study Area. The closest fire stations to Zone 4 of the "Water" Study Area are Stations 63 and 58. Station 63 is located in the northern portion of Zone 4 within the "Water" Study Area at 12395 Folsom Boulevard in the City of Rancho Cordova. Station 58 is located just south of Zone 4 of the "Water" Study Area at 7250 Sloughhouse Road in the community of Sloughhouse. Both stations serve as typical response teams with equipment and staffing for two engines, one ladder truck, and seven firefighters, including one battalion chief. Each fire station also provides emergency medical service personnel. Additionally, the City's Fire Department acts as a mutual aid responder for incidents within the northern portion of Zone 4 of the "Water" Study Area.

According to the County's General Plan, the targeted response time is five minutes for fire and emergency response. The long-term operation of the Off-site Water Facilities is not expected to involve any activities that would interfere with existing response times or emergency response plans in place through the California OES and Sacramento County. However, during construction of the Off-site Water Facilities, construction activities could block access to nearby residences for emergency vehicles or result in temporary blockages thereby increasing emergency response times. In most instances, construction equipment could be moved relatively quickly to facilitate the necessary emergency vehicle movements. Based on these considerations, implementation of the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A are not expected to involve any activities that would permanently or substantially interfere with emergency response plans or evacuation plans in place through the California OES or Sacramento County. This **direct** impact is considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.8-7 Exposure to Wildland Fire Hazards. *Implementation of the Off-site Water Facilities could expose people or structures to a significant risk of loss, injury or death involving wildland fires.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Zone 4 of the "Water" Study Area is located in a local responsibility area where the risk of grassland wildfires is moderate. Construction activities, including welding, vehicle refueling, and pipeline installation would occur in close proximity to areas containing dried vegetation or other materials that could serve as fire fuel. Any construction equipment that normally includes a spark arrester would be equipped with an arrester in good working order. Nonetheless, the potential for construction equipment and vehicles to come in contact with heavily vegetated areas, thereby igniting dry vegetation. This is a **potentially significant, direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.8-7a: Keep Construction Area Clear of Combustible Materials.

The City shall ensure, through the enforcement of contractual obligations that during construction, staging areas, welding areas, or areas slated for development using spark-producing equipment shall be cleared of dried vegetation or other materials that could serve as fire fuel. The contractor shall keep these areas clear of combustible materials in order to maintain a firebreak. Any construction equipment that normally includes a spark arrester shall be equipped with an arrester in good working order. This includes, but is not limited to, vehicles, heavy equipment, and chainsaws.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction and operation of all Off-site Water Facilities

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Fire Department

Mitigation Measure 3B.8-7b: Provide Accessible Fire Suppression Equipment.

Work crews shall be required to carry or have sufficient fire suppression equipment to ensure that any fire resulting from construction activities is immediately extinguished. All off-road equipment using internal combustion engines shall be equipped with spark arrestors.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction and operation of all Off-site Water Facilities

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site water facilities constructed within Sacramento County or the City of Rancho Cordova: Sacramento County Fire Department.

Implementation of Mitigation Measures 3B.8-7a and 3B.8-7b would reduce impacts associated with wildland fire hazards under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A to a **less-than-significant** level by requiring that construction areas are cleared of combustible materials and ensuring access to fire suppression equipment.

3B.8.4 RESIDUAL SIGNIFICANT IMPACTS

With the implementation of mitigation, the Off-site Water Facility Alternatives would not result in any residual significant and unavoidable impacts related to risks of upset or accidental release of hazards and hazardous materials. Similarly, with mitigation impacts related to the potential for wildland fires during construction would be minimized to a less-than-significant level. The use of surface water from the Sacramento River for use as a potable water supply within the SPA would not create a public hazard and impacts resulting from the use of this supply are considered less than significant. Therefore, project implementation would not result in any residual significant impacts related to hazards and hazardous materials.

3A.9 HYDROLOGY AND WATER QUALITY – LAND

3A.9.1 AFFECTED ENVIRONMENT

REGIONAL HYDROLOGY

The SPA is located at the eastern edge of the Sacramento River Hydrologic Region, and consists of gently rolling hills covered with grasslands, oak woodlands, and areas of riparian forest and scrub. The far eastern portion of the SPA, east of Empire Ranch Road, extends into San Joaquin Hydrologic Region. Alder Creek and its tributaries, and other natural seasonal drainages are present throughout the site. Shallow soils and little groundwater render the site incapable of supporting full-scale agricultural operations. As a result, the SPA has historically been (and is currently) used for cattle grazing purposes. The SPA is currently zoned for agricultural use by Sacramento County.

The topography of the SPA consists of gently rolling terrain located at the base of the Sierra Nevada foothills between Placerville Road on the east, U.S. Highway 50 (U.S. 50) on the north, White Rock Road on the south, and Prairie City Road on the west. Elevations vary from 440 feet above sea level in the western portion of the SPA to 800 feet in the eastern hillside. The majority of slopes within this region range between 0% and 15%, however, some isolated steeper slopes exist along the edges of Alder Creek and its associated tributaries.

The climate in the region is Mediterranean, characterized by hot, dry summers, and cool, moist winters. Slightly over half of the total average annual precipitation of 23 to 26 inches occurs from November through February (City and County of Sacramento 1996:4-10). During this period, measurable quantities of precipitation occur about 10 days out of every month. Thunderstorms are rare, and when they do occur it is usually in the fall, late spring, or late summer. Temperatures in July vary from an approximate average daily high of 94 degrees Fahrenheit (°F) to an average daily low of 60°F, while temperatures in January vary from an approximate average daily high of 54°F to an average daily low of 40°F. Extreme temperatures in Sacramento County have been recorded as low as 17°F in December 1932 and as high as 114°F in July 1925 (Bevan and Cline 2005:1–5).

LOCAL SURFACE WATER HYDROLOGY

The SPA lies within four separate watersheds: Alder Creek, Buffalo Creek, Coyote Creek, and Carson Creek (Exhibit 3A.9-1). Alder Creek and Buffalo Creek are tributaries to the American River; Coyote Creek and Carson Creek are tributaries to the Cosumnes River. Several irrigation/cattle water ponds exist on the SPA. These ponds are generally on-stream impoundments and appear to contain water throughout the year.

The majority of the runoff from the SPA originates within the Alder Creek watershed. Alder Creek and its tributaries generally flow east to west and eventually join the American River three miles west of Prairie City Road at Lake Natoma. The headwater tributaries of Alder Creek can generally be characterized as ephemeral and intermittent. Off-site tributary subwatersheds also contribute flow to Alder Creek, including areas where the recent Broadstone and Willow Springs developments are located north of U.S. 50. These tributaries are generally characterized as having perennial flows due to the developed nature of their respective subwatershed areas. As a result, flows in the Alder Creek mainstem within the SPA, transition from ephemeral to perennial with inputs from the tributaries originating in the developed areas north of U.S. 50.

In addition to the Alder Creek watershed, there are three small subbasins within the boundary of the SPA that contribute flow to neighboring creeks, as shown on Exhibit 3A.9-2. Runoff from the southwest corner of the SPA flows across Prairie City Road and eventually joins Buffalo Creek. An area along the southern boundary of the SPA drains off-site to Coyote Creek. Lastly, runoff from the east side of the SPA drains off-site to Carson Creek in El Dorado County (MacKay & Somps 2007:4).

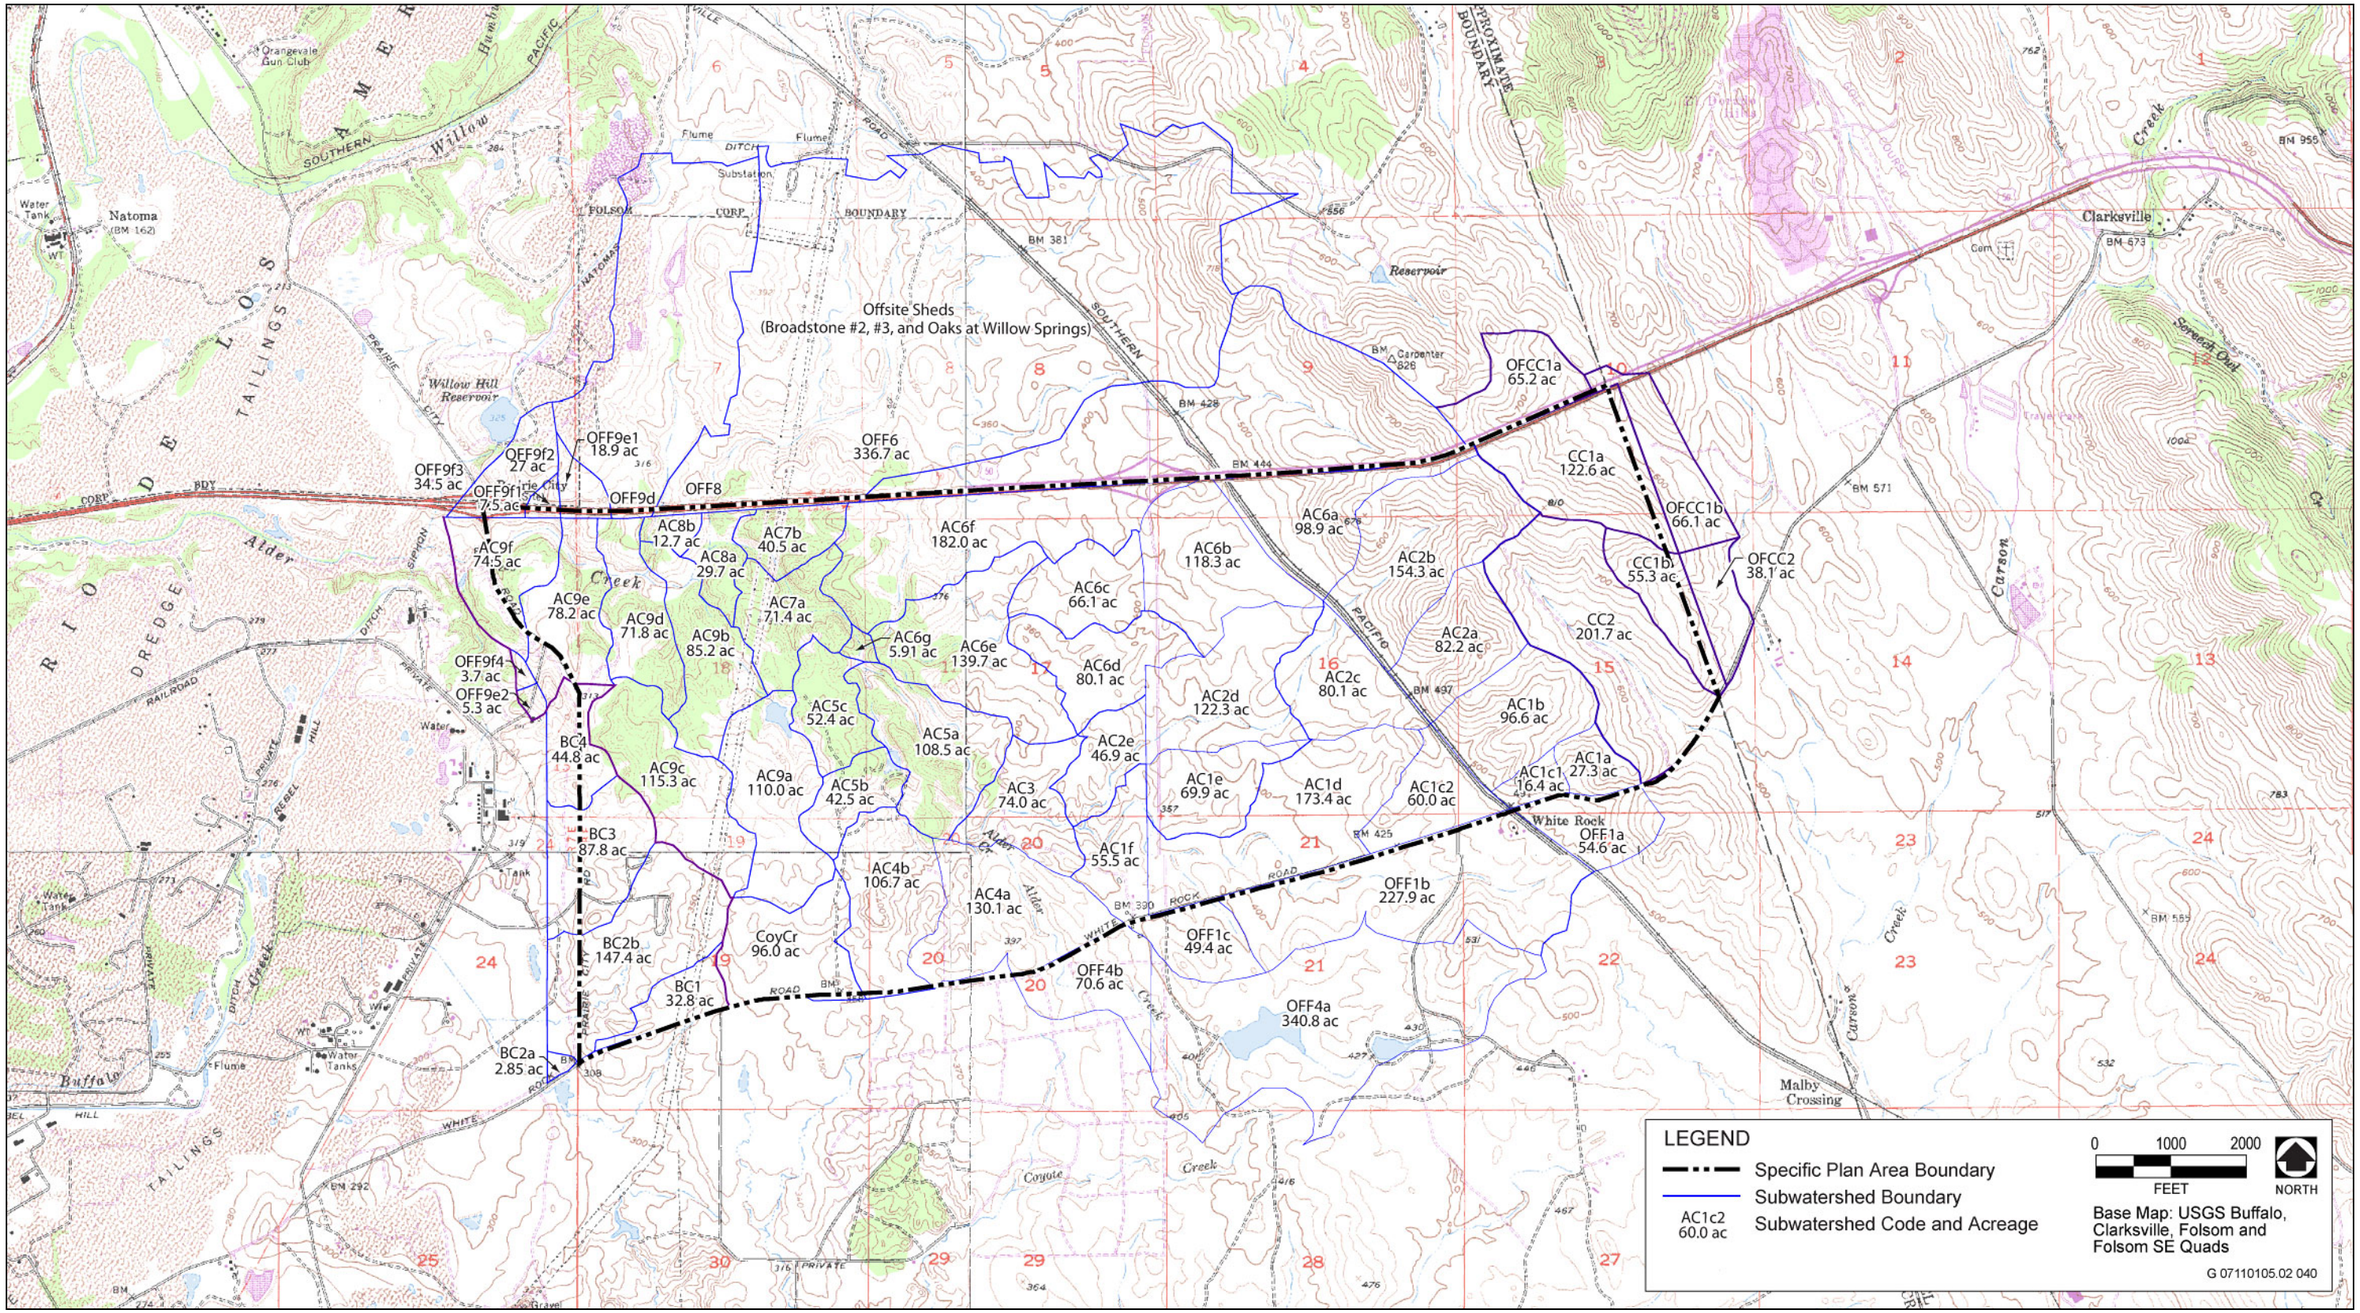
Project Site Watershed and Outfall Locations **Exhibit 3A.9-1**



Source: Domenichelli & Associates Civil Engineering, 2007

On- and Off-Site Subwatersheds **Exhibit 3A.9-2**

Existing surface flow data is generally lacking for the creeks within the SPA due to the lack of flow gaging stations or other hydrologic data collection facilities. As a result, flows were modeled based on procedures outlined in the Sacramento City/County Drainage Manual (Sacramento County 1996; MacKay & Somps 2007). Methodology from this manual was used to develop a HEC-HMS (version 3.1.0) model for the project to determine the peak flows for the 2-year, 5-year, 10-year, and 100-year 24-hour design storms. For modeling purposes, the SPA was delineated into subwatershed basins with a total of eight associated outfall locations where water leaves the boundaries of the SPA (MacKay & Somps 2007 [Figure 7]). As discussed above, the Alder Creek watershed, with one main outfall location, is the primary watershed in the SPA. Upper Buffalo Creek is located along the west project boundary on the east side of Prairie City Road. There are two main and one minor outlet locations from the SPA into the Buffalo Creek watershed. Coyote Creek watershed begins within the southwest project boundary. Runoff leaves this watershed at one location. A portion of the Carson Creek watershed is located on the east side of the SPA. There are four onsite subbasins and two off-site subbasins of Carson Creek in the SPA model. The Carson Creek watershed has three outfall locations from the SPA. All outfall locations are shown on Exhibit 3.9-1. Existing flows were determined using the HEC-HMS model at these locations for comparison to proposed conditions results. A primary objective is to maintain proposed conditions flows at or below the existing peak flows at these locations (MacKay & Somps 2007:12). Hydrologic modeling and associated results are described in detail under the "Environmental Consequences and Mitigation Measures" section below.

The SPA, encompassing portions of the Federal Emergency Management Agency (FEMA; see additional discussion below) Flood Insurance Rate Maps (FIRM) number 060262 panels 0120D, 0150B, 0250C, and 0275D, has been designated as Zone X, areas that have been determined to be outside the 100- and 500-year floodplains; however, the SPA has not been studied for the purpose of drafting an effective Flood Insurance Study (FIS). The California Department of Water Resources (DWR), under the Awareness Flood Mapping Program, has recently prepared area floodplain maps. The area along Alder Creek flowing through the SPA has been designated by DWR as lying within a 100-year floodplain (see Exhibit 3.9-3). Waterways within the SPA have not been studied in order to define a 200-year floodplain by California Water Code Section 9610(a) (DWR 2008).

GROUNDWATER HYDROLOGY

Most of the SPA lies over the Sierra Nevada hydrogeologic province, an undefined groundwater basin, with the exception of the South American groundwater basin in the western portion of the SPA underlying the Buffalo Creek watershed (DWR 2003:156-158). Only a relatively small portion of the land area of Sacramento County and the southeastern edge of El Dorado County is underlain by geologic materials with sufficient area extent, depth, and infiltration capability to provide natural groundwater recharge. These areas occur mostly along active stream channels. Most of the stream channel deposits in Sacramento County and the southeastern edge El Dorado County occur along the courses of the Cosumnes and American Rivers. In the project vicinity, the low permeability of soils containing hardpan or organic clays inhibits infiltration and the area has a poor capacity for significant groundwater recharge (Sacramento County 2007b: 8-9). Groundwater volumes typically vary locally throughout the SPA. Seasonal perched groundwater may be present in the fractures of the weathered bedrock found beneath the SPA at varying times of the year, as evidenced by the presence of vernal pools (Youngdahl Consulting Group Ltd 2003:2–3).

The South American Subbasin aquifer system, part of the larger Sacramento Valley Groundwater Basin, comprises continental deposits of Late Tertiary to Quaternary age. These deposits include younger alluvium (consisting of flood basin deposits, dredge tailings, and Holocene stream channel deposits), older alluvium including the Laguna Formation, and Miocene/Pliocene volcanics consisting of the Mehrten Formation. The cumulative thickness of these deposits increases from a few hundred feet at the SPA to over 2,500 feet along the western margin of the subbasin. The subbasin is bounded on the east by the Sierra Nevada, on the west by the Sacramento River, on the north by the American River, and on the south by the Cosumnes and Mokelumne Rivers. These perennial rivers generally create a groundwater divide in the shallow subsurface, and the

groundwater of adjacent subbasins interacts at greater depths. The Mehrten and Laguna Formations are the principal water-bearing rock strata (DWR 2004:1).

WATER QUALITY

Surface Water

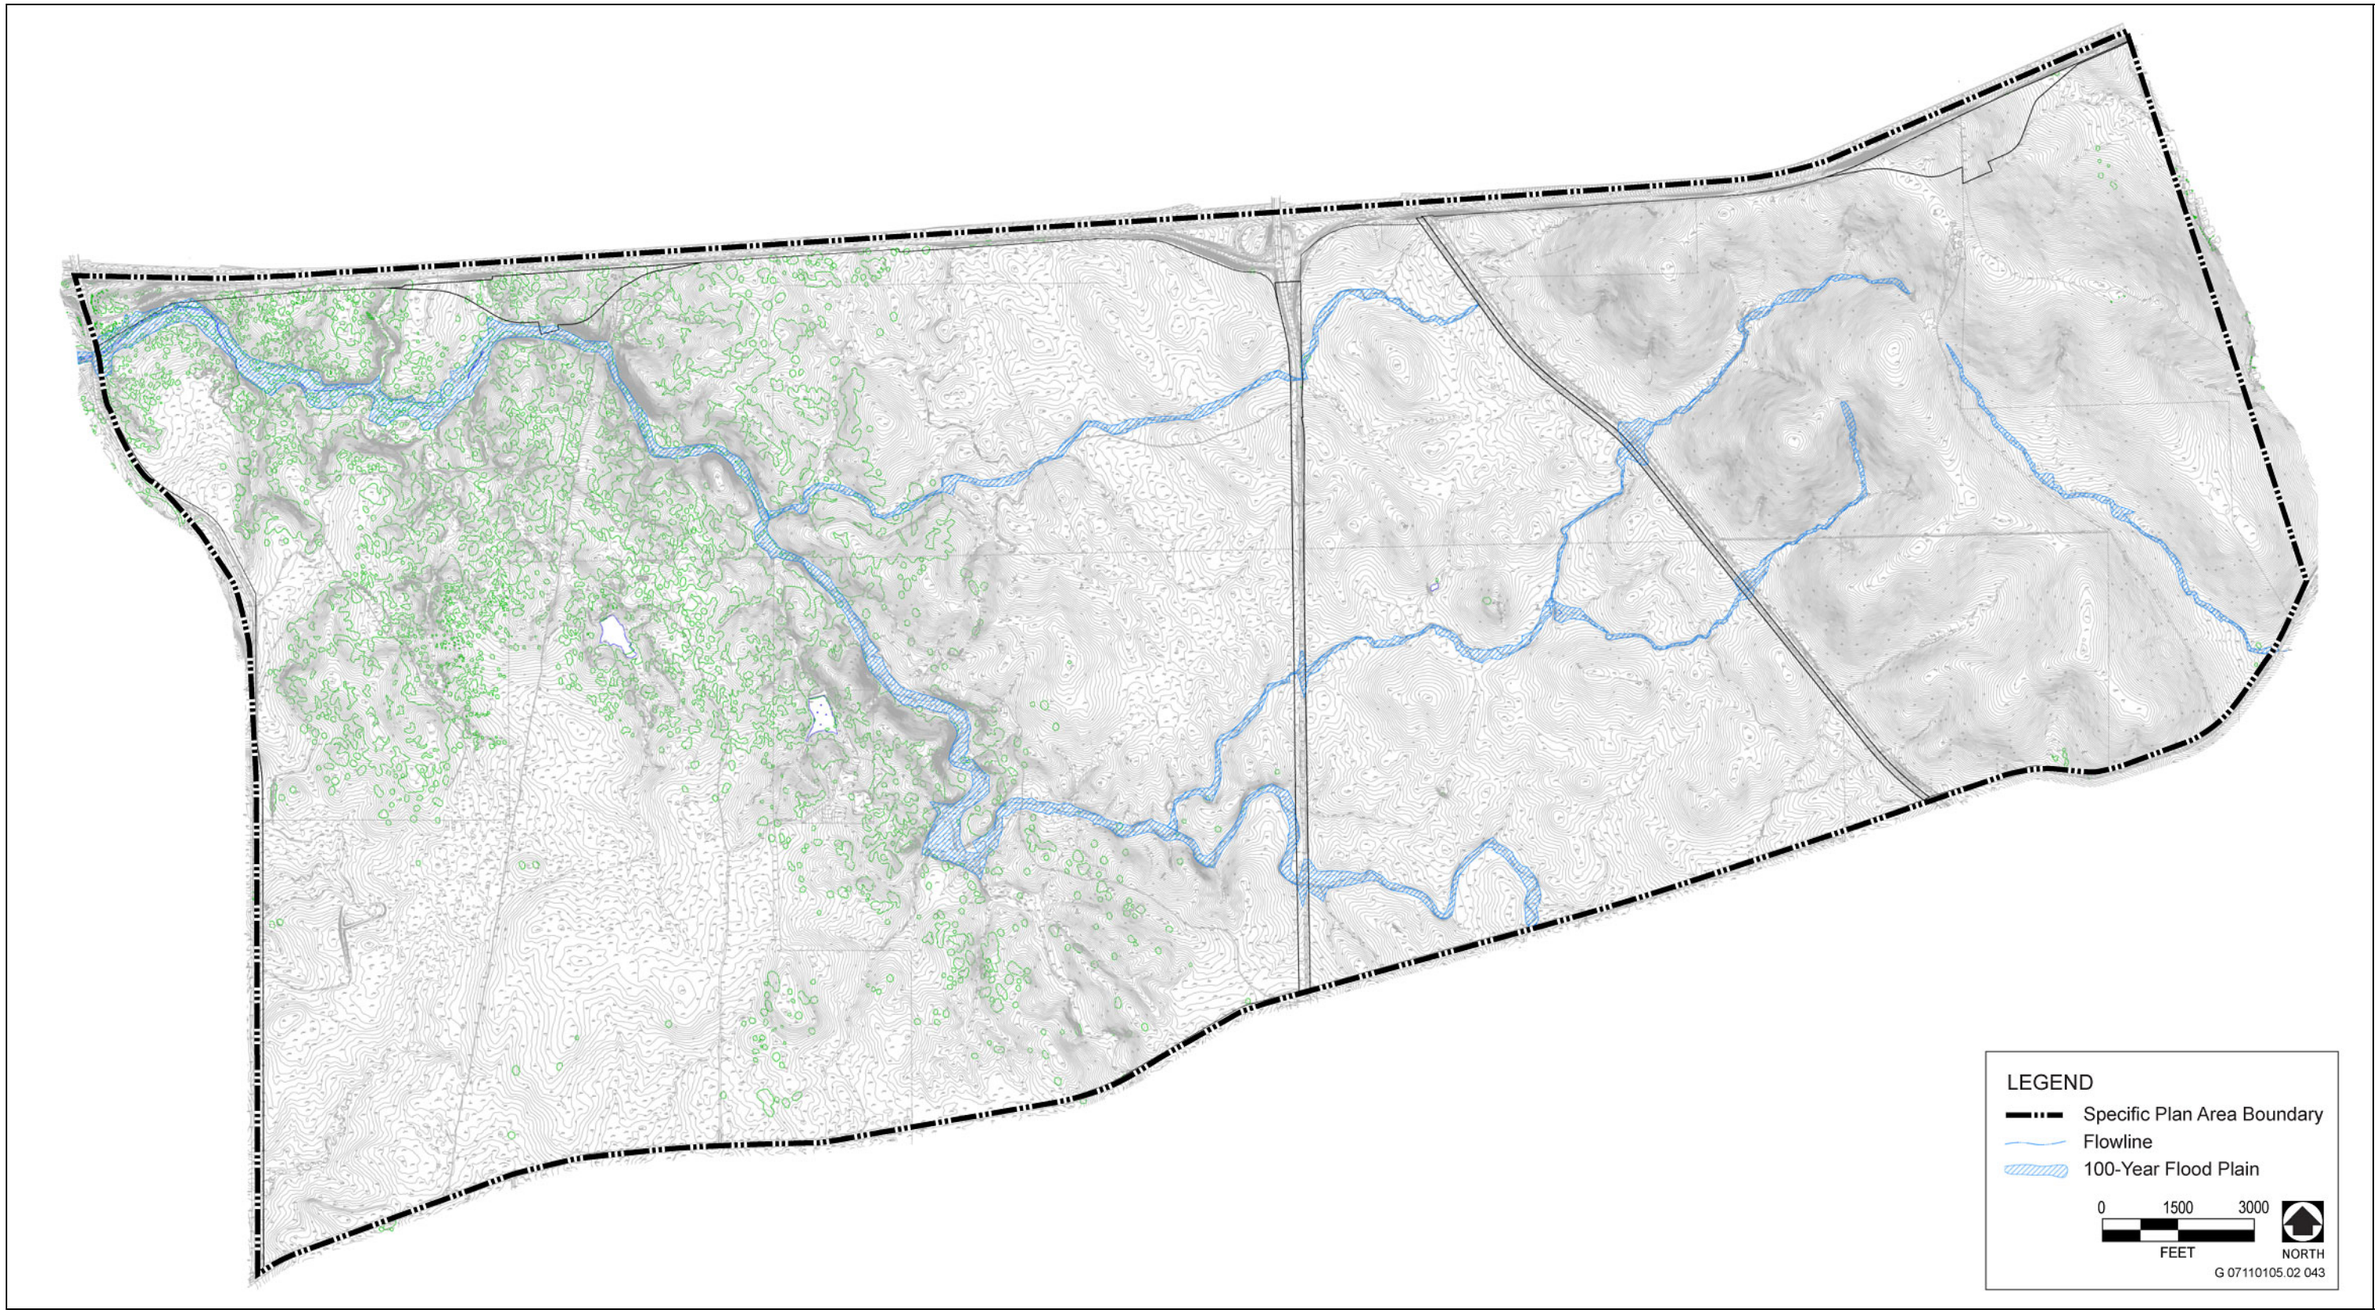
Alder Creek, Buffalo Creek, Coyote Creek, and Carson Creek do not currently have any specific designated beneficial uses attributed to them in the water-quality control plan (Basin Plan) adopted by the Central Valley Regional Water Quality Control Board (RWQCB) (described in the "Regulatory Framework" section below). Consequently, the Central Valley RWQCB applies the Basin Plan's "tributary rule" and assigns to these creeks the beneficial uses designated for the nearest downstream location. The Central Valley RWQCB also regulates waste discharges in undesignated streams to ensure that downstream water quality conditions and beneficial uses are not degraded. Thus, these creeks are subject to regulation for the existing designated uses in their receiving waterbodies. Designated beneficial uses for the American River, Lake Natoma, and Cosumnes River and their tributaries as defined by the Basin Plan (Central Valley RWQCB 2007) are:

- municipal, industrial, and agricultural supply;
- irrigation;
- contact and noncontact recreation;
- coldwater fish habitat, migration, and spawning;
- warmwater fish habitat, migration, and spawning;
- wildlife habitat;
- power generation; and
- navigation.

The segment of the American River that is the receiving water for the Alder Creek and Buffalo Creek watersheds is on the 303(d) list for mercury from resource extraction (Lake Natoma and Lower American River), and unknown toxicity (Lower American River). The segment of the Cosumnes River that is the receiving water for the Coyote Creek and Carson Creek watersheds is on the 303(d) list for Exotic Species (State Water Resource Control Board [SWRCB] 2007).

There is no comprehensive water quality monitoring station in the project vicinity, and water quality data are limited. Monitoring of water quality in the American River at Nimbus Dam is performed as part of the Sacramento Stormwater Quality Partnership (SSQP) Joint Program to comply with monitoring requirements specified in the Sacramento Municipal Separate Storm Sewer System National Pollutant Discharge Elimination System (NPDES) Stormwater Permit, and as described in the SSQP's Stormwater Quality Improvement Plan (SQIP; see below for additional information) (SSQP 2009a). Monitoring activities required by the permit included urban runoff (discharge) characterization, receiving water, urban tributary (creek), bioassessment, and additional pesticide monitoring including Diazinon and Chlorpyrifos.

For the 2006/2007 monitoring years, the American River at Nimbus Dam station (a location below the confluence of Alder Creek that is influenced by other upstream sources) showed a low level of dissolved oxygen in the December 10, 2006 sampling event (6.3 milligrams per liter [mg/L]), that was below the water quality objective of 7 mg/L for coldwater spawning and a pH of 6.2, that was below the Basin Plan range of 6.5 to 7.5. No other exceedances of water quality objectives were reported (SSQP 2007c:vol. 1-9). For the 2007/2008 monitoring year, the American River at Nimbus Dam station showed exceedances for *E. coli* (800 mpn/100 ml, above objective of 235 mpn/100 ml), fecal coliform (800 mpn/100 ml, above objective of 400 mpn/100 ml), total aluminum (951 and 528 mg/L, above objective of 200 mg/L), and dissolved lead (815 mg/L, above objective of 300 mg/L). No other exceedances of water quality objectives were reported (SSQP 2008:vol. 1-9). For the 2008/2009 monitoring year, the latest year available, the American River at Nimbus Dam station showed a single



Source: ECORP Consultants 2009

Existing 100-Year Floodplain **Exhibit 3A.9-3**

exceedance for fecal coliform (500 mpn/100 ml, above objective of 400 mpn/ 100 ml). No other exceedances of water quality objectives were reported (SSQP 2009b:2-16).

A history of gold mining in the area, and the use of mercury to process gold-bearing ore appears to be the cause of mercury in the American River watershed. Gold-dredging operations and operators of floating dredgers coated the sluices with mercury to amalgamate the gold particles, occasionally spilling the mercury into the surrounding environment.

Mercury can exist in many forms, most of which are stable and unavailable for biological uptake. However, inorganic mercury can be methylated by microbes and fungi into an organic form known as methylmercury (Baudo et al 1990, Domagalski et al 2000). Fish take in some methylmercury through their gills, but most of their intake is through their food. Once consumed by fish, methylmercury is retained in the fatty tissue and bioaccumulates so that older and larger fish contain a higher concentration of methylmercury than younger or smaller fish. Fish that predate on other fish tend to have higher concentrations of methylmercury than fish feeding at lower levels of the food chain. Humans who consume these fish are vulnerable to bioaccumulating methylmercury at levels potentially harmful to health. Methylmercury mainly attacks the nervous system causing loss of sensation in the extremities, tiredness, and blurred vision (Office of Environmental Health Hazard Assessment [OEHHA] 2004). The California Department of Health Services (undated brochure) recommends that pregnant and breast-feeding women eat no more than 0.5 pound (uncooked weight) of fish per week from freshwater sources in California. Children less than 6 years old are recommended to eat no more than 3 ounces of freshwater fish per week.

The U.S. Geological Survey (USGS) and the University of California at Davis (UCD) conducted a reconnaissance survey of mercury contamination in edible fish tissue taken from several sites in Lake Natoma, including the vicinity of the mouth of Alder Creek. These data were evaluated by the Office of Environmental Health Hazard Assessment, together with fish samples previously collected from the lower American River by the Toxic Substances Monitoring Program (TSMP) and the Sacramento River Watershed Program (SRWP), in an effort to determine whether there may be potential adverse health effects associated with consuming sport fish from these water bodies. Results from the study showed that elevated concentrations of mercury were found in fish tissues samples at high enough levels to warrant the publishing of a health advisory and fish consumption guidelines for Lake Natoma (including nearby creeks and ponds) and the lower American River (OEHHA 2004).

Groundwater

Groundwater underlying Area 40 at the western boundary of the SPA is contaminated with volatile organic compounds (VOCs) as a result of activities associated with the aerospace industry, in particular trichloroethene (TCE) and tetrachloroethene (PCE). As a result of this contamination, groundwater at the SPA may not be employed for beneficial uses, and under Proposed Project plans buildings for human occupancy would be restricted from areas overlying groundwater VOC contamination. Additional detail regarding groundwater contamination at the SPA is provided in Section 3A.8, “Hazards and Hazardous Materials - Land.”

3A.9.2 REGULATORY FRAMEWORK

Numerous Federal, state, regional, and local laws, rules, regulations, plans, and policies define the framework for regulating hydrology and water quality in the SPA and surrounding area. The following discussion focuses on hydrology and water quality requirements applicable to the project.

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Federal Clean Water Act

The Environmental Protection Agency (EPA) is the lead Federal agency responsible for managing water quality. The Clean Water Act (CWA) of 1972 is the primary Federal law that governs and authorizes EPA and the states to implement activities to control water quality. The various elements of the CWA that address water quality and are applicable to the project are discussed below. Wetland protection elements administered by the U.S. Army Corps of Engineers (USACE) under Section 404 of the CWA, including permits for the discharge of dredged and/or fill material into waters of the U.S., are discussed in Chapter 3A.4, "Biological Resources – Land."

Water Quality Criteria and Standards

Under Federal law, EPA has published water quality regulations under Volume 40 of the Code of Federal Regulations. Section 303 of the CWA requires states to adopt water quality standards for all surface waters of the U.S. As defined by the CWA, water quality standards consist of two elements: (1) designated beneficial uses of the water body in question and (2) criteria that protect the designated uses. Section 304(a) requires EPA to publish advisory water quality criteria that accurately reflect the latest scientific knowledge on the kind and extent of all effects on health and welfare that may be expected from the presence of pollutants in water. Where multiple uses exist, water quality standards must protect the most sensitive use. EPA is the Federal agency with primary authority for implementing regulations adopted under the CWA. EPA has delegated the State of California as the authority to implement and oversee most of the programs authorized or adopted for CWA compliance through the Porter-Cologne Water Quality Control Act of 1969 (Porter-Cologne Act), described below.

National Pollutant Discharge Elimination System Permit Program

The NPDES permit program was established in the CWA to regulate municipal and industrial discharges to surface waters of the U.S. A discharge from any point source is unlawful unless the discharge is in compliance with an NPDES permit. Federal NPDES permit regulations have been established for broad categories of discharges, including point-source municipal waste discharges and nonpoint-source stormwater runoff. NPDES permits generally identify effluent and receiving water limits on allowable concentrations and/or mass emissions of pollutants contained in the discharge; prohibitions on discharges not specifically allowed under the permit; and provisions that describe required actions by the discharger, including industrial pretreatment, pollution prevention, self-monitoring, and other activities.

In November 1990, EPA published regulations establishing NPDES permit requirements for municipal and industrial stormwater discharges. Phase 1 of the permitting program applied to municipal discharges of stormwater in urban areas where the population exceeded 100,000 persons. Phase 1 also applied to stormwater discharges from a large variety of industrial activities, including general construction activity if the project would disturb more than 5 acres. Phase 2 of the NPDES stormwater permit regulations, which became effective in March 2003, required that NPDES permits be issued for construction activity for projects that disturb 1 acre or more. Phase 2 of the municipal permit system (known as the NPDES General Permit for Small Municipal Separate Storm Sewer Systems [MS4s]) required small municipal areas of less than 100,000 persons to develop stormwater management programs. The nine RWQCBs in California are responsible for implementing the NPDES permit system (see additional information below).

Section 401 Water Quality Certification or Waiver

Under Section 401 of the CWA, an applicant for a Section 404 permit (to discharge dredged or fill material into waters of the U.S.) must first obtain a certificate from the appropriate state agency stating that the fill is consistent with the state's water quality standards and criteria. In California, the authority to either grant water quality certification or waive the requirement is delegated by the SWRCB to the nine RWQCBs. The Proposed Project

Alternative would require a Section 401 water quality certification because it would require a Section 404 permit and is under the jurisdiction of the Central Valley RWQCB.

Antidegradation Policy

The Federal antidegradation policy, established in 1968, is designed to protect existing uses, water quality, and national water resources. The Federal policy directs states to adopt a statewide policy that includes the following primary provisions:

- Existing in-stream uses and the water quality necessary to protect those uses shall be maintained and protected.
- Where existing water quality is better than necessary to support fishing and swimming conditions, that quality shall be maintained and protected unless the state finds that allowing lower water quality is necessary for important local economic or social development.
- Where high-quality waters constitute an outstanding national resource, such as waters of national and state parks, wildlife refuges, and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.

Safe Drinking Water Act

Under the Safe Drinking Water Act (Public Law 93-523), passed in 1974, EPA regulates contaminants of concern to domestic water supply. Contaminants of concern relevant to domestic water supply are defined as those that pose a public health threat or that alter the aesthetic acceptability of the water. These types of contaminants are regulated by EPA's primary and secondary maximum contaminant levels (MCLs), which are applicable to treated water supplies delivered to the distribution system. MCLs and the process for setting these standards are reviewed triennially. Amendments to the Safe Drinking Water Act enacted in 1986 established an accelerated schedule for setting MCLs for drinking water.

EPA has delegated to the California Department of Public Health (CDPH) the responsibility for administering California's drinking-water program. CDPH is accountable to EPA for program implementation and for adopting standards and regulations that are at least as stringent as those developed by EPA. The applicable state primary and secondary MCLs are set forth in Title 22, Division 4, Chapter 15, Article 4 of the California Code of Regulations (CCR). Provisions of the Safe Drinking Water Act would apply to water supplies being sought for the project.

Section 303(d) Impaired Waters List

Under Section 303(d) of the CWA, states are required to develop lists of water bodies that would not attain water quality objectives after implementation of required levels of treatment by point-source dischargers (municipalities and industries). Alder Creek is not on the 303(d) list, but the receiving water bodies for Alder, Buffalo, Carson, and Coyote Creeks—Lower American River, Lake Natoma, and the Cosumnes River—are listed (see "Water Quality" section below). Section 303(d) requires that the state develop a total maximum daily load (TMDL) for each of the listed pollutants. The TMDL is the amount of loading that the water body can receive and still be in compliance with water quality objectives. The TMDL can also act as a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. The TMDL prepared by the state must include an allocation of allowable loadings to point and nonpoint sources, with consideration of background loadings and a margin of safety. The TMDL must also include an analysis that shows links between loading reductions and the attainment of water quality objectives. The EPA must either approve a TMDL prepared by the state or, if it disapproves the state's TMDL, issue its own. NPDES permit limits for listed pollutants must be consistent with the waste load allocation prescribed in the TMDL. After implementation of the

TMDL, it is anticipated that the problems that led to placement of a given pollutant on the Section 303(d) list would be remediated.

Federal Emergency Management Agency

FEMA administers the National Flood Insurance Program to provide subsidized flood insurance to communities that comply with FEMA regulations that limit development in floodplains. FEMA also issues FIRMs that identify which land areas are subject to flooding. These maps provide flood information and identify flood hazard zones in the community. The design standard for flood protection covered by the FIRMs is established by FEMA, with the minimum level of flood protection for new development determined to be the 1-in-100 (0.01 annual exceedance probability [AEP]) (i.e., the 100-year flood event). As developments are proposed and constructed FEMA is also responsible for issuing revisions to FIRMs, such as Conditional Letters of Map Revision (CLOMR) and Letters of Map Revision (LOMR) through the local agencies that work with the National Flood Insurance Program. Requirements of California Senate Bill (SB) 5 regarding the 200-year flood (i.e. the 1-in-200 [0.005 AEP]) are discussed below.

U.S. Army Corps of Engineers Sacramento and San Joaquin River Basins Comprehensive Study

The Sacramento and San Joaquin River Basins Comprehensive Study is a joint effort by the Central Valley Flood Protection Board (CVFPB) (formerly the State Reclamation Board) and USACE, in coordination with Federal, state, and local agencies, groups, and organizations in California's Central Valley, to develop a comprehensive plan for flood damage reduction and environmental restoration for the Sacramento and San Joaquin River Basins. The study is a regionwide planning effort, rather than a regulatory program; however, consistency with its goals and objectives is important for any project affecting flood control in the Sacramento and San Joaquin River basins.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

In California, the SWRCB has broad authority over water-quality control issues for the state. The SWRCB is responsible for developing statewide water quality policy and exercises the powers delegated to the state by the Federal government under the CWA. Other state agencies with jurisdiction over water quality regulation in California include CDPH (for drinking-water regulations), the California Department of Pesticide Regulation, the California Department of Fish and Game (DFG), and OEHHA.

Regional authority for planning, permitting, and enforcement is delegated to the nine RWQCBs. The regional boards are required to formulate and adopt Basin Plans for all areas in the region and establish water quality objectives in the plans. California water quality objectives (or "criteria" under the Clean Water Act) are found in the Basin Plans adopted by the SWRCB and each of the nine RWQCBs. The Central Valley RWQCB is responsible for the regional area in which the SPA is located. State regulations applicable to the demonstration of adequate water supply for the future water demands resulting from implementation of the Proposed Project Alternative are addressed in Section 3A.18, "Water Supply - Land."

TITLE 22 STANDARDS

Water quality standards are enforceable limits composed of two parts: (1) the designated beneficial uses of water and (2) criteria (i.e. numeric or narrative limits) to protect those beneficial uses. Municipal and domestic supply (MUN) is among the "beneficial uses" as defined in Section 13050(f) of the Porter-Cologne Act, which defines them as uses of surface water and groundwater that must be protected against water quality degradation. Maximum contaminant levels, MCLs, are components of the drinking water standards adopted by the CDPH pursuant to the California Safe Drinking Water Act. California MCLs may be found in Title 22 of the CCR, Division 4, Chapter 15, Domestic Water Quality and Monitoring. The CDPH is responsible for Title 22 of the CCR (Article 16, Section 64449) as well, which also defines secondary drinking water standards, established primarily for reasons of consumer acceptance (i.e., taste) rather than because of health issues. Table 3A.9-1 lists

Table 3A.9-1
Surface Water and Groundwater Quality Standards of Conventional Contaminants for the Proposed Project Alternative

Constituent	Minimum Level Required for Detection[1]	Water Quality Objective (WQO) Source	WQO Value
Conventional Pollutants	mg/L [2]

2,4,5-TP-SILVEX	0.2	Primary MCL, DPH Title 22 of CCR	50

Notes:
MCL = Maximum Contaminant Level
DPH = California Department of Public Health
CCR = California Code of Regulations
DPH = California Department of Public Health
EPA = U.S. Environmental Protection Agency
WDR = Waste Discharge Requirements
mg/L = milligrams per liter (parts per million)
µg/L = micrograms per liter (parts per billion)
ng/L = nanograms per liter (parts per trillion)
NA = not applicable

[1] From the State Implementation Plan of the California Toxics Rule (SIP CTR), Appendix 4. Note that some Water Quality Objective values are lower than the Minimum Level values.
[2] Unless otherwise noted.
[3] Waters shall not contain oils, greases, waxes, or other materials in concentrations that cause nuisance, result in a visible film or coating on the surface of the water or on objects in the water, or otherwise adversely affect beneficial uses.
[4] The natural receiving water temperature of intrastate waters shall not be altered unless it can be demonstrated to the satisfaction of the Central Valley RWQCB that such alteration in temperature does not adversely affect beneficial uses.
[5] Placeholder.
[6] The most probable number of coliform organisms over any seven-day period shall be less than 2.2MPN/100 ml. This limit would only be applicable for groundwater used for domestic or municipal supply.
[7] The 30-day average for turbidity shall not exceed the following limits:
- More than 1 Nephelometric Turbidity Units (NTUs) where natural turbidity is between 0 and 5 NTUs.
- More than 20% where natural turbidity is between 5 and 50 NTUs.
- More than 10 NTUs where natural turbidity is between 50 and 100 NTUs.
- More than 10% where natural turbidity is greater than 100 NTUs.

[8] The Central Valley RWQCB has prohibited the discharge of oil or any residuary product of petroleum to the waters of the State, except in accordance with waste discharge requirements or other provisions of Division 7, California Water Code.
[9] Aquatic Life guidance Value for 4-Day Average Concentration.
[10] Central Valley RWQCB Basin Plan Narrative Objective: Water shall not contain constituent concentrations that would cause nuisance or adversely affect beneficial uses.

Source: Central Valley RWQCB 2007a, 2007b

the Title 22 constituent standards, as well as those for the Central Valley Basin Plan above and the California Toxics Rule described below.

Drinking water MCLs are directly applicable to water supply systems "at the tap ", i.e. at the point of use by consumers in their home, office, etc., and are enforceable by CDHS. California MCLs, both Primary and Secondary, are directly applicable to groundwater and surface water resources when they are specifically referenced as water quality objectives in the pertinent Basin Plan. In such cases, MCLs become enforceable limits by the State and Regional Water Boards. When fully health protective, MCLs may also be used to interpret narrative water quality objectives prohibiting toxicity to humans in water designated as a source of drinking water (MUN) in the Basin Plan.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Act is California's statutory authority for the protection of water quality. Under the act, the state must adopt water quality policies, plans, and objectives that protect the state's waters for the use and enjoyment of the people. The act sets forth the obligations of the SWRCB and RWQCBs to adopt and periodically update Basin Plans. Basin Plans are the regional water quality control plans required by both the CWA and Porter-Cologne Act in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The act also requires waste dischargers to notify the RWQCBs of their activities through the filing of reports of waste discharge (RWDs) and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements (WDRs), NPDES permits, Section 401 water quality certifications, or other approvals. The RWQCBs also have authority to issue waivers to RWDs and/or WDRs for broad categories of "low threat" discharge activities that have minimal potential for adverse water quality effects when implemented according to prescribed terms and conditions.

California State Nondegradation Policy

In 1968, as required under the Federal antidegradation policy described above, the SWRCB adopted a nondegradation policy aimed at maintaining high quality for waters in California. The nondegradation policy states that the disposal of wastes into state waters shall be regulated to achieve the highest water quality consistent with maximum benefit to the people of the state and to promote the peace, health, safety, and welfare of the people of the state. The policy provides as follows:

- Where the existing quality of water is better than required under existing water quality control plans, such quality would be maintained until it has been demonstrated that any change would be consistent with maximum benefit to the people of the State and would not unreasonably affect present and anticipated beneficial uses of such water.

- Any activity which produces waste or increases the volume or concentration of waste and which discharges to existing high-quality waters would be required to meet waste discharge requirements, which would ensure (1) pollution or nuisance would not occur and (2) the highest water quality consistent with the maximum benefit to the people of the State would be maintained.

California Toxics Rule and State Implementation Plan

The California Toxics Rule (CTR) was issued in 2000 in response to requirements of the EPA National Toxics Rule (NTR), and establishes numeric water quality criteria for approximately 130 priority pollutant trace metals and organic compounds. The CTR criteria are regulatory criteria adopted for inland surface waters, enclosed bays, and estuaries in California that are subject CWA Section 303(c). The CTR includes criteria for the protection of aquatic life and human health. Human health criteria (water and organism based) apply to all waters with a Municipal and Domestic Water Supply Beneficial Use designation as indicated in the Basin Plans.

The Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California, also known as the State Implementation Plan (SIP), was adopted by the SWRCB in 2000. It establishes provisions for translating CTR criteria, NTR criteria, and Basin Plan water quality objectives for toxic pollutants into NPDES permit effluent limits, effluent compliance determinations, monitoring for 2,3,7,8-TCDD (dioxin) and its toxic equivalents, chronic (long-term) toxicity control provisions, initiating site-specific water quality objective development, and granting of exceptions for effluent compliance. The goal of the SIP is to establish a standardized approach for the permitting of discharges of toxic effluents to inland surface waters, enclosed bays, and estuaries in a consistent fashion throughout the state.

NPDES Permit System and Waste Discharge Requirements for Construction

The SWRCB and Central Valley RWQCB have adopted specific NPDES permits for a variety of activities that have potential to discharge wastes to waters of the state. The SWRCB's statewide stormwater general permit for construction activity (Order 99-08-DWQ, to be replaced by Order 2009-0009-DWQ in July 2010) is applicable to all land-disturbing construction activities that would disturb 1 acre or more. The Central Valley RWQCB's general NPDES permit for construction dewatering activity (Order 5-00-175) authorizes direct discharges to surface waters up to 250,000 gallons per day for no more than a 4-month period each year. All of the NPDES permits involve similar processes, including submittal to the Central Valley RWQCB of notices of intent (NOI) to discharge, and implementation of storm water pollution prevention plans (SWPPPs) that include best management practices (BMPs) to minimize those discharges. As mentioned above, the Central Valley RWQCB may also issue site-specific WDRs, or waivers to WDRs, for certain waste discharges to land or waters of the state. In particular, Central Valley RWQCB Resolution R5-2003-0008 identifies activities subject to waivers of RWDs and/or WDRs, including minor dredging activities and construction dewatering activities that discharge to land.

Construction activities subject to the general construction activity permit include clearing, grading, stockpiling, and excavation. Dischargers are required to eliminate or reduce non-stormwater discharges to storm sewer systems and other waters. The permit also requires dischargers to consider the use of permanent postconstruction BMPs that would remain in service to protect water quality throughout the life of the project. All NPDES permits also have inspection, monitoring, and reporting requirements. In response to a court decision, the Central Valley RWQCB also implemented mandatory water quality sampling requirements in Resolution 2001-046 for visible and nonvisible contaminants in discharges from construction activities. Water quality sampling is now required if the activity could result in the discharge of turbidity or sediment to a water body that is listed as impaired under Section 303(d) because of sediment or siltation, or if a release of a nonvisible contaminant occurs. Where such pollutants are known or should be known to be present and have the potential to contact runoff, sampling and analysis is required. NPDES permits require the implementation of design and operational BMPs to reduce the level of contaminant runoff. Types of BMPs include source controls, treatment controls, and site planning measures.

Discharges subject to the SWRCB NPDES general permit for construction activity are subject to development and implementation of a SWPPP. The SWPPP includes a site map and description of construction activities and identifies the BMPs that would be employed to prevent soil erosion and discharge of other construction-related pollutants (e.g., petroleum products, solvents, paints, cement) that could contaminate nearby water resources.

On September 2, 2009 the SWRCB approved a new construction general permit (Order 2009-0009-DWQ), which will become effective and replace Order 99-08-DWQ on July 1, 2010. The new permit differs from Order 99-08-DWQ in the following important ways:

- Risk-Based Permitting Approach: the new general permit establishes three levels of risk possible for a construction site. Risk is calculated in two parts: 1) Project Sediment Risk, and 2) Receiving Water Risk. Risk Level 1 is considered the lowest risk, and Level 3 is considered the highest.

- Rainfall Erosivity Waiver: the new general permit includes the option allowing a small construction site (>1 and <5 acres) to self-certify if the rainfall erosivity value (R value) for their project's given location and time frame compute to be less than or equal to 5.

- Project Site Soil Characteristics Monitoring and Reporting: the new general permit provides the option for dischargers to monitor and report the soil characteristics at their project location. The primary purpose of this requirement is to provide better risk determination and eventually better program evaluation.

- Minimum Requirements Specified: the new general permit imposes more minimum BMPs and requirements that were previously only required as elements of the SWPPP or were suggested by guidance.

- Technology-Based Numeric Action Levels (NAL): the new general permit includes daily average NALs for pH and turbidity, applicable to projects in Risk Level 2.

- Technology-Based Numeric Effluent Limitations (NEL): the new general permit contains daily average NELs for pH during any construction phase where there is a high risk of pH discharge and daily average NELs turbidity for all discharges in Risk Level 3. The daily average NEL for turbidity is set at 500 NTU to represent the minimum technology that sites need to employ (to meet the traditional Best Available Technology Economically Achievable (BAT)/ Best Conventional Pollutant Control Technology (BCT) standard) and the traditional, numeric receiving water limitations for turbidity.

- Effluent Monitoring and Reporting: the new general permit requires effluent monitoring and reporting for pH and turbidity in storm water discharges. The purpose of this monitoring is to determine compliance with the NELs and evaluate whether NALs included in the General Permit are exceeded.

- Receiving Water Monitoring and Reporting: the new general permit requires some Risk Level 3 dischargers to monitor receiving waters and conduct bio assessments.

- Post-Construction Storm Water Performance Standards: the new general permit specifies runoff reduction requirements for all sites not covered by a Phase I or Phase II MS4 NPDES permit, to avoid, minimize and/or mitigate post-construction storm water runoff impacts. These requirements would not apply to the project alternatives due to Phase 1 NPDES MS4 permit described below.

- Rain Event Action Plan: the new general permit requires certain sites to develop and implement a Rain Event Action Plan (REAP) that must be designed to protect all exposed portions of the site within 48 hours prior to any likely precipitation event.

- Annual Reporting: the new general permit requires all projects that are enrolled for more than one continuous three-month period to submit information and annually certify that their site is in compliance with these requirements. The primary purpose of this requirement is to provide information needed for overall program evaluation and pubic information.

- Certification/Training Requirements for Key Project Personnel: the new general permit requires that key personnel (e.g., SWPPP preparers, inspectors, etc.) have specific qualifications or certifications as well as attend state-approved training by September 2, 2011 to ensure their level of knowledge and skills are adequate to ensure their ability to design and evaluate project specifications that will comply with General Permit requirements.

- Linear Underground/Overhead Projects: the new general permit includes requirements for all Linear Underground/Overhead Projects (LUPs).

NPDES Municipal Stormwater Permit Program

The SWRCB Municipal Storm Water Permitting Program regulates storm water discharges from MS4s. MS4 permits are issued in two phases. Under Phase I, which started in 1990, the RWQCBs have adopted NPDES storm water permits for medium (serving between 100,000 and 250,000 people) and large (serving 250,000 people) municipalities. Most of these permits are issued to a group of co-permittees encompassing an entire metropolitan area. As part of Phase II, the SWRCB adopted a General Permit for the Discharge of Storm Water from Small MS4s (WQ Order No. 2003-0005-DWQ) to provide permit coverage for smaller municipalities. The MS4 permits require the discharger to develop and implement a Storm Water Management Plan/Program with the goal of reducing the discharge of pollutants to the maximum extent practicable (MEP). MEP is the performance standard specified in Section 402(p) of the CWA. The management programs specify what best management practices (BMPs) will be used to address certain program areas. The program areas include public education and outreach; illicit discharge detection and elimination; construction and post construction; and municipal operations. In general, medium and large municipalities are required to conduct water quality monitoring, though small municipalities are not.

Two NPDES MS4 permits exist which regulate urban runoff discharges and development activities in the project area. Sacramento County and the City of Folsom are co-permittees (along with other municipal entities) for a regional NPDES MS4 (Phase I) permit that would apply to the Proposed Project Alternative site. El Dorado County is a permittee for its own NPDES MS4 (Phase II) permit for the western portion of El Dorado County, including the area where the proposed off-site roadways would be constructed under the Proposed Project Alternative. Each of these permits is described separately below.

Sacramento County and City of Folsom Phase I National Pollutant Discharge Elimination System MS4 Permit

Sacramento County and the Cities of Folsom, Rancho Cordova, Elk Grove, Citrus Heights, Galt, and Sacramento are co-permittees to the Sacramento Areawide NPDES MS4 permit (Sacramento MS4 permit) issued and enforced by the Central Valley RWQCB. First issued in 1990, the latest permit was adopted on 11 September, 2008 (NPDES Permit No. CAS082597, WDR Order No. R5-2008-0142). The permittees formed the SSQP, described in more detail in the next section, to coordinate and implement permit compliance activities. A SQIP developed for compliance with the NPDES permit is the guiding document for the permittees (SSQP 2009a) and describes the activities that will be implemented to reduce pollutant discharges in urban runoff to the MEP. The SSQP, in association with the City of Roseville, published the "Stormwater Quality Design Manual for the Sacramento and South Placer Regions" in May 2007, which is currently the guiding technical design document for development and major redevelopment in the unincorporated County of Sacramento and City of Folsom (SSQP 2007b).

An important component of the Sacramento MS4 permit requires each permittee (including the City) to update and continue to implement the planning and new development element of its SQIP to minimize the short and long-term impacts on receiving water quality from new development and redevelopment. The permit requires the continued implementation of the permittees' development standards during the entitlement and CEQA process and the development plan review process. Specifically, the Sacramento MS4 permit identifies the need to address changes in the hydrograph, defined as hydrograph modification or hydromodification, which could result from urbanization of a watershed, and to require low impact development (LID) controls to more closely mimic the pre-developed hydrologic condition. To address hydromodification, the permit requires the permittees to prepare and implement a Hydromodification Management Plan (HMP), which will entail revising development standards and associated technical guidance (aka Stormwater Quality Design Manual). Technical guidance will also be updated to incorporate new LID requirements.

El Dorado County Phase II National Pollutant Discharge Elimination System MS4 Permit

El Dorado County has been covered under the SWRCB's own NPDES Phase II MS4 general permit since April 30, 2003. A Storm Water Management Plan (SWMP) was developed by El Dorado County for the purpose of describing the minimum procedures and practices to reduce the discharge of pollutants in effluent from storm drainage systems and for compliance with the NPDES permit (El Dorado County 2004). The SWMP addresses storm water pollution control related to project planning, design, construction, and maintenance activities throughout the unincorporated area of western El Dorado County (that portion of El Dorado County within the jurisdiction of the Central Valley RWQCB, excluding the Tahoe Basin). In addition, the SWMP addresses assignment of responsibilities for implementing storm water management procedures and practices as well as training, public education and outreach, monitoring and research, program evaluation, and reporting activities.

Recycled Wastewater Requirements

A reclaimed (i.e., recycled) water distribution system would be implemented as part of the Proposed Project Alternative. Wastewater recycling in California is regulated under Title 22, Division 4, of the CCRs under the jurisdiction of CDPH. The intent of these regulations is to ensure protection of public health associated with the use of recycled water. Because the Proposed Project Alternative includes a reclaimed water distribution system, also known as a "purple pipe" system, these regulations would apply (purple is the color commonly used to identify reclaimed water conveyance facilities). The regulations establish acceptable levels of constituents in recycled water for a range of uses and prescribe means for ensuring reliability in the production of recycled water. Using recycled water for nonpotable uses is common throughout the state and is an effective means of maximizing use of water resources. The Central Valley RWQCB establishes water reclamation requirements under the Title 22 regulations and is responsible for implementing wastewater recycling projects.

Senate Bill 5

SB 5, signed into law on October 10, 2007, enacts the Central Valley Flood Protection Act of 2008. Requirements of DWR and the CVFP Board (previously known as the State Reclamation Board) under SB 5 are:

- To prepare and adopt a Central Valley Flood Protection Plan (the Plan) (described below) by 2012.
- To establish 200-year (0.005 AEP) protection as the minimum urban level of flood protection, effective with respect to specific development projects as of 2015 or 2025, as explained below.
    - The DWR is directed to produce preliminary (i.e. Best Available) maps for 100-year (0.01 AEP) and 200-year (0.005 AEP) floodplains protected by project levees, and to make them available to cities and counties in the Sacramento-San Joaquin Valley ("Central Valley"). (California Water Code Section 9610[a]) These best available maps were made available on September 8, 2008, and can be found at the California Department of Water Resources http://www.water.ca.gov/floodmgmt/lrafmo/fmb/fes/best_available_maps/. The 200-year floodplain (0.005 AEP) as defined by California Water Code Section 9610[a], pursuant to SB 5 has not been delineated for the SPA.
- Sets deadlines for cities and counties in the Central Valley to amend their general plans and their zoning ordinances to conform to the Plan within 24 months and 36 months (i.e., approximately 2014 and 2015), respectively, of its adoption.
- Obligates Central Valley counties to develop flood emergency plans within 24 months of adoption of the Plan.

DWR must propose amendments to the California Building Standards Code (Building Code) to protect areas with flood depths anticipated to exceed three feet for the 200-year flood (0.005 AEP) event. SB 5 requires that the Building Code amendments are designed to reduce the risk of flood damage and increase safety.

No later than 2015, but potentially sooner depending on when the Central Valley Flood Protection Plan takes effect, SB 5 prohibits local governments from entering development agreements or approving entitlements or permits, including ministerial permits resulting in construction of a new residence in a flood hazard zone, which result in construction of a new residence in a flood zone unless one of three conditions are met:

- flood management facilities provide level of protection necessary to withstand 200-year flood event (0.005 AEP);
- the development agreement or other entitlements include conditions that provide protections necessary to withstand 200-year flood event (0.005 AEP); or
- the local flood management agency has made adequate progress on construction of a flood protection system that shall result in protections necessary to withstand 200-year flood event (0.005 AEP) by 2025.

Central Valley Flood Protection Plan

The Central Valley Flood Protection Plan (as set forth in California Water Code, Section 9614) is a descriptive document that includes the following elements:

- a description of the Flood Management System, its performance, and the challenges to modifying it;
- a description of the facilities included in the State Plan of Flood Control;
- a description of probable impacts of projected climate change, land-use patterns, and other potential challenges;
- an evaluation of needed structural improvements and a list of facilities recommended for removal; and
- a description of both structural and nonstructural methods for providing an urban level of flood protection to currently urbanized areas in the Central Valley.

California Water Code – Dam Safety Program

The California Water Code designates the regulatory Dam Safety Program to DWR, Division of Safety of Dams (DSOD). The principal goal of this program is to avoid dam failure and thus prevent loss of life and destruction of property. The DSOD reviews plans and specifications for the construction of new dams and for the enlargement, alteration, repair, or removal of existing dams, and must grant written approval before the owner can proceed with construction. Professional engineers and geologists from the DSOD evaluate each project, investigate proposed sites, and check available construction materials. Dams under DSOD jurisdiction include artificial barriers (together with appurtenant works) that are 25 feet or more in height or have an impounding capacity of 50 acre-feet or more. Any artificial barrier not in excess of 6 feet in height, regardless of storage capacity, or that has a storage capacity not in excess of 15 acre-feet, regardless of height, is not considered jurisdictional (DWR 2009). There is one impoundment located on a tributary to Alder Creek that may be considered under DSOD jurisdiction.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

The following goals and policies of the *Sacramento County General Plan* (Sacramento County 2007a) are applicable only to the No Project Alternative.

Conservation Element

- **Policy CO-9:** Community and specific plans shall specify urban runoff control strategies and requirements, consistent with Master Drainage Plans and Public Work's urban runoff management program, for development in newly urbanizing areas and identify sites where retention and treatment are warranted consistent with discharge permit requirement and county-wide runoff measures.

- **Policy CO-11:** Hazardous materials shall not be stored in the 100-year (0.01 AEP) floodplain in such a manner as to pose a significant potential for surface water contamination.

- **Policy CO-13:** Roads and structures shall be designed, built and landscaped so as to minimize erosion during and after construction.

- **Policy CO-16:** Encourage the County and Cities of Folsom, Sacramento, and Galt to jointly participate in a long-term water quality monitoring program for receiving waters within the county.

- **Policy CO-17:** Inform the community on laws governing the proper handling of hazardous materials.

El Dorado County General Plan

The following goals and policies of the *El Dorado County General Plan* (2004) are applicable only to the two local roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goals and policies that are applicable to the No Project Alternative or the other four action alternatives.

Transportation and Circulation Element

- **Policy TC-1q:** The County shall utilize road construction methods that seek to reduce air, water, and noise pollution associated with road and highway development.

Public Services and Utilities Element

- **Policy 5.4.1.1:** The County shall require storm drainage systems for discretionary development that protect public health and safety, preserve natural resources, prevent erosion of adjacent and downstream lands, prevent the increase in potential for flood hazard or damage on either adjacent, upstream or downstream properties, minimize impacts to existing facilities, meet the National Pollution Discharge Elimination System (NPDES) requirements, and preserve natural resources such as wetlands and riparian areas.

- **Policy 5.4.1.2:** Discretionary development shall protect natural drainage patterns, minimize erosion, and ensure existing facilities are not adversely impacted while retaining the aesthetic qualities of the drainage way.

Public Health, Safety, and Noise Element

- **Policy 6.4.1.2:** The County shall identify and delineate flood prone study areas discovered during the completion of the master drainage studies or plans.

City of Folsom General Plan

The following goals and policies of the *City of Folsom General Plan* (1993) are applicable to the Proposed Project and the other four action alternatives under consideration. There are no City of Folsom goals and policies that are applicable to the No Project Alternative.

Open Space and Conservation Element

- **Policy 25.1:** The surface and groundwater quality of Folsom shall not be degraded from City standards.
- **Policy 28.2:** The quality and quantity of surface water runoff from a property shall not exceed existing flows or existing quality or shall comply with City standards.

Health and Safety Element

- **Policy 28.2:** The quality and quantity of surface water runoff from a property shall not exceed existing flows or existing quality or shall comply with City standards for off-site drainage. The City shall implement a surface runoff water quality monitoring program to insure compliance with City standards.

Land Use Element

- **Policy 1.9:** Development proposed along streams shall be in conformance with a comprehensive development and management plan to be prepared for stream waterbeds prior to project approval.

City of Folsom Hillside Development Guidelines

On February 14, 1995, the Folsom Planning Department adopted Resolution No. 4604—Hillside Development Guidelines—the purpose of which is to illustrate key design principles and issues that City staff will use in evaluating applications for development of any site within hillside areas of the City. The guidelines address street design, grading, site design, parking, drainage, architecture, landscaping, visual impact, and preservation of natural features, and are based on the City's Hillside Development Procedures and Standards Ordinance (Ordinance No. 798).

Sacramento Stormwater Quality Partnership

The permittees of the NPDES Municipal Stormwater Permit described above, i.e. the Sacramento County and the Cities of Folsom, Sacramento, Citrus Heights, Elk Grove, Galt, and Rancho Cordova, have joined together to form SSQP. The SSQP is a collaborative partnership that protects and improves water quality in local waterways for the benefit of the community and the environment. The goals of the SSQP are to:

- improve the quality of urban runoff;
- increase public awareness about water quality and encourage pollution prevention behavior;
- strive for countywide consistency between permittee agency programs;
- improve internal communication and coordination to facilitate agency wide compliance;
- use public funds efficiently and effectively; and
- keep apprised of new and evolving regulations that may affect the Program in the future.

The permittees cooperatively participate in decision-making and goal-setting for the monitoring program, are involved in consultant selection and review, and comment on compliance reports and other work products. Annual Reports are produced that describe the activities conducted to comply with the NPDES permit.

The stormwater pollution prevention efforts needed to satisfy the NPDES permit requirements are implemented by the SSQP through its SQIP, either jointly or by the individual permittees. The major categories of SQIP activities, conducted jointly by the SSQP, are:

- program management – including legal authority and funding, inter- and intra-agency coordination, effectiveness assessment;
- target pollutant program (including implementation of plans to target mercury and pesticides);
- monitoring program to satisfy monitoring requirements specified in the monitoring and reporting program (MRP) portion of the NPDES permit;
- special studies; and
- regional public outreach.

Additionally, the permittees may share resources related to selected program element activities, such as commercial and/or industrial inspections. Program activities implemented by individual permittees (e.g., the City of Folsom) primarily involve activities related to program management (e.g., legal authority, funding, regulatory liaison, compliance reporting, training and coordination within and outside of the organization), construction, commercial/industrial inspections, municipal operations, illicit discharges, public outreach, and new development.

3A.9.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to hydrology and water quality if they would do any of the following:

- violate any water quality standards or waste discharge requirements, including NPDES waste discharge or stormwater runoff requirements, state or Federal antidegradation policies, enforceable water quality standards contained in the Central Valley RWQCB Basin Plan or statewide water quality control plans, or Federal rulemakings to establish water quality standards in California;
- substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a substantial lowering of the level of the local groundwater table;
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on-site or off-site;
- create or contribute runoff water that would exceed the capacity (peak flow) of existing or planned stormwater drainage systems;
- substantially degrade water quality;
- place within a 100-year (0.01 AEP) flood hazard area structures that would impede or redirect flood flows; or
- expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam.

ANALYSIS METHODOLOGY

This analysis relies on information provided by various public agencies, as well as site-specific technical planning studies generated to support proposed development. Hydrology and drainage–related studies reviewed in support of this analysis include the following documents:

- *Folsom Sphere of Influence Storm Drainage Master Plan.* Draft. (MacKay & Somps 2007, Appendix H1);
- *Sacramento City/County Drainage Manual Volume 2: Hydrology Standards*. County of Sacramento Department of Water Resources, December 1996 (Sacramento County 1996); and
- *Stormwater Quality Design Manual for the Sacramento and South Placer Regions* (SSQP 2007b).

Impacts associated with drainage, hydrology, and water quality that could result from construction and operational activities related to buildout of the SPA were evaluated based on expected construction practice, the materials used, and the locations and duration of the activities. The effects of the proposed development were compared to environmental baseline conditions (i.e., existing conditions) to determine the duration and magnitude of impacts.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.9-1 Potential Temporary, Short-Term Construction-Related Drainage and Water Quality Effects. *Construction activities during project implementation would involve extensive grading and movement of earth, which would substantially alter on-site drainage patterns and could generate sediment, erosion, and other nonpoint source pollutants in on-site stormwater that could drain to off-site areas and degrade local water quality.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, no project-related construction disturbances would occur. However, development would continue to occur under the existing Sacramento County agricultural zoning classification, AG-80, and no off-site water facilities would be constructed. With a minimum lot size of 80 acres allowed under this classification, up to 44 rural residences would be possible in the SPA, with associated agricultural activities that could include on-site wells, grazing, and pesticide applications. These residences would be required to comply with appropriate Sacramento County erosion-control policies, Sacramento County and Section 13801 (California Water Code) well installation standards addressing aquifer contamination from surface water, and regulatory agency standards designed to avoid contaminated runoff and other waste discharges. Thus, **direct** and **indirect** construction-related drainage and water quality impacts would be **less than significant**. ***[Lesser]***

NCP, RIM

Under the No USACE Permit Alternative, because project components would be reconfigured to avoid the placement of dredged or fill material into wetlands and other waters of the U.S., approximately 450 fewer acres would be disturbed and developed. Impacts under the Resource Impact Minimization Alternative would also be less than those of the Proposed Project Alternative because an additional 375 acres of land across the SPA would

be designated as open space. This would result in fewer acres of development and associated disturbance than the Proposed Project Alternative. However, an infrastructure backbone and drainage system would be installed throughout the SPA under both alternatives and substantial temporary, construction-related alteration of the existing drainages would still occur. Temporary, short-term construction-related disturbances at the SPA would still have the potential to result in the discharge of polluted and/or contaminated stormwater or sedimentation. Therefore, the **direct** and **indirect** project-related erosion and water quality impacts would be **significant**. ***[Lesser]***

Mitigation Measure 3A.9-1: Acquire Appropriate Regulatory Permits and Prepare and Implement SWPPP and BMPs.

Prior to the issuance of grading permits, the project applicant(s) of all projects disturbing one or more acres (including phased construction of smaller areas which are part of a larger project) shall obtain coverage under the SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ), including preparation and submittal of a project-specific SWPPP at the time the NOI is filed. The project applicant(s) shall also prepare and submit any other necessary erosion and sediment control and engineering plans and specifications for pollution prevention and control to Sacramento County, City of Folsom, El Dorado County (for the off-site roadways into El Dorado Hills under the Proposed Project Alternative). The SWPPP and other appropriate plans shall identify and specify:

- the use of an effective combination of robust erosion and sediment control BMPs and construction techniques accepted by the local jurisdictions for use in the project area at the time of construction, that shall reduce the potential for runoff and the release, mobilization, and exposure of pollutants, including legacy sources of mercury from project-related construction sites. These may include but would not be limited to temporary erosion control and soil stabilization measures, sedimentation ponds, inlet protection, perforated riser pipes, check dams, and silt fences

- the implementation of approved local plans, non-stormwater management controls, permanent post-construction BMPs, and inspection and maintenance responsibilities;

- the pollutants that are likely to be used during construction that could be present in stormwater drainage and nonstormwater discharges, including fuels, lubricants, and other types of materials used for equipment operation;

- spill prevention and contingency measures, including measures to prevent or clean up spills of hazardous waste and of hazardous materials used for equipment operation, and emergency procedures for responding to spills;

- personnel training requirements and procedures that shall be used to ensure that workers are aware of permit requirements and proper installation methods for BMPs specified in the SWPPP; and

- the appropriate personnel responsible for supervisory duties related to implementation of the SWPPP.

Where applicable, BMPs identified in the SWPPP shall be in place throughout all site work and construction/demolition activities and shall be used in all subsequent site development activities. BMPs may include, but are not limited to, such measures as those listed below.

- Implementing temporary erosion and sediment control measures in disturbed areas to minimize discharge of sediment into nearby drainage conveyances, in compliance with state and local standards in effect at the time of construction. These measures may include silt fences, staked straw bales or wattles, sediment/silt basins and traps, geofabric, sandbag dikes, and temporary vegetation.

- Establishing permanent vegetative cover to reduce erosion in areas disturbed by construction by slowing runoff velocities, trapping sediment, and enhancing filtration and transpiration.

- Using drainage swales, ditches, and earth dikes to control erosion and runoff by conveying surface runoff down sloping land, intercepting and diverting runoff to a watercourse or channel, preventing sheet flow over sloped surfaces, preventing runoff accumulation at the base of a grade, and avoiding flood damage along roadways and facility infrastructure.

A copy of the approved SWPPP shall be maintained and available at all times on the construction site.

For those areas that would be disturbed as part of the U.S. 50 interchange improvements, Caltrans shall coordinate with the development and implementation of the overall project SWPPP, or develop and implement its own SWPPP specific to the interchange improvements, to ensure that water quality degradation would be avoided or minimized to the maximum extent practicable.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) during all project phases and on-site and off-site elements.

Timing: Submittal of the State Construction General Permit NOI and SWPPP (where applicable) and development and submittal of any other locally required plans and specifications before the issuance of grading permits for all on-site project phases and off-site elements and implementation throughout project construction.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.

3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

4. For the U.S. 50 interchange improvements: Caltrans.

5. For all construction activities subject to the state's Construction General Permit and violators of local ordinances referred to the state for enforcement: Central Valley Regional Water Quality Control Board.

PP, RHD

Implementation of the Proposed Project and Reduced Hillside Development Alternative would include substantial construction activity over more than 2,500 acres, including soil removal, trenching and pipe installation, fabrication of concrete channels, grading, and revegetation. An infrastructure backbone and drainage system would be installed throughout the SPA, as shown in Chapter 2, "Alternatives." Construction activities associated with development of the SPA would create the potential for soil erosion and sedimentation both within and downstream of the SPA. The construction process could also result in the accidental release of other pollutants to surface waters, including oil and grease, petroleum hydrocarbons, chemical substances used during construction, waste concrete, and wash water.

The substantial construction-related alteration of on-site drainages could result in soil erosion and stormwater discharges of suspended solids, increased turbidity, and potential release, mobilization, and exposure of other pollutants, including legacy sources of mercury from project-related construction sites. This contaminated runoff could enter Alder Creek, Buffalo Creek, Coyote Creek, Carson Creek, or other on-site drainage channels and ultimately drain off-site to downstream water bodies including Lake Natoma and the lower American River. Many construction-related wastes have the potential to degrade existing water quality and beneficial uses by altering the dissolved-oxygen content, temperature, pH, suspended-sediment and turbidity levels, or nutrient content, or by causing toxic effects in the aquatic environment. The presence and distribution of legacy mercury in upland areas and/or drainages is currently unknown; however, if it is present in the sediments where construction activities disturb soils, it could become mobilized and become exposed to the environment downstream. Therefore, project-related construction activities could violate water quality standards or cause direct harm to aquatic organisms.

Localized erosion hazards may be high where the SPA topography is steep. Intense rainfall and associated stormwater runoff in relatively flat areas could result in short periods of sheet erosion within areas of exposed or stockpiled soils. If uncontrolled, these soil materials could cause sedimentation and blockage of drainage channels. Further, the compaction of soils by heavy equipment may reduce the infiltration capacity of soils and increase the potential for runoff and erosion. Non-stormwater discharges could result from activities such as construction dewatering procedures, or discharge or accidental spills of hazardous substances such as fuels, oils, concrete, paints, solvents, cleaners, or other construction materials.

Although construction on areas of steep topography would be somewhat reduced under the Reduced Hillside Development Alternative, thereby reducing the potential for localized erosion from this source, the total acreage of development subjected to construction activities would be reduced by only approximately 64 acres, with an additional 19 acres of commercial and industrial development, resulting in a nearly identical area subject to construction activities as compared to the Proposed Project Alternative.

Because the Proposed Project and Reduced Hillside Development Alternatives would disturb large areas of land, substantially alter on-site drainage patterns, and could result in impacts on water quality within on-site drainage channels and ultimately off-site drainage channels as a result of temporary, short-term construction activities, the **direct** and **indirect** project-related erosion and water quality impacts would be **significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.9-1.

CD

Impacts under the Centralized Development Alternative would be less than those of the Proposed Project Alternative because there would be approximately 387 fewer acres of residential development and approximately 487 additional acres of the SPA (including areas of steep topography) would remain in its current undeveloped state and not be subject to construction activities. A large-scale infrastructure backbone and drainage system would be still installed throughout the SPA under this alternative and substantial temporary, construction-related alteration of the existing drainages would still occur. Temporary, short-term construction-related disturbances at the SPA would still have the potential to result in the discharge of polluted and/or contaminated stormwater or sedimentation. Therefore, project-related **direct** and **indirect** erosion and water quality impacts would be **significant**. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.9-1.

Implementation of Mitigation Measure 3A.9-1 would reduce the significant temporary, short-term construction-related drainage and water quality effects under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to **a less-than-significant level** by requiring preparation and implementation of a SWPPP with appropriate BMPs such as source

control, revegetation, and erosion control, to maintain surface water quality conditions in adjacent receiving waters. However, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

Several technical studies have been conducted regarding the impacts of water quality control features on groundwater (e.g., City of Fresno Nationwide Urban Runoff Project [as summarized in EPA 1983] and *California Storm Water Best Management Practices Handbook* prepared by the California Stormwater Quality Association [CASQA] [CASQA 2003]) and surface water (e.g., *Preliminary Data Summary of Urban Storm Water Best Management Practices* [EPA 1999] and *Cumulative Water Quality Analysis Report for the Lahontan Development 1996–2002* [County of Placer 2007]). These studies have identified that water quality control features such as revegetation, erosion control measures detention/sedimentation, and infiltration basins have been successful in controlling water quality and avoiding water quality impacts (metals and organic compounds associated with stormwater are typically lost within the first few feet of the soil of the retention basins associated with groundwater). Further, technical studies associated with the Lahontan Development demonstrated that the use of a variety BMPs such as source control, detention/sedimentation basins, revegetation, and erosion control, have been able to maintain surface water quality conditions in adjacent receiving waters.

IMPACT 3A.9-2 Potential Increased Risk of Flooding and Hydromodification from Increased Stormwater Runoff. *Project implementation would increase the amount of impervious surfaces on the SPA, thereby increasing surface runoff. This increase in surface runoff would result in an increase in both the total volume and the peak discharge rate of stormwater runoff, and therefore could result in greater potential for on- and off-site flooding.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the existing hydrology and drainage conditions at the SPA would not be altered except at a localized level with potential construction of up to 44 rural residences under the existing AG-80 Sacramento County zoning, and no off-site water facilities would be constructed. The existing land use classification would not change, overall drainage patterns in the SPA would not be substantially altered, no substantial increase in impervious surfaces would occur, and any construction activities would be required to comply with Sacramento County erosion control policies; thus, **direct** and **indirect** impacts would be **less than significant**. ***[Lesser]***

NCP, RIM

The amount of stormwater runoff would likely be lower under the No USACE Permit and Resource Impact Minimization Alternatives than under the Proposed Project Alternative because of the decreased development areas (approximately 375 and 450 acres, respectively) and associated decreases in impervious surfaces of residential, commercial, and industrial land uses, as shown in Exhibits 2-10 (RIM), and 2-17 (NCP) in Chapter 2, "Alternatives."

To eliminate any flow increase or unacceptable hydromodification caused by project development, stormwater detention facilities and other improvements (e.g., source controls, biotechnical stream stabilization) would be constructed to maintain peak storm flows at no greater than the level existing before development, as illustrated in Exhibits 2-11 (RIM) and 2-18 (NCP) in Chapter 2, "Alternatives." However, since final designs and specifications have not been submitted to or approved by the City, implementation of the No USACE Permit and Resource Impact Minimization Alternatives could result in **potentially significant, direct** and **indirect** impacts related to stormwater runoff and the subsequent risk of flooding. ***[Lesser]***

Mitigation Measure 3A.9-2: Prepare and Submit Final Drainage Plans and Implement Requirements Contained in Those Plans.

Before the approval of grading plans and building permits, the project applicant(s) of all project phases shall submit final drainage plans to the City, and to El Dorado County for the off-site roadway connections into El Dorado Hills, demonstrating that off-site upstream runoff would be appropriately conveyed through the SPA, and that project-related on-site runoff would be appropriately contained in detention basins or managed with through other improvements (e.g., source controls, biotechnical stream stabilization) to reduce flooding and hydromodfication impacts.

The plans shall include, but not be limited to, the following items:

- an accurate calculation of pre-project and post-project runoff scenarios, obtained using appropriate engineering methods, that accurately evaluates potential changes to runoff, including increased surface runoff;
- runoff calculations for the 10-year and 100-year (0.01 AEP) storm events (and other, smaller storm events as required) shall be performed and the trunk drainage pipeline sizes confirmed based on alignments and detention facility locations finalized in the design phase;
- a description of the proposed maintenance program for the on-site drainage system;
- project-specific standards for installing drainage systems;
- City and El Dorado County flood control design requirements and measures designed to comply with them;

  Implementation of stormwater management BMPs that avoid increases in the erosive force of flows beyond a specific range of conditions needed to limit hydromodification and maintain current stream geomorphology. These BMPs will be designed and constructed in accordance with the forthcoming SSQP Hydromodification Management Plan (to be adopted by the RWQCB) and may include, but are not limited to, the following:

  - use of Low Impact Development (LID) techniques to limit increases in stormwater runoff at the point of origination (these may include, but are not limited to: surface swales; replacement of conventional impervious surfaces with pervious surfaces [e.g., porous pavement]; impervious surfaces disconnection; and trees planted to intercept stormwater);
  - enlarged detention basins to minimize flow changes and changes to flow duration characteristics;
  - bioengineered stream stabilization to minimize bank erosion, utilizing vegetative and rock stabilization, and inset floodplain restoration features that provide for enhancement of riparian habitat and maintenance of natural hydrologic and channel to floodplain interactions;
  - minimize slope differences between any stormwater or detention facility outfall channel with the existing receiving channel gradient to reduce flow velocity; and
  - minimize to the extent possible detention basin, bridge embankment, and other encroachments into the channel and floodplain corridor, and utilize open bottom box culverts to allow sediment passage on smaller drainage courses.

- The final drainage plan shall demonstrate to the satisfaction of the City of Folsom Community Development and Public Works Departments and El Dorado County Department of Transportation that 100-year (0.01 AEP) flood flows would be appropriately channeled and contained, such that the risk to people or damage to structures within or down gradient of the SPA would not occur, and that hydromodification would not be increased from pre-development levels such that existing stream geomorphology would be changed (the range of conditions should be calculated for each receiving water if feasible, or a conservative estimate should be used, e.g., an Ep of 1 ±10% or other as approved by the Sacramento Stormwater Quality Partnership and/or City of Folsom Public Works Department).

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with El Dorado County.

Implementation: Project applicant(s) during all on-site project phases and off-site elements.

Timing: Before approval of grading plans and building permits of all project phases.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Public Works Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.

PP, RHD

Project implementation would include development on approximately 2,500 acres of land, most of which has not been previously developed. The Proposed Project Alternative includes residential and commercial development, and supporting facilities and services, including parks, schools, and major circulation and roadway infrastructure. The various types of proposed land uses would each contribute different relative amounts of stormwater runoff corresponding to the percentage of impervious surface associated with each land use category, which ranges from 2% (wetlands/open space) to 95% (major roads, parking, and stormwater detention) (City and County of Sacramento 1996: 5-7). This increase in impervious surface would increase the peak discharge rate of stormwater runoff generated on the SPA and from areas upstream (e.g., contribution of flow from off-site watersheds to Alder Creek within the SPA).

The Proposed Project Alternative would use an on-site conveyance and detention/water quality treatment system and the conveyance of off-site flows through the property. A Draft Storm Drainage Masterplan (Drainage Plan) has been prepared that details the proposed drainage system (MacKay & Somps 2007). The proposed stormwater drainage system has been designed to satisfy the design criteria of the SSQP, FEMA National Flood Insurance Program requirements, and the 2002-2008 NPDES requirements. As illustrated in Exhibit 2-4 (see Chapter 2, "Alternatives"), the Proposed Project Alternative has been designed to provide facilities that would maintain stormwater flows originating on the SPA during and after buildout, at a level equal to or less than predevelopment flows.

The hydrologic analysis in this study is based on procedures outlined in the Sacramento City/County Drainage Manual, Volume 2 Hydrology Standards (City and County of Sacramento 1996). Methodology from this Manual was used to develop a HEC-HMS (version 3.1.0) model for the Proposed Project Alternative, which contained project area subbasin properties, rainfall data, and pipe/channel routing information to determine the peak flows for the 2-year, 5-year, 10-year, and 100-year 24-hour design storms. Within the models, the following three scenarios were created:

1. Existing Conditions: This scenario establishes existing base flow conditions.

2. Proposed Conditions without Detention: This scenario includes the developed area without on-site detention basins.

3. Proposed Conditions with Detention: The scenario includes the developed area with the addition of on-site detention basins to mitigate for increased flows.

The subwatersheds in the SPA and immediate surrounding area were further delineated into 61 subbasins based on aerial topography for those within the Proposed Project Alternative site and USGS topographic maps for those outside of the limits of the aerial topography (MacKay & Somps 2007:10). See Exhibit 3A.9-2 and Table 3A.9-6 for subbasin locations and areas. The existing on-site and off-site subwatersheds used in the Drainage Plan hydrologic modeling are shown on Exhibit 3A.9-2.

Three off-site developments north of U.S. 50 contribute flow to the Alder Creek watershed within the SPA: Broadstone Unit #2, Broadstone Unit #3, and The Oaks at Willow Springs (see Exhibit 3A.9-2). These developments currently have detention basins that were designed to detain flows back to pre-project conditions pursuant to SSQP, FEMA, and NPDES requirements. The design outflow volumes from these detention basins that contribute flow to the watershed in the SPA were used in the Drainage Plan (see MacKay & Somps 2007 for additional detail). Additionally, off-site watersheds to the south of the SPA also contribute flow to the Alder Creek system. These watersheds would remain undeveloped under the Proposed Project Alternative. Physical parameters for these watersheds were estimated using USGS topographic maps. Data for areas north and south of the SPA, along with information on the overall watersheds, were used to simulate runoff through these areas/basins under the above three scenarios. The total estimated peak flow from these off-site watersheds are shown in Table 3A.9-2.

Table 3A.9-2
Modeled Peak 100-Year (0.01 AEP) Flow Rate Contributions from Off-Site Basins (Existing Conditions)

Under current conditions, runoff leaves the boundaries of the SPA at eight main outfall locations (see Exhibit 3A.9-1). The Alder Creek watershed, the primary watershed in the SPA, has one main outfall location on the west side of Prairie City Road. The upper Buffalo Creek portion of that watershed, located along the west project boundary, has three outfall locations on the east side of Prairie City Road. The Coyote Creek watershed begins within the southwest project boundary. Runoff leaves this watershed at one location. Four on-site sub basins and

two off-site sub basins of the Carson Creek watershed are incorporated in the hydrologic analysis. The Carson Creek watershed, on the east side of the SPA, has three outfall locations.

Modeling results of peak flows at these main outfall locations from the SPA under the three Proposed Project Alternative scenarios described above were compared for the 100-year (0.01 AEP), 10-year, 5-year, and 2-year storm events, as shown in Table 3A.9-3.

The results in Table 3A.9-4 show that with the detention basin facilities as proposed, the 100-year (0.01 AEP) and 10-year storm events under the Proposed Project Alternative development conditions would remain at or below existing conditions. During the 5-year and 2-year events, flow rates would increase at some locations under the Proposed Project Alternative. Although these increases in peak flow rates are minor and are not anticipated to affect downstream facilities, modified outlet facilities would be provided to reduce the flow to pre-project conditions of these 5-year and 2-year events if it was determined during detailed design studies that downstream facilities would be affected.

The proposed locations of the detention basins required to mitigate flow rate increases due to project development for the 100-year (0.01 AEP) storm event are shown on Exhibit 3A.9-4. Three basins would be located in the Buffalo Creek watershed, one in the Coyote Creek watershed, three in the Carson Creek watershed, and nine in the Alder Creek watershed. The applicants have stated that the basins were sized conservatively and may be refined during the design phase. The 100-year (0.01 AEP) storm detention capacities for the basins are shown in Table 3A.9-4.

The storm drain pipe alignments (see Exhibit 2-4 in Chapter 2, "Alternatives") were sized to convey the 10-year peak flow rate under gravity flow conditions (flowing full with no pressure flow). The 10-year flow volumes used to calculate pipe size were taken from the "with detention" analysis. Major trunk lines were assumed to have a slope of 1%, which was considered a conservative assumption based on the generally steep slopes in the project area, and generally resulted in oversized pipes. During a 100-year (0.01 AEP) storm event the storm drain pipes would flow under pressure, and flow not conveyed in the pipes would be allowed to flow in the streets. Because the design phase is not yet completed, alignments and detention facility locations have not been finalized.

Potential changes to the hydrologic and geomorphic processes in a watershed as a result of impervious surfaces and drainage infrastructure from urbanization include increased runoff volumes and dry weather flows, increased frequency and number of runoff events, increased long-term cumulative duration of flows, as well as increased peak flows. These changes are referred to as "hydromodification." Hydromodification intensifies the erosion and sediment transport process, and often leads to changes in stream channel geometry, streambed and streambank properties, which can result in degradation and loss of riparian habitat, and downgradient sediment deposition causing flooding problems (Geosyntec 2007:4-1). Studies have preliminarily evaluated the hydrologic and geomorphic impacts of hydromodification in the Alder Creek watershed and surrounding areas within the region (Geosyntec 2007; Northwest Hydraulics Consultants [NHC] 2009). The Alder Creek Watershed Management Action Plan (Alder Creek WMAP) (City of Folsom 2010), provides a more general assessment of the watershed, and indicates that shallow soils and prevalence of exposed bedrock limits the channel susceptibility to degradation (e.g., down cutting) within much of the presently undeveloped watershed (including areas within the SPA), and channel instability resulting from hydromodification in these areas would be generally anticipated to be restricted to bank erosion (City of Folsom 2010:4-6, NHC 2009:22-24).

One measurement used to evaluate the amounts of hydromodification in pre- and post-development scenarios is the erosion potential (Ep). The Ep measures the relative change in the amount of erosive force applied to the channel boundary under a given flow scenario, as well as sediment transport capacity, between any two watershed scenarios. An Ep of 1 would indicate no change in erosion potential due to hydromodification between two watershed scenarios, i.e. the pre-development erosion and sediment carrying capacity is maintained. A study based on 49 stream channel sites in four San Francisco Bay Area watersheds showed that as the Ep begins to exceed 1.2 (i.e., a 20 % increase) the probability of stream channel instabilities dramatically increases. The study

suggests that the effectiveness of BMPs can be evaluated by their ability to maintain a target Ep of 1 ±20%. A U.S. Army Corps of Engineers study suggests a more conservative Ep target of 1 ±10% (Geosyntec 2007:5-13). The Alder Creek WMAP provides additional guidance and recommendations related to assessment and protection of hydrologic and geomorphic processes and functions for Alder Creek (City of Folsom 2010:5-17).

The total acreage of development subjected to construction activities under the Reduced Hillside Development Alternative would be reduced by only approximately 64 acres, with an additional 19 acres of commercial and industrial development, resulting in a nearly identical area subject to construction activities as compared to the Proposed Project Alternative. Therefore, impacts under the Reduced Hillside Development Alternative would be similar to that of the Proposed Project Alternative because a similar number of acres would be developed under both scenarios, with a similar area of associated impervious surfaces, as shown in Exhibit 2-14 in Chapter 2, "Alternatives."

While it appears that the applicants' proposed Storm Drainage Masterplan (MacKay & Somps 2007) could appropriately convey upstream off-site runoff and would appropriately detain project-related on-site runoff in a manner that effectively meets current stormwater management criteria to acceptable levels, hydromodification is not addressed in the Storm Drainage Master Plan and final designs and specifications have not been submitted or approved by the City. Without the necessary information to demonstrate that all stormwater criteria and standards, including hydromodifcation management, are being met, it cannot be assumed that potentially significant impacts would not occur. Therefore, implementation of the Proposed Project or the Reduced Hillside Development Alternatives could result in **potentially significant**, **direct** and **indirect** impacts related to stormwater runoff and the subsequent risk of flooding and/or hydromodification. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.9-2.

CD

The amount of stormwater runoff would likely be lower under the Centralized Development Alternative than under the Proposed Project Alternative because there would be approximately 387 fewer acres of residential development and approximately 487 additional acres of the SPA (including most of the areas of steep topography in the eastern foothills) would remain in its current undeveloped state. This would result in associated decreases in impervious surfaces as shown in Exhibit 2-12 in Chapter 2, "Alternatives." In addition, because steep slopes are in general more erodible, have higher runoff coefficients, and cannot have detention basin placement due to instability (SSQP 2007b: DB-2), reducing or eliminating development on these areas would reduce the potential for increases in stormwater runoff quantity or contaminants.

To eliminate any flow increase caused by project development under the Centralized Development Alternative, stormwater detention facilities and other improvements (e.g., source controls, biotechnical stream stabilization) would be constructed to maintain peak storm flows at no greater than the level existing before development, as illustrated in Exhibit 2-13 in Chapter 2, "Alternatives." However, since final designs and specifications have not been submitted to or approved by the City, implementation of the Centralized Development Alternative could result in **potentially significant, direct** and **indirect** impacts related to stormwater runoff and the subsequent risk of flooding. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.9-2.

Implementation of Mitigation Measure 3A.9-2 would reduce the potentially significant impact associated with the potential increased risk of flooding from increased stormwater runoff under the No USACE Permit, Proposed Project Alternative, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because the project applicant(s) would demonstrate to the appropriate regulatory agency that the project would conform with applicable state and local regulations regulating surface water runoff, including the procedures outlined in the Sacramento City/County Drainage Manual (City and County of Sacramento 1996) and the El Dorado County SWMP (El Dorado County 2004), which are designed to meet or exceed applicable state and local regulations pertaining to stormwater runoff. Specific project design standards as required in this mitigation measure would, when implemented, provide flood protection to meet FEMA 100-year (0.01 AEP) flood protection criteria, would safely convey on-site and off-site flows through the SPA, would reduce the effects of hydromodification on stream channel geomorphology, and would prevent substantial increased flood hazard on downstream areas by limiting peak discharges of flood flows to below pre-project levels. However, some of the off-site elements (two roadway connections in El Dorado County) fall under the jurisdiction of El Dorado County; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.9-3 Long-Term Water Quality and Hydrology Effects from Urban Runoff. *Project implementation would convert a large area of undeveloped land to residential and commercial uses, thereby changing the amount and timing of potential long-term pollutant discharges in stormwater and other urban runoff to Alder Creek, Buffalo Creek, Coyote Creek, Carson Creek, and other on- and off-site drainages.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residence could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Agricultural activities could include new on-site wells, grazing, and pesticide applications, with associated contaminant discharges. These residences would be required to comply with appropriate Sacramento

County erosion-control policies, Sacramento County and Section 13801 (California Water Code) well installation standards addressing aquifer contamination from surface water, Sacramento County on-site wastewater treatment system installation standards if septic systems are installed, and regulatory agency standards designed to avoid contaminated runoff and groundwater, and other waste discharges. Thus, **direct** and **indirect** impacts under the No Project Alternative would be **less than significant**. ***[Lesser]***

NCP, RIM, CD, RHD

The amount of contaminants discharged in stormwater drainage would likely be lower under the No USACE Permit, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives than under the Proposed Project Alternative because of the decreased density and areas of residential, commercial, and industrial land uses, as shown in Exhibits 2-10 (RIM) and 2-17 (NCP) in Chapter 2, "Alternatives." Further, the contaminant amounts would likely be lower in the eastern portion of the SPA because of the reduced amount of residential, commercial, and industrial land uses under both of these alternatives.

Water quality BMPs, including those to be used for the Proposed Project Alternative and shown in Table 3A.9-7, such as revegetation, erosion control measures, and detention basins, have been shown to be successful in controlling water quality and avoiding water quality impacts (metals and organic compounds associated with stormwater are typically lost within the first few feet of the soil of the retention basins associated with groundwater [EPA 1983:7-24]). Pollutants are removed from stormwater in detention basins through gravitational settling and biological processes depending on the type of basin. Permanent ponds (i.e., micropools) in dry weather may enhance pollutant removal through biological and chemical processes (SSQP 2007b:DB-2). To eliminate any flow increase caused by project development, and any erosion related to this increase, stormwater detention facilities would be constructed to maintain peak storm flows at the level existing before development, as illustrated in Exhibits 2-11 (RIM), 2-13 (CD), 2-15 (RHD), and 2-18 (NCP) in Chapter 2, "Alternatives."

However, because final design plans and specifications have not been submitted to or approved by the City, implementation of the No USACE Permit, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives could result in **potentially significant, direct** and **indirect** impacts related to the potential for contaminants to enter receiving waters, thus resulting in adverse effects from long-term urban runoff. ***[Lesser]***

Mitigation Measure 3A.9-3: Develop and Implement a BMP and Water Quality Maintenance Plan.

Before approval of the final small-lot subdivision map for all project phases, a detailed BMP and water quality maintenance plan shall be prepared by a qualified engineer retained by the project applicant(s) of all project phases. Drafts of the plan shall be submitted to the City of Folsom and El Dorado County for the off-site roadway connections into El Dorado Hills, for review and approval concurrently with development of tentative subdivision maps for all project phases. The plan shall finalize the water quality improvements and further detail the structural and nonstructural BMPs proposed for the project. The plan shall include the elements described below.

- A quantitative hydrologic and water quality analysis of proposed conditions incorporating the proposed drainage design features.
- Predevelopment and postdevelopment calculations demonstrating that the proposed water quality BMPs meet or exceed requirements established by the City of Folsom and including details regarding the size, geometry, and functional timing of storage and release pursuant to the '"Stormwater Quality Design Manual for Sacramento and South Placer Regions" ([SSQP 2007b] per NPDES Permit No. CAS082597 WDR Order No. R5-2008-0142, page 46) and El Dorado County's NPDES SWMP (County of El Dorado 2004).

- Source control programs to control water quality pollutants on the SPA, which may include but are limited to recycling, street sweeping, storm drain cleaning, household hazardous waste collection, waste minimization, prevention of spills and illegal dumping, and effective management of public trash collection areas.

- A pond management component for the proposed basins that shall include management and maintenance requirements for the design features and BMPs, and responsible parties for maintenance and funding.

- LID control measures shall be integrated into the BMP and water quality maintenance plan. These may include, but are not limited to:

  - surface swales;
  - replacement of conventional impervious surfaces with pervious surfaces (e.g., porous pavement);
  - impervious surfaces disconnection; and
  - trees planted to intercept stormwater.

- New stormwater facilities shall be placed along the natural drainage courses within the SPA to the extent practicable so as to mimic the natural drainage patterns. The reduction in runoff as a result of the LID configurations shall be quantified based on the runoff reduction credit system methodology described in "Stormwater Quality Design Manual for the Sacramento and South Placer Regions, Chapter 5 and Appendix D4" (SSQP 2007b) and proposed detention basins and other water quality BMPs shall be sized to handle these runoff volumes.

For those areas that would be disturbed as part of the U.S. 50 interchange improvements, it is anticipated that Caltrans would coordinate with the development and implementation of the overall project SWPPP, or develop and implement its own SWPPP specific to the interchange improvements, to ensure that water quality degradation would be avoided or minimized to the maximum extent practicable.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with El Dorado County and Caltrans.

Implementation: Project applicant(s) during all on-site project phases and off-site elements.

Timing: Prepare plans before the issuance of grading permits for all project phases and off-site elements and implementation throughout project construction.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department and Public Works Department.

2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.

3. For the U.S. 50 interchange improvements: Caltrans.

PP

The conversion of undeveloped land to urban land uses would alter the types, quantities, and timing of contaminant discharges in stormwater runoff. Overall, the potential for the Proposed Project Alternative to cause or contribute to long-term discharges of urban contaminants (e.g., oil and grease, fuel, trash) into the stormwater drainage system and ultimate receiving waters would increase compared to existing conditions. Some

contaminants associated with existing on-site agricultural activities (e.g., sediment, nutrients, pathogens, agricultural chemicals) would decrease as these uses are phased out during project development. The potential discharges of contaminated urban runoff from paved and landscaped areas could increase or could cause or contribute to adverse effects on aquatic organisms in receiving waters. Urban contaminants typically accumulate during the dry season and may be washed off when adequate rainfall returns in the fall to produce a "first flush" of runoff. The amount of contaminants discharged in stormwater drainage from developed areas varies based on a variety of factors, including the intensity of urban uses such as vehicle traffic, types of activities occurring on-site (e.g., office, commercial, industrial), types of contaminants used on-site (e.g., pesticides, herbicides, cleaning agents, petroleum byproducts), contaminants deposited on paved surfaces, and the amount of rainfall.

The storm drainage system for the Proposed Project Alternative, as described in the Folsom Plan Area Specific Plan (City of Folsom 2009) and Storm Drainage Masterplan (MacKay & Somps 2007), would be designed to direct runoff flows into on-site detention basins (and one off-site basin west of Prairie City Road), and would incorporate water quality treatment. The stormwater quality treatment configurations would use treatment methodologies as described in the Stormwater Quality Design Manual (SSQP 2007b) and approved by the City. The Sacramento NPDES MS4 Permit (described in above in the "Regulatory Framework" section), which applies to this project area, requires that "priority new development and redevelopment projects shall integrate LID principles early in the project planning and design process." The goal is to increase infiltration potential, evaporation, and surface storage while reducing excess stormwater runoff. The LID techniques would consist of a series of surface swales, catch basins, drainage inlets, underground pipes and detention basins. New stormwater facilities would be placed along the natural drainage courses within the SPA to the extent practicable so as to mimic the natural drainage patterns. The goal of the LID features would be to mimic the predevelopment hydrology at the SPA by using the above decentralized design techniques that infiltrate, filter, store, evaporate, and detain runoff close to the source of rainfall.

The proposed water quality detention basins were sized based on criteria outlined in the Stormwater Quality Design Manual for the Sacramento and South Placer Regions (MacKay & Somps 2007; SSQP 2007b). Table 3A.9-6 shows the preliminary water quality volumes required for each SPA subbasin (see Exhibit 3A.9-4) based on these criteria. At locations where subbasins discharge directly into a stormwater detention basin, the water quality volume could be added to the overall detention basin size. The water quality basin sizing and design configuration for each watershed would be finalized during the final design stages.

Water quality BMPs, including those to be used for the Proposed Project Alternative and shown in Table 3A.9-7, such as landscape/buffer strips, wetlands, infiltration trenches, swales, and detention basins have been shown to be successful in controlling water quality and avoiding water quality impacts (metals and organic compounds associated with stormwater are typically lost within the first few feet of the soil of the retention basins associated with groundwater [EPA 1983:7-24]). Pollutants are removed from stormwater in detention basins through gravitational settling and biological processes depending on the type of basin. Permanent ponds (i.e., micropools)

in dry weather may enhance pollutant removal through biological and chemical processes (SSQP 2007b:DB-2). To eliminate any flow increase caused by project development, and any erosion related to this increase, stormwater detention facilities would be constructed to maintain peak storm flows not to exceed the level existing before development, as shown on Table 3A.9-3 and illustrated in Exhibit 2-4 in Chapter 2, "Alternatives."

However, because final design plans and specifications have not been submitted to or approved by the City or El Dorado County (for off-site roadway connections), implementation of the Proposed Project Alternative could result in contaminants entering receiving waters, thus resulting in adverse effects from long-term urban runoff. Because the Proposed Project Alternative could result in impacts on water quality within on-site drainage channels and ultimately off-site drainage channels as a result of runoff from the SPA, the project-related water quality impacts would be both **direct** and **indirect**, and would be **potentially significant**.

Mitigation Measure: Implement Mitigation Measure 3A.9-3.

Implementation of Mitigation Measure 3A.9-3 would reduce the potentially significant impact associated with potential long-term water quality effects of urban runoff under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because the project applicant(s) of all project phases would develop and implement a BMP and water quality maintenance plan that would demonstrate to the City that the Proposed Project Alternative would conform to applicable state and local regulations restricting surface water runoff including the Stormwater

Quality Design Manual for the Sacramento and South Placer Regions (SSQP 2007b) and El Dorado County's SWMP (El Dorado County 2004). The permanent BMPs proposed for the stormwater treatment system and described in detail in the SSQP have been shown to be effective in reducing contaminant levels in urban runoff (EPA 1999, CASQA 2003). However, some of the off-site elements fall under the jurisdiction of El Dorado County and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

Table 3A.9-7 Expected Pollutant Removal Efficiency of BMPs					
BMP Type	Typical Pollutant Removal (%)				
	Suspended Solids	Nitrogen	Phosphorus	Pathogens	Metals
Structural BMPs					
Dry detention basins	30–65	15–45	15–45	<30	15–45

IMPACT 3A.9-4 Potential Exposure of People or Structures to a Significant Risk of Flooding as a Result of the Failure of a Levee or Dam. *The SPA is not in an area protected by levees and is not located within the Folsom Dam inundation zone; however, there are existing dams impounding water within and upstream of the SPA.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, limited development of up to 44 individual residences could occur under the existing Sacramento County zoning AG-80, and no off-site water facilities would be constructed. Because the SPA is not in an area protected by levees, is not within the identified flood hazard zone of the Folsom Dam, and is also within Sacramento County, which implements the Automated Local Evaluation in Real Time (ALERT) system, **direct** and **indirect** impacts related to flooding as a result of the failure of a levee or dam are considered **less than significant**. ***[Lesser]***

NCP, PP, RIM, CD, RHD

For planning purposes, the State Office of Emergency Services (OES), with information from the U.S. Bureau of Reclamation and DWR, has the responsibility to provide local governments with critical hazard response information, including information related to potential flooding from levee failure or dam inundation. The SPA is

not in an area protected by levees; however, Folsom Dam is located approximately 4.5 miles north of the SPA. The OES has mapped the dam inundation zones in Sacramento County for Folsom Dam. The map shows that while a relatively large portion of Sacramento County and the City of Folsom would be inundated with water in the event of a dam or dike failure, the SPA is outside of the mapped inundation area (Sacramento County 2007b:383-384, Figure III-4). In addition, a dam failure plan, the flooding ALERT system, and evacuation procedures are integrated into Sacramento County's Emergency Operations Plan (City of Sacramento 2005:7.2-10). Further, the occurrence of dam inundation (due to dam or dike failure) is based on extremely remote conditions (Sacramento County 2007b:383) and implementation of any of the project alternatives would do nothing to increase the potential for dam failure.

There are five ponds within and three ponds upstream (to the south of White Rock Road) of the SPA that appear to hold water throughout the year. They are formed behind existing dams in topographically low areas along existing drainages located within subwatersheds AC1d, AC2d, AC9a, AC5b, and OF 4a and OF 4b, respectively (see Exhibit 3A.9-2). The pond in subwatershed AC9a, estimated to be approximately 3 to 5 surface acres, is formed by an earthen dam approximately 15 to 20 feet in height on the north side of the pond; the depth and associated volume of the pond is unknown (GenCorp Realty Investments, LLC 2008). The height of the other dams and/or volume of water in the associated impoundments are unknown. Due to the unknown size of the dams and associated water impoundment volumes, it is currently unknown whether or not any of the dams are under the jurisdictional oversight of the DSOD. Additionally, evaluation of the dams has not been conducted to determine stability, potential for risk of failure, and/or estimated area of downstream inundation in the event of failure.

While unlikely based on field observation of what appear to be relatively small dimensions, is currently unknown whether or not the dams are within the jurisdictional oversight of the DSOD. Because the current condition (e.g., stability) of the dams within and upstream of the SPA are unknown and the area of downstream inundation in the event of failure is also uncertain, implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives could result in people or structures downstream of these features to be exposed to a significant risk of flooding if the dams were to fail. Therefore, project-related impacts related to the failure of a dam are considered **direct** and **potentially significant. No indirect** impacts would occur. ***[Similar]***

> Mitigation Measure 3A.9-4: Inspect and Evaluate Existing Dams Within and Upstream of the Project Site and Make Improvements if Necessary.
>
> Prior to submittal to the City of tentative maps or improvement plans the project applicant(s) of all project phases shall conduct studies to determine the extent of inundation in the case of dam failure. If the studies determine potential exposure of people or structures to a significant risk of flooding as a result of the failure of a dam, the applicants(s) shall implement of any feasible recommendations provided in that study, potentially through drainage improvements, subject to the approval of the City of Folsom Public Works Department.
>
> **Implementation:** Project applicant(s) of all on-site project phases and off-site elements.
>
> **Timing:** Prior to submittal to the City of tentative maps or improvement plans.
>
> **Enforcement:** City of Folsom Public Works Department.

Implementation of Mitigation Measure 3A.9-4 would reduce the potential for increased risk of flooding s a result of the failure of a dam under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant level** because the project applicant(s) of all project phases would demonstrate that people or structures would not the small dams and associated impoundments within and upstream of the SPA meet minimum stability requirements and not exposure of people or structures to a significant risk of flooding.

IMPACT 3A.9-5 Potential Exposure to 200-Year (0.005 AEP) Flood Prior to Implementation of SB 5. *A delineation of the proposed 200-year (0.005 AEP) floodplain has been developed for the SPA and all development activities would be planned consistent with SB 5 requirements.*

On-Site and Off-Site Elements

NP

The 200-year (0.005 AEP) floodplain as defined by California Water Code Section 9610(a), pursuant to SB 5 (described in the "Regulatory Setting" section above) has not been delineated for the SPA for the No Project Alternative. Under the No Project Alternative, the agricultural activities that could occur under the existing Sacramento County AG-80 zoning, including the construction of up to 44 individual rural residences, would not appreciably alter the existing hydrology and drainage conditions at the SPA. Furthermore, no off-site water facilities would be constructed. Although it has not been determined what areas in the SPA are within the 200-year (0.005 AEP) floodplain under the existing condition, SB 5 prohibits local governments from approving entitlements or permits, including permits resulting in the construction of a new residence, in a flood hazard zone unless 200-year (0.005 AEP) flood protection is provided pursuant to implementation of the Central Valley Flood Protection Plan. Thus, **no direct** or **indirect** impacts would occur. ***[Similar]***

NCP, PP, RIM, CD, RHD,

A delineation of the proposed 200-year (0.005 AEP) floodplain has been developed for the SPA (see Exhibits 3A.9-5a and 3A.9-5b). All development activities associated with the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would be planned consistent with SB 5 (described in the "Regulatory Framework" section above). Therefore, implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would not subject people and/or structures to **direct** or **indirect** impacts related to flooding as a result of a 200-year (0.005 AEP) storm. This would be a **less-than-significant impact**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.9-6 Potential Effects on Groundwater Recharge. *Shallow and deep percolation of rainwater and related runoff and consequent depth to groundwater could be affected locally by the development of additional impervious surfaces, which could limit infiltration and recharge.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, up to 44 rural residences could be developed and agricultural activities could continue under the existing AG-80 land use and zoning designation. Because no off-site water facilities would be constructed, new groundwater wells would likely be installed to support agricultural and/or rural residential development under the existing Sacramento County agricultural zoning classification, AG-80. Although well construction would be required to comply with appropriate Sacramento County well installation policies, in addition to Section 13801 of the California Water Code, localized groundwater use would be expected to increase over existing levels, and as compared to levels under the Proposed Project Alternative and the other four alternatives (since no on-site groundwater use is proposed). Thus, **direct** and **indirect** impacts to groundwater recharge under the No Project Alternative would be **potentially significant**. ***[Greater]***

NCP, RIM, CD

Impacts under the No USACE Permit and Resource Impact Minimization Alternatives would be less than those of the Proposed Project Alternative because an additional 375 acres and 500 acres, respectively, of land throughout the SPA would be designated as open space, thus increasing the area available for infiltration and recharge. Impacts under the Centralized Development Alternative would be less than those of the Proposed Project Alternative because the total acreage of residential development would be reduced by approximately 387 acres within the eastern portion of the SPA.

Those areas within the SPA that are most conducive to groundwater recharge, e.g. the Alder Creek stream and tributary corridors would generally be maintained in open space and the retention basins and the LID features described in Mitigation Measure 3A.9-3, would be sited and designed to maximize infiltration under the Resource Impact Minimization, Centralized Development, and No USACE Permit Alternatives. Furthermore, no wells would be established for domestic use, and increased seasonal groundwater recharge from landscape irrigation activities would occur. Therefore the **direct** and **indirect** impacts on groundwater recharge under these alternatives would be considered **less-than-significant.** ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

PP, RHD

Project-specific water utility, supply, and demand impacts are addressed in Section 3B.16, "Utilities and Service Systems – Water" of this EIR/EIS. This analysis focuses on the potential effects related to on-site groundwater recharge from proposed on-site development. Planned development of the Proposed Project Alternative would include increases in impervious surfaces and the amount of surface runoff generated by proposed development. Of the approximately 3,500 acres at the SPA, approximately 2,330 acres would be developed with residential and commercial land uses, and schools and infrastructure. The remaining 1,200 acres would be retained as open space, including the preservation and enhancement of the Alder Creek stream corridor and associated tributaries. The retention basins and LID features described in Mitigation Measure 3A.9-3 would provide some groundwater recharge through localized infiltration where subsurface conditions allow. The retention areas would be sited and designed to maximize infiltration into the ground. Under the Reduced Hillside Development Alternative, while the residential development on the eastern hillsides would be reduced, thereby providing some groundwater recharge in this area, the total acreage of development subjected to construction activities under this alternative would be reduced by only approximately 64 acres, with an additional 19 acres of commercial and industrial development, resulting in a nearly identical area subject to construction activities as compared to the Proposed Project Alternative.

As described in Subsection 3A.9.1, "Groundwater Hydrology" above, soils in the SPA and surrounding area have a poor capacity for groundwater recharge, with most of the substantial recharge occurring along active stream channels. Because there is little groundwater underneath the SPA, and the amounts vary locally and seasonally, it has traditionally been used for grazing as opposed to irrigation-dependent agriculture. Those areas within the SPA that are most conducive to groundwater recharge, e.g. the Alder Creek stream and tributary corridors would generally be maintained in open space and the retention basins, and the LID features described in Mitigation Measure 3A.9-3, would be sited and designed to maximize infiltration under the Proposed Project and Reduced Hillside Density Alternatives. Furthermore, no new wells would be established for domestic use, and increased seasonal groundwater recharge from landscape irrigation activities would occur. Therefore, **direct** and **indirect** impacts on groundwater recharge under the Proposed Project and Reduced Hillside Density Alternatives would be considered **less-than-significant.** ***[Similar]***

Mitigation Measure: No mitigation measures are required.

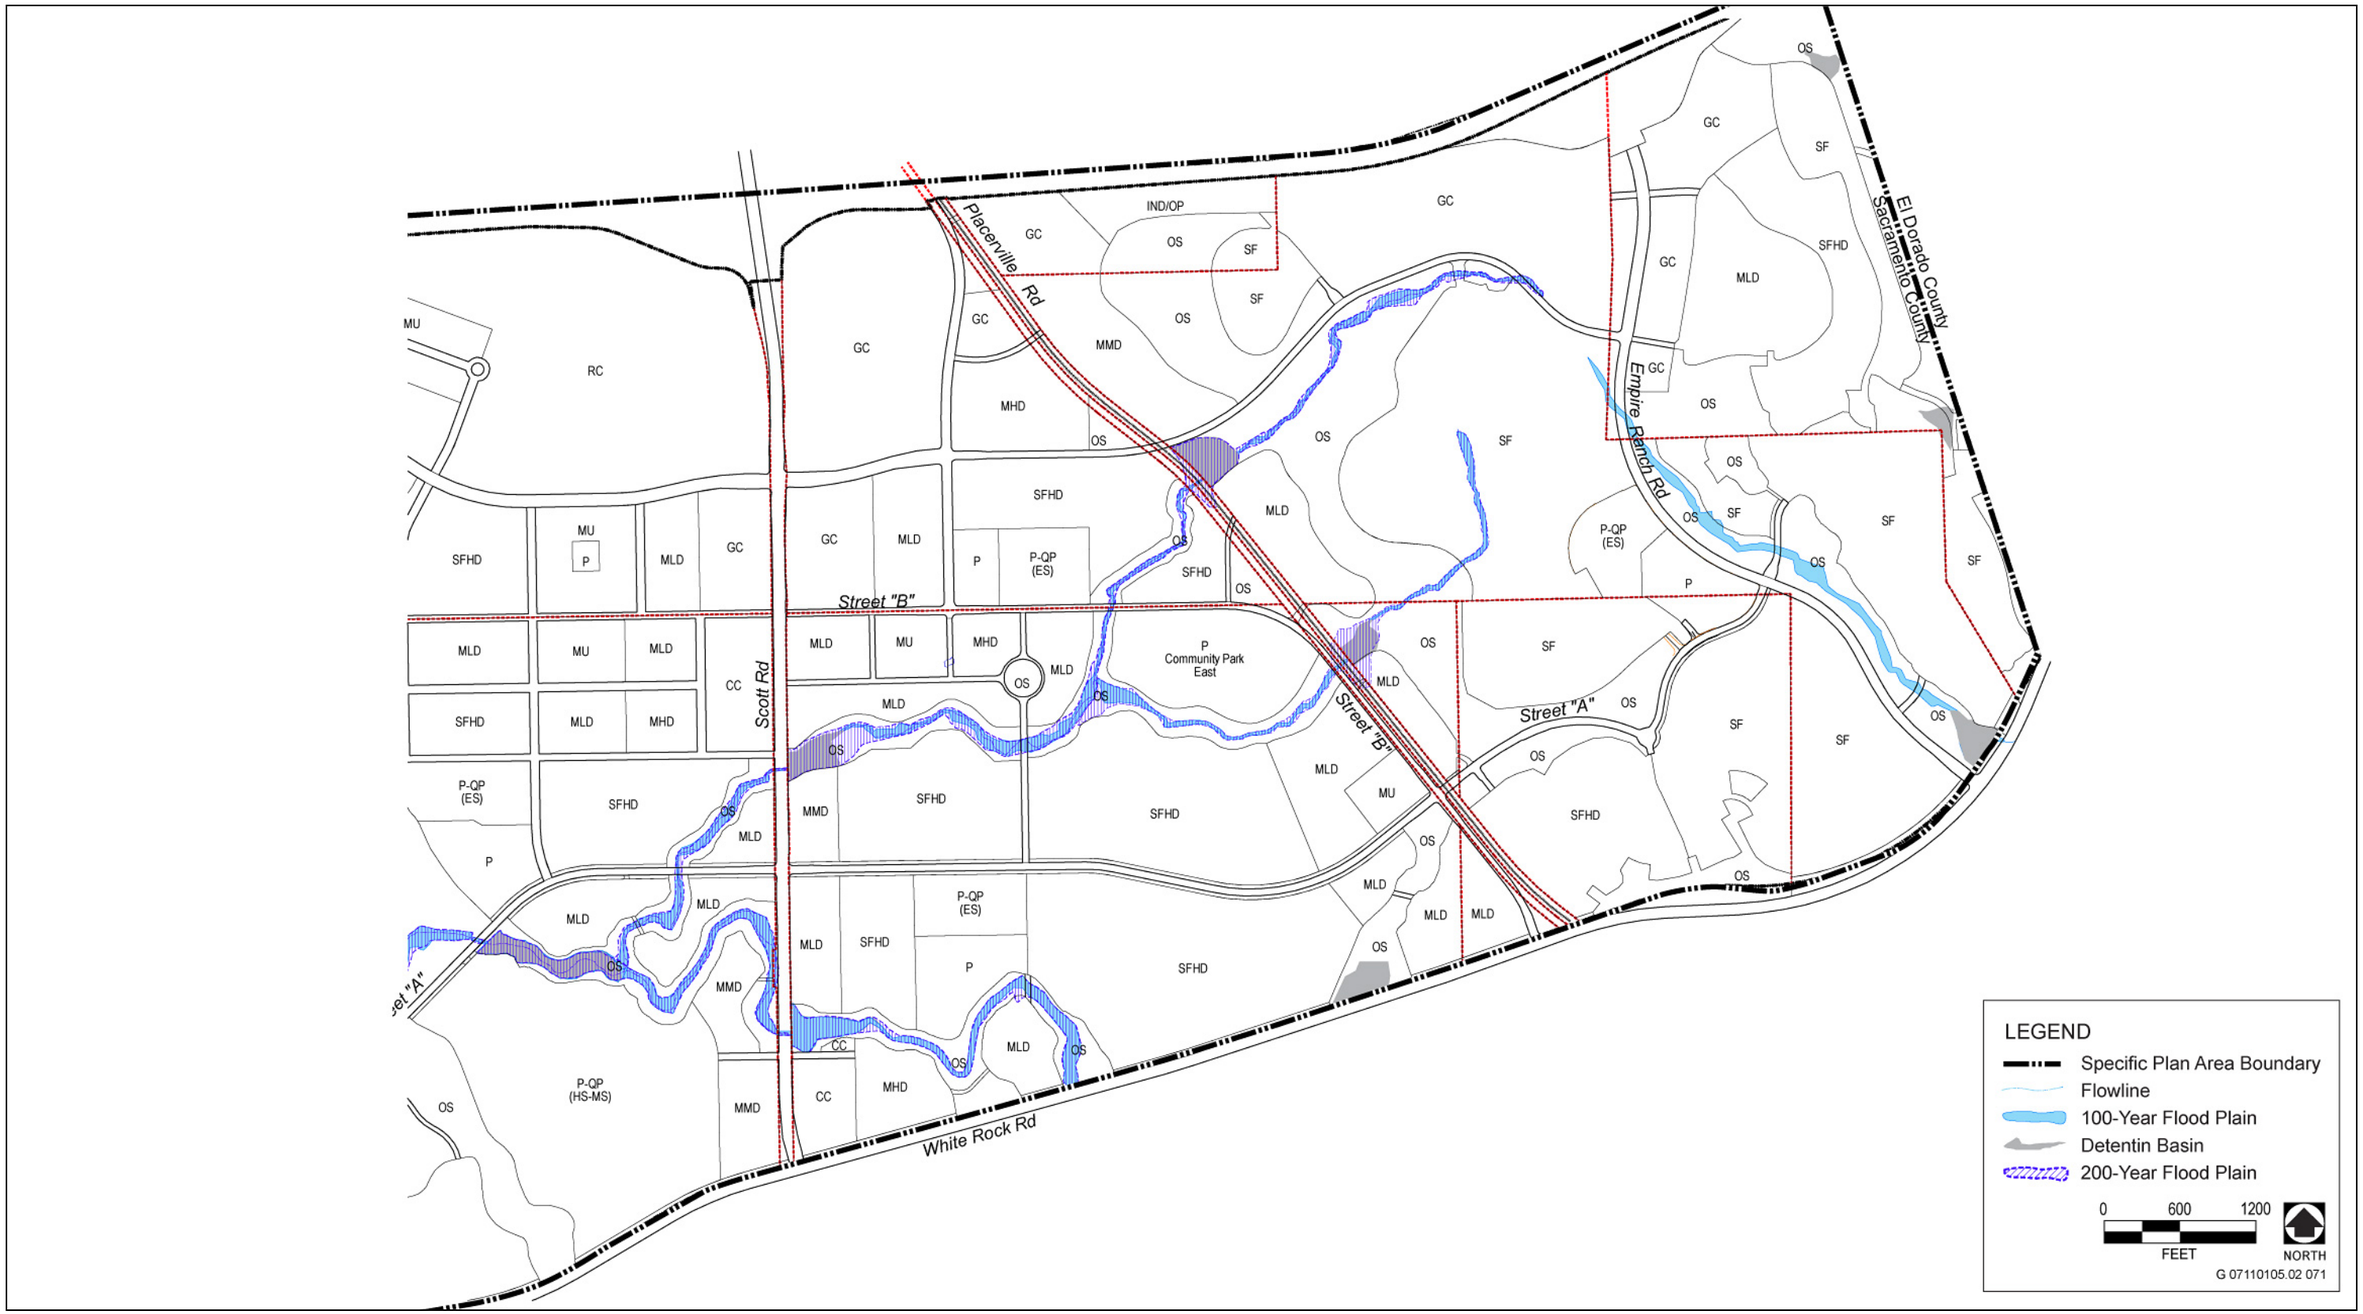
Exhibit 3A.9-5a



Source: MacKay & Somps 2010

Proposed 200-Year (0.01 AEP) Floodplains (Eastern Half of SPA)

Exhibit 3A.9-5b

3A.9.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of the mitigation measures listed above, project implementation would not result in any residual significant impacts related to short-term alteration of drainages and associated surface water quality and sedimentation, increased risk of flooding or hydromodification from stormwater runoff, water quality and hydrology effects from long-term urban runoff, or groundwater recharge.

However, some of the off-site elements (two roadway connections in El Dorado County, detention basin in Sacramento County, and U.S. 50 interchange improvements) fall under the jurisdiction of El Dorado County, Sacramento County, and Caltrans, respectively; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these off-site elements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans, Impacts 3.10-1, 3.10-2, 3.10-3, and 3.10-5 are considered potentially significant and unavoidable for off-site improvements which would be located in Sacramento County, El Dorado County, or Caltrans jurisdiction.

This page intentionally left blank.

This section was prepared by RMC Water and Environment.

3B.9 HYDROLOGY AND WATER QUALITY – WATER

3B.9.1 AFFECTED ENVIRONMENT

REGIONAL HYDROLOGY

The "Water" Study Area is characterized by a typical Mediterranean climate with wet, cool winters, and warm, dry summers. Most of the rainfall occurs between November and April with an average annual rainfall of 18 to 21 inches for the "Water" Study Area. The 10-year, 24-hour estimated precipitation amount for the "Water" Study Area is approximately 2.5 inches and the 100-year, 24-hour estimated precipitation is 3.75 inches (Western Regional Climate Center 2004).

The "Water" Study Area is located north of the Sacramento-San Joaquin Delta (Delta) within the Valley-American Hydrologic Unit, which is located at the southern end of the 27,210-square mile Sacramento River Basin. The Valley-American Hydrologic Unit is divided into two hydrologic areas, which are separated by the Lower American River, with the Coon-American Hydrologic Area (HA) located to the north and the Morrison Creek HA to the south. Natomas Central Mutual Water Company's (NCMWC's) service area or Zone 1 of the "Water" Facility Study Area, is situated in the western portion of the Coon-American HA along the Sacramento River. The conveyance improvements proposed by the City are located within Zone 4 of the "Water" Study Area and correspond with the northeastern section of the Morrison Creek HA. Exhibit 3B.9-1 illustrates this relationship. Section 3A.9, "Hydrology and Water Quality – Land" provides a description of the hydrologic conditions within the SPA.

In addition to these hydrologic areas, the "Water" Study Area includes an approximately 20-mile stretch of the Sacramento River; between River Miles 66 and 46. This portion of the Sacramento River corresponds with Zone 2 of the "Water" Study Area and would convey surface water not diverted by NCMWC to the south to the existing Freeport Project intake facility.

SACRAMENTO RIVER – ZONE 2 OF THE "WATER" STUDY AREA

Flows in the Sacramento River vary widely and are influenced by rainfall and upstream dams and diversions. Typically, the flow is highest during the winter and spring months and lowest in the summer and late fall. During the period of record (1949 through 2008), the maximum average daily flow at the Freeport gauging station was 115,000 cubic feet per second (cfs) on February 19, 1986 with a corresponding stage height of 25.00 feet; the minimum average daily flow was 3,970 cfs on October 15, 1977 (U.S. Geological Survey [USGS] 2003).

Over the past century, numerous water projects have been constructed as part of the Central Valley Project (CVP), the State Water Project (SWP), and other water storage and delivery projects developed by local water districts or purveyors. Total reservoir storage capacity in or affecting the Sacramento River basin is estimated at approximately 15,000,000 AF – or 15.0 MAF. Historically, these reservoirs have been operated to provide agricultural and domestic water supplies and flood control and, more recently, for other purposes including recreation and environmental releases (CALFED 2000).

To support agriculture and the urban populations of central and southern California, the CVP and State Water Project (SWP) were constructed to store and convey water from areas with surplus supplies to users in areas where demands exceed available local supplies. Exhibit 3B.9-1 shows the major components of the CVP and SWP that are located in the Sacramento River basin. The Sacramento River serves as the primary pathway to convey water southward to the Delta where water is re-diverted for agricultural and urban uses in the San Francisco Bay Area, San Joaquin Valley and southern California.

Over 400 water diversion intakes have been identified on the Sacramento River between Shasta Dam and the City of Sacramento. Of these diversion facilities, about 96% are reported to be unscreened or inadequately screened to protect anadromous fish from entrainment. The majority of these diversion intakes are located on the 140-mile reach between the City of Sacramento and the Colusa/Glenn County line (Herren and Kawasaki 2001).

Central Valley Project

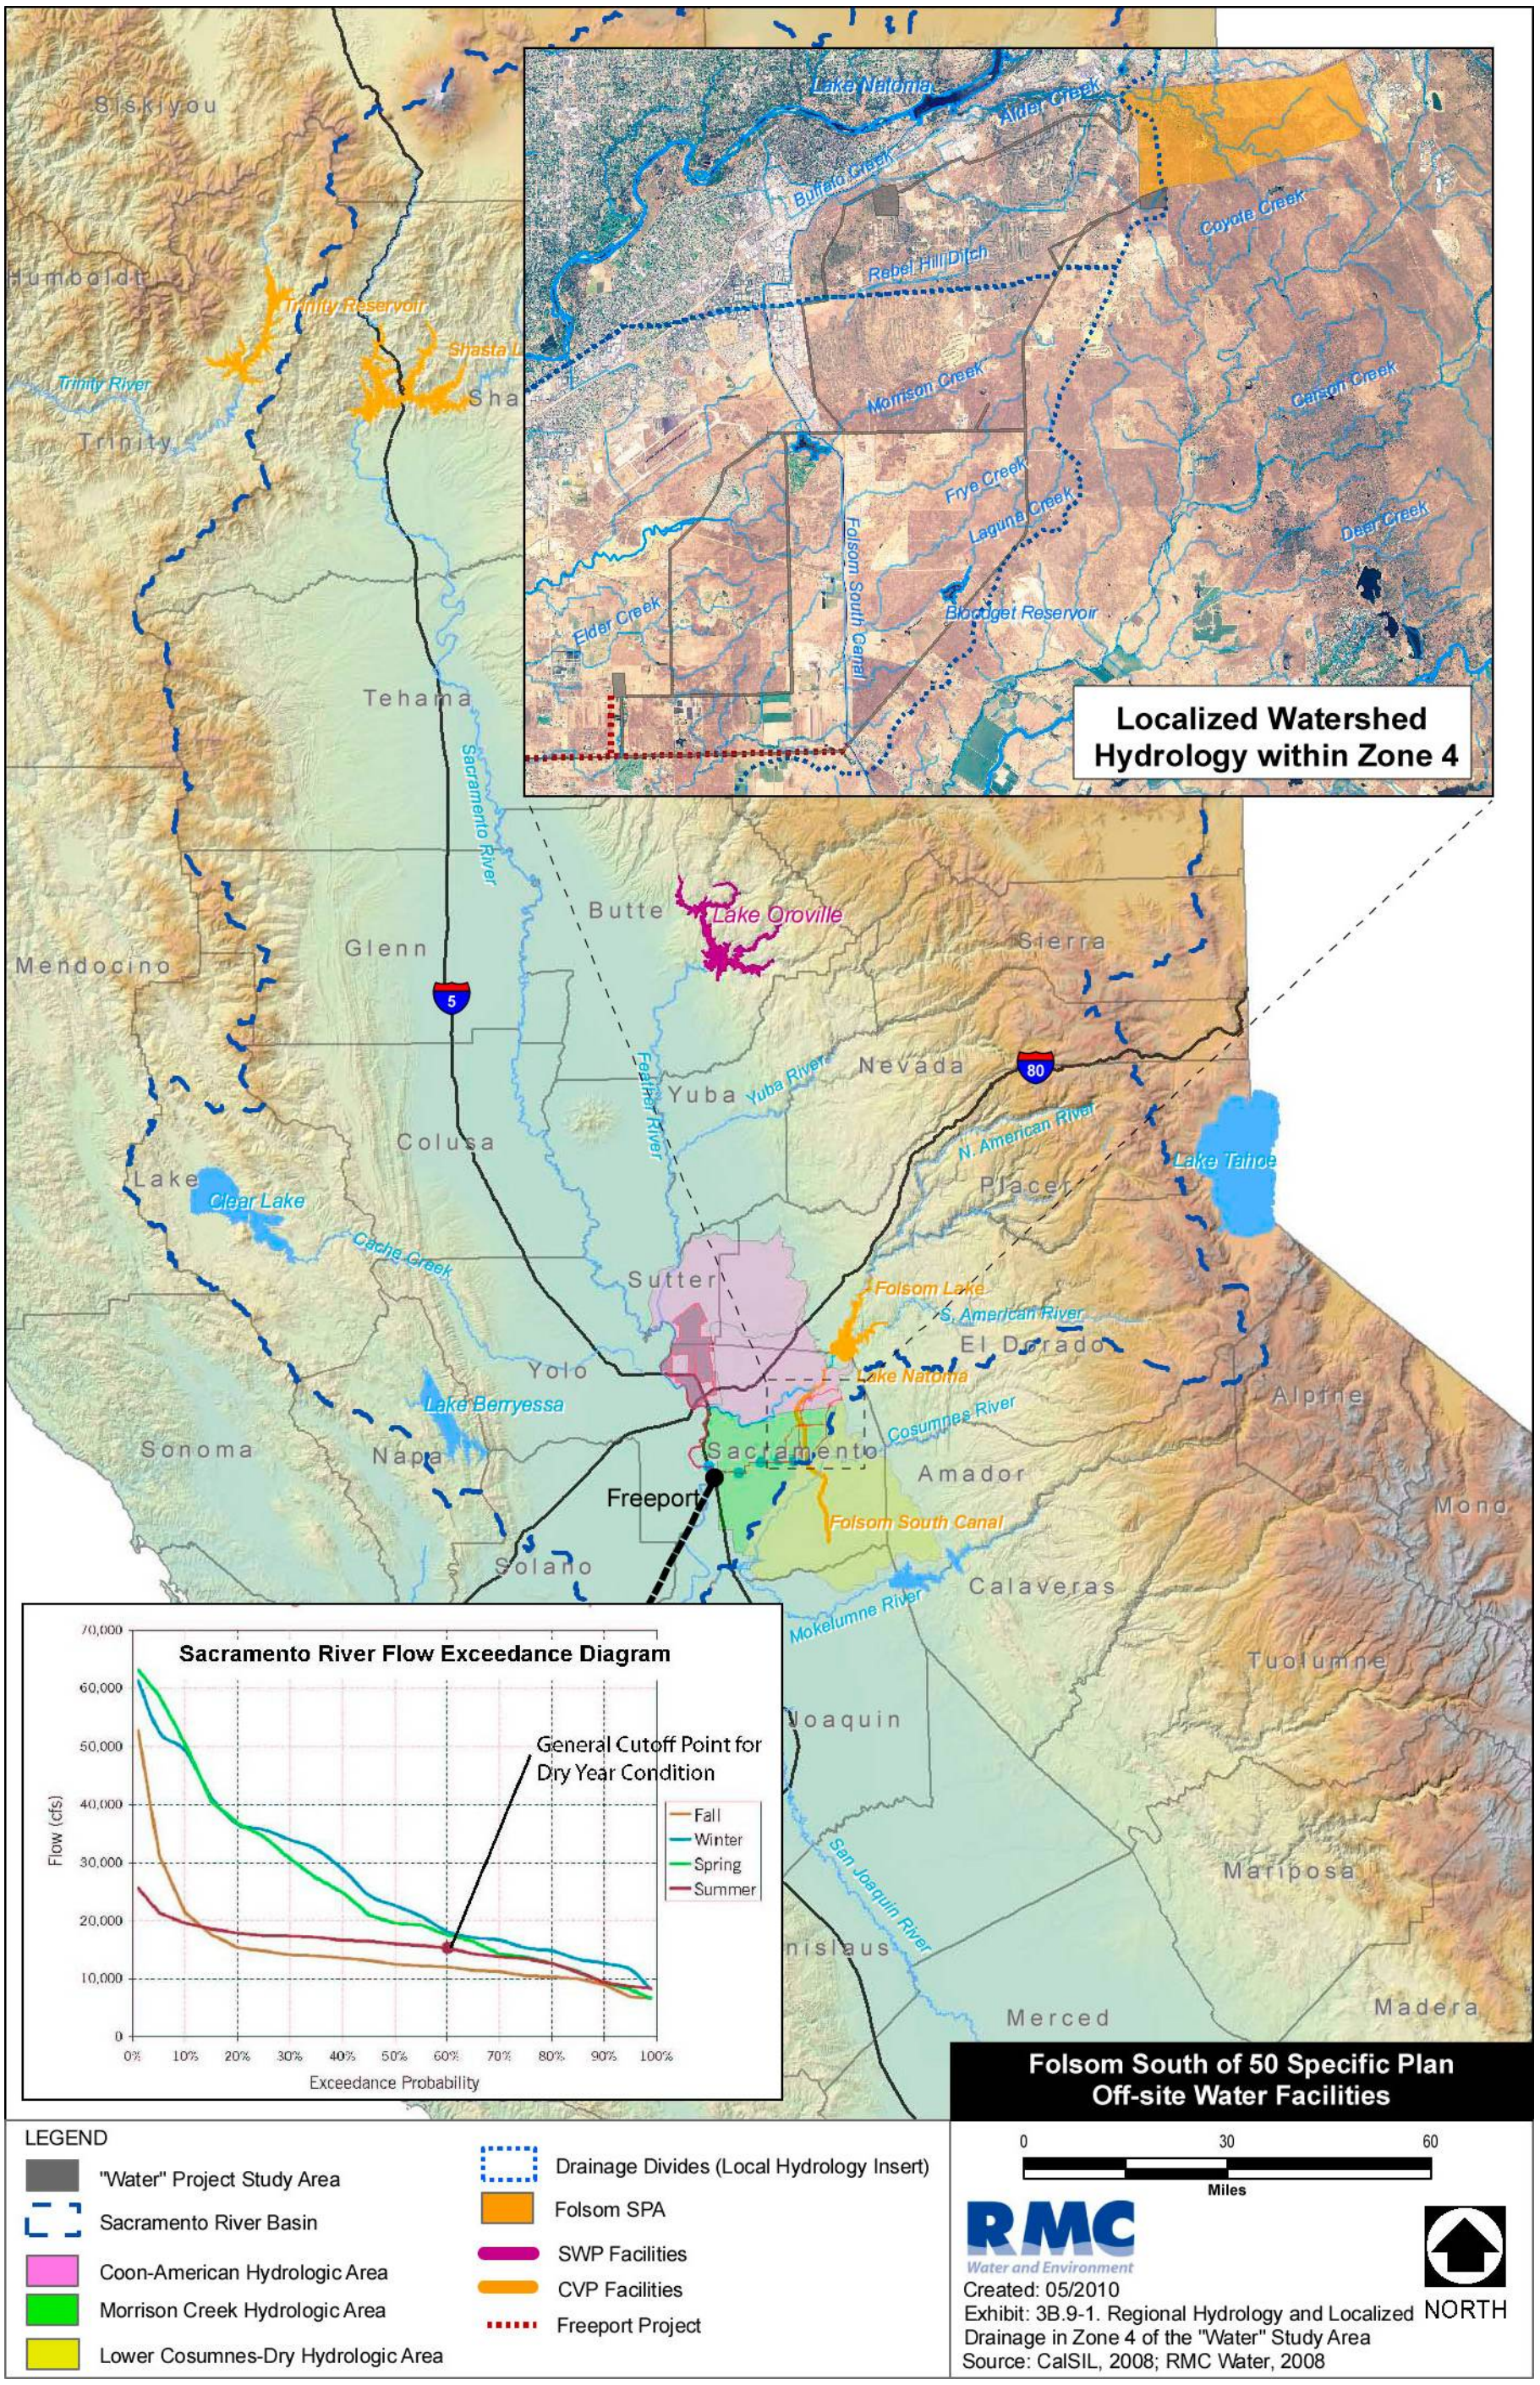
The CVP facilities consist of a series of reservoirs and conveyance canals on the Sacramento, American, Stanislaus, and San Joaquin Rivers. Major CVP reservoirs in the Sacramento River Basin are listed in Table 3B.9-1. The CVP is operated and maintained by the U.S. Bureau of Reclamation (Reclamation) and delivers approximately 7.0 MAF/yr of water to portions of the Sacramento and San Joaquin Valleys; communities in Placer, El Dorado, Sacramento Counties, the east and south San Francisco Bay areas; and fish hatcheries and wildlife refuges in the Central Valley.

Table 3B.9-1
Major Federal and State Reservoirs in the Sacramento River Basin

Reservoir Name	Stream	Capacity (TAF)	Owner
Shasta	Sacramento River	4,552	Recalamtion
Davis	Big Grizzly Creek	84	DWR
Antelope	Indian Creek	22	DWR
Frenchman	Little Last Chance Creek	55	DWR
Thermalito	Feather River	81	DWR
Oroville	Feather River	3,537	DWR
Folsom	American River	974	Reclamation
Stony Gorge	Stony Creek	50	Reclamation
East Park	Stony Creek	50	Reclamation
Whiskeytown	Clear Creek	241	Reclamation

Notes: Reclamation = U.S. Bureau of Reclamation; DWR = California Department of Water; TAF = thousand acre-feet
Source: SWRCB 1999

The CVP provides water to local users according to provisions of existing settlement contracts and water service contracts. Settlement contracts were executed with water users that hold senior water rights that were established before the CVP or were established independent of the CVP. These water rights include pre-1914 and post-1914 appropriative water rights. Generally, for these settlement contracts, Reclamation agreed to deliver a "base supply" corresponding to the estimated amount of the water contractor's prior-1914 water rights, and sometimes additional amounts of CVP water. Water service contracts were established with other parties who did not hold any prior rights to water on the Sacramento River or who desired to acquire additional water supplies beyond those provided by their water rights. The NCMWC holds a settlement contract with Reclamation that has both "base supply" and "project water" elements. The City would receive an assignment of part of that contract's project water.



Surface Water Hydrology and Localized Drainage **Exhibit 3B.9-1**

State Water Project

The SWP is administered by the California Department of Water Resources (DWR) and delivers water from northern California to users in portions of Butte and Sutter Counties, the San Francisco Bay area, San Joaquin Valley, and southern California. Twenty-nine entities have long-term water supply contracts for SWP water supplies with maximum delivery amounts totaling about 4.2 MAF, of which about 4.1 MAF are delivered to contracting agencies with service areas located south of the Delta.

Lake Oroville is used to store and regulate deliveries of SWP water (see Exhibit 3B.9-1). Water is released from Lake Oroville down the Feather and Sacramento Rivers and eventually flows into the Delta. Some of this water is diverted into the North Bay Aqueduct, which serves communities in Napa and Solano Counties. The remaining water travels further south in the Delta where it is re-diverted at the H.O. Banks Pumping Plant to the California Aqueduct.

Water-Year Classification and Flow Exceedance

The Sacramento Valley 40-30-30 Index (Index) was developed by the State Water Resources Control Board (SWRCB) as part of its Bay-Delta regulatory activities. The Index is computed as a weighted average of a water year's April-July unimpaired runoff (40%), the same water year's October–March unimpaired runoff (30%), and the previous water year's Index (30%). A cap of 10 MAF is put on the previous water year's index in order to account for required flood control reservoir releases.

A water year with a 40-30-30 Index equal to or greater than 9.2 MAF is classified as "wet," while a water year with an Index equal to or less than 5.4 MAF is classified as "critical." Water years with 40-30-30 index values between 5.4 and 9.4 MAF are classified as "above normal," "below normal," or "dry" (DWR 2004a).

Based on 30 years of data records (1968 through 1998) and spanning a variety of water year types, individual monthly average flows in the Sacramento River have ranged from a low of 4,500 cfs in October 1978 to a maximum of 87,000 cfs in January 1997. Overall, average monthly flows for the 30 years of record range between 13,000 and 40,600 cfs, with the lowest flows occurring in October and highest flows in February. The 30-year average monthly flow during the wetter months of December through May is 32,200 cfs. During the typically drier months of June through November the average monthly flow is 16,500 cfs. (Central Sacramento County Groundwater Management Plan [CSCGMP] 2006)

The exceedance diagram for the Sacramento River, based on 2020 forecasted conditions (this year is used in statewide surface water models), for each season is provided in Exhibit 3B.9-1. Forecasted conditions project the operation of reservoirs and regulation of stream flows into the future while imposing 73 years of historical hydrology on this operational scheme. For example, Exhibit 3B.9-1 indicates that up to approximately 15,000 to 27,000 cfs of Sacramento River water flows past Freeport Project diversion during the summer 60% of the time (see location of red dot on Exhibit 3B.9-1). This is the general cutoff point for a dry year condition. The remaining 40 percent of the time, approximately 8,000 cfs to 15,000 cfs flows past Freeport. More important is that approximately 8,000 cfs is flowing in the Sacramento River in all seasons (100% of the time), even in the most critically dry conditions (CSCGMP 2006).

California Simulation Model II

The California Simulation Model II (CALSIM II) is a water resources planning model for the CVP and SWP Systems[1], jointly developed by DWR and Reclamation. The primary purpose of CALSIM II is to evaluate the water supply reliability of the CVP and SWP with and without various assumed facilities, and with different modes of facility operations. Operations of many other local facilities were also incorporated at varying levels of

[1] CALSIM II's geographic coverage includes the valley floor drainage area of the Sacramento and San Joaquin Rivers, upper Trinity River, a portion of the Tulare Basin, and Southern California areas served by the CVP and SWP.

detail. For this analysis, the CALSIM II model includes the operation of the Freeport Project and applies the Long-Term CVP and SWP Operations Criteria and Plan (OCAP) as the modeling base. Detailed modeling assumptions can be found in the OCAP Biological Assessment (Reclamation 2009) and in the Benchmark Studies Assumptions Document (Reclamation/DWR 2002).

LOCALIZED DRAINAGE FOR ZONE 4 OF THE "WATER" STUDY AREA

Morrison Creek Stream Group

Much of Zone 4 of the "Water" Study Area is located within the drainage are comprising the Morrison Creek Stream Group, which drains an area of approximately 53.4 square miles. These drainage features are illustrated in the insert of the upper right-hand corner of Exhibit 3B.9-1. Stream flow data has been collected from 1959 through 1987 and again in 1997 through present. Based on these periods of measurement, the maximum discharge for Morrison Creek was 2,730 cubic feet per second (cfs), which occurred on February 17, 1986. No observed flow occurred during the summers of 1960, 1962, and 1965 (USGS 2003).

Morrison Creek and the other contributing streams (Elder, Frye, and Laguna Creeks) are mostly channelized west of Sunrise Boulevard. Each drainage feature has been significantly altered from its original drainage path into a more-or-less linear, trapezoidal cross-section containing little or no riparian vegetation. Flows within the winter months generally consist of localized stormwater runoff. During the summer months, two of the creeks experience low-velocity return flows from a wide-range of urban uses. Typically, the flow is highest during the winter and spring months and lowest in the summer and late fall. Flows within Morrison Creek either empty into Beach-Stone Lakes or are pumped into the Sacramento River by a series of pumps operated by the City of Sacramento.

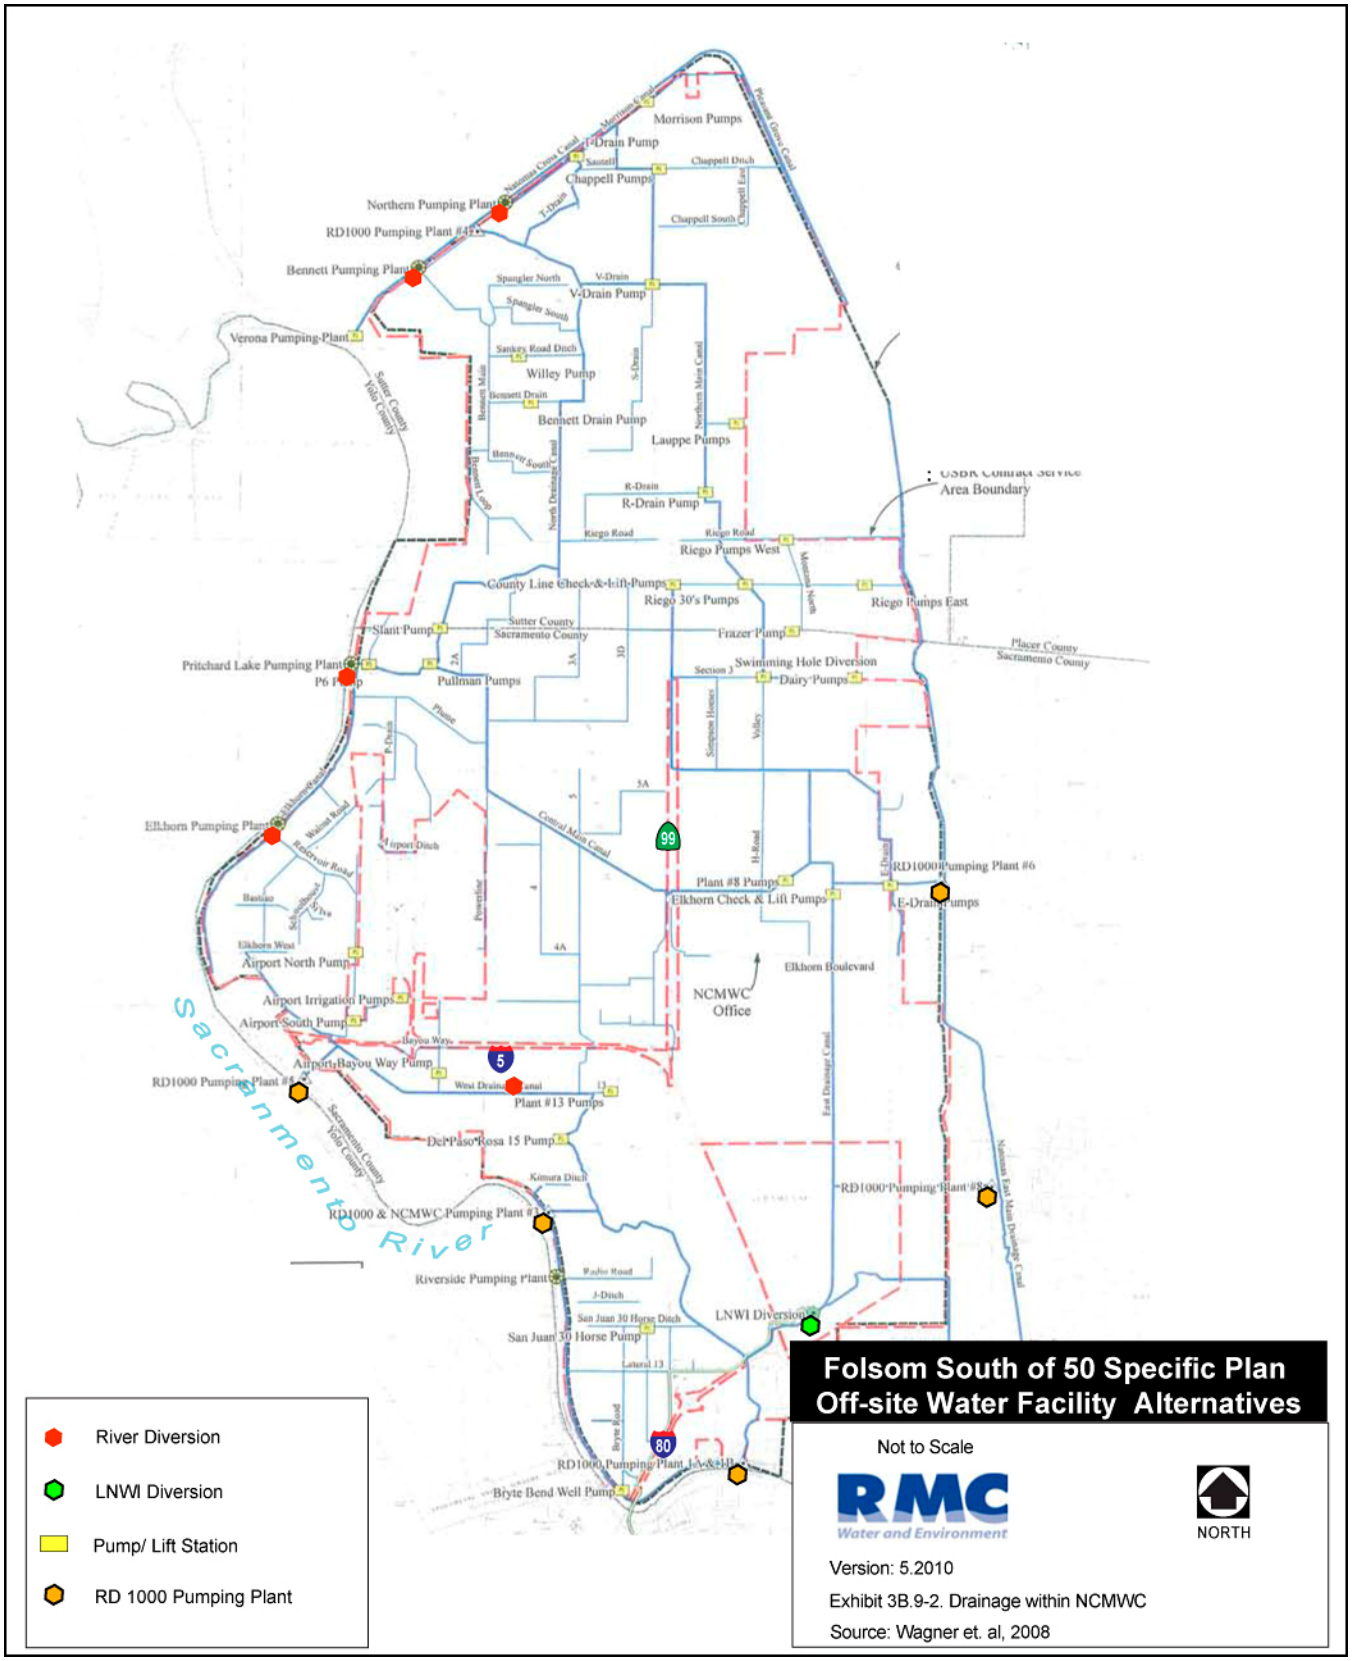
Alder and Buffalo Creeks

Surface runoff in areas generally north of White Rock Road drains into Alder Creek or Buffalo Creek. Alder Creek drains an area of 7,146 acres into the American River via Lake Natoma (MacKay & Somps 2004). Alder Creek is an unlined, perennial stream within a relatively deep ravine. It contains a small pond (Alder Creek Pond) that was created by a human-made impoundment about 1,000 feet east of Folsom Boulevard.

Buffalo Creek drains a 470-acre area south of Alder Creek's watershed and drains into an aqueduct off the American River approximately one mile west of Zone 4 of the "Water" Study Area (see inset in Exhibit 3B.9-1). Buffalo Creek between the Aerojet administrative complex and the American River is an improved, unlined trapezoidal drainage and flood control channel (MacKay & Somps 2004). Buffalo Creek crosses the FSC through a 20-foot-wide concrete flume and then flows northerly through culverts under the Regional Transit Light Rail tracks, Folsom Boulevard, and U.S. 50. Large diameter culvert crossings are also located at Coloma Road, Gold Express Drive, Gold Country Drive, and South Bridge Street.

NATOMAS CENTRAL MUTUAL WATER COMPANY SERVICE AREA – ZONE 1 OF THE "WATER" STUDY AREA

NCMWC currently maintains three water-pumping plants along the Sacramento River and two along the Natomas Cross Canal (see Exhibit 3B.9-2). These pumping plants divert surface water into NCMWC's service area. Currently, the combined Sacramento River diversion capacity for the five systems is 630 cfs. In cooperation with the California Department of Fish and Game (DFG) and Reclamation, NCMWC is proposing to consolidate its existing diversion/intakes into two new facilities with fish screens on the Sacramento River. Further information on this proposal is provided in the supporting EIR/EIS (State Clearinghouse No. 2003092006), which is available for download at http://www.usbr.gov/mp/nepa/documentShow.cfm?Doc_ID=3301.



NCMWC Service Area and Drainage Facilities **Exhibit 3B.9-2**

Within the NCMWC's service area, surface water is distributed to its shareholders via five primary irrigation systems that are interlinked. The systems are supplied by the five existing pumping plants discussed above and include the Northern, Bennett, Central, Elkhorn, and Riverside System(s). NCMWC's canal systems use gravity for deliveries by maintaining water levels above that of surrounding ground levels. Reclamation District (RD) 1000's drainage canals also are used by NMCWC to distribute water within its service area (see Exhibit 3B.9-2).

NCMWC operates a closed system whereby tailwater (i.e., runoff from the fields) within the system is recirculated as irrigation supply. Water is pumped into the canal system, mixed with the tailwater, and distributed throughout the service area. The water is lifted again to the highline canals or applied directly to the fields.

The water is recirculated to the Riverside, Central, Bennett, and Northern systems using RD 1000's Pumping Plants Nos. 2, 3, and 4. Recirculation to the Elkhorn System has never been established due to lack of access to the drainage systems. At the end of the irrigation season, the tailwater is pumped back into the Sacramento River (generally, 2 to 5 thousand acre feet). The rice fields serve as a filtering mechanism that cleans the water as it is used during the irrigation season, and then held in a settling basin before release.

FLOODING

The Federal Emergency Management Agency (FEMA) provides information on flood hazard and frequency for cities and counties on its Flood Insurance Rate Maps (FIRM) and identifies designated zones of flood hazard potential. In general, flooding occurs along waterways and in areas with constricted storm drain systems or surface water ponding. The Sacramento River and its tributaries that flow through the Sacramento Valley form part of the drainage system covering over 27,210 square miles including northern portions of the Sierra Nevada and Coast Range. High flows of moderate duration within the river basin can result in flooding at downstream locations during intense rainstorms. In addition, snowmelt in the Sierra Nevada can produce high flows of longer duration during the spring.

In addition to the major reservoirs, which are also managed to provide storage for flood control purposes, a flood damage reduction system was constructed in the Sacramento Valley to control and direct high river flows away from urban areas and to minimize hazards to adjacent land uses, improvements, and populations. The flood damage reduction system consists of a series of levees and bypasses, located to take advantage of natural overflow basins. The system includes: levees along the Sacramento River south of Ord Ferry; levees along the lower portions of the Feather, Bear, and Yuba Rivers; levees along the American River; and, the Colusa, Sutter, and Yolo Bypasses.

Bypasses are located parallel to the Sacramento River and receive excess flows from the Sacramento, Feather, and American Rivers through a series of overflow channels and weirs. When flows of the Sacramento River are high, the three bypasses form one continuous waterway flowing to the Delta. The Sacramento River intersects these bypasses at several locations, including: the Butte Slough Outfall Gates, the Fremont Weir at Verona, the Sacramento Weir north of the American River confluence, and the East Levee Toe Drain at the terminus of the Yolo Bypass upstream of Rio Vista (U.S. Army Corps of Engineers [USACE] 2002). This system of levees and flood control weirs provides flood protection to Zones 1, 2, and 3 of the "Water" Study Area, portions of which are contained within the limits of a 100-year flood event (Federal Emergency Management Agency [FEMA] 1998). Zone 4 of the "Water" Study Area is generally situated outside the limits of the 500-year flood zone with the exception of localized drainage channels, which are delineated within the 100-year flood zone.

SEICHE/TSUNAMI

Tsunamis originating in the Pacific Ocean would dissipate in the San Francisco Bay, and therefore pose a negligible hazard to the "Water" Study Area, due to its inland location. Seiches, while having no recorded occurrences within Sacramento County in the historic record, could occur in the Sacramento River under the right circumstances thereby potentially overtopping levees or lead to levee failure. However, based on water depths

within Sacramento River and the low expected ground motions anticipated for the "Water" Study Area (see Section 3B.7, "Geology, Soils, and Paleontological Resources – Water"), the risk of a seiche of sufficient magnitude to overtop the levees is low and is not discussed further in the "Water" sections of this EIR/EIS.

WATER QUALITY

Sacramento River

Water quality within the Sacramento River is generally good, and supports a variety of beneficial uses including drinking water supplies, irrigation supplies, recreation, and protection of fish and other aquatic life (Domagalski et al., 2000). Because most of the water in the Sacramento River and its major tributaries (Yuba, Feather, and American Rivers) is derived from melting snow that enters the rivers through managed discharges from upstream reservoirs, these waterways yield exceptionally high quality runoff, carrying low concentrations of dissolved minerals, sediments, and other constituents.

As water moves downstream through the watershed, it accumulates various pollutants and constituents from a variety of sources. Major sources of constituents that are added to the river include: soils eroded from upland and riparian areas; discharges from agricultural practices, including increased salts, pesticides, and soils; runoff from urban land uses containing oils, grease, and other materials; and discharges from municipal wastewater treatment facilities that may contribute a variety of nutrients, organic materials and disinfectants, such as chlorine.

Untreated water diverted at the City of West Sacramento Bryte Bend WTP, located on the Sacramento River and at the approximate midway point between the NCMWC service area and the Freeport Project intake/diversion facility, shows good water quality with no constituents exceeding applicable drinking water standards or posing a threat to other beneficial uses. Table 3B.9-2 shows water quality data obtained from this location. As monitored at the Bryte Bend WTP, untreated water routinely meets all drinking water maximum concentration levels (MCLs) except for turbidity, odor, and iron. As is typical in an undisinfected water source, the water contains elevated bacterial counts. No regulated volatile organic chemicals or synthetic organic chemicals have been detected.

Total Maximum Daily Loads

A total maximum daily load (TMDL) refers to the amount of a specific pollutant a river, stream or lake can assimilate and still meet federal water quality standards as provided in the Clean Water Act. A TMDL accounts for all sources of pollution, including point sources, non-point sources, and natural background sources. Section 303(d) of the Clean Water Act requires that regulatory agencies determine TMDLs for all water bodies that do not meet water quality standards, and the Section 303(d) list of impaired waterbodies provides a prioritization and schedule for development of TMDLs for the State.

Generally, the government agency that has permitting authority develops and implements the TMDLs. This written document includes the sources of the pollutant (both point and nonpoint sources) and designates a specific amount of the impairing pollutant that each source can contribute. To implement the TMDL, the agency works with local governments and the public to determine how to reduce pollutant loads to bring the impaired water into compliance. Implementation often involves BMPs or additional regulation of point-source discharges.

The SWRCB, in compliance with Section 303(d) of the Clean Water Act (33 USC Section 1313[d]) prepared, and EPA-approved, a 2006 list of "impaired" water bodies in the State of California. The list includes a priority schedule for the development of TMDLs for each contaminant or "stressor" impacting the water body. The Sacramento River (from Knights Landing to the Delta) is identified in the 2006 California Section 303(d) List and TMDL Priority Schedule as an impaired water body for the following contaminants: mercury, and unknown toxicity (SWRCB 2007). The Delta (eastern portion), downstream of Zone 2 of the "Water" Study Area, has been designated as impaired for a variety of contaminants, including pesticides (chlorpyrifos, DDT, diazinon, and Group A pesticides) resulting from agricultural and urban runoff/storm sewers, mercury (from abandoned mine drainage), exotic species, and unknown toxicity (unknown cause).

Sacramento County Coordinated Monitoring Program

Water quality conditions within Morrison Creek were characterized in a recent sampling program conducted in conjunction with Sacramento County's Coordinated Monitoring Program (Camp Dresser & McKee and Laboratory Data Consultants 2004). This sampling effort provides the most recent water quality data available for Morrison Creek and the first monitoring data for Morrison Creek to be included in the County's coordinated monitoring program. The data set represents a limited set of conditions in the watershed; however, provides a general assessment of water quality conditions and reflect several distinct seasonal differences typical of urbanized area streams.

The wet-weather (winter storm) event samples recorded low levels of conventional inorganic minerals. The wet-weather samples consistently demonstrated elevated counts of coliform bacteria and total suspended solid (TSS) levels that are indicative of fecal contaminant sources, likely from livestock and other animal sources and sediment transport in the watershed, respectively. The single wet-weather sample analyses also detected elevated values for several polycyclic aromatic hydrocarbons (PAHs) and the organophosphate pesticide diazinon. PAHs, which are byproducts of combustion (primarily gasoline, wood, oil, and coal) and are contained in some asphalt sealants, can enter streams via atmospheric deposition and urban stormwater runoff. (Camp Dresser & McKee and Laboratory Data Consultants 2004).

Dry-weather samples from Morrison Creek were evaluated for only a selected set of parameters; however, it is apparent that concentrations for TSS, coliform bacteria, and diazinon were lower than the winter-storm-event samples. Specific conductance and the organophosphate pesticide chlorpyrifos, another highly mobile pesticide of concern, were slightly elevated relative to wet-weather event samples. (Camp Dresser & McKee and Laboratory Data Consultants 2004).

Sacramento-San Joaquin Delta

Water quality in the Delta changes in response to freshwater inflow, tidal action, releases from upstream reservoirs, agricultural and water supply diversions, and discharges into the Delta system. Seasonal trends reflect the effects of higher spring/summer runoff and fall/winter low-flow periods.

Trends in water quality in the Delta reflect the effects of inflows, tidal exchanges with the San Francisco Bay, diversions, and pollutant releases in the Delta. The north Delta tends to have better water quality in large part because of the inflow from the Sacramento River. The quality of water in the west Delta is strongly influenced by tidal exchange with the San Francisco Bay. During low-flow periods, seawater intrusion results in increased salinity. In the south Delta, water quality tends to be poorer because of the combination of inflows of poorer water quality from the San Joaquin River, agricultural return flows from Delta islands, and effects of CVP and SWP pumping that can sometimes increase seawater intrusion from the Bay. Delta water quality is influenced by the following:

- Discharges from Delta islands that have elevated concentrations of total organic carbon and salts.
- High-salinity water from Suisun and San Francisco Bays that intrudes into the Delta during periods of lower Delta outflow.
- Bromides associated with seawater that lead to the formation of brominated compounds in treated water supplies.
- Agricultural drainage into the Delta that can contain elevated levels of nutrients, suspended solids, organic carbon, salinity, selenium, and boron in addition to pesticides.
- Heavy metals, including cadmium, copper, mercury, and zinc, continue to enter the Delta. Sources of these metals include runoff from abandoned mine sites, tailings deposits, downstream sediments where metals have been deposited over the past 150 years, urban runoff, and industrial and municipal wastewater.

Concentrations of total dissolved solids (TDS) in the western Delta result primarily from the intrusion of saline water from the San Francisco Bay system. The extent of seawater intrusion into the Delta is a function of daily tidal fluctuations, freshwater inflow from the Sacramento and San Joaquin Rivers, the rate of exports at the SWP/CVP intake pumps, and the operation of various control structures (e.g., Delta Cross-Channel Gates and Suisun Marsh Salinity Control System) (DWR 2001).

Water Rights Decision D-1641 (X-2)

Water Rights Decision D-1641 establishes requirements for Delta outflow, known as "X-2" requirements. The term X-2 specifically refers to the location of 2 parts per thousand (ppt) salinity within the Delta. Its position varies and is measured in kilometers upstream of the Golden Gate Bridge. The length of time that X-2 must be positioned at set locations in the Delta each month is determined by a formula that considers the previous month's inflow to the Delta from the Sacramento and San Joaquin Rivers. February through June are the months regulated by this X-2 standard.

X-2 is currently used as the primary indicator in managing Delta outflows. It also reflects a variety of biological consequences related to the magnitude of: (1) fresh water flowing downstream through the Delta, and (2) saltwater moving upstream within the lower portion of the Delta. The outflow that determines the location of X-2 also affects the upstream and downstream movements of various aquatic organisms, as well as overall water operations of the CVP and SWP. The Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta defines requirements for maintaining X-2 at Port Chicago and Chipps Island (RWQCB, Region 2 2007).

3B.9.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to water quality and flooding are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.9, "Hydrology and Water Quality – Land:"

- Federal Clean Water Act (CWA)
- Water Quality Criteria and Standards, Section 303 and 303(d) of the CWA
- National Pollutant Discharge Elimination System Permit Program
- Section 401 CWA Water Quality Certification or Waiver
- Antidegradation Policy
- Safe Drinking Water Act
- Federal Emergency Management Agency (FEMA)
- U.S. Army Corps of Engineers Sacramento and San Joaquin River Basins Comprehensive Study

Central Valley Project Improvement Act

On October 30, 1992, Congress enacted the Central Valley Project Improvement Act (CVPIA) under Public Law 102-575. The CVPIA modified the priorities of the CVP and established aggressive goals for the restoration of the fish and wildlife in California's Central Valley. The CVPIA provided the Secretary of the Interior with a number of authorities as tools to accomplish those goals. At the same time, the CVPIA recognized that additional management and measurement tools were needed and would be developed over time. In order to assist urban areas, agricultural water users, and others in meeting their future water needs, the CVPIA authorized all individuals or districts who receive CVP water under water service or repayment contracts, water rights settlement contracts (e.g., NCMWC) or exchange contracts to transfer, subject to certain terms and conditions, all or a portion of the water subject to such contract to any other California water users or water agency, State or Federal agency, Indian Tribe, or private non-profit organization (e.g., Applicants) for project purposes or any purpose recognized as beneficial under applicable State law.

One of the purposes of the CVPIA is to improve the operational flexibility of the CVP and to increase water-related benefits provided by the CVP to the State of California through expanded use of voluntary water transfers and improved water conservation. In addition, the CVPIA included ten major areas of change: (1) 800,000 acre-feet of water dedicated to fish and wildlife annually; (2) tiered water pricing applicable to new and renewed contracts; (3) water transfers provision, including sale of water to users outside the CVP service area; (4) special efforts to restore anadromous fish population by 2002; (5) restoration fund financed by water and power users for habitat restoration and enhancement and water and land acquisitions; (6) no new water contracts until fish and wildlife goals achieve; (7) no contract renewals until completion of a Programmatic Environmental Impact Statement; (8) terms of contracts reduced from 40 to 25 years with renewal at the discretion of the Secretary of the Interior; (9) installation of the temperature control device at Shasta Dam, fish passage measures at Red Bluff Diversion Dam; and (10) firm water supplies for Central Valley wildlife refuges along with development of a plan to increase CVP yield. Those CVP changes that facilitate the Off-site Water Facility Alternatives include the water transfers provision, which dictates the sale of water to users outside the CVP service area.

Operations Criteria and Plan for Long-Term Operation of the Central Valley Project/State Water Project

Reclamation prepared its Operations Criteria and Plan (OCAP) for the Long-term Operation of the CVP/SWP in 2008 in response to a biological opinion (BO) from USFWS in 2004 (Reclamation 2008). The 2008 OCAP covers the continued operation of the CVP and SWP and includes the operation of the temporary barriers project in the south Delta and the 500 cfs increase in SWP Delta export limit July through September. In addition to current day

operations, the OCAP outlines operation relationships to the following related actions: (1) an intertie between the California Aqueduct (CA) and the Delta-Mendota Canal (DMC), (2) Freeport Project, (3) the operation of permanent gates, which will replace the temporary barriers in the South Delta, (4) changes in the operation of the Red Bluff Diversion Dam (RBDD), and (5) Alternative Intake Project for the Contra Costa Water District (CCWD). A detailed summary of all operational components and associated modeling assumptions are included in the 2008 OCAP, which is available for reviewing at: http://www.usbr.gov/mp/cvo/ocap_page.html.

NCMWC takes its water deliveries from the CVP's Shasta Division, which includes facilities that provide the following benefits: (1) flood control, (2) navigation maintenance, (3) agricultural water supplies, (4) M&I water supplies (5) hydroelectric power generation, (6) conservation of fish in the Sacramento River, and (7) protection of the Sacramento-San Joaquin Delta from intrusion of saline ocean water. The Shasta Division includes Shasta Dam, Lake, and Powerplant; Keswick Dam, Reservoir, and Powerplant, and the Shasta Temperature Control Device.

The Sacramento River Division of the CVP was authorized after completion of the Shasta Division. Total authorized diversions for the Sacramento River Division are approximately 2.8 million AFY. Historically the total diversion has varied from 1.8 million AFY in a critically dry year to the full 2.8 million AFY in wet years. It includes facilities for the diversion and conveyance of water to CVP contractors on the west side of the Sacramento River. The division includes the Sacramento Canals Unit, which was authorized in 1950 and consists of the RBDD, the Corning Pumping Plant, and the Corning and Tehama-Colusa Canals.

Reclamation operates the Shasta, Sacramento River, and Trinity River divisions of the CVP to meet (to the extent possible) the provisions of SWRCB Order 90-05. If Reclamation cannot meet the SWRCB order an exception will be requested. An April 5, 1960, Memorandum of Agreement (MOA) between USBR and the DFG originally established flow objectives in the Sacramento River for the protection and preservation of fish and wildlife resources. The MOA provided for minimum releases into the natural channel of the Sacramento River at Keswick Dam for normal and critically dry years. Since October 1981, Keswick Dam has operated based on a minimum release of 3,250 cfs for normal years from September 1 through the end of February, in accordance with an agreement between Reclamation and DFG. This release schedule was included in SWRCB Order 90-05, which maintains a minimum release of 3,250 cfs at Keswick Dam and RBDD from September through the end of February in all water years, except critically dry years.

Flood Control

Under Executive Order 11988 FEMA is responsible for management of floodplain areas defined as the lowland and relatively flat areas adjoining inland and coastal waters subject to a one percent or greater chance of flooding in any given year (the 100-year floodplain). FEMA requires that local governments covered by Federal flood insurance pass and enforce a floodplain management ordinance that specifies minimum requirements for any construction within the 100-year floodplain.

FEMA is currently sponsoring a national FIRM map revision program, which consists of converting their existing floodplain delineation map to digital maps that are GIS compatible. DWR is assisting FEMA with this conversion. According to DWR, FEMA considers this digital conversion to be a "new study" and, therefore, all requirements of Chapter 10 of 44 CFR are considered applicable to the floodplain. Where insufficient geotechnical information is available to evaluate the integrity of the levee, the levee will be considered uncertified and not able to provide protection for the base flood (one percent annual chance flood). This map revision process is not expected to change the current flood designations for areas crossed as part of the Off-site Water Facility Alternatives.

Safe Drinking Water Act

Under the Safe Drinking Water Act (Public Law 93-523), passed in 1974, EPA regulates contaminants of concern to domestic water supply. Contaminants of concern relevant to domestic water supply are defined as those that

pose a public health threat or that alter the aesthetic acceptability of the water. These types of contaminants are regulated by EPA primary and secondary Maximum Contaminant Levels (MCLs) that are applicable to treated water supplies delivered to the distribution system. MCLs and the process for setting these standards are reviewed triennially. Amendments to the Act enacted in 1986 established an accelerated schedule for setting MCLs for drinking water.

EPA has delegated to the California Department of Public Health (CDPH) the responsibility for administering California's drinking-water program. CDPH is accountable to EPA for program implementation and for adopting standards and regulations that are at least as stringent as those developed by EPA. The applicable state primary and secondary MCLs are set forth in Title 22, Division 4, Chapter 15, Article 4 of the California Code of Regulations and shown for certain constituents in Table 3B.9-2.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following state plans, policies, regulations, and laws related to water quality and flooding are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.9, "Hydrology and Water Quality – Land:"

- Title 22 Standards
- Porter-Cologne Water Quality Control Act
- California State Nondegradation Policy
- California Toxics Rule and State Implementation Plan
- National Pollutant Discharge Elimination System (NPDES) Permit System and Waste Discharge Requirements for Construction
- NPDES Municipal Stormwater Permit Program, Sacramento County and the City of Folsom are co-permittees for a regional NPDES MS4 permit through the Central Valley RWQCB. First issued in 1990, the latest permit was adopted on 11 September, 2008 (NPDES Permit No. CAS082597, WDR Order No. R5-2008-0142
- Senate Bill (SB) 5, the Central Valley Flood Protection Act of 2008
- Central Valley Flood Protection Plan

State Water Resources and Regional Water Quality Control Boards

The SWRCB carries out its water quality protection authority through the adoption of specific Water Quality Control Plans (Basin Plans). These plans establish water quality standards for particular bodies of water. California water quality standards are composed of three parts: the designation of beneficial uses of water, water quality objectives to protect those uses, and implementation programs designed to achieve and maintain compliance with the water quality objectives.

The Central Valley RWQCB is responsible for the Water Quality Control Plan, Central Valley Basin (RWQCB 2004). The RWQCB implements management plans to modify and adopt standards under provisions set forth in Section 303(c) of the Federal CWA and California Water Code (Division 7, Section 13240). Under Section 303(d) of the 1972 CWA, the State is required to develop a list of waters with segments that do not meet water quality standards. The law requires RWQCB to establish priority rankings for waters on the lists and develop action plans, referred to as TMDL, to improve water quality.

The SWRCB adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Board 2000). This policy provides implementation measures for numerical criteria contained in the California Toxics Rule, promulgated in May 2000 by the U.S. EPA. When combined with the beneficial use designations in the Basin Plan, these documents establish statewide water quality standards for toxic constituents in surface waters.

Basin Plans and Water Quality Objectives

Basin Plans designate beneficial uses for California's major rivers and groundwater basins and establish narrative and numerical water quality objectives for those waters. Beneficial uses represent the services and qualities of a water body (i.e., the reasons why the water body is considered valuable), while water quality objectives represent the standards necessary to protect and support those beneficial uses. Basin plans are primarily implemented by using the NPDES permitting system and the issuance of waste discharge requirements (WDRs) to regulate waste discharges so that water quality objectives are met. Basin plans provide the technical basis for determining waste discharge requirements and taking regulatory enforcement actions if deemed necessary.

Basin plans have been adopted for the Sacramento and San Joaquin River Basin (Central Valley RWQCB 2004) and for the San Francisco Bay Region (San Francisco Bay RWQCB 2007). Both the Central Valley and San Francisco Bay RWQCBs (Regions 5 and 2, respectively) have set water quality objectives for all surface waters in their respective regions for the following substances and parameters: ammonia, bacteria, biostimulatory substances, chemical constituents, color, dissolved oxygen, floating material, oil and grease, pH, radioactivity, salinity, sediment, settleable material, suspended material, tastes and odors, temperature, toxicity, and turbidity. In addition, Region 2 has adopted standards for bioaccumulation, population and community ecology, sulfides, and constituents of concern for municipal and agricultural water supplies, while the Central Valley RWQCB has adopted standards for pesticides.

Specific objectives for concentrations of chemical constituents are also applied to bodies of water based on their designated beneficial uses (Central Valley RWQCB 2004; San Francisco Bay RWQCB 2007). Beneficial uses applied to the Sacramento River include municipal supply, irrigation, stock watering, industrial, power, warm and cold freshwater habitat, navigation, spawning, migration, and contact and non-contact recreation. Water quality objectives applicable to all groundwaters have been set for bacteria, chemical constituents, radioactivity, tastes and odors, and in Central Valley Region 5, for toxicity (Central Valley RWQCB 2004; RWQCB, San Francisco Bay 2007).

NPDES Program – Industrial Activities

Operation of the Off-site Water Facility Alternatives would require compliance with the requirements of the NPDES permit for Discharges of Stormwater Associated with Industrial Activities. This general NPDES permit covers all stormwater and some non-stormwater discharges associated with certain industrial activities. The Off-site Water Facilities would be covered according to its North American Industry Classification System (NAICS), No 22131. Additional activities associated with the site, such as vehicle maintenance would also trigger coverage.

The City is required to submit a Notice of Intent to the Central Valley RWQCB to file for a NPDES General Industrial Permit for Stormwater Discharges. The General Industrial Permit requires control of pollutant discharges using best available technology economically achievable (BAT) and best conventional pollutant technology (BCT) to prevent pollutants as necessary to meet water quality standards. Also, all facility operators must prepare, retain on site, and implement a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP has two objectives: 1) to help identify the sources of pollution that affect the quality of industrial stormwater and non storm discharges; and 2) to describe and ensure the implementation of BMPs to reduce or prevent pollutants in the discharges. Development and implementation of BMPs constitutes compliance with BAT and BCT and, in most cases, compliance with water quality standards.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following regional and local plans, policies, regulations, and laws related to water quality and flooding are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.9, "Hydrology and Water Quality – Land:"

- Sacramento Stormwater Quality Partnership
- Sacramento County General Plan, Agricultural, Conservation, and Safety Elements

Sacramento County General Plan

The following additional Sacramento County General Plan goals and policies as contained in the Conservation Element are relevant to the Off-site Water Facilities:

GOAL: Surface water quality which promotes a healthy aquatic environment, and is safe for public use and enjoyment.

GOAL: Adequate long-term quantity and high quality of ground water resources for both human and natural systems.

- **Policy CO-11:** Hazardous materials shall not be stored in the 100 year floodplain in such a manner as to pose a significant potential for surface water contamination.

Sacramento Water Forum

The Sacramento Water Forum process brought together a diverse group of stakeholders that included water managers, business and agricultural leaders, environmentalists, citizen groups, and representatives of local governments to evaluate available water resources and the future water needs of the Sacramento Metropolitan Area. The coequal objectives of the Water Forum Agreement (WFA) are (1) to provide a reliable and safe water supply for the region's economic health and planned development through the year 2030; and (2) to preserve the fishery, wildlife, recreational, and aesthetic values of the lower American River. The first objective will be met by additional diversions of surface water for the conjunctive use of surface water and groundwater, expanded water demand management programs, and use of recycled water. The second objective will be met by regulating American River flow patterns (or "modifying" American River flow) to improve in-stream fish habitat (spawning/hatching/rearing), as well as implementation of the Habitat Management Element of the WFA.

Demand management/water conservation is essential to meeting the coequal objectives of the WFA. As a signatory to the WFA and as a water contractor under Reclamation's CVP, the City is committed to implementing the water conservation best management practices (BMPs) defined in the Water Conservation Element of the WFA. Technical studies prepared in support of the WFA indicate that implementation of the BMPs (most notably the provision for water meter retrofits and demand pricing) will result in a demand factor reduction of 25.6% relative to the 1990 baseline by the year 2030.

The Water Forum EIR (State Clearinghouse No. 1995082041), certified in 1999, evaluated the City's water supply needs in combination with other water supply needs in the region, including SCWA. The City and SCWA agreed to a series of actions and commitments related to diversions of surface water, dry-year supplies, fishery flows, habitat management, water conservation, and groundwater management. The Water Forum EIR evaluated the provision of water for a 30-year planning period based on land use projections. The 2005 Zone 40 Water Supply Master Plan (WSMP) prepared by SCWA relied on the County of Sacramento General Plan to identify where urban development would occur within the county, consistent with WFA purveyor-specific agreements for water service to those areas.

Under the WFA, the City plans to increase its average and wet year American River diversions from an agreed upon baseline amount of 20,000 AF to a year 2030 level of 34,000 AF. Under the WFA, in drier years, the City would divert and use a decreasing amount of surface water from 34,000 AF to 22,000 AF or the equivalent, in a three stage stepped and ramped reduction in proportion to the decrease in the March through November unimpaired inflow to Folsom Reservoir, from 950,000 to 400,000 AF. Under stage 1, the City would divert a decreasing amount from 34,000 AF to 30,000 AF in proportion to the decrease in unimpaired inflow to Folsom Reservoir from March through November when the at times when inflow is greater than 870,000 AF, but less than 950,000 AF. Under stage 2, the City diverts 27,000 AF when the March through November unimpaired inflow to Folsom Reservoir is greater than 650,000 AF but less than or equal to 870,000. Under stage 3, the City would divert 22,000 AF when the March through November unimpaired inflow to Folsom Reservoir is greater than 400,000 AF but less than or equal to 650,000 AF.

In the driest years, when the March through November unimpaired inflow to Folsom Reservoir is less than or equal to 400,000 AF, the City would reduce its diversions to 20,000 AF or the equivalency based on actual flows. In addition, the City would reduce diversions in the driest years by encouraging additional, extra-ordinary conservation to effectively achieve a reduction to 18,000 AF. The WFA encouraged the City to enter into agreements with other suppliers that have access to both surface water and groundwater for an equivalent exchange of the amount of reduction needed by the City as outlined above in the three stages of reduction. Under these arrangements, those other suppliers would use groundwater in lieu of surface water equivalent to the amount that they would continue to divert.

City of Rancho Cordova

Applicable policies of the City of Rancho Cordova's General Plan relating to water quality and hydrology are provided below.

- **Policy S.2.1:** Support and encourage efforts to limit and reduce the potential for community flooding from the Cosumnes or American Rivers.
- **Policy S.2.2:** Manage the risk of flooding by discouraging new development located in an area that is likely to flood.
- **Policy S.2.3:** Discourage the creation of new parcels when the presence of easements, floodplain, marsh, or riparian habitat, and/or other features would leave insufficient land to build and operate structures. This policy shall not apply to open space lots specifically created for dedication to the City or another appropriate party for habitat protection, flood control, drainage, or wetland maintenance.
- **Policy S.2.4:** Ensure that adequate drainage exists for both existing and new development.

3B.9.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, an impact to surface water quality and/or hydrology would be significant if the Off-site Water Facility Alternatives would:

- violate any water quality standards, waste discharge requirements, or otherwise degrade water quality, including changes to the position of X-2;

- substantially alter the existing drainage pattern of the area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;

- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner, which would result in flooding on- or off-site;

- substantially increase, reduce, or otherwise modify flow within affected waterways;

- create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;

- place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;

- place within a 100-year flood hazard area structures which would impede or redirect flood flows;

- expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam; or

- result in inundation by seiche, tsunami, or mudflow.

ANALYSIS METHODOLOGY

This analysis considers the potential for the Off-site Water Facility Alternatives to impact local and regional surface hydrology and water quality based on the components described in Chapter 2, "Alternatives." The impact analysis focuses on foreseeable changes to existing hydrologic and water quality conditions in the context of the below-mentioned significance criteria. The impact analysis provides a discussion for each of the major Off-site Water Facility components in the context of the construction, off-site staging areas, and post-construction operation. Potential hydromodification impacts resulting from new impervious surfaces at the WTP (on- or off-site) were assessed by using the Sacramento Method to calculate pre- and post-construction runoff. Mitigation measures are identified where appropriate.

For the purposes of surface water modeling and assessing changes to the Sacramento River, the conditions for the operations of the Off-site Water Facilities were analyzed by post-processing results from recent runs from the California Simulation Model II (CALSIM II) which is a statewide water supply water supply systems operations model developed by DWR and USBR. The primary purpose of CALSIM II is to evaluate the water supply reliability of the CVP and SWP with and without various assumed future facilities, and with different modes of facility operations.

CALSIM II is the best available tool for modeling operations of the CVP and SWP hydrology and is the only systemwide hydrologic model being used by Reclamation and DWR to conduct planning and impact analyses of the Sacramento River and Delta. The CALSIM II model is recognized as a valuable tool for conducting comparative analysis for new facilities or changes in operations. In comparative applications, such as for this EIR/EIS, the model is run twice; once to represent a base condition (No Project Alternative) and a second time with a specific change (with Off-site Water Facilities) to assess the change that would result from the Off-site Water Facility Alternatives. Potential errors or uncertainties that exist in the "No Project Alternative" simulation are also present in the "Off-site Water Facility Alternatives" simulation. Thus, the effects from potential errors or uncertainties are, to some extent, reduced or accounted for when assessing the effects of the Off-site Water Facility Alternatives based on hydrologic changes between alternatives. Appendix M-IX provides additional detail regarding the methodology used for the for the CALSIM II modeling.

For the purposes of this analysis, the following assumptions were made in applying CALSIM II to the Off-site Water Facility Alternatives:

- Reclamation would approve the Freeport as an additional point of delivery for NCMWC's CVP Contract;
- The analysis depicts a "worst-case" for NCMWC whereby it analyzes project water (not base supply) being re-allocated into an urban demand pattern for the assignment;
- The analysis assumes an "efficiency" of 80% in the use of water conveyed through the Off-site Water Facilities, which means that only 20 percent of the water diverted makes it back to the Sacramento River via the regional wastewater treatment plant operated by the SCRSD. This estimate is considered conservative, but was deemed appropriate given plans for regional water recycling;
- The diversion of surface water as part of the Off-site Water Facilities would occur at the existing Freeport Project diversion and intake facility; and
- For the purposes of this EIR/EIS analysis, the efficiency of irrigation return flow to the Sacramento River is assumed to be 35% – or an efficiency rate of 75%.

The information contained in this section is also used in the analysis of secondary environmental effects associated with changes in groundwater levels (Section 3B.7, "Groundwater Resources – Water"), water supply conditions (Section 3B.16, "Utilities and Service Systems – Water"), and drinking water quality (Section 3B.8, "Hazards and Hazardous Materials – Water").

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Placement of Housing within a 100-Year Floodplain—The Off-site Water Facilities would not involve the construction of residential housing and, therefore, would not place housing within a 100-year flood hazard area as mapped on the most recent Federal Flood Insurance Rate Map. For this reason, this issue is irrelevant for the Off-site Water Facility Alternatives and not addressed further in this EIR/EIS.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.9-1 Potential Temporary, Short-Term Construction-Related Drainage and Water Quality Effects. *Construction of the Off-site Water Facilities could generate discharges to surface water resources that could potentially violate water quality standards or waste discharge requirements.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

Construction of the Off-site Water Facilities would involve excavation, soil stockpiling, grading, and the installation of support buildings, storage tanks, pumping facilities, and pipelines. During site grading, trenching, and construction activities, large areas of bare soil would be exposed to erosive forces for long periods of time. Bare soils are much more likely to erode than vegetated areas due to the lack of dispersion, infiltration, and retention created by covering vegetation. Construction activities involving soil disturbance, excavation, cutting/filling, stockpiling, dewatering and grading activities could result in increased erosion and sedimentation to surface waters. At locations where the crossing of a water feature (e.g. Morrison Creek), the removal of riparian vegetation and disturbance of the creek bed or bank could also result in the weakening the bank's structure and increase its susceptibility to erosion. Disturbing the geomorphic characteristics and stability of the channel bed and banks may initiate chronic erosion in natural channels. Such impacts could be exacerbated if the riparian vegetation is not reestablished and stabilized prior to the next high-flow or precipitation event and could result in **potentially significant direct** impacts within the immediate vicinity of construction and **indirect** impacts to water quality further downstream. ***[Similar]***

Hazardous materials associated with construction would be limited to substances associated with mechanized equipment, such as gasoline and diesel fuels, engine oil, and hydraulic fluids. If precautions are not taken to contain contaminants, accidental spills of these substances during construction could produce contaminated stormwater runoff (nonpoint source pollution), a major contributor to the degradation of water quality in surface waters. Without proper containment and incident response measures in place, the operation of construction equipment could result in **potentially significant direct** and **indirect** impacts to water quality. ***[Similar]***Prior to construction grading, the City must file an NOI with the Central Valley RWQCB to comply with the General NPDES Construction Permit and prepare the SWPPP, which addresses the measures that would be included in the project to minimize and control construction and post-construction runoff to the "maximum extent practicable." However, without these documents available for review as part of this EIR/EIS, the City is unable to determine their adequacy in achieving applicable water quality standards. In addition, NPDES permits require the implementation of BMP's that achieve a level of pollution control to the maximum extent practical, which may not necessarily be completely protective of aquatic life. This represents a **potentially significant**, **direct impact**. For these reasons, the implementation of the prescribed mitigation would be required to ensure that the Off-site Water Facilities SWPPP and Grading Plan(s) include measures necessary to minimize water quality impacts as a result of project construction and post-construction runoff. ***[Similar]***

Mitigation Measure 3B.9-1a: Acquire Appropriate Regulatory Permits and Prepare and Implement SWPPP and BMPs.

The City shall prepare a SWPPP specific to the selected Off-site Water Facility Alternative and secure coverage under SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ). The SWPPP shall identify specific actions and BMPs relating to the prevention of stormwater pollution from project-related construction sources by identifying a practical sequence for site restoration, BMP implementation, contingency measures, responsible parties, and agency contacts. The SWPPP shall reflect localized surface hydrological conditions and shall be reviewed and approved by the City prior to commencement of work and shall be made conditions of the contract with the contractor selected to build the Off-site Water Facilities. The SWPPP shall incorporate control measures in the following categories:

- soil stabilization and erosion control practices (e.g., hydroseeding, erosion control blankets, mulching, etc.;
- dewatering and/or flow diversion practices, if required (see Mitigation Measure 3B.9-1b);
- sediment control practices (temporary sediment basins, fiber rolls, etc.);
- temporary and post-construction on- and off-site runoff controls;
- special considerations and BMPs for water crossings, wetlands, drainages, and vernal pools;
- monitoring protocols for discharge(s) and receiving waters, with emphasis placed on the following water quality objectives: dissolved oxygen, floating material, oil and grease, pH, and turbidity;
- waste management, handling, and disposal control practices;
- corrective action and spill contingency measures;
- agency and responsible party contact information, and
- training procedures that shall be used to ensure that workers are aware of permit requirements and proper installation methods for BMPs specified in the SWPPP.

The SWPPP shall be prepared by a qualified SWPPP practitioner with BMPs selected to achieve maximum pollutant removal and represent the best available technology that is economically achievable. Emphasis for BMPs shall be placed on controlling discharges of oxygen-depleting substances, floating material, oil and grease, acidic or caustic substances or compounds, and turbidity. Performance and effectiveness of these BMPs shall be determined either by visual means where applicable (i.e., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination, (inadvertent petroleum release) as required to determine adequacy of the measure.

Implementation: City of Folsom Utilities Department

Timing: Development of the SWPPP prior to construction of all Off-site Water Facilities and implementation throughout construction.

Enforcement:
1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure 3B.9-1b: Properly Dispose of Hydrostatic Test Water and Construction Dewatering in Accordance with the Central Valley Regional Water Quality Control Board.

All hydrostatic test water and construction dewatering shall be discharged to an approved land disposal area or drainage facility in accordance with Central Valley RWCQB requirements. The City or its construction contractor shall provide the Central Valley RWQCB with the location, type of discharge, and methods of treatment and monitoring for all hydrostatic test water discharges. Emphasis shall be placed on those discharges that would occur directly to surface water bodies.

Implementation: City of Folsom Utilities Department

Timing: Incorporation measures into SWPPP prior to construction and implementation throughout construction, as appropriate.

Enforcement:

1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b.

Implementation: City of Folsom Utilities Department

Timing: Incorporation of measures into SWPPP prior to construction and implementation throughout construction.

Enforcement:

1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

2, 2A, and 2B

Under Off-site Water Facility Alternatives 2, 2A, and 2B, construction of the Off-site Water Facilities would involve similar construction-related impacts during pipeline installation and construction of above -or below-ground structures (e.g., pump stations). However, the construction area and corresponding disturbance area where soils would be exposed to rainfall would be substantially reduced under these alternatives with consolidation of treatment operations at Vineyard SWTP and storage within the SPA. However, the potential for adverse water quality effects to occur during construction would continue to exist. As a result, **direct** and **indirect** construction-related water quality impacts could be **potentially significant**. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.9-1a and 3B.9-1b.

With the implementation of the above mitigation measures, impacts to surface water quality for all the Off-site Water Facility Alternatives would be reduced to a **less-than-significant** level through the inclusion of focused BMPs for the protection of surface water resources. Monitoring and contingency response measures would be included to verify compliance with water quality objectives for all surface waters crossed during construction. Particular emphasis would be placed on dissolved oxygen, floating material, oil and grease, pH, and turbidity as these are generally the water quality constituents of most concern during construction-related activities.

IMPACT 3B.9-2 Exceedance of Surface Water Quality Standards during Operation. *The operation of the Off-site Water Facilities could result in changes to the quality of surface water resources that could potentially violate water quality standards or waste discharge requests.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Operation of the Off-site Water Facilities has the potential to result in minor changes in downstream water quality of the Freeport Project including concentrations of salinity and the potential to alter both upstream and downstream Sacramento River water temperatures by altering in-stream flows through the operation of the Off-site Water Facility Alternatives, a corresponding change in delivery schedule, and change in the location and type discharge following the proposed M&I beneficial use. The following analysis addresses these topics and presents the results of the analysis of related impacts from operations of the Off-site Water Facilities. The operation of the Off-site Water Facility Alternatives would result in NCMWC reducing its current diversion during the irrigation season and the City diverting the purchased contract water at Freeport at an average rate of 10 cfs annually and up to a maximum of 15.5 cfs during the months of July and August. The resulting total diversions from the Sacramento River are roughly equivalent to existing conditions and any changes as a result of the change to an M&I delivery schedule, as described in Impact 3B.9-4, equate to a minor fraction of total Delta outflow. As a result, this change is less than the 1% change in Delta outflow of 11,400 cfs that is required to maintain X-2 at Chipps Island (SWRCB 1999). In this context, potential **direct** and **indirect** impacts are considered **less than significant** and not expected to significantly affect the position of X-2. ***[Similar]***

The addition of a new point of diversion for diversions currently under NCMWC's CVP settlement contract as part of the operation of the Off-site Water Facilities would not be expected to adversely affect reservoir releases or result in other changes in CVP and SWP operations. In this context, the City does not expect the Off-site Water Facility Alternative's operation to result in significant adverse, indirect changes in water temperature within rivers and managed waterways in the Sacramento River basin. Rather, the operation of the Off-site Water Facilities is expected to facilitate two potential, minor benefits in water temperature by (1) adding increased flows to the section of the Sacramento River, upstream of Freeport, and (2) contributing to higher reservoir levels in CVP reservoir facilities during the summer months as a result of the change to an M&I delivery schedule. These **direct** and **indirect** impacts would be **less than significant**. ***[Similar]***

Another potential water quality change associated with the operation of the Off-site Water Facility Alternatives would be associated with the changes in the type of the return flows anticipated between agricultural and M&1 uses. Under existing conditions, water used for agricultural uses within NCMWC's service area that ultimately drains back to the Sacramento River consists of irrigation return flows. Irrigation return flows may contain detectable levels of various water quality pollutants including nitrogen-based fertilizers, pesticides, and sediment. Higher water temperatures have also been documented within agricultural irrigation return flows.

With a corresponding change to M&I use, water used within the SPA that ultimately drains back to the Sacramento River would consist of disinfected, secondary-treated effluent discharged from Sacramento Regional County Sanitation District's (SRCSD) WWTP. The disinfected, secondary-treated effluent discharged from SRCSD WWTP is regulated by the Central Valley RWQCB under NPDES No. CA0077682. For the purposes of

this analysis, changes in water quality within the Sacramento would be a function of the additional discharges of disinfected, secondary-treated wastewater from SRCSD's WWTP and the corresponding reductions in irrigation return flows from NCMWC's service area. These changes in nutrient loadings would be further influenced by the additional flows that would occur within the Sacramento River between NCMWC's service area and Freeport and downstream of Freeport and would be contingent on hydrologic conditions and the corresponding assimilative capacity of the river at any given point in the hydrologic year. Given all the various existing stressors that characterize existing river conditions combined with the fact that the Off-site Water Facility Alternatives would involve only minor hydrologic changes and essentially a trading in the type of inputs to the system, potential indirect impacts to water quality in relation to cumulative sources of existing loadings are considered **less-than significant**.***[Similar]***

The potential impacts of increased wastewater discharges to SRCSD's WWTP and corresponding changes in the quality of effluent discharged from the WWTP are discussed in Impact 3A.15.3 of Section 3A.15 "Utilities – Land." Impact 3A.13.3 specially addresses the potential impacts of the corresponding increases in wastewater discharges to the SRCSD's WWTP and SRCSD's ability to meet its waste discharge requirement, which are partially driven by the applied beneficial use, which includes municipal supply, irrigation, stock watering, industrial, power, warm and cold freshwater habitat, navigation, spawning, migration, and contact and non-contact recreation, and other economic considerations. ***[similar]***As described in Chapter 2, "Alternatives," the assignment of water from NCMWC to the City would not result in increased pumping of groundwater in the NCMWC's service areas to support continued agricultural uses. In recognizing that no increase in groundwater usage would occur as a result of the Off-site Water Facilities, no changes to agricultural return flows or Sacramento River water quality, in terms of higher levels of dissolved solids, are anticipated. As a result, no corresponding adverse changes to the Sacramento River water quality would occur and potential **direct** and **indirect** impacts would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.9-3 Alteration of Drainage Patterns Resulting in Off-site Flooding and/or Erosion. *The Off-site Water Facilities could result in the alteration of existing drainage patterns thereby increasing the rate or amount of surface runoff in a manner that could result in substantial flooding and/or erosion or siltation on- or off-site.*

NCP, PA, 1, 1A, 3, and 3A

The construction of a new WTP and storage facility under these alternatives has the potential to alter the surface infiltration characteristics of the WTP/storage site, which could result in increases in both the volume and discharge rate of stormwater runoff thereby potentially contributing to flooding on site or at downstream locations. Pump station and well facilities could also contribute to increased runoff, but at a far lesser magnitude. Following construction, the impervious surfaces created with the storage and treatment facilities and paved areas are expected to result in increases in peak runoff flows. Under these alternatives, the WTP site is located in the headwaters of Buffalo Creek, which flows west and is tributary to the Lower American River (see Exhibit 3B.9-1). All drainage runoff from the WTP would enter Buffalo Creek at two locations and, without mitigation, could contribute to hydro-modification within the drainage catchment and downstream scouring. In addition, development of the WTP site could require a minor alteration of Buffalo Creek, to facilitate development of the site.

Based on direction provided in Section 2 of the County's Drainage Manual, the Sacramento Method charts were used in estimating drainage discharges for a design storm event for an assumed overland flow system. The Sacramento Method uses the urban unit hydrograph as a basis for estimating runoff hydrographs using design charts that have been created to expedite design flow calculations for basins less than 640 acres (260 hectares) (Sacramento City/County Drainage Manual 1996). The Sacramento Method charts are based on discrete recurrence interval where peak flow is given versus drainage area for the 10- and 100-year reoccurrence intervals.

The main variables used in the simplified charts are the percentage of impervious surface area and total drainage area, which for the WTP and storage tank areas equals approximately 10 acres. Based on conditions observed on site, existing site conditions were assumed to have a 20% impervious surface cover. Under the developed Off-site Water Facilities condition, the impervious surface cover was increased to 95% to provide a worst-case estimate of peak runoff.

Using Exhibits 2-16 and 2-22 in the Sacramento City/County Drainage Manual, the results reveal the estimated rate of stormwater runoff (in cfs) produced on site for a 10- and 100-year storm event. Rates of runoff are the absolute maximum that would occur during a 24-hour storm and, therefore, provide a conservative estimate for determining the net change in post-Off-site Water Facilities runoff. Based on the simplified method, the Off-site Water Facilities WTP could produce up to 21.0 cfs during a 10-year storm event; a net increase of 6.0 cfs when compared with existing conditions. Similarly, the net increase in peak runoff during a 100-year storm event is estimated at 31.0 cfs; up 9.0 cfs from the existing condition. Appendix M-VIII provides the unit hydrographs used to derive these values.

The net increase in peak runoff as a result of these Off-site Water Facility Alternatives would likely be partially attenuated by several of the containment areas, landscaped areas, paved walkways, and crushed rock roadways included as part of the WTP design and, therefore, it is reasonable to conclude that the above values likely over-estimate post-Off-site Water Facilities drainage flows. However, given that no formal Drainage Plan has been developed to attenuate post-construction drainage flows, the Sacramento Method provides a basic means for comparison and, based on the results, it is reasonable to conclude that the Off-site Water Facilities would result in a net increase in drainage discharge from the WTP site. This increase in peak flows could contribute to additional downstream flooding and/or bank scour. These **direct** and **indirect** impacts could be **potentially significant**. ***[Similar]***

Mitigation Measure 3B.9-3a: Prepare and Implement Drainage Plan(s) for Structural Facilities.

The City shall prepare a Drainage Plan for the selected Off-site Water Facility WTP and shall incorporate measures to maintain off-site runoff during peak conditions to pre-construction discharge levels. The Drainage Plan shall provide both short- and long-term drainage solutions to ensure the proper sequencing or drainage facilities during and following construction. The City shall evaluate options for on-site detention including, but not limited to, providing temporary storage within a portion or portions of proposed paved areas, linear infiltration facilities along the site perimeter, and/or other on-site opportunities for detention, retention, and/or infiltration facilities. Design specifications for the detention, retention, and/or infiltration facilities shall provide sufficient storage capacity to accommodate the 10-year, 24-hour storm event. In addition, the Drainage Plan shall delineate the overland release path for flows generated by a 100-year frequency storm, so that structural pad elevations for buildings, containment facilities, storage tank, and container storage areas are placed a minimum of one foot above the property's highest frontage curb elevation.

Implementation: City of Folsom Utilities Department

Timing: Development of the Drainage Plan prior to start of construction.

Enforcement:

1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure 3B.9-3b: Ensure the Provision of Sufficient Outlet Protection and On-site Containment.

Energy dissipaters, vegetated rip-rap, soil protection, and/or other appropriate BMPs shall be included within all storm-drain outlets to slow runoff velocities and prevent erosion at discharge locations for the WTP. A long-term maintenance plan shall be implemented for all drainage discharge control devices. The WTP layout shall also include sufficient on-site containment and pollution-control devises for drainage facilities to avoid the off-site release of water quality pollutants, oil and grease.

Implementation: City of Folsom Utilities Department

Timing: Incorporation of measures into the Drainage Plan prior to start of construction.

Enforcement:

1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

2, 2A, and 2B

A WTP would not be constructed under these alternatives and, therefore, these Off-site Water Facility Alternatives would result in only a minor net increase in peak runoff from the new equalization tanks and pumping station. The construction of the equalization tanks would occur within the SPA and would be subject to the requirements of the Folsom South of 50 Specific Plan. Given only a minimal increase in impervious surfaces outside the SPA would be anticipated under these alternatives, these **direct** and **indirect** impacts to localized drainage facilities would be **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

4 and 4A

Following construction of these Off-site Water Facility Alternatives, the impervious surfaces associated with the WTP, storage facilities and paved areas are expected to result in increases in peak drainage flows that would in turn be discharged to Buffalo Creek, similar to that of Off-site Water Facility Alternative 1, but at a different location. Although all drainage runoff would enter an existing stormwater collection system, there is a potential for this drainage runoff to exceed the capacity of existing off-site drainage infrastructure during peak rainfall conditions thereby potentially contributing to on- and/or off-site flooding. These **direct** and **indirect** impacts could be **potentially significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3B.9-3a and 3B.9-3b.

With the implementation of the above mitigation measures, impacts to on- and off-site drainage patterns would be mitigated to a **less-than-significant** level through the preparation of a formal drainage plan to attenuate post-construction runoff thereby minimizing the potential for on and off-site flooding and long-term hydromodification impacts.

IMPACT 3B.9-4 Changes to Flow within the Sacramento River. *The Off-site Water Facilities could result in adverse effects to existing flows within the Sacramento River.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Operation of the Off-site Water Facility Alternatives could potentially affect flows within the Sacramento River by diverting CVP water through the Freeport Project as opposed to the Riverside Pumping Plant within NCMWC's service area. Table 3B.9-3 shows how flows would change with the Off-site Water Facilities as compared to existing conditions. As indicated in Chapter 2, "Alternatives," the operation of the Off-site Water Facilities would not increase the diversion of CVP water, but would only add a new point of diversion. The new point of diversion would be located approximately 20 miles south of NCMWC's service area and is expected to provide a minor addition to the total volume of flow within portions of the Sacramento River between NCMWC and Freeport; hence Zone 2 of the "Water" Study Area. This additional flow would be highest during the summer months, peaking at 1,087 AF or 18.1 cfs during the months of July and August. This direct impact is considered **less than significant**. ***[Similar]***

The diversion of surface water at the Freeport Project intake was analyzed in an EIR/EIS prepared in 2003 by the FRWA. The City does not propose an increase in the Freeport Project's maximum diversion capacity of 185 mgd. Therefore, the operations of the Off-site Water Facility Alternatives would remain within the confines of the Freeport Project's existing capacity. The potential impacts of operating the Freeport Project diversion were previously addressed in an EIR/EIS prepared by the FRWA. The Freeport Project EIR/EIS is incorporated by reference into this EIR/EIS as described in Chapter 1, "Introduction"). The CALSIM simulation completed for the Freeport Project EIR/EIS concluded that hydrologic responses to the operation of Freeport Project deliveries are distributed throughout the SWP and CVP system and that average annual changes would be slightly greater during dry periods. Very infrequent, larger increases and reductions in storage and flow within the Lower Sacramento River, south of Freeport, were also observed in some individual months even though Freeport Project diversions were small or not occurring. These changes were concluded as not substantial, infrequent, and, therefore, **less than significant**. ***[Similar]***

Based on modeling conducted by SWRI, Inc (2008), using CALSIM II, the principle changes in flow as a result of the operation of the Off-site Water Facilities occur downstream of Freeport and are a consequence of modifying the current agricultural delivery schedule for the 8,000 AFY of CVP water to an M&I delivery schedule. This change in delivery modifies the timing of diversions to smaller, more consistent withdrawals of surface water throughout the year as opposed to large diversions during the summer months when crop water demands are high. This phenomenon is demonstrated in Table 3B.9-3 whereby the Off-site Water Facility Alternatives results in a net decrease in CVP water use during the months of July and August. The data produced by SWRI is provided in its entirety in Appendix M-IX.

The change in the delivery schedule also results in minor corresponding increases in surface water diversions during other months (see Table 3B.9-3) when irrigation demands decrease or are absent. As shown in Table 3B.9-3, the Off-site Water Facility Alternatives would result in an increased diversion of CVP water on the order of 920 AF and 800 AF during the months of June and September, respectively. These increases would be offset by reductions in deliveries during the months of July and August of 3,040 AF. Additionally, as shown in Table 3B.9-3, these Off-site Water Facilities-related changes are estimated at 3 cfs or <0.04% of the total minimum flow at Freeport[2].

[2] Assuming a minimum base flow of 8,000 cfs within the Sacramento River (CSCGMP 2006).

Table 3B.9-3
Effects of Off-site Water Facility Alternatives on Sacramento River Flows

	Units	Total	Mar	Apr	May	June	July	Aug	Sept	Oct	Nov	Dec	Jan	Feb

Assumptions/Notes: CVP = Central Valley Project; NCMWC = Natomas Central Mutual Water Company; cfs = cubic feet per second; AF = acre feet; NA = not available

(1) Return Flow for the Off-site Water Facility Alternatives is calculated based on a return efficiency of 80% whereby only 20% of the diverted flow returns to the River. NCMWC's return efficiency is assumed to be 65%.

(2) Purchased Contract Water = 8,000 AF; NCMWC Deliveries = 120,200 AF. Modeling assumes that up to 2,000 AF could still be diverted by NCMWC during wet and normal years. During dry years, the modeling assumes that the City would take delivery of the full 6,000 AFY. See Appendix M-IX for additional modeling detail.

(3) Refers to portions of the Lower Sacramento River, south of Freeport.

(4) The change in minimum Freeport Flow is based on an average monthly minimum flow of 10,000 cfs.

(5) Cubic feet per second over 30 days.

Source: SWRI 2008

Beyond the actual change in the timing of diversion, the change in where surface water is applied as a result of the operation of the Off-site Water Facility Alternatives are also expected to result in corresponding reductions in the efficiency of return water draining back to the Sacramento River. Under existing conditions, approximately 35 percent of the CVP water applied within the NCMWC service area drains back into the river as a result of the complex network of drainage conveyance facilities operated by NCMWC. With operation of the Off-site Water Facilities, approximately 20 percent of the CVP Water would return to the Sacramento River with the largest source of return water coming from discharges from the SRCSD Wastewater Treatment Plant (WWTP).

Based on the conditions shown in Table 3B.9-3 for the Off-site Water Facility Alternatives and related effects to surface flows within the Sacramento River, the impacts of the Off-site Water Facility Alternatives to hydrologic conditions within the Delta would be minor and not expected to adversely affect CVP and SWP reservoir operations or pumping in the south Delta. From a perspective of total water diverted, changes in the Sacramento River as attributed to the Off-site Water Facility Alternatives would be insignificant given that Off-site Water Facility Alternatives would divert water currently assigned and diverted from an existing upstream user and would not change the amount of water diverted, only the location of the point of diversion and timing. Further, it is reasonable to conclude that the Off-site Water Facility Alternatives would not significantly reduce the flows in the Sacramento River at times when the Off-site Water Facilities would increase diversions as a result of the change to an M&I delivery schedule since more water would be present in the Sacramento River at these times. Based on this determination, the Off-site Water Facility Alternatives would not result in any significant direct or indirect changes in Delta inflow and outflow that could otherwise interfere with any CVP and SWP export diversions. For this reason, these **direct** and **indirect** impacts would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.9-5 Exceed Drainage Capacity and Contribute Sources Polluted Runoff. *The Off-site Water Facilities could create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.*

NCP, PA, 1, 1A, 3, and 3A

As previously indicated under Impact 3B.9-3, a formal Drainage Plan has not been prepared for the WTP and/or other Off-site Water Facilities components. Given that the conveyance pipeline would be completely buried underground following construction with no corresponding increase in impervious surfaces, no changes in post-construction runoff volumes are anticipated from the conveyance facilities that could otherwise overwhelm existing drainage infrastructure. Drainage runoff from the On-site or White Rock WTP site would enter Buffalo Creek near its headwaters, either east or west of Prairie City Road, respectively. Although typical engineering standards require that all storm drain pipelines are capable of conveying a 10-year frequency storm while providing temporary storage for the 100-year event, without the availability of actual engineering plans the City unable to confirm compliance with these standards. Without confirmation that the WTP's design satisfies this minimum criteria, there remains a potential for the WTP to contribute additional peak runoff that could exceed the channel capacity of Buffalo Creek, which ultimately becomes a piped waterway west of Hazel Avenue. Based on these determinations, the **direct** impacts would be **potentially significant**. ***[Similar]***

In relation to potential non-point source water quality impacts, the operation of the WTP would be required to comply with the SWRCB's Water Quality Order No. 97-03-DWQ, NPDES General Industrial Permit No. CAS000001, which applies to discharges of stormwater associated with industrial activities. Post-construction stormwater BMPs and monitoring standards would be required for the Off-site Water Facilities consistent with the General Industrial Permit and NAICS No. 22131 classification to achieve pollutant removal to the maximum extent practical. Compliance with the conditions set forth in the General Permit would address water quality concerns related to leaks and spills of chemicals stored and used at the WTP. In addition, State Law establishes minimum qualifications and an associated certification program for water treatment facility and distribution

operators to ensure that staff is informed of all WTP operating protocols and procedures. Further, compliance with the Municipal Program element of the newly adopted MS4 permit would be required. For these reasons, Alternatives 1, 1A, 3, and 3A would not create substantial additional sources of polluted runoff and the associated **indirect** impacts are **less than significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.9-3a and 3B.9-3b.

2, 2A, and 2B

Under Off-site Water Facility Alternatives 2, 2A, and 2B, water treatment would occur at the Vineyard SWTP. Beyond adding additional treated water demand to the Vineyard SWTP, the Off-site Water Facility Alternatives 2, 2A, and 2B would not create a new potential source of polluted runoff and a **less-than-significant** impact would occur. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

4 and 4A

As previously indicated, a formal drainage plan has not been prepared for the Off-site Water Facility Alternatives. However, based on a preliminary review, drainage runoff from the WTP site would enter into an existing drainage conveyance system that discharges into Buffalo Creek. Following construction, the conveyance pipeline would be completely buried underground, and therefore would not result in increased amounts of impervious surfaces. Based on these determinations, only the WTP component has the potential to exceed the capacity of existing drainage systems and, therefore, the **direct** and **indirect** impacts could be **potentially significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3B.9-3a and 3B.9-3b.

With the implementation of the above mitigation measures, impacts to existing drainage infrastructure and would be reduced to a **less-than-significant** level through the preparation of a formal drainage plan to attenuate post-construction runoff thereby minimizing the potential for off-site flooding and long-term water quality impacts. The implementation of Mitigation Measure 3B.9-3a would require that all storm drain pipelines and the proposed detention basin include sufficient capacity to minimize concerns related to the effects of hydromodification.

IMPACT 3B.9-6 Impede or Redirect Flood Flows. *The Off-site Water Facilities could place structures within a 100-year flood hazard area, which would impede or redirect flood flows.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

The WTP and storage facilities would not be constructed within a delineated 100-year flood hazard area or floodway per CDPH requirements. As a result, the construction and operation of this Off-site Water Facilities feature would not place structures within a 100-year flood hazard area as mapped on the most recent federal Flood Insurance Rate Map. Small segments of the proposed conveyance pipelines under all the alternatives would cross floodways or flood zones associated with Morison Creek, Elder Creek, or Laguna Creek. These crossings would be completed using in-channel or trenchless construction techniques and would be installed at sufficient depth below existing and/or planned flood control facilities.

Following construction, the conveyance pipeline would generally be submerged a minimum of five feet below the ground surface and set back from local waterways. Facilities installed beneath the bed of the local creeks would be constructed within a 100-year flood zone, but would be situated, beneath the channel bed. Additionally, construction of these facilities, particularly at water crossings, would likely occur during the summer months and would be of limited duration and, therefore, would be unlikely to expose workers to significant risk of injury or

death as a result of flooding. However, without the availability of site-specific engineering plans, the City is unable to ensure that the conveyance pipeline is placed within suitable bedding materials at the required depths below the channel bed. The improper placement of the conveyance pipeline at waterway crossings could destabilize the impacted portion of the channel bed and banks thereby contributing to changes in downstream changes in hydrology. The **direct** and **indirect** impacts of these changes are considered **potentially significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.7-1a and 3B.9-1a.

With the implementation of recommendations from a licensed geotechnical engineer as required by Mitigation Measure 3B.7.1a combined with measures designed to minimize impacts to channel morphology during construction as required by Mitigation Measure 3B.9.1a, the Off-site Water Facility Alternatives would not result in significant impedances or redirection of flood flows and the impact would be **less-than-significant**.

IMPACT 3B.9-7 Inundation from Flooding or Mudflows. *The Offsite Water Facility Alternatives would not expose people or structures to a significant risk of loss, injury or death involving inundation by flooding, including flooding as a result of the failure of a levee or dam, seiche, or tsunami or inundation by mudflows.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

In recognition of the "Water" Study Area's inland location, the threat of tsunamis or seiche is considered negligible. The WTP site(s) are situated in upland locations and do not require levees for flood protection. Although, the WTP site(s) are situated downslope of Folsom Reservoir, their development would occur in existing developed areas or those currently planned for development. Based on these circumstances, the hazard of inundation from a tsunamis, seiche, or failure of a levee or dam is minimal and **no impact** would occur. ***[Similar]***

As described in Section 3B.7, "Geology, Soils, and Paleontological Resources," the topography within the vicinity of Zone 4 of the Off-site Water Facilities Study Area consists of only gradual slopes and, therefore, the hazard of mudflows of adversely affecting the Off-site Water Facilities is very low. For this reason, **no impact** would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3B.9.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of the mitigation measures listed above, implementation of the Offsite Water Facility Alternatives would not result in any residual significant impacts related to increased risk of flooding from stormwater runoff, from water quality effects from long-term urban runoff, or from short-term alteration of drainages and associated surface water quality and sedimentation. Based on these circumstances, the Off-site Water Facility Alternatives would not result in any residential significant and unavoidable adverse impacts to surface water hydrology and water quality.

Based on the hydrologic modeling conducted in support for this EIR/EIS using CALSIM II, potential impacts to flows within the Sacramento River as a result of the operation of the Off-site Water Facility Alternative would be less than significant and no mitigation would be required.

EXISTING LAND USES

Specific Plan Area

The SPA consists of over 3,510 acres that is generally located in eastern Sacramento County immediately south of the Folsom City limits (see Exhibits 2-1 and 2-2 in Chapter 2, "Alternatives"). The SPA generally lies south of U.S. Highway 50 (U.S. 50), north of White Rock Road, east of Prairie City Road, and west of the Sacramento/El Dorado County line.

The SPA generally consists of undeveloped grasslands used for cattle grazing. Structures within the SPA are limited to one residence and agricultural outbuildings located in the western portion, radio towers located in the northeastern corner, and a high-voltage electrical transmission corridor that traverses the western portion in a north-south direction between U.S. 50 and White Rock Road.

Adjacent Land Uses

Urbanized development within the existing Folsom City limits are north of the SPA. These urban areas consist of large residential and commercial developments, several of which are currently under construction. Neighborhoods and shopping centers are generally concentrated as units and separated by areas of open space.

Land south of the SPA is characterized primarily by seasonal grazing land in an unincorporated area regulated by Sacramento County. The Teichert, Walltown, and DeSilva-Gates hardrock quarries are proposed 0.9 mile, 1.2 miles, and 3.7 miles, respectively, south of the SPA. The Prairie City State Vehicle Recreation Area is approximately 1.1 miles southeast of the SPA via Prairie City Road.

The El Dorado County line forms the eastern boundary of the SPA. The Stonebriar subdivision is located east of this boundary, immediately adjacent to the SPA, in the community of El Dorado Hills.

Industrial land owned by GenCorp and associated buffer lands are located to the west of Prairie City Road.

Other nearby planned or approved developments, including the Westborough at Easton Specific Plan to the west; the Promontory, El Dorado Hills, and Bass Lake Specific Plans to the northeast; the Valley View Specific Plan to the east; and the Carson Creek Specific Plan to the southeast, have converted or have been approved to convert predominantly agricultural and open space areas to urban uses. In addition, there are numerous proposed development projects, including the Rio del Oro Specific Plan, Heritage Falls, the SunCreek Specific Plan, the Preserve at Sunridge, and Cordova Hills, southwest of the SPA in the City of Rancho Cordova.

Off-Site Improvement Areas

Off-site project-related improvements include construction of the Prairie City Road and Oak Avenue interchange improvements, the Rowberry Drive Overcrossing, a sewer force main, a detention basin, and the two roadway connections into El Dorado County.

The Prairie City Road interchange improvements would be located on undeveloped land in Sacramento County west of the SPA and south of the existing Prairie City Road/U.S. 50 interchange. Commercial land uses are located north and northeast of the existing interchange, and areas south, southeast, and southwest of the interchange improvement site are undeveloped.

The Rowberry Drive Overcrossing, Oak Avenue interchange improvements, and the sewer force main alignment would be located north of the SPA within the Folsom City limits. These areas are surrounded by existing commercial land uses to the east and west and residential development to the north.

The off-site detention basin would be located on and surrounded by undeveloped land owned by GenCorp, west of Prairie City Road. An approximately 8-foot-high chain link fence separates this area from the SPA.

The El Dorado County road connections would be located east of the SPA and connect to existing roadways in the Stonebriar subdivision. The northern roadway connection would connect directly into an existing cul-de-sac at the terminus of Winterfield Drive on the eastern boundary of the SPA. The southern roadway connection would cross undeveloped open land to connect with Prima Drive. Low-density residential development and areas small areas of open space surround these roadway connections on the north, south, and east.

AGRICULTURAL RESOURCES

Farmland Map Classifications

The SPA and off-site improvement areas do not include any agricultural land designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance as defined in Appendix G of the State CEQA Guidelines. The Sacramento County Important Farmland map, published by the California Department of Conservation's (DOC's) Division of Land Resource Protection, designates the entire SPA, the off-site sewer force main alignment, and the detention basin as Grazing Land. The Rowberry Drive Overcrossing and Oak Avenue interchange improvement areas are designated as both Grazing Land and Urban and Built-Up Land (DOC 2009a).

The area identified for the two roadway connections into El Dorado Hills is designated by the El Dorado County Important Farmland map as Grazing Land and Urban and Built-Up Land (DOC 2009b).

Williamson Act Contracts

Approximately 187,102 acres of land in Sacramento County was under Williamson Act contracts in 2007 (DOC 2009:26). Of these lands, approximately 10,605 acres were in the nonrenewal process (DOC 2009:29). The nonrenewal process is the most common mechanism for termination of Williamson Act contract lands and most Williamson Act contracts are terminated through nonrenewal expiration. In Sacramento County, approximately 406 acres of land under of Williamson Act contracts entered the nonrenewal process, and the amount of contract land terminated through nonrenewal expirations was approximately 524 acres as of 2007 (DOC 2009:34, 35).

Urban development of Williamson Act lands prior to contract expiration requires cancellation of the contracts pursuant to California Government Code Section 51282 (see "Regulatory Framework," below). No Williamson Act contracts in Sacramento County were cancelled in 2007 (DOC 2009:39).

As shown in Table 3A.10-1 and Exhibit 3A.10-1, approximately 1,530 acres of the SPA consists of agricultural lands under existing Williamson Act contracts that are in the process of nonrenewal. Notices of nonrenewal were filed on these parcels in 2004 and 2006; as a result, these existing contracts will expire in 2014 and 2016, respectively.

None of the land proposed for the U.S. 50 interchange improvements, sewer force main, detention basin, or the two roadway connections into El Dorado Hills are held under Williamson Act contracts.

84-AP-001	072 0060 074	447.2	2004
Total [2]		**1,530**	—

Notes: AP = Assessor's Parcel; APN = Assessor's Parcel Number

[1] This APN corresponds to the former Sacramento Country Day School property located in the southeast portion of the SPA along White Rock Road. The Sacramento Country Day School withdrew its application to construct a campus in the SPA. Although it is assumed that school development would eventually occur on that parcel, there is currently no application; therefore, it is assumed this contract would be terminated through nonrenewal expiration and there would not be a filing for early cancellation.

[2] Excludes the 80-acre former Sacramento Country Day School property.

3A.10.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no Federal plans, policies, regulations, or laws related to land use planning that are applicable to the Proposed Project or alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

State Planning and Zoning Laws

California Government Code Section 65300 et seq. establishes the obligation of cities and counties to adopt and implement general plans. The general plan is a comprehensive, long-term, and general document that describes plans for the physical development of a city or county and of any land outside its boundaries that, in the city's or county's judgment, bears relation to its planning. The general plan addresses a broad range of topics, including, at a minimum, land use, circulation, housing, conservation, open space, noise, and safety. In addressing these topics, the general plan identifies the goals, objectives, policies, principles, standards, and plan proposals that support the city's or county's vision for the area. The general plan is a long-range document that typically addresses the physical character of an area over a 20-year period or more. Finally, although the general plan serves as a blueprint for future development and identifies the overall vision for the planning area, it remains general enough to allow for flexibility in the approach taken to achieve the plan's goals.

The State Zoning Law (California Government Code Section 65800 et seq.) establishes that zoning ordinances, which are laws that define allowable land uses within a specific zone district, are required to be consistent with the general plan and any applicable specific plans. When amendments to the general plan are made, corresponding changes in the zoning ordinance may be required within a reasonable time to ensure that the land uses designated in the general plan would also be allowable by the zoning ordinance (California Government Code Section 65860[c]).

A specific plan is another planning device that governs a smaller land area than the general plan, but must be consistent with the overarching general plan. Specifically, it implements the general plan in a particular geographic area. (California Government Code, Section 65450.) Generally, it describes the distribution, location,

and extent of the land uses and the associated infrastructure, as well as standards governing future development. The specific plan must include a statement of the relationship between it and the general plan. (California Government Code, Section 65451, subd. [b].) An agency's conclusion that a specific plan is consistent with its general plan "carries a strong presumption of regularity." (*Napa Citizens for Honest Government v. County of Napa Board of Supervisors* [2001] 91 Cal.App.4th 342, 357.)

Local Agency Formation Commissions

The local agency formation commission (LAFCo) is charged with applying the policies and provisions of the Cortese-Knox-Hertzberg Local Government Reorganization Act (reorganized and amended by legislation enacted in 2000) to its decisions regarding annexations, incorporations, reorganizations, and other changes in government organization.

LAFCos are intralocal agencies that were created by state legislation to ensure that changes in governmental organization occur in a manner that provides efficient and good-quality services and preserves open space land resources. In 1963, the California Legislature established LAFCos in each county and gave them regulatory authority over local agency boundary changes. In the 1970s, the legislature recognized the connection between decisions concerning governmental organization and the issues of urban sprawl and loss of prime agricultural land. In response to these concerns, LAFCos were charged with implementing changes in governmental organization in a manner that preserves agricultural and open space land resources, as well as provides the delivery of services. In 2000, the Cortese-Knox-Hertzberg Act was further amended as a result of Assembly Bill 2838.

The general policies of LAFCos include:

- encourage planned, well-ordered, efficient urban development patterns;
- encourage the logical formation and determination of boundaries;
- ensure that affected populations receive efficient governmental services; and
- guide development away from open space and prime agricultural land uses unless such actions would not promote planned orderly and efficient development.

For the project, the Sacramento LAFCo oversees the establishment or revision of boundaries for local municipalities and independent special districts for Sacramento County (see discussion below under "Regional and Local Plans, Policies, Regulations, and Ordinances").

California Important Farmland Inventory System and Farmland Mapping and Monitoring Program

The Farmland Mapping and Monitoring Program (FMMP) was established by the State of California in 1982 to continue the Important Farmland mapping efforts begun in 1975 by the Soil Conservation Service (SCS) (now Natural Resources Conservation Service [NRCS]). The intent of the SCS was to produce agricultural-resource maps based on soil quality and land use across the nation. The DOC sponsors the FMMP and is also responsible for establishing agricultural easements in accordance with California Public Resources Code Sections 10250–10255.

As part of the nationwide effort to map agricultural land uses, NRCS uses a series of definitions known as Land Inventory and Monitoring (LIM) criteria. The LIM criteria classify the land's suitability for agricultural production. Suitability includes both the physical and chemical characteristics of soils as well as the actual land use. Maps of Important Farmland are derived from the NRCS soil survey maps using the LIM criteria and are available by county. The maps prepared by NRCS classify land into one of eight categories, which are defined as follows (DOC 2004):

- **Prime Farmland—**Land that has the best combination of features for the production of agricultural crops.
- **Farmland of Statewide Importance—**Land other than Prime Farmland that has a good combination of physical and chemical features for the production of agricultural crops.
- **Unique Farmland—**Land of lesser quality soils used for the production of the State's leading agricultural cash crops.
- **Farmland of Local Importance—**Land that is of importance to the local agricultural economy.
- **Grazing Land—**Land with existing vegetation that is suitable for grazing.
- **Urban and Built-up Lands—**Land occupied by structures with a density of at least one dwelling unit per 1.5 acres, or approximately 6 structures to a 10-acre parcel. This land is used for residential, industrial, commercial, institutional, public utility structures, and other developed purposes.
- **Land Committed to Nonagricultural Use—**Vacant areas; existing lands that have a permanent commitment to development but have an existing land use of agricultural or grazing lands.
- **Other Lands—**Land that does not meet the criteria of the remaining categories.

The designations for Prime Farmland, Farmland of Statewide Importance, and Unique Farmland, are defined together under the term "Agricultural Land" in CEQA (California Public Resources Code Sections 21060.1 and 21095 and State CEQA Guidelines Appendix G). The conversion of these types of farmland could be considered an environmental impact.

Williamson Act Contracts

The California Land Conservation Act of 1965, commonly known as the Williamson Act, enables local governments to form contracts with private landowners to promote the continued use of the relevant land in agricultural or related open space use. In return, landowners receive property tax assessments that are based on farming and open space uses instead of full market value. Local governments receive an annual subvention (subsidy) of forgone property tax revenues from the state via the Open Space Subvention Act of 1971.

The Williamson Act empowers local governments to establish "agricultural preserves" consisting of lands devoted to agricultural uses and other compatible uses. When such preserves are established, the locality may offer owners of agricultural land that is included in the preserves the opportunity to enter into annually renewable contracts that restrict the land to agricultural use for at least 10 years (i.e., the contract continues to run for 10 years following the first date upon which the contract is not renewed). In return, the landowner is guaranteed a relatively stable tax base, founded on the value of the land for agricultural/open space use only and unaffected by its development potential.

Cancellation of a Williamson Act contract involves an extensive review and approval process, in addition to payment by the landowner of fees of up to 12.5% of the property value. The local jurisdiction approving the cancellation must make *either one* of the following findings:

- that the cancellation is consistent with the purpose of the California Land Conservation Act (Section 51282[a][1] of the California Government Code), or
- that the cancellation is in the public interest (Section 51282[a][2] of the California Government Code).

To support the finding that the cancellation of a Williamson Act contract is consistent with the purpose of the California Land Conservation Act, all of the following subfindings must be made:

- that the cancellation is for land on which a notice of nonrenewal has been served in accordance with Section 51245 of the California Government Code;
- that cancellation is not likely to result in the removal of adjacent lands from agricultural use;
- that cancellation is for an alternative use that is consistent with the applicable provisions of the city or county general plan;
- that cancellation will not result in discontiguous patterns of urban development; and
- that there is no proximate noncontracted land that is both available and suitable for the use to which it is proposed the contracted land be put, or that development of the contracted land would provide more contiguous patterns of urban development than development of proximate noncontracted land.

To support the finding that the cancellation of a Williamson Act contract is in the public interest, both of the following subfindings must be made:

- that other public concerns substantially outweigh the objectives of the Williamson Act; and
- that there is no proximate noncontracted land that is both available and suitable for the use to which it is proposed the contracted land be put, or that development of the contracted land would provide more contiguous patterns of urban development than development of proximate noncontracted land.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento Area Council of Governments' Sacramento Region Blueprint

The Sacramento Area Council of Governments (SACOG) is a regional organization that provides a variety of planning functions over its six-county region (Sacramento, Yolo, Placer, Sutter, Yuba, and El Dorado Counties). SACOG's primary functions are to provide transportation planning and funding for the region and to study and support resolution of regional issues. In 2002, SACOG initiated what is now known as the Sacramento Region Blueprint (Blueprint) process after computer modeling of the region showed that current growth patterns and transportation investment priorities would result in substantial increases in congestion over the next 50 years, as well as substantial consumption of privately held natural and agricultural land. The goal of the process was to determine whether alternatives to current and planned transportation and land use patterns could be established to improve the region's long-term travel patterns and air quality, as well as retain substantially more open space. The Blueprint is the product of a 3-year public-involvement effort and is intended to guide land use and transportation choices in the region over the next 50 years. During this 50-year period, the region's population is projected to grow from 2 million to more than 3.8 million, jobs are projected to increase from 921,000 to 1.9 million, and housing units are projected to increase from 713,000 to 1.5 million.

The starting point for the Blueprint process was the "Base Case Scenario," which shows how the region would develop through the year 2050 if growth patterns of the recent past continue. Under the Base Case Scenario, growth would continue outward into largely rural areas and on the fringes of current development. The model predicted that the average resident living in a version of a future typical of the Base Case Scenario in 2050 would probably live in a single-family house on a fairly large lot in a subdivision with similar houses. This resident would commute a longer distance to work than is typical today; trips to work and commercial areas would be lengthy and slow because of substantial increases in congestion.

In December 2004, the SACOG Board of Directors adopted the Preferred Blueprint Scenario, a vision for growth that promotes compact, mixed-use development and more transit choices as an alternative to low-density development. It includes a greater range of housing products, reinvestment in already developed areas, protection of natural-resource areas from urbanization, and more transportation choices. Residents living in a future

developed area consistent with the Preferred Blueprint Scenario in 2050 probably would live in a home on a smaller lot, in a neighborhood with some larger houses and some attached row houses, apartments, and condominiums. Residents would drive to work, but the trip would likely be shorter than present conditions, and the time needed to get there would be about the same as it is now. It is anticipated that residents may sometimes use public transportation (e.g., train or bus). Most of their shopping and entertainment trips would still be via the automobile, but the distances would be shorter. Some of these shopping trips might be via walking or biking down the block a short distance to a village or town center that contains neighborhood stores with housing units built on top of them, as well as a small park or plaza.

The Sacramento Region Blueprint depicts a way for the region to grow through the year 2050 generally consistent with seven principles of "smart growth." These principles are summarized below and include a comparison of development projected under Base Case Scenario to development projected under the Preferred Blueprint Scenario (SACOG and Valley Vision 2004).

- **Transportation Choices:** Developments should be designed to encourage people to sometimes walk, ride bicycles, ride the bus, ride light rail, take the train, or carpool. Use of Blueprint growth concepts for land use and right-of-way design would encourage use of these modes of travel and the remaining auto trips would be, on average, shorter. In the Base Case Scenario, 2% of new housing and 5% of new jobs would be located within walking distance of 15-minute bus or train service, the number of vehicle miles traveled per day per household would be 47.2 miles, and the total time devoted to travel per household per day would be 81 minutes. The Preferred Blueprint Scenario reduces the number of trips taken by car by about 10%. These trips are shifted to transit, walking, or biking. In the Preferred Blueprint Scenario, 38% of new homes and 41% of new jobs would be located within walking distance of bus or train service with 15-minute service intervals, the number of vehicle miles traveled per day per household would be 34.9 miles, and the total time devoted to travel per household per day would be 67 minutes. With the Preferred Blueprint Scenario, per capita, there would be 14% less carbon dioxide and particulates produced by car exhaust compared to the Base Case Scenario.

- **Mixed-Use Developments:** Building homes and shops, entertainment, office, and light industrial uses near each other can encourage active, vital neighborhoods. This mixture of uses can be either in a vertical arrangement (mixed in one building) or horizontal (with a combination of uses in close proximity). These types of projects function as local activity centers where people would tend to walk or bike to destinations. Separated land uses, on the other hand, lead to the need to travel more by auto because of the distance between uses. Under the Base Case Scenario, 26% of people would live in communities with a good, or balanced, mix of land uses by 2050. In the Preferred Blueprint Scenario, 53% of people would live in balanced communities.

- **Compact Development:** Creating environments that are more compactly built and use space in an efficient but aesthetic manner can encourage more walking, biking, and public-transit use and shorten auto trips. Under the Base Case Scenario, by 2050, new development would require the consumption of an additional 661 square miles of land. Under the Preferred Blueprint Scenario, 304 square miles of new land would be required for new development.

- **Housing Choice and Diversity:** Providing a variety of places where people can live—apartments, condominiums, townhouses, and single family detached homes on varying lot sizes—creates opportunities for the variety of people who need them: families, singles, seniors, and people with special needs. This issue is of special concern for people with very low-, low-, and moderate-incomes. By providing a diversity of housing options, more people would have a choice.

- **Use of Existing Assets:** In urbanized areas, development on infill or vacant lands, intensification of the use of underutilized parcels, or redevelopment can make better use of existing public infrastructure. This can also include rehabilitation and reuse of historic buildings; denser clustering of buildings in suburban office parks; and joint-use of existing public facilities, such as schools and parking garages. Under the Base Case Scenario,

all new development would be on vacant land. Under the Preferred Blueprint Scenario, it is suggested that 13% of all new housing and 10% of all new jobs would occur through reinvestment.

- **Quality Design:** The design details of any land use development—such as the relationship to the street, setbacks, placement of garages, sidewalks, landscaping, the aesthetics of building design, and the design of the public rights-of-way—are factors that can influence the attractiveness of living in a compact development and facilitate the ease of walking and biking to work or neighborhood services. Good site and architectural design is an important factor in creating a sense of community and a sense of place. Under the Base Case Scenario, 34% of people would live in pedestrian-friendly neighborhoods. Under the Preferred Blueprint Scenario, in 2050, pedestrian-friendly neighborhoods would rise to 69%.

- **Natural Resources Conservation:** This principle encourages the incorporation of public-use open space (such as parks, town squares, trails, and greenbelts) within development projects, above state requirements; it also encourages wildlife and plant habitat preservation, agricultural preservation, and promotion of environmentally friendly practices, such as energy-efficient design, water conservation and stormwater management, and planting of shade trees. Under the Base Case Scenario, 166 square miles of agricultural land would be converted into urban uses. Under the Preferred Blueprint Scenario, 102 square miles of agricultural land would be converted to urban uses. When the Preferred Blueprint Scenario was developed, the authors included a calculated, predetermined "preservation factor" that was intended to account for a certain amount of land that could be set aside in the future to preserve natural resources. However, the Preferred Blueprint Scenario did not attempt to map specific areas that could potentially be set aside as preserves. The only "preserve" areas that were mapped were those already designated as such that were in existence at the time the Preferred Blueprint Scenario was created.

The Preferred Blueprint Scenario predicts long-term environmental benefits from undertaking a realistic long-term planning process; these benefits are intended to minimize the extent of the inevitable physical expansion of the overall regional urban areas. In summary, if the Preferred Blueprint Scenario were followed throughout the SACOG region, it would result in more mixed-use communities; provide a greater number of small-lot, single family detached homes; develop a greater number of attached homes; reinvest in existing business and residential areas; and create more pedestrian-friendly neighborhoods. The results of implementing these principles would be the protection of natural resources (because less land would be required for urban uses) and less agricultural land conversion. In addition, the Preferred Blueprint Scenario predicts less time devoted to travel, fewer car trips, and fewer single-occupancy vehicle miles traveled to work and local businesses compared with development under the Base Case. The reduction in traffic would improve air quality in the region by reducing carbon monoxide and particulate matter produced by car exhaust.

The Blueprint process received broad support from most of its member agencies; however, the Blueprint is advisory and therefore does not establish land-use restrictions. SACOG has no land use authority. Although it is only advisory, the Blueprint provides policy guidance in the Sacramento region for long-term regional land use and transportation planning. A number of jurisdictions either are adopting the Blueprint concepts or are considering and encouraging projects consistent with the Blueprint. Although not establishing "buildout targets," the SACOG Blueprint Preferred Scenario anticipates an additional 24,400 households and 31,700 jobs in the City of Folsom (City) between 2000 and 2050 (SACOG and Valley Vision 2004b). With regard to the project, the SACOG Blueprint Preferred Scenario anticipates approximately 12,000 households and 7,500 jobs would be generated by development of the SPA (City of Folsom 2007). The Blueprint assumes the City would have a population of 105,000 by 2050 and most of this growth would be located on vacant land within the current City boundaries and within the SPA. Further, the Blueprint anticipates the SPA would provide open space consistent with City policies and would be developed primarily with housing in similar amounts of detached and attached single-family units, rowhouses, townhomes, condominiums, and apartments to provide housing opportunities for the City's growing employment centers (Exhibit 3A.10-2).

SACOG Blueprint Land Uses **Exhibit 3A.10-2**

Memorandum of Understanding between Sacramento County and the City of Folsom

In November 2000, Sacramento County (County) and the City of Folsom entered into a Memorandum of Understanding (MOU) to serve as a guide for sound regional long-range planning efforts relative to the annexation of the SPA. The MOU outlines a comprehensive planning process for the SPA, including public participation with various stakeholders and the general public. It also addresses a number of issues including water supply, transportation, schools, and open space that were later incorporated into language found in Measure W (discussed below) and subsequently in the City Charter.

Sacramento Local Agency Formation Commission

Sacramento LAFCo is responsible for reviewing, approving, or disapproving changes in organization to cities and special districts, including annexations, detachments, new formations, and incorporations. LAFCos must, by law, create municipal-service reviews and update spheres of influence for each independent local governmental jurisdiction within their Countywide jurisdiction. Listed below are the adopted Sacramento LAFCo applicable policies and guidelines for approval of boundary adjustments.

- Demonstrate that adequate services will be provided within the time frame needed by the inhabitants of the area included within the proposed boundary.
- Identify existing land uses and a reasonable projection of land uses which would occur if services were provided consistent with an updated Master Services Element.
- Present a map that clearly indicated the location of existing and proposed facilities, including timing and location of those facilities.
- Describe the nature of each service provided.
- Demonstrate consistency with the applicable General Plan designations and text.
- Approve conversion of prime agricultural land in open space and other uses only if:
    - the proposal will lead to the planned, orderly, and efficient development in the area;
    - the subject land is consistent with the Spheres of Influence plan;
    - the development of the subject land is likely to occur within the next five years; and
    - the proposal will have no significant adverse effect on the physical and economic integrity of other agricultural lands.
- Assess the environmental consequences of its [LAFCo's] actions and decisions (required by CEQA), and take actions to avoid or minimize a project's adverse environmental impacts if feasible, or approve a project despite significant effects because it [LAFCo] finds overriding considerations exist.

To comply with CEQA, Sacramento LAFCo would take one or more of the following actions with regard to this project:

- approve the requested determinations (at its discretion) without changes if environmental impacts are less than significant,
- require the project applicant(s) to modify a project,

- deny the proposal because of unacceptable adverse environmental impacts, or
- approve the project despite its significant effects by making findings of overriding consideration.

Resolution No. LAFC 1196

In June 2001, the Sacramento LAFCo approved the City's sphere of influence amendment application (Resolution No. LAFC 1196), and the City's sphere of influence was expanded to include the SPA. As part of the amendment approval, Sacramento LAFCo identified conditions to ensure future annexation of the SPA would include adequate services for new development within proposed annexation areas; avoid premature conversion of agricultural resources; preserve open space; and encourage planned, logical, and orderly patterns of urban growth. Prior to annexation, the project applicant(s) must demonstrate that the project meets the conditions established in Resolution No. LAFC 1196 provided below.

- **City General Plan Revisions.** Revise and update the City's general plan in accordance with State law.
- **City General Plan Housing Element.** Obtain a certification of substantial compliance from the California Department of Housing and Community Development consistent with Government Code Section 65585(d) or (h). The City shall establish in its approved Housing Element that it has or will meet its regional share housing needs for all income levels for the second and third Housing Element revisions, as defined in Government Code Section 65588.
- **Land Use Designations.** Adopt appropriate land use designations for all property within the Sphere of Influence area.
- **Pre-zoning.** Pre-zone the property consistent with Government Code Section 56375 and the Folsom General Plan.
- **Comprehensive Planning.** Develop comprehensive planning of the SPA that demonstrates well planned, orderly development that avoids the premature conversion of open space.
- **Master Service Agreement.** Submit a Master Services Agreement that identifies a program for implementation and financing for major infrastructure and services components needed to support the proposed distribution, location, extent, and intensity of proposed land uses. The Master Services Agreement must identify a water supply source and the process for securing sufficient water supplies to serve the annexed area.
- **Local Roadway Improvements.** Prepare a plan for necessary improvements to each jurisdiction's roadway network to accommodate increased traffic from the SPA in cooperation with Sacramento and El Dorado Counties. This plan must include a list of improvements, responsible jurisdiction, phasing plan, and clearly defined financing mechanism. Implementation of this plan must result in service levels on local roadways consistent with each jurisdiction's general plan.
- **Regional Roadway Improvements.** The City, in cooperation with Caltrans, Sacramento County, El Dorado County, the El Dorado County Transportation Commission, and SACOG, must identify traffic and transportation measures that are needed to mitigate potential impacts on regional transportation facilities from proposed development within the SPA. The City must also identify a funding mechanism to construct the traffic and transportation measures necessary to fully mitigate impacts from the SPA, and a timeline for the construction of improvements. As soon as reasonably possible, these improvements should be programmed into the Metropolitan Transportation Plan and Metropolitan Transportation Improvement Program.
- **Transit Master Plan.** Prepare a Transit Master Plan consistent with the City's General Plan. The master plan must identify bus transit routes, bus turnouts, pedestrian shelters, bus transfer stations, alignments for rail service, and the location of rail service stations.

- **Bikeway Master Plan.** Prepare a Bikeway Master Plan consistent with the City's General Plan. The master plan must identify bikeway and pedestrian facilities in the SPA consistent with the goals and policies of the City's general plan and incorporate bikeway designs for Prairie City Road and White Rock Road to be equivalent, or better, than those in the Sacramento City/County Bikeway Master Plan.

- **Drainage Master Plan.** Conduct hydraulic and hydrologic modeling of that portion of Alder Creek which transverses the SPA. A Drainage Master Plan must be prepared and address flood hazards, identify flood protection measures, and document no net increase in downstream floodwater surface elevations.

- **Habitat Mitigation Strategy.** Document the City's multi-species habitat mitigation strategy (Habitat Conservation Plan [HCP]) for the SPA. The strategy must address mitigation of impacts on habitat and biological resources that meets Federal and State regulatory requirements. The City may fulfill these requirements through participation in South Sacramento County HCP process.

- **Surface and Groundwater Contamination.** Document that on-site surface contamination has been remediated to Federal and State regulatory standards, and that groundwater contamination has been remediated or is being remediated effectively prior to annexation of any property owned by Aerojet General Corporation.

- **Water Supply.** Demonstrate that the City has a sufficient water supply to serve existing customers, future customers within the existing service area, and all proposed uses within the SPA in compliance with the terms and conditions of the Water Forum Agreement. This demonstration must be sufficient for LAFCo to determine water availability per Government Code Section 56668(k).

- **Wastewater Facilities.** Demonstrate the timely availability of wastewater transmission and treatment capacity to serve existing customers, future customers within the existing service area, and all proposed uses within the SPA.

- **Special Districts.** Meet and confer with the El Dorado Irrigation District (EID), the Sacramento Metropolitan Fire District, and any other special districts regarding impacts on these districts, including fiscal and operational impacts and loss of property tax revenue. With respect to EID, the City must not request any detachment from the EID service area.

- **School Mitigation.** Where permitted by law, incorporate feasible school mitigation requirements into any development agreements.

- **Mitigation Monitoring.** Comply with the mitigation measures identified in environmental review for expansion of sphere of influence boundary and adopted pursuant to CEQA by LAFCo Resolution No. LAFC 1193, including:

    - establish necessary roadway improvements and financing mechanisms;
    - implement requirements to reduce air quality emissions by 35%;
    - prepare an Air Quality Plan;
    - complete tree surveys and implement tree protection measures;
    - complete biological surveys and adopt avoidance and mitigation policies;
    - minimize incompatibility impacts on historic landscapes;
    - implement hazardous materials plans;
    - investigate and remediate railroad right-of-way, mining, and radio/transfer sites;
    - define the Alder Creek 100-year floodplain; and
    - identify secure sufficient water supplies.

- **Compliance with MOU.** Demonstrate compliance with the following conditions established in the MOU between the City and County, effective November 14, 2000:

- Prepare and adopt a comprehensive development plan to ensure the SPA would be efficiently served and resources would be protected.

- Provide for collaborative participation by the public and stakeholders including Sacramento and El Dorado Counties, the Folsom Cordova Unified School District and other stakeholders. The City must provide the opportunity for public participation through public hearings, community forums, neighborhood meetings, and other public meetings as deemed necessary.

- Identify water supplies to serve the SPA. Consistent with Goal 40 of the General Plan Public Facilities Element, no development may occur in the SPA until adequate water infrastructure or an infrastructure financing and phasing plan is in place.

- Preserve oak woodland, biological resources, and other habitat through preservation of open space by requiring the preservation of 30% natural open space within the annexed area.

- Develop an infrastructure financing and phasing plan. Consistent with Goal 40 of the General Plan Public Facilities Element, no development may occur in the SPA until adequate infrastructure or an infrastructure financing and phasing plan is in place.

- Establish revenue sharing agreements with Sacramento County establishing the apportionment of future tax revenues in the SPA.

Measure W

In November 2004, following a series of Visioning workshops, ballot Measure W (City Ordinance No. 1022) passed with support from 69% of the City voters. With the passage of Measure W, the City Charter was amended to require the Folsom City Council to take certain actions related to each of the issue areas described below prior to LAFCo's approval of annexation:

- **Water Supply**. Identify and secure the sources of water supply to serve the SPA without reducing the existing water supply currently serving users to the north of U.S. Highway 50, and at no cost to existing Folsom residents.

- **Transportation.** Adopt an Infrastructure Funding and Phasing Plan for the construction of roadways and transportation improvements that are necessary to reduce traffic impacts resulting from development of the SPA. The timing of the construction of the transportation improvements shall be tied to the anticipated rate of growth and associated traffic impacts. Existing Folsom residents shall not be required to pay fees for the construction of any new transportation improvements required to serve the SPA.

- **Open Space.** Maintain 30% of the SPA as natural open space to preserve oak woodlands and sensitive habitat areas. Natural open space cannot include active park sites, residential yard areas, golf courses, parking lots, or their associated landscaping.

- **Schools.** Provide the funding and construction of all necessary school facilities for the SPA so that Folsom residents north of U.S. 50 are not required to pay for the construction of new school facilities serving the SPA and existing schools are not overcrowded by development of the SPA.

- **Development Plan.** Adopt a General Plan Amendment to serve as the blueprint for development within the SPA. The General Plan Amendment will only be adopted after the completion and certification of an Environmental Impact Report.

- **Public Notice.** Every registered voter in the City must be mailed a notice of time, place, and date of the public meetings and hearings before the Planning Commission and City Council. The notice must include a

summary of the SPA proposal with the full proposal and associated environmental review available for public review at the City Clerk's office, at all Folsom public libraries, and on the City's website.

- **Implementation.** All existing City plans, policies, ordinances, and other legislative acts must be amended as necessary, as soon as possible, and in the time and manner required by State law, including CEQA, to ensure consistency between the Charter Amendment and those plans, policies, and other provisions.

Sacramento County Urban Service Boundary and Urban Policy Area

The *Sacramento County General Plan* (Sacramento County 1993) provides for growth and development in the unincorporated area through 2010. Portions of the Sacramento County General Plan contain policies for urban development including urban communities and the infrastructure necessary to serve them. Other sections of the Sacramento County General Plan describe strategies to recognize and preserve areas of open space and natural resources. As a whole, the general plan reflects a balance between the amount and location of land uses in urban areas and those to remain in a rural or natural setting.

The Sacramento County General Plan designates two boundaries that guide policies for growth. The Urban Service Boundary (USB) is the boundary of the urban area in the unincorporated portion of Sacramento County. It is a permanent boundary that will not be modified except under extraordinary circumstances and will be used as a planning tool for urban infrastructure providers for developing very long-range master plans that would accompany future urbanization. (Sacramento County 2009:3-11.)

The Urban Policy Area (UPA) defines the area expected to receive urban levels of public infrastructure and services within the 20-year planning period of the Sacramento County General Plan. The UPA provides the geographic basis for infrastructure master plans, particularly for public water and sewerage, which require large capital investment and relatively long lead time for the installation of capital improvements. (Sacramento County 2009:3-11.)

The SPA is adjacent to but outside of the north and west side of the USB and UPA. As shown in Exhibit 3A.10-3, the SPA and lands south and west of the SPA are within the unincorporated area of Sacramento County. These lands are designated by the Sacramento County General Plan as General Agriculture (80 acres), General Agriculture (80 acres)/Resource Conservation Area, Industrial Extensive, Natural Preserve, and Public/Quasi Public. Table 3A.10-2 shows these land use designations, identifies the compatible zoning districts, and defines allowable uses.

Lands north of the SPA are located outside of Sacramento County jurisdiction, within the City of Folsom, and are governed by the City of Folsom General Plan land use designations (see "City of Folsom General Plan," below).

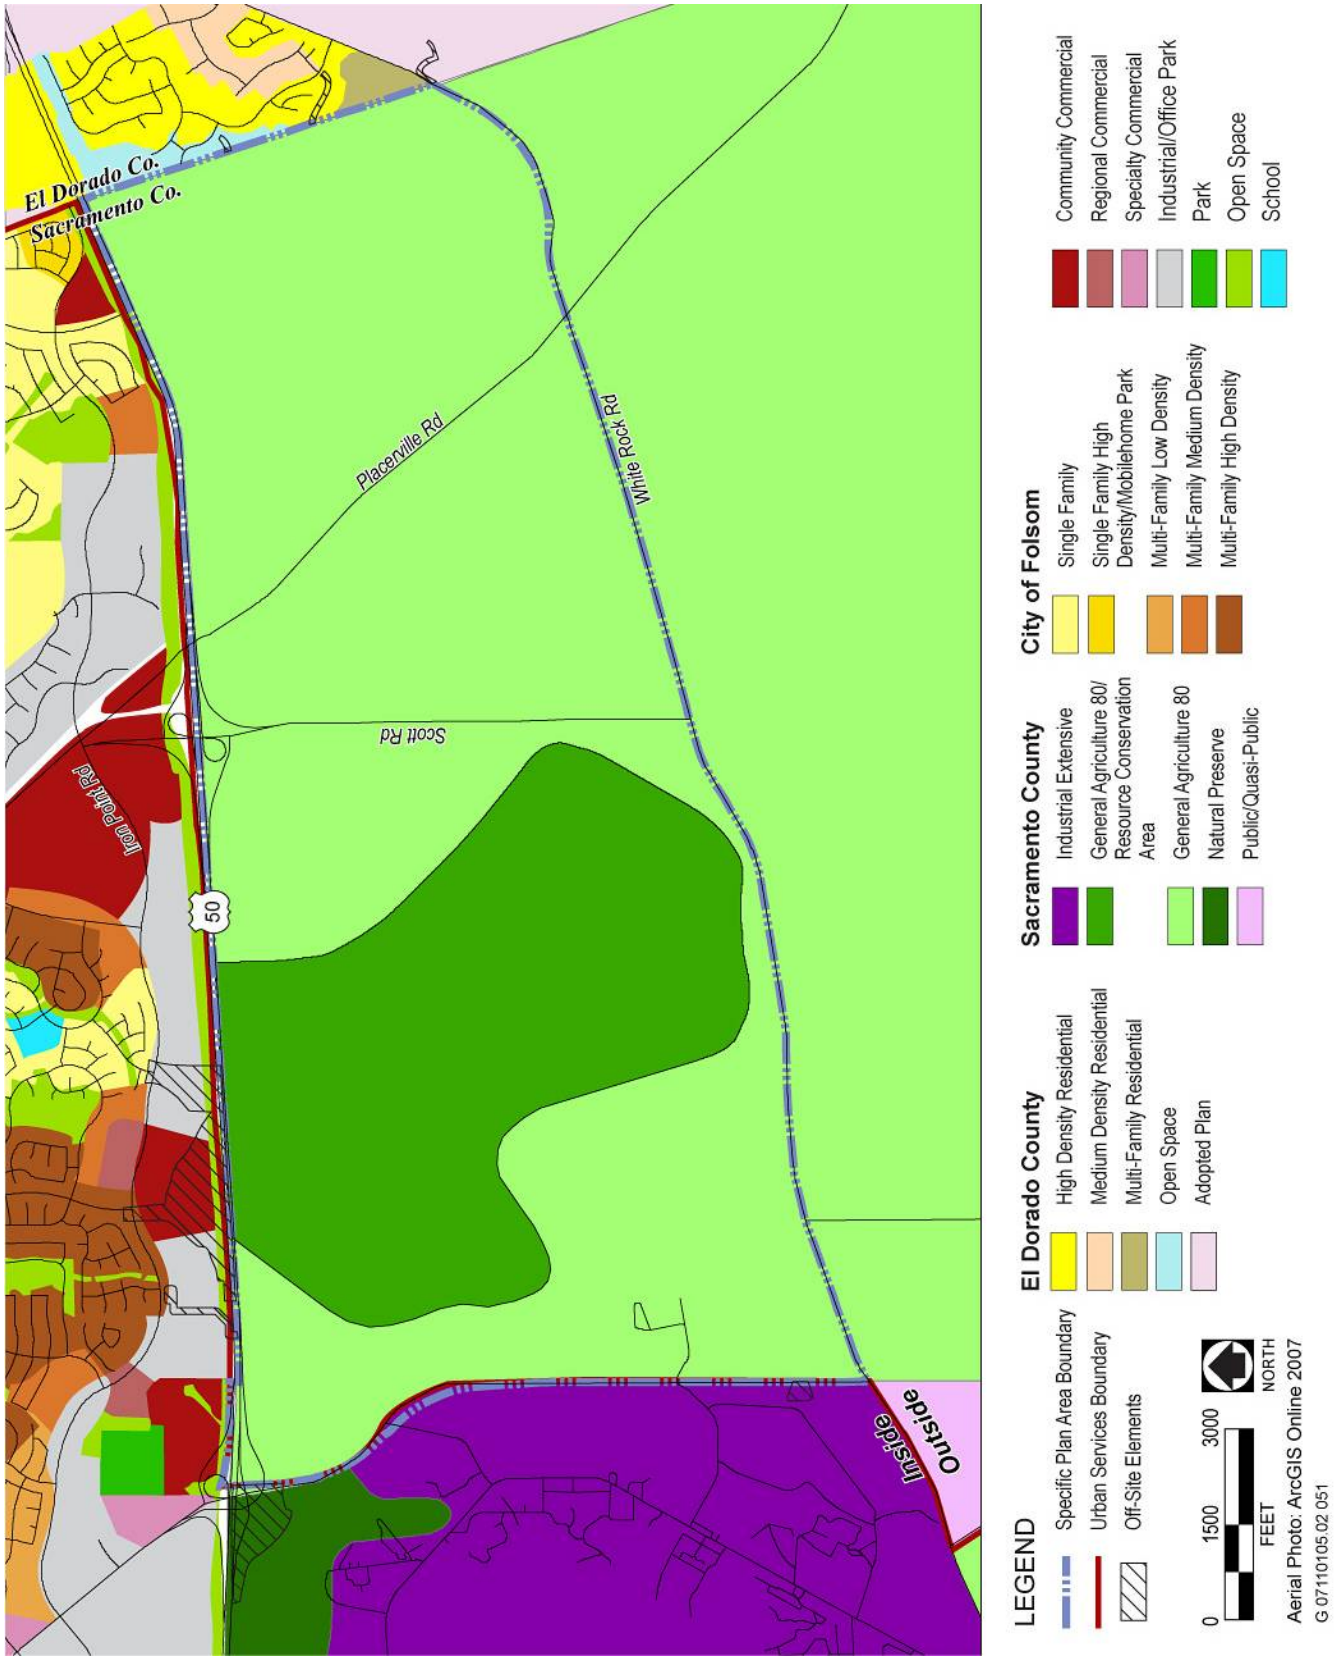
Lands east of the SPA are located outside of Sacramento County jurisdiction in the unincorporated area of El Dorado County and are governed by the El Dorado County General Plan land use designations (see "El Dorado County General Plan," below).

Sacramento County General Plan Goals and Policies

The following goals and policies outlined in the *Sacramento County General Plan* (1993) relating to land use planning are applicable to the No Project Alternative:

Land Use Element

GOAL: Land use patterns that minimize the impacts of new and existing development while maintaining the quality, character, and identity of neighborhood and community areas.



Source: Sacramento County 1993, El Dorado County 2004, City of Folsom 1988

General Plan Land Use Designations **Exhibit 3A.10-3**

Table 3A.10-2
Adopted Sacramento County, El Dorado County, and City of Folsom General Plan Land Use Designations

Land Use Designation	Compatible Zoning District	Definition
Sacramento County		
General Agriculture (80 acres)	AG-80 (Agricultural, 80-acre minimum lot size)	The General Agriculture (80 acres) land use designation identifies areas with an 80-acre minimum parcel size that are generally used for agricultural purposes. These areas have parcels large enough to maintain economically viable farming operations. Typical farming activities include dry land grain, and irrigated and dry land pasture. This land use designation allows only for agricultural production and single-family dwelling units at a density no greater than one unit per 80 acres.
Resource Conservation Area	AG-80 (Agricultural, 80-acre minimum lot size)	The Resource Conservation Area combining designation identifies areas with special resource management needs (i.e., vernal pools, wetland creation, waterfowl management, and blue oak woodland harvesting) while recognizing the validity of the underlying land use designation. The intent of this designation is to develop programs and incentives to assist land owners with resource protection and enhancement.
Industrial Extensive	SPA (Special Planning Area)	The Industrial Extensive land use designation identifies area where land use activities require large areas of land and do not require urban levels of service.
Natural Preserve	AG-80 (Agricultural, 80-acre minimum lot size) SPA (Special Planning Area)	The Natural Preserve land use designation identifies critical natural habitat for resource protection, including riparian valley oak woodland and permanent or seasonal marshes.
Public/Quasi-Public	A-10 (Interim Agricultural, 10-acre minimum lot size) AG-20 (Agricultural, 20-acre minimum lot size) AG-80 (Agricultural, 80-acre minimum lot size) SPA (Special Planning Area)	The Public/Quasi-Public land use designation establishes areas for uses such as schools, fire stations, cemeteries, and solid and liquid waste disposal. These areas are often significant size, under County jurisdiction, regional in scope, specified by state law, or have significant land use impacts.
El Dorado County		
Multi-Family Residential	RM (Multifamily Residential) RF (Recreational Facilities)	The Multi-Family Residential land use designation identifies those areas suitable for high-density, multifamily structures such as apartments, single family attached dwelling units (i.e., air-space condominiums, townhouses), and multiplexes, at density of 5 –24 dwelling units per acre (du/ac). Lands identified as Multi-Family Residential are located in areas with the highest degree of access to transportation facilities, shopping and services, employment, recreation, and other public facilities.

Table 3A.10-2
Adopted Sacramento County, El Dorado County, and City of Folsom General Plan Land Use Designations

Land Use Designation	Compatible Zoning District	Definition
High-Density Residential	R1 (One-Family Residential) RF (Recreational Facilities)	The High-Density Residential land use designation identifies those areas suitable for intensive single-family residential development at densities from 1–5 du/ac. Allowable residential structure types include single family attached (i.e., air-space condominiums, townhouses) and detached dwellings and manufactured homes.
Medium-Density Residential	R1A (One-Acre Residential) RF (Recreational Facilities)	The Medium-Density Residential land use designation establishes areas suitable for detached single-family residences with larger lot sizes with parcel sizes of 1–5 acres and a density of one du/ac. This designation is applied where the character of an area is single-family residences; where the absence or reduced level of infrastructure including roads, water lines, and sewer lines does not justify higher densities; where the topography poses a constraint to higher densities; and as a transitional land use between the more highly developed and the more rural areas of the County.
Open Space	OS (Open Space) RF (Recreational Facilities)	The Open Space land use designation designates public lands under governmental title where no development other than that specifically needed for government-related open space uses is desired. This land use includes state parks, ecological preserves, and public lands acquired specifically for open space uses. It may also be used on private lands to maintain natural features within clustered development.
City of Folsom		
Single Family	R-1-M (Residential, Single-Family Dwelling, Small Lot District)	The single family land use designation identifies those areas suitable for single family detached homes at low to medium densities with a density of two du/ac.
Single Family High Density/Mobile Home Park	R-1-M (Residential, Single-Family Dwelling, Small Lot District)	This land use designation identifies those areas suitable for single-family dwelling units with densities from 4–6.9 du/ac. Residential structure types include halfplexes, mobile home parks, and attached single-family homes.
Multi-Family Medium Density	R-M (Residential Multifamily Dwelling District)	The Multi-Family Medium Density land use designation identifies those areas suitable for medium-density multifamily developments with densities from 12–17.9 du/ac. These lands uses are generally located along arterial roads and public transportation routes, near commercial centers and public institutions, and as buffers between industrial and commercial areas and single-family neighborhoods.

Table 3A.10-2
Adopted Sacramento County, El Dorado County, and City of Folsom General Plan Land Use Designations

Land Use Designation	Compatible Zoning District	Definition
Multi-Family High Density	R-M (Residential Multifamily Dwelling District) R-4 (General Apartment District)	The Multi-Family High Density land use designation identifies those areas suitable for high-density multifamily developments with densities from 18–25 du/ac. These lands uses are generally located near commercial centers or regional commercial centers but may include parcels at the intersection of arterial roads, along transit routes, adjacent to public institutions, and as part of a commercial/industrial development compatible with residential uses.
Community Commercial	C-1 (Neighborhood Business District) C-2 (Central Business District)	The Community Commercial land use designation identifies those areas that provide goods and services for large neighborhood areas.
Regional Commercial	C-3 (General Commercial District)	The Regional Commercial land use designation identifies those areas that are primarily highway-oriented retail commercial areas and are designed mainly for customers from outside the city of Folsom but also including Folsom residents.
Specialty Commercial	C-3 (General Commercial District) BP (Business and Professional District)	The Specialty Commercial land use designation identifies those areas that mainly serve a purpose not fulfilled by the other commercial designations. Land uses within this designation include Sutter Street Historic District, specialty commercial districts, business/professional offices, and other identified areas as appropriate. Building intensity and employment density are determined on a case-by-case basis through a planned development process.
Industrial/Office Park	BP (Business and Professional District) M-1 (Light Industrial District) M-L (Limited Manufacturing District)	The Industrial/Office Park land use designation identifies those areas suitable for warehousing/storage facilities and industrial parks.
Park	OSC (Open Space Conservation District)	The Park land use designation identifies areas designated for parks.
Open Space	OSC (Open Space Conservation District)	The Open Space land use designation identifies areas designated for open space.
School	--	The School land use designation identifies areas designated for schools.

Source: Sacramento County 1993, El Dorado County 2004, City of Folsom 1988

Objective: Reserve the land supply to amounts that can be systematically provided with urban services and confine the ultimate urban area within limits established by natural resources.

- **Policy LU-57:** The County shall not provide urban services beyond the Urban Policy Area, except when the County determines the need for health and safety purposes.

- **Policy LU-58:** The County shall maintain an Urban Service Boundary that defines the long-range plans (beyond twenty years) for urbanization and extension of public infrastructure and services, and defines important areas for protecting as open space and agriculture.

GOAL: Policies and programs of County departments and other governmental agencies and jurisdictions mutually consistent with one another and with the policies contained in this plan.

Objective: Plan implementation achieved by coordination between the County and independent agencies, districts, and commissions.

- **Policy LU-71:** Annexations should only be advocated which:

    - ensure provisions and demonstrate maintenance for adequate municipal services;

    - are consistent with state law and LAFCo standards and criteria;

    - provide for equitable distribution, based on region-wide analysis, of social services and low income housing needs;

    - are consistent with General Plan and Community Plan policies; and

    - preserve community identity.

The following goals and policies outlined in the *Sacramento County General Plan* (1993) relating to land use planning are applicable to the No Project Alternative:

Objective: Limited agricultural-residential land use expansion outside the USB which does not compromise objectives for protecting prime agricultural lands and open space, and avoids groundwater overdraft and contamination.

- **Policy LU-62:** Future agricultural-residential development outside the USB…shall be limited to existing agricultural-residential lands so designated on the Land Use Diagram and new areas adjacent to existing areas with agricultural-residential land use designations.

Sacramento County General Plan Update

The existing horizon of the Sacramento County General Plan ends in 2010, and the process to update the General Plan was initiated in 2002. In June 2007, Sacramento County prepared a draft general plan and began conducting an environmental review of the General Plan update. A notice of preparation was prepared and circulated for public review in August 2007 (State Clearinghouse Number 2007082086). The draft environmental impact report (DEIR) for the general plan update was released on May 1, 2009, for a 45-day public review period. Adoption of the updated general plan is anticipated in mid 2010 (Sacramento County 2010).

The Sacramento County General Plan update will have a planning horizon of 2030, which is consistent with the planning horizons of SACOG's Sacramento Region Blueprint. The general plan update contains objectives and policies that are intended to guide Sacramento County toward a more compact urban character by concentrating

growth within existing urbanized areas and strategically located new growth areas, thereby using land resources as efficiently as possible (Sacramento County 2007a).

Sacramento County Zoning Code

The Sacramento County zoning code (Sacramento County 2007b) has been adopted to protect and promote the public health, safety, and general welfare of the community and to implement the Sacramento County General Plan goals, policies, and objectives and to guide the future growth of the County. The zoning code regulates the use of buildings, structures, and land for agricultural, industrial, businesses, residential, and open space land uses including agriculture, recreation, enjoyment of scenic beauty and use of natural resources, and other purposes.

As of December 2007, the Sacramento County Zoning Code provides for a total of 15 zoning districts: six base districts and nine "special and combining land use zones." The nine special combining land use zones are not used by themselves, but when they are used in combination with other zoning districts, they can provide specific additional uses and/or requirements.

As shown in Exhibit 3A.10-4, the SPA and lands south and west of the SPA are within the unincorporated area of Sacramento County and are currently governed by the Sacramento County Zoning Code. These lands are zoned as A-10 (Interim Agricultural, 10-acre minimum lot size), AG-20 (Agricultural, 20-acre minimum lot size), AG-80 (Agricultural, 80-acre minimum lot size), and SPA (Special Planning Area). Table 3A.10-3 shows these zoning districts, identifies the zoning code, and defines allowable uses.

Lands north of the SPA are located outside of Sacramento County jurisdiction, within the City of Folsom, and are governed by the City of Folsom zoning code (see "City of Folsom Zoning Code," below).

Lands east of the SPA are located outside of Sacramento County jurisdiction in the unincorporated area of El Dorado County and are governed by the El Dorado County zoning ordinance (see "El Dorado County Zoning Ordinance," below).

El Dorado County General Plan

The *El Dorado County General Plan* (2004) establishes a land use development pattern that makes the most efficient and feasible use of existing infrastructure and public services, provides guidelines for new and existing development that promotes a sense of community and that maintains or enhances the quality of the County, defines those characteristics which make the County rural and provides strategies for preserving these characteristics, and provides opportunities for positive economic growth.

As shown in Exhibit 3A.10-3, the lands east of the SPA are within the unincorporated area of El Dorado County and are governed by the El Dorado County General Plan. These lands are designated as High-Density Residential (HDR), Medium Density Residential (MDR), Multi-Family Residential (MFR), and Open Space (OS). Table 3A.10-2 shows these land use designations, identifies the compatible zoning districts, and defines allowable uses.

El Dorado County General Plan Goals and Policies

No goals and policies outlined in the El Dorado County General Plan (2004) relating to land use are applicable to the Proposed Project or alternatives under consideration.

El Dorado County Zoning Ordinance

The El Dorado County Zoning Ordinance (El Dorado County 2009) has been adopted to allow use of modern planning and development techniques, effect more efficient use of land, allow flexibility of development, provide for a combination of different land uses that complement each other but which may not in all aspects conform to

Table 3A.10-3
Adopted Sacramento County, El Dorado County, and City of Folsom Zoning Districts

Zoning District	Zoning Code	Allowable Uses
Sacramento County		
Interim Agriculture (10-acre minimum lot size)	A-10	The Interim Agriculture (10-acre minimum lot size) zoning district provides for agricultural uses while reserving these areas for possible future urban, recreational, or industrial uses.
Agricultural (20-acre minimum lot size)	AG-20	The Agricultural (20-acre minimum lot size) zoning district promotes long-term agricultural uses and discourages the premature and unnecessary conversion of agricultural land to urban uses. All agricultural uses and one single-family residence per parcel are permitted uses.
Agricultural (80-acre minimum lot size)	AG-80	The Agricultural (80-acre minimum lot size) zoning district promotes long-term agricultural uses and discourages the premature and unnecessary conversion of agricultural land to urban uses. All agricultural uses and one single-family residence per parcel are permitted uses.
Special Planning Area	SPA	The Special Planning Area combining zone identifies areas having existing architectural, environmental, social, or other characteristics that are intended to be maintained. New development in these areas should meet conditions that existing standards of the basic zone may not address.
El Dorado County		
One-Acre Residential	R1A	The One-Acre Residential zoning district allows for one-family detached dwelling units; guesthouses as an accessory use to an existing dwelling; accessory uses and structures including garages, swimming pools, and boathouses; excavation of earth and drilling of wells exclusively for residential purposes; and public parks, playgrounds, and golf courses.
One-Family Residential	R1	The One-Family Residential zoning district allows for one-family detached dwelling units, noncommercial accessory uses and buildings, excavation of earth and drilling of wells exclusively for residential purposes, public utilities distribution lines, and public parks.
Multifamily Residential	RM	The Multifamily Residential zoning district allows for one-family detached dwelling units, multifamily dwelling units, noncommercial accessory uses and buildings, excavation of earth and drilling of wells exclusively for residential purposes, public utilities distribution lines, and public parks.
Recreational Facilities	RF	The Recreational Facilities zoning district provides for the orderly development and maintenance of lands and areas suitable and desirable for recreational pursuits and to protect those areas from the encroachment of unrelated uses. This districts allows for picnic areas, ball fields and courts, public utilities structures or overhead lines, playgrounds, golf courses, swimming pools, non-motorized snow play areas, stables, riding and hiking trails, lakes and marinas for non-motorized craft, fishing, and hunting.
Open Space	OS	The Open Space zoning district identifies open space areas for protection of natural resources, preservation of agricultural production, preservation of recreational areas, and protection of prime or critical wildlife habitat. This district allows for single family detached dwelling units, agricultural accessory buildings, timber production and harvesting, and other agricultural crop production.

Table 3A.10-3
Adopted Sacramento County, El Dorado County, and City of Folsom Zoning Districts

Zoning District	Zoning Code	Allowable Uses
City of Folsom		
Residential Single Family, Small Lot District	R-1-M	The Residential Single Family, Small Lot District allows for single-family dwelling units, utility installations, public parks, schools, libraries, fire stations, and other public buildings.
Residential Multifamily Dwelling District	R-M	The Residential Multifamily Dwelling District allows for single-family zero lot line dwelling units, two-family dwelling units, multifamily dwelling units, utility installations, apartments, public parks, schools, libraries, fire stations, and other public buildings.
General Apartment District	R-4	The General Apartment District allows for two-family dwelling units, multifamily dwelling units, utility installations, apartments, public parks, schools, libraries, fire stations, and other public buildings.
Business and Professional District	BP	The Business and Professional District designates areas suitable for business and professional offices including low-intensity commercial uses and compatible with higher-intensity residential uses. This zoning district may serve as a buffer between retail commercial and residential uses and should be located along major arterial roadways.
Neighborhood Business District	C-1	The Neighborhood Business District provides for low-intensity retail commercial activities oriented to serve nearby residential areas.
Central Business District	C-2	The Central Business District provides for a wide range of commercial activities adjacent to major arterial roadways and thoroughfares. This zoning district includes all shopping centers.
General Commercial District	C-3	The General Commercial District provides for high-intensity commercial activities that may include heavy auto and truck traffic. This zoning district is located adjacent to major arterial roadways and thoroughfares and includes all shopping centers.
Light Industrial District	M-1	The Light Industrial District provides for high-intensity commercial activities that may include heavy auto and truck traffic. Permitted uses include wholesale and storage warehouses; feed and fuel yards; manufacturing, processing, fabricating, refining, repairing, and packaging facilities; and utility installations.
Limited Manufacturing District	M-L	The Limited Manufacturing District is designed to accommodate a limited group of business, professional, research, and technical manufacturing uses that have specific requirements for space, light, and air. Permitted uses include commercial and professional offices, research institutions, manufacturing facilities, and utility installations.
Open Space Conservation District	OSC	The Open Space Conservation District is intended to designate areas to be generally maintained as open space. Permitted uses include agricultural uses, cattle and dairy farms, public and private parks, golf courses, and floodplain areas. One single-family dwelling unit per 10 acres of land is permitted.

Source: Sacramento County 1993, El Dorado County 2004, City of Folsom 1988

the existing zoning regulations, and encourage a more efficient use of public and/or private services. As of March 2009, the El Dorado County Zoning Ordinance provides for 34 general land use zoning districts and 17 Lake Tahoe Basin zoning districts.

As shown in Exhibit 3A.10-4, lands east of the SPA are within the unincorporated area of El Dorado County and are governed by the El Dorado County zoning ordinance. These lands are zoned as R1A (One-Acre Residential), R1 (One-Family Residential), RM (Multifamily Residential), RF (Recreational Facilities), and OS (Open Space). Table 3A.10-3 shows these zoning districts, identifies the zoning code, and defines allowable uses.

City of Folsom General Plan

The *City of Folsom General Plan* (1993) provides for physical, economic, and environmental growth of the City. The City's General Plan is oriented toward the physical development of land uses, a circulation network, and supporting public facilities and services. As a whole, the general plan is intended to retain and enhance Folsom's quality of life, separate identity, and sense of community.

As shown in Exhibit 3A.10-3, lands north of the SPA are within the Folsom City limits and are governed by the City of Folsom General Plan. These lands are designated by the City of Folsom General Plan as Single Family (SF), Single-family High Density/Mobile Home Park (SFHD), Multi-family Low Density (MLD), Multi-family Medium Density (MMD), Multi-family High Density (MHD), Community Commercial (CC), Regional Commercial (RCC), Specialty Commercial (CA), Industrial/Office Park (IND), Park (P), Open Space (OS), and School (S). Table 3A.10-2 shows these land use designations, identifies the compatible zoning districts, and defines allowable uses.

City of Folsom General Plan Goals and Policies

The following goals and policies outlined in the *City of Folsom General Plan* (1993) Land Use Element relating to land use planning would be applicable to the Proposed Project and the four action alternatives. There are no goals or policies that would apply to the No Project Alternative.

GOAL 2: To ensure that the City exercise appropriate controls over the planning process.

- **Policy 2.3:** General Plan Amendments may be approved when the applicant has successfully indicated substantial benefit could be derived from the project.

    1. Requests for higher residential densities must include a demonstration of need for higher density housing.

    2. Requests for land use changes must include an evaluation of economic, social and environmental factors which would be enhanced by a change in the land use.

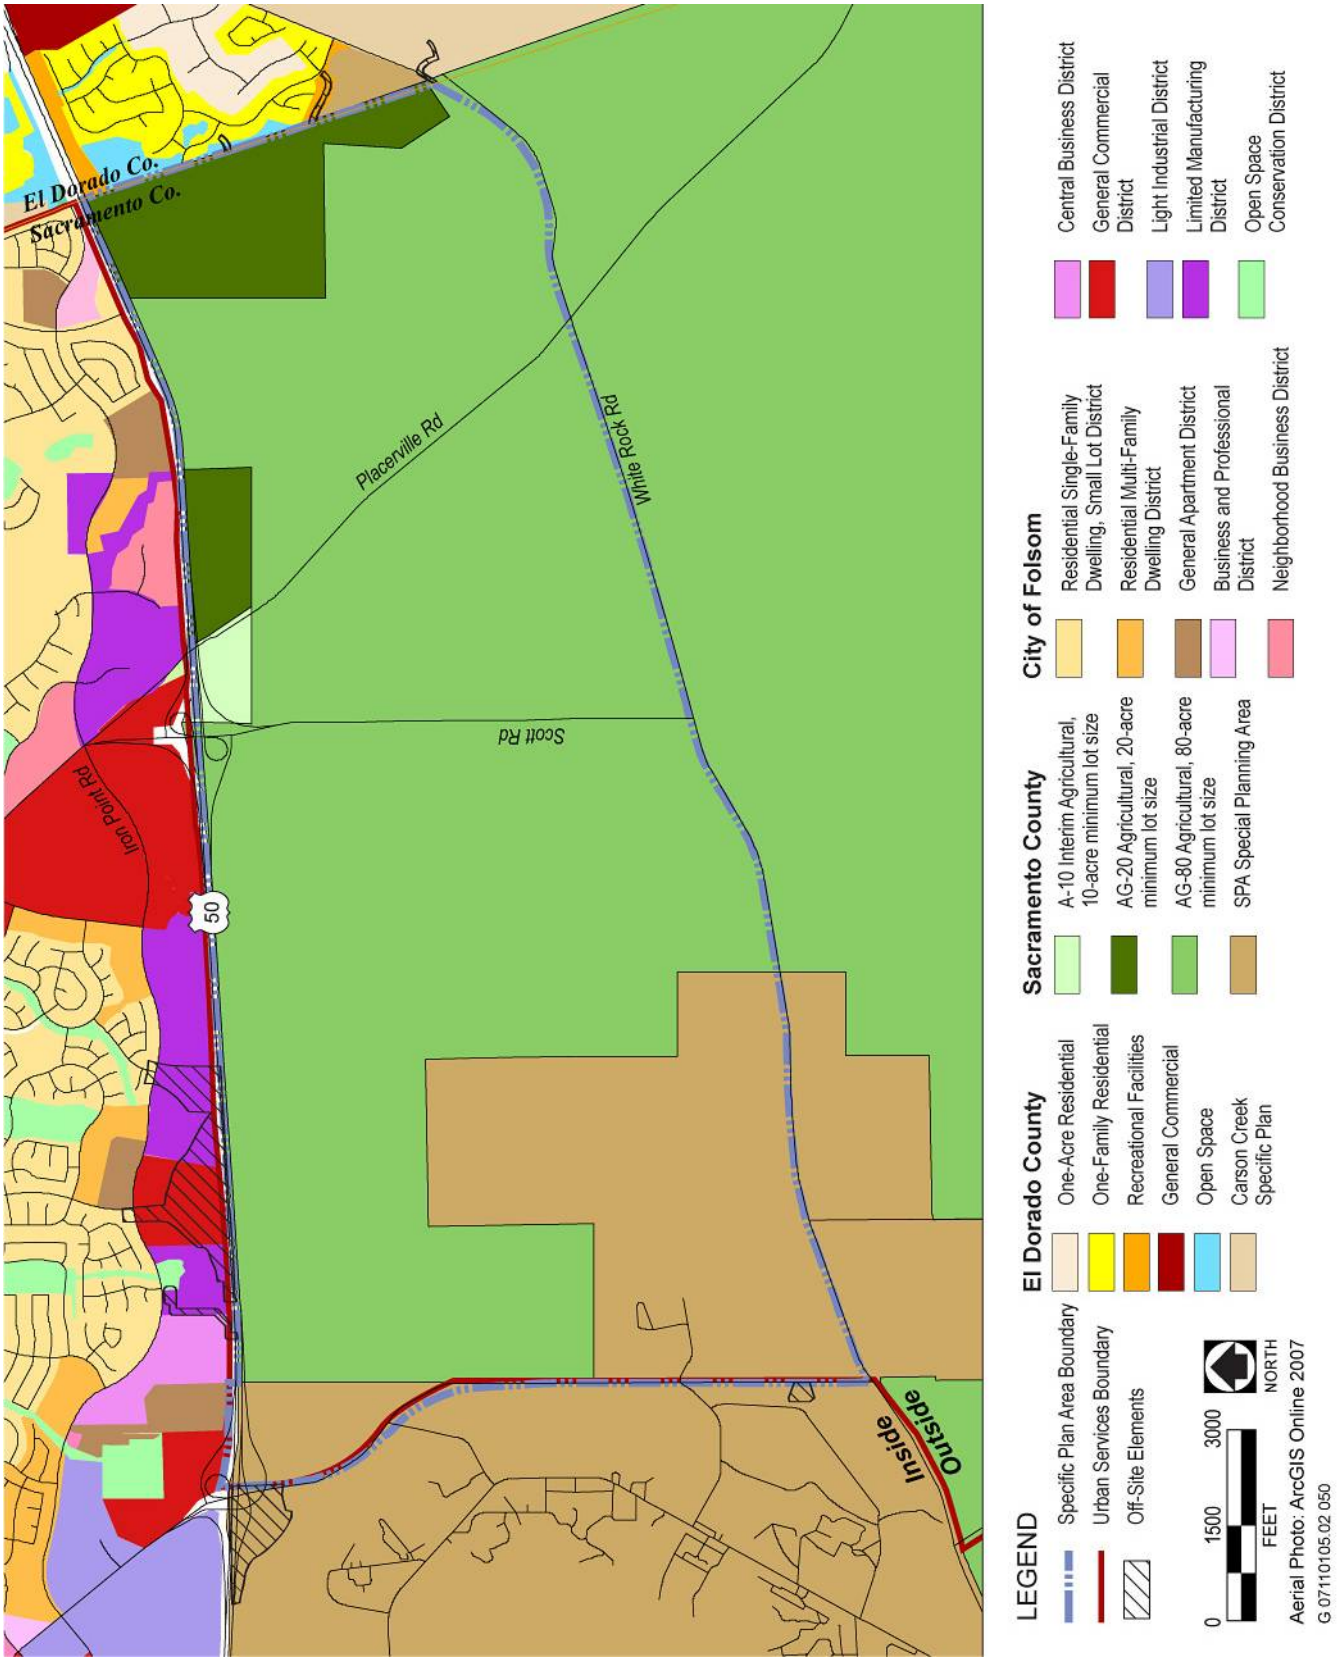
    3. Design features for open space, improved recreational facilities, protection of natural features and sensitive to surrounding development shall be carefully evaluated.

GOAL 3: To address comprehensively Folsom's development issues on the basis of community-wide needs.

- **Policy 3.3:** Development standards shall be prepared for large land holdings prior to approval of tentative maps or Planned Development permits. Development standards may consist of standards adopted by relationships among land uses within the area covered by the plan. Development standards may be included in specific plans, area plans, or be reference as a condition of approval.

GOAL 4: To provide opportunities for residents to live, work, shop, and enjoy leisure activities within the City.

Policy 4.2: The City will plan for a central community district and a regional shopping center.



Source: Sacramento County 1993, El Dorado County 2004, City of Folsom 1998

Zoning Map **Exhibit 3A.10-4**

- **Policy 4.3:** Neighborhood business areas will be allowed subject to size and business restrictions. The location of such business areas are based on area or community plans for the projects to be served by the neighborhood business area. Neighborhood business should be pedestrian-oriented, that is, their customers are primarily from the residents in the immediate vicinity of the business.

GOAL 7: To provide for the orderly annexation and development of unincorporated areas within Folsom's Sphere of Influence.

- **Policy 7.1:** The City shall only annex those lands which can be developed in accordance with the City's General Plan, fiscally sound additions to the City, can be adequately served by municipal (or acceptable alternative) facilities and services and are part of a planned, orderly annexation program.

- **Policy 7.2:** All properties proposed for annexation shall be pre-zoned by the City in a manner consistent with the General Plan. Until facilities and services can be provided, such properties will be designated as agricultural reserve. The existing County zoning or General Plan designation which applies to a property may be considered in determining the appropriate pre-zoning of the subject land which is served by on-site facilities or connected to County facilities.

- **Policy 7.3:** Prior to the annexation of lands to the City, the applicant shall submit a plan demonstrating the financial feasibility of providing services and facilities to the area proposed for annexation.

- **Policy 7.4:** The General Plan and zoning designations for annexed lands should consider the following criteria:

    - The capacity of facilities and municipal services.

    - The environmental effects that development on lands proposed for annexation may have on properties within the existing city limits.

    - Existing land uses, if any, on and in the vicinity of the annexed land.

    - The extent of any natural habitats and features of the landscape which should be preserved.

    - The demonstrated need for additional housing, retail commercial uses, other commercial uses, and industrial uses.

GOAL 8: To allow a variety of housing types which provides living choices for Folsom residents.

- **Policy 8.9:** All multiple family projects will be required to obtain a planned development permit in accordance with the City's Zoning Code. Similar development approvals, such as Specific Plans that cover the same requirements as the planned development permit shall be considered a substitute.

- **Policy 8.10:** Residential densities within an area plan or specific plan may vary, provided 1) that the dwelling unit buildout within the plan shall not exceed the authorized by the Land Use Element of the General Plan and 2) in no instance shall densities within any portion of the plan area exceed 25 dwelling units per acre. An area plan or specific plan is defined as a large development area typically over 100 acres with an overall master development plan.

GOAL 10: To provide for a commercial and industrial base of the City to encourage:

1. A strong tax base.
2. More jobs within the City.
3. A greater variety of commercial goods and services.

4. A regional shopping center.
5. Businesses and industrial compatible with Folsom's quality of life.

- **Policy 10.1:** The City shall have a variety of commercial uses such as:

    1. ….

    2. Individual businesses outside of a commercial area, serving a commercial or industrial project or providing highway-oriented services.

    3. Small commercial centers serving individual neighborhoods.

    4. A central business district with offices and retail establishments serving the entire community.

    5. A regional retail center serving Folsom residents and others from outside the community.

    6. ….

    7. Specialty commercial areas.

GOAL 11: A plan for a central commercial district that includes retail, office, and service establishments, and cultural and entertainment facilities.

- **Policy 11.2:** The purpose of the central commercial district shall be to provide a location for businesses, to provide a focus for entertainment activities, and to provide a City financial center.

GOAL 12: To plan for regional commercial centers.

- **Policy 12.1:** Regional commercial centers shall be primary highway-oriented retail commercial areas. The purpose of the centers shall be to provide locations for businesses whose customers come primarily from outside the City of Folsom, although businesses may also provide goods and services to Folsom residents.

- **Policy 12.2:** Regional centers should be located close and accessible to Highway 50, preferably near an interchange.

- **Policy 12.5:** Highway-commercial areas shall be designated adjacent to U.S. 50 in order to support the travelling public at major interchanges.

GOAL 13: To plan for small neighborhood-oriented convenience commercial areas which provide goods and services that may meet the daily needs of nearby residents.

- **Policy 13.1:** Neighborhood convenience commercial areas should be located so the residents in each neighborhood may meet their daily needs for commercial goods and services.

- **Policy 13.2:** Neighborhood commercial areas shall in general be limited to five acres or less.

- **Policy 13.6:** Neighborhood commercial centers shall be developed under the Planned Development Process.

GOAL 15: Plan for community commercial areas providing goods and services for large neighborhood areas.

- **Policy 15.1:** Community commercial centers shall in general range in size from five to ten acres.

- **Policy 15.4:** Community commercial centers should be developed adjacent to higher density residential, offices, and public uses.

- **Policy 15.5:** Community commercial centers shall be developed under the Planned Development Process.

City of Folsom Zoning Code

The City of Folsom zoning code (City of Folsom 2006, as amended) has been adopted to protect and promote the public health, safety, peace, morals, comfort, convenience, and general welfare of the community and to implement the City of Folsom General Plan goals, policies, and objectives and to guide the future growth of the City. The zoning code assists in providing a comprehensive plan for orderly development of the City through site-specific development and land use regulations that govern the placement, size, shape of structures, and type of uses.

As of October 2006, the City of Folsom Zoning Code provides for a total of 25 zoning districts: 20 base districts and five "combining districts." The five special combining land use zones are not used by themselves, but when they are used in combination with other zoning districts, they can provide specific additional uses and/or requirements.

Exhibit 3A.10-4, lands north of the SPA are within the Folsom City limits and are governed by the City of Folsom zoning code. These lands are zoned as R-1-M (Residential Single-Family Dwelling, Small Lot District), R-M (Residential Multi-Family Dwelling District), R-4 (General Apartment District), BP (Business and Professional District), C-1 (Neighborhood Business District), C-2 (Central Business District), C-3 (General Commercial), M-1 (Light Industrial District), M-L (Limited Manufacturing District), and OSC (Open Space and Conservation District). Table 3A.10-3 shows these zoning districts, identifies the zoning code, and defines allowable uses.

3A.10.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration would result in a significant impact related to land use planning if they would do any of the following:

- physically divide an established community;

- conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project adopted for the purpose of avoiding or mitigating an environmental effect;

- conflict with any applicable habitat conservation plan or natural community conservation plan;

- convert Important Farmland (i.e., Prime Farmland, Unique Farmland, or Farmland of Statewide Importance) as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use;

- conflict with existing zoning for agricultural use or a Williamson Act contract; or

- involve other changes in the existing environment which, due to their location or nature, could result in conversion of Important Farmland to nonagricultural use.

Impacts associated with potential conflicts with the South Sacramento County Habitat Conservation Plan are addressed in Section 3A.3, "Biological Resources - Land."

ANALYSIS METHODOLOGY

Evaluation of potential land use impacts of the Proposed Project and the four action alternatives and the off-site U.S. 50 interchange improvements, detention basin, and sewer force main in Sacramento County was based on a review of planning documents pertaining to the SPA and vicinity, including: the *Sacramento County General Plan* (1993) and zoning ordinance, the Sacramento County General Plan Update DEIR (2009), the *City of Folsom General Plan* (1988) and zoning code, and the SACOG Region Blueprint. The land use impacts of the two roadway connections from the Folsom Heights property into El Dorado Hills under the Proposed Project Alternative were based on a review of the *El Dorado County General Plan* (2004) and zoning ordinance. The land use impacts under the No Project Alternative were based on the *Sacramento County General Plan* (1993) and zoning ordinance, and the Sacramento County General Plan Update DEIR (2009). Additional background information on land uses were obtained through field review and consultation with appropriate agencies. In addition, the DOC Important Farmland maps for Sacramento and El Dorado Counties and the DOC map of Williamson Act contracts in Sacramento County were used to determine the agricultural significance of the lands in the SPA and in the off-site improvement areas.

The off-site elements include construction of the Prairie City Road and Oak Avenue interchange improvements, the Rowberry Drive Overcrossing, a sewer force main, and a detention basin west of Prairie City Road. Approval of the project would allow acquisition of right-of-way and construction of these improvements. Therefore, these elements would not be inconsistent with existing Sacramento County or City of Folsom land use designations or zoning or conflict with other land use plans, policies, regulations, and ordinances.

ISSUES NOT ADDRESSED FURTHER IN THIS EIR/EIS

- **Physically divide an established community**—The SPA consists of livestock grazing lands, and there is only one existing single-family residence and associated agricultural outbuildings located on the western side of the SPA. Therefore, project implementation would not physically divide an established community and this issue is not evaluated further in this EIR/EIS

- **Conversion of Important Farmland to nonagricultural uses**—The Sacramento County Important Farmland map designates the SPA and off-site U.S. 50 interchange improvements, the sewer force main, and the detention basin as Grazing Land and Urban and Built-Up Land. The two roadway extensions from the Folsom Heights property into El Dorado Hills are designated by the El Dorado County Important Farmland Map as Grazing Land and Urban and Built-Up Land. These farmland designations are not considered Important Farmland under CEQA (California Public Resources Code Sections 21060.1 and 21095 and State CEQA Guidelines Appendix G). Thus, there would be no impact related to the conversion of Important Farmland or changes which result in the conversion of Important Farmland, and this issue is not evaluated further in this EIR/EIS.

Potential conflicts with any applicable habitat conservation plan or natural community conservation plan are evaluated in Section 3A.3, "Biological Resources - Land," of this EIR/EIS.

IMPACT ANALYSIS

Introduction to the Analysis

The Folsom South of U.S. 50 Specific Plan Project includes two off-site roadways that would extend from the Folsom Heights property and connect to the Stonebriar subdivision in El Dorado Hills. The northern roadway segment would connect directly into an existing cul-de-sac at the terminus of Winterfield Drive on the eastern boundary of the SPA. The southern roadway connection would cross undeveloped open land to connect with

Prima Drive. This undeveloped land is designated by the El Dorado County General Plan as High-Density Residential and is zoned One-Family Residential (R1) and Recreational Facilities (RF) by the El Dorado County Zoning Ordinance (Exhibits 3A.10-2 and 3A.10-3). The two roadway connections were identified as future roadway improvements in the DEIR prepared for the Joerger Ranch project (Michael Brandman Associates 1992). As identified in that DEIR, the Joerger Ranch project included potential secondary access roads in the western portion of the SPA (page 4-88 and Exhibit 4.8-3), and noted that additional CEQA review would be required after the roadway alignments were identified. Because the Folsom South of U.S. 50 Specific Plan Project would require construction of these roadway connections, this EIR/EIS provides an analysis of the physical impacts from construction those roadway connections. Approval of the Folsom South of U.S. 50 Specific Plan Project would allow acquisition of right-of-way and construction of the two roadway connections. These connections are identified in existing plans and would not be inconsistent with existing El Dorado County land use designations or zoning.

The land use planning and zoning authority of local jurisdictions in California is set forth in the state's planning laws. Currently, both Sacramento County and the City of Folsom have planning jurisdiction over the SPA, though the City would have no direct land use authority over the area unless and until annexation to the City is approved by the Sacramento LAFCo. Because the SPA is located within the unincorporated area of Sacramento County and outside the legal boundaries of Folsom, Sacramento County maintains the authority to designate allowable land uses and approve development on the site. Following LAFCo's approval of the annexation, Sacramento County would relinquish land use planning authority to the City, and the Sacramento County General Plan would no longer apply to the annexed areas. Nonetheless, the project may be appropriately compared to the Sacramento County General Plan to determine the consistency of the project with existing land use designations because the City does not have the current land use control. It should be noted that any inconsistency of the project with Sacramento County or Folsom land use designations and zoning code is an issue related to land use regulation and not a physical environmental consequence of the project, and therefore would not be considered a significant impact under CEQA. Specific impacts associated with other resource and issue areas are addressed in each technical "A" or "Land" Sections of this EIR/EIS as appropriate. These technical sections provide a detailed analysis of other relevant environmental effects resulting from implementation of the project.

The project would be inconsistent with the overall intent of the Sacramento County General Plan's land use designations. The SPA is designated by the Sacramento County General Plan as General Agriculture (80 acres) and General Agriculture (80 acres)/Resource Conservation Area (Exhibit 3A.10-3). The General Agriculture (80 acres) land use designation identifies areas that are intended to be used for agricultural purposes and have parcels large enough to maintain economically viable farming operations. This land use designation allows only agricultural production and single-family dwelling units at a density no greater than one unit per 80 acres. The Resource Conservation Area combining designation identifies areas with special resource management needs while recognizing the validity of the underlying land use designation. Pursuant to California Government Code Section 65454, a specific plan must be consistent with the local government's general plan. Development of the project would require approval of a general plan amendment by the City of Folsom, and the general plan amendments would be approved concurrently with adoption of the specific plan. The specific plan includes goals, objectives, policies, and implementation measures that would make the specific plan and general plan consistent with one another. Implementation of the specific plan would be administered by the City of Folsom in concert with the City's General Plan and other implementing documents. Exhibit 2-3 in Chapter 2, "Alternatives," shows the proposed general plan land use designations, and Table 3A.10-4 summarizes definitions and permitted uses within the land use designations.

According to the Sacramento County Zoning Map, the SPA is zoned as AG-80 (Agricultural, 80-acre minimum lot size), AG-20 (Agricultural, 20-acre minimum lot size), A-10 (Interim Agricultural, 10-acre minimum lot size), and SPA (Special Planning Area) (Exhibit 3A.10-4). These agricultural zoning districts promote long-term agricultural uses and discourage the premature and unnecessary conversion of agricultural land to urban uses and are compatible with the General Agriculture (80 acres) and General Agriculture (80-acres)/Resource Conservation Area land use designations. The SPA (Special Planning Area) combining zone identifies areas having existing

Table 3A.10-4
Folsom South of U.S. 50 Specific Plan Proposed Land Use and Zoning Districts

Proposed Land Use Designation	Proposed Zoning District	Specific Plan Definition	Proposed Project Uses
Single Family	SP-SF	Densities of 1– 4 du/ac. The single-family residential land use designation would provide for individually owned, single family detached homes that may be creatively sited due to slopes and other natural features. Most areas with this land use designation are adjacent to open space areas and act as a transition from undeveloped areas to residential development. Additional neighborhood and community serving amenities, such as parks, libraries, community clubhouses, and emergency services facilities, are also permitted.	Single family detached residential development including larger executive-style housing, large-lot residential estates, and conventional single-family neighborhoods.
Single-Family High Density	SP-SFHD	Densities of 4–7 du/ac. The Single-Family High Density residential land use designation would provide for single-family residential development that promotes walkability. Areas with this land use designation are generally on level terrain and are located in some instances as a transition between larger lot residential neighborhoods and higher-density multifamily residential sites. Additional neighborhood and community serving amenities, such as parks, libraries, community clubhouses, and emergency services facilities, are also permitted.	Single-family residential development including detached, attached, clustered, zero lot line, and attached two-residences. The single-family unit may include one secondary residential rental unit per lot.
Multi-Family Low Density	SP-MLD	Densities of 7–12 du/ac. The Multi-Family Low Density residential land use designation would encourage a variety of housing types. High-density residential uses would be located in small residential pockets and near planned mixed-use centers. Additional neighborhood and community serving amenities, such as parks, libraries, community clubhouses, and emergency services facilities, are also permitted.	Multifamily residential development including small-lot single-family residential units, such as single family patio homes, single family zero lot line courtyard residential units, and attached residential units, attached or detached row homes and townhomes.
Multi-Family Medium Density	SP-MMD	Densities of 12–20 du/ac. The Multi-Family Medium Density residential land use designation would provide for detached single-family units, attached single-family units, and multifamily residential units in close proximity to commercial centers and community amenities. Areas with this land use designation are generally in the town center and in proximity to mixed-use and larger commercial areas. Additional neighborhood and community serving amenities, such as parks, libraries, community clubhouses, and emergency services facilities, are also permitted.	Residential development with maximum flexibility including detached single-family units, attached single-family units, and multifamily units.

Table 3A.10-4
Folsom South of U.S. 50 Specific Plan Proposed Land Use and Zoning Districts

Proposed Land Use Designation	Proposed Zoning District	Specific Plan Definition	Proposed Project Uses
Multi-Family High Density	SP--MHD	Densities of 20–30 du/ac. The Multi-Family High Density residential land use designation would provide for multifamily residential units in close proximity to commercial centers and major roadways. Additional neighborhood and community serving amenities, such as parks and assisted living facilities, are also permitted.	Multifamily residential development including apartment buildings, condominiums, fourplexes, row homes, and townhomes.
Mixed-Use	SP-MU	Densities of 9–30 du/ac. The Mixed Use land use designation would encourage the development of residential, commercial, office, and civic uses. This land use designation covers two distinct mixed-use types of areas: the Town Center and the smaller neighborhood centers. Town Center parcels would be developed in a traditional vertical mixed-use format with street level uses containing retail and service-based uses. Neighborhood centers may develop as vertical or horizontal mixed-uses with commercial and service-based uses that are designed to serve the local community. Residential elements within the neighborhood centers may include separate, higher density residential buildings, either in a vertical format or in a horizontal alignment.	Residential development including apartments, row homes, townhomes, condominiums, apartments, and live/work studios. Vertical mixed-use development with ground floor commercial uses with offices and/or residential above, and horizontal mixed-use consisting of a mixture of single use buildings (i.e., buildings dedicated solely to residential, office, or retail uses) on a single site or block. Additional uses include specialty retail shops, cafes, restaurants, and entertainment venues; neighborhood-serving commercial uses; civic uses; and higher density housing.
Industrial/Office Park	SP-IND/OP	0.30–0.40 floor-area-ratio (FAR). The Industrial/Office Park land use designation would provide potential new areas for employment opportunities in Folsom. Land uses within this designation are intended to be lower intensity and appropriately sited and designed to be compatible with the adjacent oak woodlands, topography, and adjacent land uses.	Business, professional, and administrative office uses; medical offices; light industrial uses; and research and development facilities.
Community Commercial	SP-CC	0.25–0.30 FAR. The Community Commercial land use designation would provide a variety of community-based retail and service uses within walking distance of residential neighborhoods.	Grocery stores, retail shops, restaurants, and professional offices.
General Commercial	SP-GC	0.25–0.30 FAR. The General Commercial land use designation would provide a wide range of commercial, retail, and service uses in proximity to major thoroughfares that may be of a larger scale and highway-oriented.	Retail, office, and personal services and civic amenities including fire stations, police substations, and common open space areas.

Table 3A.10-4
Folsom South of U.S. 50 Specific Plan Proposed Land Use and Zoning Districts

Proposed Land Use Designation	Proposed Zoning District	Specific Plan Definition	Proposed Project Uses
Regional Commercial	SP-RC	0.25–0.30 FAR. The Regional Commercial land use designation would provide large-scale retail, entertainment, and service uses. This designation is situated along U.S. 50 and Scott Road and would be located adjacent to and just north of the Town Center. This adjacency is intended to promote a relationship between this regional-scale commercial and the walkable character of the Town Center.	Regional retail uses; stand-alone retail uses; restaurants; service uses; large indoor entertainment venues, including movie theatres; and civic amenities, including fire stations, police substations, and common open space areas.
Entertainment District	Entertainment District Overlay	The Entertainment District would be located north of Easton Valley Parkway and west of Scott Road adjacent to the regional commercial center and near the Town Center. This adjacency is intended to creating a strong relationship between the district, Town Center, and regional commercial center.	Entertainment, dining, retail, personal services that creates a blend of local, regional, and national merchandisers.
Parks	SP-P	The Parks land use designation provides for active and passive recreational opportunities.	Community parks, neighborhood parks, and local parks.
Open Space	SP-OS	The Open Space land use designation would recognize the natural open space areas with habitat and scenic value. These areas include oak woodlands, riparian corridors, and landscape parkways. Land uses within this land use designation would ensure the preservation and enhancement of the natural open space habitat and features.	Passive outdoor recreational activities, including walking, hiking, horseback riding, and bicycling; ancillary facilities such as public restroom facilities and outdoor interpretive/educational facilities; maintenance and repair of ditches and other stormwater management facilities; and construction, maintenance, and repair of facilities necessary to protect the integrity of wetlands or riparian corridors.
Public/Quasi-Public	SP-P-QP	The Public/Quasi-Public land use designation would encompass a variety of uses that are both desired and required within a comprehensive community setting.	Educational facilities; governmental facilities; public safety facilities such as fire stations and police substations; public utility facilities; and cultural, recreational, and religious facilities.

Source: Data compiled by AECOM in 2009

architectural, environmental, social, or other characteristics that are intended to be maintained. The land on the SPA that is owned by Aerojet General Corporation, which includes Area 40, is zoned as SPA (Special Planning Area).

The SPA is to be zoned by the city as an Overlay Specific Plan Combining District (SP-). This overlay district allows for zoning designations to be created that are unique to and only applicable to the SPA. The zoning districts for the project establish the desired zoning requirements of the SPA. While generally consistent, some elements of the proposed zoning would differ from that of the Folsom Zoning Code to reflect the SPA's unique nature. On adoption of the specific plan, the property would be prezoned consistent with Government Code Section 56375 and the Folsom General Plan. Exhibit 2-3 in Chapter 2, "Alternatives," shows the proposed land use designations, and Exhibit 2-4 shows the proposed zoning for the SPA. Table 3A.10-4 summarizes definitions and permitted uses within each zoning district.

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.10-1 Consistency with Sacramento LAFCo Guidelines. *Annexation of the SPA into the City of Folsom would require approval by Sacramento LAFCo.*

On-Site Elements

NP

Under the No Project Alternative, the SPA would not be annexed into the city, and no off-site water facilities would be constructed. The No Project Alternative would not result in actions that would require approval by Sacramento LAFCo, such as changes in government organization, annexation to a local agency, or reorganization of a service provider's boundaries. Therefore, the No Project Alternative would have **no direct** or **indirect** impacts related to consistency with Sacramento LAFCo guidelines. No inconsistency with Sacramento LAFCo guidelines would result under the No Project Alternative. ***[Lesser]***

NCP, PP, RIM, CD, RHD

LAFCo is charged with applying the policies and provisions of the Cortese-Knox-Hertzberg Local Government Reorganization Act (California Government Code Section 56000 et seq.) to its decisions regarding annexations, incorporations, reorganizations, and other changes in government organization. This act establishes the process through which a local agency boundary change is made and associated planning authority is transferred from one local agency to another. Generally, LAFCo is responsible for determining whether an annexation is consistent with the LAFCo objectives and policies of ensuring that services would be available to new development within proposed annexation areas; avoiding premature conversion of farmland; and ensuring planned, logical, and orderly patterns of urban growth.

For the project, the Sacramento LAFCo oversees the establishment or revision of boundaries for county, cities, and special districts. In June 2001, the Sacramento LAFCo approved the City's sphere of influence amendment application (Resolution No. LAFC 1196), and the City's sphere of influence was expanded to include the SPA. As part of the amendment approval, LAFCo identified conditions to ensure future annexation of the SPA would include adequate services for new development within proposed annexation areas; avoid premature conversion of agricultural resources; preserve open space; and encourage planned, logical, and orderly patterns of urban growth. Sacramento LAFCo would need to conduct proceedings to consider if the project meets LAFCo guidelines and the conditions identified in Resolution No. LAFC 1196 for annexation of the SPA (see "Sacramento Local

Agency Formation Commission," above). The following discussion summarizes the project's consistency with LAFCo Resolution No. LAFC 1196 for annexation of the SPA into the Folsom City limits.

As part of LAFCo Resolution No. LAFC 1196, the project must demonstrate compliance with the MOU between the City of Folsom and Sacramento County. The MOU outlines a comprehensive planning process for the SPA, including public participation with various stakeholders and the general public. It also addresses a number of issues including water supply, transportation, schools, and open space that were later incorporated into language found in Measure W and subsequently in the City Charter.

As required by LAFCo, the Proposed Project and the four action alternatives would maintain at least 30% of the SPA as natural open space to preserve oak woodlands and sensitive habitat areas. (See Exhibits 2-3, 2-10, 2-12, 2-14, and 2-16 in Chapter 2, "Alternatives.") Further, the Proposed Project and the four action alternatives would not result in the conversion of Important Farmland to nonagricultural uses, because the site does not contain Important Farmland.

The Proposed Project and the four action alternatives would include improvements to regional and local roadways including U.S. 50, Easton Valley Parkway, Prairie City Road, Empire Ranch Road, White Rock Road, Rowberry Drive, and Oak Avenue. Public transit routes and a network of bike trails would also be included under all five action alternatives. (See Section 3A.15, "Traffic and Transportation - Land.")

The City has identified a water supply and wastewater conveyance and treatment facilities to service the Proposed Project and the four action alternatives. Long-term water supplies would be provided by the Natomas Central Mutual Water Company through an existing Central Valley Project contract entitlement (see Chapter 2, "Alternatives" for a detailed discussion of proposed water supply). Wastewater collection, conveyance, and treatment would be provided by Sacramento Regional County Sanitation District and El Dorado Irrigation District. Mitigation measures in Section 3A.18, "Water Supply - Land," [from RMC] and Section 3A.16, "Utilities and Service Systems - Land," would ensure adequate water supplies and wastewater conveyance and treatment would be available before implementation of the Proposed Project or any of the action alternatives and these services would take place exclusively to serve development at the SPA. Therefore, adequate municipal services would be available.

The City of Folsom Fire Department, City of Folsom Police Department, and Folsom Cordova Unified School District would provide fire, police, and school service and facilities and equipment, respectively. The Proposed Project and the action alternatives would result in construction of sufficient fire, police, and school facilities and provide adequate equipment to ensure that adequate levels of service are provided. In addition, the project applicant(s) would pay state-mandated school impact fees to the Folsom Cordova Unified School District. (See Section 3A.14, "Public Services - Land.")

As part of project implementation, an Infrastructure Funding and Phasing Plan for the construction of roadways and transportation improvements and a Public Facilities Financing Plan to define the specific mechanisms required to fund capital costs of all municipal infrastructure would be adopted. Existing Folsom residents would not be required to pay fees for the construction of any new transportation improvements or municipal and public services required to serve the SPA.

The City of Folsom would annex the SPA into its territory, and adopt a General Plan Amendment defining the compatible land uses for the SPA as listed in Table 3A.10-4 above. Approval of a general plan amendment would ensure that development of the proposed land uses identified by the specific plan would be consistent with the City's General Plan. An analysis of environmental impacts associated with the required General Plan Amendment follows in Section 3A.10.4, below.

Development at the SPA would be logical extension of existing and planned urban development in the City. The northern boundary of the site is contiguous to existing urban development within the City limit boundary and the SPA is within the City's sphere of influence and has been identified in the City General Plan as an area planned

for urban development. The SPA is also designated as an area targeted for new urban growth in the Sacramento Region Blueprint (see Impact 3A.10-2 below). Other nearby planned or approved developments, including the Westborough at Easton Specific Plan to the west; the Promontory, El Dorado Hills and Bass Lake Specific Plans to the northeast; the Valley View Specific Plan to the east; and the Carson Creek Specific Plan to the southeast, have converted or have been approved to convert predominantly agricultural and open space areas to urban uses.

Implementation of the Proposed Project and action alternatives under consideration would meet the requirements of the Cortese-Knox-Hertzberg Act and the Sacramento LAFCo Guidelines identified in Resolution No. LAFC 1196 for annexation of the SPA. Because the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would result in a logical extension of existing urban areas of the City and because regional and local roadway improvements and adequate utilities and public services and revenues to achieve service standards would be provided, this **direct** impact is considered **less than significant**. **No indirect** impacts would occur. (Refer to the other "Land" sections in Chapter 3 of this EIR/EIS for analysis of physical impacts on the environment associated with these services.) The development proposed under the Proposed Project and action alternatives under consideration would be **consistent** with Sacramento LAFCo guidelines. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the detention basin west of Prairie City Road, and the two roadway connections from the Folsom Heights property into El Dorado Hills would not result in actions that would require approval by Sacramento LAFCo, such as changes in government organization, annexation to a local agency, or reorganization of a service provider's boundaries. Therefore, implementing these elements would have **no direct** or **indirect** impacts. No inconsistency with Sacramento LAFCo guidelines would result under the Proposed Project and action alternatives under consideration. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.10-2 Consistency with the SACOG Sacramento Region Blueprint. *Project implementation could conflict with the SACOG Sacramento Region Preferred Blueprint Scenario.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural land use and zoning classification AG-80. No off-site water facilities would be constructed. The SACOG Blueprint envisions the SPA for development with urban uses.

Based on SACOG Blueprint principles, the No Project Alternative could potentially result in future conversion of agricultural land and less protection of natural resources over the long term in the greater Sacramento region because more land would be required for expansion of the overall regional urban areas. Such new development, like the project, would be required to comply with the policies of the local jurisdictions. In addition, impacts of these projects would undergo separate environmental review to identify potential impacts and mitigation measures. In summary, because dense urban development would not occur under the No Project Alternative, this alternative would be **inconsistent** with the SACOG Preferred Blueprint Scenario. ***[Greater]***

The Sacramento Region Blueprint is advisory and therefore does not establish land use restrictions on any jurisdiction. SACOG has no land use authority. SACOG makes clear that the land use designations presented on the Blueprint Preferred Scenario are conceptual and reflect general land use locations in a local area. Although it is only advisory, the Blueprint provides policy guidance in the Sacramento region for long-term regional land use and transportation planning that would potentially result in the protection of additional natural resources (because less land would be required for urban uses), less conversion of agricultural land, and reduction in traffic that would improve air quality in the region. Although the Blueprint is only advisory, the City encourages the types and intensity of land uses shown in the Preferred Blueprint Scenario.

Under smart growth principles, areas that are planned for development are developed at higher densities. Although these higher densities may result in greater on-site impacts on biological, cultural, open space, and agricultural resources, the overall area of disturbance within the region is reduced in the long term as development is concentrated in particular locations. Sacramento County has experienced demographic pressure which has reflected an increasing statewide population and intrastate migration from the San Francisco Bay Area, and the City of Folsom is interested in furthering its goals and objectives of providing a mix of housing and new jobs to its residents. Smart growth principles therefore suggest that developing the site with a higher density use while avoiding wetland areas and other environmental resources would focus market demand for development into an area near existing development, infrastructure, and services.

The types of land uses under the No USACE Permit Alternative would be the same as those under the Proposed Project Alternative. However, the project components would be reconfigured under the No USACE Permit Alternative to avoid the placement of dredged or fill material into waters of the U.S., including wetlands. This alternative would provide the greatest area of open space and avoid many of the impacts to high-quality biological habitat and cultural resources (see Exhibit 2-16 in Chapter 2, “Alternatives”).

The number of jobs generated by No USACE Permit Alternative would exceed the job projections identified in the Blueprint for the SPA. This alternative accommodates approximately 11,171 jobs, which is 3,671 more jobs than anticipated in the Blueprint. However, this alternative would generate 2,039 less than the Proposed Project Alternative.

The No USACE Permit Alternative would provide residential development on a similar footprint compared to the Proposed Project Alternative; however, the additional natural resources protection would result in fewer dwelling units. The No USACE Permit Alternative would construct 6,373, which is 6,127 less than identified in the Blueprint for the SPA, and would construct 3,837 fewer residential units than the Proposed Project Alternative. Overall the average density across the residentially designated area would decrease to approximately 5.14 du/ac compared to 6.65 du/ac in the Proposed Project Alternative.

The reduced numbers of dwelling units under the No USACE Permit Alternative would be substantially less than the Blueprint and Proposed Project Alternative resulting in reduced amounts of project-generated traffic and air quality emissions. However, the Blueprint envisions a higher density of development on the SPA than proposed under the No USACE Permit Alternative. Although low density on a particular property may reduce the levels of impacts occurring on or emanating from the property, low densities can be considered an inefficient use of finite land resources. In areas with growing populations, low-density development coupled with increasing market demand can result in development being pushed outward toward other areas on the urban periphery, with the long-term consequence of more overall loss of habitat, open space, and farmland.

Based on Blueprint principles, development under the No USACE Permit Alternative could potentially result in future conversion of agricultural land and less protection of natural resources over the long term in the greater Sacramento region because more land would be required for expansion of the overall regional urban areas. Such new development, as proposed under the No USACE Permit Alternative, would be required to comply with the

policies of the local jurisdictions. In addition, impacts of these projects would undergo separate environmental review to identify potential impacts and mitigation measures. (See "A" or "Land" Sections of this EIR/EIS for an evaluation of the physical impacts on the environment associated with development of the proposed project.) In summary, the No USACE Permit Alternative would be **inconsistent** with the SACOG Sacramento Region Preferred Blueprint Scenario. ***[Greater]***

PP

The Proposed Project Alternative reflects the concept of smart growth, consistent with the SACOG Blueprint. These features are summarized below:

- **Transportation Choices:** A public transit corridor would be included throughout the SPA with connections to the town center, regional commercial center, and neighborhood centers. Bus transit routes would be integrated into systems provided by Folsom and Regional Transit. Multi-use trails, bicycle trails, and pedestrian walkways and sidewalks would be incorporated into the development.

- **Mixed-Use Development:** A mixed-use Town Center and smaller neighborhood centers would accommodate development of residential, commercial, office, and civic uses. Neighborhood centers may develop as vertical or horizontal mixed-uses with commercial and service-based uses that are designed to serve the local community. Residential elements within the neighborhood centers may include separate, higher density residential buildings, either in a vertical format or in a horizontal alignment.

- **Compact Development:** A regional commercial center would be situated along U.S. 50 and Scott Road adjacent to and just north of the mixed-use town center. This adjacency is intended to promote a relationship between this regional-scale commercial and the walkable character of the Town Center. Additional commercial uses would be of a larger scale and highway oriented. Commercial and service-based uses would be incorporated into neighborhood centers and include residential elements such as separate, higher density residential buildings.

- **Housing Choice and Diversity:** A variety of housing types are proposed to better serve the economic diversity of local homebuyers, including single family detached and attached homes, apartments, condominiums, and townhomes.

- **Use of Existing Assets***:* Land uses are linked to existing transportation patterns, such as U.S. 50, Prairie City Road, and Scott Road. Additional linkages to the City north of U.S. 50 would be proved through improvements to the existing interchanges at U.S. 50 and Prairie City Road and at U.S. 50 and Scott Road/East Bidwell Street, a new interchange at U.S. 50 and Oak Avenue, and a new overcrossing of U.S. 50 at Rowberry Drive.

- **Quality Design:** The Proposed Project Alternative is intended to provide a variety of high-quality neighborhood, regional commercial center, town center, and neighborhood center designs, appropriate to the scale and use of these areas. Open space, recreational uses, and parks are proposed throughout the community and integrated within its design. Approximately 30% of higher density residential uses would be located near commercial uses, parks, and schools to create walkable communities.

- **Natural Resource Conservation:** The Proposed Project Alternative includes conservation of 30% of the SPA as natural open space. These areas would provide protection of oak woodlands, riparian corridors, creeks, wetlands, and heritage trees.

The Blueprint identifies the SPA as a future planned community accommodating the long-term needs of Folsom and contributing to the Sacramento region. The SACOG Blueprint Preferred Scenario anticipates the project would generate approximately 7,500 jobs and develop 12,000 households. The Blueprint's land use designation

for the SPA is illustrated in Exhibit 3A.10-2. The Proposed Project Alternative would exceed the job projections identified in the Blueprint for the SPA. This alternative accommodates approximately 13,210 jobs, which is 5,710 more jobs than anticipated in the Blueprint.

The Proposed Project Alternative would develop 10,210 dwelling units, which is 1,790 dwelling units less than identified in the Blueprint for the SPA. Overall average density across the residentially designated area of 6.65 du/ac. Although the project would include a lesser density of residential development than identified in the Blueprint for the SPA, the Proposed Project Alternative fulfills the principles of smart growth identified in the Blueprint. As discussed above, this alternative would allow for a system of multimodal transportation; would provide a variety of mixed-use areas and a range of housing choices; and would emphasize compact development, quality design, and natural resource conservation. (See "A" or "Land" Sections of this EIR/EIS for an evaluation of the physical impacts on the environment associated with project development.) In summary, the Proposed Project Alternative would be **consistent** with the SACOG Sacramento Region Preferred Blueprint Scenario.

RIM

The types of land uses under the Resource Impact Minimization Alternative would be the same as those under the Proposed Project Alternative. However, the project components would be reconfigured under the Resource Impact Minimization Alternative to include additional areas of high-quality biological habitat in the proposed preserve area, preservation of most of the known on-site cultural resources, and avoid many of the impacts on U.S. Army Corps of Engineers (USACE) jurisdictional wetlands (see Exhibit 2-10 in Chapter 2, "Alternatives").

The number of jobs generated by Resource Impact Minimization Alternative would exceed the job projections identified in the Blueprint for the SPA. This alternative accommodates approximately 9,501 jobs, which is 2,001 more jobs than anticipated in the Blueprint. However, this alternative would generate 3,709 fewer jobs than the Proposed Project Alternative.

The Resource Impact Minimization Alternative would provide residential development on a similar footprint compared to the Proposed Project Alternative; however, the additional natural resources protection would result in substantially fewer dwelling units. The Resource Impact Minimization Alternative would construct 7,965 dwelling units, which is 4,035 dwelling units less than identified in the Blueprint for the SPA, and would construct 2,245 fewer residential units than the Proposed Project Alternative. Overall, the average density across the residentially designated area would decrease to approximately 6.0 du/ac compared to 6.65 du/ac under the Proposed Project Alternative.

The reduced numbers of dwelling units under the Resource Impact Minimization Alternative would be substantially less than the Blueprint and Proposed Project Alternative resulting in reduced amounts of project-generated traffic and air quality emissions. However, the Blueprint envisions a higher density of development on the SPA than is proposed under the Resource Impact Minimization Alternative. Although low density on a particular property may reduce the levels of short-term impacts occurring on or emanating from the property, low densities can be considered an inefficient use of finite land resources. In areas with growing populations, low-density development coupled with increasing market demand can result in development being pushed outward toward other areas on the urban periphery, with the long-term consequence of more overall loss of habitat, open space, and farmland.

Based on Blueprint principles, development under the Resource Impact Minimization Alternative could potentially result in future conversion of agricultural land and less protection of natural resources over the long term in the greater Sacramento region because more land would be required for expansion of the overall regional urban areas. Such new development, as proposed under the Resource Impact Minimization Alternative, would be required to comply with the policies of the local jurisdictions. In addition, impacts of these projects would undergo separate environmental review to identify potential impacts and mitigation measures. (See "A" or "Land" Sections of this EIR/EIS for an evaluation of the physical impacts on the environment associated with

development of the proposed project.) In summary the Resource Minimization Alternative would be **inconsistent** with the SACOG Sacramento Region Preferred Blueprint Scenario. ***[Greater]***

CD

The types of land uses under the Centralized Development Alternative would be the same as those under the Proposed Project Alternative. However, project components would be reconfigured under the Centralized Development Alternative to provide additional open space within the eastern foothills and avoid and/or reduce impacts on USACE jurisdictional wetlands, high-quality biological habitat, cultural resources, and visual resources. A higher density of residential development would be located within the central portion of the SPA, thereby reducing potential impacts related to the amount of project-generated traffic and air quality emissions (see Exhibit 2-12 in Chapter 2, "Alternatives").

The number of jobs generated by Centralized Development Alternative would exceed the job projections identified in the Blueprint for the SPA. This alternative accommodates approximately 13,575 jobs, which is 6,075 more jobs than anticipated in the Blueprint, and would include 365 more jobs than the Proposed Project Alternative.

The Centralized Development Alternative would include less residential development than identified in the Blueprint for the SPA and would construct 9,026 dwelling units, which is 2,974 dwelling units less than identified in the Blueprint for the SPA and would construct 1,184 fewer dwelling units than the Proposed Project Alternative. However, this alternative would have a higher density of residential development on a smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. Overall, the average density across the residentially designated area would increase to 7.85 du/ac in the Centralized Development Alternative compared to 6.65 du/ac in the Proposed Project Alternative.

The Centralized Development Alternative fulfills the principles of smart growth identified in the Blueprint. As discussed above, this alternative would allow for a system of multimodal transportation; would provide a variety of mixed-use areas and a range of housing choices; and would emphasize compact development, quality design, and natural resource conservation. Smart growth principles suggest that developing the site with a higher density, centralized land use pattern would focus market demand for development into an area near existing development, infrastructure, and services. Although the project would include less residential development than identified in the Blueprint for the SPA, a higher density of residential development would be located within central portion of the SPA, thereby reducing potential impacts related to the amount of project-generated traffic and air quality emissions. (See "A" or "Land" Sections of this EIR/EIS for an evaluation of the physical impacts on the environment associated with development of the proposed project.) In summary, the Centralized Development Alternative would be **consistent** with the SACOG Sacramento Region Preferred Blueprint Scenario. ***[Similar]***

RHD

The types of land uses under the Reduced Hillside Development Alternative would be the same as those under the Proposed Project Alternative. However, project components would be reconfigured under the Reduced Hillside Development Alternative to avoid and/or reduce impacts on USACE jurisdictional wetlands, high-quality biological habitat, cultural resources, and visual resources. A higher density of residential development would be located within the central portion of the SPA, thereby reducing potential impacts related to the amount of project-generated traffic and air quality emissions (see Exhibit 2-14 in Chapter 2, "Alternatives").

The number of jobs generated by Reduced Hillside Development Alternative would exceed the job projections identified in the Blueprint for the SPA. This alternative accommodates approximately 14,180 jobs, which is 6,680 more jobs than anticipated in the Blueprint, and would include 970 more jobs than the Proposed Project Alternative.

The Reduced Hillside Development Alternative would have a greater density of residential development than identified in the Blueprint for the SPA. This alternative would construct 11,553 dwelling units, which is 447 fewer dwelling units than identified in the Blueprint, and would construct 1,343 more dwelling units than the Proposed Project Alternative. This alternative envisions a higher density of residential development on a slightly smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. Overall, the average density across the residentially designated area would increase to 7.84 du/ac under the Reduced Hillside Development Alternative compared to 6.65 du/ac under the Proposed Project Alternative.

Although the Reduced Hillside Development Alternative would include a greater density of residential development and exceed the jobs projections identified in the Blueprint for the SPA, the Reduced Hillside Development Alternative fulfills the principles of smart growth identified in the Blueprint. As discussed above, this alternative would allow for a system of multimodal transportation; would provide a variety of mixed-use areas and a greater range of housing choices based on its larger number of units; and would emphasize compact development, quality design, and natural resource conservation.

Smart growth principles suggest that developing the site with a higher density, centralized land use pattern would focus market demand for development into an area near existing development, infrastructure, and services. A higher density of residential development would be located within central portion of the SPA, thereby reducing potential impacts related to the amount of project-generated traffic and air quality emissions. (See "A" or "Land" Sections of this EIR/EIS for an evaluation of the physical impacts on the environment associated with development of the proposed project.) In summary, the Reduced Hillside Development Alternative would be **consistent** with the SACOG Sacramento Region Preferred Blueprint Scenario. ***[Lesser]***

Off-Site Elements

Construction of the off-site U.S. 50 highway interchange improvements, the sewer force main, the detention basin, and the two roadway connections from the Folsom Heights property into El Dorado Hills would not involve construction of new housing or development of new businesses; therefore, implementing the off-site elements would not result in land uses that would conflict with the SACOG Sacramento Region Blueprint. **No inconsistency** with SACOG Sacramento Region Preferred Blueprint Scenario would result from construction of the off-site elements under the Proposed Project or the other four action alternatives under consideration. ***[Similar]***

IMPACT 3A.10-3 Cancellation of Existing On-Site Williamson Act Contracts. *Project implementation could result in the cancellation of Williamson Act contracts.*

On-Site Elements

NP

Under the No Project Alternative, up to 44 rural residences could be developed under the existing Sacramento County AG-80 zoning, and no off-site water facilities would be constructed. Development under this land use designation and zoning would not result in cancellation of existing Williamson Act contracts; therefore, **no direct** or **indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

As shown in Table 3A.10-1 and Exhibit 3A.10-1, approximately 1,530 acres of the SPA consist of agricultural lands under existing Williamson Act contracts. Notices of nonrenewal were filed on these parcels in 2004 and 2006; as a result, these existing contracts will expire in 2014 and 2016, respectively. Project implementation would require the cancellation of one or more of these Williamson Act contracts before their expiration date because the proposed land uses would not be permitted under the existing contracts.

Because the timing of the development of particular phases of the SPA is unknown at this time (see Section 2.3.1 in Chapter 2, "Alternatives," for a discussion of project phasing), future Williamson Act cancellation requests would be submitted on an as-needed basis, in conjunction with tentative map or other entitlement actions. The project applicant(s) for development of parcels under Williamson Act contract would need to apply to the City of Folsom for contract cancellation; as a result, the actual determination of consistency with the statutory consistency requirements would be made by the Folsom City Council, as it would succeed to the contracts upon annexation of the SPA. The City would be required to make findings supporting the cancellation of all Williamson Act contracts pursuant to California Government Code Section 51282 by determining if the cancellation is consistent with the purpose of the California Land Conservation Act or the cancellation is in the public interest (as discussed in detail in the "Regulatory Framework" section above). As a result, this **direct** impact is considered **significant**. The **indirect** impact that removing the impediment of Williamson Act contracts for urban development could result in the cancellation of additional Williamson Act contracts on lands near the SPA south of White Rock Road is evaluated in Impact 3A.10-3 below and EIR/EIS Sections 4.1, "Cumulative Impacts," and 4.2, "Growth-Inducing Impacts," of Chapter 4, "Other Statutory Requirements." ***[Similar]***

Mitigation Measure: No feasible mitigation measures are available.

Off-Site Elements

The off-site U.S. 50 interchange improvements, sewer force main, detention basin, and the two roadway connections from the Folsom Heights property into El Dorado Hills would not be located on parcels identified as being held under Williamson Act contracts. Therefore, implementing the off-site elements would not result in cancellation of Williamson Act contracts and this **direct** impact is considered **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would likely result in the cancellation of one or more of the existing Williamson Act contracts prior to their expiration dates in 2014 and 2016 to accommodate the project development. Feasible mitigation measures, such as participation in an agricultural conservation easement, are not available to reduce impacts associated with the cancellation of these Williamson Act contracts to a less-than-significant level because no such programs are available. Therefore, this impact remains **significant and unavoidable**.

IMPACT 3A.10-4 Potential Conflict with Existing Off-Site Williamson Act Contracts. *Project implementation could conflict with lands under Williamson Act contracts south of the SPA; thereby potentially resulting in cancellation of those contracts.*

On-Site Elements

NP

The No Project Alternative could include development under the existing Sacramento County land use designation of General Agriculture (80 acres) and AG-80 zoning, and no off-site water facilities would be constructed. This land use designation and zoning identifies areas that are generally used for agricultural purposes and have parcels large enough to maintain economically viable farming operations. Development under this land use designation and zoning would not conflict with existing Williamson Act contracts or result in the cancellation of such contracts; therefore, **no direct** or **indirect** impacts would occur.

Land south of the SPA is characterized primarily by seasonal grazing land in an unincorporated area regulated by Sacramento County and the majority of these lands are under Williamson Act contracts. As discussed above, project implementation would require the cancellation of Williamson Act contracts because the proposed land uses would not be permitted under the existing contracts. The removal of the SPA from Williamson Act contracts for urban development may encourage the non-renewal of contracts on lands south of the SPA.

The land south of the SPA is located in a rural unincorporated portion of Sacramento County beyond the USB. The USB defines the ultimate boundary of urban development and is intended to be permanent, allowing modification only under special circumstances. These lands are not within the UPA, and it is not expected this area would receive urban levels of public infrastructure and services to support urban development. The Teichert and Walltown quarries are proposed 0.9 mile and 1.2, respectively, south of the SPA and would require cancellation of lands under Williamson Act contracts. No urban development is currently proposed south of the projects site. Nonetheless, land uses inconsistent with Williamson Act provisions and resulting in subsequent contract non-renewals could occur through requests for general plan amendments and rezoning of these lands. Project implementation could conflict with existing Williamson Act contracts or result in the cancellation of such contracts on lands south of the SPA and this **indirect** impact is considered **potentially significant**. **No direct** impacts would occur. (See also Chapter 4, "Other Statutory Requirements.") ***[Similar]***

Mitigation Measure: No feasible mitigation measures are available.

Off-Site Elements

The off-site U.S. 50 interchange improvements, the sewer force main, the detention basin in Sacramento County, and the two roadway connections into El Dorado Hills would be located on or adjacent to parcels identified as under Williamson Act contracts. Therefore, implementing the off-site elements would not conflict with existing Williamson Act contracts or result in the cancellation of such contracts. Therefore, implementing the off-site elements would not result in cancellation of Williamson Act contracts and this **indirect** impact is considered **less than significant**. **No direct** impacts would occur. (See also Chapter 4, "Other Statutory Requirements.")

Mitigation Measure: No mitigation measures are required.

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives could conflict with existing off-site Williamson Act contracts or result in the cancellation of such contracts on lands south of the SPA. No feasible mitigation measures are available to reduce impacts associated with potential conflicts or cancellation of these off-site Williamson Act contracts to a less-than-significant level. Therefore, this impact remains potentially **significant and unavoidable**.

CITY OF FOLSOM GENERAL PLAN AMENDMENT

Introduction

Implementation of the Proposed Project Alternative, Resource Impact Minimization Alternative, Centralized Development Alternative, or Reduced Hillside Development Alternative would require that the density ranges for certain Folsom General Plan land use designations be altered from the City's current ranges. Specifically, the following changes would be made:

- The density range for the Single Family (SF) designation would change from 2-4 units per acre to 1-4 units per acre, reducing the minimum density by one. This change would not change the maximum potential

number of units which could occur on Single-Family-designated land, but would allow these areas to build out at a lower density than is currently permitted.

- The density range for the Multi-family Medium Density (MMD) designation would change from 12-18 units per acre to 12–20 units per acre. This change would allow Multi-family Medium Density areas to build out at a slightly higher maximum density than is currently permitted. An additional 2 units could be constructed on each acre of Multi-family Medium Density -designated land.

- The density range for the Multi-family High Density (MHD) designation would change from 18-25 units per acre to 20-30 units per acre. For future development proposals on Multi-family High Density-designated land, the minimum permitted density would rise from 18 to 20 units per acre, while the maximum permitted density would increase to 30 units per acre. An additional 5 units could be developed on each acre of Multi-family High Density-designated land.

These amended General Plan densities would affect lands designated Single Family, Multi-family Medium Density, and Multi-family High Density throughout the existing City of Folsom, as well as the SPA. However, the majority of the land within the existing City limits is either built out, or has entitlements to build at a specified density. The change from existing conditions which would potentially occur as a result of the proposed changes would affect land which is currently undeveloped.

The changes to the Single Family density range would permit only lower-density development than is currently possible, and would not result in the potential for new population or housing units. However, the changes to the density ranges for the Multi-family Medium Density and the Multi-family High Density designations could increase the number of units and the associated population for undeveloped Multi-family Medium Density and Multi-family High Density parcels within the existing City of Folsom.

There are currently 24.2 acres of undeveloped land in the Multi-family Medium Density designation, and 88.2 acres of undeveloped land in the Multi-family High Density designation. Buildout of these areas at the proposed densities would increase the potential number of units in the Multi-family Medium Density designation by 49 units, from 435 to 484. An additional 441 units would be possible in the Multi-family High Density designation, increasing the maximum theoretical buildout from 2,205 to 2,646 units. The City of Folsom uses a factor of 1.94 persons per dwelling to estimate the population for multi-family development. Using this factor, the potential increase in units represents a potential population increase of 95 (to a total of 939 residents) for undeveloped Multi-family Medium Density-designated areas, and a potential population increase of 856 (to a total of 5,133) for undeveloped Multi-family High Density-designated areas. This would represent a total potential population increase of 951 people that was not evaluated in the existing General Plan EIR.

Evaluation of Impacts

The following sections evaluate the effects of the proposed density changes in the existing City of Folsom. Because the General Plan map for the existing City would not be changed, those impacts that are related to the geographical location of an action would be the same as those analyzed in the EIR for the City's existing General Plan. However, because the changes to the Multi-family Medium Density and Multi-family High Density density ranges have the potential to increase the number of units and, therefore, the population in the City of Folsom, impacts that are related to population or number of residential units must be reevaluated.

ISSUE AREAS WITH NO CHANGES

A number of issue areas addressed under CEQA and NEPA focus on impacts which are related to the geographic location and type of land use. These issue areas include:

- Agricultural Resources;
- Biological Resources;

- Cultural Resources;
- Geology, Soils, Minerals, and Paleontological Resources;
- Hazards and Hazardous Materials;
- Hydrology and Water Quality;
- Land Use and Planning; and
- Mineral Resources.

Because the proposed density changes would not alter the geographic location or type of land use which could occur on Multi-family Medium Density, and Multi-family High Density-designated areas, thresholds and impacts in these issue areas would not differ from those analyzed in the existing General Plan EIR.

The changes to the Single Family density range would not result in population or unit increases over the existing General Plan, and so impacts in the Single-Family–designated areas would not differ from those analyzed in the existing General Plan EIR's analysis of impacts.

EVALUATION OF GENERAL PLAN AMENDMENT

The following sections discuss the potential impacts that would occur as a result of changes to the density range in Multi-family Medium Density and Multi-family High Density-designated areas. Implementation of the proposed General Plan Amendment (GPA) would result in the potential for an additional 490 units on Multi-family Medium Density and Multi-family High Density parcels, and therefore an additional 951 residents, above and beyond what would be permitted under the existing General Plan.

Aesthetic Resources

The additional units could be constructed on infill parcels already designated for multi-family development by the City of Folsom, within the urbanized area of the City of Folsom. Although the increases in permitted density would result in more units, these increases would not be expected to substantially change the physical appearance or size of the structures that would be constructed compared to those which could be constructed under the existing General Plan. Multi-family residential units in the City of Folsom require a use permit and approval as a planned development, and the height of multifamily structures is limited to 4 stories. These standards would not change as a result of the proposed density changes included in the GPA. The Multi-family Medium Density and Multi-family High Density parcels which would be affected by the GPA are in areas characterized by urban development, and impacts related to scenic vistas, and scenic resources would be less than significant. There would be potentially significant short-term impacts on visual character during construction activities. Implementation of Mitigation Measure 3A.1-5 would reduce this impact to the extent feasible; however, the required screening of construction activity would not necessarily reduce this impact to a less-than-significant level.

In addition, the increased density of residential units could increase impacts related to creation of light and glare. This impact would be potentially significant. Implementation of Mitigation Measure 3A.1-6 would reduce this impact to the extent feasible, but this impact would remain significant and unavoidable.

Air Quality

The City of Folsom is located in the Sacramento Valley Air Basin (SVAB). The SVAB is in nonattainment status for ozone and respirable particulate matter with an aerodynamic diameter of 10 micrometers or less (PM_{10}). Construction of 490 additional units beyond those considered in the existing General Plan EIR could result in direct significant short-term construction-related air quality impacts, as well as direct significant long-term operational impacts related to increased population and number of automobile trips. No indirect impacts would occur. These increased impacts would contribute to cumulative net increases of criteria pollutants.

Implementation of Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.2-2 would reduce construction-related and operational emissions to the extent feasible, but these impacts would remain significant and unavoidable.

Many of the Multi-family Medium Density and Multi-family High Density-designated areas are located adjacent to arterial roadways. Development of multi-family housing in these areas could increase the number of sensitive receptors exposed to toxic air contaminant (TAC) emissions, resulting in a direct significant impact. No indirect impacts would occur. Implementation of Mitigation Measure 3A.2-4b would reduce this impact, but not to a less-than-significant level; therefore, this impact would remain significant and unavoidable. The GPA would only result in density changes in residential districts, not use changes, and therefore no direct or indirect impacts related to odors would occur.

Climate Change

The GPA would result in the construction of 490 additional residential units beyond those considered in the existing General Plan EIR. As noted below under "Transportation and Traffic," the traffic analysis for the project includes the additional units that would result from adoption of the GPA. These additional residential units represent approximately 951 more residents than under the existing General Plan who would be living in relatively higher-density environments within close proximity to existing services in the City of Folsom. To the extent that these additional units would accommodate regional growth at higher densities near existing centers, the proposed GPA would represent policy action to reduce greenhouse gas emissions. However, additional units would increase GHG emissions over current emissions, contributing to a cumulatively significant impact. Implementation of Mitigation Measures 3A.2-1a, 3A.2-1b, 3A.4-1, and 3A.4-2 would reduce construction-related emissions and operational emissions associated with the GPA to the extent feasible, but the contribution to a significant cumulative impact would remain significant and unavoidable.

Noise

The proposed GPA could result in construction of an additional 490 units beyond those analyzed in the existing General Plan EIR. These new units would result in increased traffic volumes, potentially increasing traffic-related noise impacts (increased traffic which would be generated by the GPA is incorporated into the 2030 traffic scenario analyzed for the project, and therefore traffic related noise impacts are analyzed in Section 3A.11, "Noise – Land"). These units would also be predominantly located along high-traffic roadways, potentially increasing the number of residents exposed to excess noise and resulting in a direct potentially significant impact. No indirect impacts would occur. Implementation of mitigation measures described in Section 3A.11, "Noise – Land," would reduce these impacts, but, as with impacts related to land use changes in the SPA, not to a less-than-significant level. Therefore, this impact would be significant and unavoidable.

Population and Housing

The proposed GPA could result in the construction of an additional 490 units that were not planned for under the existing General Plan. Construction of these additional units would result in a population increase of about 951 additional residents within the City of Folsom beyond the totals forecast in the existing General Plan and EIR. However, the City's 2009 Housing Element forecasts an increase of 32,179 residents between 2008 and 2030. This projected increase is greater than the increase that would result from the GPA and the construction of any of the land use alternatives described in this EIR/EIS. This impact would be less than significant. The indirect physical impacts of increased population are evaluated throughout this section. Because these increased units would be constructed on currently vacant or undeveloped parcels, the GPA would not directly or indirectly displace existing housing or residents. Therefore, there would be no direct or indirect impact related to displacement of housing or residents.

Public Services

For a discussion of public service providers and standards in the City of Folsom, please refer to Section 3A.14, "Public Services - Land." The Folsom Fire Department goal is 1.6 firefighters per 1,000 residents, and there are currently not sufficient firefighters to attain this goal with the existing population. Although any new units constructed under the GPA would be required to pay fire impact fees, the addition of 951 residents beyond those considered in the existing General Plan EIR would increase demand for fire services within the City of Folsom. Construction of additional units would also potentially increase demand for fire flow over existing conditions. Police response times in the City of Folsom do not meet the Police Department's standards, and the addition of new residents would potentially increase the demand for police services in the City of Folsom. These direct impacts would be potentially significant. No indirect impacts would occur. Implementation of existing City regulations and Mitigation Measures 3A.14-1 and 3A.14-2 would reduce these impacts to a less-than-significant level. The addition of 49 new Multi-family Medium Density units and 441 new Multi-family High Density units would generate 89 new students based on the Folsom Cordova Unified School District's student generation rates for Multi-family Medium Density (0.36 students per unit) and Multi-family High Density (0.16 students per unit). Under California law, payment of school impact fees, which is already required as a condition of approval in the City, is considered adequate mitigation for increased demand for schools, so this impact would be less than significant.

Recreation

The proposed GPA would result in an additional 951 residents in the City of Folsom beyond those envisioned in the existing Parks and Recreation Master Plan. the City's standard for adequate parkland is 5 acres per 1,000 residents. The City's ratio of park acreage per 1,000 residents is currently approximately 5.3; addition of these residents not accounted for in existing park planning would reduce the ratio to about 5.2. Therefore, because the proposed GPA would not reduce the City's ratio of park acreage below the City standard, there would no direct impacts related to provision of parkland. The proposed GPA would not increase the use of existing park facilities beyond acceptable standards in a manner that would cause substantial deterioration of existing facilities. Therefore, this indirect impact would be less than significant.

Traffic and Transportation

The 2030 traffic forecasts used in this EIR/EIS assume that all vacant parcels in the City would build out at the maximum permissible densities after implementation of the GPA (20 units per acre maximum in Multi-family Medium Density areas, and 30 units per acre maximum in Multi-family High Density areas). At these maximum densities, the change would increase the number of peak hour vehicle trips generated within the City by about 294 trips over conditions without the GPA. The Multi-family Medium Density and Multi-family High Density parcels are scattered around the City, with an increase of about 65 peak hour trips or less from any one parcel over conditions without the GPA. Under Cumulative No Project conditions, some intersections within the City would operate at unacceptable conditions (i.e. LOS D or worse). If vacant Multi-family Medium Density and Multi-family High Density parcels were developed to the currently permissible maximum densities (17.9 units per acre in Multi-family Medium Density and 25 units per acre in Multi-family High Density), the decrease in peak hour traffic volume at any intersection within the City compared to the analyzed total would be small and would not appreciably change intersection levels of service compared to the Cumulative No Project conditions. Traffic impacts of the GPA are included in the analysis contained in Section 3A.15, "Traffic and Transportation – Land." This analysis identified several significant impacts, and imposes mitigation measures to reduce impacts related to the GPA to the extent feasible. Therefore, no further mitigation is required beyond the mitigation measures already outlined in Section 3A.15, "Traffic and Transportation - Land". However, implementation of the GPA would contribute to the significant and unavoidable traffic and transportation impacts identified in Section 3A.15.

Utilities, Service Systems, and Water Supply

Section 3B.16, "Public Utilities and Services - Water," provides background on water demand within the City of Folsom. Demand in the City is projected to decrease in coming years as construction activity declines. All additional units would be required to document the availability of sufficient water supplies as part of individual project review by the City of Folsom. The City's 2005 UWMP estimates that at buildout under the current General Plan, with an average density of 13.595 units per acre in multi-family areas, water demand would exceed supply in single dry years. Construction of an additional 490 units beyond those planned for in the current General Plan and UWMP would result in potentially significant impacts related to water supply.

Section 3A.16, "Utilities and Service Systems - Land," provides background information on other utility providers within the City of Folsom. The construction of 490 additional units beyond those analyzed in the existing General Plan EIR could potentially result in wastewater flows that would exceed local collection and conveyance capacity within the existing City boundary, which would be a direct significant impact. No indirect impacts would occur. Implementation of Mitigation Measures 3A.16-1 and 3A.16-3 would require individual projects approved in GPA areas to provide proof of capacity for service prior to City approval of tentative subdivision maps or improvement plans. Therefore, implementation of these mitigation measures would reduce this impact to a less-than-significant level. Based on the data regarding treatment and conveyance capacity presented in Section 3A.16, "Utilities and Service Systems - Land," SRCSD would have treatment and conveyance capacity for the 490 additional units; therefore, direct impacts related to treatment and conveyance capacity outside the City boundary would be less than significant. No indirect impacts would occur. Although demand for solid waste, electricity, natural gas, telecommunications, and cable infrastructure would increase, existing capacity could accommodate the increased units in the existing city (please refer to Section 3A.16, "Utilities and Service Systems– Land" for a discussion of utility capacity in Folsom). Therefore, direct impacts related to demand for solid waste, electricity, natural gas, telecommunications, and cable infrastructure would be less than significant. No indirect impacts would occur.

Growth-Inducing Impacts (Folsom General Plan Amendment)

The GPA could result in the construction of up to 490 additional units (which could result in up to 951 new City residents) that are not accounted for in the existing Folsom General Plan's growth projections. This development would occur at relatively higher densities (multi-family) compared to the typical development pattern in the Sacramento Region, and would place more residents in infill locations, in closer proximity to more services, generally aligning with the principles of the SACOG Blueprint.

No infrastructure or public services improvements are proposed as part of the GPA; to the extent that specific individual developments which might occur under the GPA would require improvements, the potential growth implications of these improvements would be identified and analyzed at a project level; insufficient data concerning the potential location and capacity of any improvements makes such an evaluation speculative at a program level.

Folsom and the Sacramento region are slightly job-rich relative to the population. The GPA could result in the construction of residential units; no job-generating uses are envisioned as part of the GPA. These units would likely have a relatively small effect on the overall jobs-housing balance, but construction of additional units would bring the City and the region slightly closer to a balance between jobs and housing. Based on its effects with respect to development density and location, utilities and services, and jobs-housing balance, the GPA would not be expected to have significant growth-inducing impacts.

3A.10.4 RESIDUAL SIGNIFICANT IMPACTS

No feasible mitigation measures are available to reduce the conflict between the No USACE Permit and Resource Impact Minimization Alternatives and the SACOG Preferred Blueprint Scenario to a less-than-significant level.

The City would determine whether conflicts between the project and the SACOG Preferred Blueprint Scenario would translate into potentially significant environmental impacts. In determining whether any particular conflict translates into such an effect, the City would carefully consider whether implementation of the No USACE Permit and Resource Impact Minimization Alternatives, compared with implementation of a Blueprint-based plan, would yield either a lost opportunity to accomplish a long-term environmental benefit, or a lost opportunity to minimize a long-term environmental impact For these reasons, this impact must be assumed to remain **significant and unavoidable**. Impacts related to the consistency of the No Project, Centralized Development, and Reduced Hillside Development Alternatives with the SACOG Preferred Blueprint Scenario would be less than significant; therefore, no residual significant impacts would result from implementation of these action alternatives.

Impacts related to the cancellation of existing on-site Williamson Act contracts to accommodate the project development would be **significant and unavoidable** and no feasible mitigation measures are available to reduce impacts to a less-than-significant level. In addition, project implementation could conflict with existing off-site Williamson Act contracts or result in the cancellation of such contracts on lands south of the SPA and no feasible mitigation measures are available to reduce this impact to a less-than-significant level.

Several impacts of the GPA would remain **significant and unavoidable** after implementation of all feasible mitigation, including aesthetics, air quality, climate change, noise, population and housing, and traffic.

This section was prepared by RMC Water and Environment.

3B.10 LAND USE AND AGRICULTURAL RESOURCES – WATER

3B.10.1 AFFECTED ENVIRONMENT

The Off-site "Water" Study Area includes a large portion of Sacramento County, stretching from the Natomas basin, north of the City of Sacramento, to eastern Sacramento County, south of U.S. 50 and the City of Folsom. As provided in Chapter 2, "Alternatives," the Off-site" Water" Study Area is divided into four zones, which include the (1) NCMWC's service area, (2) Sacramento River, (3) Freeport Project, and (4) alternative conveyance alignments or physical improvements. The Sacramento River is described in extensive detail in Section 3B.9, "Hydrology and Water Quality – Water." A description of the Freeport Project and how it relates to the Off-site Water Facilities is provided in Chapter 1, "Introduction," and Chapter 2, "Alternatives." Extensive detail regarding existing land use within Zone 3 is provided in the Freeport Regional Water Project EIR/EIS, which is incorporated by reference. Based on these considerations, the land use and planning description for the affected environment is focused to Zone 4 of the "Water" Study Area where physical improvements are proposed as part of the Off-site Water Facilities Alternatives, in east-central Sacramento County. Additionally, a general description of land use patterns within Zone 1 of the "Water" Study Area is provided to establish the necessary context for potential indirect impacts to irrigated agriculture within the Natomas Basin.

EXISTING LAND USES

The physical environment of the "Water" Study Area is suited for a broad range of land uses. Land use within NCMWC's service area largely consists of irrigated agriculture, with the exception of the southern portion, which is currently urbanizing from northern Sacramento and to the Sacramento/Sutter County line. This trend is expected to continue over the next 20-years with new growth planned within the Natomas Vision Area in the southern portion of NCMWC's service area and the planned Sutter Pointe Specific Plan development in north of the Sacramento/Sutter County line.

Land uses within eastern Sacramento County, in the vicinity of Zone 4 of the "Water" Study Area, are characterized by a similar transition to urbanized land uses with growth extending to the east from the City of Rancho Cordova and south from the City of Folsom. Unlike the Natomas basin, agricultural uses in eastern Sacramento County largely consist of grazing mixed with large surface mining operations. These two portions of the "Water" Study Area are described in more detail below.

Eastern Sacramento County – Zone 4 of the "Water" Study Area

A description of existing land uses are provided for each Off-site "Water" Alternative below. Where alternatives overlap, this fact is noted.

Off-site Water Facility Alternatives 1 and 1A

As described and illustrated in Chapter 2, "Alternatives," the water conveyance facilities would extend from the Freeport bifurcation at Vineyard and Gerber Roads and extend cross-county to the FSC, west of the intersection of Grant Line Road and Sunrise Boulevard, and then north along Grant Line Road and White Rock Road. Under these alternatives, the initial segment of the conveyance alignment and pump station would be constructed within an agricultural-residential area that extends along Gerber Road and east to the FSC. The Wild Hawk Golf Course is located immediately south of the bifurcation, near the intersection of Vineyard Road and Gerber. Several residences are also located north of the golf course and further east along Gerber Road. Agricultural-residential uses continue to the east along Gerber Road and past its current terminus to the FSC.

From the FSC, the conveyance alternatives would extend north and northeast along Grant Line Road and past the Kiefer Landfill, which is situated approximately 1/2 mile east of the roadway at Kiefer Boulevard. Grant Line Road currently delineates the eastern extent of urban growth planned within the eastern portion of the County; however, currently, much of the land base is currently used for grazing. Although, new residential and commercial uses are developing along Douglas Road, west of Grant Line Road, the extension of these uses to Grant Line Road is not expected for several years. Additionally, several large existing and proposed aggregate mining operations are located along Grant Line Road, both to the east and west of the roadway. Several OHV recreation areas are also located along White Rock Road, to the south and west of the proposed White Rock WTP. Exhibit 3B.10-1 illustrates the White Rock WTP site, surrounding uses, and current County General Plan land use designations.

Off-site Water Facility Alternatives 2, 2A, and 2B

These alternatives would originate at the Vineyard SWTP or North Douglas Water Tanks and extend to the Folsom SPA. The new pump facilities would be constructed at the Vineyard SWTP, which is currently under construction, or the North Douglas Water Tanks. Off-site Water Facility Alternative 2 could potentially include improvements along Florin and Eagles Nest Roads, which include scattered agricultural-residences, small farming operations, and livestock grazing. A large nursery is also located along Florin Road, between Excelsior and Eagles Nest Roads.

As described in Chapter 2, "Alternatives," Off-site Water Facility Alternative 2 would follow Eagles Nest Road north to Douglas Road. Eagles Nest Road, north of Florin Road is characterized as a rural roadway with only a few agricultural residences located in areas just north of Florin Road. Eagles Nest Road transitions into an unpaved roadway. The Off-site Water Facility Alternative 2 alignment transitions along a paved roadway through the Mather Regional Park and adjacent to the Mather Golf Course.

In contrast to Off-site Water Facility Alternative 2, Off-site Water Facility Alternative 2A would deviate from Florin Road and travel north along Excelsior and Mather Field Roads north to Douglas Road. The southern section of this alignment is very similar to Off-site Water Facility Alternative 2 in terms of existing land uses. This alignment would border the western edge of Mather Regional Park and the Sacramento Raceway Motorsports Park before entering Eastridge Estates. Eastridge Estates consists of low-density, single-family residential subdivisions with Veterans Park situated near its geographic center. At the intersection with Douglas Road, the alignment is within 1/4 mile of Mather Airport.

Once at Douglas Road, Off-site Water Facility Alternatives 2 and 2A would cross the FSC and Sunrise Boulevard and extend east to Grant Line Road. East of Sunrise Boulevard, single-family residential communities are developing immediately south of Douglas Road within the Sunrise-Douglas Community Plan Area. Although areas north of Douglas Road are planned for eventual development, these areas are still relatively undeveloped and used primarily for grazing. The Sunrise-Douglas Community Plan area includes the conceptual development plan for approximately 6,015 acres north and south of Douglas Road, west of Grant Line Road, and corresponds with the southeastern portion of the City of Rancho Cordova.

Off-site Water Facility Alternative 2B would join the Off-site Water Facility Alternative 2 alignment at the intersection of Ivan Way and Douglas Road and, once at Grant Line Road, would follow the same route as described for Off-site Water Facility Alternative 1. Uses along Ivan Way include new low-density residential areas to the west within the North Douglas Community Plan and agricultural grazing lands to the east.

Existing General Plan Land Use Designations for the White Rock and Folsom Boulevard WTP Sites

Exhibit 3B.10-1

Off-site Water Facility Alternatives 3 and 3A

Under Off-site Water Facility Alternatives 3 and 3A, the raw-water conveyance alignments would generally follow the same alignments as described for Off-site Water Facility Alternatives 2 and 2A, respectively. The main difference in these two alternatives is that these alignments would extend from the Freeport bifurcation as opposed to the Vineyard SWTP to the White Rock WTP site, thereby adding additional roadway along Vineyard and Florin Roads. Exhibit 3B.10-1 illustrates the White Rock WTP site, surrounding uses, and current Sacramento County General Plan land use designations. Uses along the additional length of roadway are similar to that previously described with agricultural-residential situated on large lots, generally greater than 10 acres. In addition, a series of waste lagoons are located immediately south of Florin Road and the Vineyard SWTP.

Off-site Water Facility Alternatives 4 and 4A

As described in Chapter 2, "Alternatives," these alternatives would follow the same respective alignments as Off-site Water Facility Alternatives 3 and 3A up to Douglas Road and just east of Sunrise Boulevard. These alternatives would then deviate from Douglas Road and follow Sunrise Boulevard north for a short distance before deviating from the roadway, just south of Mechanical Drive. The alignment would then travel north through undeveloped property along the western perimeter of the planned Rio del Oro Specific Plan area. Numerous commercial and light and heavy industrial uses are situated just west of the alignment along Luyung Drive. In the future, uses proposed within the Rio del Oro Specific Plan area along the conveyance alignment include a mix of commercial and industrial land uses.

North of White Rock Road, the conveyance alignment would follow the planned Rancho Cordova Parkway, which is planned for construction in conjunction with new development proposed within the City of Rancho Cordova's Westborough Planning Area. This area is planned for residential, commercial, and office uses similar to the proposed Glenborough at Easton community. The Westborough Planning areas currently consist of open space and are lined with remnant dredge tailings, which are characteristic of the Aerojet property, including Rio del Oro.

The Folsom Boulevard WTP site location is located at the northern edge and adjacent to the Westborough Planning Area and just south of Folsom Boulevard and the FSC. Existing land uses along Folsom Boulevard near the WTP site include commercial and industrial uses. Multifamily residential uses are located further east along Folsom Boulevard and south of U.S. 50. Land uses south of Folsom Boulevard include the Aerojet industrial facilities, the Hazel Avenue Light Rail Station and parking lot, and the Folsom Auto Mall. Lands to the east are undeveloped and currently used for seasonal grazing. These lands also include open space resources such as Alder Creek and several other drainages, stock ponds, wetland and riparian habitat, and oak woodland. Exhibit 3B.10-1 illustrates the Folsom Boulevard WTP site, surrounding uses, and current Sacramento County General Plan land use designations.

Natomas Central Mutual Water Company Service Area – Zone 1 of the "Water" Study Area

The NCMWC service area is located in northern Sacramento County and southern Sutter County and encompasses approximately 33,000 acres. Land use within the NCMWC's service area is primarily agricultural, although northern portions of the City of Sacramento are located within the extreme southern portion of the NCMWC's service area. Land uses associated with these populated areas include residential, industrial, and commercial.

In addition to growth pressures from the south, the proposed Sutter Pointe Specific Plan area within southern Sutter County the Sutter/Sacramento County line consists of 7,500 acres planned for various forms of development. Current land uses include agricultural and industrial uses, primarily rice fields, but also the 50-acre Sysco Corporation warehousing and distribution center and the Holt Tractor Manufacturing facility. Other existing and planned developments within and/or adjacent to NCMWC's service area include Sacramento International Airport expansion projects and Metro Air Park, Placer Vineyards Specific Plan, the Rio Linda/

Elverta Community Plan, Natomas Vision development area, and The Natomas Basin Conservancy Mitigation Lands, which are managed in conjunction with the Natomas Basin Habitat Conservation Plan (City of Sacramento 2003).

EXISTING AGRICULTURAL RESOURCES

Much of the land base within Sacramento County was, at one time, considered highly productive farmland. Existing agricultural land uses within the eastern portion of the "Water" Study Area, roughly corresponding with Zone 4, include large-scale dry-land farming, animal husbandry, small-scale agricultural-residential uses, and small-scale irrigated farming operations in areas north of Jackson Highway/SR 16, west of Grant Line Road, and south of Douglas Road along Sunrise Boulevard. Areas west of Sunrise Road and north of Jackson Highway/ SR 16 consist of rangeland and dry-land farming. East of Sunrise Boulevard, existing agricultural operations include sheep and cattle range grazing, and large fields of clover, alfalfa, wheat, and oats. Operations north of Douglas Road include a small-scale cherry orchard and livestock grazing.

Natomas Central Mutual Water Company – Zone 1 of the "Water" Study Area

The NCMWC service area is located in northern Sacramento County and southern Sutter County and encompasses approximately 33,000 acres. Agricultural land uses dominate within NCMWC's service area, although urban uses within northern portions of the City of Sacramento are encroaching into the southern portion of NCMWC's service area. Portions of NCMWC's service area are planned to continue undergoing this transition in land use as urban development expands from the south and new development becomes established in south Sutter County. This transition is already occurring and is reflected in Table 3B.10-1 by the change in total crop acreages for 2004 and 2007. Notwithstanding this recent reduction, large portions of the NCMWC's service area will remain in agriculture or open space corresponding to provisions of the Natomas Basin Habitat Conservation Plan and the current update (City of Sacramento 2003).

Table 3B.10-1
Natomas Central Mutual Water Company 2004 and 2007 Crop Acreages

Crop Type	2004	2007
Alfalfa	0	741
Clover	181	0
Corn	422	648
Golf Course	90	120
Grain	40	227
Grass/Hay	0	195
Kiwis	3	3
Managed Marsh	433	439
Melons, Squash	95	75

Agricultural Production and Revenues

In 2007, agricultural production within Sacramento County earned approximately $364.8 million for the State of California's economy (Sacramento County 2007b). Grapes and wine were the top commodities in Sacramento County producing $74.15 million in 2007. Milk and Nursery Stock were the next two largest commodities generating $66.1 and $37.7 million, respectively for Sacramento County (Sacramento County 2007b).

Farmland Quality

Prime farmland, as defined by the U.S. Department of Agriculture (USDA), is farmland characterized by the best combination of physical and chemical features enabling it to sustain long-term agricultural production (FMMP 2006). Farmland of Statewide Importance includes lands that are nearly prime farmland and may produce as high a yield as prime farmland when treated and managed according to acceptable farming methods. Some lands in this category may include those that are set aside by state law for agricultural purposes.

To assess the quality of the "Water" Study Area for agricultural cultivation, the City reviewed Important Farmland maps produced by the California Department of Conservation's (DOC's) Farmland Mapping and Monitoring Program (FMMP). The 2006 important farmland maps for Sacramento County indicate that portion of Zone 4 of the "Water" Study Area, or areas east of Excelsior Road are mainly classified as grazing land or other with small, isolated areas of Farmland of Local and Statewide Importance. These classifications differ substantially from those within Zone 1 of the "Water" Study Area, or the NCMWC's service area, which is generally classified as Prime Farmland or Farmland of Statewide Importance. Through 2006, Sacramento County contained approximately 19,597 acres of Prime Farmland, 9065 acres of Farmland of Statewide Importance, and approximately 464.5 acres of Unique Farmland (FMMP 2006).

Table B3.10-2 provides a summary of agricultural land within Sacramento County converted to nonagricultural uses during the time frame from 2004 to 2006.

Table 3B.10-2
Farmland Conversion from 2004–2006 in Sacramento County

Land Use Category	Total Acres Inventoried		2004–2006 Acreage Changes		
	2004	2006	Acres Lost	Acres Gained	Net Change
Prime Farmland	110,278	106,667	3,813	202	-3,611
Farmland of Statewide Importance	56,141	51,217	5,180	256	-4,924
Unique Farmland	15,187	15,268	402	483	81
Farmland of Local Importance	39,873	41,961	3,854	5,942	2,088
Important Farmland Subtotal	**221,479**	**215,113**	**13,249**	**6,883**	**-6,366**
Grazing Land	163,175	156,977	6,694	496	-6,198
Agricultural Land Subtotal	**384,654**	**372,090**	**19,943**	**7,379**	**-12,564**
Urban/Built Land	165,630	175,523	60	9,953	9,893
Other	67,548	70,242	5,536	8,230	2,694
Water	18,253	18,230	32	9	-23
Total Area Inventoried	**636,085**	**636,085**	**25,571**	**25,571**	**0**

Note: *During the period of 2004–2006 Sacramento County experienced a 9,893-acre net increase in Urban and Built-Up Land.
Source: California Department of Conservation, Division of Land Resource Protection 2006, (Table A-24)

Soil Suitability

The suitability of the local soil resource plays a crucial part in the determination of a plot's farmland designation. The land capability classification system developed by the USDA, Natural Resource Conservation Service (NRCS), rates each of the soil types within the County in relation to its limitations for crop management. A soil rated as Class I is considered to have few limitations whereas a soil rated as Class VIII could have severe limitations that, in many circumstances, would preclude it from commercial crop production. Generally, areas contained within Zone 4 of the Off-site Water Facilities Study Area are characterized by soils rated from Class IV to VII. In contrast, soils within the Natomas Basin are rated I to III, with soil wetness or shallow groundwater during winter months being the primary limitation to crop production.

3B.10.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no Federal plans, policies, regulations, or laws related to land use planning that are applicable to the Off-site Water Facility Alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following state plans, policies, regulations, and laws related to land use and planning are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.10, "Land Use and Agricultural Resources – Land:"

- State Planning Law, California Government Code Section 65300 et seq.
- State Zoning Laws, California Government Code Section 65800 et seq.
- Local Agency Formation Commissions, Cortese-Knox-Hertzberg Local Government Reorganization Act
- California Important Farmland Inventory System and Farmland Mapping and Monitoring Program
- California Land Conservation Act of 1965

Williamson Act

According to the maps prepared by the DOC, multiple properties within Sacramento and Sutter County portions of NCMWC's service area are under the provisions of an existing Williamson Act contract. Within Sacramento County, the remaining contracted lands within NCMWC's service area are generally limited to lands along and immediately south of the Sacramento/Sutter County line (DOC 2008). A large block of these properties are identified as land in non-renewal status east of SR 99.

The White Rock WTP site is currently under the provisions of a Williamson Act contract. According the Sacramento County Assessor's Office, a non-renewal notice was filed for this property in 2008 (Sacramento County Assessor 2010).

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following state plans, policies, regulations, and laws related to land use and planning are relevant to the Off-site Water Facilities, and are described in detail in Section 3A.10, "Land Use and Agricultural Resources – Land:"

- Sacramento Area Council of Governments' Sacramento Region Blueprint
- Memorandum of Understanding between Sacramento County and the City of Folsom
- Sacramento Local Agency Formation Commission and Resolution No. LAFC 1196
- Measure W
- Sacramento County Urban Service Boundary and Urban Policy Area

- Sacramento County General Plan Land Use Element and General Plan Designations; see Table 3.10A-2

Sacramento County General Plan – Land Use Element

The Sacramento County General Plan Land Use Element (Sacramento County 1993) identifies two basic types of land use designations: urban and rural, both of which are present in the "Water" Study Area. Urban designations are those planned for urban use during the time horizon of the General Plan (a 20-year plan), while rural designations are outside the area planned for urban uses during the time horizon of the General Plan.

A major emphasis of the General Plan Land Use Element is to achieve compact growth patterns that make the most efficient use of County lands. The current and past status quo of land development has created "low-density, auto-dependent land use patterns," causing unnecessary loss of "open space, deteriorating air quality, decrease in housing affordability, degradation of public facilities, and increase in traffic congestion" (Sacramento County 1993). In order to ensure a more efficient use of land in the future, the General Plan establishes a specific area where growth will occur, the Urban Policy Area (UPA), within a larger ultimate growth area delineated by an Urban Services Boundary (USB). As shown in Exhibit 3B.10-1, the proposed Folsom SPA and White Rock WTP site are located outside the USB, however, much of the remaining portions of the "Water" Study Area are located within the USB.

The General Plan includes the County's policies for the use of public and private land. These policies cover a range of land use planning issues and are intended to guide County decision-making for land use in the County. Many of the General Plan policies relate to environmental issues and are intended to avoid or mitigate environmental effects.

The land use designation for the White Rock WTP is General Agriculture (80 acres) and zoned AG-80; see Exhibit 3B.10-1. Areas to the south and north are both currently zoned AG-80 with a Resource Conservation [AG-80(RC)] combining district. The General Agriculture designation identifies land that is generally used for agricultural purposes, but is less suited for intensive agricultural than the Agricultural Cropland land use designation. The minimum lot size allowed is 80 acres, which is large enough to maintain an economically viable farming operation. Typical farming activities include dry land grain, and irrigated and dry land pasture. Constraints found in areas with this designation include shallow soils, uncertain water supply, moderate slopes, fair to poor crop yield, and farm unit fragmentation. Only agricultural production is permitted in areas with this designation. The General Agriculture/80 acre designation allows single-family dwelling units at a density no greater than 80 acres per unit (Sacramento County 1993).

Lands within the Folsom Boulevard WTP site and adjacent areas are designated Industrial Extensive under the County General Plan (see Exhibit 3B.10-1). This land use designation allows activities that require large areas of land and do not require urban levels of services. Extensive Industrial areas are not located within the urban portion of the County and do not require public infrastructure and services. Further, the General Plan indicates that urbanized levels of service will not be extended to these areas during the current planning period. Floor Area Ratios range from 0.15 to 0.40. (Sacramento County 1993).

Sacramento County General Plan Update

Sacramento County is preparing the first comprehensive update of its General Plan since it was adopted in 1993. This update is necessary to plan for growth in the County's next planning cycle (2005–2030) and to address new emerging planning issues.

A public review draft of the Land Use Element for the General Plan Update was published on May 30, 2007, and includes strategies that would accommodate the County's growth allocation defined in SACOG's adopted Sacramento Region Blueprint (Sacramento County 2007a, SACOG 2004). SACOG's Blueprint allocates 99,700 new residential units for the unincorporated County through 2030. Because this allocation exceeds the current residential holding capacity of the county's UPA, the draft General Plan Update includes management strategies

to accommodate this growth. One strategy includes establishment of new growth areas that would include new mixed use communities, in currently undeveloped portions of the "Water" Study Area within Zone 4 (Sacramento County 2007a).

The Sacramento County General Plan provides for growth and development in the unincorporated area through the year 2010. At the time of this EIR/EIS's preparation, the County remains in the process of updating the current General Plan, which was adopted in 1993. Part of the overall goal of the Sacramento County General Plan is the maintenance of the County's agricultural lands and their agricultural productivity. Sacramento County has recognized the importance of agricultural issues and continues to promote the following general goals (Sacramento County 1993):

GOAL: Maintenance of the County's agricultural lands, their agricultural productivity and natural resource benefits they provide; and

GOAL: Maintenance of farming and related industries as a strong and viable sector of the economy of a rapidly urbanizing County.

In addition to the above goals, the County has established the following objectives and policies to manage agricultural land. Those policies and objectives that are applicable to this project are as follows:

Urban Encroachment Objective. Prime Farmlands as defined by the California Department of Conservation, and lands with intensive agricultural investments, such as orchards, vineyards, dairies, and other concentrated livestock or poultry operations, should be protected from urban encroachment.

- **Policy AG-5:** Mitigate loss of prime farmlands or lands with intensive agricultural investments through CEQA requirements to provide in-kind protection of nearby farmland.

Agricultural Zoning Objective. Retain agricultural land holdings in units large enough to guarantee future and continued agricultural use.

- **Policy AG-8:** Agricultural land divisions shall not adversely affect the integrity of agricultural pursuits. Agricultural land divisions may be denied if the reviewing authority finds that the division of land is likely to create circumstances inconsistent with this policy. (Sacramento County 1993)

Sacramento County Zoning Code

The Zoning Code of Sacramento County regulates the use of buildings, structures, and land in unincorporated Sacramento County in order to encourage the most appropriate use of land. The zoning code establishes Land Use Zones and describes the purposes, permitted uses, special conditions, and prohibitions for the land use zones.

Sacramento Local Agency Formation Commission

The Sacramento Local Agency Formation Commission (LAFCo) is a Countywide Commission, required in each California County. LAFCo's primarily goal is to ensure the orderly formation of local governmental agencies and preserve agricultural and open space lands. In this role, LAFCo has the power to approve local agency boundary changes, annexations, and agency formations.

As part of the City of Folsom's sphere of influence Amendment, LAFCo adopted Resolution LAFC 1196, which includes Condition (3) requiring that at the time "an application to annex property within the sphere of influence, the City shall submit to LAFCo for its review and approval, an updated Master Services Element which includes a program for implementing and financing measures necessary to support the provision of major components of infrastructure and services, and other essential services, needed to support the distribution, location, extent, and intensity of land uses proposed within the sphere of influence Amendment Area. The Master Services Element

shall identify a water sources and ability to acquire said water sources sufficient to service the area contained in the annexation application. The Master Services Element shall identify the process the City will undertake to acquire and secure a water supply sufficient for LAFCo to determine compliance with Condition (11)(a) of this Resolution."

In addition to issues relating to the City's annexation of lands within the Folsom sphere of influence, the Sacramento County LAFCo would retain approval authority for any annexation of unincorporated County land to City jurisdiction for the WTP site. Applicable polices as contained in LAFCo's Policy, Standards and Procedures Manual are identified in Section 3A.10, "Land Use and Agricultural Resources – Land."

City of Rancho Cordova General Plan

Portions of Zone 4 of the "Water" Study Area are contained within the planning jurisdiction of the City of Rancho Cordova. Rancho Cordova officially became a city on July 1, 2003. Upon incorporation, the City adopted applicable portions of the County's general plan and zoning ordinance, as well as applicable community and specific plans, and zoning designations in areas within the newly incorporated city.

On June 26, 2006, the Rancho Cordova City Council adopted the City of Rancho Cordova General Plan. The "Water" Study Area encompasses several Planning Areas within the City of Rancho Cordova including the Aerojet, Rio del Oro, Grant Line South, West, Jackson, Westborough, Glenborough, and East Planning Areas. These planning areas are illustrated in Exhibit LU-6 of the City's General Plan. Detailed planning efforts within the City of Rancho Cordova are generally specific to each of the City's Planning Areas.

The Folsom Boulevard WTP site is located within the Westborough Planning Area. The Westborough Planning Area is currently the subject of a development application that features primarily residential development focused around a regional town center at the new Rancho Cordova Parkway/U.S. 50 interchange. The regional town center will likely feature significant retail shopping with other restaurant, service, office, and residential uses at a density of 15 to 25 units per acre. Entertainment venues and/or sports-oriented uses may be a key component of the town center. Because of the area's proximity to U.S. 50 and light rail the average residential density for the project will be approximately seven units per acre (City of Rancho Cordova 2006).

Specific land use planning goals and policies contained in the city of Rancho Cordova's General Plan applicable to the Off-site Water Facilities Alternatives are identified below:

- **Policy LU.4.1:** Coordinate with regional and local planning agencies and jurisdictions to set land use, circulation, park, and environmental policies and cooperate in the implementation of programs and developments/improvements consistent with the City of Rancho Cordova's General Plan.

    - **Action LU.4.1.1:** Establish and maintain agreements or working relationships with SACOG, Sacramento County, and the cities of Folsom, Sacramento, and Elk Grove to facilitate a coordinated approach to land use decisions that affect each jurisdiction.

    - **Action LU.4.1.2:** Facilitate agreements (e.g., memorandums of understanding) for critical planning topics and activities with neighboring jurisdictions and SACOG and allow for shared responsibility and an equal voice for all participants.

- **Policy LU.6.2:** Ensure subsequent detailed land planning for those Planning Areas with Conceptual Land Plans.

    - **Action LU.6.2.1:** Require the development and approval of Specific Plans or Special Planning Areas for the Aerojet, East, Glenborough, Grant Line North, Grant Line South, Grant Line West, Jackson, Mather, Rio del Oro, Suncreek/Preserve, and Westborough Planning Areas to create parcel-specific land use plans for those areas. Subsequent land use plans shall be consistent with relevant General Plan provisions and

shall reflect the ideas communicated in the Conceptual Land Plans and associated planning area descriptions.

- **Policy LU.6.4:** Revitalize Folsom Boulevard consistent with the Folsom Boulevard Planning Area.

  - **Action LU.6.4.1:** Develop, adopt, and implement a Folsom Boulevard Specific Plan that refines the vision and creates a detailed land plan with action steps for revitalization of the corridor. The Specific Plan shall include a land plan consistent with the vision and development envelope in the General Plan as well as the Planning Area description.

  - **Action LU.6.4.2:** Analyze development projects proposed for the Folsom Boulevard Planning Area for consistency with the planning area description for the corridor.

City of Folsom General Plan

The City's General Plan outlines the pattern of urban growth and the requirements for individual land uses for areas north of U.S. 50 and within the current city limits. The City's General Plan does not contain specific policy language as it relates to the Off-site Water Facility Alternatives. However, the Folsom Specific Plan, in which the Off-site Water Facilities would ultimately serve, would require an amendment to the City's General Plan in conjunction with a petition for annexation of the Folsom SPA into the City of Folsom.

As part of the southern extension of the City's sphere of influence, the City entered into an MOU with LAFCo to establish a guide for regional, long-range planning efforts relative to the annexation of the Folsom SPA. The MOU addresses a number of issues including water supply, transportation, schools, and open space that were later incorporated into language found in Measure W and subsequently the City Charter. Measure W requires the City to take certain actions related to each of the issue areas. In terms of water supply, Measure W requires the City to identify and secure the sources of water supply to serve the SPA without reducing the existing water supply currently serving users to the north of U.S. 50, and at no cost to existing Folsom residents.

3B.10.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The compatibility of land uses is based largely upon the anticipated environmental effects on adjacent uses. Since general, community, and specific plans are adopted by Sacramento County and the Cities of Folsom and Rancho Cordova to promote orderly, efficient development and avoid land use compatibility issues and associated environmental effects, the Off-site Water Facility Alternatives are evaluated for consistency with the goals, policies, and objectives of the adopted plans for local jurisdictions and water agencies.

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this EIR/EIS, the Off-site Water Facilities would result significant environmental effects to land use and agricultural resources if it would:

- physically divide an established community;

- conflict with any applicable water master plan or land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect;

- develop land uses that are incompatible with each other or with adjacent uses;

- convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use;

- conflict with existing zoning for agricultural use, or a Williamson Act contract; or

- involve other changes in the existing environment which, due to their location or nature, could result in impacts to existing agricultural operations.

Potential land use conflicts or incompatibility with adjacent areas are sometimes the result of environmental effects, such as the generation of noise or objectionable odors. Biological resources, noise, traffic, light/glare, public service-related effects of the Off-site Water Facilities are discussed in detail in other relevant "Water" sections of Chapter 3.

ANALYSIS METHODOLOGY

This evaluation of the Off-site Water Facility Alternatives considers potential land use conflicts resulting from the placement of new structures in agricultural and residential areas within Zone 4 of the Off-site Water Facility Study Area and consistency with applicable Federal, state, local, and regional planning documents. Background regarding Zone 4 was obtained through a combination of field reconnaissance to verify existing land use and review of pertinent planning documents, including, but not limited to: the *Sacramento County General Plan* (1993) and zoning ordinance, the Sacramento County General Plan Update DEIR (2009), the *City of Folsom General Plan* (1988) and zoning code, and the *City of Rancho Cordova General Plan* (2006) and zoning ordinance. To analyze land use consistency and land use conflicts, the Off-site Water Facility Alternatives were reviewed relative to the existing and planned land use designations for each jurisdiction.

In the context of the actions proposed in conjunction with the Off-site Water Facility Alternatives, the consistency evaluation also considers other applicable water-related planning documents including, but not limited to, SCWA's Water Supply Master Plan, the Water Forum Agreement (WFA), LAFCo's Resolution Approving the sphere of influence extension, and related documents, and other applicable regional water planning documents. Many of these regulations are described in more detail in other applicable sections and Section 3A.10, 3A.10, "Land Use and Agricultural Resources – Land," of this EIR/EIS. The standard for consistency used here is based on The Planners Guide to Specific Plans (OPR 2001): "An action, program, or project is consistent with the general plan if, considering all its aspects, it will further the objectives and policies of the general plan and not obstruct their attainment."

In some instances, a plan or land use inconsistency also poses physical environmental consequences, such as noise or traffic. In these cases, the consequences are generally referenced in this section with more detail provided in the discussion provided in the specific "Water" section of Chapter 3 that focuses on that issue (e.g., noise).

Important Farmlands and agricultural operations within the "Water" Study Area were identified using a combination of data from the DOC's FMMP, the County Agricultural Commissioner, and field reconnaissance (DOC 2006). The Off-site Water Facility Alternatives were then analyzed to determine the potential extent for direct and/or indirect conversion of Important Farmland[1]. Additionally, potential conflicts with existing agricultural zoning, incompatibility with existing Williamson Act contracts, or other changes resulting from the implementation of the Off-site Water Facilities, which could remove Important Farmland from agricultural production were considered.

[1] Important Farmland includes lands classified as Prime Farmland, Farmland of Statement Importance, and Unique Farmland.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Physical Division of an Established Community—New structural facilities associated with the Off-site Water Facilities would be located within existing road right-of-way or on undeveloped land. Once constructed, the water conveyance pipeline would be buried underground and not visible at the ground surface. The two Off-site WTP site locations currently under evaluation would be constructed at undeveloped locations within Zone 4 of the "Water" Study Area and, therefore, are not located within an established community. Based on these considerations, it is reasonable to conclude that the Off-site Water Facilities would not physically divide an established community and no impact would occur. Therefore, this issue area is not discussed further.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.10-1 Conflict with Applicable Water Resource Management and Facility Plans, Policies, or Regulations. *Implementation of the Off-site Water Facility Alternatives would not conflict with applicable water resource management and facility plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

The various actions that are common to the Off-site Water Facility Alternative were evaluated in relation to existing public infrastructure and water supply planning documents for the region at large. These documents

include, the Public Facility Elements of the General Plans adopted by local jurisdictions (e.g., Sacramento County, City of Rancho Cordova) and water supply planning documents prepared at local, regional, state, and Federal levels by multiple agencies (e.g., Water Forum Agreement and Groundwater Management Plans). The planning documents were reviewed to assess the consistency of the operational components of the Off-site Water Facility Alternatives with applicable goal, polices, and objectives. A review of these planning documents indicates that the Off-site Water Facility Alternatives are respectful of existing surface water and groundwater interests and environmental concerns and are generally consistent with the objectives of local jurisdictions. The full text of the goals, policies, and objectives can be reviewed in each jurisdiction's General Plans and related planning documents; pertinent goals and objectives are referenced in Sections 3A.10.2 and 3B.10.2, Regulatory Framework.

From an operational perspective, implementation of the Off-site Water Facilities would be consistent with the City of Folsom's General Plan goals and objectives adopted to ensure the adequate provision of potable water supplies to new development. The Off-site Water Facilities would be consistent with the voter-approved Measure W by securing a new surface water supply for the Folsom SPA and constructing the necessary conveyance and treatment improvements to avoid any impacts to the City's existing water supply and treatment and conveyance infrastructure. Additionally, based on these considerations and the details provided in Chapter 2, "Alternatives," the Off-site Water Facility Alternatives demonstrate compliance with Conditions 3 and 11 of LAFCo's Resolution LAFC 1196, which require the securing of a sufficient, reliable water supply to serve new development prior to annexation of lands from within the Folsom SPA into the City. Based on these considerations, these alternatives would be **consistent** with these polices and, therefore, **direct** or **indirect** impacts would be **less than significant.** ***[Similar]***

The Off-site Water Facilities would support the improvement of the City of Folsom's infrastructure in areas annexed from the County and encourage the efficient and cost-effective delivery of potable water to these areas. Further, the Off-site Water Facilities would be consistent with the County's General Plan policies PF-1, PF-2, PF-3, and PF-5. These policies direct annexing jurisdictions to provide adequate public infrastructure to meet the needs of future development while minimizing impacts to in-stream water flow in the Sacramento and American Rivers by integrating diversions at Freeport and funding all facility operations associated with the WTP and conveyance facilities. Further, under the alternative, new structural features for the Off-site Water Facilities would be limited outside the Folsom SPA (e.g., underground pipelines) and integrated into the Freeport Project (e.g., existing permitted diversion). From these perspectives, it is reasonable to conclude that the methods of conveyance, diversion, and the proposed water supply for the Off-site Water Facility Alternatives would be consistent with County and City General Plan policies adopted for the purposes of mitigating or avoiding significant environmental impacts. For these reasons, this **direct** and **indirect** impact is considered **less than significant** and **consistent** with adopted plans and policies. ***[Similar]***

The assignment of CVP water to the City would further objectives identified for the region under the WFA by securing new surface water supplies for M&I uses and using existing diversion/intake facilities. The Off-site Water Facilities would involve only a minor change in operation for the CVP service systems to deliver water to the City under an M&I schedule instead of NCMWC under an agricultural delivery schedule. As provided in Section 3B.9, "Hydrology and Water Quality – Water," these changes would be less than significant and could entail desirable benefits. The assigned CVP water would continue to be stored in reservoirs north of the Delta until needed by the City. Based on these considerations, operation of the Off-site Water Facility Alternative would be **consistent** with operational objectives for Reclamation (e.g., flow objectives) as they relate to the continued operation of the CVP north of the Delta. For these reason, no inconsistencies with Federal plans and polices adopted for the purposes for avoiding or mitigating significant environmental effects would occur under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative and the **direct** and **indirect** impact would be **less than significant** with adopted plans and policies. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.10-2 Conflict with Applicable Local Agency Land Use Plans, Policies, or Regulations. *Implementation of the Off-site Water Facility Alternatives could conflict with an applicable land use plan, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.*

NCP, PA

Under this alternative, new structural features for the Off-site Water Facilities would be limited outside the Folsom SPA (e.g., underground pipelines) and contained within the Folsom SPA (e.g., On-Site WTP) and integrated into the Freeport Project (e.g., existing permitted diversion). From these perspectives, it is reasonable to conclude that the location of the structural facilities water supply for the No USACE Permit and Proposed Off-site Water Facility Alternative would be consistent with County and City General Plan land use policies adopted for the purposes of mitigating or avoiding significant environmental impacts (e.g., land use incompatibility). Similarly, this alternative would be **consistent** with LAFCo's general policy of siting urban forms of development, including the WTP, within a City's sphere of influence or the Folsom SPA. Additionally, the On-site WTP would be required to adhere to the policies and guidelines set forth in the Folsom Specific Plan as they pertain to development setbacks, height restrictions, and access. Based on these considerations, **direct** or **indirect** impacts would be **less than significant**. ***[Similar]***

Beyond the conveyance pipeline, the Off-site pump station would likely be the most substantial improvement outside the Folsom SPA. This facility would be constructed within close proximity to the Freeport bifurcation and would require a small easement, which is assumed to be within 200-foot corridor study area under consideration. This facility would likely be subject to the County's use requirements and could require a use permit. Given the small size of the facility and land area requirements, its placement along Vineyard or Gerber Roads would not present a substantial inconsistency with existing land use patterns and, from a planning context, impacts would be **less than significant**. Nuisance related issues are addressed in the other corresponding resource sections as provided in the "Water – B" portions of Chapter 3. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

1, 1A, 3, and 3A

The main distinguishing feature for these alternatives from the No USACE Permit Alternative and Proposed Off-site Water Facility Alternative is that they would require the City to annex the White Rock WTP site to within its jurisdiction or seek development entitlements through the County to enable for construction of the WTP. To annex the White Rock WTP site, the City would be required to amend its currently adopted sphere of influence prior to annexing the property prior to pre-zoning the White Rock WTP site to public use. Annexation of the White Rock WTP would be subject to LAFCo approval and would need to be included as part of the City's proposed Corporation Yard application, if pursued, for the sphere of influence amendment. Ultimate approval from LAFCo is not guaranteed given several factors. First, annexation of agriculturally designated land by the City is generally discouraged; however, emphasis is typically placed on the land's productivity, which at this time, the current use is limited to grazing. Secondly, as shown in Exhibit 3B.10-1, the White Rock WTP site is located outside the County USB, with urban-type uses generally discouraged. Lastly, the annexation and development of the WTP would require cancellation of a Williamson Act Contract, currently undergoing the non-renewal process. These **direct** and **indirect** impacts would be **inconsistent** with LAFCo's adopted plans and policies and considered **significant**. ***[Greater]***

The City's WTP would be considered an institutional use under the adopted County General Plan and could, under certain circumstances, be allowed within the AG-80 zone subject to a use permit from the County. Goals and policies applied to the agricultural use focus on avoiding the placement of urban-type land uses, which may

be disruptive to the agricultural economy, near agriculturally zoned lands. As the WTP is a non-sensitive, institutional use, its operations would not be disruptive to adjacent grazing, aggregate mining, and OHV uses. Likewise, these adjacent activities would not be disruptive to typical operations at a WTP. However, ultimate approval would or a use permit would be the discretion of Sacramento County and the City would be subject to any conditions of use. However, the WTP under these alternatives would be constructed outside the current confines of the County USB and, therefore, there is no guarantee the County would approve the City's application. This **inconsistency** with the County's General Plan combined with uncertainties regarding whether the County would approve the City's application within the necessary time frame are considered **significant direct** impacts. ***[Greater]***

Mitigation Measure 3B.10-2: Acquire Development Approvals for Off-site WTPs.

The City shall implement one of the two following options to enable development of the White Rock WTP under Off-site Water Facility Alternatives 1, 1A, 3, and 3A:

(1) Annexation and Pre-Zoning to Public Use. The City shall file an application with Sacramento LAFCo to amend its sphere of influence to include the White Rock WTP and City Corporation Yard, if applicable. The application shall include a statement describing that the sphere of influence amendment is necessary to ensure the provision of adequate water supply, distribution, and treatment for planned development with the Folsom SPA. Subject to LAFCo approval of the sphere of influence amendment, the City shall prepare an application to annex and prezone the White Rock WTP site for Public Use. As part of the White Rock WTP site's design, spacing opportunities between the WTP facilities and adjacent land use shall be maximized to encourage open space continuity and disruption to adjacent agricultural areas. Prior the annexation approval, the City shall provide LAFCo with the following: (a) dedications of rights-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping/open space for the protection of adjoining and nearby properties.

or

(2) Obtain County Use Permit or General Plan Amendment. The City shall file an application with Sacramento County for a Use Permit to allow the operation of the proposed WTP within the AG-80 zone. The City shall comply with the conditions of the Use Permit, so that the WTP site is developed consistent with County requirements in terms of the following: (a) dedications of right-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping for the protection of adjoining and nearby properties. Alternatively, the City may file an application for a General Plan Amendment and Rezone to designate the White Rock WTP site for Public Use. In addition to complying with the requirements of the Public zone, the City shall develop the site consistent with the County's for the following: (a) dedications of right-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping for the protection of adjoining and nearby properties.

Implementation: City of Folsom Utilities Department

Timing: Prior to acquisition and development of the Off-site WTP

Enforcement:
1. For annexation and sphere of influence applications: Sacramento County LAFCo.
2. For the entitlement and General Plan applications through Sacramento County: Sacramento County Planning and Community Development Department.

2, 2A, and 2B

Under Off-site Water Facility Alternatives 2, 2A, and 2B, the City would purchase capacity within SCWA's Vineyard SWTP, thereby consolidating treatment operations at one location and no new WTP would be required. With purchased capacity at the Vineyard SWTP, the construction of a new WTP would not be required and, therefore, a conditional use permit from the County or SOI amendment through LAFCo would not be required for these Off-site Water Facility Alternatives. Additionally, pumping facilities would likely be located on the Vineyard SWTP or Douglas Tanks site and, therefore, the **direct** and **indirect** impacts related to land use planning and planning consistency are **consistent** with adopted plans and policies and **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

4 and 4A

Similar to Alternative 1, Off-site Water Facility Alternatives 4 and 4A would involve the construction of a new WTP, but at a different location. The Folsom Boulevard WTP site is located south of Folsom Boulevard and currently designated under the County General Plan as Industrial. Additionally, the Folsom Boulevard WTP is located within the County's USB. The operation of the WTP within this designation and associated zone is considered a permitted use. In this context, the placement of a WTP at this location would generally be **consistent** with the County's General Plan and **direct** and **indirect** impacts would be **less than significant**. ***[Similar]***

Under these alternatives, the WTP would be located adjacent to the planned Westborough Planning Area for the City of Rancho Cordova. A development proposal for the Westborough at Easton was submitted to that City and the associated CEQA documentation is currently in preparation. Based on information provided in the NOP for the Westborough at Easton project, the WTP site would be situated within the vicinity of uses including Public, Park, and Medium and High Density. Additionally, these alternatives would involve similar planning issues related to LAFCo's approval for annexation and the County development entitlement process. These factors in conjunction with the close proximity of planned residential uses present **potentially inconsistent** land use planning issues. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3B.10-2.

Implementation of Mitigation Measure 3B.10-1 could reduce potentially significant impacts related to inconsistencies with existing land use policies and plans under Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A to a less-than-significant level by requiring use permits or annexation to the City prior to the construction and operation of the White Rock and Folsom Boulevard WTPs. However, given that discretionary approval conflict would be required by either LAFCo or the corresponding local jurisdiction (e.g., Sacramento County), the City is unable to guarantee that the prescribed mitigation measure reduce inconsistencies associated with potential conflicts with LAFCo's policies and Sacramento County's USB to a less-than-significant level. Therefore, this impact remains **potentially significant and unavoidable** for Off-site Water Facility Alternatives 1, 1A, 3, and 3A, 4 and 4A. Impacts under Alternatives 2, 2A, and 2B would be **less than significant**.

IMPACT 3B.10-3 Conversion of Important Farmland to Nonagricultural Uses. *Implementation of the Off-site Water Facility Alternatives could result in the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to nonagricultural uses.*

NCP, PA, 1, and 1A

As described in Chapter 2, "Alternatives," the conveyance pipeline alignments under Alternatives PA, 1, and 1A would generally follow existing roadways from the Freeport Project bifurcation. Based on review of aerial

photographs and field reconnaissance, these agricultural areas include dry land farming, grazing, and small patches of irrigated farmland. No important farmlands are identified within the conveyance alignment under these alternatives except for the area between the Freeport bifurcation and Grant Line Road. This area contains several small, fragmented areas of Unique Farmland and Farmland of Statewide Importance. These lands would be temporarily impacted during construction. However, following pipeline installation, roadways within these areas would be restored to preproject conditions, thereby ensuring continued agricultural cultivation.

In terms of the WTP site, these Off-site Water Facility Alternatives would require acquisition and conversion of up to 10 acres of grazing land to nonagricultural use, according to maps prepared pursuant to the FMMP. Grazing land is not considered Important Farmland and, therefore, the conversion of 10 acres would not result in a significant impact. Therefore, implementation of the Off-site Water Facilities would not convert important farmland to nonagricultural uses. The On-Site WTP is located on similarly designated land within the Folsom SPA and its construction would result in a similar impact. This **direct** impact would be **less than significant**. ***[Similar]***

The Off-site Water Facilities would increase water supply to the City of Folsom, which in turn could facilitate and remove an obstacle to urban growth within the City's adopted sphere of influence. Chapter 4, "Other Required Analyses," provides a detailed discussion of the growth-inducement potential and the related secondary effects of growth of the Off-site Water Facilities, which includes the indirect impact related to potential conversion of farmland and open space.

Impacts to Natomas Central Mutual Water Company Service Area

The assignment of surface water from NCMWC to the City of Folsom would not conflict with or prevent the continuation of existing agricultural uses within NCMWC's service area. Based on a study prepared by Wagner and Bonsignore (2007) and included in Appendix M-II, the amount of water transferred to the City would not adversely affect current cropping patterns within the NCMWC. As shown in Table 3B.10-1, the NCMWC has experience a crop reduction of over 5,000 acres in the crop acreage between 2004 and 2007. Based on current development patterns, this decline is expected to continue over time but at a slower rate. Notwithstanding this current pattern of development, even if rice production were to increase in the future, landowners within the NCMWC would have sufficient surface water supplies to service the land available for planting in most years and no supplemental groundwater during normal conditions would be required.

Similar to existing conditions, landowners would continue to also have the option to pump groundwater in critically dry years. Based on these considerations, the Off-site Water Facility Alternatives would not limit the availability of surface water for NCMWC's service area or require a long-term or permanent fallowing of agricultural lands within the NCMWC to facilitate the assignment of a portion of NCMWC's CVP water supply for the Off-site Water Facility Alternatives. Therefore, implementation of the Off-site Water Facilities would not convert Important Farmland to nonagricultural uses and this **direct** impact is considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2, 2A, 2B, 3, 3A, 4, and 4A

As described in Chapter 2, "Alternatives," the conveyance pipeline alignments under the above alternatives would generally follow existing roadways from the Freeport Project bifurcation to the Vineyard SWTP under Alternatives 2, 2A, and 2B; to the White Rock WTP under Alternatives 3 and 3A; or to the Folsom Boulevard WTP under Alternatives 4 and 4A. Areas north of Vineyard Road are generally already planned for future urban development and are currently not classified as Important Farmlands. The Folsom Boulevard WTP site is classified as urban and, therefore, is not considered Important Farmland. Beyond these differences, these alternatives would have the same impact as described for Alternatives 1 and 1A. Therefore, implementation of the

Off-site Water Facilities would not convert Important Farmland to nonagricultural uses and the **direct** impact would be **less than significant**. ***[Lesser]***

The Alternatives 2, 2A, 2B, 3, 3A, 4, and 4A would increase water supply to the City of Folsom, which in turn could facilitate and remove an obstacle to urban growth within the City's adopted sphere of influence. Chapter 4, "Other Statutory Requirements," provides a detailed discussion of the growth-inducement potential and the related secondary effects of growth of the Off-site Water Facilities, which includes the **indirect** impact related to potential conversion of farmland and open space.

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.10-4 Cancellation of Existing On-site Williamson Act Contracts. *Construction of the Off-site Water Facility Alternatives could conflict with lands under Williamson Act contracts; thereby potentially resulting in cancellation of those contracts.*

NCP, PA, 1, and 1A

Construction of the conveyance pipeline under Alternatives PA, 1, and 1A would be located primarily within existing roadway right-of-way with the exception of a small section of agricultural land between the Freeport bifurcation and Grant Line Road and, under Alternative 1A between Prairie City Road and the northern terminus of Grant Line Road. This would require a temporary construction easement and a permanent easement. No existing Williamson Act Contracts are on file for areas bordering the conveyance alignment under Alternatives PA, 1, and 1A.

Construction of the WTP under Alternatives PA, 1, 1A, 3, 3A, 4, and 4A would occur on land currently protected by a Williamson Act Contract, but as described in the setting section, that land is currently in non-renewal status. For instances where the Off-site Water Facilities would affect contracted lands, such as the WTP site, the Williamson Act has specific provisions for acquisition of contracted land for public improvements. Article 6 of the Williamson Act (California Government Code Sections 51290–51295) provides that a public entity may acquire land within an agricultural preserve for a public improvement through eminent domain or in lieu of eminent domain, and that this action terminates the contract.

However, given that these alternatives would necessitate the premature cancellation of the existing Williamson Act non-renewal process, these alternatives would be in conflict with the general intent of the Williamson Act. This **indirect** impact would be **significant**. ***[Similar]***

Impacts to Natomas Central Mutual Water Company Service Area

Implementation of the Off-site Water Facilities would not conflict with existing agricultural zoning or Williamson Act contracts within the NCMWC's service area since no change in existing land use would occur. As discussed in Impact 3B.10-2 above, implementation of the Off-site Water Facilities would not limit the availability of surface water for NCMWC's service area or require a long-term or permanent fallowing of agricultural lands within the NCMWC to facilitate the Assignment Agreement. Therefore, implementation of the Off-site Water Facilities would not adversely affect lands under the provisions of a Williamson Act contract or result in premature cancellation of existing contracts. This **direct** impact is considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No Feasible Mitigation Measures are Available.

2, 2A, 2B, 3, 3A, 4, and 4A

Large tract of Williamson Act contracted land is located east of Eagles Nest Road and along the Alternatives 2, 2A, 2B, 3, 3A, 4, and 4A alignments. However, given that the conveyance pipeline would be installed underground and along the periphery of these contracted lands, the Off-site Water Facilities would not have a substantial effect on productivity of the land, existing zoning, or would not require contract cancellation. Under Off-site Water Facility Alternative 4 and 4A, the Folsom Boulevard WTP would be constructed within an existing urbanized area just east of the City of Rancho Cordova. This area does not contain any agriculturally zoned properties or Williamson Act Contracts. Based on these considerations, the **direct** and **indirect** impacts to Williamson Act contracted lands is considered **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

Implementation of Alternatives PA, 1, and 1A would conflict with existing off-site Williamson Act contracts or result in the cancellation of such contracts on lands south of the project site. No feasible mitigation measures are available to reduce impacts associated with potential conflicts or cancellation of these off-site Williamson Act contracts to a less-than-significant level. Therefore, this impact remains **potentially significant and unavoidable**.

IMPACT 3B.10-5 Potential Temporary Disruptions to Existing Agricultural Operations. *Implementation of the Off-site Water Facilities could potentially affect existing agricultural operations and result in a loss in agricultural productivity.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

The conveyance pipeline options under these alternatives would primarily be located within existing road rights-of-way, although construction areas may extend into adjacent lands used for agriculture. Although the pipeline would be buried and installed in close proximity to the roadway, construction activities may require the removal of existing irrigation structures and topsoil. The temporary disruption caused by installation of the conveyance pipeline and auxiliary structures has the potential to be significant depending on its ultimate placement. If not sufficiently buried, future use of tillage equipment, drainage facilities, or other agricultural activities within the easement may not be possible thereby resulting in a loss in agricultural productivity. Therefore, this **direct** temporary impact would be **significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.10-5: Restore Affected Agricultural Lands to Preproject Conditions.

The City shall consult with all affected land owners where the selected alignment would cross Important Farmland. As part of the easement acquisition process, the City shall demonstrate a good-faith effort to negotiate with affected landowners an agreed-upon compensation for the loss of any existing pasture and/or row crops currently in production. During these consultations the City shall also, in conjunction with landowners' input, identify areas along the right-of-way that could be left in agricultural production as well as locations for access gates to allow for city staff access. Access gate locations shall be included in the final design plans for the Off-site Water Facilities. Compensation for the loss of crops and associated revenues shall be up to the provisions of law.

Implementation: City of Folsom Utilities Department

Timing: Immediately following construction

Enforcement: Sacramento County Community Development and Planning Department

Implementation of Mitigation Measure 3B.10-4 would reduce significant impacts related to disruption of existing agricultural operations under the Proposed Off-site Water Facility Alternative and Off-site Water Facility

Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A to a less-than-significant level by restoring agricultural land within the easement area to preproject conditions.

3B.10.4 RESIDUAL SIGNIFICANT IMPACTS

No conversion of Important Farmland would occur under the Off-site Water Facility Alternatives. Operation of the Off-site Water Facilities would generally be consistent with applicable Federal, state, regional, and local plans and policies. Based on these circumstances, the Off-site Water Facility Alternatives would not result in any residual significant and unavoidable impacts to land use and agricultural resources.

With the implementation of the mitigation under 3B.10-1, issues related to consistency of the WTP with local land use policies and LAFCo's policies and procedures would be reduced to a less-than-significant level for Alternatives 2, 2A, 2B, 3, 3A, 4, and 4A. This impact would remain significant and unavoidable under Alternatives PA, 1, and 1A.

Impacts related to the cancellation of existing on-site Williamson Act contracts to accommodate the WTP in Alternatives PA, 1, and 1A would be significant and unavoidable and no feasible mitigation measures are available to reduce impacts to a less-than-significant level. In addition, these alternatives could conflict with existing off-site Williamson Act contracts or result in the cancellation of such contracts on lands south of the project site and no feasible mitigation measures are available to reduce this impact to a less-than-significant level.

3A.11 NOISE – LAND

3A.11.1 AFFECTED ENVIRONMENT

ACOUSTIC FUNDAMENTALS

Acoustics is the scientific study that evaluates perception, propagation, absorption, and reflection of sound waves. Sound is a mechanical form of radiant energy, transmitted by a pressure wave through a solid, liquid, or gaseous medium. Sound that is loud, disagreeable, unexpected, or unwanted is generally defined as noise; consequently, the perception of sound is subjective in nature, and can vary substantially from person to person. Common sources of environmental noise and noise levels are presented in Exhibit 3A.11-1.

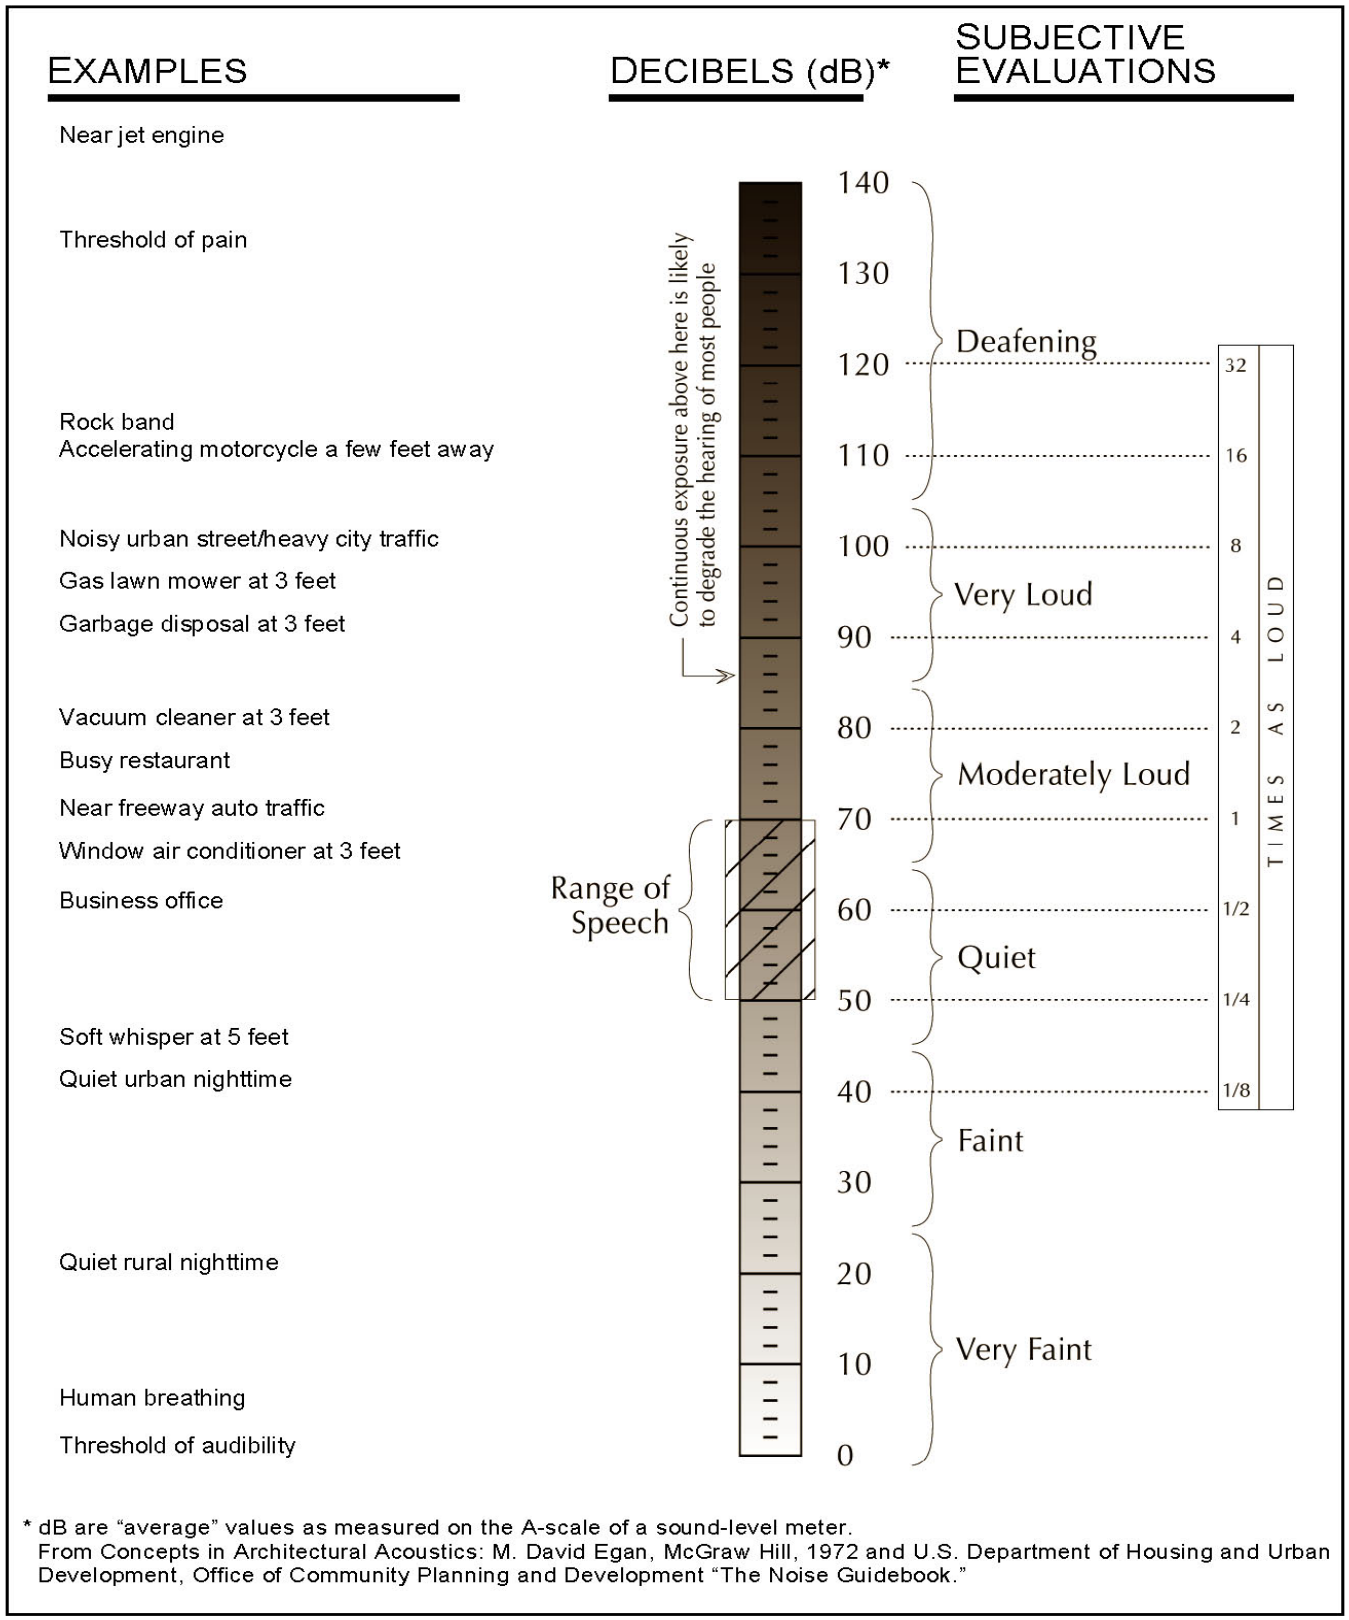
A sound wave is initiated in a medium by a vibrating object (e.g., vocal chords, the string of a guitar, the diaphragm of a radio speaker). The wave consists of minute variations in pressure, oscillating above and below the ambient atmospheric pressure. The number of pressure variation cycles occurring per second is referred to as the frequency of the sound wave and is expressed in hertz (Hz).

Directly measuring sound pressure fluctuations would require the use of a very large and cumbersome range of numbers. To avoid this and have a more useable numbering system, the decibel (dB) scale was introduced. A sound level expressed in decibels is the logarithmic ratio of two like pressure quantities, with one pressure quantity being a reference sound pressure. For sound pressure in air the standard reference quantity is generally considered to be 20 micropascals, which directly corresponds to the threshold of human hearing. The use of the decibel is a convenient way to handle the million-fold range of sound pressures to which the human ear is sensitive. A decibel is logarithmic; it does not follow normal algebraic methods and cannot be directly added. For example, a 65 dB source of sound, such as a truck, when joined by another 65 dB source results in a sound amplitude of 68 dB, not 130 dB (i.e., doubling the source strength increases the sound pressure by 3 dB). A sound level increase of 10 dB corresponds to 10 times the acoustical energy, and an increase of 20 dB equates to a 100 fold increase in acoustical energy.

The loudness of sound perceived by the human ear depends primarily on the overall sound pressure level and frequency content of the sound source. The human ear is not equally sensitive to loudness at all frequencies in the audible spectrum. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. The standard weighting networks are identified as A through E. There is a strong correlation between the way humans perceive sound and A-weighted sound levels (dBA). For this reason the dBA can be used to predict community response to noise from the environment, including noise from transportation and stationary sources. Sound levels expressed as dB in this section are A-weighted sound levels, unless noted otherwise.

Noise can be generated by a number of sources, including mobile sources (transportation noise sources) such as automobiles, trucks, and airplanes and stationary sources (nontransportation noise sources) such as construction sites, machinery, and commercial and industrial operations. As acoustic energy spreads through the atmosphere from the source to the receiver, noise levels attenuate (decrease) depending on ground absorption characteristics, atmospheric conditions, and the presence of physical barriers (walls, building façades, berms). Noise generated from mobile sources generally attenuate at a rate of 4.5 dB per doubling of distance. Stationary noise sources spread with more spherical dispersion patterns that attenuate at a rate of 6 to 7.5 dB per doubling of distance.

Atmospheric conditions such as wind speed, turbulence, temperature gradients, and humidity may additionally alter the propagation of noise and affect levels at a receiver. Furthermore, the presence of a large object (e.g., barrier, topographic features, and intervening building façades) between the source and the receptor can provide significant attenuation of noise levels at the receiver. The amount of noise level reduction or “shielding”



* dB are "average" values as measured on the A-scale of a sound-level meter.
From Concepts in Architectural Acoustics: M. David Egan, McGraw Hill, 1972 and U.S. Department of Housing and Urban Development, Office of Community Planning and Development "The Noise Guidebook."

Source: Data compiled by AECOM in 2009

Common Noise Sources and Levels **Exhibit 3A.11-1**

provided by a barrier primarily depends on the size of the barrier, the location of the barrier in relation to the source and receivers, and the frequency spectra of the noise. Natural barriers such as berms, hills, or dense woods, and human-made features such as buildings and walls may be used as noise barriers.

Noise Descriptors

The intensity of environmental noise fluctuates over time, and several different descriptors of time-averaged noise levels are used. The selection of a proper noise descriptor for a specific source depends on the spatial and temporal distribution, duration, and fluctuation of both the noise source and the environment. The noise descriptors most often used to describe environmental noise are defined below.

- **L_{max} (Maximum Noise Level):** The highest A/B/C weighted integrated noise level occurring during a specific period of time.
- **L_{min} (Minimum Noise Level):** The lowest A/B/C weighted integrated noise level during a specific period of time.
- **Peak:** The highest weighted or unweighted instantaneous peak-to-peak value occurring during a measurement period.
- **L_n (Statistical Descriptor):** The noise level exceeded n% of a specific period of time, generally accepted as an hourly statistic. An L_{10} would be the noise level exceeded 10% of the measurement period.
- **L_{eq} (Equivalent Noise Level):** The energy mean (average) noise level. The steady-state sound level that, in a specified period of time, contains the same acoustical energy as a varying sound level over the same time period.
- **L_{dn} (Day-Night Noise Level):** The 24-hour L_{eq} with a 10-dB "penalty" applied during nighttime noise-sensitive hours, 10 p.m. through 7 a.m. The L_{dn} attempts to account for the fact that noise during this specific period of time is a potential source of disturbance with respect to normal sleeping hours.
- **CNEL (Community Noise Equivalent Level):** Similar to the L_{dn} described above, but with an additional 5-dB "penalty" for the noise-sensitive hours between 7 p.m. to 10 p.m., which are typically reserved for relaxation, conversation, reading, and watching television. If the same 24-hour noise data are used, the CNEL is typically 0.5 dB higher than the L_{dn}.
- **SEL (Sound Exposure Level):** The cumulative exposure to sound energy over a stated period of time.

Effects of Noise on Humans

Excessive and chronic exposure to elevated noise levels can result in auditory and non-auditory effects on humans. Auditory effects of noise on people are those related to temporary or permanent hearing loss caused by loud noises. Non-auditory effects of exposure to elevated noise levels are those related to behavioral and physiological effects. The non-auditory behavioral effects of noise on humans are associated primarily with the subjective effects of annoyance, nuisance, and dissatisfaction, which lead to interference with activities such as communications, sleep, and learning. The non-auditory physiological health effects of noise on humans have been the subject of considerable research attempting to discover correlations between exposure to elevated noise levels and health problems, such as hypertension and cardiovascular disease. The mass of research infers that noise-related health issues are predominantly the result of behavioral stressors and not a direct noise-induced response. The extent to which noise contributes to non-auditory health effects remains a subject of considerable research, with no definitive conclusions.

The degree to which noise results in annoyance and interference is highly subjective and may be influenced by several non-acoustic factors. The number and effect of these non-acoustic environmental and physical factors vary depending on individual characteristics of the noise environment such as sensitivity, level of activity, location, time of day, and length of exposure. One key aspect in the prediction of human response to new noise environments is the individual level of adaptation to an existing noise environment. The greater the change in the noise levels that are attributed to a new noise source, relative to the environment an individual has become accustomed to, the less tolerable the new noise source will be perceived.

With respect to how humans perceive and react to changes in noise levels, a 1 dB increase is imperceptible, a 3 dB increase is barely perceptible, a 6 dB increase is clearly noticeable, and a 10-dB increase is subjectively perceived as approximately twice as loud (Egan 1988). These subjective reactions to changes in noise levels was developed on the basis of test subjects' reactions to changes in the levels of steady-state pure tones or broad-band noise and to changes in levels of a given noise source. It is probably most applicable to noise levels in the range of 50 to 70 dB, as this is the usual range of voice and interior noise levels. For these reasons, a noise level increase of 3 dB or more is typically considered substantial in terms of the degradation of the existing noise environment.

Vibration

Vibration is the periodic oscillation of a medium or object with respect to a given reference point. Sources of vibration include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, (e.g., operating factory machinery or transient in nature, explosions). Vibration levels can be depicted in terms of amplitude and frequency, relative to displacement, velocity, or acceleration.

Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings (Federal Transit Administration [FTA] 2006: **7**-1 – 7-8, California Department of Transportation [Caltrans] 2004: 5-7). PPV and RMS vibration velocity are normally described in inches per second (in/sec).

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. The response of the human body to vibration relates well to average vibration amplitude; therefore, vibration impacts on humans are evaluated in terms of RMS vibration velocity. Similar to airborne sound, vibration velocity can be expressed in decibel notation as vibration decibels (VdB). The logarithmic nature of the decibel serves to compress the broad range of numbers required to describe vibration.

Typical outdoor sources of perceptible groundborne vibration include construction equipment, steel-wheeled trains, and traffic on rough roads. Although the effects of vibration may be imperceptible at low levels, effects may result in detectable vibrations and slight damage to nearby structures at moderate and high levels, respectively. At the highest levels of vibration, damage to structures is primarily architectural (e.g., loosening and cracking of plaster or stucco coatings) and rarely results in damage to structural components. The range of vibration that is relevant to this analysis occurs from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings (FTA 2006:8-1 – 8-8).

EXISTING NOISE ENVIRONMENT

Project Location

Land uses near the SPA include open space and agricultural uses to the south; residential land uses to the east and north, the Aerojet General-Corporation rocket engine manufacturing and test facility to the west, and the Prairie

City State Recreational Vehicle Area (SRVA) facility to the southwest. Mather Airport is located approximately 9 miles west of the SPA.

Ambient-Noise Survey

An ambient-noise survey was conducted by AECOM in February 2009, to document the existing noise environment at various locations in the project vicinity. Noise level measurements were taken in accordance with American National Standards Institute (ANSI) standards at five locations using Larson Davis Laboratories (LDL) Model 820 precision integrating sound level meters (SLMs). The SLMs were calibrated before and after use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the ANSI for Type 1 SLMs. Ambient-noise survey locations are shown in Exhibit 3A.11-2. The L_{eq}, L_{max}, and L_{50} values taken at each ambient noise measurement location are presented in Table 3A.11-1.

Table 3A.11-1
Summary of Measured Ambient-Noise Levels

Site	Location	Start Date and Time	Average Measured Hourly Noise Levels, dB						
			L_{dn}/CNEL	Daytime (7 a.m.–10 p.m.)			Nighttime (10 p.m.–7 a.m.)		
				L_{eq}	L_{50}	L_{max}	L_{eq}	L_{50}	L_{max}
A	White Rock Road	2/18/2009, 12 p.m.	67.6	64.8	58.1	79.3	60.2	40.9	76.8
B	U.S. 50	2/18/2009, 1 p.m.	72.5	70.0	69.4	80.9	64.9	61.7	75.3
C	Prairie City Road	2/18/2009, 4 p.m.	60.0	58.1	52.5	73.8	51.9	39.9	67.5
D	Scott Road	2/19/2009, 3 p.m.	64.9	63.5	55.0	78.2	56.4	44.7	72.4
E	U.S. 50	2/20/2009, 4 p.m.	63.2	61.6	59.8	70.8	55.0	52.0	66.0

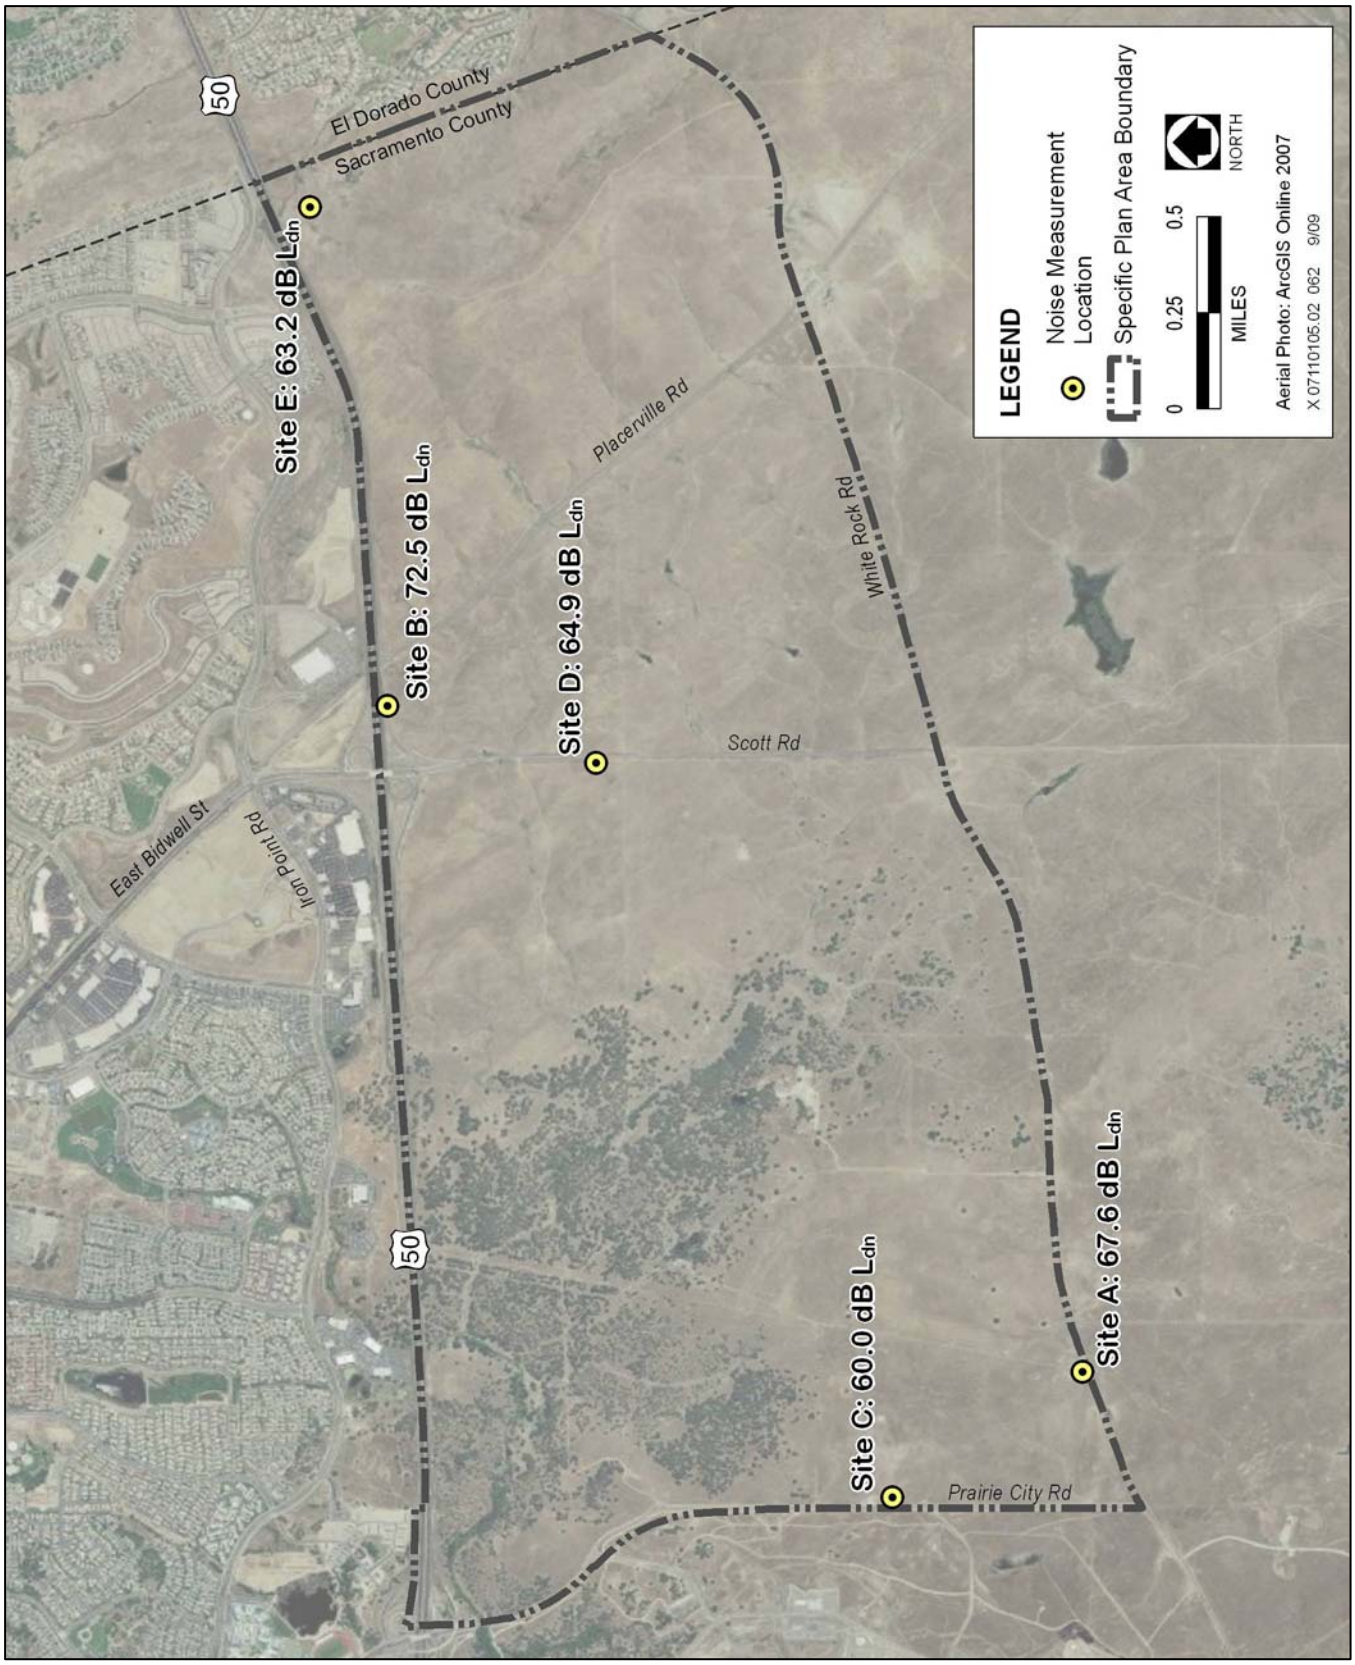
Notes: CNEL = Community Noise Equivalent Level; dB = A-weighted decibels; L_{dn} = day-night average noise level; L_{eq} = the equivalent hourly average noise level; L_{50} = the noise level exceeded 50% of a specific period of time; L_{max} = maximum noise level
Monitoring locations correspond to those depicted on Exhibit 3A.11-2.
Time refers to the beginning hour of the measurement. All measurement data presented are for one contiguous 24-hour period.
Source: Data compiled by AECOM in 2009

Average daytime hourly noise levels measured during the survey ranged from approximately 58 to 70 dB L_{eq}, with maximum daytime noise levels that ranged from 71 to 81 dB $L_{max.}$ The primary noise source affecting noise measurement locations was vehicular traffic on U.S. 50 and White Rock Road, depending on the proximity of the measurement location to the roadway. Meteorological conditions during the measurement period were favorable for reliable noise measurements, with clear skies, temperatures ranging from 69.2 degrees °F to 72.4°F, and light winds from the west at 0 to 5 miles per hour (mph).

Existing Noise Sources

The existing noise environment in and surrounding the SPA is influenced primarily by surface-transportation noise emanating from vehicular traffic on area roadways. Vehicle traffic noise levels are attributed to U.S. 50, Placerville Road, Scott Road, Prairie City Road, and White Rock Road.

The ambient noise levels in the SPA are not generally influenced by noise generated by nearby commercial industrial and recreational land uses, including the Aerojet General Corporation facility located adjacent to the eastern boundary of the SPA or the Prairie City SRVA located southwest of the SPA. However, occasional noise from outdoor testing of engines, fans, and other mechanical devices at the Aerojet facility and from vehicles using the Prairie City SRVA may influence noise levels in the SPA.



Source: Prepared by AECOM in 2009

Ambient Noise Measurement Locations **Exhibit 3A.11-2**

Noise levels associated with these transportation and nontransportation noise sources, as perceived within the vicinity of the SPA, are discussed separately below.

Traffic Noise

Existing traffic noise levels were calculated for roadway segments in the project vicinity using the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (RD-77-108) (FHWA 1978), and traffic data provided in the traffic impact study prepared for the project. The FHWA model is based on the California vehicle noise (CALVENO) reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and ground attenuation factors. Truck usage and vehicle speeds on study area roadways were estimated from field observations and data from Caltrans where available (Caltrans 2008: 146).

Table 3A.11-2 summarizes the modeled existing traffic noise levels at 50 to 100 feet from the centerline of each major roadway in the project vicinity, depending on the proposed setback under the Proposed Project and each of the other four action alternatives, and lists distances from each roadway centerline to the 60-dB, 65-dB, and 70-dB L_{dn}/CNEL traffic noise contours. Traffic noise modeling results are based on existing average daily traffic (ADT) volumes from the traffic analysis and assumes no natural or human-made shielding (e.g., vegetation, berms, walls, buildings). As shown in Table 3A.11-2, the location of the 60-dB L_{dn}/CNEL traffic noise contours along segments in the project vicinity, except for those where the contour falls within the roadway right-of-way, range from 43 to 15,349 feet from the centerline of the modeled roadways under existing conditions. The extent to which existing land uses in the project vicinity are affected by existing traffic noise depends on their respective proximity to the roadways and their individual sensitivity to noise.

Prairie City State Recreational Vehicle Area

The Prairie City SRVA is a facility managed by the California State Parks that serves recreational and competition users of off-road motorcycles, four wheel drive, and all-terrain vehicles (ATVs). The park is divided into areas that cater separately for four-wheel drive vehicles; motorcycles and ATVs; motocross; and off-road racing. The closest of these areas to the SPA is the four-wheel-drive area, which is located across the street from the southwest corner of the SPA.

Noise emissions from recreational off-road vehicles are governed in California by Assembly Bill (AB) 2274, Chapter 563, enacted in September 2002, and enforced by California State Parks. AB 2274 limits the noise level produced by recreational off-road vehicles manufactured after 1998 and vehicles defined as competition vehicles that were manufactured after 1986 to 96 dB at 20 inches from the exhaust pipe. It should be noted that during the ambient noise survey, off-road vehicles were audible in the SPA; however, noise attributable to the operation of off-road vehicles in the park could not be isolated and measured due to White Rock Road traffic noise levels dominating the immediate noise environment.

Aerojet General Corporation Facility

Aerojet land is located south of U.S. 50 between Mercantile Drive and Prairie City Road, west of the SPA. Primary noise-generating activities at this facility have historically been associated with the testing of rocket and high-performance aircraft engines for use in military and aerospace applications. GenCorp Realty Investments, Aerojet's parent company, is currently in the process of phasing out the testing of the large-diameter rocket and aircraft engines at this facility, although testing of smaller engines would continue (Gunderson, pers. comm., 2005). The 65- and 75-dB noise contours associated with the firing of smaller rocket engines (60,000 pounds of thrust) extend to approximately 7,920 and 4,224 feet, respectively, from the test stand. Additional on-site noise sources associated with this facility include industrial operations such as manufacturing, cleaning, maintenance, heating and cooling, and pollution control activities. Based on prior noise studies conducted at Aerojet, noise from these additional noise sources were not found to exceed County noise standards at nearby off-site receptors (County of Sacramento 1993).

Refer to Appendix J for detailed modeling input data and output results.
Source: Data provided by AECOM in 2009

According to the City of Folsom's General Plan Noise Element, "Noise sources involved in Aerojet operations include testing of rocket engines, large hovercraft fans and high-pressure fire nozzles. Other engine testing could occur in the future. Noise produced by rocket engine testing typically includes a brief loud impulsive noise at ignition, followed by several seconds of sustained lower noise levels. Fan and nozzle testing may consist of sustained noise levels. Testing is usually conducted during daylight hours."

The City of Folsom's General Plan Noise Element recommends that noise from the Aerojet facility be considered in acoustical analyses prepared for noise-sensitive development in the South Folsom Planning Area between Folsom Boulevard and Prairie City Road. It is reasonable to infer that the intent of this recommendation also applies to noise-sensitive land uses east of Prairie City Road, including the SPA.

Mather Airport

Mather Airport (formerly Mather Air Force Base [AFB]) has been open as a public-use air cargo and general-aviation airport since May 5, 1995. Managed by the County of Sacramento Department of Airports, the airport, which operates 24 hours per day, consists of two primary runways: one 11,300 feet long and the other 6,100 feet long, generally aligned in a northeast-to-southwest direction. Mather Airport is a joint-use facility that supports both military and commercial operations, and it is rapidly developing as an air cargo depot. The airport includes approximately 40 acres of exclusive air cargo ramp space. Mather Airport is a designated back-up airport for Sacramento International Airport if it is closed by an emergency.

Following the closure of Mather AFB in 1988, the County of Sacramento adopted a reuse plan for Mather Airport in fall 1991. The Airport Land Use Compatibility Plan (ALUCP) for Mather Airport was subsequently adopted in May 1997. Prior to the opening of Mather Airport as a public use airport in May 1995, the County of Sacramento performed the required Federal and state environmental analyses to determine the environmental impacts of Mather Airport on the surrounding communities. Aircraft noise was one of the many areas evaluated in that environmental impact statement (EIS).

A "capacity" noise contour was developed to account for the potential growth in aircraft operations at the yet unused public use airport. The noise contours included operations by cargo jets, military jets, business jets, propeller-driven aircraft, and helicopters. Although the level of operations modeled were well beyond what was anticipated to actually occur when the airport opened, the resulting noise contours did not extend into noise sensitive areas. The Mather Airport EIS received Federal and state approvals and the Airport began operation as a public use airport in May 1995. Therefore, the "capacity" contour represents the expected worst maximum extent of the 60 and 65 dB CNEL contours from the airport. The noise contours produced by present traffic levels at the airport and the contours that would be produced by the increased traffic levels if Sacramento International Airport were temporarily closed due to an emergency, would be of a lesser extent than the capacity contour.

The SPA is not located within the currently adopted 60 and 65 dB CNEL noise contours of the ALUCP for Mather Airport. These noise contours have been proposed for revision as part of the development of the *Mather Airport Master Plan*, which is currently being prepared by the Sacramento County Airport System. However, even with these revisions, the nearest 60 dB CNEL noise contour would be approximately 5,000 feet to the west of the nearest SPA boundary line.

Existing Noise-Sensitive Land Uses

Noise-sensitive land uses are generally considered to include those uses where noise exposure could result in health-related risks to individuals, as well as places where quiet is an essential element of their intended purpose. Residential dwellings are of primary concern because of the potential for increased and prolonged exposure of individuals to both interior and exterior noise levels. Additional land uses such as parks, historic sites, cemeteries, and recreation areas are also generally considered sensitive to increases in exterior noise levels. Schools, places of worship, hotels, libraries, and other places where low interior noise levels are essential, are also considered noise-sensitive.

Existing noise-sensitive land uses in the project vicinity include: off-site residences adjacent to the eastern boundary of the SPA; Folsom High School (approximately 1,000 feet north of the proposed improvements to the Prairie City Road/U.S. 50 interchange); residences accessible via Iron Point Road (approximately 1,000 feet north of the proposed Oak Avenue/U.S. 50 interchange) and the proposed Rowberry Drive Overcrossing/U.S. 50 interchange; residences accessible via Iron Point Road (approximately 2,200 feet north of the proposed improvements to the Scott Road/U.S. 50 interchange); and the residences accessible via Iron Point Road (approximately 400 feet from the proposed Empire Ranch Road/U.S. 50 interchange).

3A.11.2 Regulatory Framework

Various private and public agencies have established noise guidelines and standards to protect citizens from potential hearing damage and other adverse physiological and social effects associated with noise. Applicable standards and guidelines are described below.

Federal Plans, Policies, Regulations, and Laws

The U.S. Environmental Protection Agency's (EPA's) Office of Noise Abatement and Control was originally established to coordinate Federal noise control activities. After its inception EPA's Office of Noise Abatement and Control issued the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and

address the effects of noise on public health, welfare, and the environment. In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at more local levels of government. Consequently, in 1982, responsibilities for regulating noise control policies were transferred to state and local governments. However, noise control guidelines and regulations contained in EPA rulings in prior years remain in place by designated Federal agencies where relevant. No Federal noise regulations are applicable to the Proposed Project or any of the other alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The State of California has adopted noise standards in areas of regulation not preempted by the Federal government. State standards regulate noise levels of motor vehicles, sound transmission through buildings, occupational noise control, and noise insulation.

Title 24 of the California Code of Regulations, also known as the California Building Standards Code, establishes building standards applicable to all occupancies throughout the state (California Building Standards Commission 2002). The code provides acoustical regulations for both exterior-to-interior sound insulation as well as sound and impact isolation between adjacent spaces of various occupied units. Title 24 regulations state that interior noise levels generated by exterior noise sources shall not exceed 45 dB L_{dn}/CNEL, with windows closed, in any habitable room for general residential uses. The California Streets and Highways Code also contains regulations for assessing traffic noise impacts of new or altered state freeways on schools.

Though not adopted by law, the *State of California General Plan Guidelines 2003*, published by the California Governor's Office of Planning and Research (OPR), provides guidance for the compatibility of projects within areas of specific noise exposure. Table 3A.11-3 presents acceptable and unacceptable community noise exposure limits for various land use categories. The guidelines also present adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution.

Table 3A.11-3
Land Use Noise Compatibility Guidelines

Land Use Category	Community Noise Exposure (L_{dn}/CNEL, dB)			
	Normally Acceptable[1]	Conditionally Acceptable[2]	Normally Unacceptable[3]	Clearly Unacceptable[4]
Residential-Low Density Single Family, Duplex, Mobile Home	<60	55–70	70–75	75+
Residential-Multiple Family	<65	60–70	70–75	75+
Transient Lodging, Motel, Hotel	<65	60–70	70–80	80+
School, Library, Church, Hospital, Nursing Home	<70	60–70	70–80	80+
Auditorium, Concert Hall, Amphitheater		<70	65+	
Sports Arenas, Outdoor Spectator Sports		<75	70+	
Playground, Neighborhood Park	<70		67.5–75	72.5+
Golf Courses, Stable, Water Recreation, Cemetery	<75		70–80	80+
Office Building, Business Commercial and Professional	<70	67.5–77.5	75+	
Industrial, Manufacturing, Utilities, Agriculture	<75	70–80	75+	

Notes: CNEL = Community Noise Equivalent Level; dB = A-weighted decibels; L_{dn} = day-night average noise level.

[1] Specified land use is satisfactory, based on the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

[2] New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

[3] New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design. Outdoor areas must be shielded.

[4] New construction or development should generally not be undertaken.

Source: OPR 2003:244-254

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND ORDINANCES

County of Sacramento General Plan

The following goals and policies outlined in the County of Sacramento General Plan relating to noise are applicable to the No Project Alternative.

Noise Element

GOAL 1. To protect the citizens of Sacramento County from the harmful and annoying effects of exposure to excessive noise.

GOAL 2. To protect the economic base of Sacramento County by preventing incompatible land uses from encroaching upon existing or planned noise-producing uses.

- **Policy NO-1:** Noise created by new transportation noise sources should be mitigated so as not to exceed 60 dB L_{dn}/CNEL at the outdoor activity areas of any affected residential lands or land use situated in the unincorporated areas. When a practical application of the best available noise-reduction technology cannot achieve the 60 dB L_{dn}/CNEL standard, then an exterior noise level of 65 dB L_{dn}/CNEL may be allowed in outdoor activity areas.

- **Policy NO-2:** Noise created by new nontransportation noise sources shall be mitigated so as not to exceed any of the noise level standards of Table II-1 (included here as Table 3A.11-4), as measured immediately within the property line of any affected residentially designated lands or residential land use situated in the unincorporated areas.

Table 3A.11-4
County of Sacramento Noise Level Performance Standards[1] for Residential Areas Affected by Nontransportation Noise[2]

Statistical Noise Level Descriptor	Exterior Noise Level Standards (dB)	
	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
L_{50}	50	45
L_{max}	70	65

Notes: dB = A-weighted decibels; L_{50} = noise level exceeded 50% of a specified period of time; L_{max} = maximum noise level

[1] These standards are for planning purposes and may vary from the standards of the County's Noise Control Standards, which are for enforcement purposes.

[2] These standards apply to new or existing residential areas affected by new or existing nontransportation sources.

Source: County of Sacramento General Plan, Noise Element 1993

- **Policy NO-3:** Where proposed nontransportation noise sources are likely to produce noise levels exceeding the performance standards of Table II-1 (included here as Table 3A.11-4) at existing or planned residential uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design. (Requirements for the content of an acoustical analysis are given by Table II-1 (included here as Table 3A.11-5)

- **Policy NO-4:** Where residential land uses are proposed in areas exposed to existing or projected exterior noise levels exceeding either 60 dB L_{dn}/CNEL or the performance standards of Table II-1 (included here as Table 3A.11-4), an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

Table 3A.11-5
Requirements for an Acoustical Analysis

An acoustical analysis prepared pursuant to the Noise Element shall:

A. Be the financial responsibility of the applicant.

B. Be prepared by a qualified person experienced in the fields of environmental noise assessment and architectural acoustics.

C. Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions and the predominant noise sources.

D. Estimate existing and projected cumulative (20 years) noise in terms of L_{dn}/CNEL and/or standards of Table II-1 (included here as Table 3A.11-4), and compare those levels to the adopted policies of the Noise Element.

E. Recommend appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element. Where the noise source in question consists of intermittent single events, the report must address the effects of maximum nose levels in sleeping rooms in terms of possible sleep disturbance.

F. Estimate noise exposure after the prescribed mitigation measures have been implemented.

G. Describe a post-project assessment program which could be used to evaluate the effectiveness of the proposed mitigation measures.

Notes: CNEL = Community Noise Equivalent Level; L_{dn} = day-night average noise level
Source: County of Sacramento General Plan, Noise Element 1993

- **Policy NO-5:** New residential development shall not be allowed where the noise level due to nontransportation noise sources will exceed the noise level standards of Table II-1 (included here as Table 3A.11-4) as measured immediately within the property line of the new development.

- **Policy NO-6:** The compatibility of proposed nonresidential projects with existing and future noise levels due to transportation noise sources shall be evaluated through a comparison to Figure II-1(included here as Table 3A.11-6).

County of Sacramento Code, Noise Control

The County of Sacramento Code contains performance standards for the purpose of preventing unnecessary, excessive, and offensive noise levels within the county. Table 3A.11-7 includes pertinent excerpts from the Noise Control section that would apply to the No Project Alternative, and to the off-site detention basin west of Prairie City Road under all five action alternatives.

Exemptions

Section 6.68.090 of the County of Sacramento Code establishes conditions that are considered exempt from the associated provisions, as described below:

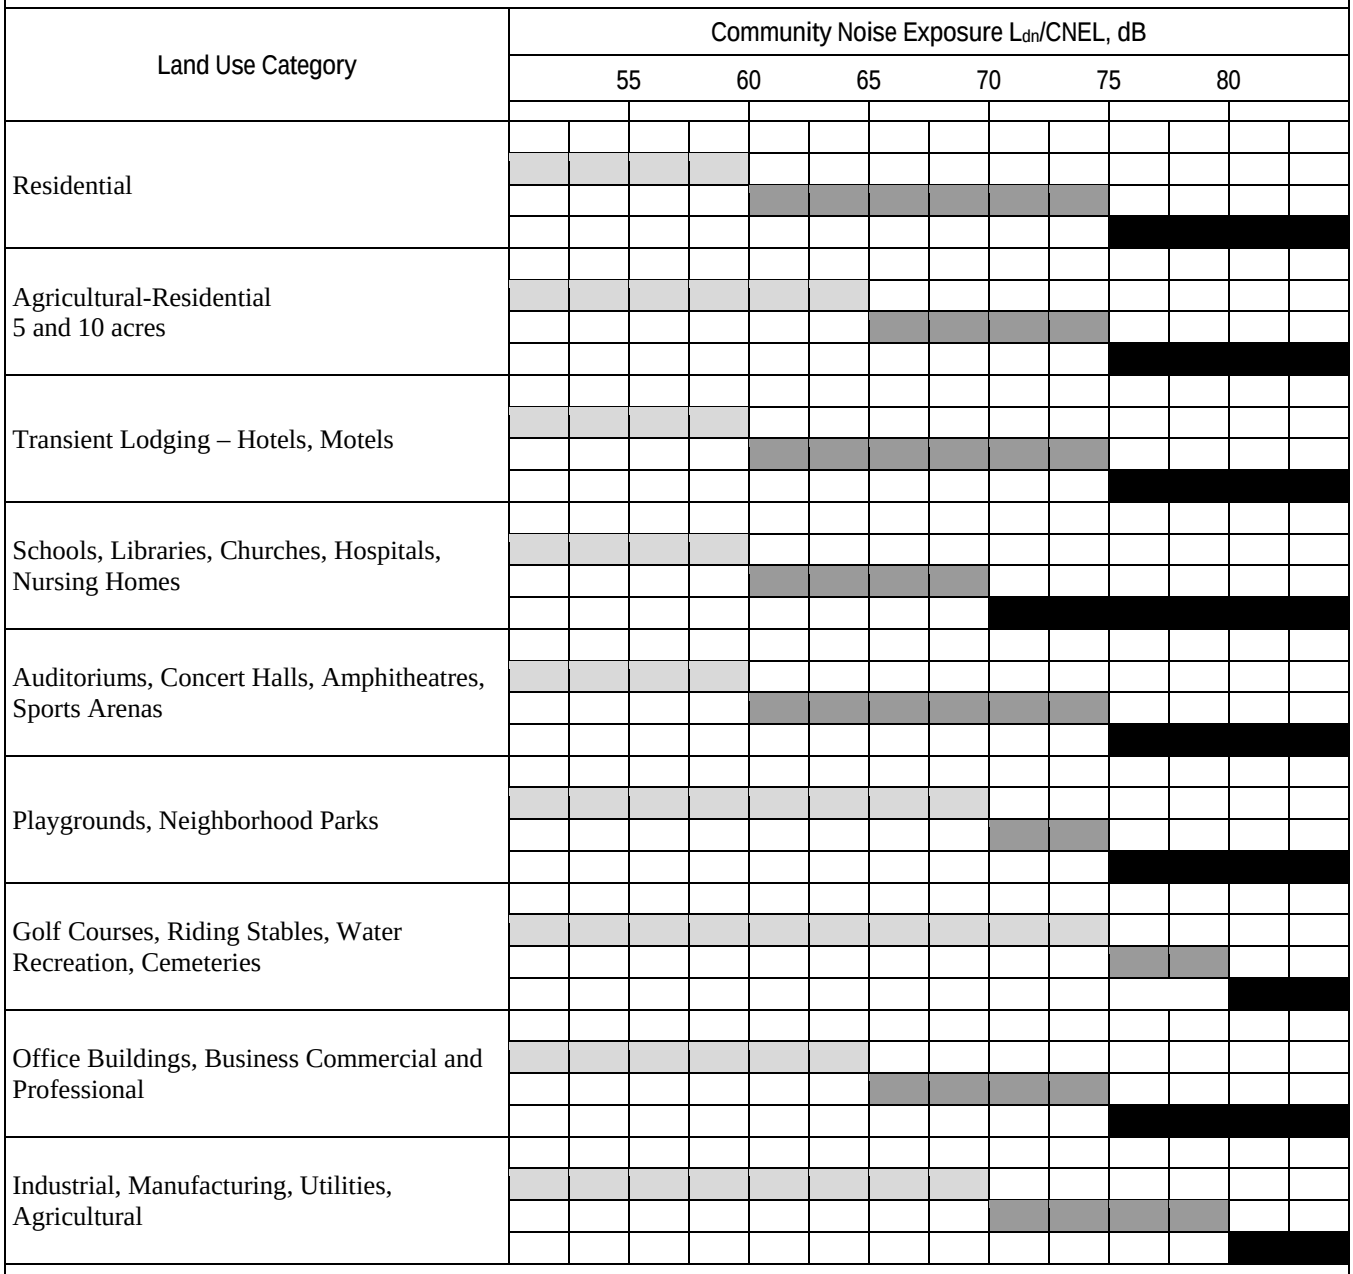
a. School bands, school athletic and school entertainment events;

b. Outdoor gatherings, public dances, shows and sporting and entertainment events, provided said events are conducted pursuant to a license or permit by the County;

c. Activities conducted on parks, public playgrounds and school grounds, provided such parks, playgrounds and school grounds are owned and operated by a public entity or private school;

d. Any mechanical device, apparatus or equipment related to or connected with emergency activities or emergency work;

Table 3A.11-6
Land Use Compatibility for Community Noise Environments



Acceptable – Specified land use is satisfactory, no noise mitigation measures are required.

Conditionally Acceptable – Use should be permitted only after careful study and inclusion of protective measures as needed for intended use and to satisfy policies of the Noise Element.

Unacceptable – Development is not feasible in accordance with Noise Element. Use is prohibited.

Notes: CNEL = Community Noise Equivalent Level; dB = A-weighted decibels; L_{dn} = day-night average noise level

Source: County of Sacramento General Plan, Noise Element 1993

Table 3A.11-7
Excerpts from the County of Sacramento Code, Noise Control

Noise Area	County Zoning Districts	Time Period	Exterior Noise Standard
1	RE-1, RD-1, RE-2, RD-2, RE-3, RD-3, RD-4, R-1-A, RD-5, R-2, RD-10, R-2A, RD-20, R-3, R-D-30, RD-40, RM-1, RM-2, A-1-B, AR-1, A-2, AR-2, A-5, AR-5	7 a.m.–10 p.m.	55 dB
		10 p.m.–7 a.m.	50 dB

b. It is unlawful for any person at any location within the County to create any noise which causes the noise levels on an affected property, when measured in the designated noise area, to exceed for the duration of time set forth following, the specified exterior noise standards in any one hour by:

Cumulative Duration of the Intrusive Sound	Allowance Decibels (dB)
1. Cumulative period of 30 minutes per hour	0
2. Cumulative period of 15 minutes per hour	+ 5
3. Cumulative period of 5 minutes per hour	+10
4. Cumulative period of 1 minute per hour	+15
5. Level not to be exceeded for any time per hour	+20

c. Each of the noise limits specified in subdivision (b) of this section shall be reduced by five dB for impulsive or simple tone noises, or for noises consisting of speech or music.

d. If the ambient noise level exceeds that permitted by any of the first four noise-limit categories specified in subdivision (b), the allowable noise limit shall be increased in five dB increments in each category to encompass the ambient noise level. If the ambient noise level exceeds the fifth noise level category, the maximum ambient noise level shall be the noise limit for that category.

Notes: dB = A-weighted decibels
Source: County of Sacramento Code, Noise Control 1976

e. Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of eight p.m. and six a.m. on weekdays and Friday commencing at eight p.m. through and including seven a.m. on Saturday; Saturdays commencing at eight p.m. through and including seven a.m. on the next following Sunday and on each Sunday after the hour of eight p.m. Provided, however, when an unforeseen or unavoidable condition occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after eight p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner;

f. Noise sources associated with agricultural operations, provided such operations do not take place between the hours of eight p.m. and six a.m.;

g. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of adverse weather conditions or when the use of mobile noise sources is necessary for pest control;

h. Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of six a.m. and eight p.m. on any day except Saturday or Sunday, or between the hours of seven a.m. and eight p.m. on Saturday or Sunday;

i. Any activity, to the extent provisions of Chapter 65 of Title 42 of the United States Code, and Articles 3 and 3.5 of Chapter 4 of Division 9 of the Public Utilities Code of the State of California preempt local control of

noise regulations and land use regulations related to noise control of airports and their surrounding geographical areas, any noise source associated with the construction, development, manufacture, maintenance, testing or operation of any aircraft engine, or of any weapons system or subsystems which are owned, operated or under the jurisdiction of the United States, or any other activity to the extent regulation thereof has been preempted by state or Federal law or regulation; and

j. Any noise sources associated with the maintenance and operation of aircraft or airports which are owned or operated by the United States.

County of El Dorado General Plan

The following goals and policies outlined in the County of El Dorado General Plan relating to noise are applicable to the two off-site roadway connections from the Folsom Heights property into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County General Plan policies related to noise that would apply to the other alternatives under consideration.

Noise Element

GOAL 6.5: Acceptable Noise Levels

Ensure that County residents are not subjected to noise beyond acceptable levels.

OBJECTIVE 6.5.1: Protection of Noise-Sensitive Development. Protect existing noise-sensitive developments (e.g., hospitals, schools, churches and residential) from new uses that would generate noise levels incompatible with those uses and, conversely, discourage noise-sensitive uses from locating near sources of high noise levels.

- **Policy 6.5.1.1:** Where noise-sensitive land uses are proposed in areas exposed to existing or projected exterior noise levels exceeding the levels specified in Table 6-1 (included here as Table 3A.11-8) or the performance standards of Table 6-2 (included here as Table 3A.11-9), an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

- **Policy 6.5.1.2:** Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table 6-2 (included here as Table 3A.11-9) at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

- **Policy 6.5.1.3:** Where noise mitigation measures are required to achieve the standards of Tables 6-1 (included here as Table 3A.11-8) and 6-2 (included here as Table 3A.11-9), the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers shall be considered a means of achieving the noise standards only after all other practical design-related noise mitigation measures have been integrated into the project and the noise barriers are not incompatible with the surroundings.

- **Policy 6.5.1.4:** Existing dwellings and new single-family dwellings on legal lots of record, as of the date of adoption of this General Plan, are not subject to County review with respect to satisfaction of the standards of the Public Health, Safety, and Noise Element except in areas governed by the CLUPs for applicable airports.

  As a consequence, such dwellings may be constructed in other areas where noise levels exceed the standards of the Public Health, Safety, and Noise Element. It is not the responsibility of the County to ensure that such dwellings meet the noise standards of the Public Health, Safety, and Noise Element, or the noise standards imposed by lending agencies such as HUD [U.S. Department of Housing and Urban Development], FHA [Federal Housing Administration] and Cal Vet [California Department of Veterans Affairs]. If homes are located and constructed in accordance with the Public Health, Safety, and Noise Element, it is expected that the resulting exterior and interior noise levels will conform to the HUD/FHA/Cal Vet noise standards.

Table 3A.11-8
Maximum Allowable Noise Exposure for Transportation Noise Sources

Land Use	Outdoor Activity Areas[1] L_{dn}/CNEL, dB	Interior Spaces	
		L_{dn}/CNEL, dB	L_{eq}, dB[2]
Residential	60[3]	45	--
Transient Lodging	60[3]	45	--
Hospitals, Nursing Homes	60[3]	45	--
Theaters, Auditoriums, Music Halls	--	--	35
Churches, Meeting Halls, Schools	60[3]	--	40
Office Buildings	--	--	45
Libraries, Museums	--	--	45
Playgrounds, Neighborhood Parks	70	--	--

Notes: CNEL = community noise equivalent level; dB = A-weighted decibels; L_{dn} = day-night noise level; L_{eq} = equivalent noise level

[1] In Communities and Rural Centers, where the location of outdoor activity areas is not clearly defined, the exterior noise level standard shall be applied to the property line of the receiving land use. For residential uses with front yards facing the identified noise source, an exterior noise level criterion of 65 dB L_{dn}/CNEL shall be applied at the building façade, in addition to a 60 dB L_{dn}/CNEL criterion at the outdoor activity area. In Rural Regions, an exterior noise level criterion of 60 dB L_{dn}/CNEL shall be applied at a 100-foot radius from the residence unless it is within Platted Lands where the underlying land use designation is consistent with the Community Region densities in which case the 65 dB L_{dn}/CNEL may apply. The 100-foot radius applies to properties which are five acres and larger; the balance will fall under the property line requirement.

[2] As determined for a typical worst-case hour during periods of use.

[3] Where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

Source: El Dorado County General Plan, Noise Element 2004

- **Policy 6.5.1.5:** Setbacks shall be the preferred method of noise abatement for residential projects located along U.S. 50. Noise walls shall be discouraged within the foreground viewshed of U.S. 50 and shall be discouraged in favor of less intrusive noise mitigation (e.g., landscaped berms, setbacks) along other high volume roadways.

- **Policy 6.5.1.6:** New noise-sensitive uses shall not be allowed where the noise level, due to nontransportation noise sources, will exceed the noise level standards of Table 6-2 (included here as Table 3A.11-9) unless effective noise mitigation measures have been incorporated into the development design to achieve those standards.

- **Policy 6.5.1.7:** Noise created by new proposed nontransportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 6-2 (included here as Table 3A.11-9) for noise-sensitive uses.

- **Policy 6.5.1.8:** New development of noise sensitive land uses will not be permitted in areas exposed to existing or projected levels of noise from transportation noise sources which exceed the levels specified in Table 6-1 (included here as Table 3A.11-8) unless the project design includes effective mitigation measures to reduce exterior noise and noise levels in interior spaces to the levels specified in Table 6-1 (included here as Table 3A.11-8).

- **Policy 6.5.1.9:** Noise created by new transportation noise sources, excluding airport expansion but including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table 6-1 (included here as Table 3A.11-8) at existing noise-sensitive land uses.

- **Policy 6.5.1.10:** To provide a comprehensive approach to noise control, the County shall:

  A. Develop and employ procedures to ensure that noise mitigation measures required pursuant to an acoustical analysis are implemented in the project review process and, as may be determined necessary, through the building permit process.

  B. Develop and employ procedures to monitor compliance with the standards of the Noise Element after completion of projects where noise mitigation measures were required.

  C. The zoning ordinance shall be amended to provide that noise standards will be applied to ministerial projects with the exception of single-family residential building permits if not in areas governed by the Airports Comprehensive Land Use Plans.

- **Policy 6.5.1.11:** The standards outlined in Tables 6-3, 6-4, and 6-5 (included here as Tables 3A.11-10, 3A.11-11, and 3A.11-12) shall apply to those activities associated with actual construction of a project as long as such construction occurs between the hours of 7 a.m. and 7 p.m., Monday through Friday, and 8 a.m. and 5 p.m. on weekends, and on federally-recognized holidays. Exceptions are allowed if it can be shown that construction beyond these times is necessary to alleviate traffic congestion and safety hazards.

Table 3A.11-9
Noise Level Performance Protection Standards for Noise Sensitive Land Uses Affected by Nontransportation* Sources

Noise Level Descriptor	Daytime 7 a.m. – 7 p.m.		Evening 7 p.m. – 10 p.m.		Night 10 p.m. – 7 a.m.	
	Community	Rural	Community	Rural	Community	Rural
Hourly L_{eq}, dB	55	50	50	45	45	40
Maximum level, dB	70	60	60	55	55	50

Notes: dB = A-weighted decibels; L_{eq} = equivalent noise level

Each of the noise levels specified above shall be lowered by five dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings).

The County can impose noise level standards which are up to 5 dB less than those specified above based upon determination of existing low ambient noise levels in the vicinity of the SPA.

In Community areas the exterior noise level standard shall be applied to the property line of the receiving property. In Rural Areas the exterior noise level standard shall be applied at a point 100' away from the residence. The above standards shall be measured only on property containing a noise sensitive land use as defined in Objective 6.5.1. This measurement standard may be amended to provide for measurement at the boundary of a recorded noise easement between all affected property owners and approved by the County.

* Note: For the purposes of the Noise Element, transportation noise sources are defined as traffic on public roadways, railroad line operations and aircraft in flight. Control of noise from these sources is preempted by Federal and State regulations. Control of noise from facilities of regulated public facilities is preempted by California Public Utilities Commission (CPUC) regulations. All other noise sources are subject to local regulations. Nontransportation noise sources may include industrial operations, outdoor recreation facilities, HVAC units, schools, hospitals, commercial land uses, other outdoor land use, etc.

Source: El Dorado County General Plan, Noise Element 2004

- **Policy 6.5.1.12:** When determining the significance of impacts and appropriate mitigation for new development projects, the following criteria shall be taken into consideration.

  A. Where existing or projected future traffic noise levels are less than 60 dB L_{dn}/CNEL at the outdoor activity areas of residential uses, an increase of more than 5 dB L_{dn}/CNEL caused by a new transportation noise source will be considered significant;

  B Where existing or projected future traffic noise levels range between 60 and 65 dB L_{dn}/CNEL at the outdoor activity areas of residential uses, an increase of more than 3 dB L_{dn}/CNEL caused by a new transportation noise source will be considered significant; and

  C. Where existing or projected future traffic noise levels are greater than 65 dB L_{dn}/CNEL at the outdoor activity areas of residential uses, an increase of more than 1.5 dB L_{dn}/CNEL caused by a new transportation noise will be considered significant.

- **Policy 6.5.1.13:** When determining the significance of impacts and appropriate mitigation to reduce those impacts for new development projects, including ministerial development, the following criteria shall be taken into consideration:

  A. In areas in which ambient noise levels are in accordance with the standards in Table 6-2 (included here as Table 3A.11-9), increases in ambient noise levels caused by new nontransportation noise sources that exceed 5 dB shall be considered significant; and

  B. In areas in which ambient noise levels are not in accordance with the standards in Table 6-2 (included here as Table 3A.11-9), increases in ambient noise levels caused by new nontransportation noise sources that exceed 3 dB shall be considered significant.

- **Policy 6.5.1.14:** The County will adopt a noise ordinance to resolve neighborhood conflicts and to control unnecessary noise in the County. Examples of the types of noise sources that can be controlled through the use of a quantitative noise ordinance include noisy mechanical equipment (e.g., swimming pool pumps, HVAC [heating, ventilating, and air conditioning] units), and amplified music in commercial establishments.

- **Policy 6.5.1.15:** The County will establish and maintain coordination among city, county, and state agencies involved in noise abatement and other agencies to reduce noise generated from sources outside the County's jurisdiction.

City of Folsom General Plan

The following goals and policies outlined in the City of Folsom General Plan relating to noise are applicable to the Proposed Project and the other four action alternatives. There are no City of Folsom General Plan policies related to noise that are applicable to the No Project Alternative.

Noise Element

GOAL 30: To protect the citizens of Folsom from the harmful effects of exposure to excessive noise and protect the economic base of Folsom by preventing the encroachment of incompatible land uses within areas protected by existing noise producing uses.

- **Policy 30.2:** Develop and implement effective strategies to abate and avoid excessive noise exposures in the City by requiring that effective noise mitigation measures be incorporated into the design of new noise-generating and new noise-sensitive land uses.

- **Policy 30.3:** Protect areas within the City where the present noise environment is within acceptable limits.

- **Policy 30.4:** Areas within the City of Folsom shall be designated as noise impacted if exposed to existing or projected exterior noise levels exceeding 60 dB L_{dn}/CNEL or the performance standards of Table 26-3 of the Noise Element (included here as Table 3A.11-13).

Table 3A.11-13
Noise Level Performance Standards for New Projects and Developments

Noise created by nontransportation-related noise sources associated with new projects or developments shall be controlled so as not to exceed the noise level standards set forth below as measured at any affected residentially designated lands or land use situated in either the incorporated or unincorporated areas. New residential development shall not be allowed where the ambient noise level due to nontransportation-related noise sources will exceed the noise level standards as set forth below:

Exterior Noise Level Standards, dB			
Category	Cumulative number of minutes in any one-hour time period	Daytime 7 a.m.–10 p.m.	Nighttime 10 p.m.–7 a.m.
1	30	50	45
2	15	55	50
3	5	60	55
4	1	65	60
5	0	70	65

Note: dB = A-weighted decibels
Source: City of Folsom General Plan, Noise Element 1988

Each of the noise level standards specified above shall be reduced by 5 dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises.

Noise from single occurrences such as the passage of locomotives, heavy trucks, or aircraft should also be evaluated in terms of single event noise levels. The maximum noise level created by such an event may have the potential to result in activity interference even though the cumulative noise exposure in terms of L_{dn}/CNEL is within acceptable limits. The potential for sleep disturbance is usually of primary concern, and should be evaluated on a case-by-case basis.

- **Policy 30.5**: New development of residential or other noise sensitive land uses will not be permitted in noise impacted areas unless effective mitigation measures are incorporated into the project design to reduce noise levels to:

  1. For noise due to traffic on public roadways, railroad operations, and aircraft: 60 dB L_{dn}/CNEL or less. Where it is not possible to reduce exterior noise due to these sources to 60 dB L_{dn}/CNEL or less by incorporating a practical application of the best available noise-reduction technology, an exterior noise level of up to 65 dB L_{dn}/CNEL will be allowed. Under no circumstances will interior noise levels be permitted to exceed 45 dB L_{dn}/CNEL with the windows and doors closed.

  2. For nontransportation related noise sources: achieve compliance with the performance standards contained within Table 26-3 (included here as Table 3A.11-3).

  3. If compliance with the adopted standards and policies of the Noise Element will not be achieved, a statement of overriding considerations for the project must be provided.

- **Policy 30.6:** When industrial, commercial land uses or other uses including nontransportation related noise sources are proposed which would affect areas containing noise sensitive land uses, noise levels generated by

the proposed use shall not exceed the performance standards contained within Table 26-3 (included here as Table 3A.11-13).

- **Policy 30.7:** Prior to the approval of proposed development of residential or other noise sensitive land uses in a noise impacted area, an acoustical analysis may be required. The acoustical analysis shall:

  1. Be the responsibility of the applicant.

  2. Be prepared by a qualified person experienced in the fields of environmental noise assessment and architectural acoustics.

  3. Include representative noise level measurements with sufficient sampling periods and locations to adequately describe local conditions.

  4. Include estimated noise levels in terms of L_{dn}/CNEL and/or the standards of Table 26-3 (included here as Table 3A.11-13)for existing and projected future (20 years hence) conditions, with a comparison made to the adopted policies of the noise element.

  5. Include recommendations for appropriate mitigation to achieve compliance with the adopted policies and standards of the Noise Element. Where the noise source in question consists of intermittent single events, the report must address the effects of maximum noise levels in sleeping rooms in terms of possible sleep disturbance.

  6. Include estimates of noise exposure after the prescribed mitigation measures have been implemented.

- **Policy 30.9:** Noise level criteria applied to land uses other than residential or other noise sensitive uses shall be consistent with the standards in Table 26-3 (included here as Table 3A.11-13).

- **Policy 30.10:** The City of Folsom shall enforce the State Noise Insulation Standards (California Administrative Code, Title 24) and Chapter 35 of the Uniform Building Code.

- **Policy 30.15:** If noise barriers are required to achieve the noise level standards contained within this Element, the following construction practices are recommended:

  1. Noise barriers exceeding six feet in height relative to the roadway should incorporate an earth berm to raise the height of the base so that the total height of the vertical planar portion of barrier is less than six feet.

  2. The total height of the noise barrier above roadway elevation should normally be limited to 12 feet.

  3. The noise barriers should be designed so that their appearance is consistent with other noise barriers in the project vicinity.

City of Folsom Municipal Code, Noise Control

The noise standards contained in the City of Folsom Municipal Code are provided below, and apply to the Proposed Project and the other four action alternatives. These standards would not apply to the No Project Alternative.

Exterior Noise Standards (Section 8.42.040)

A. It is unlawful for any person at any location within the incorporated area of the city to create any noise, or to allow the creation of any noise, on property owned, leased, occupied or otherwise controlled by such person

which causes the exterior noise level when measured at any affected single- or multiple-family residence, school, church, hospital or public library situated in either the incorporated or unincorporated area to exceed the noise level standards as set forth in Table 8.42.040 (included here as Table 3A.11-14).

Table 3A.11-14
Exterior Noise Level Standards

Noise Level Category	Cumulative Number of minutes in any 1-hour time period	Daytime (dB) (7 a.m.–10 p.m.)	Nighttime (dB) (10 p.m.–7 a.m.)
1	30	50	45
2	15	55	50
3	5	60	55
4	1	65	60
5	0	70	65

Note: dB = A-weighted decibels
Source: City of Folsom Code, Noise Control 1993

B. In the event the measured ambient noise level exceeds the applicable noise level standard in any category above, the applicable standard shall be adjusted so as to equal the ambient noise level.

C. Each of the noise level standards specified above shall be reduced by 5 dB for simple tone noises, noises consisting primarily of speech or music, or for recurring noises.

D. If the intruding noise source is continuous and cannot reasonably be discontinued or stopped for a time period whereby the ambient noise level can be measured, the noise level measured while the source is in operation shall be the noise level standards as specified above.

Interior Noise Standards (Section 8.42.050)

A. It is unlawful for any person, at any location within the city, to operate or cause to be operated within a dwelling unit, any source of sound or to allow the creation of any noise which causes the noise level when measured inside a receiving dwelling unit situated in the area either within the city or adjacent to the city to exceed the noise level standards as set forth in the Table 8.42.050 (included here as Table 3A.11-15).

Table 3A.11-15
Interior Noise Level Standards

Noise Level Category	Cumulative Number of minutes in any 1-hour time period	Daytime (dB) (7 a.m.–10 p.m.)	Nighttime (dB) (10 p.m.–7 a.m.)
1	5	45	35
2	1	50	40
3	0	55	45

Note: dB = A-weighted decibels
Source: City of Folsom Code, Noise Control 1993

B. In the event the measured ambient noise level exceeds the applicable noise level standard in any category above, the applicable standard shall be adjusted so as to equal the ambient noise level.

C. Each of the noise level standards specified above shall be reduced by 5 dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises.

D. If the intruding noise source is continuous and cannot reasonably be discontinued or stopped for a time period whereby the ambient noise level can be measured, the noise level measured while the source is in operation shall be the noise level standards as specified above.

Noise Source Exemptions (Section 8.42.060)

Section 8.42.060 of the City of Folsom Municipal Code establishes the following activities that are considered exempt from the associated exterior noise provisions:

A. Activities conducted in unlighted public parks, public playgrounds and public or private school grounds, during the hours of 7 a.m. to dusk, and in lighted public parks, public playgrounds and public or private school grounds, during the hours of 7 a.m. to 11 p.m., including but not limited to school athletic and school entertainment events;

B. Any mechanical device, apparatus, or equipment used, related to or connected with emergency activities or emergency work;

C. Noise sources associated with construction, provided such activities do not take place before 7 a.m. or after 6 p.m. on any day except Saturday or Sunday, or before 8 a.m. or after 5 p.m. on Saturday or Sunday;

D. Noise sources associated with the maintenance of residential property provided such activities take place between the hours of seven a.m. to dusk on any day except Saturday or Sunday, between the hours of 8 a.m. to dusk on Saturday or Sunday;

E. Noise sources associated with agricultural activities on agricultural property;

F. Noise sources associated with a lawful commercial or industrial activity caused by mechanical devices or equipment, including air conditioning or refrigeration systems, installed prior to the effective date of this chapter. This exemption shall expire 1 year after the effective date of this chapter;

G. Noise sources associated with the collection of waste or garbage from property devoted to commercial or industrial uses;

H. Any activity to the extent regulation thereof has been preempted by state or Federal law.

Air Conditioning and Refrigeration (Section 8.42.070)

Notwithstanding the provisions of Section 8.42.040 or 8.42.050, where the intruding noise source when measured as provided in Section 8.42.030 is an air-conditioning or refrigeration system or associated equipment installed prior to the effective date of this chapter, the exterior noise level shall not exceed 55 dB, except where such equipment is otherwise exempt from the provisions of this chapter. The exterior noise level shall not exceed 50 dB for such equipment installed or in use after 1 year after the effective date of this chapter.

Electrical Substations (Section 8.42.080)

Notwithstanding the provisions of Sections 8.42.040 and 8.42.050, noise sources associated with the operation of electrical substations shall not exceed 50 dB when measured as provided in Section 8.42.030.

Vibration Criteria

CEQA states that the potential for any excessive groundborne noise and vibration levels must be analyzed; however, it does not define the term "excessive" vibration. Numerous public and private organizations and governing bodies have provided guidelines to assist in the analysis of groundborne noise and vibration; however, the Federal, state, and local governments have yet to establish specific groundborne noise and vibration requirements. The following publications of the FTA and Caltrans are two of the seminal works for the analysis of groundborne noise and vibration relating to transportation and construction-induced vibration. Caltrans recommends that a level of 0.2 in/sec PPV not be exceeded for the protection of normal residential buildings, and that 0.08 in/sec PPV not be exceeded for the protection of old or historically significant structures (Caltrans 2004: 17). With respect to human response within residential and school uses (i.e., annoyance), FTA recommends maximum acceptable vibration levels of 80 and 78 VdB, respectively (FTA 2006).

3A.11.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. Noise impacts under consideration were determined to be significant if the Proposed Project or alternatives under consideration would do any of the following:

- expose persons to or generate noise levels in excess of applicable standards (e.g., County of Sacramento General Plan as shown in Table 3A.11-4 for nontransportation and Table 3A.11-6 for transportation; County of Sacramento Code as shown in Table 3A.11-7; County of El Dorado General Plan as shown in Table 3A.11-8 for transportation, Table 3A.11-9 for nontransportation, and Tables 3A.11-10 through Table 3A.11-12 for construction; City of Folsom General Plan as shown in Table 3A.11-13 for transportation and Table 3A.11-13 for nontransportation; and the City of Folsom Code as shown in Table 3A.11-14 and Table 3A.11-15);

- expose persons to or generate excessive groundborne vibration or groundborne noise levels (e.g., 0.2 in/sec PPV for the prevention of structural damage and 78 VdB for the prevention of human disturbance at sensitive land uses);

- result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project (e.g., increase of more than 3 dB L_{dn}/CNEL);

- result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project (e.g., increase of more than 3 dB L_{dn}/CNEL);

- expose people residing or working in the area to excessive noise levels, for a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or public use airport; or

- expose people residing or working in the project area to excessive noise levels, for a project within the vicinity of a private airstrip.

Analysis Methodology

To assess potential temporary and short-term (construction-related) noise impacts, sensitive receptors and their relative exposure were identified. Project-generated construction source noise levels at these sensitive receptors were determined using the Federal Transit Noise and Vibration Impact Assessment methodology for construction

noise prediction (FTA 2006) along with reference emission noise levels and usage factors based on information contained in the *FHWA Roadway Construction Noise Model User's Guide* (FHWA 2006).

To assess potential long-term (operation-related) noise impacts due to project-generated increases in traffic, modeling was conducted for affected roadway segments using the FHWA Highway Traffic Noise Prediction Model (RD-77-108) (FHWA 1978) and traffic data (e.g., ADT volumes, vehicle speeds, and percent distribution of vehicle types) from DKS & Associates, Inc. and Caltrans. This model is based on the California vehicle noise (CALVENO) reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and ground attenuation factors and does not assume any natural or human-made shielding (e.g., the presence of vegetation, berms, walls, or buildings).

With respect to nontransportation noise sources (e.g., stationary) associated with project implementation, the assessment of long-term (operational-related) impacts was based on reconnaissance data, existing documentation, and standard attenuation rates and modeling techniques.

The methods identified above for transportation and nontransportation source noise were also used to assess the compatibility of the project with future on-site noise levels.

To assess the potential exposure of sensitive receptors to, and generation of excessive groundborne vibration and noise levels, sensitive receptors and their relative exposure were determined based on documented source-specific vibration levels and standard modeling procedures as recommended by federal and state agency guidance.

To evaluate relative significance, noise and vibration impacts were determined based on comparisons to applicable regulations and guidance provided by federal, state, and local agencies.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Exposure to aircraft noise: The nearest 2005 60 dB CNEL noise contour attributable to Mather Airport would be approximately 5,000 feet to the west of the nearest SPA boundary line. Because the SPA would not be located in an area exposed to excessive aircraft-generated noise levels (e.g., not within the 60 dB L_{dn}/CNEL contour of any airport), there would be no impact related to aircraft noise, and therefore this issue is not discussed further in this EIR/EIS.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the Proposed Project Alternative at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.11-1 **Temporary, Short-Term Exposure of Sensitive Receptors to Increased Equipment Noise from Project Construction.** *Project implementation would result in temporary, short-term construction activities associated with development of residential, commercial, schools, and park uses, supporting roadways, and other infrastructure improvements. Project-related construction activities could expose existing off-site and future on-site sensitive receptors to temporary noise levels that exceed the applicable noise standards and/or result in a substantial increase in ambient noise levels.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences would not be anticipated to require a high number of heavy-duty construction equipment, involve intense levels of earth movement, or occur simultaneously within close proximity to sensitive receptors for an extended period of time. Furthermore, agriculture-related noise sources would not be considered subject to applicable County of Sacramento noise-related policies and regulations. Finally, no off-site water facilities would be constructed. Consequently, temporary, short-term construction-related equipment noise levels under the No Project Alternative would not be anticipated to expose persons to or generate levels in excess of applicable standards, or result in a substantial temporary or periodic increase in ambient noise levels. Thus, this would be considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

The No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives include development of a variety of mixed uses (i.e., residential, commercial, office/industrial, schools, community parks, and open space land uses) and supporting on-site roadway and infrastructure improvements. Construction of the proposed land uses and improvements would likely occur by sub-areas, within the SPA, in a sequence established by individual land owners (project applicant[s]) and influenced by market demand.

Construction noise levels in the project vicinity from on-site activities would fluctuate depending on the particular type, number, and duration of usage for the varying equipment. The effects of construction noise largely depend on the type of construction activities occurring on any given day, noise levels generated by those activities, distances to noise sensitive receptors, and the existing ambient noise environment in the receptor's vicinity. Construction generally occurs in several discrete stages, each phase requiring a specific complement of equipment with varying equipment type, quantity, and intensity. These variations in the operational characteristics of the equipment change the effect they have on the noise environment of the SPA and in the surrounding community for the duration of the construction process.

The site preparation phase typically generates the most substantial noise levels because of the on-site equipment associated with grading, compacting, and excavation, which uses the noisiest types of construction equipment. Site preparation equipment and activities include backhoes, bulldozers, loaders, and excavation equipment (e.g., graders and scrapers); and possibly bedrock blasting. Erection of large structural elements and mechanical systems could require the use of a crane for placement and assembly tasks, which may also generate noise levels. Although a detailed construction equipment list is not currently available, it is expected that the primary sources of noise would include backhoes, bulldozers, excavators, bedrock blasting, and other related equipment. Table 3A.11-16 depicts the noise levels generated by various types of construction equipment.

To assess noise levels associated with the various equipment types and operations, construction equipment can be considered to operate in two modes, mobile and stationary. Mobile equipment sources move around a construction site performing tasks in a recurring manner (e.g., loaders, graders, dozers). Stationary equipment operates in a given location for an extended period of time to perform continuous or periodic operations. Thus, determining the location of stationary sources during specific phases, or the effective acoustical center of operations for mobile equipment during various phases of the construction process is necessary. Operational characteristics of heavy construction equipment are additionally typified by short periods of full-power operation followed by extended periods of operation at lower power, idling, or powered-off conditions. As mentioned

above, blasting may also occur on the project-site to loosen bedrock, which would produce a single event noise level (L_{max}) followed by debris removal activities.

Based on the information provided in Table 3A.11-16 and accounting for the usage factor of individual pieces of equipment and activity types, on-site construction would be predicted to result in hourly average noise levels of 87 dB L_{eq} at 50 feet and maximum noise levels of 90 dB L_{max} at 50 feet from the simultaneous operation of heavy-duty equipment and blasting activities. Typical airborne noise associated with blasting activities is at a frequency below the range audible to humans and thus the impacts associated with blasting focus on the effects of groundborne noise and vibration which are discussed separately below in Impact 3A.11-3.

Table 3A.11-16
Noise Emission Levels from Construction Equipment

Equipment Type	Typical Noise Level (dB) @ 50 feet
Air Compressor	78
Asphalt Paver	77
Backhoe	78
Blasting	94
Compactor	83
Concrete Breaker	82
Concrete Pump	81
Concrete Saw	90
Crane, Mobile	81
Dozer	82
Front-end Loader	79
Generator	81
Grade	85
Hoe Ram Extension	90
Jack Hammer	89
Pneumatic Tools	85
Rock Drill	81
Scraper	84
Trucks	74–81
Water Pump	81

Notes:
dB = A-weighted decibels.
Assumes all equipment is fitted with a properly maintained and operational noise control device, per manufacturer specifications. Noise levels listed are manufacture-specified noise levels for each piece of heavy construction equipment.
Source: Bolt Beranek and Newman Inc. 1981, FTA 2006

Noise from localized point sources (such as construction sites) typically decreases by 6 dB to 7.5 dB with each doubling of distance from source to receptor. The existing intervening ground type in the SPA is soft and attenuates noise due to absorption; therefore, an attenuation rate of 7.5 dB per doubling of distance was assumed and accounted for in construction operation noise level predictions.

With respect to future on-site noise-sensitive receptors, the City of Folsom exempts daytime construction noise from applicable standards, as described above in Section 3A.11.2. However, if construction activities occur during the more noise-sensitive evening and nighttime hours, due to the potential necessity of continuous activity for specific components to maintain structural integrity, project-generated noise levels could exceed 45 dB L_{eq} at future on-site sensitive receptors within 2,000 feet of activity centers (e.g., the acoustical center of areas of the SPA where construction activities are focused). Currently, there are no on-site noise-sensitive receptors; however, it is projected that as the project develops, new noise-sensitive receptors could be located near construction source noise activity centers (e.g., well within 2,000 feet as subsequent project phases are developed and each phase includes sensitive uses).

Existing off-site noise sensitive receptors are located in the City of Folsom to the north of the eastern portion of the SPA and in the County of El Dorado to the east of the eastern portion of the SPA. It is projected that the noise-sensitive receptors located in the City of Folsom would not be affected by project construction noise during the daytime hours due to the intervening location of U.S. 50 that serves as a major dominating noise source. In addition, as described above, the City of Folsom exempts daytime construction noise from the applicable standards. Conversely, the County of El Dorado has not adopted an exemption for construction noise that occurs in the daytime hours. Based on the modeling conducted, project-generated noise levels could exceed 55 dB L_{eq} within 850 feet of the activity center. Currently, off-site noise-sensitive receptors in the County of El Dorado are located to the east of the SPA and within 800 feet of proposed areas of construction. Also, if construction activities were to occur during the more noise-sensitive evening and nighttime hours, due to the potential necessity of continuous activity for specific components to maintain structural integrity, project-generated noise levels could exceed 50 and 45 dB L_{eq} within 1,300, and 2,000 feet of the activity centers, respectively. Currently, off-site noise sensitive receptors in both the City of Folsom and the County of El Dorado are located within those project-generated contour distances.

Thus, project construction of on-site elements could expose future on-site and existing off-site sensitive receptors to equipment noise levels that exceed the applicable noise standards and/or result in a substantial increase in ambient noise levels especially during the more noise-sensitive hours of the day. Thus, this would be considered a **direct, significant** impact. **No indirect** impacts would occur. ***[Similar]***

Off-Site Elements

The Proposed Project Alternative includes two off-site roadways that would extend proposed on-site residential streets at the eastern boundary of the SPA to existing roadways in the Stonebriar subdivision. The roadways would extend for a short distance into El Dorado County connecting at Winterfield Drive and Stonebriar Drive opposite the existing junction with Prima Drive. These roadways would not extend into El Dorado Hills under the other four action alternatives. The area around the proposed roadway extensions is currently developed with residential dwellings, and consequently roadway construction would have to be conducted within close proximity to sensitive receptors. Construction of the roadway connections would temporarily result in noise levels that exceed El Dorado County daytime construction noise standards.

Therefore, the potential for temporary, short-term construction-generated noise levels from project implementation of off-site elements to exceed applicable thresholds under the Proposed Project Alternative would be a **direct significant** impact**. No indirect** impacts would occur.

Off-site improvements to the U.S. 50 interchanges at Prairie City Road, Oak Avenue, and Empire Ranch, the Rowberry Drive Overcrossing, and the detention basin west of Prairie City Road are assumed to be constructed during daytime hours as described in the City of Folsom and County of Sacramento Code for which noise levels would be considered exempt from the applicable standards. It should be noted that existing noise levels at the proposed U.S. 50 interchanges and overcrossing (Prairie City Road, Oak Avenue, and Empire Ranch, the Rowberry Drive Overcrossing) are currently dominated by U.S. 50 traffic volumes. Furthermore, the existing and future land uses adjacent to the Prairie City Road, Oak Avenue, and Rowberry Drive Overcrossing are not considered noise sensitive.

Therefore, the potential for temporary, short-term construction-generated noise levels from project implementation of off-site elements to exceed applicable thresholds under the No USACE Permit, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would be a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure 3A.11-1: Implement Noise-Reducing Construction Practices, Prepare and Implement a Noise Control Plan, and Monitor and Record Construction Noise near Sensitive Receptors.

To reduce impacts associated with noise generated during project-related construction activities, the project applicant(s) and their primary contractors for engineering design and construction of all project phases shall ensure that the following requirements are implemented at each work site in any year of project construction to avoid and minimize construction noise effects on sensitive receptors. The project applicant(s) and primary construction contractor(s) shall employ noise-reducing construction practices. Measures that shall be used to limit noise shall include the measures listed below:

- Noise-generating construction operations shall be limited to the hours between 7 a.m. and 7 p.m. Monday through Friday, and between 8 a.m. and 6 p.m. on Saturdays and Sundays.
- All construction equipment and equipment staging areas shall be located as far as possible from nearby noise-sensitive land uses.
- All construction equipment shall be properly maintained and equipped with noise-reduction intake and exhaust mufflers and engine shrouds, in accordance with manufacturers' recommendations. Equipment engine shrouds shall be closed during equipment operation.
- All motorized construction equipment shall be shut down when not in use to prevent idling.
- Individual operations and techniques shall be replaced with quieter procedures (e.g., using welding instead of riveting, mixing concrete off-site instead of on-site).
- Noise-reducing enclosures shall be used around stationary noise-generating equipment (e.g., compressors and generators) as planned phases are built out and future noise sensitive receptors are located within close proximity to future construction activities.
- Written notification of construction activities shall be provided to all noise-sensitive receptors located within 850 feet of construction activities. Notification shall include anticipated dates and hours during which construction activities are anticipated to occur and contact information, including a daytime telephone number, for the project representative to be contacted in the event that noise levels are deemed excessive. Recommendations to assist noise-sensitive land uses in reducing interior noise levels (e.g., closing windows and doors) shall also be included in the notification.
- To the extent feasible, acoustic barriers (e.g., lead curtains, sound barriers) shall be constructed to reduce construction-generated noise levels at affected noise-sensitive land uses. The barriers shall be designed to obstruct the line of sight between the noise-sensitive land use and on-site construction equipment. When installed properly, acoustic barriers can reduce construction noise levels by approximately 8–10 dB (EPA 1971).
- When future noise sensitive uses are within close proximity to prolonged construction noise, noise-attenuating buffers such as structures, truck trailers, or soil piles shall be located between noise sources and future residences to shield sensitive receptors from construction noise.
- The primary contractor shall prepare and implement a construction noise management plan. This plan shall identify specific measures to ensure compliance with the noise control measures specified

above. The noise control plan shall be submitted to the City of Folsom before any noise-generating construction activity begins. Construction shall not commence until the construction noise management plan is approved by the City of Folsom. Mitigation for the two off-site roadway connections into El Dorado County must be coordinated by the project applicant(s) of the applicable project phase with El Dorado County, since the roadway extensions are outside of the City of Folsom's jurisdictional boundaries.

Implementation: Project applicant(s) and primary contractor(s) of all project phases.

Timing: Before and during construction activities in the SPA and within El Dorado Hills.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department.

With implementation of Mitigation Measure 3A.11-1, construction would be limited to daytime hours, for which associated noise levels are considered exempt from the provisions of applicable standards established by the City of Folsom and the County of Sacramento. Therefore, on-site and off-site impacts from temporary, short-term exposure of sensitive receptors to increased equipment noise from project construction under the No USACE Permit, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would be reduced to a **less-than-significant level**. However, because the County of El Dorado has not established an exemption for daytime construction noise levels and sensitive receptors are present near the proposed roadway extensions, Mitigation Measure 3A.11-1 would not reduce impacts to El Dorado County residences under the Proposed Project Alternative related to construction of the off-site roadway connections. Furthermore, the off-site elements in El Dorado Hills fall under the jurisdiction of El Dorado County; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Therefore, this impact under the Proposed Project Alternative, and only related to the off-site roadway connections into El Dorado County, would remain **significant and unavoidable**.

IMPACT 3A.11-2 Temporary, Short-Term Exposure of Sensitive Receptors to Increased Traffic Noise Levels from Project Construction. *Project implementation would result in temporary increases in on- and off-site roadway traffic noise associated with project construction. Construction-generated traffic could expose sensitive receptors to noise levels along on- and off-site roadways that exceed the applicable noise standards and/or result in a substantial increase in ambient noise levels.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences would not be anticipated to require a high number of heavy-duty construction equipment, involve intense levels of earth movement, or occur simultaneously within close proximity to sensitive receptors for an extended period of time. Furthermore, no off-site water facilities would be constructed. Consequently, the No Project Alternative would not be anticipated to require in a substantial increase in traffic on off-site or on-site roadways from construction. Thus, temporary, short-term construction-related traffic noise levels under the No Project Alternative would not be anticipated to expose sensitive receptors to or generate levels in excess of applicable standards, or result in a substantial temporary or periodic increase in ambient noise levels. Thus, this would be considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD,

Construction of the Proposed Project and the other four action alternatives would result in additional vehicle trips on the local roadway network from worker commute and the transport of equipment and materials. The exact number of daily trips required for project construction is not known at this time. However, based on professional judgment and experience with similar types of projects, said activities typically do not include more than 500 daily one-way trips even with projects that involve intensive earth movement activities (e.g., soil import/export), which would not be anticipated for construction of any of the on-site or off-site elements. An increase in traffic noise levels of 3 dB CNEL/L_{dn} or greater at noise-sensitive receptors along affected roadway segments would be considered substantial as such is perceivable to the human ear. Typically, when the ADT volume is doubled on a roadway segment in comparison to existing conditions, the resultant increase is approximately 3 dB CNEL/L_{dn}. According to the traffic analysis, ADT volumes on roadway segments in the project vicinity range from 1,800 to149,000 under existing no project conditions. Additionally, the existing no project ADT volumes on those segments (i.e., White Rock Road, between Prairie City Road and the eastern boundary of the SPA, and U.S. 50) anticipated to provide primary access to construction areas would range from 7,600 up to 87,000, respectively. Therefore, project construction would not be anticipated to result in a doubling of ADT volumes (e.g., assuming a maximum of 500 additional one-way trip to roadways with a minimum of 1,800 under existing conditions) along affected roadway segments even when considering the increased tire and engine source noise from these types of trips (e.g., primarily heavy-duty trucks). Thus, implementation of on- and off-site elements of the Proposed Project and the other four action alternatives would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project from project construction traffic; or, consequently, expose sensitive receptors to or generate noise levels in excess of applicable standards. As a result, this **direct impact** would be **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.11-3 Temporary, Short-Term Exposure of Sensitive Receptors to Potential Groundborne Noise and Vibration from Project Construction. *Project implementation could expose sensitive receptors to groundborne noise and vibration levels that exceed applicable standards that could cause human disturbance or damage structures.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences would not be anticipated to require high intensity groundborne noise or vibration-generating equipment or activities within close proximity to sensitive receptors. Furthermore, no off-site water facilities would be developed. Therefore, the impact from temporary construction-generated vibration or groundborne noise is considered **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD,

Construction activities in the SPA may result in varying degrees of temporary groundborne noise and vibration, depending on the specific construction equipment used and activities involved. Groundborne noise and vibration levels caused by various types of construction equipment and activities (e.g., bulldozers, blasting, etc.) are summarized in Table 3A.11-17.

Table 3A.11-17
Representative Groundborne Noise and Vibration Levels for Construction Equipment

Equipment	PPV at 25 feet (in/sec)[1]	Approximate L_v (VdB) at 25 feet[2]
Blasting	1.13	109
Large Bulldozer	0.089	87
Caisson Drilling	0.089	87
Trucks	0.076	86
Rock Breaker	0.059	83
Jackhammer	0.035	79
Small Bulldozer	0.003	58

[1] Where PPV is the peak particle velocity
[2] Where Lv is the root mean square velocity expressed in vibration decibels (VdB), assuming a crest factor of 4.
Source: FTA 2006

With respect to the Proposed Project and the other four action alternatives, maximum groundborne noise and vibration levels would be associated with bulldozing and blasting activities. According to FTA, levels associated with the use of a large bulldozer and blasting are 0.089 and 1.13 in/sec PPV (87 and 109 VdB) at 25 feet, respectively, as shown in Table 3A.11-17.

With respect to the prevention of structural damage, bulldozing would not exceed the Caltrans-recommended level of 0.2 in/sec PPV, even at a distance of 25 feet. However, blasting could exceed this level within 80 feet of said activities based on FTA's recommended procedure for applying a propagation adjustment to these reference levels. In addition, with respect to prevention of human disturbance, bulldozing and blasting could exceed the FTA-recommended level of 78 VdB within 50 and 275 feet, respectively. Long-term operational-related activities would not be anticipated to include any major sources of groundborne noise or vibration. The exact locations of bulldozing activities and blasting points have not been determined at this time; however, the nearest sensitive receptors (e.g., existing off-site El Dorado residences to the east of the steep hillside area where blasting could occur, and planned on-site receptors) could be located within the distances modeled above that are correlated with the Caltrans- and FTA- recommended exceedance levels. Thus, short-term construction could result in the exposure of persons to or generation of excessive groundborne noise or vibration levels. As a result, this would be a **direct significant** impact. **No indirect** impacts would occur. ***[Similar]***

Off-Site Elements

The off-site improvements to the U.S. 50 interchanges at Prairie City Road and the construction of the Oak Avenue and Empire Ranch interchanges, the Rowberry Drive Overcrossing, the El Dorado County roadway connections and the detention basin west of Prairie City Road would be anticipated to include the use of typical heavy construction equipment (e.g., bulldozing). Blasting is not expected to be required for construction of these off-site elements. As described above, bulldozing would not exceed the Caltrans-recommended level of 0.2 in/sec PPV for the prevention of structural damage even at a distance of 25 feet; however, bulldozing could exceed the FTA-recommended level of 78 VdB for the prevention of human disturbance within 50 feet of said activities. The nearest receptor relative to off-site construction elements is approximately 40 feet from the proposed Empire Ranch interchange onramp, which is within the distance modeled above that is correlated with the FTA-recommended exceedance levels. Thus, short-term construction could result in the exposure of persons to or generation of excessive groundborne noise or vibration levels. As a result, this would be a **direct, significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.11-3: Implement Measures to Prevent Exposure of Sensitive Receptors to Groundborne Noise or Vibration from Project Generated Construction Activities.

- To the extent feasible, blasting activities shall not be conducted within 275 feet of existing or future sensitive receptors.
- To the extent feasible, bulldozing activities shall not be conducted within 50 feet of existing or future sensitive receptors.
- All blasting shall be performed by a blast contractor and blasting personnel licensed to operate in the State of California.
- A blasting plan, including estimates of vibration levels at the residence closest to the blast, shall be submitted to the enforcement agency for review and approval prior to the commencement of the first blast.
- Each blast shall be monitored and documented for groundbourne noise and vibration levels at the nearest sensitive land use and associated recorded submitted to the enforcement agency.

Implementation: Project applicant(s) and primary contractor(s) of all project phases.

Timing: Before and during bulldozing and blasting activities in the SPA and within El Dorado Hills and the County of Sacramento

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department.
3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measure 3A.11-3 would reduce project-generated groundborne noise and vibration levels and the exposure thereof under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives. However, depending on the exact location of said activities, which is not determined at this time, sensitive receptors could still be exposed to levels that exceed those recommended by Caltrans and FTA for the prevention of structural damage and human disturbance. Furthermore, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. As a result, this **direct** impact would be considered **significant and unavoidable**. ***[Similar]***

IMPACT 3A.11-4 Long-Term Exposure of Sensitive Receptors to Increased Traffic Noise Levels from Project Operation. *Project implementation would result in long-term increases in ADT volumes on affected roadway segments. Increased traffic volumes would result in a substantial (e.g., 3 dB L_{dn}/CNEL) increase in ambient noise levels on- and off-site at nearby noise-sensitive receptors.*

On-Site Elements

NP

Under the No Project Alternative, agricultural activities would continue under the existing AG-80 zoning, along with potential construction of up to 44 rural residences, and no off-site water facilities would be constructed. The increase in ADT volumes on affected roadway segments would be minor compared to existing and predicted future traffic volumes. Therefore, this is considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

Project implementation would result in an increase in ADT volumes on affected roadway segments and, consequently, an increase in traffic source noise. To assess this impact, traffic noise levels associated with the Proposed Project and the other four action alternatives under existing no project and plus project conditions were predicted for affected roadway segments using FHWA's Highway Noise Prediction Model (FHWA-RD-77-108) (FHWA 1978) and traffic data (e.g., ADT volumes, vehicle speeds, and percent distribution of vehicle types) from DKS Associates, Inc. and Caltrans. This model is based on the California vehicle noise (CALVENO) reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and ground attenuation factors and does not assume any natural or human-made shielding (e.g., the presence of vegetation, berms, walls, or buildings).

Table 3A.11-18 summarizes the modeled traffic noise levels at the approximate road corridor boundary under existing no project and existing plus project (i.e., the Proposed Project and the other four action alternatives) conditions. Table 3A.11-18 also includes the net increase under existing plus project (i.e., the Proposed Project and the other four action alternatives) conditions in comparison to existing no project conditions. As shown in Table 3A.11-18, project implementation would result in net increases along affected roadway segments in comparison to existing no project conditions that range from -6.7 to 10.0 under existing plus Proposed Project Alternative conditions; -6.7 to 10.1 under existing plus Resource Impact Minimization Alternative conditions; -8.2 to 10.8 under existing plus Centralized Development Alternative conditions; -6.2 to 10.9 under existing plus Reduced Hillside Development Alternative conditions; and -6.7 to 10.5 under existing plus No USACE Permit Alternative conditions. In Table 3A.11-18, those modeled increases that would be considered substantial (e.g., 3 dB L_{dn}/CNEL where existing or projected future traffic noise levels range between 60 and 65 dB L_{dn}/CNEL, or 1.5 dB L_{dn}/CNEL where existing or projected future traffic noise levels are greater than 65 dB L_{dn}/CNEL) in comparison to existing no project conditions are indicated in bold. Table 3A.11-19 summarizes the modeled traffic noise levels at the approximate road corridor boundary under future (2030) no project and future plus project (i.e., Proposed Project and the other four action alternatives) conditions. Similar to the modeling presented in Table 3A.11-18 for existing conditions, modeled increases for future conditions that would be considered substantial are indicated in bold. As shown, there are numerous roadway segments for which project implementation would result in a substantial permanent increase in ambient noise levels on- and off-site at nearby sensitive receptors (e.g., Empire Ranch Road from Broadstone Parkway to Iron Point Road and Latrobe Road from White Rock Road to Golden Foothills Parkway). As a result, this would be a **direct significant** impact. **No indirect** impacts would occur. ***[Similar]***

Notes: CNEL = Community Noise Equivalent Level; dB = A-weighted decibels; L_{dn} = day-night average noise level; Δ = Change; NP = No Project; PP = Proposed Project Alternative; RIM = Resource Impact Minimization Alternative; CD = Centralized Development Alternative; RHD = Reduced Hillside Development Alternative; NCP = No USACE Permit Alternative.

Bold: Represents the potential for substantial increase (e.g., 3 dB L_{dn}/CNEL where existing or projected future traffic noise levels range between 60 and 65 dB L_{dn}/CNEL, 1.5 dB L_{dn}/CNEL where existing or projected future traffic noise levels are greater than 65 dB L_{dn}/CNEL) in comparison to existing no project conditions.

Refer to Appendix J for detailed modeling input data and output results.

Source: Data provided by AECOM in 2009

Mitigation Measure 3A.11-4: Implement Measures to Prevent Exposure of Sensitive Receptors to Increases in Noise from Project-Generated Operational Traffic on Off-Site and On-Site Roadways.

To meet applicable noise standards as set forth in the appropriate General Plan or Code (e.g., City of Folsom, County of Sacramento, and County of El Dorado) and to reduce increases in traffic-generated noise levels at noise-sensitive uses, the project applicant(s) of all project phases shall implement the following:

- Obtain the services of a consultant (such as a licensed engineer or licensed architect) to develop noise-attenuation measures for the proposed construction of on-site noise-sensitive land uses (i.e., residential dwellings and school classrooms) that will produce a minimum composite Sound Transmission Class (STC) rating for buildings of 30 or greater, individually computed for the walls and the floor/ceiling construction of buildings, for the proposed construction of on-site noise-sensitive land uses (i.e., residential dwellings and school classrooms).
- Prior to submittal of tentative subdivision maps and improvement plans, the project applicant(s) shall conduct a site-specific acoustical analysis to determine predicted roadway noise impacts attributable to the project, taking into account site-specific conditions (e.g., site design, location of structures, building characteristics). The acoustical analysis shall evaluate stationary- and mobile-source noise attributable to the proposed use or uses and impacts on nearby noise-sensitive land uses, in accordance with adopted City noise standards. Feasible measures shall be identified to reduce project-related noise impacts. These measures may include, but are not limited to, the following:
  - limiting noise-generating operational activities associated with proposed commercial land uses, including truck deliveries;
  - constructing exterior sound walls;
  - constructing barrier walls and/or berms with vegetation;
  - using "quiet pavement" (e.g., rubberized asphalt) construction methods on local roadways; and,
  - using increased noise-attenuation measures in building construction (e.g., dual-pane, sound-rated windows; exterior wall insulation).

Implementation: Project applicant(s) of all project phases.

Timing: Before submittal of tentative subdivision maps or improvement plans; during project construction activities at noise-sensitive receptors in the SPA; at the existing noise-sensitive receptors on Empire Ranch Road from Broadstone Parkway to Iron Point Road; and at the existing noise-sensitive receptors on Latrobe Road from White Rock Road to Golden Foothills Parkway

Enforcement:

1. For all noise-sensitive receptors that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For all noise-sensitive receptors in El Dorado Hills: El Dorado County Development Services Department.
3. For all noise-sensitive receptors in the vicinity the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For all noise-sensitive receptors adjacent to the U.S. 50 interchange improvements: Caltrans.

Significant traffic noise impacts at existing noise-sensitive areas associated with growth of communities are generally very difficult to feasibly mitigate because some areas may already have noise barriers, or new noise barriers may be infeasible from a cost standpoint or ineffective because of openings in the barriers that are commonly required for roadway ingress and egress. Because it may not be feasible to reduce the project-related

long-term operations traffic noise level increases to a less-than-significant level at all existing noise-sensitive land uses along affected roadway segments, this **direct** impact under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would remain **significant and unavoidable**. **No indirect** impacts would occur. ***[Similar]***

Off-Site Elements

The off-site elements would not be anticipated to result in increased traffic noise levels beyond those associated with the on-site project development. While the road improvement-related elements would accommodate local vehicle traffic, they would not be expected to result in a substantial increase in vehicle trips and associated increase in traffic source noise. (A substantial portion of vehicle trips using the proposed roadway infrastructure elements would be generated by the land uses developed in the SPA and associated traffic source noise levels are discussed in the analysis of on-site elements above.) Some of the roadway infrastructure improvements may actually reduce ADT by enabling more direct travel routes between area destinations. Also, it is not anticipated that the detention basin would generate a substantial number of vehicle trips other than the nominal amount of trips associated with routine maintenance of the facility. As a result, under all five action alternatives this **direct** impact would be **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.11-5 Long-Term Exposure of Sensitive Receptors to Increased Stationary-Source Noise Levels from Project Operation. *Project implementation would result in increases in on-site stationary-source noise levels associated with the proposed residential, commercial, mixed-use, office/industrial, park, and educational land uses. These stationary noise sources could exceed the applicable noise standards (hourly and maximum) and result in a substantial increase in ambient noise levels.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences could include the operation of stationary noise sources related to heating and cooling. Agriculture-related noise sources would not be considered subject to applicable County of Sacramento noise-related policies and regulations. Furthermore, mechanical equipment associated with heating and cooling is typically shielded and would likely be located far from any sensitive receptors due to the rural nature of the area. Furthermore, no off-site water facilities would be constructed. Consequently, long-term operational-related stationary source noise levels under the No Project Alternative would not be anticipated to expose persons to or generate levels in excess of applicable standards, or result in a substantial permanent increase in ambient noise levels. Thus, this would be considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

This impact assesses the long-term exposure of existing off-site and proposed on-site sensitive receptors to increased stationary-source noise levels from proposed on-site project operations. The land use compatibility of future noise levels at the proposed on-site sensitive receptors from off-site stationary noise sources are discussed in Impact 3A.11-7. It is important to also note for the assessment of this impact that the applicable Code states that the external noise level at residential land uses caused by stationary noise sources must be less than 50 dB for 30 minutes in every hour during the daytime (7 a.m. to 10 p.m.) and less than 45 dB for 30 minutes of every hour during the night time (10 p.m. to 7 a.m.). These criteria are the most stringent of the applicable noise standards. Therefore, all criteria that apply to stationary noise sources would be complied with if external noise levels at

residential land uses were limited to less than 50 dB during the day time and less than 45 dB during the night time.

The land use plans under the Proposed Project and the other four action alternatives feature a mix of various land uses, including residential, commercial, mixed-use, office/industrial, park, and educational. These land uses would introduce new on-site stationary noise sources, including rooftop heating, ventilation, and air conditioning (HVAC) equipment; mechanical equipment; emergency electrical generators; parking lot activities; and loading dock operations. The sources and levels of noise typically associated with these land uses that are stationary in nature are discussed separately below.

Mechanical HVAC Equipment

HVAC equipment could be a primary noise source associated with residential, commercial, and industrial uses. HVAC equipment is often mounted on rooftops, located on the ground, or located within mechanical rooms. The noise sources could take the form of fans, pumps, air compressors, chillers, or cooling towers. Noise levels from HVAC equipment vary substantially depending on unit efficiency, size, and location, but generally range from 45 to 70 dB L_{eq} at a distance of 50 feet (EPA 1971). Accounting for typical attenuation rates of 6 dB per doubling of distance and shielding provided by on-site structures, noise levels attributed to HVAC mechanical systems are not anticipated to exceed stationary-source noise level criteria; however, the potential for impacts still exists. As a result, the impact of noise from HVAC equipment under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Emergency Electrical Generators

Emergency generators may be used to supply necessary power requirements to vital systems within facilities constructed on the general commercial, community commercial, office/industrial, and mixed-use land uses. Emergency generators are typically operated under two conditions: loss of main electrical supply or preventive maintenance/testing. The operation of mechanical equipment associated with emergency operations is exempt from the noise standards outlined in the Folsom City Municipal Code; thus, this analysis focuses on routine preventive maintenance and testing operations, which are conducted on a periodic basis.

Reference noise-level measurements of emergency generators with rated power outputs from 50 kilowatts (kW) to 125 result in noise levels ranging from 61 to 73 dB L_{eq} and 63–84 dB L_{max} at a distance of 45 feet (EPA 1971, RCNM 2006). Based on these reference noise levels, emergency electrical generators located within 700 feet of noise-sensitive land uses could exceed the City noise standard for daytime stationary-source noise. In addition, generators located within 1,200 feet of noise-sensitive land uses could exceed the City noise standard for nighttime stationary-source noise. As a result, the impact of noise levels from preventive maintenance testing and operation of emergency electrical generators under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Parking Lot Activities

Parking lots are expected to be included in the office/industrial and community commercial land uses. The details required to accurately predict noise emissions from car parking activities, location, size, and parking demand are not yet established. Therefore, the potential impact of noise generated by parking lot operations is evaluated in this analysis using a representative scenario at a programmatic level.

Reference noise level measurements of parking lot activities indicate that average sound exposure levels (SEL) associated with a single parking event are approximately 71 dB SEL at distance of 50 feet (FTA 2006). Activities making up a single parking event included vehicle arrival, limited idling, occupants exiting the vehicle, door closures, conversations among passengers, occupants entering the vehicle, startup, and departure of the vehicle. A

representative parking lot with 1,000 stalls and 1,000 parking events per hour would produce a noise level that exceeds the City standard for the daytime at distances up to 380 feet and exceeds the nighttime noise standard at distances up to 600 feet. It is possible that the distance between parking lots and residential land uses would be less than 380 feet because shared boundaries between commercial, community commercial, and office/industrial land uses exist under the Proposed Project and the other four action alternatives. Therefore, the impact of noise generated from parking lot activities under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Loading Dock and Delivery Activity

Noise sources associated with loading dock and delivery activities can include trucks idling, on-site truck circulation, trailer-mounted refrigeration units, pallets dropping, and the operation of forklifts. Reference noise level measurements at loading docks previously undertaken by AECOM indicates that typical hourly average noise levels range from 55 to 60 dB L_{eq} and from 80 to 84 dB L_{max} at a distance of 50 feet (EDAW/AECOM [now AECOM] 2008). Based on these previously measured noise levels, the City's daytime stationary noise criterion would be exceeded approximately 300 feet from the acoustic centre of the loading dock and the nighttime stationary noise criterion would be exceeded approximately 170 feet from the acoustic centre of the loading dock.

It is possible that the distance between loading docks and residential land uses could be less than 170 feet because shared boundaries between commercial, community commercial, and office/industrial land uses are planned under the Proposed Project and the other four action alternatives. Therefore, noise generated from loading dock and delivery activities under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives is considered a **direct, potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Emergency Facilities

The proposed land uses would also include emergency facilities such as fire stations that generate high noise levels from alarms and vehicle movements when station crews respond to emergency situations. The noise levels associated with the operation of emergency activities are exempt from the Folsom City Noise Ordinance and proposed locations are anticipated to include perimeter walls around the emergency facilities to shield noise-sensitive receptors from facility operational noise. Thus, this would be considered a **direct, less-than-significant** impact under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives. **No indirect** impacts would occur. ***[Similar]***

Outdoor Recreational and Educational Activities

Activities in the proposed parks, open spaces, and schools would also be sources of noise. The Folsom City Municipal Code considers noise from unlighted public parks, public playgrounds, and public or private schools exempt from the Code from the hours of 7 a.m. to dusk, and from 7 a.m. to 11 p.m. for such facilities that are lighted. In addition, proposed locations are of sufficient distance (greater than 100 feet) or shielded by the eastern hillside with regards to off-site noise-sensitive receptors located in El Dorado Hills. Therefore, noise from outdoor recreational and educational activities under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives is considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Similar]***

> Mitigation Measure 3A.11-5: Implement Measures to Reduce Noise from Project-Generated Stationary Sources.
>
> The project applicant(s) of all project phases shall implement the following measures to reduce the effect of noise levels generated by on-site stationary noise sources that would be located within 600 feet of any noise-sensitive receptor:

- Routine testing and preventive maintenance of emergency electrical generators shall be conducted during the less sensitive daytime hours (i.e., 7:00 a.m. to 6:00 p.m.). All electrical generators shall be equipped with noise control (e.g., muffler) devices in accordance with manufacturers' specifications.

- External mechanical equipment associated with buildings shall incorporate features designed to reduce noise emissions below the stationary noise source criteria. These features may include, but are not limited to, locating generators within equipment rooms or enclosures that incorporate noise-reduction features, such as acoustical louvers, and exhaust and intake silencers. Equipment enclosures shall be oriented so that major openings (i.e., intake louvers, exhaust) are directed away from nearby noise-sensitive receptors.

- Parking lots shall be located and designed so that noise emissions do not exceed the stationary noise source criteria established in this analysis (i.e., 50 dB for 30 minutes in every hour during the daytime [7 a.m. to 10 p.m.] and less than 45 dB for 30 minutes of every hour during the night time [10 p.m. to 7 a.m.]). Reduction of parking lot noise can be achieved by locating parking lots as far away as possible from noise sensitive land uses, or using buildings and topographic features to provide acoustic shielding for noise-sensitive land uses.

- Loading docks shall be located and designed so that noise emissions do not exceed the stationary noise source criteria established in this analysis (i.e., 50 dB for 30 minutes in every hour during the daytime [7 a.m. to 10 p.m.] and less than 45 dB for 30 minutes of every hour during the night time [10 p.m. to 7 a.m.]). Reduction of loading dock noise can be achieved by locating loading docks as far away as possible from noise sensitive land uses, constructing noise barriers between loading docks and noise-sensitive land uses, or using buildings and topographic features to provide acoustic shielding for noise-sensitive land uses.

Implementation: Project applicant(s) of all project phases.

Timing: Before submittal of improvement plans for each project phase, and during project operations for testing of emergency generators.

Enforcement: City of Folsom Community Development Department.

Implementation of Mitigation Measure 3A.11-5 would reduce stationary source noise from proposed on-site project operations to levels in compliance with the City of Folsom Code to a **less-than-significant** level under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives through the use of noise control devices, restricted operational periods, and required design features.

Off-Site Elements

Project implementation would not create off-site stationary noise sources under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives. Therefore, there would be **no direct** or **indirect** impact. ***[Similar]***

Mitigation Measures: No mitigation measures are required.

IMPACT 3A.11-6 Single-Event Aircraft Noise. *New noise-sensitive land uses proposed in the SPA could be exposed to single-event noise from aircraft overflights. Overflights would not result in interior noise levels that create sleep disturbance.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. If developed, the residents of these homes would be subject to similar nighttime flyover conditions as under the Proposed Project Alternative. For the same reasons described below under the Proposed Project Alternative, this **direct** impact is considered **less-than-significant**. **No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

Aircraft approaching and departing Mather Airfield have the potential to pass above the SPA. The single-event noise exposure level (SENEL) is a measure of the acoustical energy generated during an aircraft flyover normalized to a one-second flyover time. This normalization allows for a comparison of events with different flyover times and acoustic output. Thus, a very short duration, high noise level event could be equivalent to a much longer event generating a lower noise level.

According to the *Noise Measurements and Analysis Along the Approach Corridor to Mather Airport* technical memorandum prepared by Harris Miller Miller & Hanson Inc. (November 12, 2002), the average noise levels at the most representative measurement site of the SPA were 76.9 dB SENEL and 66.1 dB L_{max}. In addition, the loudest noise level measured for an aircraft approaching Mather Airport was 87.8 dB SENEL with a maximum instantaneous noise level of 77.4 dB L_{max} as the aircraft passed directly overhead. It should be noted that an aircraft approaching Mather Airport on October 24, 2002 at 7:17 a.m. created the loudest noise measured at 87.8 dB SENEL and 77.4 dB L_{max} (Harris Miller Miller & Hanson 2002). Also, sound levels measured on October 25, 2002 showed that the maximum noise level measured did not exceed 70 dB during the early morning hours (Harris Miller Miller & Hanson 2002).

A typical home with windows and doors closed will provide an exterior to interior noise level reduction of 25 to 30 dB (Veneklasen 1973: 21). In addition, the FAA concluded that a maximum interior noise level of 55 dB would not create significant sleep disturbance (FAA 1985). The loudest noise level measured of an aircraft flyover (77.4 dB L_{max}) would result in an interior noise level between 47.4 and 53.4 dB. Based on the measured noise levels of variable single event nighttime flyovers documented by Harris Miller Miller & Hanson Inc. at the representative noise measurement site for the SPA, aircraft flyovers are not expected to generate interior noise levels greater than 55 dB with windows and doors closed. Therefore, aircraft flyovers would not cause sleep disturbance at sensitive noise receptors in the SPA. As a result, this **direct** impact would be considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Off-Site Elements

Implementation of the off-site elements would not include the creation of noise-sensitive land uses. Therefore, there would be no noise incompatibilities between the off-site elements and nighttime flyovers associated with Mather Airport, and **no direct** or **indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.11-7 Compatibility of Proposed On-Site Land Uses with the Ambient Noise Environment. *The project includes development of on-site noise-sensitive land uses that could be exposed to noise levels that exceed the noise standards set forth in the applicable General Plan and Code.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, these residences would be anticipated to be sparsely developed over approximately 3,500 acres and setback from nearby roadways and stationary noise sources (e.g., future development at the Aerojet site) at sufficient distances where associated noise levels would not exceed applicable standards. Furthermore, no off-site water facilities would be constructed. Therefore, this **direct** impact is considered **less-than-significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

Noise from roadway traffic, and activities at the Aerojet General Corporation and Prairie City SRVA with respect to ambient noise levels in the SPA, are discussed separately below.

Roadway Traffic

Ambient noise levels in the SPA would be influenced largely by vehicle traffic on area roadways. Traffic noise levels within the SPA were modeled using the FHWA's Highway Noise Prediction Model (FHWA-RD-77-108) and traffic data (e.g., ADT volumes, vehicle speeds, and percent distribution of vehicle types) from DKS Associates, Inc. and Caltrans. This model is based on the California vehicle noise (CALVENO) reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and ground attenuation factors and does not assume any natural or human-made shielding (e.g., the presence of vegetation, berms, walls, or buildings).

Table 3A.11-18 summarizes the modeled traffic noise levels at the approximate road corridor boundary under existing no project and existing plus project (i.e., the Proposed Project and the other four action alternatives) conditions. Table 3A.11-19 summarizes the modeled traffic noise levels at the approximate road corridor boundary under future (2030) no project and future plus project (i.e., the Proposed Project and the other action alternatives) conditions.

The 60-dB L_{dn}/CNEL noise contours for adjacent roadways (i.e., U.S. 50, White Rock Road, and Prairie City Road) and on-site proposed roadways (i.e., Oak Avenue, Scott Road, Placerville Road, Street "B," Empire Ranch Road, Easton Valley Parkway, and Street "A"), extend onto portions of the SPA, including areas of proposed single-family and multifamily residential development. Predicted noise levels at some proposed on-site residential land uses would exceed the City's land-use compatibility standard of 60 dB L_{dn}/CNEL. In addition, exterior noise levels that exceed 70 L_{dn}/CNEL would also be anticipated to exceed the City's interior noise standard of 45 L_{dn}/CNEL, based on a standard interior to exterior reduction of 25 dB. Thus, exposure of proposed on-site land uses to traffic noise levels would be considered a **direct, significant** impact. **No indirect** impacts would occur. ***[Similar]***

Aerojet General Corporation

Aerojet land is located south of U.S. 50 between Mercantile Drive and Prairie City Road, west of the SPA. Primary noise-generating activities at this facility have historically been associated with the testing of rocket and high-performance aircraft engines for use in military and aerospace applications. GenCorp Realty Investments,

Aerojet's parent company, is currently in the process of phasing out the testing of the large-diameter rocket and aircraft engines at this facility, although testing of smaller engines would continue (Gunderson, pers. comm., 2005). Typically, the 65- and 75-dB noise contours associated with the firing of smaller rocket engines (60,000 pounds of thrust) extend to approximately 7,920 and 4,224 feet, respectively, from test stands. Noise from engine testing typically occurs during the daytime hours for periods of 1 to 60 seconds in duration (Sacramento County 1998.) Additional on-site noise sources associated with this facility include industrial operations such as manufacturing, cleaning, maintenance, heating and cooling, equipment operations, and pollution control activities (Sacramento County 1998; Gunderson 2005). Noise from these additional noise sources can generate noise levels ranging from less than 50 dB to approximately 110 dB at 3 feet from the source (EPA 1971). Because of the distance between the projects site and such activities, combined with information that testing typically occurs during the less-sensitive daytime hours for short durations (e.g., 1 to 600 seconds), activities at the Aerojet facility would not be anticipated to exceed the City's nontransportation noise standards (e.g., 50 dB for 30 minutes in every hour during the daytime [7 a.m. to 10 p.m.]). As a result this **direct** impact is considered **less-than-significant**. **No indirect** impacts would occur. ***[Similar]***

Prairie City State Vehicular Recreation Area

Noise from use of recreational off-road vehicles on the Prairie City SRVA to the southwest of the SPA could exceed City noise standards at noise-sensitive receptors in the SPA. Noise emissions from the Prairie City SRVA were predicted using the assumption that noise produced by all vehicles operating on the site would be limited to 96 dB at 20 inches from the tail pipe as required by state law. The boundary of the Prairie City SRVA is approximately 1,600 feet from the nearest noise-sensitive development in the SPA. At this distance, the worst-case simultaneous operation of four off-road vehicles operating in the same location for an extended period of time on the SRVA boundary and emitting the maximum legal noise level would produce a noise level of approximately 40 dB at the nearest residential receptor in the SPA, which would not be anticipated to exceed the City's noise standards. Therefore, this potential **direct** impact is considered **less-than-significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.11-4.

Timing: Before submittal of tentative subdivision maps or improvement plans

Enforcement: Folsom Community Development Department

Typically, a 6-foot sound wall would reduce noise levels from approximately 5-6 dB and for each additional foot of wall another 1 dB (Caltrans 1998). Thus, implementation of Mitigation Measure 3A.11-4 would reduce on-site traffic noise levels at proposed noise-sensitive land uses to levels conditionally acceptable with mitigation (i.e., 65 dB L_{dn}/CNEL). As a result, this direct impact would be reduced to a **less-than-significant** level under all five action alternatives.

Off-Site Elements

Implementation of the off-site elements would not include the creation of noise-sensitive land uses. Therefore, there would be no incompatibilities between City or Sacramento or El Dorado County noise standards for land uses and the off-site elements, and **no direct** or **indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3A.11.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of mitigation measures contained in this section would reduce impacts associated with temporary, short-term exposure of sensitive receptors to increased equipment noise and groundborne noise and vibration

from project construction and the long-term exposure of sensitive receptors to increased operational traffic noise levels from project operation, but not to a less-than-significant level, because noise levels would (or could potentially) still exceed applicable thresholds and, therefore, residual significant impacts would occur. All other noise impacts would be reduced to a less-than-significant following implementation of mitigation measures contained in this section.

Additionally, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties and/or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Therefore, the impacts related to those off-site facilities that are under the jurisdiction of El Dorado County, Sacramento County, or Caltrans, are considered potentially significant and unavoidable. If El Dorado County, Sacramento County, and Caltrans cooperate in implementation of the recommended mitigation measures, then those impacts would be reduced to a less-than-significant level.

This section was prepared by RMC Water and Environment.

3B.11 NOISE – WATER

3B.11.1 AFFECTED ENVIRONMENT

This section provides a description of the existing ambient noise environment for the "Water" Study Area. In the context of the actions proposed as part of the Off-site Water Facility Alternatives, emphasis is placed on portions of the "Water" Study Area where physical environmental changes would occur. As provided in Chapter 2, "Alternatives," physical improvements associated with the Off-site Water Facility Alternatives are limited to areas within Zone 4; whereas no physical improvements are proposed within Zones 1, 2, or 3. For this reason, the, "Noise" analysis for the "Water" project is focused primarily on Zone 4.

NOISE EXPOSURE AND COMMUNITY NOISE

Community noise varies continuously over a period of time with respect to the contributing sound sources of the community noise environment. Community noise is primarily the product of many distant noise sources which constitute a relatively stable background noise exposure, with the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources such as traffic and atmospheric conditions. Community noise is constantly changing throughout the day due to short duration single-event noise sources, such as aircraft flyovers, vehicle passbys, or sirens. These successive additions of sound to the community noise environment vary the community noise level from instant to instant. This requires the measurement of noise exposure over a period of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts. This time-varying characteristic of environmental noise is described using statistical noise descriptors. The most frequently used noise descriptors are summarized below (Caltrans 1998):

- **L_{eq}:** the equivalent sound level is used to describe noise over a specified period of time, typically one hour, in terms of a single numerical value. The L_{eq} is the constant sound level which would contain the same acoustic energy as the varying sound level, during the same time period (i.e., the average noise exposure level for the given time period).

- **L_{max}:** the instantaneous maximum noise level for a specified period of time.

- **L_{dn}:** 24-hour day and night A-weighed noise exposure level which accounts for the greater sensitivity of most people to nighttime noise by weighting noise levels at night ("penalizing" nighttime noises). Noise between 10:00 p.m. and 7:00 a.m. is weighted (penalized) by adding 10 dB to take into account the greater annoyance of nighttime noises.

EFFECTS OF NOISE ON PEOPLE

The effects of noise on people can be placed in three categories:

1. subjective effects of annoyance, nuisance, dissatisfaction;
2. interference with activities such as speech, sleep, learning; and
3. physiological effects such as hearing loss or sudden startling.

Environmental noise typically produces effects in the first two categories. Workers in industrial settings can experience noise in the last category. A satisfactory method for measuring the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction does not exist. However, a wide variation in individual thresholds of annoyance does exist, and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted, i.e., the "ambient noise" level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise would be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships occur (Caltrans 1998):

- except in carefully controlled laboratory experiments, a change of 1 dBA cannot be perceived;
- outside of the laboratory, a 3 dBA change is considered a perceivable difference;
- a change in level of at least 5 dBA is required before any noticeable change in human response would be expected; and
- a 10 dBA change is subjectively heard as approximately a doubling in loudness, and can cause adverse response.

These relationships occur in part because of the logarithmic nature of sound and the decibel system. The human ear perceives sound in a nonlinear fashion hence the decibel scale was developed. Because the decibel scale is based on logarithms two noise sources do not combine in a simple additive fashion, rather logarithmically. For example, if two identical noise sources produce noise levels of 50 dB, the combined sound level would be 53 dB, not 100 dB. Because of this sound characteristic, if two noise emission sources, one producing a noise level greater than 9 dB than the other, the contribution of the quieter noise source is negligible and the sum of the noise sources is that of the louder noise source.

NOISE ATTENUATION

Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate (lessen) at a rate between 6 dBA for hard sites and 7.5 dBA for soft sites for each doubling of distance from the reference measurement. Hard sites are those with a reflective surface between the source and the receiver such as parking lots or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the changes in noise levels with distance (drop-off rate) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface such as soft dirt, grass or scattered bushes and trees. In addition to geometric spreading, an excess ground attenuation value of 1.5 dBA (per doubling distance) is normally assumed for soft sites. Line sources (such as traffic noise from vehicles) attenuate at a rate between 3 dBA for hard sites and 4.5 dBA for soft sites for each doubling of distance from the reference measurement (Caltrans 1998).

EXISTING CONDITIONS

Existing Noise Environment

Emphasis for the description of the affected environment is placed on locations within Zone 4 of the "Water" Study Area where physical improvements would be constructed and operated as part of the Off-site Water Facility Alternatives. Results from a countywide community noise survey indicate that typical noise levels in noise-sensitive areas of the county are in the range of 50 to 60 dBA L_{dn}. The existing noise environment within Zone 4 of the "Water" Study Area is primarily influenced by the noise produced from the following sources:

- vehicle traffic along major roadways including Sunrise Boulevard, Douglas Road, Florin Road, and SR 16, Folsom Boulevard, Grant Line Road, and U.S. Highway 50 (U.S. 50);
- Regional Transit Light Rail (located along the Folsom Boulevard/U.S. 50 corridor);
- Mather Airport (formerly Mather Air Force Base);

- Operations at Aerojet, south of U.S. 50 between Hazel Avenue and Prairie City Road, include testing of rocket and high-performance aircraft engines for use in military and aerospace applications. However, GenCorp Realty Investments, Aerojet's parent company, is currently in the process of phasing out the testing of the large-diameter rocket and aircraft engines at this facility, although testing of smaller engines is expected to continue (Sacramento County 2008);

- Cordova Shooting Center, located on Douglas Road west of Sunrise Boulevard, includes weapons firing with noise levels ranging from approximately 97 to 112 dBA per round at approximately 50 feet. Based on these noise levels, predicted maximum noise levels of 70 dBA could occur at a distance of 1/2-half to 1 mile from this facility, depending on local shielding and atmospheric conditions (County of Sacramento 1993);

- Kiefer Landfill (located at 12701 Kiefer Boulevard, surrounded by undeveloped rolling terrain);

- Sacramento Raceway (located on Excelsior Road north of Jackson Highway/SR 16);

- Aggregate mining operations along White Rock, Grant Line, and Scott Roads; and

- Off-Highway Vehicle (OHV) Use at the Prairie City State OHV area.

In addition to the sources identified above, the Sunrise Boulevard corridor includes a variety of industrial operations ranging from heavy-equipment repair facilities, equipment and material storage yards, loading-dock operations, concrete batch plants, and various manufacturing operations. Industrial land uses are also located in the Security Park area, north of Douglas Road. Hours of operation for these land uses vary, but are generally limited to daytime hours. Noise levels associated with industrial land uses can vary greatly depending on the activities conducted. Activities involving the use of heavy-duty equipment such as front-end loaders, forklifts, and diesel-powered trucks are common noise sources typically associated with these land uses. Noise typically associated with industrial operations, including the use of heavy-duty equipment, can reach maximum levels of approximately 85 dBA at 50 feet (Caltrans 2004).

Sensitive Receptors

Although noise pollution can affect all segments of the population, certain groups and land uses are considered more sensitive to ambient noise levels than others, sensitivity being a function of noise exposure (in term of both exposure duration and insulation from noise) and the types of activities involved. Children, the elderly, and the chronically or acutely ill are the most sensitive population groups.

Some land uses are considered more sensitive to changes in ambient noise levels than others, sensitivity being a function of noise exposure (in term of both exposure duration and insulation from noise) and the types of activities involved. Residential land uses are generally more sensitive to noise than commercial and industrial land uses. Sensitive receptors in the vicinity of the conveyance alignment alternatives include residences located on or adjacent to the roadway where construction would occur. The White Rock Water Treatment Plant (WTP) site is located within an undeveloped area within no residences located within a 1/2 mile of the site. However, multifamily high-density residential uses area planned within the SPA approximately 300 to 400 feet to the north of the White Rock WTP site.

Similarly, no sensitive land uses are currently located within 1/2 mile of the Folsom Boulevard WTP. However, medium- and high-density residential uses are proposed adjacent and to the west of the Folsom Boulevard WTP based on the current land use diagram for planned City of Rancho Cordova's Westborough Specific Plan.

GROUNDBORNE VIBRATION

Groundborne vibration consists of rapidly fluctuating motions or waves, which are also measured in decibels. Construction activities, train operations, and street traffic are some of the most common external sources of

vibration that can be perceptible inside structures. Differences in subsurface geologic conditions and distance from the source of vibration will result in different vibration levels characterized by different frequencies and intensities. In all cases, vibration amplitudes will decrease with increasing distance. High frequency vibrations reduce much more rapidly than low frequencies, so that low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances.

Human response to vibration is difficult to quantify. Vibration can be felt or heard well below the levels that produce any damage to structures. The duration of the event has an effect on human response, as does frequency. Generally, as the duration and vibration frequency increase, the potential for adverse human response increases. While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings may be perceived as motion of building surfaces or rattling of windows, items on shelves, and pictures hanging on walls. Vibration of building components can also take the form of an audible low-frequency rumbling noise, which is referred to as groundborne noise.

Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when the structure and the source of vibration are connected by foundations or utilities, such as sewer and water pipes. To assess a project's vibration impacts, Caltrans has prepared a publication concerning vibration impact assessment, entitled the "Transportation and Construction-Induced Vibration Guidance Manual," which was prepared in 2004. The guidance manual uses peak particle velocity (PPV) to quantify vibration amplitude. Peak particle velocity is defined as the maximum instantaneous peak of the vibratory motion.

Table 3B.11-1 identifies acceptable vibration limits for transportation and construction projects based on guidelines prepared by Caltrans.

Table 3B.11-1
Typical Groundborne Vibration Thresholds

Structure and Condition	Transient Sources PPV at 25 feet (in/sec)	Continuous/Frequent Intermittent Sources PPV at 25 feet (in/sec)
Extremely fragile historic buildings, ruins, and ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
New residential structures with gypsum board walls/ceilings	1.00	0.50
Modern Industrial/commercial buildings	2.00	0.50
Strongly perceptible	0.90	0.10

PPV = Peak particle velocity
Source: Caltrans 2004

3B.11.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Federal regulations establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under 40 CFR, Part 205, Subpart B. The federal truck passby noise standard is 80 dB at 15 meters from the vehicle pathway centerline. These controls are implemented through regulatory controls on truck manufacturers. In addition to noise standards for individual vehicles, under regulations established by the U.S. Department of Transportation's Federal Highway Administration, noise abatement must be considered for certain federal or federally-funded projects. Abatement is an issue for new highways or significant modification of an existing

freeway. The agency must determine if the project would create a substantial increase in noise or if the predicted noise levels approach or exceed the Noise Abatement Criteria.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The state establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state passby standard is consistent with the federal limit of 80 dB. The State passby standard for light trucks and passenger cars (less than 4.5 tons, gross vehicle rating) is also 80 dB at 15 meters from the centerline. These standards are implemented through controls on vehicle manufacturers and by state and local laws enforced against vehicle operators. For new roadway projects, Caltrans employs the Noise Abatement Criteria, discussed above in connection with the Federal Highway Administration.

The state has also established noise insulation standards for new multi-family residential units, hotels, and motels that would be subject to relatively high levels of transportation-related noise. These requirements are collectively known as the California Noise Insulation Standards (California Code of Regulations, Title 24). The noise insulation standards set forth an interior standard of DNL 45 dB for any habitable room. They also require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to noise levels greater than DNL 60 dB. Title 24 standards are typically enforced by local jurisdictions through the building permit application process.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan, Noise Element and Noise Control Ordinance

The Noise Element of the County General Plan identifies compatible noise environments for different types of land uses in the City. Table 3B.11-2 contains exterior noise standards for residential areas. These guidelines were used in evaluating the noise effects of the Off-site Water Facilities. Table 3B.11-3 provides the noise standards contained in the County's Noise Ordinance Standards. The County's noise ordinance is based on the application of a cumulative duration of an intrusive sound, whereby the longer the duration, the lower the standard.

The Noise Control Ordinance sets limits for exterior noise levels on designated agricultural and residential property. The standards found in the Noise Control Ordinance are based on the duration of noise on private property over one-hour periods. The ordinance is primarily concerned with regulating noise other than noise generated by transportation noise sources such as passing cars or aircraft flyovers. The ordinance limits the duration of sound based on many factors, including the type of source, tonal characteristics of the source, ambient noise levels, and time of day by using a system of noise criteria not to be exceeded based on the duration of noise over any given hour. Table 4.4-5 of the ordinance summarizes the exterior noise standards that would apply to the project.

Table 3B.11-2
Sacramento County Noise Level Standards for Residential Areas

Statistical Noise Level Descriptor	Exterior Noise Level Standard	
	Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
L_{50}	50 dB	45 dB
L_{max}	70 dB	65 dB

Notes: L_{max} = the instantaneous maximum noise level for a specified period of time; db = decibels
These standards are for planning purposes and may vary from standards of the County Noise Ordinance, which are established for enforcement purposes.
These standards apply to new or existing residential areas affected by new or existing non-transportation sources.
Source: Sacramento County 1993

Table 3B.11-3 Sacramento County Noise Ordinance Standards			
Cumulative Duration of the Intrusive Sound	Noise Level Descriptor	Exterior Noise Standard (dB)	
		Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
30-60 minutes per hour	L_{50}	55	50
15-30 minutes per hour	L_{25}	60	55
5-15 minutes per hour	L_{05}	65	60
1-5 minutes per hour	L_{02}	70	65
Level not to be exceeded at any time	L_{max}	75	70
Source: Sacramento County 1993			

In addition to the above standards, an off-site activity may not create interfering or disturbing noise levels at any school, hospital, or church that exceed the exterior noise level standards or that are 10 dBA above ambient noise levels.

Under Section 6.68.090, the following activities are exempt from the quantitative limits of the Noise Control Ordinance described above:

- School activities, including bands, athletic and entertainment events.
- Outdoor gatherings, public dances, shows and sporting events. These activities may require a license or permit.
- Activities on parks, public playgrounds, and school grounds owned and operated by public entity or private school.
- Emergency activities and equipment.
- Agricultural activities between 6 a.m. and 8 p.m. or whenever using equipment to protect crops.
- Construction, demolition or similar activity, provided they occur between 6 a.m. and 8 p.m. Monday through Friday, and 7 a.m. and 8 p.m. on weekends.
- Residential property maintenance, provided it occurs between 6 a.m. and 8 p.m. Monday through Friday, and 7 a.m. and 8 p.m. on weekends.
- United States airports, aircraft, and armed service facilities.
- Noise and land use regulations related to airports.

Rancho Cordova General Plan and Noise Ordinance

The City of Rancho Cordova's General Plan was adopted in June 2006 and outlines goals and policies that set performance standards for stationary noise sources and maximum allowable noise exposure from transportation noise sources. Applicable noise standards as specified in the Noise Element of the City of Rancho Cordova's General Plan, are included below as Table 3B.11-4.

Table 3B.11-4
City of Rancho Cordova Noise Level Standards

Stationary Noise Source	Noise Level Descriptor	Exterior Noise Standard (dB)	
		Daytime (7 a.m. to 10 p.m.)	Nighttime (10 p.m. to 7 a.m.)
Typical	Hourly L_{eq}, dB	55	45
Tonal, impulsive, repetitive, or consist primarily of speech or music	Hourly L_{eq}, dB	50	40

Notes:
The City may impose noise level standards which are more or less restrictive than those specified above based upon determination of existing low or high ambient noise levels.
Source: Rancho Cordova General Plan, 2006

According to Rancho Cordova's Noise Ordinance, activities generally considered to be exempt from the noise standards include construction activities (provided that they occur between the daytime hours of 7 a.m.–6 p.m., Monday through Saturday, and 9 a.m.–6 p.m. on Sunday), school athletic and entertainment events, activities conducted on public parks and playgrounds, and transportation noise.

3B.11.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, noise impacts as a result of the Off-site Water Facilities would be considered significant if it would:

- expose persons to or generate noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- expose of persons to or generate of excessive groundborne vibration or groundborne noise levels;
- create a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project;
- create a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project;
- for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the project area to excessive noise levels; or
- for a project within the vicinity of a private airstrip, expose people residing or working in the project area to excessive noise levels.

Analysis Methodology

This section provides a programmatic impact analysis of potential noise and vibration impacts as they relate to construction and operation of the Off-site Water Facility Alternatives. The significance of Off-site Water

Facilities-related noise impacts was determined by comparing estimated Off-site Water Facilities-related noise levels, based on published literature, to existing noise levels within Zone 4 of the "Water" Study Area as described in other recently-prepared environmental documents for other projects within Zone 4 including:

- White Rock Road Widening Project, Phases A, B, and C, EIR;
- Freeport Regional Water Project EIR/EIS;
- Easton Project EIR for the Easton Valley Parkway; and
- Rio del Oro Specific Plan EIR/EIS.

For the purposes of analysis, an increase of at least 3 dBA is usually required before most people will perceive a change in noise levels, and an increase of 5 dBA is required before the change will be clearly noticeable. A common practice has been to assume that minimally perceptible to clearly noticeable increases of 3 to 5 dBA represents a significant increase in ambient noise levels. A sliding scale is commonly used to identify the significance of noise increases, allowing greater increases at lower absolute sound levels than at higher sound levels. This approach is based on research that relates changes in noise to the percentage of individuals that would be highly annoyed by the change in ambient noise levels. Based on this approach, noise impacts are "generally significant" if the Off-site Water Facility Alternative would cause noise standards or ordinances to be exceeded, or increases in the community noise levels of greater than 5 dBA in built-up areas, or increases by 10 dBA or more in rural areas.

To ensure that potentially noise sensitive land uses that are not constructed and, hence, acknowledged under the 2008 baseline, this analysis also consider planned land uses that have received approval, but are not yet construction.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Airport Noise—The project would not involve the construction of sensitive land uses within two miles of a public or private airport and, therefore, would not expose people to excessive airport noise levels. Thus, this issue is not discussed further in this EIR/EIS.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.11-1 **Temporary, Short-Term Exposure of Sensitive Receptors to Increased Equipment Noise from Project Construction.** *The Off-site Water Facility Alternatives could expose persons to or generate noise levels in excess of applicable City and County standards.*

NCP, PA, 1, 1A, and 4

Construction of the Off-site Water Facilities under these alternatives would occur in rural and industrial portions of the eastern Sacramento County. Over the entire length of these conveyance alternatives, there are approximately 25 rural residences that would be located within 50 to 100 feet of Off-site Water Facilities construction. Construction activities would generally involve excavation, concrete removal, earth movement, stockpiling, trenching activities, and truck hauling. These construction activities would generate temporary and intermittent noise at and near the conveyance pipeline alignment during the 36-month construction schedule. Noise levels would fluctuate depending on the particular type, number, and duration of use of various pieces of construction equipment. In addition, construction-related material haul trips would raise ambient noise levels along haul routes depending on the number of haul trips and the types of vehicles used. These activities would be more pronounced at the booster pump station facility where construction activities would occur for an extended duration of time. Table 3B.11-5 shows typical noise levels produced by various types of construction equipment at a distance of 50 feet.

Table 3B.11-5
Typical Noise Levels for Construction Equipment

Equipment	Typical Noise Levels (dBA, at 50 feet)	Equipment	Typical Noise Levels (dBA, at 50 feet)
Front loaders	85	Forklifts	76-82
Backhoes, excavators	80-85	Pumps	76
Tractors, dozers	83-89	Generators	81
Graders, scrapers	85-89	Compressors	83
Trucks	88	Pneumatic tools	85
Concrete pumps, mixers	82-85	Jack hammers, rock drills	98
Cranes (movable)	83	Pavers	89
Cranes (derrick)	88	Compactors	82
Pipelayers	83-88	Drill rigs	70-85

Source: Adapted from U.S. Environmental Protection Agency, Noise from Construction Equipment and Operations, 1972 and U.S. Department of Transportation, Federal Transit Administration, Noise and Vibration Impact Assessment Guideline, April 1995.

In addition to actual pipe installation, staging areas would be located at various points along the construction route. These areas would be used to store pipe, equipment, and other construction related material. In some cases, staging areas would be used for the duration of the Off-site Water Facilities construction. In other cases, the area

would be moved along the route to minimize the hauling distances and avoid disrupting any one area for an extended period of time. Potential staging areas include vacant private and public land and parking lots are identified in Exhibits 2-26, 2-28, 2-29, and 2-30. These staging areas could be considerable sources of noise, particularly if equipment is accessed and moved during nighttime hours when individuals are sensitive to intrusive noise.

Based on the noise levels provided in Table 3B.11-5 and in assuming a conservative attenuation rate of 4.5 dBA per doubling distance, noises levels generated during construction could range from 75.5 to over 80 dBA at the nearest sensitive receptor locations depending on the types of equipment in operation. Additionally, back-up beepers associated with trucks and equipment used for material loading and unloading at the staging area would generate significantly increased noise levels over the ambient noise environment in order to be discernable and protect construction worker safety as required by the U.S. Occupational Safety and Health Administration (OSHA) (29 CFR 1926.601 and 29 CFR 1926.602).

Because existing daytime noise levels in the vicinity of the conveyance pipeline alignment are assumed to range from 50 to 60 dBA, daytime construction work associated with the Off-site Water Facilities would significantly affect the noise environment of residences in close proximity to construction activities by increasing ambient noise levels by five dBA or more. While construction activities would occur when a majority of people are at work, retired persons, people who work at home, and people caring for their children in their homes could be significantly affected temporarily by noise when construction activities are occurring in the immediate vicinity. This **direct** temporary and short-term impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

In contrast, the nearest existing sensitive receptors to the on-site, White Rock, and Folsom Boulevard WTP site(s) are located over 1/2 mile or more away from any sensitive receptors. Further, the White Rock WTP site location under Off-site Water Facility Alternatives 1 and 1A is bordered by other noise intensive uses including aggregate mining and OHV use. Similarly, Folsom Boulevard WTP site is situated adjacent to existing industrial uses. For these reasons, temporary and short-term construction noise at the WTP site(s) would not exceed noise standards established in the County General Plan or noise control ordinance and a **less-than-significant**, **direct** temporary and short-term impact would result. **No indirect** impacts would occur. ***[Similar]***

The exposure of individual sensitive receptors to elevated noise levels would be contingent on the types of equipment in use and the duration of use. For example, while construction of the Off-site Water Facilities would occur on a 36-month construction schedule, pipeline construction would progress at rate of approximately 50 to 100 feet a day and, therefore, no one particular receptor along the selected alignment would be subjected to elevated noise for more than a couple of days. Construction activities associated with the Off-site Water Facilities would therefore be temporary in nature and related noise impacts would be short-term. However, since pipeline construction activities could substantially increase ambient noise levels at noise-sensitive locations, with potential intermittent noise levels exceeding 80 dBA, construction noise would result in **potentially significant**, temporary, **direct** impacts to sensitive receptors. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.11-1a: Limit Construction Hours.

Construction activities shall be limited to daylight hours between 7 a.m. and 7 p.m. Monday through Friday, and 9 a.m. and 5 p.m. on Saturday. No construction shall be allowed on Sundays or holidays.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1b: Minimize Noise from Construction Equipment and Staging.

Construction equipment noise shall be minimized during project construction by muffling and shielding intakes and exhaust on construction equipment (per the manufacturer's specifications) and by shrouding or shielding impact tools, where used. The City's construction specifications shall also require that the contractor select staging areas as far as feasibly possible from sensitive receptors.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1c: Maximize the Use of Noise Barriers.

Construction contractors shall locate fixed construction equipment (such as compressors and generators) and construction staging areas as far as possible from nearby residences. If feasible, noise barriers shall be used at the construction site and staging area. Temporary walls, stockpiles of excavated materials, or moveable sound barrier curtains would be appropriate in instances where construction noise would exceed 90 dBA and occur within less than 50 feet from a sensitive receptor. The final selection of noise barriers will be subject to the City's approval and shall provide a minimum 10 dBA reduction in construction noise levels.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1d: Prohibit Non-Essential Noise Sources During Construction.

No amplified sources (e.g., stereo "boom boxes") shall be used in the vicinity of residences during project construction.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1e: Monitor Construction Noise and Provide a Mechanism for Filing Noise Complaints.

An on-site complaint and enforcement manager shall track and respond to noise complaints. The City shall also provide a mechanism for residents, businesses, and agencies to register complaints with the City if construction noise levels are overly intrusive or construction occurs outside the required hours.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

2, 2B, and 3

Under Off-site Water Facility Alternatives 2, 2B, and 3, impacts described for pipeline construction would be similar to those described for Off-site Water Facility Alternatives 1 and 1A. The main difference with these alternatives is the number of sensitive receptors affected by Off-site Water Facilities construction. As a result of new residential development along and south of Douglas Road and west of Ivan Way, pipeline construction under these alternatives would temporarily impact a higher number of sensitive receptors; estimated at over 100. This temporary, short-term **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.11-1a, 3B.11-1b, 3B.11-1c, 3B.11-1d, and 3B.11-1e.

2A, 3A, and 4A

Under Off-site Water Facility Alternatives 2A, 3A, and 4A, impacts described for pipeline construction would be similar to those described for Off-site Water Facility Alternatives 1, 1A, and 4. The main difference with these alternatives is the number of sensitive receptors affected by Off-site Water Facilities construction. As a result of new residential development along and south of Douglas Road and existing residential development along Mather Boulevard, pipeline construction under these alternatives would temporarily impact a higher number of sensitive receptors; estimated at over 200. This temporary and short-term **direct** impact is considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.11-1a, 3B.11-1b, 3B.11-1c, 3B.11-1d, and 3B.11-1e.

Although implementation of the above mitigation measures would generally reduce construction noise, construction-related noise levels could occasionally exceed the Sacramento County and City of Rancho Cordova standards regarding construction noise. Although there are smaller number of receptors potentially affected under Off-site Water Facility Alternatives 1, 1A, 4, and 4A, the implementation of the prescribed mitigation would not reduce construction-related noise impacts to less than significant level at these locations. In addition, construction activities at the pump station facility may occur over a more extended period of time, up to several months, and could contribute to noises levels in excess of 80 dBA. These impacts could remain **significant and unavoidable**, because there is no feasible mitigation to fully reduce temporary, short-term construction-related impacts to a less-than-significant level. Based on the larger number of receptors affected along the conveyance alignments, construction-related noise impacts under Off-site Water Facility Alternatives 2, 2A, 2B, 3, and 3A could also remain significant and unavoidable to these residential centers, because there is no feasible mitigation to fully reduce temporary, short-term construction-related impacts to a **less-than-significant** level.

IMPACT 3B.11-2 Exposure to and/or Generation of Groundborne Vibration. *The Off-site Water Facilities could expose persons to or generate excessive groundborne vibration or groundborne noise levels.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

There are two groundborne vibration impacts of general concern: annoyance to humans and damage to buildings. For other locations, it is anticipated that installation of distribution pipelines would require a backhoe or similar forms of other trenching equipment. Vibration from typical construction activity is typically below the threshold of perception when the activity is more than about 50 feet from the receiver. Construction activities are not expected to encroach within 50 feet of existing structures and, therefore, the level of **direct** and **indirect** vibration impact at these receptors would be **less than significant**. ***[Similar]***

In relation to the potential for structural damage at adjacent residential and commercial structures, peak particle velocity (PPV) is the maximum instantaneous positive or negative peak of the vibration signal, measured as a distance per time (such as millimeters or inches per second). The PPV measurement has been used historically to evaluate shock-wave type vibrations from actions like blasting, pile driving, and mining activities, and their relationship to building damage.

As provided in Table 3B.11-1, the level of potential impact resulting project construction is generally contingent on the structural composition of the buildings potentially affected. As shown in Table 3B.11-1, new residential structures with gypsum board walls/ceilings have a PPV threshold of 1.0 in/sec respectively and would be the types of structures most likely to be impacted by project construction activities. However, given that construction activities would employ the use of equipment similar to those identified in Table 3B.11-6, would not involve the use of pile driving, and would be situated 50 feet or more from existing structures , project construction is

unlikely to generate vibration levels in excess of the thresholds identified in Table 3B.11-6. Based on these considerations, the Proposed Project Alternative would result in **less than significant, direct** and **indirect** impacts from groundborne vibration during construction. ***[Similar]***

Table 3B.11-6
Construction Equipment Vibration Levels

Equipment	PPV at 25 feet (in/sec)	Equipment	PPV at 25 feet (in/sec)
Vibratory roller	0.210		
Large bulldozer	0.089		
Caisson drilling	0.089		
Loaded trucks	0.076		
Jackhammer	0.035		
Small bulldozer	0.003		

Source: Federal Transit Administration, Transit Noise and Vibration Impact Assessment, May 2006

Limited areas along the conveyance alignment, east of Grant Line Road, and the WTP site may require the use of explosives to break through the underlying bedrock and allow for the installation of pipeline or foundation materials. Blasting can generate an instantaneous PPV of greater than 0.2 in/sec and can contribute to damage of existing structures. However, in the event that explosives are required, the amount of explosives used would be minimal and in short durations. Further, given that no existing structures are currently located in close proximity to these portions of Zone 4 of the Off-site Water Facilities Study Area, these activities, if required, are not expected to produce ground shockwaves that could damage nearby structures or cause a significant nuisance. For this reason, the **direct** and indirect impact is considered **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.11-3 Permanent Increase in Ambient Noise Levels. *The Off-site Water Facility Alternatives could create a substantial permanent increase in ambient noise levels in the vicinity of new pumping facilities.*

NCP, PA

The principal long-term, operational noise impacts resulting from the Off-site Water Facilities under the Proposed Off-site Water Facility Alternative would result from the pumps and generators operated at the proposed booster pump station and WTP. Noise generated from each of these facilities is discussed in more detail below.

Pump Station(s)

The booster pump station would eventually consist of multiple 400 horsepower (HP) vertical turbine pumps. At times, the pumps may operate 24 hours a day, 7 days a week. Based on a review of publish literature, the typical noise level for water supply pumping facilities ranges from 70 to 76 dBA at 50 feet (Environmental Science Associates 2005). However, the pumping facilities sampled as part the referenced analysis included substantially less horsepower than the Off-site Conveyance Pump's proposed capacity and, therefore, noise levels from the proposed pumping facilities could be higher. This could result in a **potentially significant direct** impact to adjacent residences. **No indirect** impacts would occur. ***[Similar]***

Additionally, a small standby generator would be installed in an enclosure to operate up to two pumps during a power outage. The typical noise level for a generator is approximately 80 dBA at 50 feet. With a surrounding

masonry buffer, or with generator placement using other structures as shielding, the effective noise level may be reduced by 10 to 15 dBA at 50 feet. Since emergency generators would operate infrequently, they would generally not contribute substantially to the overall community noise exposure outside of the site boundary. However, the combined operation of the pumps, the back-up generator, and maintenance activities depending on the proximity to the nearest sensitive receptor could generate long-term noise level in excess of Sacramento County or City of Rancho Cordova standards. This would be a **potentially significant**, **direct** impact. **No indirect** impacts would occur. ***[Similar]***

Water Treatment Plant

The On-site WTP site is currently located in an undeveloped area, with the nearest sensitive receptors being over a mile away from the site. However, the Folsom Specific Plan designates areas around the WTP site as multifamily, medium-density residential. The final placement of the On-site WTP would be required to adhere to setback requirements contained within the Folsom Specific Plan and, therefore, **direct** increases in noise from the stationary and mobile sources present at the WTP are expected to result in a **less-than-significant** impact. **No indirect** impacts would occur. ***[Similar]*** This issue is discussed in more detail in Section 3A.11, "Noise – Land" of this EIR/EIS.

Traffic Noise

Operation of the WTP and conveyance facilities would result in a minor increase in the use of motor vehicles, primarily associated with employees traveling to and from the WTP facility and routine maintenance and inspection activities. It is expected that no more than 10 staff personnel would be on-site at any one time for typical operation and maintenance of the WTP, most on-site during typical working hours, 7 a.m. to 5 p.m. Assuming an average of four trips per employee (including lunch breaks), operation of the proposed facilities would result in approximately 40 one-way daily employee trips. Due to the relatively low volume of Off-site Water Facilities-generated traffic, operation of the proposed facilities would not result in noticeable changes in the traffic noise along area roadways in relation to existing and projected roadway traffic volumes (e.g., with the Folsom Specific Plan Area). As a result, **direct** and **indirect** long-term increases in traffic noise levels would be **less than significant**. ***[Similar]***

Mitigation Measure 3B.11-3: Implement Operational Noise Minimization Measures.

The following mitigation measures shall be implemented for the design of the WTP and the pump station(s) to ensure that operational noise levels at the property line do not exceed the City/County standards:

- Shielding and other specified measures as deemed appropriate and effective by the design engineer shall be incorporated into the design in order to comply with performance standards.
- Pumps located underground shall be shielded to not affect nearby sensitive receptors.
- Project equipment shall be outfitted and maintained with noise-reduction devices such as equipment closures, fan silencers, mufflers, acoustical louvers, noise barriers, and acoustical panels to minimize operational noise.
- Particularly noisy equipment shall be located as far away as feasibly possible from nearby sensitive receptors.
- The orientation of acoustical exits shall always be facing away from nearby sensitive receptors.
- Buildings and landscaping shall be incorporated, where possible, to absorb or redirect noise away from nearby sensitive receptors.

Implementation: City of Folsom Utilities Department

Timing: Approval of engineering plans for the On- or Off-site WTPs and Off-site booster pumping facilities prior to construction

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

1, 1A, 3, and 3A

Long-term noise impacts identified for the booster pumping station under the Proposed Off-site Water Facility Alternative would be similar under Off-site Water Facility Alternatives 1, 1A, 3 and 3A. **Direct** noise impacts relating to pumping could be **potentially significant** at the nearest sensitive receptor. **No indirect** impacts would occur. ***[Similar]***

In contrast to the Proposed Off-site Water Alternative, these alternatives would involve the construction and operation of the White Rock WTP site in a currently undeveloped area south of White Rock Road and in close proximity to the City Corporation Yard, with the nearest sensitive receptors over 1/2 mile away from the site. However, the Folsom Specific Plan designates an area just north of WTP site as multifamily, high-density. Because these uses are not currently present, the City has assumed a conservative distance of 200 feet based on a minimum 50-foot setback for the WTP from the northern property line, a 100 right-of-way for White Rock Road, and an additional setback of 50 feet for the multifamily residential uses on the north side of White Rock Road.

The WTP would operate continuously at various flow rates during the year with ongoing operations and maintenance. Potential operational noise impacts at the WTP would primarily be from maintenance vehicle circulation and the operation of stationary mechanical equipment. This equipment includes blowers, generators, pumps, process motors, and heavy trucks delivering chemical supplies and materials. Minor noises associated with the operation of low power equipment, such as sludge collectors and flocculators, and water flow noise would also occur. The level of noise generated by pumps and other stationary equipment would depend on: characteristics of the noise source, number of noise sources clustered together, type and effectiveness of building enclosure, and operational characteristics. Based on the noisiest pieces of equipment expected to be present (e.g., pumps) and applying a noise attenuation rate of 4.5 dBA per doubling distance, the noise levels from the pumping facilities and on-site generator at 200 feet would be expected to range between 67 and 72 dBA.

Without the inclusion of noise reduction measures in the design and operation of the WTP, noise generated from ongoing operations at the WTP would contribute noise levels to the surrounding area that could exceed County and City standards. For this reason, the operation of the WTP under these alternatives could result in **potentially significant**, **direct** long-term noise impacts. **No indirect** impacts would occur. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.11-3.

2, 2A, and 2B

These alternatives would further integrate the Off-site Water Facilities components with existing water supply infrastructure, which includes SCWA's Vineyard SWTP and, potentially, the North Douglas Tanks. Although pumping facilities would be required, these facilities along with water treatment operations would occur at the existing Vineyard SWTP. In addition, the number of Off-site Water Facilities operational staff under these alternatives would be smaller than if the City constructed a new WTP. However, based on these considerations, these Off-site Water Facility Alternatives would not generate increased noise levels from new water conveyance and treatment facilities at new locations where these facilities do not currently exist and, therefore, this **direct** impact is considered **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

4 and 4A

Long-term noise impacts under Off-site Water Facility Alternatives 4 and 4A would be similar to the Off-site Water Facility Alternatives 1 and 1A. The main difference in relation to potential long term noise impacts under Off-site Water Facility Alternatives 4 and 4A is the distance of the WTP from residential uses are planned within the Westborough Specific Plan. Under a worst-case scenario, the WTP could be constructed within 50 to 100 feet of these future residential uses thereby subjecting them to noise levels approaching 80 dBA. These noise levels are considered unacceptable for residential uses according to City of Rancho Cordova standards and therefore represent a **potentially significant direct** impact. **No indirect** impacts would occur. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.11-3.

Implementation of the above mitigation measures are expected to reduce potential impacts to levels at or below standards and would generally reduce the impacts to less than significant levels. However, because of the uncertainty associated with the placement of these facilities, especially the booster pump station, and the pump station's actual design (above- verses below-ground), the City is unable to verify whether noise levels would be reduced to below Sacramento County and City of Rancho Cordova standards as a result of the measures above and the impact could remain **potentially significant and unavoidable** for Alternatives PA, 1, 1A, 3, 3A, 4, and 4A. In addition, given the potential for the placement of the WTP in close proximity to planned residences under Off-site Water Facility Alternatives 4 and 4A, permanent noise impacts could remain **significant and unavoidable**.

3B.11.4 RESIDUAL SIGNIFICANT IMPACTS

Even after implementation of all feasible mitigation, construction noise impacts would remain significant and unavoidable for all Off-site Water Facilities Alternatives. The operation of the pumps and generators for Off-site Water Facilities pump stations and WTP facilities could occur within close proximity of sensitive receptors, thereby resulting in a permanent increase in noise levels. Although the City has identified a series of mitigation measures to address potential long-term impacts to adjacent sensitive receptors, given uncertainties regarding the design of these facilities and their respective locations, the City is unable to confirm whether the mitigation imposed would be effective in reducing long-term noise to a less-than-significant level. For this reason, long-term, residual noise impacts from these facilities under Alternatives PA, 1, 1A, 3, 3A, 4, and 4A could be significant and unavoidable.

This page intentionally left blank.

3A.12 PARKS AND RECREATION - LAND

The two local roadway connections from the Folsom Heights property off-site into El Dorado Hills would not generate direct increases in population that could result in additional demand for parkland facilities in El Dorado County. Therefore, the "Affected Environment" does not contain a discussion of conditions in El Dorado County related to parks and recreation.

3A.12.1 AFFECTED ENVIRONMENT

REGIONAL ENVIRONMENT

Folsom Lake

Folsom Lake State Recreation Area (SRA), located approximately 5 miles north of the SPA, serves the greater Sacramento area for recreation in the form of camping, hiking, biking, boating, and other outdoor recreation activities. The lake also hosts bass fishing tournaments that frequently draw fishermen from throughout the state. California State Parks manages the Folsom Lake SRA, which includes Folsom Lake and the surrounding facilities. The lake features approximately 75 miles of shoreline and 80 miles of trails that provide opportunities for hiking, horseback riding, nature studies, camping, and picnicking. There are seven major recreation areas with facilities located around the lake. The Folsom Lake SRA, including Folsom Lake, is one of the most heavily used recreational facilities in the California State Park system, with 2 to 3 million visitor days per year. Approximately 75% of the annual visitations to the Folsom Lake SRA occur during the spring and summer, and many (85%) of the Folsom Lake SRA activities are water dependent.

The Lake Natoma sub-unit of the Folsom Lake SRA is located adjacent to the City of Folsom, between Hazel Avenue and Folsom Dam, upstream from the Sacramento County-operated portion of the American River Parkway. The area encompasses approximately 500 surface acres of water and 1,600 acres of land. Most of the land immediately adjacent to Lake Natoma is Federally owned land administered by the U.S. Bureau of Reclamation (Reclamation). This land is managed by California State Parks as part of the Folsom Lake SRA through an agreement with Reclamation. In addition to Federal land, California State Parks has acquired fee title to additional lands around Lake Natoma that are also part of Folsom Lake SRA and Folsom Powerhouse State Historic Park (SHP). Folsom Powerhouse SHP is a small unit (35 acres) located on the south side of Lake Natoma, adjacent to historic downtown Folsom. Both Folsom Lake SRA and the Folsom Powerhouse SHP are administered and managed by the Gold Fields District of California State Parks.

The state facilities are managed to meet the recreational needs of the larger statewide population, and thus tend to be oriented more to the traveling public than are the adjacent County and City-operated facilities, which serve the needs of the regional and local population of the Sacramento area and City of Folsom residents.

Sacramento–San Joaquin Delta

The Sacramento–San Joaquin Delta (Delta) includes portions of the cities of Sacramento and Stockton as well as several smaller cities and towns. The Delta encompasses 738,000 acres of land in portions of six counties and has nearly 1,000 miles of navigable channels. As such, recreation opportunities are generally water-oriented, consisting primarily of boating and fishing. Other common activities include waterskiing, wakeboarding, sailing, operating personal watercraft (e.g., jet skis), house boating, kayaking, swimming, boat camping, and windsurfing. Land-based recreational activities in the Delta include hunting, camping, picnicking, walking, bicycling, viewing and photographing wildlife, sightseeing, and attending festivals and special events (Delta Protection Commission [DPC] 2002). Access to the Delta is available via several locations along the Sacramento River from downtown Sacramento to Freeport (approximately 20 miles southwest of the SPA), as well as numerous locations farther south (California Department of Water Resources [DWR] 1995).

Prairie City State Vehicular Recreation Area

The Prairie City State Vehicular Recreation Area (SVRA), located on White Rock Road approximately 2 miles west of the SPA, offers off-highway vehicle enthusiasts 836 acres of varying terrain and trails for motorcycles, all-terrain vehicles, and four-wheel-drive vehicles. The SVRA includes the Hangtown MX Track, which hosts the annual national outdoor MX (motocross) championship; the Quarter Midget Track, which is used by the American Quarter Midget Association for both practice and competitive events; and a 4x4 vehicle area, motorcycle/all-terrain vehicle (ATV) area, several practice tracks, a go-kart track, and several staging areas that include picnic facilities. The Prairie City SVRA is operated by the Off-Highway Vehicle Division of California State Parks and is open year-round (California State Parks 2004).

LOCAL ENVIRONMENT

County of Sacramento

Park planning in Sacramento County is an interagency and interjurisdictional process. At the broadest level, the Sacramento County Department of Regional Parks, Recreation and Open Space (DPROS) manages the regional park system. Local parks (mini, neighborhood, and community parks) are planned and operated primarily by the 18 parks and recreation districts located throughout the unincorporated and incorporated areas of the County. Sacramento County defines four basic types of parks as follows:

- **Mini Parks** (1.5–4 acres): Publicly owned sites generally serving a radius within 1/3 mile and within easy walking distance for a parent with tot or an elderly person. Good visual access from surrounding homes and streets is essential. Mini parks typically provide playgrounds and picnic facilities.

- **Neighborhood Parks** (5–10 acres): Often adjacent to school sites, are publicly-owned sites intended to serve the needs of a radius within 2/3 mile, usually the residential neighborhood in which they are located. They should be within walking distance of the residents they serve, without access barriers, such as a major street or canal. Neighborhood parks typically provide playgrounds, playfields, and court game areas.

- **Community Parks** (20–60 acres): Larger, publicly-owned sites that serve a larger area and population than neighborhood parks. They should be served by a major thoroughfare and be within bicycling distance of the people they serve. Community parks typically provide specialized functions such as swimming pools, tennis courts, sports complexes, and community buildings in addition to basic neighborhood park facilities.

- **Regional Parks** (75+ acres): Typically provide a specialized recreation function, or preserve natural, cultural, historical, or archaeological features of Countywide significance. They are usually greater than 75 acres in size, with a large service area and population, extending beyond the County boundary.

Department of Regional Parks, Recreation, and Open Space

Sacramento County DPROS was established in 1959 with acquisition of land now known as the American River Parkway. Since that time, the County has expanded its total parklands to more than 11,000 acres, including the American River Parkway, Dry Creek Parkway, Mather Regional Park, Discovery Park, Elk Grove Regional Park, the Effie Yeaw Nature Center, and other historic and natural sites. In addition to traditional regional park activities, DPROS also oversees four regional golf facilities.

American River Parkway

On January 19, 1981, approximately 23 miles of the American River, from the confluence with the Sacramento River to Nimbus Dam, was designated a National Wild and Scenic River by the National Park Service (NPS) (NPS 2005). Nimbus Dam is located approximately 4 miles west of the SPA. This stretch of river, managed by DPROS, flows through the City of Sacramento and is the most heavily used Wild and Scenic River in California.

The American River Parkway (Parkway) is a river corridor/open space greenbelt that extends along the American River from the confluence with the Sacramento River to Nimbus Dam. The Parkway's trail system, which has been designated a "National Recreation Trail," includes the 32-mile-long multiuse (pedestrian, equestrian, and bicycle) Jedediah Smith Memorial Trail, which parallels the American River from Folsom to downtown Sacramento.

The Parkway is one of the most valuable recreation/open space assets in the region. There are several points of entry to this recreation area near the SPA. The closest access point for the section of Parkway between Nimbus Dam and the Sacramento River is located off of Hazel Avenue at the Fish Hatchery below the dam. Hazel Avenue also provides access to the Parkway above Nimbus Dam, which is within the Natoma sub-unit of the Folsom Lake SRA, described above. There are many access points in the City of Folsom to the Folsom Lake SRA.

City of Folsom

The City of Folsom Parks and Recreation Department provides and maintains a full range of recreational activities and park facilities for the City of Folsom. Per the City of Folsom General Plan Parks and Recreation Element (1993 Update), the City has categorized parks in terms of their function and sizes into the following categories:

- **Mini Parks** (1 to 2 acres): Specialized facilities that usually serve a concentrated or limited population or specific group such as tots or senior citizens. Mini parks may feature children's play areas, quiet game areas, landscaping and some sports activities such as multiuse courts if space allows. Ideal in close proximity to apartment complexes, townhouses, or elderly housing. May be used to enhance beauty of the City.

- **Neighborhood Parks** (10 to 20 acres): A recreation area which provides for indoor and outdoor programs and activities. Neighborhood recreation parks should serve one neighborhood and be centralized within that neighborhood, a park which can be walked to by children. Where possible, they should be located next to schools to avoid duplication and achieve joint use advantages. Neighborhood recreation parks should primarily serve the needs of the neighborhood residents.

- **School/Parks** (10 to 20 acres): A neighborhood park located adjacent to a school. (See "Neighborhood Park" above.)

- **Schools** (10 to 20 acres): School playing fields and facilities can be shared with the City Parks and Recreation program to maximize facilities use. Conversely, parks and other recreation facilities can be shared with schools to enhance school facilities and reduce the need for duplicate facilities and programs.

- **Special Use Areas** (undetermined acreage): Within the City there are special use areas which do not fit easily in the other categories.

- **Community Parks** (20 to 60 acres): A recreation area which provides recreational opportunities for several neighborhoods. Community parks should avoid duplication of facilities already provided in neighborhood recreation parks, and where suitable, be located adjacent to a secondary school. It should include such facilities as an aquatic center, provision for evening recreation, indoor facilities, amphitheater, specialized athletic fields, tennis, handball, basketball courts, large and small picnic areas, and barbecue facilities, convenient parking, tot play apparatus and restrooms.

- **Regional Parks** (200+ acres): A recreation area that provides some remoteness from the urban setting or has features of regional significance including opportunities not possible in other parks within the City park system. This type of park serves a population within a large region, usually those within an hour's travel time. A regional park may be the joint effort of more than one governmental agency. It should be developed to preserve existing natural areas, areas of great scenic beauty, or areas of historical interest. A regional park

could include facilities such as arboretums, camping areas, boating and fishing facilities, bicycling, equestrian and hiking trails, and other special-use facilities.

- **Open Space/Natural Areas/Parkways** (undetermined acreage): Natural habitat areas, stream courses, utility easements, or other corridors designated in the Open Space and Conservation Element and/or Circulation Element for purpose of preservation of natural features or circulation. Open space is clearly distinguished form park acreage and shall not be calculated or credited as parkland acreage. Parkways shall be preserved in their natural state with a network of trails for walking, cycling, and horseback riding. Parkways are classified as open space for the preservation of natural resources and shall not be credited as parkland acreage.

A complete listing of existing Folsom Parks and Recreation Department parks with total acreage and developed acreage of parkland is provided in Table 3A.12-1, below. The locations of all existing City facilities are shown in Exhibit 3A.12-1. A total of 385.35 acres of parkland are currently located within the City of Folsom, including 260.96 acres of developed parkland and 124.39 acres of undeveloped parkland (City of Folsom 2008). Developed public recreation facilities within the City of Folsom include an aquatic center with 3 pools, 14 little league fields, 8 youth softball fields, 3 adult baseball fields, 5 adult softball fields, 11 youth soccer fields, 19 adult (12 and up) soccer fields, 1 youth football field, 16 outdoor basketball courts, and 19 tennis courts. The closest existing City park facilities to the SPA are Amos P. Catlin Park, Livermore Community Park, John Kemp Community Park, and Handy Family Park, all located north of U.S. Highway 50 (U.S. 50) and north of Iron Point Road.

The 2008 population of the City of Folsom was 72,590 residents (California Department of Finance 2008). Therefore, the City's parkland acreage to population ratio is currently 5.3 acres per 1,000, which is slightly above the City's park acreage standard of 5 acres per 1,000 residents (City of Folsom General Plan Parks and Recreation Element, Goals and Policies, 1993 Update). It should be noted that, as required by the City, this parkland acreage does not take into account the open space and bike trails that are within the City Parks and Recreation Department's responsibility.

3A.12.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

National Recreation and Park Association

The National Recreation and Park Association (NRPA) recommends that communities have a park system that includes 5–10 acres of developed parklands for every 1,000 residents. Although the amount of parkland varies from community to community and is not regulated by law, many communities have used the NRPA recommendation to develop a standard of 5 acres per 1,000 residents for traditional service/passive park acreage, with an additional 5 acres allocated for special-use facilities and open space (i.e., nontraditional parklands), for a total standard of 10 acres per 1,000 residents.

Americans with Disabilities Act

The Americans with Disabilities Act (ADA) of 1990 (42 United States Code [USC] 12181) prohibits discrimination on the basis of disability in public accommodation and state and local government services. Under the ADA, the Architectural and Transportation Barriers Compliance Board issues guidelines to ensure that facilities, public sidewalks, and street crossings are accessible to individuals with disabilities. Typical ADA improvements include creating parking spaces for handicapped users, restroom modifications, door hardware requirements, and lighting upgrades. Play areas, meeting rooms, park restrooms, and other buildings and park structures must comply with ADA requirements. Park facilities under the Proposed Project or any of the action alternatives would be required to be ADA compliant.

Schools

- A Carl Sundahl Elementary, 9932 Inwood Road
- B Sutter Middle School, 715 Riley Street
- C Theodore Judah Elementary, 101 Dean Way
- D Blanche Sprentz Elementary, 249 Flower Drive

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

Quimby Act

The Quimby Act (California Government Code Section 66477) was established by the California Legislature in 1965 to preserve open space and parkland in rapidly urbanizing areas of the state. The Quimby Act allows cities and counties to establish requirements for new development to dedicate land for parks, pay an in-lieu fee, or perform a combination of the two.

The Quimby Act provides two standards for the dedication of land for use as parkland. If the existing area of parkland in a community is greater than 3 acres per 1,000 residents, then the community may require dedication based on a standard of up to 5 acres per 1,000 persons residing in the subdivision. If the existing amount of parkland in a community is less than 3 acres per 1,000 residents, then the community may require dedication based on a standard of only 3 acres per 1,000 persons residing in the subdivision. The Quimby Act requires a city or county to adopt standards for recreational facilities in its general plan if it is to adopt a parkland dedication or fee ordinance. See "Regional and Local Plans, Policies, Regulation, and Laws," below, for City of Folsom standards for recreational facilities.

It should be noted that the Quimby Act applies only to the acquisition of new parkland; it does not apply to the physical development of new park facilities or associated operations and maintenance costs. Therefore, the Quimby Act effectively preserves open space needed to develop park and recreation facilities, but it does not ensure the development of the land or the provision of park and recreation services to residents. In addition, the Quimby Act applies only to residential subdivisions. Nonresidential projects could contribute to the demand for park and recreation facilities without providing land or funding for such facilities. Quimby Act fees are collected by the local agency (park district, city, or county) in which the new residential development is located.

Folsom Lake State Recreational Area and Folsom Powerhouse State Historic Park General Plan/ Resource Management Plan

The current Folsom Lake State Recreation Area General Plan was adopted by the State of California in 1979. California State Parks and Reclamation are currently developing a new combined General Plan/Resource Management Plan for both the Folsom Powerhouse SHP and Folsom Lake SRA, including the Lake Natoma sub-unit. The summary of management direction provided below is derived from the direction that will be part of the new General Plan/Resource Management Plan (Sacramento County 2008).

Thirty-four management zones have been tentatively established in the new General Plan/Resource Management Plan, including twelve management zones at Lake Natoma. The management zones reflect the consideration of a number of factors, including existing and potential type and intensity of land use and visitor experience, existing and potential resource values, and the practicalities of day-to-day management and operations. The zones generally represent areas of the park that share common physical and use characteristics and should be managed as identifiable components or sub-areas.

The management zones are further used to designate each area of the park with one of four broad land use designations: recreation, conservation, preservation, and administration. The intent of the land use designations is to reflect the varying physical, social, and management attributes throughout the park and to provide a framework for making future management decisions.

The new General Plan/Resource Management Plan for Folsom Lake SRA and Folsom Powerhouse SHP is intended to provide an extensive array of management direction for the full range of resources and uses within these two park units in the form of goals and guidelines which apply to both units in their entirety. This includes direction for the protection and management of natural and cultural resources, the management of recreation and facilities, interpretation, and many other areas regarding visitor services and park operations.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

There are no goals and policies of the Sacramento County General Plan (1998) that are applicable to the Proposed Project or the alternatives under consideration.

El Dorado County General Plan

There are no goals and policies of the El Dorado County General Plan (2004) that are applicable to the Proposed Project or the alternatives under consideration.

City of Folsom General Plan

The following goals and policies of the City of Folsom General Plan (1993) are applicable to the Proposed Project and the other four action alternatives under consideration. There are no City of Folsom goals and policies that are applicable to the No Project Alternative since the site would remain under Sacramento County's jurisdiction under the No Project Alternative.

Park and Recreation Element

GOAL 35. To achieve and maintain quality parks, which provide optimum satisfaction to the leisure and recreation needs of the citizens.

- **Policy 35.12.** The following standards are the minimum acceptable standards for parks, open space and recreation facilities in the City of Folsom:

  Parkland Acreage Standard: Five acres per thousand population (5 acres per 1,000 persons)
  Space Standards: [See Table 3A.12-2, below.]

GOAL 36. To acquire and improve land and facilities for recreational use in pace with local needs.

GOAL 37. To achieve and maintain quality recreation activities which provide optimum satisfaction to leisure and recreation needs of the citizens.

GOAL 38. To involve and inform the residents, merchants and visitors of the need for public participation in planning, development and maintenance of recreation facilities.

GOAL 39. To effectively use the resources of the City of Folsom and other governmental entities (such as school districts, county, state and Federal agencies) to accomplish coordinated, effective planning of recreation and leisure activities.

The City of Folsom's General Plan park standards and classification of neighborhood, community, and regional parks are provided in Table 3A.12-2.

City of Folsom Parks and Recreation Master Plan

The City of Folsom Parks and Recreation Master Plan (Master Plan) is an implementation tool that identifies Folsom's diverse recreational facilities and activities and establishes policies for acquisition, development, administration, and use of Folsom's parks and recreation resources. In 1989, the City of Folsom Parks and Recreation Master Plan was completed as part of the City of Folsom General Plan. The Master Plan document included recommendations that reflected the park and recreation needs in the City.

Table 3A.12-2
City of Folsom Park Acreage Standards

Park Category	Desirable Size (acres)	Population	Service Area	Standard (acres per 1,000 residents)
Mini Park	1–2 acres	1,000–2,000	Less than ¼-mile radius	0.5 to 1 acre
Neighborhood Park	15 acres	2,000–5,000	¼- to ½-mile radius	2.5 to 3.5 acres
Community Park	45 acres	12,000–25,000	Several neighborhoods 1 to 2 miles	2.5 to 3.5 acres
Special Use Recreation Area/ Natural Area/ Wildlife Area/ Parkway	Variable depending on desired size	Within community 25,000–50,000	Not defined	Variable
Regional Park	200+ acres	Contiguous to or encompassing natural resources	Several communities within one-hour driving time radius	5 to 10 acres

Source: City of Folsom 1993

The most recent update of the Master Plan was completed and adopted by the City Council in 1996. The goals and policies contained in the General Plan Park and Recreation Element are contained in the Master Plan. The 1996 update identified recreational elements (program) for all undeveloped parks. A "Needs Assessment Survey" was completed and used to facilitate the Parks and Recreation Master Plan Update. The 1996 Master Plan was revisited and modified through the adoption of the 2002 Implementation Plan Update. That update reevaluated the status of park development, the estimated cost of developing the remaining parks, and made recommendations on the prioritization of undeveloped parks. The City of Folsom Parks and Recreation Department is in the process of another update; however, it is anticipated that there will be no goal or objective changes proposed in the update. The Parks and Recreation Commission and staff will examine programmatic changes related to the existing service levels, and projected needs based on these existing services and development revenues for build-out of the existing City, similar to the 2002 Implementation Plan Update (Simpson, pers. comm., 2009). The update will review the status of remaining park development, program needs, and funding.

American River Parkway Plan

The American River Parkway is an open space greenbelt, which extends approximately 29 miles from Folsom Dam to the American River's confluence with the Sacramento River and includes a 32-mile multiuse trail. The Parkway comprises several distinct sections, each having individual features and falling under the jurisdiction of different agencies and management plans. The 23-mile section of Parkway between Nimbus Dam and the American River confluence with the Sacramento River is the lower American River (LAR) and is classified as a "Recreation" river within the State and Federal Wild and Scenic River Systems (Sacramento County 2008). The Parkway is managed by Sacramento County DRPROS, which oversees implementation of the American River Parkway Plan (Parkway Plan). The purpose of the Parkway Plan is to provide a guide to land use decisions affecting the Parkway; specifically, addressing its preservation, use, development, and administration. The current Parkway Plan was adopted in 1985; however, an update to the 1985 Parkway Plan—the American River Parkway Plan 2008—has been completed and adopted at the local level by Sacramento County and the City of Sacramento, and endorsed by the City of Rancho Cordova. Finalization of the Parkway Plan is pending State legislative action (Moffitt, pers. comm., 2009).

The goals of the Parkway Plan (2008) are:

- To provide, protect, and enhance for public use a continuous open space greenbelt along the American River extending from Sacramento to Folsom Dam.
- To provide appropriate access and facilities so that present and future generations can enjoy the amenities and resources of the Parkway which enhance the enjoyment of leisure activities.
- To preserve, protect, interpret, and improve the natural, archaeological, historical, and recreational resources of the Parkway, including an adequate flow of high quality water, anadromous and resident fishes, migratory and resident wildlife, and diverse natural vegetation.
- To mitigate adverse effects of activities and facilities adjacent to the Parkway.
- To provide public safety and protection within and adjacent to the Parkway.

The guiding concept policies focus on balanced management, recreation appropriate to the Parkway, resource protection, and land use and cooperation among the jurisdictions and agencies that have regulatory responsibilities within the Parkway.

3A.12.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to parks and recreation if they would do any of the following:

- include new recreational facilities, or require the construction or expansion of existing recreational facilities that might have a substantial adverse physical effect on the environment; or

- increase demand on existing neighborhood and community parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

ANALYSIS METHODOLOGY

The evaluation of recreational resources is based on a comparison between existing and planned future recreational facilities and the policies of the City of Folsom General Plan and Parks and Recreation Master Plan. Because the SPA would be annexed into the City of Folsom as part of the project, the demand for recreational resources was estimated based on the City of Folsom's adopted park acreage standard of 5 acres per 1,000 residents. However, under the No Project Alternative, the SPA would not be annexed into the City and would remain in Sacramento County as agricultural land, which does not require development of parks or recreational facilities. The number of residents generated by the project was estimated based on per-dwelling-unit population generation factors (see Table 3A.13-3 in Section 3A.13, "Population, Employment, and Housing - Land"). Parklands (mini, neighborhood, and community parks) identified in the City of Folsom Parks and Recreation Master Plan and those proposed for the project are the focus of this analysis. Open Space and Public/Quasi-Public land uses (including schools, open space, preservation areas, and bicycle trails) are not considered part of this analysis because the City does not consider these uses as meeting parkland dedication requirements; therefore, these uses were not included in the project's total parkland acreage.

The El Dorado County General Plan Parks and Recreation policies (July 2004) are not used to analyze the project's impacts on recreation facilities because the only elements that would be located in El Dorado County are two local roadway connections (under the Proposed Project Alternative only) that would connect to existing roads within a residential subdivision in El Dorado Hills. These off-site roadway improvements would not involve construction of new housing or development of new employment opportunities in El Dorado County beyond temporary construction jobs. Therefore, these roadway connections would not generate direct increases in population that would result in additional demand for parkland facilities in El Dorado County or cause deterioration of existing facilities. With the exception of the No Project Alternative, all project (action) alternatives would include community parks, which would provide communitywide recreational opportunities serving multiple neighborhoods, and neighborhood parks, which would range in size from 3–10 acres and would be linked to neighborhoods and services by trails and bicycle facilities. The neighborhood parks would be located adjacent to proposed school sites to provide joint-use opportunities. Small local parks would also be provided within residential areas. These local (mini) parks would be between 1 and 3 acres in size and would serve the recreational needs of the immediate residential area.

With the exception of the No Project Alternative, all project alternatives would include the development of bicycle and pedestrian trails, including Class I paved off-street bike paths, Class II bicycle lanes, and 12-foot-wide multi-use trails. However, because these uses are not considered by the City as meeting parkland dedication requirements, they were not included in the project's total parkland acreage evaluated herein.

Table 3A.12-3
Project Parkland Acreage Calculations

Alternative	Projected Population[1]	Parkland Requirement (5 acres per 1,000 residents)[2]	Total Proposed Parkland (acres)	Total Surplus (+) or Deficit (-) of Parkland Acreage Compared with Requirement
No Project[3]	128	0.6	0	-0.6
Proposed Project	24,335	121.7	121.7	0
Resource Impact Minimization	19,584	97.9	105.7	+7.8
Centralized Development	20,689	103.4	118.7	+15.3
Reduced Hillside Development	28,084	140.4	170.9	+30.5
No USACE Permit	15,808	79.0	84.8	+5.8

Notes:
[1] See Table 3A.13-3 of this EIR/EIS for details on the projected population of each project alternative.
[2] City of Folsom General Plan Parks and Recreation Element, Goals and Policies, 1993 Update.
[3] Under the No Project Alternative, the SPA would not be annexed into the City of Folsom and would remain in Sacramento County. Therefore, the parkland requirement would be a minimum of 3 acres of parkland per 1,000 residents.
Source: Data compiled by AECOM in 2010

This analysis does not address various public and commercial recreational and entertainment facilities, such as community centers, movie theaters, or gymnasiums, which can be expected to be developed as part of the project but which have not been specifically identified at this time. Open space areas do not qualify as park space under the City's standards, and a comparison with open space requirements is also not part of this analysis. Compliance with Sacramento Local Agency Formation Commission (LAFCo) requirements for the annexation of the SPA into the City of Folsom, including open space requirements, is addressed in Section 3A.10, "Land Use Planning and Agricultural Resources - Land," of this EIR/EIS.

Table 3A.12-3 presents the estimated population, the total parkland acreage proposed, and comparison to the City of Folsom's park acreage standard for the Proposed Project and each of the four action alternatives. The No Project Alternative is compared to the Sacramento County park acreage standard. As explained in Section 3A.13 "Population, Employment, and Housing - Land" of this EIR/EIS, the population projections for each project alternative were calculated by multiplying the number of proposed housing units by the City of Folsom persons per dwelling unit factor. Single-family dwelling units were assumed to generate 2.92 persons per dwelling unit. Multifamily and mixed use dwelling units were assumed to generate 1.94 persons per dwelling unit. The population estimate has been rounded (either up or down) to create a whole number estimate for each land use category. The total proposed parkland acres are based on the land use plans for the action alternatives, which are contained in Chapter 2, "Alternatives."

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.12-1 Sufficiency of Proposed Parkland to Meet Increased Demand and Potential Increased Use and Deterioration of Existing Facilities. *Residential development proposed for the SPA would require 5 acres of parkland per 1,000 residents to meet the adopted City of Folsom standards. Increased population could increase the demand on existing neighborhood and community parks such that the physical deterioration of the existing facilities could occur or be accelerated.*

On-Site Elements

NP

The SPA is currently zoned AG-80, which allows for the construction of one dwelling unit per 80 acres. The SPA encompasses approximately 3,500 acres; therefore a total of 44 dwelling units could be constructed under the No Project Alternative. Based on the average household size factor for a single-family residence, 44 additional dwelling units would result in 128 new residents. No off-site water facilities would be constructed.

Under the No Project Alternative, the SPA would not be annexed into the City of Folsom and would remain in Sacramento County. Potential construction of individual rural residences on 80-acre parcels under the existing agricultural land use and zoning would not require any tentative maps, subdivision maps, or other approvals other than individual building permits. Agricultural land uses do not have a requirement for provision of park land. Although the new residents generated under this alternative would increase the demand on existing neighborhood and community parks, the contribution of these residents to increased use of existing off-site neighborhood or community parks would be minimal because of the limited increased in population. Therefore, this **indirect** impact is considered **less than significant**. **No direct** impacts would occur. ***[Lesser]***

NCP

As shown in Table 3A.12-3 above, the No USACE Permit Alternative would generate 15,808 new residents in the City of Folsom at buildout. This alternative would include 84.8 acres of community, neighborhood, and local parks for active recreation, which in comparison with the parkland requirement of 79 acres would result in a surplus of 5.8 acres of parkland. This would result in over 5 acres of developed parks per 1,000 residents at buildout. Because the No USACE Permit Alternative would provide sufficient park facilities to meet the demand generated by the projected population at buildout, this **direct** impact would not result in a substantial increase in the use of existing parks and is considered **less than significant**. The indirect impacts from development of parklands on all other topical areas are analyzed in Impact 3A.12-2 and throughout the resource sections in Chapter 3 of this EIR/EIS. Because implementation of the Proposed Project Alternative would meet the City's parkland requirements, deterioration of existing neighborhood and community parks would not occur or be accelerated from increased demand, and there would be **no indirect** impacts. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

PP

As shown in Table 3A.12-3 above, the Proposed Project Alternative would generate 24,335 new residents in the City of Folsom at buildout. The Proposed Project Alternative would include 118.4 acres of community and neighborhood parks and an additional 3.5 acres of local parks, for a total of 121.7 acres of developed parks for active recreation, which meets the City's requirement of 5 acres of parkland per 1,000 residents. Because the Proposed Project Alternative would provide sufficient park facilities to meet the demand generated by the projected population at buildout, this **direct** impact would not result in a substantial increase in the use of existing parks and is considered **less than significant**. The indirect impacts from development of parklands on all other resource areas are analyzed in Impact 3A.12-2 and throughout the topical sections in Chapter 3 of this EIR/EIS. Because implementation of the Proposed Project Alternative would meet the City's parkland requirements,

deterioration of existing neighborhood and community parks would not occur or be accelerated from increased demand, and there would be **no indirect** impacts.

Mitigation Measure: No mitigation measures are required.

RIM

As shown in Table 3A.12-3 above, the Resource Impact Minimization Alternative would generate 19,584 new residents in the City of Folsom at buildout. This alternative would include 105.7 acres of community, neighborhood, and local parks for active recreation, which in comparison with the parkland requirement of 97.9 acres, would result in a surplus of parkland. Because the Resource Impact Minimization alternative would result in over 5.0 acres of developed parks per 1,000 residents at buildout and would provide sufficient park facilities to meet the demand generated by the projected population at buildout, this **direct** impact would not result in a substantial increase in the use of existing parks and is considered **less than significant**. The indirect impacts from development of parklands on all other resource areas are analyzed in Impact 3A.12-2 and throughout the topical sections in Chapter 3 of this EIR/EIS. Because implementation of the Proposed Project Alternative would meet the City's parkland requirements, deterioration of existing neighborhood and community parks would not occur or be accelerated from increased demand, and there would be **no indirect** impacts. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

CD

As shown in Table 3A.12-3 above, the Centralized Development Alternative would generate 20,689 new residents in the City of Folsom at buildout. This alternative would include 113.5 acres of community and neighborhood parks and 5.2 acres of local parks for active recreation. This would result in a total of 118.7 acres of parkland, which would meet the City's requirement of 5 acres of developed parks per 1,000 residents. Because the Centralized Development Alternative would provide sufficient park facilities to meet the demand generated by the projected population at buildout, this **direct** impact would not result in a substantial increase in the use of existing parks and is considered **less than significant**. The indirect impacts from development of parklands on all other topical areas are analyzed in Impact 3A.12-2 and throughout the resource sections in Chapter 3 of this EIR/EIS. Because implementation of the Proposed Project Alternative would meet the City's parkland requirements, deterioration of existing neighborhood and community parks would not occur or be accelerated from increased demand, and there would be **no indirect** impacts. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

RHD

As shown in Table 3A.12-3 above, the Reduced Hillside Development Alternative would generate 28,084 new residents in the City of Folsom at buildout. This alternative would include 158.6 acres of community and neighborhood and 12.3 acres of local parks for active recreation. This would result in a total of 170.9 acres of parkland, which would meet the City's requirement of 5 acres of developed parks per 1,000 residents. Because the Reduced Hillside Density Alternative would provide sufficient park facilities to meet the demand generated by the projected population at buildout, this **direct** impact would not result in a substantial increase in the use of existing parks and is considered **less than significant**. The indirect impacts from development of parklands on all other topical areas are analyzed in Impact 3A.12-2 and throughout the resource sections in Chapter 3 of this EIR/EIS. Because implementation of the Proposed Project Alternative would meet the City's parkland requirements, deterioration of existing neighborhood and community parks would not occur or be accelerated from increased demand, and there would be **no indirect** impacts. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

The off-site elements of the Proposed Project Alternative are related to the provision of utilities and infrastructure to the SPA and roadway improvements, and would not involve construction of new housing or development of new employment opportunities in Sacramento or El Dorado Counties beyond temporary construction jobs. Therefore, there would be no direct increases in population that would result in additional demand for parkland facilities. No parkland facilities would be constructed in relation to off-site elements, nor would any be required. Therefore, off-site elements would result in **no direct** or **indirect** impact to parkland facilities. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.12-2 Increased Use and Potential Physical Deterioration of Existing Off-Site Local or Regional Park Facilities. *Project implementation would result in a large number of new residents, which would increase the use and could cause the potential physical deterioration of existing off-site local and regional park facilities.*

On-Site Elements

NP

The 128 new residents that could be generated by ongoing development under the AG-80 zoning would be expected to use existing off-site recreational opportunities and facilities such as those at Folsom Lake SRA, Folsom Powerhouse SHP, and the American River Parkway, including bicycle trails, campgrounds, boat launch facilities, and sports parks. However, the contribution of these residents to increased use of existing off-site local or regional parks would be minimal due to the limited increase in population, as compared with the expected service populations and service areas of these facilities as presented in Table 3A.12-1. No off-site water facilities would be constructed. Additionally, although it cannot be fully ascertained with any degree of certainty exactly how many residents and with what frequency they would choose to use off-site recreational facilities, for purpose of this analysis, it is assumed that revenues from use charges and admission fees of these off-site facilities would increase along with increased usage, thus supporting increased maintenance. This **indirect** impact is considered **less than significant**. **Direct** impacts are analyzed in Impact 3A.12-1. ***[Lesser]***

NCP, PP, RIM, CD, RHD

As presented in Table 3A.14-3 of this EIR/EIS, at full project buildout, the No USACE Permit Alternative would result in an estimated 15,808 new residents; the Proposed Project Alternative would result in an estimated 24,335 new residents in the City of Folsom; the Resource Impact Minimization Alternative would result in an estimated 19,584 new residents; the Centralized Development Alternative would result in an estimated 20,689 new residents; and the Reduced Hillside Development Alternative would result in an estimated 28,084 new residents. Any of these project alternatives would represent a substantial population increase. In addition to the on-site facilities, the new residents would also be expected to use existing off-site recreational facilities such as those at Folsom Lake SRA, Folsom Powerhouse SHP, and the American River Parkway, including bicycle trails, campgrounds, boat launch facilities, and sports parks. Although it cannot be fully ascertained with any degree of certainty exactly how many residents and with what frequency they would choose to use off-site recreational facilities, for purpose of this analysis, it is assumed that revenues from use charges and admission fees of these off-site facilities would increase along with increased usage, thus supporting increased maintenance. This **indirect** impact is considered **less than significant**. **Direct** impacts are analyzed in Impact 3A.12-1 ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

The off-site elements of the Proposed Project Alternative are related to the provision of utilities and infrastructure to the SPA and roadway improvements, and would not involve construction of new housing or development of new employment opportunities in Sacramento or El Dorado Counties beyond temporary construction jobs. Therefore, there would be no direct increases in population from construction of these facilities that would result in increased use of existing off-site recreational facilities such as those at Folsom Lake SRA, Folsom Powerhouse SHP, and the American River Parkway, including bicycle trails, campgrounds, boat launch facilities, and sports parks. Therefore, construction of the off-site elements would result in **no indirect** impact to off-site parkland facilities. **Direct** impacts are analyzed in Impact 3A.12-1. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

3A.12.4 RESIDUAL SIGNIFICANT IMPACTS

Impacts associated with parks and recreation are considered less than significant. Therefore, there would be no residual significant impacts as a result of project implementation.

This page intentionally left blank.

This section was prepared by RMC Water and Environment.

3B.12 PARKS AND RECREATION – WATER

3B.12.1 AFFECTED ENVIRONMENT

This section provides a description of the existing park and recreation opportunities and facilities within the "Water" Study Area. In the context of the actions proposed as part of the Off-site Water Facility Alternatives, emphasis is placed on portions of the "Water" Study Area where physical environmental changes would occur. As provided in Chapter 2, "Alternatives," physical improvements proposed in Zone 4; whereas no physical improvements are proposed within Zones 1, 2, and 3. Zone 2 is also considered in this EIR/EIS from an operational standpoint in the context of the potential changes in flow that could occur within the Sacramento River as a result of long-term operation of the Off-site Water Facility Alternatives.

ZONE 4 OF THE "WATER" STUDY AREA

There are numerous open space resources within and adjacent to Zone 4 of the "Water" Study Area. Open space uses are concentrated in areas north along the American River Parkway, at Mather Regional Park, agricultural areas to the east of Sunrise Boulevard (south of White Rock Road), and within the floodplains of Morrison and Laguna Creeks. Recreational corridors have been developed along the FSC and Laguna Creek. The FSC from Nimbus Dam to about Sloughhouse Road includes a paved, bike and pedestrian path open to the public year-round. The path is used for recreational bicycling, commuter bicycling, and walking. South of Sloughhouse Road, the FSC is not open to the public. The Folsom Lake State Recreational Area (SRA) is located to the north of Zone 4 of the "Water" Study Area; however, views from the SRA in the vicinity of Folsom Lake include eastern portions of the "Water" Study Area.

The Prairie City OHV Park is located within the eastern section of the "Water" Study Area, south of White Rock Road and west of Scott Road. Blodgett Reservoir is situated in the southeastern part of Zone 4 of the "Water" Study Area and provides recreational opportunities for residents south of Mather Field and within the Sunrise-Douglas Community. Other regional and local parks that provide significant open space opportunities include the Wildhawk Golf Course south of the Freeport Project bifurcation, Mather Sports Complex, and the Cordova Shooting Center.

ZONE 2 OF THE "WATER" STUDY AREA

The Off-site Water Facility Alternatives would operate from the Freeport Project diversion/intake on the Sacramento River and would withdraw water for M&I uses in the SPA. The Sacramento River supports a variety of recreational, water-dependent activities including boating and fishing, and recreational activities including camping, hiking, picnicking, and sightseeing, that are enhanced by the scenic value of the river.

Two private marinas are located within the immediate vicinity of the project area: the Alamar Marina and Metro Marina. The Alamar Marina is located at River Mile 70.5 on the eastside of the Sacramento River. This marina offers covered and non-covered boat docks, a fuel dock, and houseboat and jet ski rentals. The Metro Marina is located at River Mile 70.5 on the eastside of the river. This marina consists of 13 cover slips that can accommodate boats 30 feet in length. The spaces are rented out on a daily, monthly or yearly basis. There are also several public and private boat launches located along the river.

There are numerous other informal recreation sites located along the length of the Sacramento River where public access is readily available and vehicle parking can be accommodated. These sites usually support bank fishing that occur during the course of the year, depending on the presence of game fish in this river reach. One such site is the area immediately north of the Sacramento Weir, where vehicle parking can be accommodated and access to

the Sacramento River is readily available. Public river access is typically not promoted or allowed on private property along the Sacramento River.

3B.12.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to parks and recreation are relevant to the Off-site Water Facilities Alternatives, and are described in detail in Section 3A.12, "Parks and Recreation – Land:"

- Americans with Disabilities Act

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to parks and recreation are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.12, "Parks and Recreation – Land:"

- Folsom Lake State Recreational Area and Folsom Powerhouse State Historic Park General Plan/ Resource Management Plan

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following local and regional plans, policies, regulations, and laws related to parks and recreation are relevant to the Off-site Water Facilities alternatives, and are described in detail in Section 3A.12, "Parks and Recreation – Land:"

- Sacramento County General Plan
- City of Folsom General Plan
- City of Folsom Parks and Recreation Master Plan
- American River Parkway Plan

City of Rancho Cordova General Plan

The following goals and policies of the City of Rancho Cordova General Plan (2006) are applicable to the Off-site Water Facility Alternatives under consideration.

- **Policy OSPT.3.1:** Develop a trails system that provides for maximum connectivity, so that all trails are linked for greater use as recreational and travel routes.

- **Upper Laguna Creek Collaborative:** The Collaborative is advocating the planning, design, and development of a parkway along the Upper Laguna Creek. The City is participating in and supporting the effort of the Collaborative to develop a plan for Upper Laguna Creek. Future successes will be incorporated into the General Plan implementation documents such as the Trails Master Plan.

3B.12.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its

impacts. For the purposes of this analysis, the City's proposed Off-site Water Facilities would result significant environmental effects to recreational facilities if they would:

- cause a change in river flows or lake elevations that would result in substantial changes to existing recreational opportunities,
- locate project facilities that would result in a substantial short or long-term disruption of any existing recreational activities and/or facilities,
- cause an increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated, or
- include the construction of new or expanded recreational facilities, which could result in adverse physical effects to the environment.

ANALYSIS METHODOLOGY

The assessment of potential impacts to recreational opportunities or facilities focuses on evaluating whether the Off-site Water Facilities would impact (1) water-dependent (e.g., boating and swimming) and water-enhanced recreation opportunities along the Sacramento River and other major water supply reservoirs (i.e., Shasta, Folsom) and (2) recreation areas or facilities crossed by facilities proposed as part of the Off-site Water Facilities. Effects on recreation were evaluated in relation to potential construction and operational-related impacts. A long-term, operational effect could occur if a recreation opportunity is eliminated as a result of construction activities associated with a project facility.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Increase Use of Parks and Recreational Facilities—The Off-site Water Facility Alternatives would not result in land uses that could directly increase the use of existing neighborhood and regional parks, or other recreational facilities. The Off-site Water Facility Alternatives would involve the acquisition of new surface water supplies for the SPA and the construction of supporting conveyance and treatment facilities to enable for the delivery of treated-water. Based on these actions, it is reasonable to conclude that the Off-site Water Facility Alternatives would indirectly facilitate additional population growth within the SPA. These issues are addressed in more detail in Chapter 4, "Other Statutatory Requirements," under the discussion of "Growth-Inducement." Given that the Off-site Water Facilities would not directly generate new population growth that could result in increases in the use of neighborhood and regional parks or other recreational facilities, no adverse impacts are expected. Therefore, this issue area is not discussed further.

Construction of New Recreational Facilities—Based on those actions described in Chapter 2, "Alternatives," the Off-site Water Facility Alternatives would not involve the construction of new or expanded recreational facilities, which could result in adverse physical effects to the environment. In this context, no adverse impacts are expected, and this issue area is not discussed further.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.12-1 Temporary Disruptions to Existing Recreational Facilities and Opportunities. *Implementation of the Off-site Water Facility Alternatives could temporarily disrupt trail, golf course, or park facility access.*

NCP, PA, 1, 1A, 2, 2A, 3, 3A, 4, and 4A

Construction of the Off-site Water Facilities under each of the alternatives would involve crossing the FSC, which could temporarily disrupt the use of the FSC multiuse trail. In addition, Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A would traverse through Mather Regional Park, thereby potentially disrupting trail, golf course, or park facility access. Therefore, disruptions to local recreation facilities as a result of the Off-site Water Facilities construction under Alternatives PA, 1, 1A, 2, 2A, 3, 3A, 4, and 4A would result in **potentially significant**, **direct** impacts. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3B.12-1: Provide for Continued Recreational Access as Identified in Mitigation Measure 3.14-1a.

As part of the Traffic Control Plan identified in Mitigation Measure 3.14-1a, the City shall ensure that trail access is maintained throughout the construction period through the use of detours. Proper signage shall be included in multiple locations, where necessary, to provide advance notice to hikers and equestrian riders of up-comings construction activities.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction activities

Enforcement: 1. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

2. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

2B

Off-site Water Facility Alternative 2B would be constructed to the east of the FSC and Mather Regional Park and is not expected to result in the obstruction of recreational trail access. As a result, **no impacts** to existing recreational facilities or opportunities are expected from construction of the Off-site Water Facilities under Alternative 2B. ***[Lesser]***

Because Mitigation Measure 3B.12-1 would require the public to be notified of the duration of roadway construction, detour routes would be established either through the construction site or on adjacent public streets, and access would be restored to preconstruction conditions, therefore, impacts on recreational facilities would be reduced to a **less-than-significant** level.

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.12-2 Effects to Water-Oriented Recreational Facilities and Opportunities. *Implementation of the Off-site Water Facility Alternatives would not cause an adverse change in river flows or lake elevations that could result in substantial changes to existing recreational opportunities.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Section 3B.9, "Hydrology and Water Quality – Water" provides a detailed discussion of the potential impacts to flows within the Sacramento River as a result of the Off-site Water Facilities' operations. As described in Chapter 2, "Alternatives," all of the Off-site Water Facility Alternatives would involve an assignment of CVP water from NCMWC to the City that would then be diverted through the Freeport Project intake. This change in point of diversion would result in water being diverted further south, approximately 20 miles, as compared to existing conditions. As described in Section 3B.9.3, this operational change would result in a negligible change in the frequency with which flows in the Sacramento River are within a range suitable for water-dependent recreation during the peak recreation season (May to September). In addition, based on CALSIM modeling, the reduced demand during the late summer months would likely benefit water recreational activities by a minor addition in river flows. Based on these circumstances, **direct** impacts to river recreation would be **less than significant**. **No indirect** impacts would result. ***[Similar]***

Likewise, the Off-site Water Facilities would result in negligible changes in the frequency with which the surface elevations of Shasta and Trinity Reservoirs would fall below levels identified as important water-dependent recreation thresholds. This finding is primary due to reduction in releases that would occur under the Off-site Water Facility Alternatives during the late summer months thereby adding slighting to surface elevations within the reservoirs. Additionally, the increases in releases during the winter and spring months are expected to be more than compensated for by high inflows to the reservoirs during these months. In the context of these findings, these **direct** impacts are considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3B.12.4 RESIDUAL SIGNIFICANT IMPACTS

After implementation of applicable mitigation measures, including 3B.12-1, impacts from implementation of the Off-site Water Facility Alternatives would all be less than significant.

This page intentionally left blank.

3A.13 POPULATION, EMPLOYMENT, AND HOUSING - LAND

3A.13.1 AFFECTED ENVIRONMENT

POPULATION

Sacramento County

The following population data for Sacramento County (County) was obtained from the adopted Sacramento County General Plan Housing Element (2008). Population data in the Housing Element was based on 1990 and 2000 U.S. Census Bureau data, California Department of Finance (DOF) data, and the Sacramento Area Council of Governments' (SACOG's) most recent projections released in 2007. From 1990 to 2000, the population of Sacramento County increased from 1,041,219 to 1,223,499, or 17.5% (Sacramento County 2008). The population in the unincorporated area of the County declined by 26% during the same time period with the incorporation of the City of Elk Grove and the City of Rancho Cordova. As of January 1, 2008, the population of Sacramento County was estimated to be 1,424,415 (DOF 2008), an approximately 14.1% increase from 2000.

The Sacramento County General Plan Housing Element projects the County's population growth in the single-digit range for each five-year period between 2000 and 2025. Population growth per five-year period is anticipated to gradually decline, from nearly 9% between 2000 and 2005 to about 3% between 2020 and 2025. Modest population growth is also anticipated in the unincorporated County area. However, much of the projected population growth will occur in developing areas of the County that are now part of Elk Grove and Rancho Cordova. Sacramento County is projected to have a population of 1,695,498 by 2025 (Sacramento County 2008).

City of Folsom

The following population data for the City of Folsom are taken from City of Folsom General Plan Housing Element Background Report, adopted July 14, 2009. The population data in the City's adopted Housing Element is drawn largely from 2000 U.S. Census Bureau data, the DOF, and SACOG. The City's adopted Housing Element (2009) serves a 7.5-year planning period from January 1, 2006 to June 30, 2003. As presented in the City's 2002 Housing Element Background Report, from 1990 to 2000, the population of Folsom increased from 29,802 to 51,884, a 42.6% increase. Folsom's population was anticipated to increase from 51,884 in 2000 to 74,185 in 2010, an average annual growth rate of 3.6%. The City's current Housing Element (2009) estimates the population of Folsom will grow to 69,800 in 2013 and 76,333 in 2015. These population projections show a substantial decline in growth from what occurred between 1990 and 2008. By 2035, population is anticipated to increase to 97,485 persons. These projections do not include Folsom Prison or California State Prison Sacramento population. In addition, these projections do not include population that would be generated by the project.

As of January 1, 2008, the population of the City of Folsom, including the inmate population in Folsom Prison and the California State Prison Sacramento, was estimated to be 72,590 (DOF 2008). After subtracting the 7,284 inmates that the California Department of Corrections and Rehabilitation counted at Folsom Prison and California State Prison Sacramento in March 2008, the noninstitutionalized population in Folsom is estimated at 65,306 as of 2008.

Approximately 10% of Folsom's population is located in group quarters, which consists mainly of Folsom Prison, California State Prison Sacramento, and other facilities such as nursing care facilities. Per the adopted Housing Element (2009), the total group quarters population in Folsom increased only slightly from 6,720 in 1990 to 6,944 in 2000. The Folsom Prison population was 6,740 as of June 2001 (City of Folsom 2002). The total group quarters population in the City increased slightly from 6,944 in 2000 to 6,852 in 2007. Data from the California Department of Corrections and Rehabilitation shows that the population at Folsom Prison and California State Prison Sacramento has increased from 6,523 inmates in March 2002 to 7,284 inmates in March 2008. The

estimated number of inmates in 2008 exceeds the 2007 DOF estimate of group quarters population by approximately 400 (City of Folsom 2009).

El Dorado Hills

El Dorado Hills is a census designated place (CDP) within unincorporated El Dorado County. El Dorado Hills is the most rapidly developing region of El Dorado County. This area is dominated by high-end housing that serves primarily residents commuting to the Sacramento region (El Dorado County 2003:5-1.7). From 1990 to 2000, the population of El Dorado Hills increased from 18,016 to 32,436, or 44.5% (U.S. Census 2000, 2007).

EMPLOYMENT

Employment growth is one of the primary determinants of housing demand. Working-age individuals often choose a place to live based on employment prospects in the local area. Therefore, employment trends are an important indicator of housing demand. The rate of employment growth, and the types of jobs most likely to be created, would determine how much housing would be needed by type and cost. For example, an economy based on seasonal tourism will generate different housing needs for workers than an economy based on government, education, research, and technology. The following discussions provide the historical, current, and future employment conditions for Sacramento County, Folsom, and El Dorado Hills. The anticipated trend in the jobs/housing index is provided in Chapter 4, "Other Statutory Requirements."

Sacramento County

The following summarizes employment trends in Sacramento County in the last 10 years (Sacramento County 2008:5-12).

- The Sacramento County economy diversified, with decreasing reliance on government employment on the long-term.
- Significant job growth occurred among companies that serve markets beyond Sacramento County.
- New jobs included higher-paying professional jobs and lower-paying service and retail jobs. However, three-fourths of new jobs in occupations with the greatest anticipated job growth will pay salaries below the Sacramento County median income.
- Most employment growth was centered within incorporated areas of the County. However, there will be an increasing potential for job growth through conversion and reuse of older commercial and industrial sites within unincorporated communities.

The Sacramento County labor market has traditionally been dominated by public agency employment, services, and retail/wholesale trades. Sacramento County had an average of 573,100 civilian jobs in 2004. Of the total employment, 32% was in nonfinancial services, 28% in government, 20% in retail and wholesale trades, 12% in goods producing industries, 7% in financial/insurance/real estate services, and 1% in farming (Sacramento County 2008:5-12). Among all employers (public and private), the sectors that consist of local government agencies, health care and related services firms, educational establishments, and technology firms are among the major employers in the Sacramento region. The largest employers in Sacramento County include Kaiser Permanente, Raley's Inc., UC Davis Health Systems, Mercy/CHW, Intel Corporation, Sutter Health, and AT&T (Sacramento County 2008:5-13).

Between 1990 and 2000, business service firms added nearly 38,000 jobs to the Sacramento economy. Manufacturing firms added another 21,000 jobs, followed by engineering and management service firms at nearly 5,000 jobs. The U.S. Census Bureau's 2007 data estimates 655,300 persons in the Sacramento County labor force (population 16 years and over) during that period (Sacramento County 2008:5-12). Annual job growth is expected

to accelerate between 2005 and 2015 to over 4,000 jobs per year and then decline to about 1,400 jobs per year by 2025. The rate of projected job growth in the unincorporated area, about 1%, is below the projected Countywide level of 2.5% between 2000 and 2005. Much of the projected job growth is expected to occur in employment centers located within the newly incorporated City of Rancho Cordova (Sacramento County 2005). Projections for employment in Sacramento County indicate 814,220 in the labor force by 2025. (Sacramento County 2008 :5-14.)

Jobs with the greatest anticipated growth in the Sacramento region are health care services, security services, food and retail trades, business and personal services, and clerical/ administrative support. Substantial job growth is also anticipated in computer and other technical specialties, law enforcement and emergency services, and transportation. Most of these jobs will pay salaries at low- to moderate-income ranges, even accounting for an average of 1.4 workers per household. Among the jobs that are expected to experience the most growth are food service, maintenance, personal care, and retail jobs that pay average wages of $8 to $14 per hour, or approximately $17,000 to $29,000 per year (Sacramento County 2008:5-14).

City of Folsom

For many years, Folsom had an economy largely based on Folsom State Prison "industry," which has been in existence for over a century. Recent economic and employment trends have shifted, however, with Folsom's economic development efforts to plan for commercial and industrial development. A number of large, national corporations involved in the research, development, and manufacturing of electronic components have located regional offices and manufacturing facilities in Folsom. Additionally, several large retail/commercial centers have been completed or are under construction. Intel Corporation is the largest private industry employer in Folsom with approximately 6,800 employees at its Folsom branch (as of early 2008). About one-third of Intel's employees are Folsom residents, another third reside in the Greater Sacramento Area, and the other third reside in El Dorado and Placer Counties. Other large employers in Folsom include the California State Prison system (1,500), Folsom-Cordova Unified School District (1,400), and Verizon Wireless (1,000) (SACOG 2005).

Employment in the City Folsom is projected to increase at a 4.8% annual rate from 2000 to 2010 (from 21,237 to 33,826 people), which is almost twice the projected annual employment growth rate of 2.5% for Sacramento County for the same period. Between 2000 and 2007, employment in Folsom increased from 25,311 to 33,782 (population of persons 16 years and older) (U.S. Census Bureau 2007). The City's Housing Element (2009) projects future growth in employment to 26,548 in 2013 and 40,901 in 2025, but indicates that employment will increase at a declining rate because the City is reaching commercial/industrial buildout.

El Dorado Hills

Between 2000 and 2007, employment in El Dorado Hills increased from 9,001 to 16,927 (population of persons 16 years and older) (U.S. Census Bureau 2007). Of the total employment, 47% was in nonfinancial services, 29% in goods producing industries, 15% in retail and wholesale trades, and 12% in financial/insurance/real estate services (Sacramento County 2008:5-12). In general, these jobs do not pay in the range to support habitation in the type of housing available in El Dorado Hills. The result is an increasing number of individuals living in more affordable areas (in other parts of El Dorado County and Sacramento County) and commuting to work in El Dorado Hills (El Dorado County 2008).

The El Dorado Hills Business Park is one of the largest employment centers in El Dorado County (El Dorado County 2003:5.1-7). It is expected that the El Dorado Hills community area would develop 301 acres of job-generating land uses in the future (El Dorado County 2003:5.1-14).

HOUSING

Sacramento County

The total number of housing units in Sacramento County increased from 474,814 in 2000 to 541,106 in 2007. Sacramento County's housing growth rate was approximately 12.3%, with the supply and composition of housing changing little in this period. Approximately 63% of housing units Countywide are single-family homes (U.S. Census Bureau 2007). In 2007, Sacramento County had an average household size of 2.69 (considered to be a relatively large household). The County's Housing Element projects that in 2025, the total housing units would increase to 662,004 and the average household size would increase to 2.55, based on the assumption that housing development in the unincorporated area will attract more families with children and that, conversely, there will be slight declines in average household sizes for most of the cities in Sacramento County. The 2035 projections indicate a further increase in households in the county, with a total of 732,678 households by 2035 (SACOG 2007).

The relative ability of a community to meet the demands for local housing is analyzed using a "vacancy rate," which establishes the relationship between housing supply and demand. If the demand for housing units is greater than the available supply, then the vacancy rate is low and the price of housing will most likely increase at a higher rate than an area where supply and demand are more in balance. According to HCD (2000), a housing vacancy rate of 5% is considered normal. Vacancy rates below 5% indicate a housing shortage in a community. Sacramento County had a vacancy rate of 7.5% from 2005–2007 (U.S. Census Bureau), which indicates that the County had a greater amount of housing supply than demand, not a housing shortage. However, SACOG (2001) projects a vacancy rate of 4.74% by 2025 (SACOG 2001), which may indicate there will be a slight shortage of housing in the County in the future.

City of Folsom

The City of Folsom is a suburban, bedroom community for the greater Sacramento area. The total number of housing units in Folsom increased from 17,968 in 2000 to 24,825 in 2007. The City's housing growth rate was approximately 27.6%, with the supply and composition of housing changing little in this period. Approximately 72% of housing units are single-family homes (U.S. Census Bureau 2007; City of Folsom 2008). In 2007, Folsom had an average household size of 2.63 (considered to be a relatively large household). The number of households is projected to grow to 26,548 in 2013 and 36,119 in 2035. With the population increasing at a faster rate than the number of households, household size is projected to increase to 2.63 in 2013 and 2.70 in 2035 (City of Folsom 2008:18).

The U.S. Census Bureau reports that Folsom had a vacancy rate of 1.6% for owner-occupied units and 2.6% for rental units in 2007. These vacancy rates indicate that the City experienced a tight housing market and a housing shortage.

El Dorado Hills

There is currently a concentration of high-end housing development in El Dorado Hills (El Dorado County 2008:28). The total number of housing units in El Dorado Hills increased from 6,071 in 2000 to 11,268 in 2007. The housing growth rate in El Dorado Hills was approximately 46%, with the supply and composition of housing changing little in this period. Approximately 72% of housing units are single-family homes (U.S. Census Bureau 2007). In 2007, El Dorado Hills had an average household size of 3.03 (considered to be a relatively large household). By 2025, El Dorado Hills is projected to have approximately 4,481 high-density residential units (El Dorado County 2003:5-1.37).

The U.S. Census Bureau reports that El Dorado Hills had a vacancy rate of 1.5% for owner-occupied units and 3.9% for rental units in 2007. These vacancy rates indicate that the community experienced a tight housing market and a housing shortage.

Regional Housing Needs Allocation

The 2006–2013 Regional Housing Needs Plan (RHNP) allocates to SACOG cities and counties their "fair share" of the region's projected housing needs (SACOG 2008). Each city and county in the RHNP receives a Regional Housing Needs Allocation (RHNA) of total number of housing units that it must plan for within a 7.5-year time period through their General Plan Housing Elements. Within the total number of needed units, allocations are also made for the number of very low-, low-, moderate-, and above-moderate-income units. The RHNP allocations take into consideration several factors: market demand for housing; type and tenure of housing supply; employment opportunities; commuting patterns; availability of suitable residential sites and public facilities; loss of assisted multifamily units; avoiding further concentration of lower income households; and special housing needs.

Sacramento County

As shown in Table 3A.13-1, SACOG anticipates that 59,093 housing units would be required in Sacramento County to meet regional housing needs. Of this total, 3,601 housing units have been allocated to the City of Folsom during the current planning period (2006-2013), as shown in Table 3A.13-2.

Table 3A.13-1
Sacramento County Regional Housing Needs Allocation for 2006–2013

Income Grouping	Projected Housing Units (2013)	Percent of Housing Need
Very low	12,604	21.3
Low	9,573	16.2
Moderate	11,265	19.1
Above-moderate	25,652	43.4
Total	**59,094**	**100.0**

Source: SACOG 2008

Table 3A.13-2
City of Folsom Regional Housing Needs Allocation for 2006–2013

Income Grouping	Projected Housing Units (2013)	Percent of Housing Need
Very low	1,073	29.8
Low	766	21.3
Moderate	810	22.5
Above-moderate	952	26.4
Total	**3,601**	**100.0**

Source: SACOG 2008

City of Folsom

As shown on Table 3A.13-3, the City has determined that there are a total of 1,399 affordable housing units under construction: 216 very low-income, 177 low-income, and 1,006 moderate-income housing units. There are an additional 479 planned and built above-moderate housing units for a total of 1,878 housing units (City of Folsom 2009:1-2). Folsom has estimated that 711 very low-income, 256 low-income, 213 moderate-income, and 1,273 above-moderate-income housing units for a total of 2,453 housing units could be constructed on vacant land within the existing City limits (City of Folsom 2009:6). In addition, the City has estimated that the project could construct 1,052 affordable housing units and 1,155 above-moderate housing units for a total of 2,816 housing units during the housing element planning period (City of Folsom 2009:7).

Table 3A.13-3
City of Folsom Projected Housing Units to Meet Regional Housing Needs Allocation for 2006-2013

Category	Very Low	Low	Moderate	Above-Moderate
Built and planned projects	216	177	1,006	479
Potential housing units within the existing City limits	711	256	213	1,273
Potential housing units within the SPA	1,052	--	609	1,155
Total housing units	**1,979**	**433**	**1,828**	**2,907**
Projected housing units (2013)	1,073	766	810	952
Total Difference	**+906**	**-333**	**+1,018**	**+1,955**

Source: City of Folsom 2009

The City anticipates that a total of 7,147 housing units could be constructed in Folsom during the current planning period (2006–2013) to meet regional housing needs. The total number of very low income, moderate income, and above-moderate income housing units would exceed the total required number of housing units in these categories. The total number of low income housing units would be less than that required to meet regional housing needs. Nevertheless, the projected number of housing units (7,147) would exceed the required number of housing units (3,601) identified in the RHNA.

3A.13.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no Federal plans, policies, regulations, or laws related to population, employment, and housing that apply to the Proposed Project or alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

Regional Housing Needs Plan

A RHNP is mandated by the State of California (California Government Code Section 65584) for regions to address housing issues and needs based on future growth projections for the area. The RHNP is developed by SACOG and allocates to cities and counties their "fair share" of the region's projected housing needs based on household income groupings over the planning period for the housing elements of each specific jurisdiction. On February 21, 2008, the SACOG Board of Directors adopted the 2006–2013 RHNP. Cities and counties must develop and adopt their Housing Elements to address how they will meet their allocations. The Sacramento County General Plan and the City of Folsom General Plan Housing Elements are described below.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

The following goals and policies of the *Sacramento County General Plan* (1993) are applicable only to the off-site detention basin east of Prairie City Road under the Proposed Project and the other four action alternatives. There are no Sacramento County goals and policies that are applicable to the No Project Alternative.

Land Use Element

GOAL: Accommodate projected population and employment growth in areas where the appropriate level of public infrastructure and services are or will be available during the planning period.

- **Policy LU-9.** Specific plans may be prepared for subareas of an urban growth area for the purpose of prioritizing development opportunities. In such cases, the Plan shall have defensible boundaries and address development of all lands within them.

GOAL: Land use patterns that minimize the impacts of new and existing development while maintaining the quality, character, and identity of neighborhood and community areas.

Objective: Neighborhoods with a balanced mix of employment, neighborhood services, and different housing types.

- **Policy LU-11.** Specific Plans and Community Plans for areas within the Urban Service Boundary should provide a balance of employment, neighborhood services, and different housing types wherever feasible.

GOAL: Accommodate an effective range of residential densities or commercial and industrial land use intensities within areas defined by the General Plan Land Use Diagram of the unincorporated County area.

Housing Element

GOAL: Provide an adequate supply of suitable sites for the development of a range of housing that varies sufficiently in terms of cost, design, size, location, and tenure to meet the housing needs of all segments of the County's population.

El Dorado County General Plan

There are no *El Dorado County General Plan* (2004) policies that are applicable to the Proposed Project or alternatives under consideration.

City of Folsom General Plan

The following goals and policies of the *City of Folsom General Plan* (January 1993) are applicable to the Proposed Project and the other four action alternative. There are no City of Folsom goals and policies that are applicable to the No Project Alternative.

Land Use Element

GOAL 4: To provide opportunities for residents to work, shop and enjoy leisure activities in the City.

- **Policy 4.1.** The City will plan for additional housing as determined in the Housing Element for the next 5 to 25 years.

GOAL 8: To allow a variety of housing types which provides living choices for Folsom residents.

GOAL 10: To provide for a commercial and industrial base of the City to encourage:

1. A strong tax base.
2. More jobs within the City.
3. A greater variety of commercial goods and services.
4. A regional shopping center.
5. Businesses and industries compatible with Folsom's quality of life.

Housing Element

GOAL 18: To provide for the City's regional share of new housing for all income groups.

- **Policy 18.1.** The City shall ensure that sufficient land is designated and zoned in a range of residential densities to accommodate the City's regional share of housing.

- **Policy 18.3.** The City shall identify sites that are suitable for multifamily housing and residential redevelopment.

- **Policy 18.4.** The City shall encourage home builders to develop their projects on multifamily-designated land at the high end of the applicable density range.

3A.13.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration could result in a significant impact related to population, employment, and housing if they would do any of the following:

- induce substantial population growth in an area, either directly (by proposed new homes and businesses) or indirectly (through the extension of roads or other infrastructure);

- generate a substantial demand for new housing, the construction of which could cause significant environmental impacts; or

- displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

Analysis Methodology

The examination of population, employment, and housing conditions in this section is based on information obtained from review of available population, employment, and housing data and projections, including those in the Sacramento County General Plan (1996) and Housing Element (2008), the City of Folsom General Plan (1988) and Housing Element (2009), the U.S. Census Bureau (1990, 2000, 2007), the DOF (2008), and other sources. El Dorado Hills is included in the area of consideration for population, employment, and housing issues for the Proposed Project Alternative only, because it is the only alternative that would include off-site roadway connections into El Dorado County.

Population projections for the SPA were calculated by multiplying the number of proposed housing units by the City of Folsom persons per dwelling unit factor. Single-family dwelling units were assumed to generate 2.92 persons per dwelling unit. Multifamily and mixed use dwelling units were assumed to generate 1.94 persons per dwelling unit. The population estimate has been rounded (either up or down) to create a whole number estimate for each land use category.

The Proposed Project and the other four action alternatives include new housing and businesses that would result in direct increases in population in Folsom over the buildout time period, estimated to be complete in 2030. This analysis assumes that project development would generate the numbers of residents and housing units, as presented in see Table 3A.13-4. Housing and population increases under the No Project Alternative would not be added to the City of Folsom because the SPA would remain under the jurisdiction of Sacramento County, therefore, the No Project Alternative is not included in the following or in Table 3A.13-4).

- The No USACE Permit Alternative would have a maximum of 6,373 dwelling units and generate approximately 15,808 new residents in Folsom.
- The Proposed Project Alternative would have a maximum of 10,210 dwelling units and generate approximately 24,335 new residents in Folsom.
- The Resource Impact Minimization Alternative would have a maximum of 7,965 dwelling units and generate approximately 19,584 new residents in Folsom.
- The Centralized Development Alternative would have a maximum of 9,026 dwelling units and generate approximately 20,689 new residents in Folsom.
- The Reduced Hillside Development Alternative would have a maximum of 11,553 dwelling units and generate approximately 25,022 new residents in Folsom.

In addition, the project would include development of mixed-use, office park, and commercial land uses. The target floor area ratios attached to each commercial/office/mixed-use acreage were developed by DKS Associates and were used to calculate the potential building square footage generated by project development. This analysis assumes that development of the Proposed Project and the other four action alternatives would generate the building square footage and numbers of employees listed below. No employees would be generated under the No Project Alternative.

- The No USACE Permit Alternative would include 401.9 acres of commercial land use, which would provide for an estimated 5,910,527 square feet of commercial building space and generate 13,021 employees.
- The Proposed Project Alternative would include a total of 475.6 acres of commercial land use, which would provide for an estimated 5,054,616 square feet of commercial building space and generate 13,210 employees.
- The Resource Impact Minimization Alternative would include a total of 349.7 acres of commercial land uses, which would provide for an estimated 5,083,059 square feet of commercial building space and generate 9,749 employees.
- The Centralized Development Alternative would include 349.7 acres in commercial land use, which would provide for an estimated 6,893,631 square feet of commercial building space and generate 16,860 employees.

Table 3A.13-4
Folsom South of 50 Specific Plan Residential Population Projections

Land Use Type	Acreage					Dwelling Units (DU)[1]					Projected Population[2]				
	PP	RIM	CD	RHD	NCP	PP	RIM	CD	RHD	NCP	PP	RIM	CD	RHD	NCP
Single - Family [2]	557.8	504.5	213.7	370.7	795.8	1,687	1,513	641	989	2,388	4,926	4,418	1,872	2,888	6,973
Single-Family High Density [2]	532.5	491.5	473.1	331.0	204.9	2,933	2,703	2,602	1,619	1,127	8,564	7,893	7,598	4,727	3,291

Multifamily Medium Density [3]	67.0	52.3	113.6	144.6	54.5	1,224	942	2,044	2,314	981	2,375	1,827	3,965	4,489	1,903
Multifamily High Density [3]	49.9	11.5	30.5	107.1	8.4	1,251	287	764	2,380	210	2,427	557	1,482	4,617	407
Mixed-Use District [3, 4]	35.5	15.4	21.7	36.1	17.2	681	307	433	385	344	1,321	596	840	747	667
Total	**1,509.4**	**1,321.1**	**1,135**	**1,472.7**	**1,227.8**	**10,210**	**7,965**	**9,026**	**11,553**	**6,373**	**24,335**	**19,584**	**20,689**	**25,022**	**15,808**

PP = Proposed Project; RIM = Resource Minimization Alternative; CD = Centralized Development Alternative; RHD = Reduced Hillside Development Alternative; NCP = No USACE Permit Alternative.

[1] Target dwelling unit allocation is an estimate. Actual total dwelling units may be higher or lower, so long as it falls within land use density ranges and does not exceed the total target dwelling units.

[2] Based on the City of Folsom persons per dwelling unit for single-family dwelling units (2.92).

[3] Based on the City of Folsom persons per dwelling unit for multifamily and mixed-use dwelling units (1.94).

[4] The Mixed-Use District assumes that 60% of the total land use acreage would be used for residential and 40% would be used for commercial.

Source: RRM Design Group 2008 and 2009, data compiled by AECOM in 2009

- The Reduced Hillside Development Alternative would include 485.3 acres of commercial land use, which would provide for an estimated 7,183,306 square feet of commercial building space and generate 17,484 employees.

Specific indirect impacts associated with increased population, employment, and housing, such as traffic congestion, air quality degradation, noise generation, and increased demand for public services and utilities, are addressed in each technical section of this EIR/EIS, as appropriate. These technical sections provide a detailed analysis of other relevant environmental effects of the project; therefore, indirect impacts are not discussed further in this section.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.13-1 Temporary Increase in Population and Subsequent Housing Demand during Construction. *Project implementation would generate a temporary increase in employment and subsequent housing demand in Sacramento County and the City of Folsom from construction jobs.*

On-Site and Off-Site Elements

NP

The No Project Alternative could develop up to 44 rural residences and generate approximately 128 new residents under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. All or a portion of these dwelling units could be constructed by individual property owners over the proposed 19-year buildout period (2011–2030); however, it would be speculative to attempt to predict how many units would develop or when they would develop, since they would be constructed on a parcel-by-parcel basis. Construction of 44 individual dwelling units would require a minimal number of construction workers; therefore, the temporary increase in population growth and housing demand associated with construction of the No Project Alternative is considered a **direct**, **less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

Project construction activities would occur at intervals throughout the planning horizon of the project, and the site would ultimately be built out in approximately 19 years (2011-2030). A greater number of construction workers would be employed during peak construction periods (determined by market demand and overall economic conditions), while fewer construction workers would be employed during nonpeak periods. Each development phase would likely be constructed as several small projects that would be ongoing in each development phase. For example, roads, utilities, a housing development, a commercial center, and supporting off-site improvements could all be constructed simultaneously. It is estimated, based on prior analyses of similar projects, that project-related construction would generate approximately 500 construction jobs during the peak construction period of each of the four phases. A greater number of construction workers would be employed during peak construction periods (determined by market demand and overall economic conditions), whereas fewer construction workers would be employed during nonpeak periods.

Construction workers serving the project can be expected to come from Folsom, Sacramento County, El Dorado Hills, and from nearby communities. According to the latest labor data available from the U.S. Census Bureau (2007), it is estimated that 2,269 residents in the Folsom, 54,964 residents in Sacramento County, and 850

residents in El Dorado Hills are employed in the construction industry. These existing residents in the city and counties who are employed in the construction industry would likely be sufficient to meet the demand for construction workers that would be generated by the project. Because construction workers serving the project could be expected to come from Folsom itself and from nearby communities in Sacramento County or El Dorado County, neither substantial population growth nor an increase in housing demand in the region is anticipated as a result of these jobs. Furthermore, if some construction workers from outside the region were employed for the project, the temporary nature of the work supports the conclusion that these workers would not typically change residences when assigned to a new construction site. Therefore, substantial permanent relocations of construction workers to the area are not anticipated. The project would not be expected to generate the need for substantial additional housing stock in Folsom, Sacramento County, or El Dorado County during construction. Because of these conditions, the temporary increase in population growth and housing demand associated with project construction is considered a **direct, less-than-significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.13-2 Permanent Increase in Population Growth. *Project implementation would result in the development of new residential dwelling units, which would cause a direct long-term increase in population.*

On-Site Elements

NP

The No Project Alternative could develop up to 44 rural residences and generate approximately 128 new residents under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Based on 2.92 persons per dwelling unit, these units could potentially generate 128 persons in Sacramento County over the proposed 19-year buildout period (2011–2030). These residents would not generate population growth that exceeds estimates for Sacramento County; therefore, the No Project Alternative would not result in unplanned population growth in the area. This impact is **direct** and **less than significant**. The **indirect** environmental impacts resulting from increase population growth are evaluated through Chapter 3 of this EIR/EIS. ***[Lesser]***

NCP

Implementation of the No USACE Permit Alternative would directly induce population growth in Sacramento County and the City of Folsom through construction of new homes and businesses over the 19-year buildout period (2011–2030). The No USACE Permit Alternative would develop 6,373 residential units. As shown in Table 3A.13-3 above, these residential units are estimated to generate 15,808 new residents by build out in 2030.

The current City (2002) and County (2008) General Plan Housing Elements do not include estimates of population from planned development beyond 2010 and 2025, respectively. The project-related estimated increases in population (15,808 new residents) could be potentially greater than the increases in population from the planned residential growth in the city or county. Therefore, development of the No USACE Permit Alternative could potentially generate population growth exceeding projections for Folsom and Sacramento County as a whole.

The 2035 projected population for the city (97,485) represents an increase of 32,179 persons from 2008 to 2035. Comparing the new residents expected to be generated by the No USACE Permit Alternative (15,808), the project-related estimated increase in population is within the increase in population that would result from the planned residential growth as projected by the City's Housing Element.

Because it cannot be determined whether the No USACE Permit Alternative would generate population growth that exceeds estimates for Sacramento County or the City of Folsom under their currently adopted General Plans,

this alternative could potentially result in unplanned population growth in the area. Population growth consistent with current population projections by itself is not considered a significant environmental impact. However, development of housing, infrastructure, and facilities and services to serve this growth can have significant environmental impacts through land conversions, commitment of resources, and other mechanisms. Because the No USACE Permit Alternative would generate 8,527 fewer residents than the Proposed Project Alternative, it is likely that direct impacts associated with development would be less. The **indirect** impacts associated with the development needed to accommodate increased population are evaluated in each resource area within Chapter 3 of this EIR/EIS. Because population growth is not, itself, considered a significant environmental impact, this **direct** impact is considered **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

PP

Implementation of the Proposed Project Alternative would directly induce population growth in Folsom through construction of new homes and businesses over the 19-year buildout period (2011–2030). The Proposed Project would develop 10,210 residential units. As shown in Table 3A.13-3 above, these residential units are estimated to generate 24,335 new residents at buildout (2030).

The current City (2002) and County (2008) General Plan Housing Elements do not include estimates of population from planned development beyond 2010 and 2025, respectively. The project-related estimated increases in population (26,850 new residents) could be potentially greater than the increases in population from the planned residential growth in the city or county. Therefore, development of the Proposed Project Alternative could potentially generate population growth exceeding projections for Folsom and Sacramento County as a whole.

The City has recently prepared an updated Housing Element (2009). The Housing Element projects the city would result in a total population of approximately 97,485 persons by 2035. As of January 1, 2008, the population of Folsom was estimated to be 65,306 (excluding the inmate population at Folsom Prison and California State Prison Sacramento) (DOF 2008). The 2035 projected population for the City (97,485) represents an increase of 32,179 persons from 2008 to 2035. Comparing the new residents expected to be generated by the Proposed Project Alternative (24,335), the project-related estimated increase in population is within the increase in population that would result from the planned residential growth as projected by the City's Housing Element.

Because it cannot be determined whether the Proposed Project Alternative would generate population growth that exceeds estimates for Folsom or Sacramento County under their currently adopted General Plans, the project could potentially result in unplanned population growth in the area. Population growth consistent with current population projections by itself is not considered a significant environmental impact. However, development of housing, infrastructure, and facilities and services to serve this growth can have significant environmental impacts through land conversions, commitment of resources, and other mechanisms. The **indirect** impacts associated with the development needed to accommodate increased population under the Proposed Project Alternative are evaluated in each resource area within Chapter 3 of this EIR/EIS. Because population growth is not, itself, considered a significant environmental impact, this **direct** impact is considered **less than significant**.

Mitigation Measure: No mitigation measures are required.

RIM

Implementation of the Resource Impact Minimization Alternative would directly induce population growth in Folsom through construction of new homes and businesses over the 19-year buildout period (2011–2030). The Resource Impact Minimization Alternative would develop 17,965 residential units. As shown in Table 3A.13-3 above, these residential units are estimated to generate 19,594 new residents by buildout in 2030.

The current City (2002) and County (2008) General Plan Housing Elements do not include estimates of population from planned development beyond 2010 and 2025, respectively. The project-related estimated increases in population (19,584 new residents) could be potentially greater than the increases in population from the planned residential growth in the city or county. Therefore, development of the Resource Impact Minimization Alternative could potentially generate population growth exceeding projections for Folsom and Sacramento County as a whole.

The 2035 projected population for the City (97,485) represents an increase of 24,985 persons from 2008 to 2035. Comparing the new residents expected to be generated by the Resource Impact Minimization Alternative (19,584), the project-related estimated increase in population is within the increase in population that would result from the planned residential growth as projected by the City's Housing Element.

Because it cannot be determined whether the Resource Impact Minimization Alternative would generate population growth that exceeds estimates for Folsom or Sacramento County under their currently adopted General Plans, this alternative could potentially result in unplanned population growth consistent with current population projections in the area. Population growth by itself is not considered a significant environmental impact. However, development of housing, infrastructure, and facilities and services to serve this growth can have significant environmental impacts through land conversions, commitment of resources, and other mechanisms. Because the Resource Impact Minimization Alternative would generate 4,751 fewer residents than the Proposed Project Alternative, it is likely that direct impacts associated with development would be less. The **indirect** impacts associated with the development needed to accommodate increased population are evaluated in each resource area within Chapter 3 of this EIR/EIS. Because population growth is not, itself, considered a significant environmental impact, this **direct** impact is considered **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

CD

Implementation of the Centralized Development Alternative would directly induce population growth in Sacramento County and the City of Folsom through construction of new homes and businesses over the 19-year buildout period (2011–2030). The Centralized Development Alternative would generate 9,026 residential units. As shown in Table 3A.13-3 above, these residential units are estimated to generate 20,689 new residents by buildout in 2030.

The current City (2002) and County (2008) General Plan Housing Elements do not include estimates of population from planned development beyond 2010 and 2025, respectively. The project-related estimated increases in population (20,689 new residents) could be potentially greater than the increases in population from the planned residential growth in the City or County. Therefore, development of the Centralized Development Alternative could potentially generate population growth exceeding projections for Folsom and Sacramento County as a whole.

The 2035 projected population for the City (97,485) represents an increase of 32,179 persons from 2008 to 2035. Comparing the new residents expected to be generated by the Centralized Development Alternative (20,689), the project-related estimated increase in population is within the increase in population that would result from the planned residential growth as projected by the City's Housing Element.

Because it cannot be determined whether the Centralized Development Alternative would generate population growth that exceeds estimates for Folsom or Sacramento County under their currently adopted General Plans, this alternative could potentially result in unplanned population growth in the area. Population growth consistent with current population projections by itself is not considered a significant environmental impact. However, development of housing, infrastructure, and facilities and services to serve this growth can have significant environmental impacts through land conversions, commitment of resources, and other mechanisms. Because the

Centralized Development Alternative would generate 3,646 fewer residents than the Proposed Project Alternative, it is likely that direct impacts associated with development would be less. The **indirect** impacts associated with the development needed to accommodate increased population are evaluated in each resource area within Chapter 3 of this EIR/EIS. Because population growth is not, itself, considered a significant environmental impact, this **direct** impact is considered **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

RHD

Implementation of the Reduced Hillside Development Alternative would directly induce population growth in Folsom through construction of new homes and businesses over the 19-year buildout period (2011–2030). The Reduced Hillside Development Alternative would develop 11,553 residential units. As shown in Table 3A.13-3 above, these residential units are estimated to generate 25,022 new residents by buildout in 2030.

The current City (2002) and County (2008) General Plan Housing Elements do not include estimates of population from planned development beyond 2010 and 2025, respectively. The project-related estimated increases in population (25,022 new residents) could be potentially greater than the increases in population from the planned residential growth in the City or County. Therefore, development of the Reduced Hillside Development Alternative could potentially generate population growth exceeding projections for Folsom and Sacramento County as a whole.

The 2035 projected population for the City (97,485) represents an increase of 32,179 persons from 2008 to 2035. Comparing the new residents expected to be generated by the Reduced Hillside Development Alternative (25,022), the project-related estimated increases in population exceed the population that would result from the planned residential growth as projected by the City's Housing Element.

Because it cannot be determined whether the Reduced Hillside Development Alternative would generate population growth that exceeds estimates for Folsom or Sacramento County under their currently adopted General Plans, this alternative could potentially result in unplanned population growth in the area. Population growth consistent with current population projections by itself is not necessarily considered a significant environmental impact. However, development of housing, infrastructure, and facilities and services to serve this growth can have significant environmental impacts through land conversions, commitment of resources, and other mechanisms. Because the Reduced Hillside Development Alternative would generate 687 more residents than the Proposed Project Alternative, it is likely that direct impacts associated with development would be greater but still remain **less than significant**. The **indirect** impacts associated with the development needed to accommodate increased population are evaluated in each resource area within Chapter 3 of this EIR/EIS. Because population growth is not, itself, considered a significant environmental impact, this **direct** impact is considered **less than significant**. ***[Greater]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of U.S. 50 interchange improvements, the sewer force main, the detention basin, and the two roadway connections into El Dorado Hills would not involve construction of new housing or development of new long-term employment opportunities in Folsom, Sacramento County, or El Dorado County. Therefore, there would be no direct long-term increases in population in Folsom, Sacramento County, or El Dorado County from construction of these elements. **Indirect** impacts related to the potential that infrastructure improvements could induce additional long-term population growth are addressed in Chapter 4, "Other Statutory Requirements." Because there would be no direct impact related to long-term increases in population growth from off-site infrastructure, this impact is **direct** and **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.13-3 Displacement of Existing Housing or People Resulting from Project Development. *Project implementation would displace one existing residence located in the SPA.*

On-Site Elements

NP

The No Project Alternative could develop up to 44 rural residences and generate approximately 128 new residents under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. It is likely that the existing single-family residence located in the SPA would remain under the No Project Alternative. No development would occur under the No Project Alternative that would result in housing displacement; thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

There is one existing single-family residence located in the SPA. This residence would likely be removed as part of project development. Project implementation would result in the construction of low-, medium-, and high-density residential dwelling units in the SPA. Construction of these residential dwelling units in the SPA would fully replace the single unit removed during project construction. Because the project would not displace substantial numbers of existing housing or people, this impact is considered **direct** and **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

There are no existing residences within the areas proposed for off-site U.S. 50 interchange improvements, the sewer force main, or the detention basin. There are existing residences in the vicinity of the two roadway connections into El Dorado Hills. However, those roadway connections were planned at the time that community was constructed, and no residences would be displaced. Therefore, construction of these elements would not result in housing displacement and **no direct** or **indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3A.13.4 Residual Significant Impacts

Impacts associated with population growth and housing demand are considered less than significant. Therefore, there would be no residual significant impacts.

3A.14 PUBLIC SERVICES - LAND

3A.14.1 AFFECTED ENVIRONMENT

FIRE PROTECTION SERVICES

Sacramento Metropolitan Fire District

The Sacramento Metropolitan Fire District (SMFD) currently provides fire protection services to approximately 3,406 acres of the SPA. SMFD offers fire protection, fire suppression, inspection, plan checking, emergency transportation and medical services, public education, advanced life support, and rescue services to the unincorporated portions of Sacramento County. SMFD was formed in 2000 by consolidation of the American River Fire District and the Sacramento County Fire Protection District. As the largest fire district in Sacramento County, SMFD currently operates 42 stations and provides service through 750 uniformed and support personnel to nearly 600,000 people in a 417-square-mile area. SMFD operates 10 transporting Advanced Life Support medics, 7 reserve transporting medics, 38 engine companies, 5 truck companies, 24 grass engines, 2 crash rescue rigs, 6 water tenders, 4 swift water rescue bikes, 5 swift water rescue inflatable rubber boats, 5 air units, three reserve firefighter engine companies, and 2 reserve firefighter grass engines (SMFD 2009). Many of SMFD's engines are paramedic staffed and all responding units provide coverage by emergency medical technicians. SMFD's personnel are trained and equipped to deal not only with emergency medical alarms and structural or wildland fires, but also with swift water emergencies, confined space incidents, technical rescues, hazardous materials incidents, and crash fire rescue. In 2004, SMFD responded to more than 60,000 alarms, providing a response time of six minutes or less greater than 90% of the time (SMFD 2007). The nearest SMFD facility to the SPA is Station 63 located at 12395 Folsom Boulevard, approximately 5.1 miles west of the SPA via Prairie City Road and U.S. Highway 50 (U.S. 50).

City of Folsom Fire Department

Upon annexation of the SPA, fire protection services within the SMFD service area would become the responsibility of the City of Folsom Fire Department. The department has 74 employees that provide fire protection and emergency medical services to approximately 65,000 people in a 24-square-mile area (City of Folsom Fire Department 2009a). Fire fighting personnel are typically assigned on a three-shift work schedule, which provides the city with coverage 24 hours a day, 7 days a week. The department maintains four fire stations within the City:

- Station 35—535 Glenn Drive
- Station 36—9700 Oak Avenue Parkway
- Station 37—70 Clarksville Road
- Station 38—1300 Blue Ravine Road

The department is equipped with one 65-foot aerial ladder truck, three Type III grass engines, two transporting ambulances, an air support unit, an OES engine, a hazmat decon trailer, an inflatable rescue boat, a Community Emergency Response Team support trailer, and staff vehicles (Haverty, pers. comm., 2009). Currently the department provides paramedic/advanced life support services from all four stations using cross-trained firefighter/paramedics. The department participates in a countywide resource deployment plan that ensures the closest available emergency crew responds to the scene of emergencies, regardless of geographic boundaries. The department responds to over 5,400 requests for service annually, an average of 14.8 per day. The City of Folsom currently requires 1.6 fire staff per 1,000 residents.

The Insurance Services Office (ISO) rating is the recognized classification for a fire department or district's ability to defend against major fires. According to the ISO, newly developing urban areas should have a fire station opened within 1.5 miles of all commercial development and 2.5 miles from all residential development when

"build-out" exceeds 20% of the planning area. A rating of 10 generally indicates no protection, whereas an ISO rating of 1 indicates high firefighting capability. The department's ISO rating is currently a class 3.

First-response service to the SPA would be provided by Station 37 at 70 Clarksville Road, approximately 1.6 miles north of the SPA via Scott Road. Station 37 is staffed with five fire fighting personnel (Haverty, pers. comm., 2009).

The City of Folsom Fire Department, in cooperation with the City of Folsom Parks and Recreation Department, is constructing the new Station 39 to serve the northern and eastern portions of the City and some portions of El Dorado Hills. The station is located at Empire Ranch Road and Ritchie Street and is being planned as a three-phased project. The 10,500-square-foot facility will house a three-person engine company able to respond with a structural engine, wildland engine, and reserve ambulance (City of Folsom 2009b). This station would close a response performance gap currently being served primarily by crews from Fire Stations 37 and 38. Station 39 is planned to be operational in 2010 (Haverty, pers. comm., 2009).

El Dorado Hills Fire Department

The El Dorado Hills Fire Department (EDHFD) serves approximately 178 acres of the northeastern portion of the SPA as a multi-jurisdictional district. The EDHFD has 66 paid employees and 38 volunteers that provide fire protection and emergency medical services 24 hours a day, 7 days a week (EDHFD 2009). The department maintains four fire stations:

- Station 84—2180 Francisco Drive
- Station 85—1050 Wilson Boulevard
- Station 86—3670 Bass Lake Road
- Station 87—4680 Golden Foothill Parkway

The EDHFD is equipped with ten engines, one air/light support unit, one water tender, three medic units and one Quint (ladder truck) (EDHFD 2009). Currently the EDHFD provides emergency medical/advanced life support; residential, commercial, and wildland fire suppression; hazardous materials safety; fire prevention code enforcement; public education; and community services. The ISO rating for the EDHFD is currently a Class 3 in areas within five miles of a fire station, Class 8 in areas within five miles of a fire station but more than 1,000 feet from a fire hydrant, and Class 10 in areas more than five miles from a fire station (El Dorado County Fire Prevention Officers 2009). In 2008, the EDHFD responded to over 2,500 requests for service (EDHFD 2008). The EDHFD serves approximately 42,000 people, which would result in a ratio of 2.1 fire staff per 1,000 residents.

First-response service to the SPA within the EDHFD would be provided by Station 85 at 1050 Wilson Boulevard, approximately 1.2 miles northeast of the SPA via Latrobe Road in the unincorporated portion of El Dorado County.

LAW ENFORCEMENT

Law enforcement services for the SPA are currently provided by the Sacramento County Sheriff's Department North Division. The North Division provides patrol and investigative services to the communities of Carmichael, Fair Oaks, Foothill Farms, Orangevale, and other unincorporated areas of Sacramento County (County). The division is staffed by over 100 sworn officers and 19 support staff. The patrol officers and detectives serving these areas work out of the Garfield Station at 5510 Garfield Avenue, approximately 16.6 miles southwest of the SPA. The North Division also maintains the Fair Oaks/Orangevale Community Service Center located at 8525 Madison Avenue, approximately 8.8 miles northwest of the SPA. It is staffed with a Sergeant, Problem-Oriented Policing Officers, a Crime Prevention Specialist, an office manager, and a staff of volunteers. This center assists the community through the organization and presentation of community meetings, helping to establish Business and

Neighborhood Watch programs, taking reports, and providing public assistance and information at the front counter (Sacramento County Sheriff's Department 2009).

Upon annexation of the SPA, law enforcement services would become the responsibility of the City of Folsom Police Department. The department has 125 employees including officers and support staff (City of Folsom Police Department 2009). The police station is located at 49 Natoma Street, approximately 5 miles northeast of the SPA via Prairie City Road. The City of Folsom currently requires 1.3 police officers per 1,000 residents.

The City of Folsom's Field Operations Division is staffed with 68 personnel and is the largest division within the police department. It is comprised of the Patrol Bureau, Traffic Bureau, Mounted Unit, K-9 Unit, School Resource Officers, Crime Scene Investigation Unit, and Special Weapons and Tactic Team. The primary functions of the Field Operations Division are to provide prompt response to community requests for police assistance and to implement proactive measures that reduce and prevent criminal activity through comprehensive community policing.

One important measurement of service delivery is response time to emergency calls-for-service. The Police Department Service Delivery Plan calls for emergency call response within five minutes or less for Priority One calls. A Priority One call is a violent crime against a person or an emergency requiring an immediate response to save a life. In 2006, the response time for the first unit on the scene was approximately seven minutes and the response time for a second unit was nine minutes. In general, response times for the first unit increased by three seconds, while the second unit response time decreased by 28 seconds. Overall, response times have decreased but remain higher than the department's goal of five minutes or less for two officers responding to priority calls for service (City of Folsom Police Department 2006).

Any traffic complaints, concerns, or collisions occurring outside of the Folsom City boundaries and within the unincorporated area of Sacramento County are handled by the California Highway Patrol (CHP). CHP is responsible for providing patrols on all interstate freeways and highways in California. CHP has numerous offices throughout California and can be contacted directly to report accidents, hazards, and other traffic related inquiries. The SPA is located within the Valley Division, which oversees Interstate 80, Interstate 5, U.S. 50, and State Route 99. The Valley Division includes 16 area offices, three resident posts, one commercial inspection facility, one transportation management center, three communications/dispatch centers and is staffed with 785 uniformed officers and 250 non-uniformed personnel (CHP 2008).

PUBLIC SCHOOLS

The SPA is located in the Folsom Cordova Unified School District (FCUSD). Located in eastern Sacramento County, the district covers 95 square miles. The FCUSD boundaries encompass the City of Folsom, portions of the City of Rancho Cordova, and portions of the unincorporated areas of Sacramento County (FCUSD 2008b:A-1). FCUSD currently operates 21 elementary schools, 4 middle schools, 3 comprehensive high schools, 2 continuation high schools, and 4 adult and alternative education centers (FCUSD 2008b:A-1). FCUSD had a 2008–2009 school year enrollment of 19,119 students and the current school capacity is 19,932 students (Education Data Partnership 2009a, FCUSD 2008b:A-1). The district expects to reach 21,561 students by the 2012–1013 school year (FCUSD 2008a:14).

The FCUSD has experienced considerable growth in the past few years that has affected the ability to provide adequate educational facilities. A new elementary school, Navigator Elementary, was opened in August 2006 in the Rancho Cordova portion of the district and a second elementary school, Russell Ranch Elementary, was opened in August 2007 in Folsom. A new high school, Vista del Lago High, was opened in August 2007 in Folsom to relieve crowding at Folsom High School (FCUSD 2008b:A-1).

As shown on the FCUSD school attendance boundaries map, students living in the SPA would attend Russell Ranch Elementary School, Folsom Middle School, and Vista del Lago High School. Table 3A.14-1 identifies the 2007–2008 school-year enrollments for these schools.

Table 3A.14-1
Folsom Cordova Unified School District Enrollment, 2008–2009

School Name	Grade	Current Enrollment	State Standard Capacity	Estimated Remaining Capacity
Russell Ranch Elementary School	K–5	428	529	101
Folsom Middle School	6–8	1,248	1,220	-28
Vista del Lago High School [1]	9–12	955	1,497	542

Note: Student enrollment in the district changes daily as more students enroll and others leave; therefore, Table 3A.14-1 does not necessarily reflect exact current enrollment.

[1] For the 2008–2009 school year, the Vista del Lago High School is open to freshman, sophomores, and juniors.

Source: California Department of Education 2009, FCUSD 2008b

Russell Ranch Elementary School located at 375 Dry Creek Road, approximately 5.7 miles northeast of the SPA, is the newest elementary school in the FCUSD and currently serves elementary school students in grades K–5. The buildings were completed and occupied in August 2007, and include 25 permanent classrooms, a library, a multipurpose room, an administrative building, and one permanent portable to house the Student Care Program. (FCUSD 2008b:B-22.)

Folsom Middle School is located at 500 Blue Ravine Road, approximately 4.5 miles north of the SPA, and serves students in grades 6-8. Folsom Middle School includes 34 classrooms, library, multipurpose room, gymnasium, and an administrative building. (FCUSD 2008b:B-28.)

Vista del Lago High School is located at 1655 Iron Point Road, approximately 2.0 miles north of the SPA. The high school serves students in grades 9–12. The first phase of construction opened for the 2007–2008 school year serving freshmen and sophomores. The second phase of construction, along with the joint use library, opened for the 2008–2009 school year and Vista del Lago High School currently serves freshman, sophomores, and juniors. When completed, the campus will include an administration building, gymnasium, learning resource center, multipurpose building, joint use library, 56 permanent classrooms, and temporary relocatable classrooms. (FCUSD 2008b:B-41.)

School Facilities Improvement District 3—South of U.S. Highway 50/East of Sunrise Boulevard

FCUSD has planned for development of the SPA in its *Folsom Cordova Unified School District Revised Facility Needs Assessment* (2008a) and *FCUSD Facility Master Plan* (2008b). The SPA is within the School Facilities Improvement District (SFID) 3, which encompasses portions of Rancho Cordova and Folsom in the area south of U.S. 50, east of Sunrise Boulevard, north of Douglas Road, and east to the El Dorado County line. Within this area, planning has begun for large-scale residential developments, including the Proposed Project, Rio del Oro, Westborough, Easton, Glenborough, and North Douglas.

Based on information from the City of Folsom Planning Department, the City of Rancho Cordova Planning Department, the Sacramento County Planning Department, and local developers, it is estimated that SFID 3 will eventually contain over 32,327 new residential units: 20,603 single-family units, 6,073 multifamily medium-density units, and 6,154 high density multifamily units (FCUSD 2008b:E-5). These residential developments are expected to generate 18,005 new students and require development of 16 elementary schools, 4 middle schools, and 2 high schools over the next 25 years (FCUSD 2008b:D-18). Of this total, the FCUSD estimates that

development of the Proposed Project Alternative would generate 5,823 students and require five elementary schools, one middle school, and one high school over the next 17 years (FCUSD 2008b:D-17).

FCUSD prepared an updated facility master plan in October 2008 for the SFID 3 area to provide updated enrollment, capacity, student generation rates, and expected buildout totals anticipated to be generated by new residential development. A student-yield generation rate study was conducted as part of the master planning process. The yield-rate study included a survey of new (built within the last 1–5 years) single-family and multi-family residential units. The current student-yield generation rates for SFID 3, which is used in this analysis to calculate the estimated number of students generated by the Proposed Project and alternatives under consideration, are provided in Table 3A.14-2, below.

Table 3A.14-2
Student-Yield Generation Rates for the Folsom Cordova Unified School District

Grade Level	Single Family (Students per Dwelling Unit)	Multifamily Medium Density (Students per Dwelling Unit)	Multifamily (Students per Dwelling Unit)
Elementary (K–5)	0.42	0.20	0.07
Middle (6–8)	0.14	0.08	0.04
High (9–12)	0.16	0.07	0.04
Special Day Classrooms (K–12) [1]	0.01	0.01	0.01
Total	**0.72**	**0.36**	**0.16**

Notes:
[1] Special education students were evenly weighted by grade group and included in the corresponding grade group for the calculation of the number of schools required.
Source: FCUSD 2008b:D-16

The FCUSD is funded by 50% state and 50% local sources. The district can receive local funding through developer impact fees, tax revenue from Mello-Roos districts, and General Obligation (GO) bonds. Developer impact fees are the major source of funding for the district. Based on its facility needs assessment, FCUSD demonstrated the need to levy Level II developer fees (described below in Section 3A.14.2, "Regulatory Framework") in the SFID 3 that are higher than the statutory fee. As of August 2008, Level II fees for residential development are $6.99 per square foot and $0.47 per square foot for commercial/industrial construction (FCUSD 2008a:22, 2009). Developer fees may be used to finance new schools and equipment, and to reconstruct existing facilities to maintain adequate housing for all the district's students. Mello-Roos districts are defined tax areas usually associated with new residential subdivisions, which are often used for additional school taxes.

In April 2007, voters passed Measure M, a $750 million school-facilities GO bond. Measure M will fund the construction of elementary, middle, and high school facilities, a district education services center, and maintenance facilities. The FCUSD is currently in the master planning stage for Rio del Oro Elementary #1 and in the schematic design phase for Mather High/Morrison Creek Middle Schools. The estimated completion date for the elementary and high/middle school is currently 2015. The District has preliminary site approval for both sites from the California Department of Education (CDE). (FCUSD 2008b:D-14.)

Measure W, passed by Folsom voters in 2004, amended the Folsom City Charter to require the funding and construction of all necessary school facilities in the SPA by new development so that Folsom residents north of U.S. 50 are not required to pay for the construction of new school facilities serving the SPA and existing schools are not overcrowded by development of the Proposed Project Alternative.

3A.14.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no Federal plans, policies, regulations, or laws related to public services that apply to the Proposed Project or alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

California Occupational Safety and Health Administration

In accordance with California Code of Regulations Title 8 Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Equipment," the California Occupational Safety and Health Administration has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials; fire hose sizing requirements; restrictions on the use of compressed air; access roads; and the testing, maintenance, and use of all fire fighting and emergency medical equipment.

Fire Codes and Guidelines

The California Fire Code contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the code include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises. The California Fire Code contains specialized technical regulations related to fire and life safety.

All development projects in Folsom are required to meet various other fire protection requirements identified in the Folsom Fire Code (City of Folsom Municipal Code Title 8, Chapter 8.36). The fire code requires that automatic fire sprinklers be installed in all new commercial construction that exceeds 3,600 square feet and some residential properties exceeding 4,999 square feet. The fire code outlines the number and distribution of fire hydrants and minimum fire-flow requirements for structures exceeding 3,600 square feet. The City of Folsom Fire Department requirements are determined for specific development projects at the design stage.

An important requirement for fire suppression is adequate fire flow, which is the amount of water, expressed in gallons per minute (gpm), available to control a given fire and the length of time that this flow is available. The availability of sufficient water flows and pressure is a basic requirement of the California Building Code. The total fire flow needed to extinguish a structural fire is based on a variety of factors, including building design, internal square footage, construction materials, dominant use, height, number of floors, and distance to adjacent buildings. Minimum requirements for available water flow at a given building are dependent on standards set in the California Fire Code.

State School Funding

California Education Code Section 17620 authorizes school districts to levy a fee, charge, dedication, or other requirement against any development project for the construction or reconstruction of school facilities, provided that the district can show justification for levying the fees. California Government Code Section 65995 limits the fee to be collected to the statutory fee unless a school district conducts a Facility Needs Assessment (Government Code Section 65995.6) and meets certain conditions.

Senate Bill 50 (Chapter 407, Statutes of 1998) instituted a new school facility program by which school districts can apply for state construction and modernization funds. This legislation limits the power of cities and counties

to require developers to mitigate impacts on school facilities as a condition of approving new development. This legislation also provides the authority for school districts to levy fees at three different levels:

- Level I fees are the current statutory fees allowed under Education Code Section 17620. As mentioned above, this code section authorizes school districts to levy a fee against residential and commercial developers to fund school construction or reconstruction. These fees are adjusted in January every 2 years in accordance with the statewide cost index for Class B construction as determined by the State Allocation Board.

- Level II developer fees are outlined in California Government Code Section 65995.5. This code section allows a school district to impose a higher fee on residential construction if certain conditions are met. These conditions include having a substantial percentage of students on multitrack year-round scheduling, having an assumed debt equal to 15–30% of the district's bonding capacity (the percentage is based on revenue sources for repayment), having at least 20% of the district's teaching stations housed in relocatable classrooms, and having placed (within the last 4 years) a local bond measure on the ballot that received at least 50% plus one of the votes cast. A Facility Needs Assessment must demonstrate that the need for new school facilities for unhoused pupils is attributable to projected enrollment growth from the construction of new residential units over the next five years. As of August 2008, Level II fees are $6.99 per square foot for residential development and $0.47 per square foot for commercial/industrial construction (FCUSD 2009).

- Level III developer fees are outlined in California Government Code Section 655995.7. This code section authorizes a school district that has been approved to collect Level II fees to collect a higher fee on residential construction if state funding becomes unavailable. This fee is equal to twice the amount of Level II fees. However, if a district eventually receives state funding, this excess fee may be reimbursed to the developers or subtracted from the amount of state funding.

California Department of Education

The CDE School Facilities Planning Division (SFPD) has prepared the *School Site Analysis and Development*. This guide was changed by CDE in 2000 to reflect various changes in educational conditions, such as lowering of class sizes and use of advanced technology. The guide provides specific recommendations for school size and school site selection criteria for locating appropriate school sites in the State of California. This document suggests a ratio of 1:2 between buildings and land. CDE is aware that in a number of cases, primarily in urban settings, smaller sites cannot accommodate this ratio. In such cases, SFPD may approve an amount of acreage less than the recommended gross site size and building-to-grounds ratio. The expanded use of school buildings and grounds for community and agency joint use also influenced the modification of the CDE recommendations, as did concern for the safety of students and staff members.

Certain health and safety requirements for school site selection are governed by state regulations and SFPD policies. These requirements are outlined in the *School Site Selection and Approval Guide* and relate to:

- proximity to airports, high-voltage power transmission lines, railroads, and major roadways;

- presence of toxic and hazardous substances;

- hazardous facilities and hazardous air emissions within one-quarter mile;

- proximity to high-pressure natural-gas lines, propane storage facilities, gasoline lines, pressurized sewer lines, or high-pressure water pipelines;

- noise;

- results of geological studies or soil analyses;

- traffic and school bus safety; and
- safety issues related to joint-use facilities.

The public services analysis for this EIR/EIS is being conducted at a programmatic level only. Therefore, an analysis of conformity of the proposed school sites with the CDE School Siting Criteria is not part of this program-level analysis and would be the subject of further, separate project-level environmental review.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

There are no goals and policies of the Sacramento County General Plan (1993) that are applicable to the Proposed Project or alternatives under consideration.

El Dorado County General Plan

There are no goals and policies of the El Dorado County General Plan (2004) that are applicable to the Proposed Project or alternatives under consideration.

City of Folsom General Plan

The following goals and policies of the City of Folsom General Plan (1988) are applicable to the Proposed Project and the other four action alternatives. There are no City of Folsom goals and policies that are applicable to the No Project Alternative.

Land Use Element

GOAL 16: To allow for public and quasi-public land uses meeting the governmental service, education, cultural, recreational, and religious needs of Folsom residents.

- **Policy 16.1:** Fire and police department substations shall be planned and located so that a maximum response time goals as set by the City Council can be maintained.

Safety Element

GOAL 29: To protect lives and property from unacceptable risks resulting from natural and manmade hazards.

- **Policy 29.1:** Fire and police department personnel/resident population ratios shall be maintained at adequate levels as defined by the City Council.

Public Facilities Element

GOAL 40: To set targets for ultimate build-out of the City, to plan for the provision of public facilities and services to meet this level of development, and to phase development according to the capacity of public facilities and services to meet those targets.

- **Policy 40.1:** No permit for construction shall be issued for any new development not served by existing municipal facilities until the following conditions have been met:

    1. The applicant can provide for the installation and/or financing (through fees or other means) of needed public facilities.

    2. The project is included in the area covered by an existing facilities plan approved by the City.

3. The project can be served by on-site or private facilities meeting City and County health and safety requirements.

- **Policy 40.2:** The City shall require the preparation of a facilities plan for an identified area when:

1. Development of an area necessitates the provision, extension, and/or expansion of municipal services and facilities which are not customarily constructed by a developer, or

2. There is a need for services or facilities not otherwise funded by regular City fees, or

3. The construction of the necessary services and facilities cannot be logically or economically provided by one landowner/development in the normal sequence of orderly development.

- **Policy 40.3:** An area facilities plan shall include, but not be limited to the following:

1. Description of the plan area, the basis for the selection of the proposed boundaries, and the development potential of the area which is based on a comprehensive land use map.

2. A statement of the plan's consistency with the Folsom General plan and the City's Urban Development Policy.

3. Identification of the nature and extent of facilities necessary to serve the area and a schedule of estimated time within which facilities must be constructed.

4. Engineer's estimate of the total cost of such improvements (including plan preparation).

5. A plan for the equitable apportionment of costs among benefited properties and adjustments thereof based on the time such costs are paid.

6. The nature of the obligation of each land-owner or developer.

7. Discussion of the options available to finance the improvements including, but not limited to, construction by developers.

8. Provisions for amendments to the plan which may result from changes in the plan area, development patterns, etc.

9. Provisions to refund or reimburse landowners who construct facilities with capacity beyond the ultimate need of their developments.

10. A statement which recognizes that the financial commitments required pursuant to such plans are not in lieu of other municipal service and facilities fees. The financial commitments of landowners/developers shall be taken into account by the City in determining the extent of the imposition of such other municipal service and facilities fees.

11. A statement which recognizes that the area facilities plan is not intended to be responsible for the provision of all possible public facilities that will be needed in the future and that there are or may be additional costs/fees established by the City and other jurisdictions (such a school district) that may apply to the area. However, the plan must address the need for public facilities which may reasonably be assumed to be necessary during buildout of the area.

12. Provisions for administration of the area plan and the collection and distribution of funds.

3A.14.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to public services if they would do any of the following:

- create a need for the development of new service facilities (e.g., fire, police, schools, and other public facilities, the construction of which could result in significant environmental impacts;
- create circumstances where existing services and facilities could not meet established performance standards (i.e., response times, provider-per-resident ratios); or
- substantially impede existing services.

Analysis Methodology

Impacts on fire services, police services, and public schools that would result from project implementation were identified by comparing existing service capacity and facilities against future demand associated with project implementation. Evaluation of potential public-services impacts was based on a review of documents pertaining to the SPA and vicinity, including the City of Folsom General Plan (1988), the *Folsom Cordova Unified School District Revised Facility Needs Assessment* (2008a), and the *FCUSD Facility Master Plan* (2008b). Additional background information on current services, staffing, and equipment was obtained through consultation with appropriate agencies, including the City of Folsom Fire Department and FCUSD.

The project proposes to construct three fire stations, one police service center, five elementary schools, and one combined middle school and high school at different locations within the SPA. The number of new firefighters and police officers were calculated based the population projections for the project alternatives and the City's ratio of 1.6 fire personnel to 1,000 residents and 1.3 police officers per 1,000 residents. Table 3A.14-3 shows the number of new firefighters and police officers that would be required to serve the project under each action alternative. The No Project Alternative would not require new firefighters or police officers because the 44 rural residences would be served by existing firefighting/law enforcement capacity within Sacramento County.

Table 3A.14-3
Folsom South of U.S. 50 Specific Plan Firefighter and Police Officer Projections

Action Alternative	Number of Required Firefighters[1]	Number of Required Police Officers[2]
Proposed Project	39	32
Resource Impact Minimization	31	25
Centralized Development	33	27
Reduced Hillside Development	40	33
No USACE Permit	25	21

Notes:
[1] The number of required firefighters is based on the population projected for each action alternative and the City of Folsom Fire Department's ratio of 1.6 firefights per 1,000 residents.
[2] The number of required police officers is on the population projected for each action alternative and the City of Folsom Police Department's ratio of 1.3 police officers per 1,000 residents.
Source: Data compiled by AECOM in 2010

The number of new elementary, middle, and high school students were calculated based on the student-yield generation rates shown in Table 3A.14-2. Special education students are calculated by the FCUSD using an evenly weighted student-yield generation factor regardless of grade level and dwelling unit type. These students are considered to be evenly distributed throughout all grades levels (K-12). It can not be determined how these students would be ultimately distributed by grade level and it is assumed that the proposed project and action alternatives would generate slightly more students than analyzed below. However, special education students have been considered in the number of schools required to serve the proposed project and action alternatives. The number of new students generated under each action alternative is summarized below in Table 3A.14-4. The up to 44 rural residences that could be constructed under the No Project Alternative would not generate substantial new students.

Table 3A.14-4
Folsom South of U.S. 50 Specific Plan Elementary, Middle, and High School Student Projections

Action Alternative	Number of Elementary School Students[1]	Number of Middle School Students[2]	Number of High School Students[3]	Number of Special Education Students (K-12) [4, 5]	Total Number of Students (K-12) [6]
Proposed Project	2,807	1,017	1,073	102	4,999
Resource Impact Minimization	2,996	866	919	80	3,076
Centralized Development	2,363	864	889	90	2,453
Reduced Hillside Development	2,556	1,480	972	116	2,672
No USACE Permit	2,005	710	756	64	2,069

Notes:

[1] The number of elementary school students was calculated based on the sum of the dwelling units under the Single Family and Single Family High Density land use designation multiplied by the FCUSD's student-yield generation rate shown in Table 3A.14-2.

[2] The number of middle school students was calculated based on the sum of the dwelling units under the Multi-Family Low Density and Multi-Family Medium Density land use designations multiplied by the FCUSD's student-yield generation rate shown in Table 3A.14-2.

[3] The number of high school students was calculated based on the sum of the dwelling units under the Multi-Family High Density and Mixed-Use land use designations multiplied by the FCUSD's student-yield generation rate shown in Table 3A.14-2.

[4] The number of special education students was calculated based on the total number of dwelling units multiplied by the FCUSD's student-yield generation rate shown in Table 3A.14-2.

[5] Special education students were evenly weighted by grade group and included in the corresponding grade group for the calculation of the number of schools required.

[6] It can not be determined how these special education students would be ultimately distributed by grade level. However, the total number of special education students has been considered in the number of schools required to serve the proposed project and action alternatives.

Source: Data compiled by AECOM in 2010

It is anticipated that the provision of all new or physically altered public service facilities intended to meet the increased demand for public services would occur on site. Because public facilities would be constructed as part of the Proposed Project Alternative and would be confined to the SPA, this EIR/EIS already anticipates and addresses the physical environmental impacts associated with construction and operation of these facilities (along with development of the project in general) in other sections of the EIR/EIS (e.g., Section 3A.4, "Air Quality - Land," Section 3A.4, "Biological Resources - Land"). Therefore, these indirect, physical impacts are not addressed in this section.

The Sacramento Country Day School had originally proposed construction of a new campus on an approximately 80-acre property in the southeast portion of the SPA along White Rock Road. The Sacramento Country Day

School would be privately owned and would serve pre-kindergarten through grade 12 students throughout Sacramento County. Because the Sacramento Country Day School would be a privately owned facility, it would not be subject to the CDE school facilities planning criteria and would not be required to pay state-mandated school impact fees. Recently, the Sacramento Country Day School withdrew its application to construct a campus in the SPA. For purposes of this EIR/EIS, some type of school facility would still be constructed on this site; however, because it not known what type of facility (public or private) or how many students could be accommodated, it not possible to perform any analysis related to school facilities on this property.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development) (for information on project phasing, please refer to Section 2.3.1 in Chapter 2, "Alternatives"). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.14-1 Temporary Reduction in Emergency Response Services during Construction. *Project implementation could obstruct roadways in the project vicinity during construction, potentially obstructing or slowing emergency vehicles attempting to access the area.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could be constructed under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. All or a portion of these dwelling units could be constructed by individual property owners over the project's 19-year buildout period (2011–2030). Development of individual dwelling units would require minimal, temporary, short-term construction activities; therefore, roadways would not be obstructed and emergency response times would be unaffected during construction under the No Project Alternative. This impact would be **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD,

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Density Alternatives would include construction activities of varying levels over a 19-year period (approximately 2011 through 2030). Most of the project-related construction activities would occur on site; however, the project involves a variety of off-site U.S. 50 interchange improvements and construction of the sewer force main and detention basin in Sacramento County and two roadway connections in El Dorado County. Nearby roadways in the vicinity of the SPA and off-site areas, such as White Rock Road, Prairie City Road, and U.S. 50, would likely be affected intermittently during construction activities (see Section 3A.15, "Traffic and Transportation - Land"). Ongoing construction activities could result in temporary lane closures, increased truck traffic, and other roadway effects that could slow or stop emergency vehicles, temporarily increasing response times and impeding existing services. Potential reduction of emergency response services during construction would be a **direct, significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.14-1: Prepare and Implement a Construction Traffic Control Plan.

The project applicant(s) of all project phases shall prepare and implement traffic control plans for construction activities that may affect road rights-of-way. The traffic control plans must follow any applicable standards of the agency responsible for the affected roadway and must be approved and signed

by a professional engineer. Measures typically used in traffic control plans include advertising of planned lane closures, warning signage, a flagperson to direct traffic flows when needed, and methods to ensure continued access by emergency vehicles. During project construction, access to existing land uses shall be maintained at all times, with detours used as necessary during road closures. Traffic control plans shall be submitted to the appropriate City or County department or the California Department of Transportation (Caltrans) for review and approval before the approval of all project plans or permits, for all project phases where implementation may cause impacts on traffic.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties and Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of all relevant plans and/or permits and during construction of all project phases.

Enforcement:

1. For those roadways that would be annexed into the City of Folsom: City of Folsom Public Works Department.
2. For those roadways that would remain under the control of Sacramento County: Sacramento County Department of Transportation.
3. For the two off-site roadway connections into El Dorado Hills: El Dorado County Department of Transportation.
4. For U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measure 3A.14-1 would reduce significant impacts associated with decreased emergency response times during construction under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level by requiring preparation and implementation of a construction traffic control plan that would provide for adequate emergency access during construction activities. However, some of the off-site elements (two roadway connections in El Dorado County, detention basin in Sacramento County, and off-site interchange improvements on U.S. 50) fall under the jurisdiction of El Dorado and Sacramento Counties and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. The impacts could be reduced to a less-than-significant level if El Dorado and Sacramento Counties and Caltrans cooperate in implementing the mitigation.

IMPACT 3A.14-2 Increased Demand for Fire Protection Facilities, Systems, Equipment, and Services. *Project development would result in increased demand for fire protection facilities and services, potentially resulting in the need for additional staff and equipment to maintain an adequate level of service.*

On-Site Elements

NP

The No Project Alternative could develop of up to 44 rural residences and generate approximately 128 new residents under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Increased demands for fire protection services would be minimal under the No Project Alternative and new residential units would not require additional fire protection services beyond what is

currently available. Therefore, impacts on fire protection facilities and services would be **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP

Under the No USACE Permit Alternative, the estimated residential population at project buildout would be 15,808 persons. To maintain adequate levels of service, additional fire personnel, facilities, and equipment would be required to serve project development at buildout. Using the City's ratio of 1.6 fire personnel to 1,000 residents, a minimum of 25 new firefighters would be needed to serve project development at buildout. This would be approximately 14 fewer new firefighters than would be required under the Proposed Project Alternative.

The No USACE Permit Alternative would include construction of fire stations to serve the SPA. The location, number of personnel, and equipment required at new fire stations has not been determined. Final size and location of the fire station sites would be determined on completion of response time analysis studies and through coordination with the City of Folsom Fire Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development. In addition, new development within the EDHFD service area would be required to pay $1.16 per square foot of residential and commercial development, which is used exclusively for construction of new fire stations and associated apparatus.

Because the City of Folsom Fire Department and EDHFD outlines fire prevention standards to be incorporated into new residential and commercial development and these standards require approval by the City of Folsom Fire Department, the City of Folsom Community Department, and EDHFD for those areas of the SPA within the EDHFD service area, impacts on fire protection facilities and services would be **direct** and **potentially significant**. However, these impacts would be less than under the Proposed Project Alternative because fewer new firefighters would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

> Mitigation Measure 3A.14-2: Incorporate California Fire Code; City of Folsom Fire Code Requirements; and EDHFD Requirements, if Necessary, into Project Design and Submit Project Design to the City of Folsom Fire Department for Review and Approval.
>
> To reduce impacts related to the provision of new fire services, the project applicant(s) of all project phases shall do the following, as described below.
>
> 1. Incorporate into project designs fire flow requirements based on the California Fire Code, Folsom Fire Code (City of Folsom Municipal Code Title 8, Chapter 8.36), and other applicable requirements based on the City of Folsom Fire Department fire prevention standards. Improvement plans showing the incorporation automatic sprinkler systems, the availability of adequate fire flow, and the locations of hydrants shall be submitted to the City of Folsom Fire Department for review and approval. In addition, approved plans showing access design shall be provided to the City of Folsom Fire Department as described by Zoning Code Section 17.57.080 ("Vehicular Access Requirements"). These plans shall describe access-road length, dimensions, and finished surfaces for firefighting equipment. The installation of security gates across a fire apparatus access road shall be approved by the City of Folsom Fire Department. The design and operation of gates and barricades shall be in accordance with the Sacramento County Emergency Access Gates and Barriers Standard, as required by the City of Folsom Fire Code.

2. Submit a Fire Systems New Buildings, Additions, and Alterations Document Submittal List to the City of Folsom Community Development Department Building Division for review and approval before the issuance of building permits.

In addition to the above measures, the project applicant(s) of all project phases shall incorporate the provisions described below for the portion of the SPA within the EDHFD service area, if it is determined through City/El Dorado County negotiations that EDHFD would serve the 178-acre portion of the SPA.

3. Incorporate into project designs applicable requirements based on the EDHFD fire prevention standards. For commercial development, improvement plans showing roadways, land splits, buildings, fire sprinkler systems, fire alarm systems, and other commercial building improvements shall be submitted to the EDHFD for review and approval. For residential development, improvement plans showing property lines and adjacent streets or roads; total acreage or square footage of the parcel; the footprint of all structures; driveway plan views describing width, length, turnouts, turnarounds, radiuses, and surfaces; and driveway profile views showing the percent grade from the access road to the structure and vertical clearance shall be submitted to the EDHFD for review and approval.

4. Submit a Fire Prevention Plan Checklist to the EDHFD for review and approval before the issuance of building permits. In addition, residential development requiring automation fire sprinklers shall submit sprinkler design sheet(s) and hydraulic calculations from a California State Licensed C-16 Contractor.

The City shall not authorize the occupancy of any structures until the project applicant(s) have obtained a Certificate of Occupancy from the City of Folsom Community Development Department verifying that all fire prevention items have been addressed on-site to the satisfaction of the City of Folsom Fire Department and/or the EDHFD for the 178-acre area of the SPA within the EDHFD service area.

Implementation: Project applicant(s) of all project phases.

Timing: Before issuance of building permits and issuance of occupancy permits or final inspections for all project phases.

Enforcement: City of Folsom Fire Department, and City of Folsom Community Development Department, and/or EDHFD for the portion of the SPA within the EDHFD service area.

PP

Upon annexation of the SPA, fire protection services within the SMFD service area would become the responsibility of the City of Folsom Fire Department. During initial project development, Station 37 at 70 Clarksville Road would provide first-response service. This station is approximately 1.6 miles north of the SPA via Scott Road.

The EDHFD serves approximately 178 acres of the northeaster portion of the SPA as a multi-jurisdictional district. Currently, ongoing revenue neutrality negations between the EDHFD and the City will determine if this portion of the SPA remains in the EDHFD service area or is transferred to the jurisdiction of the City of Folsom Fire Department; therefore, it is assumed that this portion of the SPA would remain in the EDHFD service area. First-response service to the SPA within the EDHFD would be provided by Station 85 at 1050 Wilson Boulevard, approximately 1.2 miles northeast of the SPA via Latrobe Road in unincorporated El Dorado County.

The estimated population of the project under buildout of the Proposed Project Alternative would be 24,335 persons. To maintain adequate levels of service, additional fire personnel, facilities, and equipment would be

required to serve project development at buildout. Using the City's ratio of 1.6 fire personnel to 1,000 residents, a minimum of 39 new firefighters would be needed to serve the Proposed Project Alternative at buildout.

The Proposed Project Alternative would include construction of two fire stations to serve the SPA (see Exhibit 2-3, "Folsom South of 50 Conceptual Land Use Plan," in Chapter 2, "Alternatives"). The first fire station would be east of Oak Avenue and north of "A" Street and would house an engine company with three personnel on each of three shifts (Haverty, pers. comm., 2009). The second fire station would be north of "B" Street and east of Scott Road. The number of personnel and equipment required at this fire station has not been determined. Final size and location of the two fire station sites would be determined on completion of response time analysis studies and through coordination with the City of Folsom Fire Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development. In addition, new development within the EDHFD service area would be required to pay $1.16 per square foot of residential and commercial development, which is used exclusively for construction of new fire stations and associated apparatus (El Dorado County Fire Prevention Officers 2009).

The project applicant(s) would be required to incorporate California Fire Code and Folsom Fire Code (City of Folsom Municipal Code Title 8, Chapter 8.36) requirements into all development phases, including adequate on-site circulation, equipment access during emergency conditions, adequate firefighting water flow, hydrant spacing. In addition, the Folsom Fire Code requires that automatic fire sprinklers be installed in all new commercial construction that exceeds 3,600 square feet and some residential properties exceeding 4,999 square feet. The City of Folsom Community Development Building Division requires all new development to submit a Fire Systems New Buildings, Additions, and Alterations Document Submittal List documenting the incorporation of fire code requirements before issuance of building permits.

For those areas of the SPA within the EDHFD service area, the project applicant(s) would be required to incorporate EDHFD requirements into all development phases in addition to the requirements outlined in the California Fire Code and Folsom Fire Code. The EDHFD has adopted the El Dorado County Regional Fire Protection Standards and these standards include adequate on-site circulation, equipment access during emergency conditions, adequate firefighting water flow, and automatic fire sprinklers be installed in two-family residential dwelling units and extended to attached garages and basements. The EDHFD requires all new development to submit a Fire Prevention Plan Checklist documenting fire code requirements before issuance of building permits.

Because the City of Folsom Fire Department and EDHFD outlines fire prevention standards to be incorporated into new residential and commercial development and these standards require approval by City of Folsom Fire Department, City of Folsom Community Development Department and EDHFD for those areas of the SPA within the EDHFD service area, impacts on fire protection facilities and services would be **direct** and **potentially significant**. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development.

Mitigation Measure: Implement Mitigation Measure 3A.14-2.

RIM

Under the Resource Impact Minimization Alternative, the estimated residential population at project buildout would be 19,584 persons. To maintain adequate levels of service, additional fire personnel, facilities, and equipment would be required to serve project development at buildout. Using the City's ratio of 1.6 fire personnel to 1,000 residents, a minimum of 31 new firefighters would be needed to serve project development at buildout.

This would be approximately 8 fewer new firefighters than would be required under the Proposed Project Alternative.

The Resource Minimization Alternative would include construction of fire stations to serve the SPA. The location, number of personnel, and equipment required at new fire stations has not been determined. Final size and location of the fire station sites would be determined on completion of response time analysis studies and through coordination with the City of Folsom Fire Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development. In addition, new development within the EDHFD service area would be required to pay $1.16 per square foot of residential and commercial development, which is used exclusively for construction of new fire stations and associated apparatus.

Because the City of Folsom Fire Department and EDHFD outlines fire prevention standards to be incorporated into new residential and commercial development and these standards require approval by the City of Folsom Fire Department, the City of Folsom Community Development Department, and EDHFD for those areas of the SPA within the EDHFD service area, impacts on fire protection facilities and services would be **direct** and **potentially significant**. However, these impacts would be less than under the Proposed Project Alternative because fewer new firefighters would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.14-2.

CD

Under the Centralized Development Alternative, the estimated residential population at project buildout would be 20,689 persons. To maintain adequate levels of service, additional fire personnel, facilities, and equipment would be required to serve project development at buildout. Using the City's ratio of 1.6 fire personnel to 1,000 residents, a minimum of 33 new firefighters would be needed to serve project development at buildout. This would be approximately six fewer new firefighters than would be required under the Proposed Project Alternative.

The Centralized Development Alternative would include construction of fire stations to serve the SPA. The location, number of personnel, and equipment required at new fire stations has not been determined. Final size and location of the fire station sites would be determined on completion of response time analysis studies and through coordination with the City of Folsom Fire Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development. In addition, new development within the EDHFD service area would be required to pay $1.16 per square foot of residential and commercial development, which is used exclusively for construction of new fire stations and associated apparatus.

Because the City of Folsom Fire Department and EDHFD outlines fire prevention standards to be incorporated into new residential and commercial development and these standards require approval by the City of Folsom Fire Department, the City of Folsom Community Development Department, and EDHFD for those areas of the SPA within the EDHFD service area, impacts on fire protection facilities and services would be **direct** and **potentially significant**. However, these impacts would be less than under the Proposed Project Alternative because fewer

new firefighters would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.14-2.

RHD

Under the Reduced Hillside Development Alternative, the estimated residential population at project buildout would be 28,084 persons. To maintain adequate levels of service, additional fire personnel, facilities, and equipment would be required to serve project development at buildout. Using the City's ratio of 1.6 fire personnel to 1,000 residents, a minimum of 40 new firefighters would be needed to serve project development at buildout. This would be approximately one more new firefighter than would be required under the Proposed Project Alternative.

The Reduced Hillside Development Alternative would include construction of fire stations to serve the SPA. The location, number of personnel, and equipment required at new fire stations has not been determined. Final size and location of the fire station sites would be determined on completion of response time analysis studies and through coordination with the City of Folsom Fire Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development. In addition, new development within the EDHFD service area would be required to pay $1.16 per square foot of residential and commercial development, which is used exclusively for construction of new fire stations and associated apparatus.

Because the City of Folsom Fire Department and EDHFD outlines fire prevention standards to be incorporated into new residential and commercial development and these standards require approval by the City of Folsom Fire Department, the City of Folsom Community Development Department, and EDHFD for those areas of the SPA within the EDHFD service area, impacts on fire protection facilities and services would be **direct** and **potentially significant**. However, these impacts would be greater than under the Proposed Project Alternative because more new firefighters would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3A.14-2.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the drainage basin in Sacramento County, and the two roadway connections into El Dorado Hills would not involve construction of new housing or development of new businesses that would require firefighting services; therefore, the off-site elements would have **no direct** impact on the demand additional firefighting personnel, facilities, and equipment. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measure 3A.14-2 would reduce significant impacts under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives associated with the increased demand for fire protection facilities, systems, equipment, and services to a **less-than-significant** level by requiring that applicable California Fire Code, City of Folsom Fire Code, and/or EDHFD standards are incorporated into the project design, along with review and approval of project plans by the City of Folsom Fire Department, the City of Folsom Community Development Department Building

Division, and/or EDHFD for the 178-acre area of the SPA within the EDHFD service area prior to issuance of building permits.

IMPACT 3A.14-3 Increased Demand for Fire Flow. *Project implementation would include the development of residential, commercial, school, and other uses that would require adequate available water flow for fire suppression. Lack of adequate fire flow would impede effective fire suppression in the SPA.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. There is currently no public water service available in the SPA, and property owners would be served by individual groundwater wells. Domestic groundwater wells would likely not be capable of pumping a sufficient amount of water to meet fire flow requirements. However, before issuance of a building permit from Sacramento County, the property owners would be required to coordinate with the SMFD regarding fire flow requirements and obtain a "Fire District Certificate of Release" (Sacramento County 2008). Therefore, increased demands for fire flow would be a **direct** and **less-than-significant** impact. **No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

The City of Folsom Fire Department and EDHFD maintain oversight authority to ensure that adequate water volume and pressure are available their respective service areas. The total fire flow needed to extinguish a structural fire is based on a variety of factors, including building design, internal square footage, construction materials, dominant use, height, number of floors, and distance to adjacent buildings. Minimum requirements for available fire flow at a given building are dependent on standards set in the California Fire Code. Generally, fire flow requirements for the type of development associated with the Proposed Project Alternative are identified by the California Fire Code. These fire flow requirements are 1,500 gpm for low- and medium-density residential (2-hour duration), 2,500 gpm for high-density residential (3-hour duration), 3,000 gpm for commercial/office and light industrial (3-hour duration).

In addition to meeting minimum water flow requirements, all development projects in Folsom are required to meet various other fire protection requirements identified in the Folsom Fire Code. The fire code requires that automatic fire sprinklers be installed in all new commercial construction that exceeds 3,600 square feet and some residential properties exceeding 4,999 square feet. The fire code outlines the number and distribution of fire hydrants and minimum fire-flow requirements for structures exceeding 3,600 square feet. The City of Folsom Fire Department requirements are determined for specific development projects at the design stage. For the 178-acre area of the SPA within the EDHFD service area, all development projects are required to incorporate EDHFD requirements in addition to the requirements outlined in the California Fire Code and Folsom Fire Code. As discussed above, on-going revenue neutrality negations between the EDHFD and City would determine if the 178-acre portion of the SPA remains in the EDHFD service area or is transferred to the jurisdiction of the City of Folsom Fire Department.

Lack of adequate fire flow would impede the ability of the City of Folsom Fire Department and/or EDHFD to provide effective fire suppression service in the SPA. Increased demands for fire flow would be considered a **significant**, **direct** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.14-2.

Mitigation Measure 3A.14-3: Incorporate Fire Flow Requirements into Project Designs.

The project applicant(s) of all project phases shall incorporate into their project designs fire flow requirements based on the California Fire Code, Folsom Fire Code, and/or EDHFD for those areas of the SPA within the EDHFD service area and shall verify to City of Folsom Fire Department that adequate water flow is available, prior to approval of improvement plans and issuance of occupancy permits or final inspections for all project phases.

Implementation: Project applicant(s) of all project phases.

Timing: Before issuance of building permits and issuance of occupancy permits or final inspections for all project phases.

Enforcement: City of Folsom Fire Department, City of Folsom Community Development Department, and/or EDHFD for the 178-acre portion of the SPA within the EDHFD service area.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the drainage basin in Sacramento County, and the roadway connections into El Dorado Hills would not involve construction of new housing or development of new businesses that would require provision of fire flow; therefore, the off-site elements would have **no direct** or **indirect** impacts on the demand for fire flow.

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measures 3A.14-2 and 3A.14-3 would reduce impacts associated with increased demand for fire flow to a **less-than-significant** level under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives because verification from the City of Folsom Fire Department and/or EDHFD that adequate water supply is available would be obtained prior to approval of improvement plans, and project fire flow would design would based on specification requirements included in the California Fire Code, the Folsom Fire Code, and/or the EDHFD for the portion of the SPA within the EDHFD service area and reviewed and approved by the City.

IMPACT 3A.14-4 Increased Demand for Police Protection Facilities, Services, and Equipment. *Project development would increase the demand for police protection facilities and services, resulting in the need for additional staff and equipment to maintain an adequate level of service.*

On-Site Elements

NP

The No Project Alternative could develop up to 44 rural residences and generate approximately 128 new residents under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Increased demands for police protection services would be minimal under the No Project Alternative and new residential units would not require additional police protection services beyond what is currently available. Therefore, impacts on police protection services would be **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP

To maintain adequate levels of service, additional officers, facilities, and equipment would be required to serve project development at buildout. Under the No USACE Permit Alternative, the estimated residential population at project buildout would be 15,808 persons. Using the City's ratio of 1.3 officers to 1,000 residents, a minimum of 21 new police officers would be needed to serve project development at buildout. This would be approximately 11 fewer new officers than would be required under the Proposed Project Alternative.

The No USACE Permit Alternative would include construction of one police service center north of Easton Valley Parkway west of Scott Road. The location, number of personnel, and equipment required at new police service center has not been determined. The final size and location of the police service center would be determined through coordination with the City of Folsom Police Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development.

Because the applicants would fund and construct sufficient police facilities to serve the Proposed Project Alternative, impacts related to increased demands for police protection facilities, services, and equipment would be **direct** and **less than significant**, and would occur to a lesser degree than under the Proposed Project Alternative because fewer new police officers would be required. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

PP

The City of Folsom Police Department, which is located approximately 5 miles northeast of the SPA, would provide first-response service for the SPA. Under the Proposed Project Alternative, the estimated population of the project would be 24,335 persons at buildout. To maintain adequate levels of service, additional law enforcement facilities, services, and equipment would be required to serve project development at buildout. Using the City's ratio of 1.3 officers to 1,000 residents, a minimum of 32 new police officers would be needed to accommodate project development at buildout.

The Proposed Project Alternative would include construction of one police service center north of Easton Valley Parkway west of Scott Road (see Exhibit 2-3, "Folsom South of 50 Conceptual Land Use Plan," in Chapter 2, "Alternatives"). The final size and location of the police service center would be determined through coordination with the City of Folsom Police Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development.

Because the project applicant(s) would fund and construct sufficient police facilities and personnel to serve the Proposed Project Alternative, impacts related to increased demands for police protection facilities, services, and equipment would be **direct** and **less than significant**. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development.

Mitigation Measure: No mitigation measures are required.

RIM

To maintain adequate levels of service, additional officers, facilities, and equipment would be required to serve project development at buildout. Under the Resource Impact Minimization Alternative, the estimated residential population at project buildout would be 19,584 persons. Using the City's ratio of 1.3 officers to 1,000 residents, a minimum of 25 new police officers would be needed to serve project development at buildout. This would be approximately seven fewer new officers than would be required under the Proposed Project Alternative.

The Resource Impact Minimization Alternative would include construction of one police service center. The location, number of personnel, and equipment required at new police service center has not been determined. The final size and location of the police service center would be determined through coordination with the City of Folsom Police Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development.

Because the applicants would fund and construct sufficient police facilities to serve the Proposed Project Alternative, impacts related to increased demands for police protection facilities, services, and equipment would be **direct** and **less than significant**, and would occur to a lesser degree than under the Proposed Project Alternative because fewer new police officers would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

CD

To maintain adequate levels of service, additional officers, facilities, and equipment would be required to serve project development at buildout. Under the Centralized Development Alternative, the estimated residential population at project buildout would be 20,689 persons. Using the City's ratio of 1.3 officers to 1,000 residents, a minimum of 27 new police officers would be needed to serve project development at buildout. This would be approximately five fewer new officers than would be required under the Proposed Project Alternative.

The Centralized Development Alternative would include construction of one police service center. The location, number of personnel, and equipment required at new police service center has not been determined. The final size and location of the police service center would be determined through coordination with the City of Folsom Police Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development.

Because the applicants would fund and construct sufficient police facilities to serve the Proposed Project Alternative, impacts related to increased demands for police protection facilities, services, and equipment would be **direct** and **less than significant**, and would occur to a lesser degree than under the Proposed Project

Alternative because fewer new police officers would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

RHD

To maintain adequate levels of service, additional officers, facilities, and equipment would be required to serve project development at buildout. Under the Reduced Hillside Development Alternative, the estimated residential population at project buildout would be 28,084 persons. Using the City's ratio of 1.3 officers to 1,000 residents, a minimum of 33 new police officers would be needed to serve project development at buildout. This would be approximately one more new officer than would be required under the Proposed Project Alternative.

The Reduced Hillside Development Alternative would include construction of one police service center. The location, number of personnel, and equipment required at new police service center has not been determined. The final size and location of the police service center would be determined through coordination with the City of Folsom Police Department.

Per the City of Folsom Municipal Code Chapter 3, Title 3.80, "Capital Improvement New Construction Fee," new development is responsible for the full cost of additional facilities and equipment necessary as a result of that development through payment of the City's capital improvement new construction fees. This fee is used exclusively for construction of new fire and police stations and associated apparatus as required by new development.

Because the applicants would fund and construct sufficient police facilities to serve the Proposed Project Alternative, impacts related to increased demands for police protection facilities, services, and equipment would be **direct** and **less than significant**, but would occur to a greater degree than under the Proposed Project Alternative because more new police officers would be required. The **indirect** physical impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Greater]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the drainage basin in Sacramento County, and the two roadway connections into El Dorado Hills, would not involve construction of new housing or development of new businesses that would require police services; therefore, the off-site elements would have **no direct** impact on the demand additional law enforcement personnel, facilities, and equipment. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.14-5 Increased Demand for Public Elementary School Facilities and Services. *Project implementation would increase demand for elementary schools (grades K–5) to serve the project.*

On-Site Elements

NP

The No Project Alternative could include development of a maximum of 44 residential units and generate approximately 128 new residents in Sacramento County under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Based on student-yield generation rates shown in Table 3A.14-2, the No Project Alternative would generate approximately 49 new elementary school students (grades K–5). Existing elementary schools in FCUSD would have sufficient capacity to accommodate these students. Therefore, impacts on elementary school facilities and services would be **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the No USACE Permit Alternative would generate approximately 2,005 new elementary school students (grades K–5) at project buildout. This would be approximately 802 fewer elementary school students than under the Proposed Project Alternative. Once constructed, the five proposed elementary schools in the SPA would accommodate all 2,005 new students and would have capacity for an additional 995 students. Therefore, the proposed elementary schools would have sufficient capacity to meet the demands of project-generated elementary school students and would not result in a shortfall of elementary school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient elementary school facilities to serve the project. Therefore, implementation of the No USACE Permit Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

PP

The SPA would be within the boundaries of FCUSD. Based on student-yield generation rates shown in Table 3A.14-2, implementation of the Proposed Project Alternative would generate approximately 2,807 new elementary school students (grades K–5) at project buildout. The Proposed Project Alternative includes construction of five elementary schools throughout the SPA (see Exhibit 2-3, “Folsom South of 50 Conceptual Land Use Plan,” in Chapter 2, “Alternatives”).

Elementary schools in FCUSD have an average capacity of 600 students (FCUSD 2008a:18). Using this average as the assured capacity of schools to be built on-site, the five proposed school sites would have a total capacity of 3,000 students. Thus, once constructed, the proposed elementary schools would accommodate all 2,807 new students and would have capacity for an additional 193 students. To accommodate students in the SPA, school attendance boundaries would be adjusted regularly to account for the phases of development and available capacity at completed schools in the SPA. Therefore, the proposed elementary schools would have sufficient

capacity to meet the demands of project-generated elementary school students and would not result in a shortfall of school services or facilities.

As required by state law, the project applicant(s) would pay the state-mandated school impact fees to FCUSD. As of March 2008, the developer is charged Level II fees of $6.99 per square foot for residential development and $0.47 per square foot for commercial development in the FCUSD boundaries (FCUSD 2009). The City would determine the assessable square footage that would be subject to the fee at the time of development (FCUSD 2009). This fee is typically an insufficient amount to fund 100% of new school facility construction. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient elementary school facilities to serve the Proposed Project Alternative.

Because the project applicant(s) would pay state-mandated school impact fees and fund all costs associated with construction of middle and high school facilities, and assuming that the middle school/high school is constructed, implementation of the Proposed Project Alternative would have a **less-than-significant, direct** impact on school services in the long term. This impact would be further reduced by the project applicant(s)' compliance with their obligations under Measure W to provide "for the funding and construction of all necessary school facilities for the Area, so that Folsom residents north of Highway 50 are not required to pay for the construction of new school facilities serving the Area and existing schools are not overcrowded by development in the Area." The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development.

Mitigation Measure: No mitigation measures are required.

RIM

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Resource Impact Minimization Alternative would generate approximately 2,996 new elementary school students (grades K–5) at project buildout. This would be approximately 189 more elementary school students than under the Proposed Project Alternative. Once constructed, the five proposed elementary schools in the SPA would accommodate all 2,996 new students and would have capacity for an additional 4 students. Therefore, the proposed elementary schools would have sufficient capacity to meet the demands of project-generated elementary school students and would not result in a shortfall of elementary school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient elementary school facilities to serve the project. Therefore, implementation of the Resource Impact Minimization Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

CD

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Centralized Development Alternative would generate approximately 2,363 new elementary school students (grades K–5) at project buildout. This would be approximately 444 fewer elementary school students than under the Proposed Project Alternative.

The Centralized Development Alternative proposes four elementary schools, which would be one less than the Proposed Project Alternative. Using this average as the assured capacity of schools to be built on-site, the four proposed school sites would have a total capacity of 2,400 students. Once constructed, the four proposed elementary schools in the SPA would accommodate all 2,363 new students and would have capacity for an additional 37 students. Therefore, the proposed elementary school would have sufficient capacity to meet the demands of project-generated elementary school students and would not result in a shortfall of elementary school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. However, The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient elementary school facilities to serve the project. Therefore, implementation of the Centralized Development Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

RHD

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Reduced Hillside Development Alternative would generate approximately 2,556 new elementary school students (grades K–5) at project buildout. This would be approximately 251 fewer elementary school students than under the Proposed Project Alternative. Once constructed, the five proposed elementary schools in the SPA would accommodate all 2,556 new students and would have capacity for an additional 444 students. Therefore, the proposed elementary schools would have sufficient capacity to meet the demands of project-generated elementary school students and would not result in a shortfall of elementary school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient elementary school facilities to serve the project. Therefore, implementation of the Reduced Hillside Development Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the drainage basin in Sacramento County, and the two roadway connections into El Dorado Hills would not involve construction of new housing or development of new businesses that would generate elementary school students. Therefore, the off-site elements would have **no direct** or **indirect** impact on elementary school services and facilities.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.14-6 Increased Demand for Public Middle and High School Facilities and Services. *Project implementation would increase demand for middle schools (grades 6–8) and high schools (grades 9–12) to serve the project.*

On-Site Elements

NP

The No Project Alternative could include development of a maximum of 44 residential units and generate approximately 128 new residents in Sacramento County under the existing Sacramento County agricultural zoning classification AG-80, and no off-site water facilities would be constructed. Based on student-yield generation rates shown in Table 3A.14-2, the No Project Alternative would generate approximately 16 new middle school students (grades 6–8) and 19 new high school students (grades 9–12). Existing middle schools and high schools in Sacramento County would have sufficient capacity to accommodate these students. Therefore, impacts on middle and high school facilities and services would be **direct** and **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

NCP

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the No USACE Permit Alternative would generate approximately 710 new middle school students (grades 6–8) and approximately 756 new high school students (grades 9–12) at buildout. This would be approximately 307 fewer middle school students and 317 fewer high school students than under the Proposed Project Alternative.

The proposed middle school, with a total capacity of 900 students, would accommodate all 710 new students and would have capacity for an additional 190 students. The proposed high school, with a capacity for 2,000 students, would accommodate all 756 students and would have capacity for an additional 1,244 students. Therefore, with implementation of the No USACE Permit Alternative, the combined middle school and high school would have sufficient capacity to accommodate students living in the SPA; the project would not result in a shortfall of school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient middle and high school facilities to serve the project. Therefore, implementation of the No USACE Permit Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

PP

The SPA would be within the boundaries of FCUSD. Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Proposed Project Alternative would generate approximately 1,017 new middle school students (grades 6–8) and approximately 1,073 new high school students (grades 9–12) at buildout. The proposed combined middle school and high school site would accommodate a combined campus on one 70-acre site in the south-central portion of the SPA north of White Rock Road, south of "A" Street, and east of Scott Road (see Exhibit 2-3, "Folsom South of 50 Conceptual Land Use Plan," in Chapter 2, "Alternatives").

Middle schools in FCUSD have an average capacity of 900 students (FCUSD 2008a:18). Therefore, under the Proposed Project Alternative, approximately 193 students would not be accommodated by the proposed on-site middle school. These middle schools students would likely attend Folsom Middle School, which is currently operating above capacity. The additional students from the SPA could result in overcrowding at Folsom Middle School. However, Measure W requires the project applicant(s) to fund and construct sufficient middle school facilities to serve students on the Proposed Project Alternative.

High schools in FCUSD have an average capacity of 2,000 students (FCUSD 2008a:18). The proposed high school in the SPA would accommodate all 1,073 students and would have capacity for an additional 927 students. Therefore, with implementation of the Proposed Project Alternative, the combined high school would have sufficient capacity to accommodate high school students living in the SPA; this alternative would not result in a shortfall of high school services or facilities.

As required by state law, the project applicant(s) would pay the state-mandated school impact fees to FCUSD. As of March 2008, the developer is charged Level II fees of $6.99 per square foot for residential development and $0.47 per square foot for commercial development in the FCUSD boundaries (FCUSD 2009). The City would determine the assessable square footage that would be subject to the fee at the time of development (FCUSD 2009). This fee is typically an insufficient amount to fund 100% of new school facility construction. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the applicants to

Because the project applicant(s) would pay state-mandated school impact fees and fund all costs associated with construction of middle and high school facilities, and assuming that the middle school/high school is constructed, implementation of the Proposed Project Alternative would have a **less-than-significant, direct** impact on school services in the long term. This impact will be further reduced by the project applicant(s)'s compliance with their obligations under Measure W to provide "for the funding and construction of all necessary school facilities for the Area, so that Folsom residents north of Highway 50 are not required to pay for the construction of new school facilities serving the Area and existing schools are not overcrowded by development in the Area." The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development.

Mitigation Measure: No mitigation measures are required.

RIM

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Resource Impact Minimization Alternative would generate approximately 866 new middle school students (grades 6–8) and approximately 919 new high school students (grades 9–12) at buildout. This would be approximately 151 fewer middle school students and 154 fewer high school students than under the Proposed Project Alternative.

The proposed middle school, with a total capacity of 900 students, would accommodate all 866 new students and would have capacity for an additional 34 students. The proposed high school, with a capacity for 2,000 students, would accommodate all 919 students and would have capacity for an additional 1,081 students. Therefore, with implementation of the Resource Impact Minimization Alternative, the combined middle school and high school would have sufficient capacity to accommodate students living in the SPA; the project would not result in a shortfall of school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W requires the project applicant(s) to fund and construct sufficient middle and high school facilities to serve the project. Therefore, implementation of the Resource Impact

Minimization Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

CD

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Centralized Development Alternative would generate approximately 869 new middle school students (grades 6–8) and approximately 889 new high school students (grades 9–12) at buildout. This would be approximately 148 fewer middle school students and 184 fewer high school students than under the Proposed Project Alternative.

The proposed middle school, with a total capacity of 900 students, would accommodate all 869 new students and would have capacity for an additional 37 students. The proposed high school, with a capacity for 2,000 students, would accommodate all 889 students and would have capacity for an additional 1,111 students. Therefore, with implementation of the Centralized Development Alternative, the combined middle school and high school would have sufficient capacity to accommodate students living in the SPA; the project would not result in a shortfall of school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California Government Code Section 65996.) In addition, Measure W would require the project applicant(s) to fund and construct sufficient middle and high school facilities to serve the project. Therefore, implementation of the Centralized Development Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

RHD

Based on student-yield generation rates shown in Table 3A.14-2 above, implementation of the Reduced Hillside Development Alternative would generate approximately 1,480 new middle school students (grades 6–8) and approximately 972 new high school students (grades 9–12) at buildout. This would be approximately 463 more middle school students and 101 fewer high school students than under the Proposed Project Alternative.

The proposed middle school in the SPA, with a total capacity of 900 students, approximately 580 students would not be accommodated by the proposed facility. These middle schools students would likely attend Folsom Middle School, which is currently operating above capacity. The additional students from the SPA could result in overcrowding at Folsom Middle School. However, Measure W requires the project applicant(s) to fund and construct sufficient middle school facilities to serve students on the project.

The proposed high school, with a capacity for 2,000 students, would accommodate all 972 students and would have capacity for an additional 1,028 students. Therefore, with implementation of the Reduced Hillside Development Alternative, the combined middle school and high school would have sufficient capacity to accommodate students living in the SPA; the project would not result in a shortfall of school services or facilities.

The project applicant(s) would pay the state-mandated school impact fees to FCUSD. This fee is typically an insufficient amount to fund 100% of new school facility construction and operation. The California Legislature has declared that the school impact fee is deemed to be full and adequate mitigation under CEQA. (California

Government Code Section 65996.) In addition, Measure W would require the applicants to fund and construct sufficient middle and high school facilities to serve the project. Therefore, implementation of the Reduced Hillside Development Alternative would have a **less-than-significant**, **direct** impact on school services and facilities in the long term. The **indirect** impacts of constructing these facilities are addressed throughout this EIR/EIS in connection with discussions of the impacts of overall site development. ***[Greater]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

Construction of the off-site freeway interchange improvements, the sewer force main, the drainage basin in Sacramento County, and the two roadway connections into El Dorado Hills would not involve construction of new housing or development of new businesses that would generate middle school or high school students Therefore, the off-site elements would have **no direct** or **indirect** impacts on the middle and high school services and facilities.

Mitigation Measure: No mitigation measures are required.

3A.14.4 RESIDUAL SIGNIFICANT IMPACTS

With implementation of the mitigation measures listed above, project implementation would not result in any on-site residual significant impacts related to public services.

However, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these off-site elements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of El Dorado and Sacramento Counties, or Caltrans, impact 3A.14-1 is considered **potentially significant and unavoidable** for off-site improvements which would be located in Sacramento County, El Dorado County, or Caltrans jurisdiction.

This section was prepared by DKS Associates.

3A.15 TRAFFIC AND TRANSPORTATION – LAND

This chapter presents the results of the transportation impact analysis (TIA) prepared by DKS Associates (DKS) for implementation of full buildout of the Proposed Project. Because of the large volume of raw data generated during traffic counts and modeling analyses conducted in support of the traffic analysis, it is not feasible to provide these data as an appendix to this draft environmental impact report/environmental impact statement (DEIR/DEIS). However, the data are available for review at the City of Folsom, 50 Natoma Street, Folsom, CA 95630.

Development of project is anticipated to be completed by the year 2030. The SPA, other areas of Folsom, and cities and communities throughout Sacramento County are expected to experience significant growth over this period. Major projects have been entitled for development throughout the region, and more are expected. As projects develop, traffic will increase on local and regional roadways and freeways. As regional development proceeds, transportation system improvements will be provided through local and regional funding programs, individual project mitigation, and improvements funded by the California Department of Transportation (Caltrans).

For analysis purposes, cumulative conditions reflect year 2030 conditions, the anticipated build-out date of the project. Year 2030 land use and transportation networks, described in additional detail later in this section, are based upon regional Sacramento Area Council of Governments (SACOG) forecasts as well as General Plan and specific project information in jurisdictions near the SPA. Year 2030 conditions also include the full operation of three rock quarries south of the SPA.

As part of the traffic analysis, the following scenarios were analyzed to assist in the identification of project-related traffic impacts:

- **Existing conditions – No Project (NP) Alternative** – Existing roadway operations were analyzed using existing roadway geometrics and existing volumes obtained from traffic count data.

- **Existing conditions – No USACE Permit (NCP) Alternative** – Similar to the Proposed Project Alternative, this scenario assumes full development of the SPA in accordance with the No USACE Permit Alternative. This alternative would change the location of certain portions of development such that no jurisdictional waters of the U.S. would be filled. The total amount of development under the No USACE Permit Alternative is less than the amount of development associated with the Proposed Project Alternative.

- **Existing conditions – Proposed Project (PP) Alternative** – Although full development of the Proposed Project would likely take many years, this scenario assumes full development of the Proposed Project immediately. In this manner, traffic conditions associated with full Project development can be directly compared to the No Project Alternative. This alternative presents an unlikely condition, given the magnitude of planned development associated with the Project. In reality, the Proposed Project will develop over a period of years (as dictated by market absorption rates), and other development outside the area of the Proposed Project would also occur in this same time frame.

- **Existing conditions – Resource Impact Minimization (RIM) Alternative** – Similar to the Proposed Project Alternative, this scenario assumes full development of the SPA in accordance with the Resource Impact Minimization Alternative. This alternative would include additional areas of high–quality biological habitat in the proposed preserve area, and would also preserve all of the on-site cultural resources eligible for listing on the California Register of Historic / National Register of Historic Places. The total amount of development under the Resource Impact Minimization Alternative is less than the amount of development associated with the Proposed Project Alternative.

- **Existing Conditions – Centralized Development (CD) Alternative** – Similar to the Proposed Project Alternative, this scenario assumes full development of the SPA in accordance with the Centralized Development Alternative. This alternative would preserve the eastern portion of the SPA, which lies within the Sierra Nevada foothills, leaving more of this area in its current undeveloped state for aesthetic, biological, and cultural resource purposes. The total amount of development under the Centralized Development Alternative is less than the amount of development associated with the Proposed Project Alternative.

- **Existing Conditions – Reduced Hillside Development (RHD) Alternative** – Similar to the Proposed Project Alternative, this scenario assumes full development of the SPA in accordance with the Reduced Hillside Development Alternative. This alternative would reduce the development area on the eastern portion of the SPA, which lies within the Sierra Nevada foothills, leaving more of this area in its current undeveloped state for aesthetic, biological, and cultural resource purposes. The total amount of development under the Reduced Hillside Development Alternative is greater than the amount of development associated with the Proposed Project Alternative, but the development is more compact.

- **Cumulative Conditions – No Project (NP) Alternative** – This scenario analyzes roadway conditions in the year 2030, assuming that the Proposed Project is not built. All cumulative scenarios incorporate roadway improvement projects associated with assumed development projects in the area, as identified by the City; Tier I projects identified in the SACOG *Metropolitan Transportation Plan for 2035* (MTP 2035) (SACOG 2008) that are outside the city limits through the year 2030; and additional improvements identified by the City that would be required pursuant to the City's capital improvement program (CIP).

- **Cumulative Conditions – No USACE Permit (NCP) Alternative** – This scenario assumes full development of the No USACE Permit Alternative in the year 2030, with the same off-site land use and roadway assumptions as the No Project Alternative.

- **Cumulative Conditions – Proposed Project (PP) Alternative** – This scenario assumes full development of the Proposed Project in the year 2030, with the same off-site land use and roadway assumptions as the No Project Alternative.

- **Cumulative Conditions – Resource Impact Minimization (RIM) Alternative** – This scenario assumes full development of the Resource Impact Minimization Alternative in the year 2030, with the same off-site land use and roadway assumptions as the No Project Alternative.

- **Cumulative conditions – Centralized Development (CD) Alternative** – This scenario assumes full development of the Centralized Development Alternative in the year 2030, with the same off-site land use and roadway assumptions as the No Project Alternative.

- **Cumulative conditions – Reduced Hillside Development (RHD) Alternative** – This scenario assumes full development of the Reduced Hillside Development Alternative in the year 2030, with the same off-site land use and roadway assumptions as the No Project Alternative.

3A.15.1 AFFECTED ENVIRONMENT

The site location and surrounding roadway network are shown in Exhibit 3A.15-1. The SPA is in unincorporated Sacramento County, and is generally bounded by U.S. Highway 50 (U.S. 50) to the north, White Rock Road to the south, Prairie City Road to the west and the El Dorado County line to the east. Annexation into the City of Folsom would be a part of the project. Detailed traffic analyses were performed for the intersections, roadway segments, freeway facilities, and interchanges shown in Table 3A.15-1. The study roadway segments, intersections, and freeway facilities identified for inclusion in this analysis were selected in consultation with City of Folsom, City of Rancho Cordova, Sacramento County, El Dorado County and Caltrans staff members.

Notes: SR = State Route; U.S. 50 = U.S. Highway 50

Source: Data provided by DKS Associates in 2006–2007

EXISTING ROADWAY NETWORK

Exhibit 3A.15-1 shows the surface roadways in the vicinity of the SPA and the number of lanes on each roadway. Intersection lane configurations and traffic control devices for the existing roadway network were obtained during a field visit to the project study area in fall 2007. The lane configurations are shown in Exhibits 3A.15-2 through 3A.15-6. A brief description of each of the key roadways in the project study area is provided below.

U.S. Highway 50

U.S. Highway 50 (U.S. 50) is an east-west freeway that extends from the Interstate 80 (I-80) junction in West Sacramento to Canal Street in the City of Placerville, where it continues as a highway across the Sierra Nevada to South Lake Tahoe and Nevada. West of Sunrise Boulevard it is an eight lane freeway. Between Sunrise Boulevard and Folsom Boulevard it has six mixed flow lanes and two High Occupancy Vehicle (HOV) lanes (carpool lanes). Between Folsom Boulevard and El Dorado Hills Boulevard U.S. 50 has four mixed flow lanes and two HOV lanes. East of El Dorado Hills Boulevard it has four mixed flow lanes.

Prairie City Road

Prairie City Road is a north-south arterial that extends from Blue Ravine Road (north of Blue Ravine Road it is called Sibley Street) to White Rock Road. It is a five lane urban arterial road between Blue Ravine Road and Iron Point Road. Prairie City Road is a six lane urban arterial road between Iron Point Road and U.S. 50. It is a two lane rural road between U.S. 50 and White Rock Road.

Scott Road

Scott Road is a north-south two lane rural road that extends from U.S. 50 at East Bidwell Street to White Rock Road. Another segment of Scott Road extends southerly from White Rock Road to Latrobe Road.

Placerville Road

Placerville Road is a two lane north-south rural road that extends from East Bidwell Street to White Rock Road, where it continues as Payen Road.

White Rock Road

White Rock Road is an east-west arterial that extends from International Drive in Rancho Cordova to Silva Valley Road in El Dorado County. It is a two lane rural road between Sunrise Boulevard in Rancho Cordova and Carson Crossing Road in El Dorado County. It is a two lane urban arterial road between Carson Crossing Road and Silva Valley Road, with a four lane section between Manchester Drive and Latrobe Road.

Blue Ravine Road

Blue Ravine Road is a southwest-northeast arterial that extends from Folsom Boulevard to East Natoma Street, where it becomes Green Valley Road. It is a six lane arterial road between Folsom Boulevard and Prairie City Road. It is a four lane urban arterial road between Prairie City Road and East Natoma Street.

East Bidwell Street

East Bidwell Street is a northwest-southeast arterial that extends from Riley Street to U.S. 50, where it becomes Scott Road. It is a four lane urban arterial road between Riley Street and Oak Avenue Parkway. It is a five lane urban arterial road between Oak Avenue Parkway and Clarksville Road – Scholar Road. It is a six lane arterial road between Clarksville Road – Scholar Road and U.S. 50.

Folsom Boulevard

Folsom Boulevard is a four lane east-west arterial road that extends from the City of Sacramento to Greenback Lane, where it becomes Folsom Auburn Road. In the City of Folsom, between U.S. 50 and Greenback Lane, it has a generally north-south alignment.

Oak Avenue Parkway

Oak Avenue Parkway is a north-south arterial that extends from Willow Creek Drive to Iron Point Road. It is a four lane urban arterial road between Willow Creek Drive and Blue Ravine Road. It is a six lane urban arterial road between Blue Ravine Road and Riley Street. It is a four lane urban arterial road between Riley Street and Iron Point Road.

Broadstone Parkway

Broadstone Parkway is a four lane east-west arterial that extends from Iron Point Road to Empire Ranch Road. It has six through lanes at the East Bidwell Street intersection.

Empire Ranch Road

Empire Ranch Road is a four lane north-south arterial that extends from East Natoma Street (it continues north as Sophia Parkway is El Dorado County) to Iron Point Road.

Iron Point Road

Iron Point Road is an east-west arterial that extends from Folsom Boulevard to the El Dorado County Line. It is a six lane urban arterial road between Folsom Boulevard and Black Diamond Road. It is a four lane urban arterial road between Black Diamond Road and Prairie City Road. Iron Point Road is a six lane urban arterial road between Prairie City Road and Buckingham Way. It is a four lane urban arterial road between Buckingham Way and Broadstone Parkway. Iron Point Road is a six lane urban arterial road between Broadstone Parkway and Carpenter Hill Road. It is a four lane urban arterial road between Carpenter Hill Road and the El Dorado County Line.

Sunrise Boulevard

Sunrise Boulevard is a north-south arterial that extends from I-80 in Placer County to Grant Line Road. It is a six lane urban arterial road from north of Greenback Lane to Douglas Road. It is a five lane urban arterial road between Douglas Road and Kiefer Road. It is a two lane rural road between Douglas Road and Grant Line Road.

Hazel Boulevard

Hazel Boulevard is a north-south arterial that extends from the Placer county line (where it continues north as Sierra College Boulevard) to Folsom Boulevard. It is a four lane urban arterial road from Sierra College Boulevard to Gold Country Boulevard. It is a six lane urban arterial road between Gold Country Boulevard and U.S. 50. It is a four lane urban arterial road between U.S. 50 and Folsom Boulevard.

Grant Line Road

Grant Line Road is a southwest-northeast two lane rural road that extends from State Route 99 freeway in Elk Grove to White Rock Road.

El Dorado Hills Boulevard

El Dorado Hills Boulevard is an El Dorado County north-south arterial that extends from Green Valley Road, where it continues as Salmon Falls Road, to U.S. 50, where it continues as Latrobe Road. It is a six lane urban arterial road between Serrano Parkway and U.S. 50.

Latrobe Road

Latrobe Road is an El Dorado County north-south arterial that extends from U.S. 50, where it continues as El Dorado Hills Boulevard, to State Route 16. It is a six lane urban arterial road between U.S. 50 and White Rock Road. Latrobe Road is a four lane urban arterial road between White Rock Road and Suncast Lane. It is a two lane urban road from Suncast Lane to Investment Boulevard and a two lane rural road south of Investment Boulevard.

EXISTING TRAFFIC VOLUMES

DKS Associates conducted traffic counts in June 2006 and in November 2007, to determine a.m. and p.m. peak-period intersection turning volumes in the project study area. Average daily traffic (ADT) counts collected by Sacramento County between 2005 and 2007 were used. Freeway traffic count data was gathered from previous studies, including the Easton Glenborough Specific Plan EIR and the U.S. 50 Auxiliary Lanes Project Study Report (PSR). Traffic counts were gathered for all roadway segments and intersections in the project study area. The existing intersection volumes are shown in Exhibits 3A.15-2 through 3A.15-6. ADT volumes for existing roadways are presented in Exhibit 3A.15-7. Freeway volumes are illustrated in Exhibit 3A.15-8.

EXISTING TRANSIT SERVICE

Sacramento Regional Transit (RT) operates bus and light-rail transit (LRT) service in Sacramento County. The City of Folsom provides local bus transit within the City. El Dorado County Transit provides commuter bus transit. The existing transit services near the SPA are described below and are shown in Exhibit 3A.15-9.

Fixed-Route Bus Service

There is no regular fixed route bus service in the project area. Fixed-route bus service is provided north of the SPA. Folsom Stage Line Route 10 provides service along Iron Point Road between Folsom Boulevard and East Bidwell Street. El Dorado County Transit's Iron Point Connector operates along U.S. 50 and Iron Point Road during weekday peak periods only. The following describes these individual routes in greater detail.

- **Folsom Stage Line Route 10** provides service between the intersection of Main Street and Madison Avenue, and the Iron Point Road light-rail station. Weekday service is provided between 6:41 a.m. and 9:08 p.m. on a 60-minute headway. ("Headway" is the amount of time between buses. For example, if a bus on the same route arrives at a given stop every 60 minutes, it is operating on a 60-minute headway.) No Saturday, Sunday or holiday service is provided.

- **El Dorado County Transit's Iron Point Connector** provides fixed-route service between Placerville and the Iron Point Road light-rail station on weekdays only. The route operates between 5:40 a.m. and 7:27 p.m. on a 120-minute headway. No Saturday, Sunday or holiday service is provided.

Light-Rail Transit Service

LRT service is provided from downtown Sacramento along the Folsom Boulevard / U.S. 50 corridor to the Historic Folsom light-rail station, with stops at Glenn Drive, Iron Point Road, Hazel Avenue and Sunrise Boulevard in the project vicinity. During peak periods, service runs every half hour east of the Sunrise Boulevard

station and every 15 minutes west of the Sunrise Boulevard station. The trains run from 5:00 AM to 7:00 PM east of the Sunrise Boulevard station and 5:00 AM to 12:00 AM west of the Sunrise Boulevard station.

EXISTING BICYCLE AND PEDESTRIAN SYSTEM

There are no existing bicycle or pedestrian facilities in the project area. There is a sidewalk on the south side of White Rock Road just east of the El Dorado County line. All City of Folsom roadways in the study have sidewalks, and all City of Folsom major streets have bike lanes.

EXISTING TRAFFIC CONDITIONS

Existing operations of roadways, intersections, freeway facilities, and bicycle/pedestrian facilities in the project study area are discussed below.

Analysis Methodology

The operations of roadway facilities are described in terms of level of service (LOS). LOS is a qualitative description of traffic flow based on factors such as speed, travel time, delay, freedom to maneuver, volume, density, and capacity. Six levels are defined, from LOS A, as the best operating conditions, to LOS F, or the worst operating conditions. LOS E represents "at-capacity" operations. When volumes exceed capacity, stop-and-go conditions result and operations are designated as LOS F.

Level of Service Standards

For roadways within the City of Folsom's existing boundaries (north of U.S. 50), LOS C is considered the minimum acceptable operating condition. For roadways within the project boundaries (south of U.S. 50), LOS D conditions can be considered acceptable if improvements required to meet LOS C exceeds the City's "normally accepted maximum" improvements.

For roadways under the jurisdiction of Sacramento County, LOS E is considered the minimum acceptable operating condition within the Urban Service Area. Outside the Urban Service Area, LOS D is considered the minimum acceptable operating condition.

For roadways under the jurisdiction of the City of Rancho Cordova, LOS D is considered the minimum acceptable operating condition.

For roadways under the jurisdiction of El Dorado County, LOS E is considered the minimum acceptable operating condition.

The standards for Caltrans' facilities in the study area are detailed in the U.S. 50 Corridor System Management Plan (CSMP) and the SR 16 Route Concept Report. The 20-Year Concept LOS for U.S. 50 in the study area is LOS F, because improvements necessary to improve the LOS to E are not feasible due to environmental, right-of-way, financial, and other constraints. For SR 16, LOS E is considered the minimum acceptable operating condition.

Signalized Intersections

Signalized intersections in the City of Folsom and in El Dorado County were analyzed using the methodology contained in Chapter 16 of the *Highway Capacity Manual* (Transportation Research Board 2000) consistent with the El Dorado County Guidelines. The LOS rating is based on the average control delay expressed in seconds per vehicle, as shown in Table 3A.15-2.

Table 3A.15-2
Definitions of Intersection Levels of Service

Level of Service	Description	Unsignalized Intersection Control Delay (sec/veh)	Signalized Intersection Control Delay (sec/veh)	Signalized Intersection Volume-to-Capacity Ratio
A	Represents free flow. Individual users are virtually unaffected by others in the traffic stream.	≤ 10.0	≤ 10.0	≤ 0.60
B	Stable flow, but the presence of other users in the traffic stream begins to be noticeable.	10.1—15.0	10.1—20.0	0.61—0.70
C	Stable flow, but the beginning of the range of flow in which the operation of individual users becomes significantly affected by interactions with others in the traffic stream.	15.1—25.0	20.1—35.0	0.71—0.80
D	Represents high-density, but stable flow.	25.1—35.0	35.1—55.0	0.81—0.90
E	Represents operating conditions at or near the capacity level.	35.1—50.0	55.1—80.0	0.91—1.00
F	Represents forced or breakdown flow.	> 50.0	> 80.0	> 1.00

Note: sec/veh = seconds per vehicle
Sources: Transportation Research Board 1980, 2000

Signalized intersections in Sacramento County and in the City of Rancho Cordova were analyzed using the methodology contained in *Interim Materials on Highway Capacity* (Circular 212) (Transportation Research Board 1980), consistent with the Sacramento County Guidelines. This methodology determines the intersection LOS by comparing the critical volume to capacity (V/C) ratio at the intersection to the thresholds shown in last column of Table 3A.15-2. Because the County Guidelines specify higher capacities (based on field measurements) than those originally published in Circular 212, the capacities at signalized intersections were increased as follows:

- Four or more critical-phase operations: from 1,375 to 1,500 vehicles per lane per hour
- Three critical-phase operations: from 1,425 to 1,550 vehicles per lane per hour
- Two critical-phase operations: from 1,500 to 1,650 vehicles per lane per hour

Unsignalized (Stop-Controlled) Intersections

For unsignalized (four-way stop-controlled and side-street stop-controlled) intersections, the LOS analysis was conducted using the methodology contained in Chapter 17 of the *Highway Capacity Manual* (Transportation Research Board 2000). The LOS rating is based on the control delay expressed in seconds per vehicle. At two-way or side-street stop-controlled intersections, LOS is calculated for the stopped movements (worst movement reported and evaluated), not for the intersection as a whole. For approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. At all-way stop-controlled intersections, LOS is based on the average delay experienced on all approaches. Table 3A.15-2 summarizes the relationship between delay and LOS for unsignalized intersections.

Roadway Segments

Roadway segments were analyzed by comparing the ADT volume to daily volume thresholds. Table 3A.15-3 displays the daily volume thresholds for various facility types. These thresholds were used as guidelines to determine the need for new or upgraded facilities. In general, analysis of intersection operations provides a more realistic assessment of traffic conditions on a road than analysis of roadway segments.

Table 3A.15-3
Daily Volume Thresholds for Roadway Segments[1]

Facility Type	Number of Lanes	Daily Volume Threshold (Level of Service)				
		LOS A	LOS B	LOS C	LOS D	LOS E
Residential	2	600	1,200	2,000	3,000	4,500
Residential local road with frontage	2	1,600	3,200	4,800	6,400	8,000
Residential local road without frontage	2	6,000	7,000	8,000	9,000	10,000
Secondary road, low access control	2	9,000	10,000	12,000	13,500	15,000
	4	18,000	21,000	24,000	27,000	30,000
	6	27,000	31,500	36,000	40,500	45,000
Secondary road, moderate access control	2	10,800	12,600	14,400	16,200	18,000
	4	21,600	25,200	28,800	32,400	36,000
	6	32,400	37,800	43,200	48,600	54,000
Secondary road, high access control	2	12,000	14,000	16,000	18,000	20,000
	4	24,000	28,000	32,000	36,000	40,000
	6	36,000	42,000	48,000	54,000	60,000
Rural, two-lane highway	2	2,400	4,800	7,900	13,500	22,900
Rural, two-lane road, paved shoulders	2	2,200	4,300	7,100	12,200	20,000
Rural, two-lane road, no shoulders	2	1,800	3,600	5,900	10,100	17,000
Expressway[2]	6	24,300	39,720	56,700	72,900	81,000

Note: LOS = level of service

Freeway Mainline Segments

A freeway mainline segment analysis was conducted based on a regular lane capacity of 2,200 vehicles per hour per lane and a calculated auxiliary lane capacity. This methodology was chosen because it is the analysis methodology typically used to evaluate development impacts to state freeways within the region, and is based on values calibrated to match observations by Caltrans. The freeway mainline capacity has been utilized in various studies in the U.S. 50 Corridor, including the U.S. 50 Major Investment Study (1997). The auxiliary lane capacity for each individual auxiliary lane was calculated based on the length and weaving volume using the methodology from the Traffic Operations Report for U.S. 50 Auxiliary Lane Project (2007). The process in that study was based on the weaving analysis in Chapter 24 of the Highway Capacity Manual (HCM), modified to estimate capacity of auxiliary lanes over 2,500 feet. Table 3A.15-4 summarizes the relationship between volume to capacity ratio and LOS for freeway mainline segments.

Freeway Ramp Merge, Diverge, and Weave Analysis

Freeway ramp junctions (merge / diverge) and weaving area analyses were conducted at area interchanges using the 2000 Highway Capacity Software package. The software is consistent with the methodologies contained in Chapters 24 and 25 of the *Highway Capacity Manual* (Transportation Research Board 2000). This methodology was chosen because it is the analysis methodology typically used by Caltrans for analysis of freeway-ramp merge, diverge, and weave maneuvers and because it correlates the LOS to the expected density of vehicles in passenger cars per mile per lane. Table 3A.15-5 summarizes the relationship between density and LOS for freeway ramp junctions and weaving areas.

Table 3A.15-4 Definitions of Freeway Mainline Segment Levels of Service	
Level of Service	Volume/Capacity[1]
A	< 0.32
B	> 0.32 and < 0.53
C	> 0.53 and < 0.74
D	> 0.74 and < 0.90
E	> 0.90 and < 1.00
F	> 1.00
Note: Volume/Capacity = Volume to Capacity ratio Source: Transportation Research Board,2000	

Table 3A.15-5 Definitions of Freeway Ramp Merge / Diverge and Weaving Levels of Service		
Level of Service	Merge / Diverge Density (pc/mi/ln)[1]	Freeway Weaving Segment Density (pc/mi/ln)[1]
A	≤ 10.0	≤ 10.0
B	> 10.0 – 20.0	> 10.0 – 20.0
C	> 20.0 – 28.0	> 20.0 – 28.0
D	> 28.0 – 35.0	> 28.0 – 35.0
E	> 35.0	> 35.0
F	Demand exceeds capacity	Demand exceeds capacity

City of Folsom

Study Intersections

The existing peak-hour traffic volumes, traffic control, and intersection lane configurations shown in Exhibit 3A.15-2 were used to calculate LOS at the study intersections. Table 3A.15-6 summarizes intersection LOS under existing conditions in the City of Folsom.

The following intersections operate at an unacceptable LOS D, LOS E or LOS F during both the a.m. and p.m. peak traffic hours:

- Folsom Boulevard / Blue Ravine Road
- Prairie City Road / White Rock Road

The following intersections operate at an unacceptable LOS D, LOS E or LOS F during only the a.m. or p.m. peak traffic hour:

- Sibley Street / Blue Ravine Road
- East Bidwell Street / Iron Point Road

Table 3A.15-6

Sacramento County

Study Intersections

Table 3A.15-7 summarizes intersection LOS under existing conditions in Sacramento County.

The following intersections operate at an unacceptable LOS F during only the p.m. peak traffic hour:

- Hazel Avenue / Gold Country Boulevard
- Grant Line Road / White Rock Road

Table 3A.15-7
Intersection Levels of Service — Existing Conditions – Sacramento County

Intersection	Control	A.M. Peak Hour		P.M. Peak Hour

Roadway Segments

Table 3A.15-8 presents the existing conditions analysis for Sacramento County roadway segments in the project study area.

The following roadway segments operate at an unacceptable LOS F (or LOS E outside the Urban Limit Line):

- Hazel Avenue between Greenback Lane and Gold Country Boulevard
- Jackson Road between Grant Line Road and Dillard Road (outside the Urban Limit Line)

City of Rancho Cordova

Study Intersections

Table 3A.15-9 summarizes intersection LOS under existing conditions in the City of Rancho Cordova.

All of the intersections operate at an acceptable LOS D or better during both the a.m. and p.m. peak traffic hour.

Table 3A.15-8
Roadway Levels of Service — Existing Conditions – Sacramento County

Roadway Segment	Existing Conditions			
	Lanes	Volume	V/C	LOS
1. Folsom Boulevard—Sunrise Boulevard to Mercantile Drive	4	19,900	0.55	A

Caltrans Facilities

Study Intersections

Table 3A.15-12 summarizes intersection LOS under existing conditions on Caltrans facilities.

The following intersection operates at an unacceptable LOS F during both the a.m. and p.m. peak traffic hours:

- Hazel Avenue / Tributary - WB U.S. 50 ramps

The following intersection operates at an unacceptable LOS F during only the a.m. peak traffic hour:

- Grant Line Road / Jackson Highway (State Route 16)

The following intersection operates at an unacceptable LOS F during only the p.m. peak traffic hour:

- Hazel Avenue / EB U.S. 50 ramps

Table 3A.15-12
Intersection Levels of Service — Existing Conditions – Caltrans

Intersection	Control	A.M. Peak Hour		P.M. Peak Hour	
		Delay[1]	LOS	Delay	LOS
1. Hazel Avenue / Tributary - WB U.S. 50 ramps	Signalized	**>80.0**[2]	**F**	**>80.0**[2]	**F**
2. Hazel Avenue / EB U.S. 50 ramps	Signalized	21.6	C	**>80.0**[2]	**F**
3. Folsom Boulevard / WB U.S. 50 ramps	Signalized	8.8	A	9.0	A
4. Folsom Boulevard / EB U.S. 50 ramps	Signalized	21.7	C	34.2	C
5. Prairie City Road / WB U.S. 50 ramps	Signalized	20.7	C	12.8	B
6. Prairie City Road / EB U.S. 50 ramps	Signalized	17.7	B	17.3	B
7. East Bidwell Street / WB U.S. 50 ramps	Signalized	19.8	B	24.2	C
8. East Bidwell Street / EB U.S. 50 ramps	Signalized	18.0	B	17.4	B
9. El Dorado Hills Blvd / WB U.S. 50 ramps	Signalized	42.9	D	25.1	C
10. El Dorado Hills Blvd / EB U.S. 50 ramps	Signalized	35.7	D	33.3	C
11. Sunrise Boulevard / Jackson Highway	Signalized	58.4	E	39.8	D
12. Grant Line Road / Jackson Highway	Signalized	**87.1**	**F**	76.0	E

Notes:
LOS = level of service; SR = State Route; U.S. 50 = U.S. Highway 50;
[1] Average intersection delay reported in seconds per vehicle.
[2] Operations are worse at these ramp terminal intersections than reflected in the LOS analysis. LOS is based on vehicles that get through the intersections. Because of upstream and downstream congestion, fewer cars get through the intersection, which yields a better LOS.
Bold indicates deficiency.
Source: Data provided by DKS Associates in 2009

Analyses of Freeway Mainline Segments

The results of the analyses of freeway mainline segments are summarized in Table 3A.15-13.

The following mainline freeway segments operate at an unacceptable LOS F:

- Eastbound U.S. 50
  - Folsom Boulevard to Prairie City Road—p.m. peak hour only
  - Prairie City Road to E. Bidwell Street–Scott Road—p.m. peak hour only
  - El Dorado Hills Boulevard–Latrobe Road to Bass Lake Grade—p.m. peak hour only

- Westbound U.S. 50
  - El Dorado Hills Boulevard to E. Bidwell Street—a.m. peak hour only
  - Prairie City Road to Folsom Boulevard—a.m. peak hour only
  - Hazel Avenue to Sunrise Boulevard—a.m. peak hour only
-

Analyses of Freeway-Ramp Merge, Diverge, and Weave Maneuvers

The results of the analyses of freeway-ramp merge, diverge, and weave maneuvers are summarized in Table 3A.15-14.

The merge, diverge, and weave maneuvers for the following on- and off-ramps are operating at LOS F, where demand exceeds capacity based on *Highway Capacity Manual* (HCM) methodology:

- Eastbound U.S. 50
  - Hazel Avenue direct off-ramp — p.m. peak hour only
  - Folsom Boulevard on-ramp — p.m. peak hour only
  - Prairie City Road off-ramp — p.m. peak hour only
  - Prairie City Road flyover on-ramp — p.m. peak hour only
  - E. Bidwell Street - Scott Road direct off-ramp — p.m. peak hour only
  - El Dorado Hills Boulevard - Latrobe Road on-ramp — p.m. peak hour only

- Westbound U.S. 50
  - El Dorado Hills Boulevard - Latrobe Road off-ramp — a.m. peak hour only
  - El Dorado Hills Boulevard - Latrobe Road on-ramp— a.m. peak hour only
  - E. Bidwell Street - Scott Road direct off-ramp— a.m. peak hour only
  - E. Bidwell Street - Scott Road direct on-ramp— a.m. peak hour only
  - Prairie City Road direct off-ramp— a.m. peak hour only
  - Folsom Boulevard off-ramp— a.m. peak hour only
  - Hazel Avenue direct on-ramp— a.m. peak hour only

Table 3A.15-13
Levels of Service for Freeway Mainline Segments — Existing Conditions

Segment	A.M. Peak		P.M. Peak	
	V/C[1]	LOS	V/C[1]	LOS
Eastbound U.S. 50				
Zinfandel Drive to Sunrise Boulevard	0.72	C	0.99	E
Sunrise Boulevard to Hazel Avenue	0.64	C	0.94	E
Hazel Avenue to Folsom Boulevard	0.72	C	0.96	E
Folsom Boulevard to Prairie City Road	0.67	C	**1.12**	**F**

3A.15.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

There are no Federal plans, policies, regulations, or laws related to traffic and transportation that apply to the project or alternatives under consideration. Federal regulations that apply to traffic and transportation are administered by Caltrans and local jurisdictions.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

Caltrans policies are applicable to the project and alternatives under consideration and are summarized in Caltrans' *Guide for the Preparation of Traffic Impact Studies* (Caltrans 2002). These guidelines identify circumstances under which Caltrans believes that a traffic impact study would be required, information that Caltrans believes should be included in the study, analysis scenarios, and guidance on acceptable analysis methodologies.

The standards for Caltrans' facilities in the study area are detailed in the U.S. 50 Corridor System Management Plan (CSMP) and the SR 16 Transportation Concept Report.

The U.S. 50 CSMP has been developed to plan and manage transportation in the corridor across modes and jurisdictional boundaries. The CSMP outlines a foundation to support the partnership based, integrated corridor management of all travel modes (transit, cars, trucks, bicycles) and infrastructure (rail tracks, roads, highways, information systems, bike routes), to provide mobility in the most efficient and effective manner possible. This approach brings facility operations and transportation service provision together with capital projects into a coordinated system management strategy that focuses on high demand travel corridors such as U.S. 50. The 20-Year Concept LOS for U.S. 50 in the study area is LOS F, because improvements necessary to improve the LOS to E are not feasible due to environmental, right-of-way, financial, and other constraints.

According to the SR 16 Transportation Concept Report, SR 16 in the project study area has a concept LOS E.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Metropolitan Transportation Plan for 2035 (MTP 2035)

The MTP 2035 (SACOG 2007) is a long-range planning document for identifying and programming roadway improvements throughout the Sacramento region based on projections for growth in population, housing and jobs. Federal law requires the MTP to conform to air quality goals for the region, satisfy financial constraints such that all proposed projects can be reasonably funded, and undergo extensive public review. State law further requires the MTP process include careful environmental analysis and review.

City of Folsom General Plan

Goals and policies of the City General Plan relating to traffic and transportation that the City has found to be applicable to the project are listed below:

GOAL 17: To develop a comprehensive transportation / circulation system which includes as a minimum:

1. Freeways, highways, and/or expressways designed to route through-traffic away from Folsom's neighborhoods.

2. Arterial roads which provide access among Folsom's neighborhoods, major cross-town links, and links between Folsom and adjacent communities.

3. Additional crossing(s) over the American River.

4. Pathways and designated route for bicycle and pedestrian traffic.

5. Designated routes for commercial vehicles.

6. The protection of residential neighborhoods from through-traffic.

7. Public transportation routes.

- **Policy 17.1:** The City shall plan for an integrated circulation system which provides for travel by private vehicles, commercial vehicle routes, a public transportation system, and for pedestrian and bicycle routes.

- **Policy 17.2:** The City should establish a hierarchy of roads consisting of the following:

    1. **Freeways or limited access highways.** Such roads shall be grade separated at each intersection with another road. The major purpose of such roads is to route traffic around Folsom, with as few interruptions to the surface street system as possible. U.S. Highway 50 currently meets the definition of a freeway. The City has made a firm commitment that a new freeway would not bisect the city.

    2. **Expressways.** Allow for moderate- to high-speed travel within the City. The purpose of an expressway is to carry cross-town traffic from other communities or between neighborhoods within the City. An expressway may contain some grade-separated intersections, but this type of road would be mainly a surface street. Expressways should be located to allow for controlled intersections spaced at one-half mile intervals or more. Only arterial and collector roads should intersect with an expressway.

    3. **Arterial roads (or major streets).** Serve to connect neighborhoods within the City and the City with surrounding communities. Arterials would normally define the boundaries of neighborhoods, not provide internal access to a neighborhood.

    4. **Collector (or secondary) roads.** Serve to route traffic from local streets within a neighborhood to an arterial road. Collector streets would not normally serve as "through" roads for more than one area, but would circulate throughout a neighborhood.

    5. **Local (or tertiary) roads.** Serve a portion of a neighborhood only and route traffic to a collector street.

    6. **Street-ends (cul-de-sacs, dead end streets, etc.).** Limited in length and serve only a few residences.

- **Policy 17.3:** Arterial roads serving new developments shall be aligned with arterial roads whenever possible.

- **Policy 17.9:** The City should plan for the expansion of future public transit routes (bus and fixed rail service).

    1. Transit routes should coincide with major destinations for employment and shopping, the location of major institutions, concentrations of multifamily housing, and other land uses likely to attract public transit ridership.

    2. The City should preserve existing railroad rights-of-way for their potential future use as public transit routes.

    3. Bus routes should follow major roads with service to residential neighborhoods via collector streets.

- **Policy 17.10:** The City should develop and maintain a bikeway and pedestrian master plan that links residential developments with sources of employment, public open space, parks, schools, neighborhood

shopping areas, the central commercial district, other major recreational destinations, and adjoining communities.

1. The City should ensure that new residential developments incorporate pedestrian and bicycle paths or routes when there are nearby schools, parks, public open spaces, sources of employment or other destinations for such travel. Such paths or routes should be designed so that schools and parks accessible to area residents. Pedestrian / bicycle over- and under-crossings may be provided when necessary to cross arterial roads or expressways.

3. The City should establish and maintain an internal pathway system that links parks sources of employment and public open spaces using right-of-way and parkways.

4. Where on-street bikeways are not feasible, the City should provide for Class I off-street bikeways.

5. The City should endeavor to provide routes for recreational travel, providing access to important recreational areas of the City, including Folsom Lake.

- **Policy 17.16:** The City shall designate locations for park and ride lots and adopt standards for their development. Several such lots are designated on the Plan Map and dedication of land for each site shall be required as part of the approval process for developing of adjoining parcels.

- **Policy 17.17:** The City should strive to achieve at least a traffic Level of Service "C" throughout the City. During the course of the Plan buildout it may occur that temporary higher Level of Service results where roadway improvements have not been adequately phased as development proceeds. However, this situation will be minimized based on annual traffic studies as approved by the City of Folsom and Monitoring programs. Resolution No. 3798.

- **Policy 17.18:** The City will work with the California Department of Transportation in planning for and funding freeway interchange improvements and additional interchanges along U.S. Highway 50. A specific study should be prepared by the City to determine the required phasing of construction of freeway and interchange improvements based upon buildout of land uses designated on the Plan Map.

- **Policy 17.19:** Because the Traffic Studies upon which this Circulation Element are based shows various intersections which will not achieve Level of Service "C", the City should adopt a mandatory TSM program that applies to existing as well as future development and will ensure the assumed reduction in peak hour trips. Prior to adoption of the Program by the City, all discretionary development permits issued by the City should require the applicants to participate in the TSM program when enacted. Specific Studies should be conducted to determine the most desirable methods for achieving the required level of trip reduction.

- **Policy 17.22:** The City shall require a minimum two lane arterial roads be installed adjacent to or in the vicinity of new subdivision.

The city plans to update the General Plan following the adoption of this Specific Plan.

The Specific Plan proposes an amended Level of Service policy within the project area (south of U.S. 50) as follows:

> The City should strive to achieve at least a traffic Level of Service "C" within the Folsom South of U.S. 50 Specific Plan. For roadways and intersections within the Specific Plan, LOS "D" conditions may be considered on a case by case basis if improvements required to meet LOS "C" exceeds the "normally accepted maximum" improvements established by the City. Complete Streets principles require that streets and intersections be designed with all transportation modes in mind, and that the road widths, delays, and safety impacts to pedestrians and bicycles make larger roadways and intersections

incompatible with this philosophy. Coupled with the limited reduction in vehicular delay that such improvements would provide, the City has determined that the benefits of excessively wide roadways and intersections do not outweigh the impacts to the community. Therefore, "normally accepted maximum" improvements on arterial roadways include three through-lanes in each direction; and at intersections includes two left-turn lanes, three through-lanes and one right-turn lane on an approach.

Policy 17.17 will not change within the City of Folsom's existing boundaries (north of U.S. 50).

Sacramento County General Plan

Goals and policies of the Sacramento County General Plan relating to traffic and transportation that the Sacramento County has found to be applicable to the project are listed below:

- **Policy CI-2** Sacramento County shall conduct land use and transportation planning with a regional perspective.

- **Policy CI-10;** Sacramento County shall promote and support the network of Transportation Corridors as designated on the Transportation Plan accompanying this Element.

- **Policy CI-14:** Sacramento County shall utilize design and development standards which support travel by transit, walking, bicycling, and clean alternative fuel and low emission vehicles.

- **Policy CI-21:** Incorporate preferential consideration for buses and private HOV's at strategic congestion points (such as bridges and on-ramps) directed at discouraging drive-alone commuting.

- **Policy CI-22:** Sacramento County shall apply the following Level of Service (LOS) standards for planning roads in the unincorporated area:

  - Rural collectors: LOS D
  - Urban area roads: LOS E

  and may proceed with additional capacity projects within the scope of the adopted Transportation Plan when the Board of Supervisors has determined that the implementation of all feasible measures which will reduce travel demand in the affected corridor will not provide the target level of service.

- **Policy CI-24:** Sacramento County shall support a program to develop a regional network of High Occupancy Vehicle (HOV) lanes throughout the urban area that includes provisions to designate existing mixed flow lanes for HOV use.

Sacramento County is in the process of updating the Sacramento County General Plan.

City of Rancho Cordova General Plan

Goals and policies of the City of Rancho Cordova General Plan relating to traffic and transportation that the City of Rancho Cordova has found to be applicable to the project are listed below:

- **Policy C.1.2:** Seek to maintain operations on all roadways and intersections at Level of Service D or better at all times, including peak travel times, unless maintaining this Level of Service would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. Congestion in excess of Level of Service D may be accepted in these cases, provided that provisions are made to improve traffic flow and/or promote non-vehicular transportation as part of a development project or a City-initiated project.

- **Policy C.1.11:** As part of major individual roadway enhancement project (e.g., intersection redesign, signalization of previously un-signalized intersection), enhance and upgrade pedestrian and bicycle facilities within one-quarter mile of the project.

- **Policy C.2.6:** Provide on-street bike lanes along all connector roadways and on local and major roadways when necessary to provide for interconnected routes. On-street bike routes may be provided on local, connector, and major roadways as deemed necessary by the City.

El Dorado County General Plan

Goals and policies of the El Dorado County General Plan relating to traffic and transportation that El Dorado County has found to be applicable to the project are listed below:

- **TC-1:** To plan for and provide a unified, coordinated, and cost-efficient countywide road and highway system that ensures the safe, orderly, and efficient movement of people and goods.

- **TC-X:** To coordinate planning and implementation of roadway improvements with new development to maintain adequate level of service on County roads.

- **TC-Xd:** Level of Service (LOS) for County-maintained roads and state highways within the unincorporated areas of the county shall not be worse than LOS E in the Community Regions or LOS D in the Rural Centers and Rural Regions except as specified in Table TC-2 or, after December 31, 2008, Table TC-3. The volume to capacity ratio of the roadway segments listed in Tables TC-2 and TC-3 as applicable shall not exceed the ratio specified in that Table. Level of Service will be defined in the latest edition of the Highway Capacity manual (Transportation Research Board, National Research Council) and calculated using the methodologies contained in that manual. Analysis periods shall be based on the professional judgment of the Department of Transportation which shall consider periods including, but not limited to, Weekday Average Daily Traffic (ADT), AM Peak Hour, and PM Peak hour traffic volumes.

- **TC-Xe:** For the purpose of this Transportation and Circulation Element, "worsen" is defined as any of the following number of project trips using a road facility at the time of issuance of a use and occupancy permit for the development project:

    - A 2 percent increase in traffic during the a.m. peak hour, p.m. peak hour, or daily, or
    - The addition of 100 or more daily trips,
    - The addition of 10 or more trips during the a.m. peak hour or the p.m. peak hour.

- **TC-4c:** The County shall give priority to bikeways that will serve population centers and destinations of greatest demand and to bikeways that close gaps in the existing bikeway system.

- **TC-4d:** The County shall develop and maintain a program to construct bikeways, in conjunction with road projects, consistent with the County's *Bikeway Master Plan*, taking into account available funding for construction and maintenance.

- **TC-4f:** The County Shall sign and stripe Class II bicycle routes, in accordance with the County's *Bikeway Master Plan*, on roads shown on Figure TC-1, when road width, safety, and operational conditions permit safe bicycle operation.

3A.15.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Roadway Facilities

Because the project and development alternatives under consideration would cause traffic impacts on roadways that are under state, County, and City jurisdictions, this analysis was conducted using a combination of policies and guidelines. The City of Folsom identifies LOS C as its minimum standard for intersection operations within its existing boundaries (north of U.S. 50). For roadways within the project boundaries (south of U.S. 50), LOS D conditions can be considered acceptable if improvements required to meet LOS C exceeds the City's "normally accepted maximum" improvements. Sacramento County identifies LOS E as the minimum acceptable standard for intersection and roadway operations in the project vicinity (except for LOS D outside the Urban Limit Line). The City of Rancho Cordova identifies LOS D as its minimum standard for intersection and roadway operations. El Dorado County identifies LOS E as the minimum acceptable standard for intersection operations in the project vicinity. For state-controlled facilities, thresholds presented in the State's Corridor System Management Plan or Route Concept Report were applied. (The concept service level for SR 16 is LOS E. The concept service level for U.S. 50 is LOS F. For this study, LOS E is applied to U.S. 50 as a conservative approach for identifying impacts).

Signalized Intersections

Based on the Circulation Element/Plan of the City of Folsom General Plan, the Sacramento County Guidelines, the Circulation Element/Plan of the City of Rancho Cordova General Plan, and the El Dorado County DOT traffic impact study protocols and procedures, a signalized-intersection impact at a study intersection is considered significant if the addition of project-generated traffic under the Proposed Project or alternatives under consideration would cause:

- a signalized intersection operating at an acceptable LOS C or better in Folsom to degrade to an unacceptable LOS D, LOS E or LOS F; for intersections within the project boundaries (south of U.S. 50), LOS D conditions can be considered acceptable if improvements required to meet LOS C exceeds the City's "normally accepted maximum" improvements
- an increase in the delay of 5 or more seconds at a signalized intersection in Folsom operating at an unacceptable level (LOS D, E or LOS F);
- a signalized intersection operating at an acceptable LOS D or better in Rancho Cordova to degrade to an unacceptable LOS E or LOS F;
- a signalized intersection operating at an acceptable LOS E or better in Sacramento County to degrade to an unacceptable LOS F; or
- an increase in the V/C ratio of more than 0.05 at a signalized intersection in Rancho Cordova or Sacramento County operating at an unacceptable level (LOS E or LOS F in Rancho Cordova, or LOS F in Sacramento County);
- a signalized intersection operating at an acceptable LOS E or better in El Dorado County Community Region (El Dorado Hills) to degrade to an unacceptable LOS F, or add significantly more traffic to a signalized intersection operating at an unacceptable LOS F (2% increase, or 10 or more peak hour trips).
- a signalized intersection operating at an acceptable LOS E or better at a State Highway interchange (U.S. 50) to degrade to an unacceptable LOS F, or add more traffic to a signalized intersection operating at an unacceptable LOS F (1 or more peak hour trips).

Unsignalized Intersections

Based on the Circulation Element/Plan of the City of Folsom General Plan, the Sacramento County Guidelines, the Circulation Element/Plan of the City of Rancho Cordova General Plan, and the El Dorado County DOT traffic impact study protocols and procedures, an unsignalized-intersection impact at a study intersection is considered significant if the addition of project-generated traffic under the Proposed Project or alternatives under consideration would cause:

- a unsignalized intersection operating at an acceptable LOS C or better in Folsom to degrade to an unacceptable LOS D, LOS E or LOS F;
- an unsignalized intersection in Rancho Cordova operating at an acceptable LOS D or better to degrade to an unacceptable LOS E or LOS F;
- an unsignalized intersection in Sacramento County and inside the Urban Limit Line operating at an acceptable LOS E or better to degrade to an unacceptable LOS F; or outside the Urban Limit Line operating at an acceptable LOS D or better to degrade to an unacceptable LOS E or F; or
- an increase of 5 seconds or more of control delay at an unsignalized intersection operating at an unacceptable level (LOS D, E or LOS F in Folsom, LOS E or LOS F in Rancho Cordova, or LOS F in Sacramento County).
- a unsignalized intersection operating at an acceptable LOS E or better in El Dorado County Community Region (El Dorado Hills) to degrade to an unacceptable LOS F, or add significantly more traffic to a signalized intersection operating at an unacceptable LOS F (2% increase, or 10 or more peak hour trips).

Roadway Segments

Based on the Sacramento County Guidelines and the LOS policy in the Circulation Element/Plan of the City of Rancho Cordova General Plan, a roadway-segment impact is considered significant if the addition of project-generated traffic under the Proposed Project or alternatives under consideration would cause:

- a roadway segment in Rancho Cordova operating at an acceptable LOS D or better to degrade to an unacceptable LOS E or LOS F;
- a roadway segment in Sacramento County and in the Urban Limit Line operating at an acceptable LOS E or better to degrade to an unacceptable LOS F; or a roadway segment in Sacramento County and outside the Urban Limit Line operating at an acceptable LOS D or better to degrade to an unacceptable LOS E or F;
- an increase in the volume-to-capacity (V/C) ratio of more than 0.05 on a roadway segment in Rancho Cordova or Sacramento County operating an unacceptable level (LOS E or LOS F in the Rancho Cordova, or LOS F in Sacramento County inside the Urban Limit Line; or LOS E or F in Sacramento County outside the Urban Limit Line.

Freeway Segments

Based on the Guide for the Preparation of Traffic Impact Studies and the Corridor System Management Plan, a freeway-segment impact is considered significant if the addition of project-generated traffic under the Proposed Project or alternatives under consideration would:

- cause a facility operating at an acceptable level (LOS E) to deteriorate to an unacceptable level (LOS F), or
- increase the volume to capacity ratio by 1% or more on a freeway segment that is operating at an unacceptable level (LOS F).

Freeway Ramp Merge, Diverge, and Weave

Based on the Guide for the Preparation of Traffic Impact Studies and the Corridor System Management Plan, a freeway ramp merge / diverge / weave impact is considered significant if the addition of project-generated traffic under the Proposed Project or alternatives under consideration would:

- cause a facility operating at an acceptable level (LOS E) to deteriorate to an unacceptable level (LOS F), or
- increase the density by 0.1 passenger cars per mile per lane or more at a freeway location that is operating at an unacceptable level (LOS F).

Bicycle, Pedestrian, and Transit Facilities

Bicycle facilities include Class I (off-street facilities), Class II (on-street bicycle lanes identified with signage and markings), and Class III (on-street bicycle routes identified by signage). Pedestrian facilities are composed of paths, sidewalks, and pedestrian crossings. Transit facilities include shuttle services, bus service, BRT, and light-rail facilities.

A bicycle, pedestrian, or transit-facility impact is considered significant if the Proposed Project or alternatives under consideration would do any of the following:

- eliminate or adversely affect an existing bikeway, pedestrian facility, or transit facility in a way that would discourage its use;
- interfere with the implementation of a planned bikeway, planned pedestrian facility or be in conflict with any future transit facility;
- result in unsafe conditions for bicyclists or pedestrians, including unsafe bicycle/pedestrian, bicycle/motor vehicle, pedestrian/motor vehicle, transit/bicycle, transit/pedestrian, or transit/motor vehicle conflict; or
- result in demands to transit facilities greater than available capacity.

The Specific Plan implements General Plan policy 17.13 by incorporating bikeways and lanes. Because the proposed specific plan is consistent with the City's General Plan, the project is expected to have less-than-significant impacts on pedestrian, bicycle, and transit facilities.

ANALYSIS METHODOLOGY

The study roadway segments, intersections, and freeway facilities identified for inclusion in this analysis were developed in consultation with City of Folsom, City of Rancho Cordova, Sacramento County, El Dorado County and Caltrans staff members.

Analysis Scenarios

As described previously in this section, the following scenarios were reviewed at a full and equal level of quantitative analysis:

- Existing conditions – No Project (NP)
- Existing conditions – No USACE Permit (NCP) Alternative
- Existing conditions – Proposed Project (PP) Alternative
- Existing conditions – Resource Impact Minimization (RIM) Alternative
- Existing conditions – Centralized Development (CD) Alternative
- Existing conditions – Reduced Hillside Development (RHD) Alternative

- Cumulative conditions – No Project (NP) Alternative
- Cumulative conditions – No USACE Permit (NCP) Alternative
- Cumulative conditions – Proposed Project (PP) Alternative
- Cumulative conditions – Resource Impact Minimization (RIM) Alternative
- Cumulative conditions – Centralized Development (CD) Alternative
- Cumulative conditions – Reduced Hillside Development (RHD) Alternative

Existing Scenario Land Use

Within the SPA, land use represents the particular alternative being analyzed. For analysis purposes, the Existing No Project Alternative assumes no change in the project area land use from existing conditions (no additional development). In this manner, the Existing No Project Alternative is the same as existing conditions, and comparison to the build alternatives provides a conservative analysis. The No Project Alternative would entail development under the existing AG-80 zoning, which could include up to 44 individual rural residences. However, this traffic conditions associated with this level of development would be very similar to existing conditions for purposes of CEQA impact analysis.

Cumulative Land Use

As discussed previously, the project is anticipated to be completed (built-out) by the year 2030. Land use for the cumulative scenarios is based on the following sources:

- SACOG forecasts – Throughout the region, the starting point for the 2030 land use forecasts is taken from SACOG land use forecasts. Growth to the year 2030 was proportionately calculated from existing land use inventories and SACOG year 2035 forecasts. Unless otherwise replaced as discussed below, these year 2030 estimates are used throughout the region.

- SPA – Within the SPA, land use represents the particular alternative being analyzed. While the Cumulative No Project Alternative includes development under the existing AG-80 zoning which could include up to 44 individual rural residences, no additional development was assumed in the transportation analysis for the no project scenario. This provides a conservative comparision to the build alternatives.

- City of Folsom – Year 2030 land use forecasts within the City of Folsom were derived from the City's General Plan.

- City of Rancho Cordova – Year 2030 land use forecasts within the City of Rancho Cordova were derived from the City's General Plan.

- El Dorado Hills – Within the El Dorado Hills District of El Dorado County, year 2025 forecasts from the El Dorado County General Plan were utilized. Year 2025 is the horizon year of the El Dorado County General Plan.

- Sacramento County – Within the area of the Easton / Glenborough development, year 2030 forecasts were derived from the pertinent Specific Plan. For the Cordova Hills area, a forecast of year 2030 development was estimated based upon an unapproved Phase I plan.

- Rock Quarries – In the year 2030, three rock quarries south of the site are assumed to be fully operational. These quarries are discussed in further detail later in this section.

Existing Scenarios Roadway Networks

The roadway system associated with the project and alternatives was added to the existing roadway system for analysis purposes. The Proposed Project and the build alternatives all include improvements to the Prairie City

Road and East Bidwell Street (Scott Road) interchanges to serve the higher volumes created by the project. They would also include a new extension of Rowberry Drive south across U.S. 50 to Easton Valley Parkway. The Proposed Project and the build alternatives all include the construction of the Oak Avenue Parkway and Empire Ranch Road interchange to provide access to U.S. 50. These interchanges would be fully constructed with auxiliary lanes to the next interchange in both directions, because Caltrans would likely require the auxiliary lanes as part of the new interchanges. The Proposed Project and the build alternatives all include widening White Rock Road to five lanes, with two eastbound and three westbound lanes, between Prairie City Road and Carson Crossing Road. They all also include widening Prairie City Road to six lanes between U.S. 50 and the community park, and widening Prairie City Road to four lanes between the community park and White Rock Road. Exhibit 3A.15-10 shows the assumed roadway network for the existing scenarios with the Proposed Project or build alternative.

Cumulative Scenarios Roadway Networks

The roadway system associated with the Proposed Project and alternatives was added to the cumulative roadway system for analysis purposes. The Proposed Project and the build alternatives all include improvements to the Prairie City Road, Oak Avenue Parkway, East Bidwell Street (Scott Road) and Empire Ranch Road interchanges to serve the higher volumes created by the project. They would also include a new extension of Rowberry Drive south across U.S. 50 to Easton Valley Parkway. The Proposed Project and the build alternatives all include widening White Rock Road to five lanes, with two eastbound and three westbound lanes, between Prairie City Road and Carson Crossing Road. They all also include widening Prairie City Road to six lanes between U.S. 50 and the community park, and widening Prairie City Road to six lanes between the community park and White Rock Road.

Outside the immediate project environs, regional roadways assumed for the cumulative scenarios are consistent with improvements identified in the MTP 2035 (Tier I), depending on the assumed year of completion. Roadway improvements identified in the City's CIP (to be completed before year 2030) were incorporated into the Cumulative Conditions analysis for facilities within the City's current city limit boundary. This assumes that the City's CIP will be fully funded by Year 2030.

Cumulative regional roadway improvements include:

- HOV lanes on U.S. 50 between Watt Avenue and Sunrise Boulevard
- Auxiliary lanes on U.S. 50 between Sunrise Boulevard and Prairie City Road
- HOV, truck climbing and auxiliary lanes on U.S. 50 between El Dorado Hills Boulevard – Latrobe Road and Greenstone Road
- Iron Point Road widened to six lanes from Folsom Boulevard to East Bidwell Street
- East Bidwell Street to six lanes from Blue Ravine Road to U.S. 50
- Hazel Avenue widened to six lanes from Madison Avenue to U.S. 50
- A six lane Hazel Avenue extended from Folsom Boulevard to Easton Valley Parkway
- A six lane Easton Valley Parkway built between Rancho Cordova Parkway and Prairie City Road
- Rancho Cordova Parkway built from a new U.S. 50 interchange to Grant Line Road
- Grant Line Road widened to four lanes

- Douglas Road widened to six lanes
- International Drive extended as a six lane road to White Rock Road east of Rancho Cordova Parkway
- Numerous new roads in Rancho Cordova
- White Rock Road widened to four lanes from Rancho Cordova Parkway to U.S. 50 at the new Silva Valley interchange
- A four lane Saratoga Road extended to Iron Point Road

Exhibit 3A.15-11 shows the assumed roadway network for Cumulative (2030) Conditions and shows the roadway network identified in the City General Plan and the City's CIP.

Travel Forecasts

Impacts on the roadway system for existing and cumulative 2030 conditions were determined by forecasting the increase in daily and peak-hour traffic volumes that would occur with implementation of the project and alternatives. A modified version of the 2008 SACMET regional travel demand forecasting (TDF) model was used to develop daily and a.m. and p.m. peak-hour traffic volume forecasts for the study roadways and intersections. A TDF model is a tool that assigns trips generated by the various land uses to the surrounding roadway network based on the locations of trip attractions and productions. To accomplish this task, the TDF incorporates several types of data, including detailed land use; trip generation characteristics of specific land use types; mode choice propensity based upon user and trip characteristics; roadway, pedestrian, and transit networks; and census information. Using the TDF model for the Folsom South of U.S. 50 Annexation project allowed reasonably foreseeable planned development projects and fully funded roadway improvement projects to be systematically incorporated into traffic forecasting efforts. This approach uses the best available technical tools in the region to develop future forecasts for the project study area.

Within the study environs, the TDF model was modified to improve its local forecasting abilities. Large traffic analysis zones (TAZs) associated with SACOG's regional model were split into smaller zones to better replicate planned travel access patterns, and additional roadway links were added to represent existing and planned roadways.

Cumulative Rock Quarry Truck Traffic

Three rock quarries are proposed for the area south of the SPA, in unincorporated Sacramento County. While Teichert has an existing quarry on Grant Line Road south of White Rock Road, there are currently no quarries south of the SPA. All three proposed rock quarries are expected to be in full operation by the year 2030. The only study of the potential impact of these rock quarry operations that is currently available is the Teichert Quarry Environmental Impact Report. Truck trips generated by these projects, as described by the Teichert Quarry EIR, were added to the forecasted cumulative volumes because these projects are considered reasonably foreseeable. There would not usually be any quarry trucks operating in the PM peak hour; therefore, these truck trips were added to the cumulative daily and AM peak hour volumes. More information about the truck traffic assumption is included later in this section.

Cumulative Transit Conditions

The cumulative transit assumptions are based on a modified version of the transit system in SACOG's 2035 MTP model. Regional Transit's Folsom Light rail line is assumed to have passing tracks added allowing for 15 minute frequency to the Historic Folsom Station. Regional Transit would add several new bus lines to serve the developed area of Easton-Glenborough and southern Rancho Cordova, including Westborough, Rio Del Oro and

Sunridge. Folsom Stage Lines is assumed to add another route by 2030. El Dorado County would add a local El Dorado Hills route.

It is also assumed that the three transit agencies would work together to connect the communities with two new multijurisdictional bus lines. One would run on Folsom Boulevard, Iron Point Road and Saratoga Road. A second would run on White Rock Road. This future transit network, which is assumed to exist without the project, is shown on Exhibit 3A.15-12.

The Proposed Project or any build alternative is assumed to add additional transit services, as shown on Exhibit 3A.15-13. This includes the extension of the BRT system operating on Easton Valley Parkway, from the Hazel Light Rail Station to Prairie City Road, through the project to White Rock Road. The Proposed Project or any build alternative would provide a local circulatory bus within the project area. The City of Folsom would extend or reroute its bus lines to connect the SPA to the current City of Folsom north of U.S. 50. It is likely that RT would extend some of its local Easton-Glenborough lines into the SPA. It is also likely that the interagency White Rock Road bus would be rerouted to pass through the SPA.

Vehicle-Trip Generation Estimates

Table 3A.15-15 summarizes the vehicle-trip generation of the Proposed Project and the build alternatives, based upon cumulative (year 2030) conditions (build-out). Trip generation is shown for the a.m. and p.m. peak hours, as well as on a daily basis.

Table 3A.15-15
Folsom South of U.S. 50 Annexation Area Vehicle-Trip Generation Summary

Development		Total Vehicle Trips[1]		
		A.M. Peak Hour	P.M. Peak Hour	Daily
Proposed Project Specific Plan buildout	Total trips[2]	**14,300**	**18,500**	**202,900**
	Internal trips[3]	3,100	4,000	44,000
	External trips[4]	11,200	14,500	158,900
No USACE Permit Alternative buildout	Total trips[2]	**11,300**	**15,000**	**163,400**
	Internal trips[3]	2,000	2,700	29,300
	External trips[4]	9,300	12,300	134,100
Resource Impact Minimization Alternative buildout	Total trips[2]	**11,300**	**14,700**	**160,700**
	Internal trips[3]	2,200	2,900	31,200
	External trips[4]	9,100	11,800	129,500
Centralized Development Alternative buildout	Total trips[2]	**13,500**	**17,500**	**191,200**
	Internal trips[3]	2,700	3,600	39,000
	External trips[4]	10,800	13,900	152,200
Reduced Hillside Development Alternative buildout	Total trips[2]	**15,800**	**19,900**	**218,500**
	Internal trips[3]	3,500	4,500	49,800
	External trips[4]	12,300	15,400	168,700

Table 3A.15-15 Folsom South of U.S. 50 Annexation Area Vehicle-Trip Generation Summary			
Development	Total Vehicle Trips[1]		
	A.M. Peak Hour	P.M. Peak Hour	Daily

Notes:
1 Trip summary based from the SACMET travel demand forecasting (TDF) model.
2 Represents total vehicle trips generated including trips internal to a traffic analysis zone (TAZ) and trips from one TAZ to another TAZ within the Folsom South of U.S. 50 Annexation area.
3 Represents total vehicle trips generated including trips internal to a traffic analysis zone (TAZ) and trips from one TAZ to another TAZ within the Folsom South of U.S. 50 Annexation area.
4 Represents vehicle trips external to the SPA (trips outside of the Folsom South of U.S. 50 Annexation site). Does not include trips from one TAZ to another TAZ within the Folsom South of U.S. 50 Annexation area.
Source: Data provided by DKS Associates in 2009

Traffic Volume Forecasts

The travel demand model assigned the vehicle trips to the roadway network for each alternative under the existing and cumulative conditions. Existing scenario traffic volume forecasts (peak hour intersection volumes, freeway volumes, and daily segment volumes) are illustrated in Exhibits 3A.15-2 through 3A.15-8, and in Exhibits 3A.15-14 through 3A.15-53. Cumulative scenario traffic volume forecasts (peak hour intersection volumes, freeway volumes, and daily segment volumes) are illustrated in Exhibits 3A.15-54 through 3A.15-100.

IMPACT ANALYSIS

Program level impacts and mitigation measures are presented together in the section below. Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

EXISTING PLUS PROJECT SCENARIOS

The Proposed Project and the build alternatives would cause significant impacts in the City of Folsom, Sacramento County, the City of Rancho Cordova, and El Dorado County and to Caltrans facilities. Tables 3A.15-16 through 3A.15-24 summarize the results of the analyses. There are feasible mitigation measures for all of the impacts; however, the impacts outside of Folsom can only be mitigated with the cooperation of the affected agency. There would be less impacts with the No USACE Permit and the Resource Impact Minimization Alternatives than with the Proposed Project.

Exhibits 3A.15-14 through 19, 3A.15-22 through 27, 3A.15-30 through 35, 3A.15-38 through 43, and 3A.15-46 through 51 present peak-hour traffic volumes, lane configurations, and traffic control under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit alternatives, respectively. Exhibits 3A.15-20, 3A.15-28, 3A.15-36, 3A.15-44, and 3A.15-52 compare ADT volumes under Baseline No Project (NP) conditions with those under the Proposed Project (PP), Resource Impact Minimization (RIM), Centralized Development (CD), Reduced Hillside Development (RHD), and No USACE Permit (NCP) alternatives, respectively. Exhibits 3A.15-21, 3A.15-29, 3A.15-37, 3A.15-45, and 3A.15-53 compare present freeway peak-hour traffic volumes and lane configurations under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit alternatives, respectively.

Notes: LOS = level of service; U.S. 50 = U.S. Highway 50; V/C = volume-to-capacity; Blank = intersection does not exist under this alternative
[1] Average intersection delay reported for signalized intersections, worst-case delay reported for unsignalized, side-street-stop intersections; average intersection delay reported for all-way-stop intersections. All delays are reported in seconds per vehicle.
[2] Intersection signalized as part of proposed project
Bold indicates deficiency. Shaded areas indicate impact.

Notes: LOS = level of service; NA = not applicable – a lane drops at off ramp or adds at on ramp; U.S. 50 = U.S. Highway 50; Blank = ramp does not exist under this alternative
[1] Density in passenger cars per mile per lane for merge/diverge analysis only.
[2] LOS computed using Highway Capacity Software (HCS) 2000 software for the merge/diverge/weave analysis consistent with *Highway Capacity Manual* (HCM) 2000 methodologies.
[3] Where an auxiliary lane begins at an on ramp (as an add lane) or where a auxiliary lane end at an off ramp (as an add lane)
Shaded areas indicate impact where calculation indicates that demand exceeds capacity.
Source: Data provided by DKS Associates in 2009

IMPACT 3A.15-1 Increases to Peak-Hour and Daily Traffic Volumes, Resulting in Unacceptable Levels of Service. *Implementation of development of the Project or build alternatives would cause an increase in a.m. peak-hour, p.m. peak-hour, and/or daily traffic volumes on area roadways, resulting in unacceptable LOS and warranting the need for improvements such as traffic signals and additional lanes.*

NP

Under the Existing No Project Alternative, no development beyond what currently exists is assumed. No off-site water facilities would be constructed. No new trips are generated under this scenario; therefore, there are no intersection, roadway segment, freeway mainline, or ramp merge / diverge / weaving area impacts. These impacts are less than those associated with the Proposed Project.

NCP, PP, RIM, CD, RHD

The sub-impacts and mitigation measures discussed below are specific to individual locations. These locations include only those intersections, roadways, freeway segments and freeway ramps where significant, direct impacts would occur.

Project Participation in Funding Transportation Improvements

a Within the project boundaries and the eastern half of Prairie City Road, the Applicant shall construct all feasible physical improvements necessary and available to reduce the severity of the project's significant transportation-related impacts, which may be subject to fee credits and/or reimbursement, coordinated by the City, from other fee-paying development projects if available with respect to roads or other facilities that would also serve those non-project fee-paying development projects Funding of improvements on the perimeter of the project boundaries will be shared with other development/jurisdictions.

b Outside the project boundaries, the Applicant shall be responsible for the project's fair share of feasible physical improvements necessary and available to reduce the severity of the project's significant transportation-related impacts within the City of Folsom, in other jurisdictions and on State facilities, based on "cumulative plus project conditions." For purposes of this measure, "cumulative plus project conditions" refers to development authorized under the project as well as development consistent with approved general plans, specific plans, and other entitlements in the City and other jurisdictions. In cases where the project's fair share contribution is identified, the share will be based on the project's relative contribution to traffic growth under "cumulative plus project conditions." The project's contribution toward such improvements may take any, or some combination, of the following forms:

1. Construction of roads, road improvements, or other transportation facilities outside the boundaries of the project, subject in some instances to fee credit against other improvements necessitated by the project or future reimbursement, coordinated by the City, from other fee-paying development projects if available where the roads or improvements at issue would also serve those non-project fee paying development projects;

2. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation facilities to be built or improved within the City, consistent with the City's Capital Improvement Program ("CIP");

3. The payment of other adopted regional impact fees that would provide improvements to roadways, intersections and/or interchanges that are affected by multiple jurisdictions, except where the project applicant's payments of other fees or construction of improvements within the City of Folsom creates credit against the payment of regional impact fees;

4. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation facilities and/or improvements within affected jurisdictions outside of Folsom, which payments to the City of Folsom and transmittal of fees to other agencies would occur through one or more enforceable agreements provided that for each required improvement, there is a reasonable mitigation plan that ensures that (i) the fees collected from the project will be used for their intended purposes, and (ii) the improvements will actually be built within a reasonable period of time, and

5. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation facilities and/or improvements on federal or state highways or freeways needed in part because of the project, to be made available to the California Department of Transportation ("Caltrans") if and when Caltrans and the City of Folsom enter into an enforceable agreement consistent with state law provided that, for each required improvement, Caltrans has a reasonable mitigation plan that ensures that (i) the fees collected from the project will be used for their intended purposes, and (ii) the improvements will actually be built within a reasonable period of time.

c In pursuing a single agreement or multiple agreements with any jurisdictions outside of the City of Folsom that will be affected by traffic from the project in order to effectuate proposed mitigation measures for improvements outside the City of Folsom, the City will seek to negotiate in good faith with these other jurisdictions to enter into fair and reasonable arrangements with the intention of achieving, within a reasonable time period after approval of the project's, commitments for (i) the provision of adequate "fair share" mitigation payments from the project for out-of-jurisdiction traffic impacts and impacts on federal and state freeways and highways, and (ii) reciprocal payments from regional development projects to the City of Folsom to address cumulative "fair share" mitigation payments towards federal and state freeways and highways for transportation-related facilities and/or improvements within the City of Folsom necessitated by the development within the region. It is intended that these agreements shall permit the participating agencies flexibility in providing cross-jurisdictional credits and reimbursements consistent with the general "fair share" mitigation standard, and require an updated model run incorporating the best available information in order to obtain the most accurate, up-to-date impact assessment feasible and to generate the most accurate, up-to-date estimates of regional fair share contributions. Best efforts should be made to secure funding from federal, state and regional sources. These agreements, moreover, should also include provisions that allow for periodic updates to the traffic modeling on which fair share payment calculations depend in order to account for (i) newly approved projects cumulatively contributing to transportation-related impacts and that therefore should contribute to the funding of necessary improvements (ii) additional physical improvements necessitated in whole or in part by newly approved projects, (iii) changing cost calculations for the construction of needed improvements based on changes in the costs of materials, labor, and other inputs.

d If transportation improvements required to be constructed as mitigation are constructed prior to project implementation, the project will pay its fair share portion (as defined and explained in subsection [b] above) for those improvements prior to building permit issuance.

e In considering individual projects within the project area (e.g., small-lot tentative subdivision maps or similar discretionary non-residential approvals), the City of Folsom shall identify required improvements, and shall base its calculations for such projects' fair share payments, based on the most recent traffic modeling (i.e., modeling that accounts for (i) newly approved projects cumulatively contributing to transportation-related impacts and that therefore should contribute to the funding of necessary improvements, (ii) additional physical improvements necessitated in whole or in part by newly approved projects, and (iii) changing cost calculations for the construction of needed improvements based on changes in the costs of materials, labor, and other inputs).

The requirement that the Applicant participate in funding transportation improvements outside the City of Folsom would mitigate or substantially lessen the project's significant impact on roadways outside of the City but those

impacts would remain **significant and unavoidable**. This conclusion in part reflects the fact that, even with the installation of proposed improvements, some impacts (addressed specifically below under specific impact categories) will still remain significant because acceptable levels of service will not be achieved. This conclusion also reflects the reality, however, that successful implementation of some of the proposed improvements will require the cooperation of third party agencies (Sacramento and El Dorado Counties, the City of Rancho Cordova, and Caltrans) over which the City of Folsom has no control. For this latter reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CITY OF FOLSOM

IMPACT 3A.15-1a — Unacceptable LOS at the Folsom Boulevard/Blue Ravine Road Intersection (Intersection 1). *Project or build alternative traffic would cause signalized intersection operations at the Folsom Boulevard/Blue Ravine Road intersection to deteriorate with an increase in delay of more than 5 seconds during either or both a.m./p.m. peak hours.*

NCP, PP, RIM, CD, RHD

This intersection operates at an unacceptable LOS D or worse during the a.m. and p.m. peak hours under existing conditions. Delay would increase by more than 5 seconds and **significantly impact** intersection operations during either or both a.m./p.m. peak hours under the project and all build alternatives. The impacts of the build alternatives would be similar to that of the project.

Mitigation Measure 3A.15-1a: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the Folsom Boulevard/Blue Ravine Road Intersection (Intersection 1).

To ensure that the Folsom Boulevard/Blue Ravine Road intersection operates at an acceptable LOS, the eastbound approach must be reconfigured to consist of two left-turn lanes, one through lane, and one right-turn lane. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the Folsom Boulevard/Blue Ravine Road intersection (Intersection 1).

Implementation: City of Folsom Public Works Department.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented and when fair share funding should be paid.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-1a would reduce the significant impact at Intersection 1 under the project and all build alternatives to a **less-than-significant** level. Implementation of the mitigation measure will reduce the a.m. delay to less than five seconds above the existing condition, and reduce the p.m. delay to less than the existing condition.

IMPACT 3A.15-1b Unacceptable LOS at the Sibley Street/ Blue Ravine Road Intersection (Intersection 2). *Project or build alternative traffic would cause signalized intersection operations at the Sibley Street/Blue Ravine Road intersection to deteriorate with an increase in delay of more than 5 seconds during the a.m. peak hour.*

NCP, RIM

The impact at this intersection under the No USACE Permit and Resource Impact Minimization alternatives **is less than significant.** This impact is less than that associated with the project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This intersection operates at an unacceptable LOS D during the a.m. peak hour and at an acceptable LOS C during the p.m. peak hour under existing conditions. Delay would increase by more than 5 seconds and **significantly impact** intersection operations during the a.m. peak hour under the Proposed Project, Centralized Development and Reduced Hillside Development alternatives. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1b: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements at the Sibley Street/Blue Ravine Road Intersection (Intersection 2).

To ensure that the Sibley Street/Blue Ravine Road intersection operates at an acceptable LOS, the northbound approach must be reconfigured to consist of two left-turn lanes, two through lanes, and one right-turn lane. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the Sibley Street/Blue Ravine Road intersection (Intersection 2).

Implementation: City of Folsom Public Works Department.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented and when fair share funding should be paid.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-1b would reduce the significant impact on Intersection 2 under the Proposed Project, Centralized Development, Reduced Hillside Development alternatives to a **less-than-significant** level.

IMPACT 3A.15-1c Unacceptable LOS at the Scott Road (West)/White Rock Road Intersection (Intersection 28). *Unsignalized intersection operations at Scott Road (West)/White Rock Road would degrade to LOS D during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This intersection operates at an acceptable LOS C during the a.m. and p.m. peak hours under existing conditions. Unsignalized intersection operations at Scott Road (West)/White Rock Road would degrade to LOS D during the p.m. peak hour under the project and all build alternatives. This is a **significant impact.** The impacts of these alternatives would be similar to that of the project.

Mitigation Measure 3A.15-1c: The Applicant Shall Fund and Construct Improvements to the Scott Road (West)/White Rock Road Intersection (Intersection 28).

To ensure that the Scott Road (West)/White Rock Road intersection operates at an acceptable LOS, a traffic signal must be installed. The applicant shall fund and construct these improvements.

Implementation: City of Folsom Public Works Department.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-1c would reduce the significant impact on Intersection 28 under the project and all build alternatives to a **less-than-significant** level. Implementation of the mitigation measure will restore the LOS to the existing LOS C condition.

IMPACT 3A.15-1d LOS D at the Scott Road (East)/Easton Valley Parkway Intersection (Intersection 38). *Signalized intersection operations at Scott Road (East)/Easton Valley Parkway would operate at LOS D during the p.m. peak hour.*

NCP, RIM

This intersection would operate at LOS C conditions under the No USACE Permit and Resource Impact Minimization alternatives is **less than significant**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This intersection does not currently exist; however, signalized intersection operations at Scott Road (East)/Easton Valley Parkway would operate at LOS D during the p.m. peak hour under the Proposed Project, Centralized Development, and Reduced Hillside Development alternatives.

The Specific Plan proposes an amended Level of Service policy within the project area (south of U.S. 50) as follows

> The City should strive to achieve at least a traffic Level of Service "C" within the Folsom South of U.S. 50 Specific Plan. For roadways and intersections within the Specific Plan, LOS "D" conditions may be considered on a case by case basis if improvements required to meet LOS "C" exceeds the "normally accepted maximum" improvements established by the City. Complete Streets principles require that streets and intersections be designed with all transportation modes in mind, and that the road widths, delays, and safety impacts to pedestrians and bicycles make larger roadways and intersections incompatible with this philosophy. Coupled with the limited reduction in vehicular delay that such improvements would provide, the City has determined that the benefits of excessively wide roadways and intersections do not outweigh the impacts to the community. Therefore, "normally accepted maximum" improvements on arterial roadways include three through-lanes in each direction; and at intersections includes two left-turn lanes, three through-lanes and one right-turn lane on an approach.

The number of travel lanes on the Scott Road (East)/Easton Valley Parkway intersection approaches would be at the "normally accepted maximum" levels with the project. Thus LOS "D" conditions would be acceptable at this intersection

The impact at this intersection is **less than significant.** The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1e Unacceptable LOS at the Hillside Drive/Easton Valley Parkway Intersection (Intersection 41). *Unsignalized intersection operations at Hillside Drive/Easton Valley Parkway would be at LOS D during both a.m. and p.m. peak hours.*

NCP, PP, RIM, CD

The impact at this intersection under the No USACE Permit, Proposed Project, Resource Impact Minimization, and Centralized Development alternatives is **less than significant**. The impact of these alternatives is similar to that associated with the Proposed Project.

Mitigation Measure: No mitigation measures are required.

RHD

This intersection does not exist currently exist; however, unsignalized intersection operations at Hillside Drive/Easton Valley Parkway would operate at unacceptable LOS D during both a.m. and p.m. peak hours under the Reduced Hillside Development alternative. This impact is greater than the impact of the Proposed Project.

Mitigation Measure 3A.15-1e: Fund and Construct Improvements to the Hillside Drive/Easton Valley Parkway Intersection (Intersection 41).

To ensure that the Hillside Drive/Easton Valley Parkway intersection operates at an acceptable LOS, the eastbound approach must be reconfigured to consist of one dedicated left turn lane and two through lanes, and the westbound approach must be reconfigured to consist of two through lanes and one dedicated right-turn lane. The applicant shall fund and construct these improvements.

Implementation: City of Folsom Public Works Department.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-1e would reduce the significant impact on Intersection 41 under the Reduced Hillside Development alternative to a **less-than-significant** level. Implementation of the mitigation measure will improve operations to a LOS C or better condition.

IMPACT 3A.15-1f Unacceptable LOS at the Oak Avenue Parkway/Middle Road Intersection (Intersection 44). *Unsignalized intersection operations at Oak Avenue Parkway/Middle Road would operate at unacceptable LOS D during either or both a.m./p.m. peak hours.*

NCP, RIM

There is no impact at this intersection under the No USACE Permit and Resource Impact Minimization alternatives. This impact is less than that associated with the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This intersection does not exist currently exist; however, unsignalized intersection operations at Oak Avenue Parkway/Middle Road would operate at unacceptable LOS D during either or both a.m./p.m. peak hours under the Proposed Project, Centralized Development, and Reduced Hillside Development alternatives. This is a **significant impact.** The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1f: Fund and Construct Improvements to the Oak Avenue Parkway/Middle Road Intersection (Intersection 44).

To ensure that the Oak Avenue Parkway/Middle Road intersection operates at an acceptable LOS, control all movements with a stop sign. The applicant shall fund and construct these improvements.

Implementation: City of Folsom Public Works Department.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-1f would reduce the significant impact on Intersection 44 under the Reduced Hillside Development alternative to a **less-than-significant** level. Implementation of the mitigation measure will improve operations to a LOS C or better condition.

SACRAMENTO COUNTY INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-1g Unacceptable LOS at the Hazel Avenue/Gold Country Blvd Intersection (Sacramento County Intersection 1). *Signalized intersection operations at Hazel Avenue/Gold Country Boulevard would deteriorate, with the volume-to-capacity ratio increasing by more than 0.05 during the p.m. peak hour.*

NCP, PP, RIM, RHD

The impact at this intersection under the No USACE Permit, Proposed Project, Resource Impact Minimization, and Reduced Hillside Development alternatives would be **less than significant**. The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

CD

This intersection operates at an acceptable LOS B during the a.m. peak hour and at an unacceptable LOS F during the p.m. peak hour under existing conditions. Signalized intersection operations at Hazel Avenue/Gold Country Boulevard would deteriorate, with the v/c ration increasing by more than 0.05 during the p.m. peak hour under the Centralized Development alternative. To ensure that the Hazel Boulevard/Gold Country Boulevard intersection operates at an acceptable LOS, the planned widening of Hazel Avenue to six lanes from the Curragh Downs Drive intersection to the Gold Country Boulevard intersection is required. This will create a third receiving lane northbound and improve the northbound lane utilization; therefore, increasing the intersection capacity. Construction of the Hazel Avenue widening project, from Highway 50 to Curragh Downs Drive, has begun and is expected to be completed before the first phase of the project alternative is built. Thus this impact would be **less than significant.** The impact of this alternative would be greater than that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1h Unacceptable LOS at the Hazel Avenue/Folsom Blvd Intersection (Sacramento County Intersection 2). *Signalized intersection operations at Hazel Avenue/Folsom Boulevard would deteriorate, with the volume-to-capacity ratio increasing by more than 0.05 during the p.m. peak hour.*

NCP, CD

This intersection operates at an acceptable LOS D or better during the a.m. and p.m. peak hours under existing conditions. Signalized intersection operations at Hazel Avenue/Folsom Boulevard would deteriorate under the No USACE Permit and Centralized Development alternatives to LOS F during the p.m. peak hour. This is a **significant impact**. The impact of these alternatives is greater than the impact of the Proposed Project.

Mitigation Measure 3A.15-1h: Participate in Fair Share Funding of Improvements to Reduce Impacts to the Hazel Avenue/Folsom Boulevard Intersection (Sacramento County Intersection 2).

To ensure that the Hazel Avenue/Folsom Boulevard intersection operates at an acceptable LOS, this intersection must be grade separated including "jug handle" ramps. No at grade improvement is feasible. Grade separating and extended (south) Hazel Avenue with improvements to the U.S. 50 / Hazel Avenue interchange is a mitigation measure for the approved Easton-Glenbrough Specific Plan development project. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Hazel Avenue/Folsom Boulevard intersection (Sacramento County Intersection 2).

Implementation: Sacramento County Public Works Department and Caltrans.

Timing: A phasing analysis shall be performed prior to approval of the first subdivision map to determine when the improvement should be implemented.

Enforcement: Sacramento County Public Works Department and Caltrans

Implementation of Mitigation Measure 3A.15-1h would reduce the significant impact at the Hazel Avenue/Folsom Boulevard Intersection under development of the No USACE Permit and Centralized Development alternatives to a less-than-significant level.

Until Sacramento County and Caltrans implements the improvements, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve p.m. operations to a LOS D condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County and Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

PP, RIM, RHD

The impact at this intersection under the Proposed Project, Resource Impact Minimization and Reduced Hillside Development alternatives is **less than significant**. The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1i Unacceptable LOS at the Grant Line Road/White Rock Road Intersection (Sacramento County Intersection 3). *Delay at the unsignalized Grant Line Road/White Rock Road intersection would increase delay by more than 5 seconds during the a.m. and p.m. peak hours.*

NCP, PP, RIM, CD, RHD

This intersection operates at an acceptable LOS E during the a.m. peak hour and at an unacceptable LOS F during the p.m. peak hour under existing conditions. With the Proposed Project and build alternatives, the intersection would operate at LOS F during the a.m. peak hour, and delay would increase by more than 5 seconds during the p.m. peak hour. This would be a **significant impact**. The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1i: Participate in Fair Share Funding of Improvements to Reduce Impacts on the Grant Line Road/White Rock Road Intersection and to White Rock Road widening between the Rancho Cordova City limit to Prairie City Road (Sacramento County Intersection 3).

Improvements must be made to ensure that the Grant Line Road/White Rock Road intersection operates at an acceptable LOS. The currently County proposed White Rock Road widening project will widen and realign White Rock Road from the Rancho Cordova City limit to the El Dorado County line (this analysis assumes that the Proposed Project and build alternatives will widen White Rock Road to five lanes from Prairie City road to the El Dorado County Line). This widening includes improvements to the Grant Line Road intersection and realigning White Rock Road to be the through movement. The improvements include two eastbound through lanes, one eastbound right turn lane, two northbound left turn lanes, two northbound right turn lanes, two westbound left turn lanes and two westbound through lanes. This improvement also includes the signalization of the White Rock Road and Grant Line Road intersection. With implementation of this improvement, the intersection would operate at an acceptable LOS A. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Grant Line Road/White Rock Road intersection (Sacramento County Intersection 3).

Implementation: Sacramento County Public Works Department.

Timing: Before project build out. Design of the White Rock Road widening to four lanes, from Grant Line Road to Prairie City Road, with intersection improvements has begun, and because this widening project is environmentally cleared and fully funded, it's construction is expected to be complete before the first phase of the Proposed Project or alternative is built.

Enforcement: Sacramento County Public Works Department

Implementation of Mitigation Measure 3A.15-1i would reduce the significant impact on the Grant Line Road/White Rock Road Intersection under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives to a less-than-significant level.

Until Sacramento County implements the improvements, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS A condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

SACRAMENTO COUNTY ROADWAY SEGMENTS

Off-Site Elements

IMPACT 3A.15-1j: Unacceptable LOS on Hazel Avenue between Madison Avenue and Curragh Downs Drive (Sacramento County Roadway Segment 10). *The volume-to-capacity ratio on this LOS F segment would increase by more than 0.05 with project-related traffic.*

NCP, RIM

The impact on this roadway segment under the No USACE Permit and Resource Impact Minimization alternatives is less than significant. The impact of these alternatives is less than that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

The volume-to-capacity ratio on this LOS F segment would increase by more than 0.05 under the Proposed Project, Centralized Development, and Reduced Hillside alternatives. This is a **significant impact**. The impact of these alternatives is similar to that of the Proposed Project.

Mitigation Measure 3A.15-1j: Participate in Fair Share Funding of Improvements to Reduce Impacts on Hazel Avenue between Madison Avenue and Curragh Downs Drive (Roadway Segment 10).

To ensure that Hazel Avenue operates at an acceptable LOS between Curragh Downs Drive and Gold Country Boulevard, Hazel Avenue must be widened to six lanes. This improvement is part of the County adopted Hazel Avenue widening project. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Hazel Avenue between Madison Avenue and Curragh Downs Drive (Sacramento County Roadway Segment 10).

Implementation: Sacramento County Public Works Department.

Timing: Before project build out. Construction of phase two of the Hazel Avenue widening, from Madison Avenue to Curragh Downs Drive, is expected to be completed by year 2013, before the first phase of the Proposed Project or alternative is complete.

Enforcement: Sacramento County Public Works Department

Implementation of Mitigation Measure 3A.15-1j would reduce the significant impact on Hazel Avenue between Madison Avenue and Curragh Downs Drive under development of the Proposed Project, Centralized Development, and Reduced Hillside Development Alternatives to a less-than-significant level.

Until Sacramento County implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS D condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this roadway segment but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1k Unacceptable LOS on Hazel Avenue between Curragh Downs Drive and Gold Country Boulevard (Sacramento County Roadway Segment 11). *Operations on this roadway segment would deteriorate, with an increase in the volume-to-capacity ratio of this LOS F segment by more than 0.05 under the project and all build alternatives.*

NCP, PP, RIM, CD, RHD

Operations on this roadway segment would deteriorate, with an increase in the volume-to-capacity ratio on this LOS F segment by more than 0.05 under the Proposed Project and all build alternatives. To ensure that Hazel Avenue operates at an acceptable LOS between Curragh Downs Drive and Gold Country Boulevard, Hazel Avenue must be widened to six lanes. Construction of phase one of the Hazel Avenue widening, from Highway 50 to Curragh Downs Drive, has begun and is expected to be completed before the first phase of the Proposed Project or alternative is built. Thus this impact is **less than significant**. The impact of these alternatives is similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

CITY OF RANCHO CORDOVA INTERSECTIONS

All of the study intersections located in the City of Rancho Cordova operate at an acceptable LOS D or better during the a.m. and p.m. peak hours under the Proposed Project and all build alternatives. As there are no significantly impacted intersections when evaluated with the City of Rancho Cordova standards, no mitigation is necessary.

CITY OF RANCHO CORDOVA ROADWAY SEGMENTS

Three of the nine study roadway segments located in the City of Rancho Cordova currently and would continue to operate deficiently at an unacceptable LOS E or F during the a.m. and p.m. peak hours under all development alternatives; however, the volume-to-capacity increases under the Proposed Project and all build alternatives are less than 0.05, which is considered to be a less-than significant impact. As there are no significantly impacted roadway segments under all development alternatives when evaluated with the City of Rancho Cordova standards, no mitigation is necessary.

EL DORADO COUNTY INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-1l — Unacceptable LOS at the White Rock Road/Windfield Way Intersection (El Dorado County Intersection 3). *Unsignalized intersection operations at White Rock Road/Windfield Way would degrade as the delay would increase by more than 5 seconds under unacceptable LOS F conditions during the p.m. peak traffic hour.*

NCP, PP, RIM, CD, RHD

Unsignalized intersection operations at the White Rock Road/Windfield Way intersection would degrade as the delay would increase by more than 5 seconds under unacceptable LOS F conditions during the p.m. peak traffic hour with project-related traffic under the Proposed Project and all build alternatives. This is a **significant impact.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1l: Participate in Fair Share Funding of Improvements to Reduce Impacts on the White Rock Road/Windfield Way Intersection (El Dorado County Intersection 3).

To ensure that the White Rock Road/Windfield Way intersection operates at an acceptable LOS, the intersection must be signalized and separate northbound left and right turn lanes must be striped. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the White Rock Road/Windfield Way intersection (El Dorado County Intersection 3).

Implementation: El Dorado County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: El Dorado County Department of Transportation

Implementation of Mitigation Measure 3A.15-1l would reduce the significant impact on the White Rock Road/Windfield Way Intersection to a less-than-significant level by improving intersection LOS under

development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives to a less-than-significant level.

Until El Dorado County implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS C condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of El Dorado County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-1m — Unacceptable LOS at the Hazel Avenue/U.S. 50 Westbound Ramps Intersection (Caltrans Intersection 1). *Signalized intersection operations at Hazel Avenue/U.S. 50 westbound ramps would degrade as the delay increases with the addition of project or alternative traffic.*

NCP, PP, RIM, CD, RHD

Signalized intersection operations at Hazel Avenue/U.S. 50 westbound ramps operates at LOS F during the a.m. and p.m. peak traffic hour. With the addition of Proposed Project or alternative traffic, the delay would increase under the Proposed Project and all build alternatives. To ensure that the Hazel Avenue/U.S. 50 westbound ramps intersection operates at an acceptable LOS, the planned widening of Hazel Avenue to six lanes from the Curragh Downs Drive intersection to the Gold Country Boulevard intersection is required. Currently northbound p.m. peak hour traffic backs up into the Hazel Avenue/U.S. 50 westbound ramps intersection from the lane drop north of the Gold Country Boulevard intersection. The planned widening of Hazel Avenue to six lanes from the Madison Avenue intersection to the Gold Country Boulevard intersection would remove this downstream bottleneck and improve operations at this intersection to LOS C conditions. Construction of the Hazel Avenue widening project, from U.S. 50 to Curragh Downs Drive, has begun and is expected to be completed before the first phase of the project is built. Thus this impact is **less-than-significant.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1n — Unacceptable LOS at the Hazel Avenue/U.S. 50 Eastbound Ramps Intersection (Caltrans Intersection 2). *Signalized intersection operations at Hazel Avenue/U.S. 50 eastbound ramps would degrade as the delay would increase during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

Signalized intersection operations at Hazel Avenue/U.S. 50 eastbound ramps would operate at LOS F during the p.m. peak traffic hour, and the addition of Proposed Project or alternative traffic would increase the delay at the

intersection (by 2% or more) in the p.m. peak hour, which would increase the likelihood that vehicles on the eastbound off-ramp may backup on to the U.S. 50 mainline. To ensure that the Hazel Avenue/U.S. 50 eastbound ramps intersection operates at an acceptable LOS, the planned widening of Hazel Avenue to six lanes from the Curragh Downs Drive intersection to the Gold Country Boulevard intersection is required. Currently northbound p.m. peak hour traffic backs up into the Hazel Avenue/U.S. 50 eastbound ramps intersection from the lane drop north of the Gold Country Boulevard intersection. The planed widening of Hazel Avenue to six lanes from the Madison Avenue intersection to the Gold Country Boulevard intersection would remove this downstream bottleneck and improve operations at this intersection to LOS C conditions. Construction of the Hazel Avenue widening project, from U.S. 50 to Curragh Downs Drive, has begun and is expected to be completed before the first phase of the project is built. Thus this impact is **less than significant.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1o — Unacceptable LOS at the Folsom Boulevard/U.S. 50 Eastbound Ramps Intersection (Caltrans Intersection 4). *The signalized intersection of Folsom Boulevard/U.S. 50 eastbound ramps would degrade from an acceptable LOS C to an unacceptable LOS F during the p.m. peak traffic hour with project-related traffic.*

NCP, PP, RIM, CD, RHD

The signalized intersection of Folsom Boulevard/U.S. 50 eastbound ramps would degrade from an acceptable LOS C to an unacceptable LOS F during the p.m. peak traffic hour under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1o: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 as an alternative to improvements at the Folsom Boulevard/U.S. 50 Eastbound Ramps Intersection (Caltrans Intersection 4).

- Congestion on eastbound U.S. 50 is causing vehicles to use Folsom Boulevard as an alternate parallel route until they reach U.S. 50, where they must get back on the freeway due to the lack of a parallel route. It is preferred to alleviate the congestion on U.S. 50 than to upgrade the intersection at the end of this reliever route.

- To ensure that the Folsom Boulevard/U.S. 50 eastbound ramps intersection operates at an acceptable LOS, auxiliary lanes should be added to eastbound U.S. 50 from Hazel Avenue to east of Folsom Boulevard. This was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Folsom Boulevard/U.S. 50 Eastbound Ramps intersection (Caltrans Intersection 4).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1o would reduce the significant impact on the Folsom Boulevard/U.S. 50 eastbound ramp intersection to a less-than-significant level by improving intersection LOS under development of the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvements, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS C condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1p — Unacceptable LOS at the Grant Line Road/ State Route 16 Intersection (Caltrans Intersection 12). *The signalized intersection of Grant Line Road/State Route 16 would experience an increase in delay during the a.m. peak traffic hour and degrade to an unacceptable LOS F during the p.m. peak traffic hour.*

NCP, PP, RIM, CD, RHD

The signalized intersection of Grant Line Road/State Route 16 would experience an increase in delay under unacceptable LOS F conditions during the a.m. peak traffic hour, and degrade from an acceptable LOS E to an unacceptable LOS F during the p.m. peak traffic hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1p: Participate in Fair Share Funding of Improvements to Reduce Impacts on the Grant Line Road/ State Route 16 Intersection (Caltrans Intersection 12).

To ensure that the Grant Line Road/State Route 16 intersection operates at an acceptable LOS, the northbound and southbound approaches must be reconfigured to consist of one left-turn lane and one shared through/right-turn lane. Protected left-turn signal phasing must be provided on the northbound and southbound approaches. Improvements to the Grant Line Road/State Route 16 intersection are contained within the County Development Fee Program, and are scheduled for Measure A funding.

- Improvements to this intersection must be implemented by Caltrans, Sacramento County, and the City of Rancho Cordova.

The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Grant Line Road/SR 16 intersection (Caltrans Intersection 12).

Implementation: Caltrans, Sacramento County Department of Transportation and the City of Rancho Cordova Department of Public Works

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans, Sacramento County Department of Transportation and the City of Rancho Cordova Department of Public Works

Implementation of Mitigation Measure 3A.15-1p would reduce the significant impact on Grant Line Road/State Route 16 intersection to a less-than-significant level by improving intersection LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans, Rancho Cordova, and Sacramento County implement the improvements, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS C condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, Sacramento County and the City of Rancho Cordova, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS FREEWAY SEGMENTS

Off-Site Elements

IMPACT 3A.15-1q: Unacceptable LOS on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1). *This freeway segment would degrade to an unacceptable LOS F during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway segment would degrade from an acceptable LOS E to an unacceptable LOS F during the p.m. peak hour under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1q: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Zinfandel Drive and Sunrise Boulevard, a bus-carpool (HOV) lane must be constructed. This improvement is currently planned as part of the Sacramento 50 Bus-Carpool Lane and Community Enhancements Project. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1).

Implementation: Caltrans

Timing: Before project build out. Construction of the Sacramento 50 Bus-Carpool Lane and Community Enhancements Project is expected to be completed by year 2013, before the first phase of the Proposed Project or alternative is complete.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1q would reduce the significant impact on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard to a less-than-significant level by improving freeway segment LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvements, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed.. Implementation of the mitigation measure will improve operations to a LOS E condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1r Unacceptable LOS on Eastbound U.S. 50 between Hazel Avenue and Folsom Boulevard (Freeway Segment 3). *This freeway segment would degrade to an unacceptable LOS F during the p.m. peak hour with project-related traffic.*

NCP, PP, RIM, CD, RHD

This freeway segment would degrade from an acceptable LOS E to an unacceptable LOS F during the p.m. peak hour under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1r: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Hazel Avenue and Folsom Boulevard (Freeway Segment 3).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Hazel Avenue and Folsom Boulevard, an auxiliary lane must be constructed. This improvement was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. This improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Eastbound U.S. 50 between Hazel Avenue and Folsom Boulevard (Freeway Segment 3).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1r would reduce the significant impact on Eastbound U.S. 50 between Hazel Avenue and Folsom Boulevard to a less-than-significant level by improving freeway segment LOS

under development of the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS D condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1s: Unacceptable LOS on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 4). *This freeway segment would degrade to an unacceptable LOS F during the p.m. peak hour and would experience an increase in the volume to capacity ratio under unacceptable LOS F conditions during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway segment would experience an increase in the volume-to-capacity ratio under unacceptable LOS F conditions during the p.m. peak hour with project-related traffic under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1s: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 4).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Folsom Boulevard and Prairie City Road, an auxiliary lane must be constructed. This improvement was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. This improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 4).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1s would reduce the significant impact on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road to a less-than-significant level by improving freeway segment LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS E condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1t — Unacceptable LOS on Eastbound U.S. 50 between El Dorado Hills Boulevard – Latrobe Road and Bass Lake Grade (Freeway Segment 9). *This freeway segment would experience an increase in the volume to capacity ratio under unacceptable LOS F conditions during the p.m. peak.*

NCP, PP, RIM, CD, RHD

This freeway segment would experience an increase in the volume to capacity ratio under unacceptable LOS F conditions during the p.m. peak hour under the project and all build alternatives. To ensure that Eastbound U.S. 50 operates at an acceptable LOS between El Dorado Hills Boulevard – Latrobe Road and Bass Lake Grade, the truck climbing lane and the bus-carpool (HOV) lane must be extended. Construction on this improvement has begun and is expected to be complete by the end of 2010, before the first phase of the Proposed Project or alternative is built. Thus this impact is **less than significant.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1u — Unacceptable LOS on Westbound U.S. 50 between Prairie City Road and Folsom Boulevard (Freeway Segment 16). *This freeway segment would experience an increase in the volume to capacity ratio under unacceptable LOS F conditions during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway segment would experience an increase in the volume-to-capacity ratio under unacceptable LOS F conditions during the a.m. peak hour with project-related traffic under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1u: Participate in Fair Share Funding of Improvements to Reduce Impacts on Westbound U.S. 50 between Prairie City Road and Folsom Boulevard (Freeway Segment 16).

To ensure that Westbound U.S. 50 operates at an acceptable LOS between Prairie City Road and Folsom Boulevard, an auxiliary lane must be constructed. This improvement was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. This improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid

for by applicant, to reduce the impacts to Westbound U.S. 50 between Prairie City Road and Folsom Boulevard (Freeway Segment 16).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1u would reduce the significant impact on Westbound U.S. 50 between Prairie City Road and Folsom Boulevard to a less-than-significant level by improving freeway segment LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to LOS D.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS FREEWAY RAMP MERGE, DIVERGE AND WEAVING SECTIONS

Off-Site Elements

IMPACT 3A.15-1w: Unacceptable LOS at the U.S. 50 Eastbound / Folsom Boulevard Ramp Merge (Freeway Merge 4). *This freeway merge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway merge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1w: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Folsom Boulevard Ramp Merge (Freeway Merge 4).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the Folsom Boulevard merge, an auxiliary lane from the Folsom Boulevard merge to the Prairie City Road diverge must be constructed. This improvement was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. This improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the U.S. 50 Eastbound/Folsom Boulevard Ramp Merge (Freeway Merge 4).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1w would reduce the significant impact on the U.S. 50 Eastbound / Folsom Boulevard Ramp Merge to a less-than-significant level by improving freeway merge LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant, but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS D condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1x Unacceptable LOS at the U.S. 50 Eastbound / Prairie City Road Diverge (Freeway Diverge 5). *This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1x: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Prairie City Road Diverge (Freeway Diverge 5).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the Prairie City Road off-ramp diverge, an auxiliary lane from the Folsom Boulevard merge must be constructed. This improvement was recommended in the Traffic Operations Analysis Report for the U.S. 50 Auxiliary Lane Project. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/Prairie City Road diverge (Freeway Diverge 5).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1x would reduce the significant impact on the U.S. 50 Eastbound / Prairie City Road Diverge to a less-than-significant level by eliminating the diverge movement from the freeway mainline under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to an acceptable condition. With the elimination of the diverge movement there is no specific LOS for the mitigated condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1y — Unacceptable LOS at the U.S. 50 Eastbound / Prairie City Road Merge (Freeway Merge 6). *This freeway merge would degrade to an unacceptable LOS F during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway merge would degrade from an acceptable LOS E to an unacceptable LOS F during the p.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1y: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Prairie City Road Direct Merge (Freeway Merge 6).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the Prairie City Road on-ramp direct merge, an auxiliary lane to the East Bidwell Street – Scott Road diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/Prairie City Road direct merge (Freeway Merge 6).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1y would reduce the significant impact on the U.S. 50 Eastbound / Prairie City Road Direct Merge to a less-than-significant level by eliminating the merge movement from the

freeway mainline under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to an acceptable condition. With the elimination of the direct merge movement there is no specific LOS for the mitigated condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1z: Unacceptable LOS at the U.S. 50 Eastbound / Prairie City Road Flyover On-Ramp to Oak Avenue Parkway Off-Ramp Weave (Freeway Weave 8). *This new freeway weave would operate an unacceptable LOS F during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This new freeway weave would operate an unacceptable LOS F during the p.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1z: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Prairie City Road Flyover On-Ramp to Oak Avenue Parkway Off-Ramp Weave (Freeway Weave 8).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the Prairie City Road flyover on-ramp to Oak Avenue Parkway off-ramp weave, an improvement acceptable to Caltrans should be implemented to eliminate the unacceptable weaving conditions. Such an improvement may involve a "braided ramp". The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/Prairie City Road flyover on-ramp to Oak Avenue Parkway off-ramp weave (Freeway Weave 8).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1z would reduce the significant impact on the U.S. 50 Eastbound / Prairie City Road Flyover On-Ramp to Oak Avenue Parkway Off-Ramp Weave to a less-than-significant level by improving intersection LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS D condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1aa — Unacceptable LOS at the U.S. 50 Eastbound / Oak Avenue Parkway Loop Merge (Freeway Merge 9).
This new freeway merge would operate an unacceptable LOS F during the p.m. peak.

NCP, PP, RIM, CD, RHD

This new freeway merge would operate an unacceptable LOS F during the p.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

> Mitigation Measure 3A.15-1aa: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Oak Avenue Parkway Loop Merge (Freeway Merge 9).
>
> To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the Oak Avenue Parkway loop merge, an auxiliary lane to the East Bidwell Street – Scott Road diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/ Oak Avenue Parkway loop merge (Freeway Merge 9).
>
> **Implementation:** Caltrans
>

>
> **Enforcement:** Caltrans

Implementation of Mitigation Measure 3A.15-1aa would reduce the significant impact on the U.S. 50 Eastbound / Oak Avenue Parkway Loop Merge to a less-than-significant level by improving intersection LOS under development of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but eventually would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS C condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's

significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1bb — Unacceptable LOS at the U.S. 50 Eastbound / El Dorado Hills Boulevard – Latrobe Road Merge (Freeway Merge 19). *This freeway merge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway merge would experience an increase in density under unacceptable LOS F conditions during the p.m. peak hour under the Proposed Project and all build alternatives. To ensure that Eastbound U.S. 50 operates at an acceptable LOS at the El Dorado Hills Boulevard – Latrobe Road Merge, a truck climbing lane and a bus-carpool (HOV) lane must be constructed to the Bass Lake Grade truck climbing lane. Construction on this improvement has begun and is expected to be complete by the end of 2010, before the first phase of the Proposed Project or alternative is built. Thus this impact is **less-than-significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1cc — Unacceptable LOS at the U.S. 50 Westbound / El Dorado Hills Boulevard Diverge (Freeway Diverge 20). *This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour with under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives. To ensure that Westbound U.S. 50 operates at an acceptable LOS at the El Dorado Hills Boulevard Diverge, a bus-carpool (HOV) lane from the Bass Lake Road merge must be constructed. This improvement is currently under construction. Construction on this improvement has begun and is expected to be complete before the first phase of the Proposed Project or alternative is built. Thus this impact is **less-than-significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-1dd — Unacceptable LOS at the U.S. 50 Westbound / Empire Ranch Road Loop Ramp Merge (Freeway Merge 23). *This freeway merge would operate at an unacceptable LOS F during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This new freeway merge would operate at an unacceptable LOS F during the a.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of this alternative would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1dd: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Empire Ranch Road Loop Ramp Merge (Freeway Merge 23).

To ensure that Westbound U.S. 50 operates at an acceptable LOS, the northbound Empire Ranch Road loop on ramp should start the westbound auxiliary lane that ends at the East Bidwell Street – Scott Road off ramp. The slip on ramp from southbound Empire Ranch Road would merge into this extended auxiliary lane. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Empire Ranch Road loop ramp merge (Freeway Merge 23).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1dd would reduce the significant impact on the U.S. 50 Westbound / Empire Ranch Road Loop Ramp Merge to a less-than-significant level by eliminating the merge movement from the freeway mainline under development of the Proposed Project and all the build alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to an acceptable condition. With the elimination of the direct merge movement there is no specific LOS for the mitigated condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1ee — Unacceptable LOS at the U.S. 50 Westbound / Oak Avenue Parkway Loop Ramp Merge (Freeway Merge 29). *This freeway merge would operate at an unacceptable LOS F during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This new freeway merge would operate at an unacceptable LOS F during the a.m. peak hour under the Proposed Project and all build alternatives. This is a **significant** impact**.** The impact of this alternative would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1ee: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Oak Avenue Parkway Loop Ramp Merge (Freeway Merge 29).

To ensure that Westbound U.S. 50 operates at an acceptable LOS, the northbound Oak Avenue Parkway loop on ramp should start the westbound auxiliary lane that ends at the Prairie City Road off ramp. The

slip on ramp from southbound Oak Avenue Parkway would merge into this extended auxiliary lane. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Oak Avenue Parkway loop ramp merge (Freeway Merge 29).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1ee would reduce the significant impact on the U.S. 50 Westbound / Oak Avenue Parkway Loop Ramp Merge to a less-than-significant level by eliminating the merge movement from the freeway mainline under development of the Proposed Project and all the build alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to an acceptable condition. With the elimination of the direct merge movement there is no specific LOS for the mitigated condition. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1gg — Unacceptable LOS at the U.S. 50 Westbound / Prairie City Road Ramp Merge (Freeway Merge 33). *This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour under the Proposed Project and all of the build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1gg: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Prairie City Road Direct Ramp Merge (Freeway Merge 33).

To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Prairie City Road direct ramp merge, an auxiliary lane to the Folsom Boulevard off ramp diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Prairie City Road direct ramp merge (Freeway Merge 33).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1gg would reduce the significant impact the U.S. 50 Westbound / Prairie City Road Direct Ramp Merge to a less-than-significant level by improving freeway merge LOS under development of the Proposed Project and all build alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS C.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1hh — Unacceptable LOS at the U.S. 50 Westbound / Folsom Boulevard Diverge (Freeway Diverge 34). *This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour, and degrade from an acceptable LOS D to an unacceptable LOS F during the p.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour under the Proposed Project and all build alternatives, and degrade from an acceptable LOS D to an unacceptable LOS F during the p.m. peak hour under the Centralized Development, Reduced Hillside Development alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1hh: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Folsom Boulevard Diverge (Freeway Diverge 34).

To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Folsom Boulevard Diverge, an auxiliary lane from the Prairie City Road loop ramp merge must be constructed. Improvements to this freeway segment must be implemented by Caltrans. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound / Folsom Boulevard diverge (Freeway Diverge 34).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1hh would reduce the significant impact on the U.S. 50 Eastbound / Folsom Boulevard Diverge to a less-than-significant level by improving intersection LOS under development of

the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure will improve operations to a LOS B.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-1ii Unacceptable LOS at the U.S. 50 Westbound / Hazel Avenue Ramp Merge (Freeway Merge 38). *This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour.*

NCP, PP, RIM, CD, RHD

This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour under the Proposed Project and all of the build alternatives. This is a **significant** impact**.** The impact of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-1ii: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Hazel Avenue Direct Ramp Merge (Freeway Merge 38).

To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Hazel Avenue direct ramp merge, an auxiliary lane to the Sunrise Boulevard off ramp diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the U.S. 50 Westbound/Hazel Avenue direct ramp merge (Freeway Merge 38).

Implementation: Caltrans

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Caltrans

Implementation of Mitigation Measure 3A.15-1ii would reduce the significant impact the U.S. 50 Westbound / Hazel Avenue Direct Ramp Merge to a less-than-significant level by eliminating the merge movement from the freeway mainline under development of the Proposed Project and all build alternatives.

Until Caltrans implements the improvement, the impact would be classified as significant but would be reduced to a less-than-significant level once those improvements are constructed. Implementation of the mitigation measure

will improve operations to an acceptable condition. With the elimination of the direct merge movement there is no specific LOS for the mitigated condition.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom's control would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-2 *Increased Demand for Single-Occupant Automobile Travel in the Project Area. Project implementation would increase demand for single-occupant automobile travel on area roadways and intersections causing roadway and intersection impacts.*

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

The project would add significant traffic to area roadways and intersections, increasing the demand for single-occupant automobile travel on area roadways and intersections, causing roadway and intersection impacts under all five development alternatives. This increase is considered a **significant** impact. The impacts of the alternatives are similar to that of the Proposed Project.

Mitigation Measure 3A.15-2a: Develop Commercial Support Services and Mixed-use Development Concurrent with Housing Development, and Develop and Provide Options for Alternative Transportation Modes.

The project applicant(s) for all project phases shall develop commercial and mixed-use development concurrent with housing development, to the extent feasible in light of market realities and other considerations, to internalize vehicle trips. Pedestrian and bicycle facilities shall be implemented to the satisfaction of the City Public Works Department. To further minimize impacts from the increased demand on area roadways and intersections, the project applicant(s) for all project phases shall develop and implement safe and secure bicycle parking at schools and commercial centers to promote alternative transportation uses and reduce the volume of single-occupancy vehicles using area roadways and intersections.

Implementation: City of Folsom and Applicant(s)

Timing: Before approval of improvement plans for all project phases.

Enforcement: City of Folsom Public Works Department.

The project applicant(s) for all project phases shall participate in capital improvements and operating funds for transit service to increase the percent of travel by transit. The project's fair-share participation and the associated timing of the improvements and service shall be identified in the project conditions of approval and/or the project's development agreement. Improvements and service shall be coordinated, as necessary, with Folsom Stage Lines and Sacramento RT.

Implementation: City of Folsom, Regional Transit, and Applicant(s)

Timing: As a condition of project approval and/or as a condition of the development agreement for all project phases.

Enforcement: City of Folsom Public Works Department.

Mitigation Measure 3A.15-2b: Participate in the City's Transportation System Management Fee Program.

The project applicant(s) for all project phases shall pay an appropriate amount into the City's existing Transportation System Management Fee Program to reduce the number of single-occupant automobile travel on area roadways and intersections.

Implementation: City of Folsom and Applicant(s)

Timing: Concurrent with construction for all project phases.

Enforcement: City of Folsom Public Works Department.

Mitigation Measure 3A.15-2c: Participate with the 50 Corridor Transportation Management Association.

The project applicant(s) for all project phases shall join and participate with the 50 Corridor Transportation Management Association to reduce the number of single-occupant automobile travel on area roadways and intersections.

Implementation: 50 Corridor Transportation Management Association and Applicant(s)

Timing: Concurrent with construction for all project phases.

Enforcement: City of Folsom Public Works Department.

Implementation of Mitigation Measure 3A.15-2a would reduce the demand of the single-occupant vehicle on area roadways and intersections. Implementation of Mitigation Measures 3A.15-2b and 3A.15-2c would promote usage of alternative transportation modes and increase the supply of these modes. Although the mitigation measures have the potential to substantially reduce the number of single-occupant vehicles, the project would continue to add single-occupant vehicles in the area and the impact would remain **significant and unavoidable**.

CUMULATIVE SCENARIOS

This section addresses impacts of the project under cumulative (2030) conditions. Impacts are identified when the project's incremental contribution is "cumulatively considerable" and thus is considered significant. Tables 3A.15-25 through 3A.15-33 summarize the results of the analyses.

Exhibits 3A.15-61 through 66, 3A.15-69 through 74, 3A.15-77 through 82, 3A.15-85 through 90, and 3A.15-93 through 98 present peak-hour traffic volumes, lane configurations, and traffic control under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit alternatives, respectively. Exhibits 3A.15-67, 3A.15-75, 3A.15-83, 3A.15-91 and 3A.15-99 compare ADT volumes under Baseline No Project conditions with those under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit alternatives, respectively. Exhibits 3A.15-68, 3A.15-76, 3A.15-84, 3A.15-92, and 3A.15-100 compare present freeway peak-hour traffic volumes and lane configurations under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and USACE Permit alternatives, respectively.

IMPACT 3A.15-3 **Potential Impacts Associated with the City's Transportation Impact Fee Program.** *The City of Folsom has a transportation impact fee program to implement roadway facilities (those identified in the City General Plan for implementation before Year 2030) within the city limits. However, this fee program does not cover the new roadway facilities that will be needed due to the Proposed Project or alternative.*

On-Site and Off-Site Elements

NCP, PP, RIM, CD, RHD

The City's fee transportation impact fee program does not cover the South of U.S. 50 area, or improvements within the existing City that will only be needed because of the Proposed Project or alternative. Measure W, passed by the City of Folsom voters, requires that all improvements required by the South of U.S. 50 Specific Plan be fully funded by the development in the SPA. Therefore, cumulative impacts identified require additional funding (beyond the current fee program) to mitigate the impacts. This is considered a **significant** impact. The impacts of the alternatives are similar to that of the Proposed Project.

Mitigation Measure 3A.15-3: Pay Full Cost of Identified Improvements that Are Not Funded by the City's Fee Program.

In accordance with Measure W, the project applicant(s) for all project phases shall fully fund improvements only required because of the Specific Plan.

Implementation: City of Folsom and Applicant(s)

Timing: As a condition of project approval and/or as a condition of the development agreement for all project phases.

Enforcement: City of Folsom Public Works Department.

Implementation of Mitigation Measure 3A.15-3 requires project applicants to fully fund all improvements only required by the Proposed Project or alternative. However, because ultimate funding of the improvements cannot be guaranteed and the City cannot guarantee implementation of the identified measures, the impact would remain **significant and unavoidable.** If the City is able to ultimately fully fund the fee program through fair-share contributions or external funding sources, the impact would be classified as significant in the short term but would be reduced to a less-than-significant level in the long term.

IMPACT 3A.15-4 **Increases to Peak-Hour and Daily Traffic Volumes, Resulting in Unacceptable Levels of Service, under Cumulative (2030) Conditions.** *Implementation of the Proposed Project (or alternatives) and other reasonably foreseeable development would cause an increase in a.m. peak traffic hour, p.m. peak traffic hour, and/or daily traffic volumes on area roadways, resulting in unacceptable LOS and warranting the need for improvements such as traffic signals and additional lanes under cumulative (2030) conditions.*

NP

Under the Cumulative No Project Alternative, no development beyond what currently exists is assumed. No off-site water facilities would be constructed under this scenario. No new trips are generated in the SPA under this scenario; therefore, there are no intersection, roadway segment, freeway mainline, or ramp merge / diverge / weaving area impacts by definition. These impacts are less than those associated with the Proposed Project.

The following sub-impacts and mitigation measures are specific to individual locations. These locations include only those intersections, roadways, freeway segments and freeway ramps where significant, direct impacts would occur.

Notes:
LOS = level of service; V/C = volume-to-capacity
[1] V/C ratio is shown for signalized intersections. Delay is shown for unsignalized intersections.
[2] Worst-case delay reported for unsignalized, side-street-stop intersections; average intersection delay reported for all-way-stop intersections. Both delays are reported in seconds per vehicle.
Bold indicates deficiency. Shaded areas indicate impact.

City of Folsom

On-Site and Off-Site Elements

IMPACT 3A.15-4a **Unacceptable LOS at the Sibley Street/Blue Ravine Road Intersection (Folsom Intersection 2) under Cumulative (2030) Conditions.** *This signalized intersection would degrade to an unacceptable level of service D or E with an increase of five or more seconds of delay during the a.m. peak traffic hour under cumulative (2030) conditions.*

NCP, RIM

The impact at this intersection is **less than significant** under the No USACE Permit and Resource Impact Minimization alternatives. The impacts of these alternatives are less than that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This signalized intersection would degrade from an unacceptable level of service D to an unacceptable level of service D or E with an increase of five or more seconds of delay during the a.m. peak traffic hour with traffic from the Proposed Project, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions. This would be a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4a: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the Sibley Street/Blue Ravine Road Intersection (Folsom Intersection 2).

To ensure that the Sibley Street/Blue Ravine Road intersection operates at a LOS D with less than the Cumulative No Project delay, the northbound approach must be reconfigured to consist of two left-turn lane, two through lanes, and one dedicated right-turn lane. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the Sibley Street/Blue Ravine Road intersection (Folsom Intersection 2).

Implementation: City of Folsom Public Works Department.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-4a would reduce the significant impact on Folsom Intersection 2 under cumulative (2030) conditions to a **less-than-significant** level, by enabling the intersection to operate at a LOS D with less than the Cumulative No Project delay.

IMPACT 3A.15-4b **Unacceptable LOS at the Oak Avenue Parkway/East Bidwell Street Intersection (Folsom Intersection 6) under Cumulative (2030) Conditions.** *This signalized intersection would degrade to an unacceptable level of service D with an increase of five or more seconds of delay during the p.m. peak traffic hours under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would degrade from an unacceptable level of service D to an unacceptable level of service D with an increase of five or more seconds of delay during the p.m. peak traffic hours with traffic associated with the Proposed Project and all build alternatives under cumulative (2030) conditions. The impacts of these alternatives would be similar to that of the Proposed Project.

> Mitigation Measure 3A.15-4b: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the Oak Avenue Parkway/East Bidwell Street Intersection (Folsom Intersection 6).
>
> To ensure that the Oak Avenue Parkway/East Bidwell Street intersection operates at an acceptable LOS, the eastbound (East Bidwell Street) approach must be reconfigured to consist of two left-turn lanes, four through lanes and a right-turn lane, and the westbound (East Bidwell Street) approach must be reconfigured to consist of two left-turn lanes, four through lanes, and a right-turn lane. It is against the City of Folsom policy to have eight lane roads because of the impacts to non motorized traffic and adjacent development; therefore, this improvement is infeasible.

Implementation of Mitigation Measure 3A.15-4b would reduce the significant impact on Folsom Intersection 6 under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level; however, identified improvement is against the City of Folsom policy because of the impacts to non motorized traffic; therefore, the improvement would not be implemented. Given these conditions the impact is **significant-and-unavoidable**.

IMPACT 3A.15-4c **Unacceptable LOS at the East Bidwell Street/Nesmith Court Intersection (Folsom Intersection 7) under Cumulative (2030) Conditions.** *Project or build alternative traffic would increase delay at this deficient intersection by more than 5 seconds during the p.m. peak traffic hour under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would operate at an unacceptable LOS E during the p.m. peak traffic hours with or without project traffic under cumulative (2030) conditions. Project traffic would increase delay at this intersection by more than 5 seconds during the p.m. peak traffic hours under all the Proposed Project and all of the build alternatives. The impacts of these alternatives would be similar to that of the Proposed Project.

> Mitigation Measure 3A.15-7c: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the East Bidwell Street/Nesmith Court Intersection (Folsom Intersection 7).
>
> To ensure that the East Bidwell Street/College Street intersection operates at acceptable LOS C or better, the westbound approach must be reconfigured to consist of one left-turn lane, one left-through lane, and two dedicated right-turn lanes. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the East Bidwell Street/Nesmith Court intersection (Folsom Intersection 7).

Implementation: City of Folsom Public Works Department.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-4c would reduce the significant impact on Folsom Intersection 7 under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a **less-than-significant** level, by enabling this intersection to operate at an acceptable LOS C.

IMPACT 3A.15-4d Unacceptable LOS at the East Bidwell Street /Iron Point Road Intersection (Folsom Intersection 21) under Cumulative (2030) Conditions. *This signalized intersection would degrade to an unacceptable LOS F during the p.m. peak traffic hours under the proposed project and all of the build alternatives under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would degrade from an unacceptable LOS E to an unacceptable LOS F during the p.m. peak traffic hours under the Proposed Project and all of the build alternatives under cumulative (2030) conditions. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4d: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the East Bidwell Street/Iron Point Road Intersection (Folsom Intersection 21).

To ensure that the East Bidwell Street /Iron Point Road intersection operates at an acceptable LOS, the northbound approach must be reconfigured to consist of two left-turn lanes, four through lanes and a right-turn lane, and the southbound approach must be reconfigured to consist of two left-turn lanes, four through lanes and a right-turn lane. It is against the City of Folsom policy to have eight lane roads because of the impacts to non motorized traffic and adjacent development; therefore, this improvement is infeasible.

Implementation of Mitigation Measure 3A.15-4d would reduce the significant impact on Folsom Intersection 21 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level; however, identified improvement is against the City of Folsom policy because of the impacts to non motorized traffic; therefore, the improvement would not be implemented. Given these conditions the impact is **significant-and-unavoidable**.

IMPACT 3A.15-4e Unacceptable LOS at the Serpa Way/ Iron Point Road Intersection (Folsom Intersection 23) under Cumulative (2030) Conditions. *Traffic increases would increase the delay at this deficient intersection by more than 5 seconds under cumulative (2030) conditions.*

NCP, PP, RIM

The impact at this intersection under the No USACE Permit, Proposed Project, and Resource Impact Minimization alternative would be **less than significant**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

CD, RHD

This signalized intersection would operate at an unacceptable LOS D during the p.m. peak traffic hour without project traffic under cumulative (2030) conditions. Project traffic would increase the delay at this intersection by more than 5 seconds under the Centralized Development and Reduced Hillside Development Alternatives. The impacts of these alternatives would be greater than that of the Proposed Project.

Mitigation Measure 3A.15-4e: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the Serpa Way/ Iron Point Road Intersection (Folsom Intersection 23).

To improve LOS at the Serpa Way/ Iron Point Road intersection, the northbound approaches must be restriped to consist of one left-turn lane, one shared left-through lanes, and one right-turn lane. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the Serpa Way/Iron Point Road Intersection (Folsom Intersection 23).

Implementation: City of Folsom Public Works Department.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be build.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-4e would reduce the significant impact on Folsom Intersection 23 from the Centralized Development and Reduced Hillside Development Alternatives under cumulative (2030) conditions to a **less-than-significant** level, by enabling this intersection to operate at an acceptable LOS C.

IMPACT 3A.15-4f Unacceptable LOS at the Empire Ranch Road / Iron Point Road Intersection (Folsom Intersection 24) under Cumulative (2030) Conditions. *During the p.m. peak traffic hour, this intersection would operate at LOS E or F with an increase in delay of 5 or more seconds under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

Addition of traffic associated with the Proposed Project and build alternatives would cause this intersection to operate at LOS E or F during the p.m. peak hour with an increase in delay of 5 seconds or greater. This is a **significant impact**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4f: The Applicant Shall Pay a Fair Share to Fund the Construction of Improvements to the Empire Ranch Road / Iron Point Road Intersection (Folsom Intersection 24).

To ensure that the Empire Ranch Road / Iron Point Road intersection operates at a LOS D or better, all of the following improvements are required:

- The eastbound approach must be reconfigured to consist of one left-turn lane, two through lanes, and a right-turn lane.
- The westbound approach must be reconfigured to consist of two left-turn lanes, one through lane, and a through-right lane.

- The northbound approach must be reconfigured to consist of two left-turn lanes, three through lanes, and a right-turn lane.

- The southbound approach must be reconfigured to consist of two left-turn lanes, three through lanes, and a right-turn lane.

The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the Empire Ranch Road/Iron Point Road Intersection (Folsom Intersection 24).

Implementation: City of Folsom Public Works Department.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-4f would reduce the significant impact on Folsom Intersection 24 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a **less-than-significant** level, by allowing this intersection to operate at a LOS D or better.

IMPACT 3A.15-4g Unacceptable LOS at the Oak Avenue Parkway / Easton Valley Parkway Intersection (Folsom Intersection 33) under Cumulative (2030) Conditions. *This new signalized intersection would operate at an unacceptable LOS D during the a.m. peak traffic hour with the addition of proposed project and alternative traffic under cumulative (2030) conditions.*

NCP, RIM

Under the No USACE Permit and Resource Impact Minimization alternatives, the impact at this intersection is **less than significant**. The impacts of these alternatives would be less than that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This new signalized intersection would operate at an unacceptable LOS D during the a.m. peak traffic hour with the addition of Proposed Project, Centralized Development and Reduced Hillside Development alternative traffic under cumulative (2030) conditions. This is a **significant impact**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4g: The Applicant Shall Fund and Construct Improvements to the Oak Avenue Parkway / Easton Valley Parkway Intersection (Folsom Intersection 33).

To ensure that the Oak Avenue Parkway / Easton Valley Parkway intersection operates at an acceptable LOS the southbound approach must be reconfigured to consist of two left-turn lanes, two through lanes, and two right-turn lanes. The applicant shall fund and construct these improvements.

Implementation: City of Folsom Public Works Department.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: City of Folsom Public Works Department

Implementation of Mitigation Measure 3A.15-4g would reduce the significant impact on Folsom Intersection 33 from the Proposed Project, Centralized Development and Reduced Hillside Development Alternatives under cumulative (2030) conditions to a **less-than-significant** level, by allowing this intersection to operate at an acceptable LOS C.

IMPACT 3A.15-4h LOS D at the Scott Road (East)/Easton Valley Parkway Intersection (Intersection 38) under Cumulative (2030) Conditions. *This new signalized intersection would operate at LOS D during the p.m. peak traffic hour with project traffic under cumulative (2030) conditions.*

NCP, RIM

This intersection would operate at LOS C conditions under the No USACE Permit and Resource Impact Minimization alternatives. This impact is **less than significant**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

PP, CD, RHD

This new signalized intersection would operate at LOS D during the p.m. peak traffic hour with the Proposed Project, Centralized Development, and Reduced Hillside Development alternatives cumulative (2030) conditions.

The Specific Plan proposes an amended Level of Service policy within the project area (south of U.S. 50) as follows

> The City should strive to achieve at least a traffic Level of Service "C" within the Folsom South of U.S. 50 Specific Plan. For roadways and intersections within the Specific Plan, LOS "D" conditions may be considered on a case by case basis if improvements required to meet LOS "C" exceeds the "normally accepted maximum" improvements established by the City. Complete Streets principles require that streets and intersections be designed with all transportation modes in mind, and that the road widths, delays, and safety impacts to pedestrians and bicycles make larger roadways and intersections incompatible with this philosophy. Coupled with the limited reduction in vehicular delay that such improvements would provide, the City has determined that the benefits of excessively wide roadways and intersections do not outweigh the impacts to the community. Therefore, "normally accepted maximum" improvements on arterial roadways include three through-lanes in each direction; and at intersections includes two left-turn lanes, three through-lanes and one right-turn lane on an approach.

The number of travel lanes on the Scott Road (East)/Easton Valley Parkway intersection approaches would be at the "normally accepted maximum" levels. Thus LOS "D" conditions would be acceptable at this intersection

This impact is **less than significant**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure: No mitigation measures are required.

SACRAMENTO COUNTY INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-4i — Unacceptable LOS at the Grant Line Road/White Rock Road Intersection (Sacramento County Intersection 3) under Cumulative (2030) Conditions. *This signalized intersection would degrade to an unacceptable LOS F during the a.m. peak traffic hours under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would degrade from an acceptable LOS E to an unacceptable LOS F during the a.m. peak traffic hours under the Proposed Project and all of the build alternatives under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4i: Participate in Fair Share Funding of Improvements to Reduce Impacts on the Grant Line Road/White Rock Road Intersection (Sacramento County Intersection 3).

To ensure that the Grant Line Road/White Rock Road intersection operates at an acceptable LOS E or better this intersection should be replaced by some type of grade separated intersection or interchange.

Improvements to this intersection are identified in the Sacramento County's Proposed General Plan. Implementation of these improvements would assist in reducing traffic impacts on this intersection by providing acceptable operation. Intersection improvements must be implemented by Sacramento County. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Grant Line Road/White Rock Road Intersection (Sacramento County Intersection 3).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4i would reduce the significant impact on the Grant Line Road/White Rock Road intersection from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this intersection to operate at an acceptable LOS E or better.

If Sacramento County implements the improvements, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision

(a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

SACRAMENTO COUNTY ROADWAYS

Off-Site Elements

IMPACT 3A.15-4j **Unacceptable LOS on Grant Line Road between White Rock Road and Kiefer Boulevard (Sacramento County Roadway Segments 5-7) under Cumulative (2030) Conditions.** *Operating conditions of these deficient roadway segments would deteriorate and the V/C ratio would increase by more than 0.05 with project traffic under cumulative (2030) conditions.*

NCP, PP, NFA, RIM, CD

Operation of these roadway segments would operate at an unacceptable LOS F with or without the Proposed Project or alternative, and the V/C ratio would increase by more than 0.05 with project and build alternative traffic under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4j: Participate in Fair Share Funding of Improvements to Reduce Impacts on Grant Line Road between White Rock Road and Kiefer Boulevard (Sacramento County Roadway Segments 5-7).

To improve operation on Grant Line Road between White Rock Road and Kiefer Boulevard, this roadway segment must be widened to six lanes. This improvement is proposed in the Sacramento County and the City of Rancho Cordova General Plans; however, it is not in the 2035 MTP. Improvements to this roadway segment must be implemented by Sacramento County and the City of Rancho Cordova.

The identified improvement would more than offset the impacts specifically related to the Folsom South of U.S. 50 project on this roadway segment. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Grant Line Road between White Rock Road and Kiefer Boulevard (Sacramento County Roadway Segments 5-7).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4j would reduce the significant impact on Grant Line Road between White Rock Road and Kiefer Boulevard from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions, by offsetting impacts of project traffic. The resulting mitigated LOS is F but the V/C ratio is less than the No Project condition.

If Sacramento County and the City of Rancho Cordova implement the improvement, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact

on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County and the City of Rancho Cordova, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4k — Unacceptable LOS on Grant Line Road between Kiefer Boulevard and Jackson Highway (Sacramento County Roadway Segment 8) under Cumulative (2030) Conditions. *Operating conditions of this deficient roadway segment would degrade by increasing the V/C by 0.05 with increased traffic under cumulative (2030) conditions.*

NCP, PP, CD, RHD

This roadway segment would operate at an unacceptable LOS F with an increase of V/C ratio of 0.05 or greater under the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4k: Participate in Fair Share Funding of Improvements to Reduce Impacts on Grant Line Road between Kiefer Boulevard and Jackson Highway (Sacramento County Roadway Segment 8).

To improve operation on Grant Line Road between Kiefer Boulevard Jackson Highway, this roadway segment could be widened to six lanes. This improvement is proposed in the Sacramento County and the City of Rancho Cordova General Plans; however, it is not in the 2035 MTP. Improvements to this roadway segment must be implemented by Sacramento County and the City of Rancho Cordova.

The identified improvement would more than offset the impacts specifically related to the Folsom South of U.S. 50 project on this roadway segment. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Grant Line Road between Kiefer Boulevard and Jackson Highway (SR 16) (Sacramento County Roadway Segment 8).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4k would reduce the significant impact on Grant Line Road between Kiefer Boulevard and Jackson Highway from the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions, by improving operations to LOS C.

If Sacramento County and the City of Rancho Cordova implement the improvement, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact

on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County and the City of Rancho Cordova, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

RIM

There is a **less-than-significant** impact on this roadway segment under the Resource Impact Minimization alternative. This impact is less than that associated with the Proposed Project.

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.15-4l Unacceptable LOS on Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segment s 12-13) under Cumulative (2030) Conditions. *Operation of these deficient roadway segments degrade with the V/C ratio increasing by more than 0.05 with project and alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

Operation of these roadway segments would operate at an unacceptable LOS F with or without the project or alternative, and the V/C ratio would increase by more than 0.05 with project and build alternative traffic under cumulative (2030) conditions. This is a **significant impact**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4l: Participate in Fair Share Funding of Improvements to Reduce Impacts on Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segment s 12-13).

To improve operation on Hazel Avenue between Curragh Downs Drive and the U.S. 50 westbound ramps, this roadway segment could be widened to eight lanes. This improvement is inconsistent with Sacramento County's general plan because the county's policy requires a maximum roadway cross section of six lanes.

Analysis shown later indicates that improvements at the impacted intersection in this segment can be mitigated (see Mitigation Measure 3A.15-4p). Improvements to impacted intersections on this segment will improve operations on this roadway segment and, therefore; mitigate this segment impact. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segments 12-13).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4l would reduce the significant impact on Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions, by offsetting impacts of project traffic. The mitigated intersection LOS is shown later in this section.

If Sacramento County and Caltrans implements the intersection improvement, the impact would be reduced to a less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County and Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4m — Unacceptable LOS on White Rock Road between Grant Line Road and Prairie City Road (Sacramento County Roadway Segment 22) under Cumulative (2030) Conditions. *Operation of this roadway segment would degrade this LOS F segment by increasing the V/C ratio by more than 0.05 with project and alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

The addition of traffic on this roadway segment already operating at an unacceptable LOS F would increase the V/C ratio by more than 0.05 with project and build alternative traffic under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4m: Participate in Fair Share Funding of Improvements to Reduce Impacts on White Rock Road between Grant Line Road and Prairie City Road (Sacramento County Roadway Segment 22).

To improve operation on White Rock Road between Grant Line Road and Prairie City Road, this roadway segment must be widened to six lanes. This improvement is included in the 2035 MTP but is not included in the Sacramento County General Plan. Improvements to this roadway segment must be implemented by Sacramento County.

The identified improvement would more than offset the impacts specifically related to the Folsom South of U.S. 50 project on this roadway segment. However, because of other development in the region that would substantially increase traffic levels, this roadway segment would continue to operate at an unacceptable LOS F even with the capacity improvements identified to mitigate Folsom South of U.S. 50 impacts. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to White Rock Road between Grant Line Road and Prairie City Road (Sacramento County Roadway Segment 22).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4m would reduce the significant impact on White Rock Road between Grant Line Road and Prairie City Road from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by offsetting impacts of project traffic. The resulting mitigated LOS is F but the V/C ratio is less than the No Project condition.

If Sacramento County implements the improvement, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4n Unacceptable LOS on White Rock Road between Empire Ranch Road and Carson Crossing Road (Sacramento County Roadway Segment 28) under Cumulative (2030) Conditions. *Operating conditions on this roadway segment would deteriorate from an acceptable LOS D to an unacceptable LOS F with the Centralized Development , Reduced Hillside Development alternative under cumulative (2030) conditions, and deteriorate from an acceptable LOS D to an unacceptable LOS E with the No USACE Permit, Proposed Project, and Resource Impact Minimization alternatives under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

Operation of this roadway segment would deteriorate from an acceptable LOS D to an unacceptable LOS F with the Centralized Development and Reduced Hillside Development alternatives under cumulative (2030) conditions, and deteriorate from an acceptable LOS D to an unacceptable LOS E with the No USACE Permit, Proposed Project, and Resource Impact Minimization alternatives under cumulative (2030) conditions. This is a **significant** impact**.** The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4n: Participate in Fair Share Funding of Improvements to Reduce Impacts on White Rock Road between Empire Ranch Road and Carson Crossing Road (Sacramento County Roadway Segment 28).

To improve operation on White Rock Road between Empire Ranch Road and Carson Crossing Road, this roadway segment must be widened to six lanes. Improvements to this roadway segment must be implemented by Sacramento County. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to White Rock Road between Empire Ranch Road and Carson Crossing Road (Sacramento County Roadway Segment 28).

Implementation: Sacramento County Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Sacramento County Department of Transportation.

Implementation of Mitigation Measure 3A.15-4n would reduce the significant impact on White Rock Road between Empire Ranch Road and Carson Crossing Road from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by improving operations to LOS A.

If Sacramento County implements the improvement, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CITY OF RANCHO CORDOVA INTERSECTIONS

There are no impacts to any City of Rancho Cordova intersections under cumulative (2030) conditions.

CITY OF RANCHO CORDOVA ROADWAYS

There are no impacts to any City of Rancho Cordova roadways under cumulative (2030) conditions.

EL DORADO COUNTY INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-4o Unacceptable LOS at the White Rock Road / Carson Crossing Road Intersection (El Dorado County 1) under Cumulative (2030) Conditions. *This signalized intersection would degrade to an unacceptable LOS F during the a.m. peak traffic hour under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would degrade from an acceptable LOS C to an unacceptable LOS F during the a.m. peak traffic hour under the Proposed Project and all of the build alternatives under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4o: Participate in Fair Share Funding of Improvements to Reduce Impacts on the White Rock Road / Carson Crossing Road Intersection (El Dorado County 1).

To ensure that the White Rock Road / Carson Crossing Road intersection operates at an acceptable LOS, the eastbound right turn lane must be converted into a separate free right turn lane, or double right. Improvements to this intersection must be implemented by El Dorado County. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a

program established by that agency to reduce the impacts to the White Rock Road/Carson Crossing Road Intersection (El Dorado County 1).

Implementation: El Dorado County Department of Public Works.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: El Dorado County Department of Public Works.

Implementation of Mitigation Measure 3A.15-4o would reduce the significant impact on the White Rock Road / Carson Crossing Road intersection from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this intersection to operate at an acceptable LOS C.

If El Dorado County implements the improvement, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of El Dorado County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS INTERSECTIONS

Off-Site Elements

IMPACT 3A.15-4p Unacceptable LOS at the Hazel Avenue/U.S. 50 Westbound Ramps Intersection (Caltrans Intersection 1) under Cumulative (2030) Conditions. *This signalized intersection would degrade from an unacceptable LOS F during the a.m. and p.m. peak traffic hours with an increase in the delay at this intersection during the a.m. and p.m. peak traffic hours by more than 5 seconds under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This signalized intersection would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and alternative traffic under cumulative (2030) conditions. Project and build alternative traffic would increase the delay at this intersection during the a.m. and p.m. peak traffic hours by more than 5 seconds. This is a **significant impact**. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4p: Participate in Fair Share Funding of Improvements to Reduce Impacts on the Hazel Avenue/U.S. 50 Westbound Ramps Intersection (Caltrans Intersection 1).

To ensure that the Hazel Avenue/U.S. 50 westbound ramps intersection operates at an acceptable LOS, the westbound approach must be reconfigured to consist of one dedicated left turn lane, one shared left-through lane and three dedicated right-turn lanes. Improvements to this intersection must be implemented

by Caltrans and Sacramento County. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Hazel Avenue/U.S. 50 Westbound Ramps Intersection (Caltrans Intersection 1)

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4p would reduce the significant impact on the Hazel Avenue/U.S. 50 Westbound Ramps Intersection from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by reducing the intersection delay below Cumulative No Project levels. The resulting mitigated LOS is F but the V/C ratio is less than the No Project condition.

If Caltrans and Sacramento County implements the improvements, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans and Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS FREEWAY SEGMENTS

Off-Site Elements

IMPACT 3A.15-4q Unacceptable LOS on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1) under Cumulative (2030) Conditions. *Project traffic would increase on this LOS F freeway segment under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway segment would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway segment volume under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4q: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Zinfandel Drive and Sunrise Boulevard, an additional eastbound lane could be constructed. This improvement is not consistent with

the Concept Facility in Caltrans State Route 50 Corridor System Management Plan; therefore, it is not likely to be implemented by Caltrans by 2030.

Construction of the Capitol South East Connector, including widening White Rock Road and Grant Line Road to six lanes with limited access, could divert some traffic from U.S. 50 and partially mitigate the project's impact. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard (Freeway Segment 1).

Implementation: Capitol Southeast Connecter Joint Powers Authority.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Capitol Southeast Connecter Joint Powers Authority.

Implementation of Mitigation Measure 3A.15-4q would partially reduce the significant impact on Eastbound U.S. 50 between Zinfandel Drive and Sunrise Boulevard from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions. A mitigated LOS cannot be calculated because the design of the Capitol South East Connector is not know at this time; therefore, it is not known how much traffic would be diverted off of U.S. 50 and what LOS that reduced U.S. 50 volume would produce.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Capital Southeast, the City of Rancho Cordova and Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4r Unacceptable LOS on Eastbound U.S. 50 between Rancho Cordova Parkway and Hazel Avenue (Freeway Segment 3) under Cumulative (2030) Conditions. *Project traffic would increase on this LOS F freeway segment under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway segment would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway segment under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4r: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Rancho Cordova Parkway and Hazel Avenue (Freeway Segment 3).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Rancho Cordova Parkway and Hazel Avenue, an additional eastbound lane could be constructed. This improvement is not consistent with the Concept Facility in Caltrans State Route 50 Corridor System Management Plan; therefore, it is not likely to be implemented by Caltrans by 2030.

Construction of the Capitol South East Connector, including widening White Rock Road and Grant Line Road to six lanes with limited access, could divert some traffic off of U.S. 50 and partially mitigate the project's impact. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Eastbound U.S. 50 between Rancho Cordova Parkway and Hazel Avenue (Freeway Segment 3).

Implementation: Capitol Southeast Connecter Joint Powers Authority.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Capitol Southeast Connecter Joint Powers Authority.

Implementation of Mitigation Measure 3A.15-4r would partially reduce significant impact on Eastbound U.S. 50 between Rancho Cordova Parkway and Hazel Avenue from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions. A mitigated LOS cannot be calculated because the design of the Capitol South East Connector is not know at this time; therefore, it is not known how much traffic would be diverted off of U.S. 50 and what LOS that reduced U.S. 50 volume would produce.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Capital Southeast, the City of Rancho Cordova and Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4s Unacceptable LOS on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 5) under Cumulative (2030) Conditions. *This freeway segment would deteriorate from LOS E to LOS F during the a.m. and p.m. peak traffic hours with project and build alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

Traffic associated with the project and build alternatives would deteriorate operating conditions on this segment from LOS E to F during both the a.m. and p.m. peak hours under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4s: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 5).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Folsom Boulevard and Prairie City Road, the eastbound auxiliary lane should be converted to a mixed flow lane that extends to and drops at the Oak Avenue Parkway off ramp (see mitigation measure 3A.15-4t). Improvements to this freeway segment must be implemented by Caltrans. This improvement is not consistent with the Concept Facility in Caltrans State Route 50 Corridor System Management Plan; therefore, it is not likely to be implemented by Caltrans by 2030.

Construction of the Capitol South East Connector, including widening White Rock Road and Grant Line Road to six lanes with limited access, could divert some traffic off of U.S. 50 and partially mitigate the project's impact.

The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road (Freeway Segment 5).

Implementation: Capitol Southeast Connecter Joint Powers Authority.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: Capitol Southeast Connecter Joint Powers Authority.

Implementation of Mitigation Measure 3A.15-4s would partially reduce the significant impact on Eastbound U.S. 50 between Folsom Boulevard and Prairie City Road from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions. A mitigated LOS cannot be calculated because the design of the Capitol South East Connector is not know at this time; therefore, it is not known how much traffic would be diverted off of U.S. 50 and what LOS that reduced U.S. 50 volume would produce.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Capital Southeast, the City of Rancho Cordova and Sacramento County, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4t Unacceptable LOS on Eastbound U.S. 50 between Prairie City Road and Oak Avenue Parkway (Freeway Segment 6) under Cumulative (2030) Conditions. *This freeway segment would degrade to an unacceptable LOS F during the a.m. peak traffic hour with project and build alternative traffic, and this deficient freeway segment (LOS F) would experience higher volumes during the p.m. peak traffic hour with the addition of traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway segment would degrade from an acceptable LOS E to an unacceptable LOS F during the a.m. peak traffic hour with the project and all build alternatives traffic under cumulative (2030) conditions. This freeway segment would operate at an unacceptable LOS F during the p.m. peak traffic hour with or without the project and all but one build alternative under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4t: Participate in Fair Share Funding of Improvements to Reduce Impacts on Eastbound U.S. 50 between Prairie City Road and Oak Avenue Parkway (Freeway Segment 6).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS between Prairie City Road and Oak Avenue Parkway, the northbound Prairie City Road slip on ramp should merge with the eastbound

auxiliary lane that extends to and drops at the Oak Avenue Parkway off ramp (see Mitigation Measures 3A.15-4u, v and w), and the southbound Prairie City Road flyover on ramp should be braided over the Oak Avenue Parkway off ramp and start an extended full auxiliary lane to the East Bidwell Street – Scott Road off ramp. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to Eastbound U.S. 50 between Prairie City Road and Oak Avenue Parkway (Freeway Segment 6).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4t would reduce the significant impact on Eastbound U.S. 50 between Prairie City Road and Oak Avenue Parkway from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this freeway segment to operate at an acceptable LOS. With the proposed mitigated design this freeway segment will operate at LOS F but with a lower traffic density than under the No Project condition.

If Caltrans implements the improvements, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

CALTRANS FREEWAY RAMP MERGE, DIVERGE AND WEAVING SECTIONS

Off-Site Elements

IMPACT 3A.15-4u — Unacceptable LOS at the U.S. 50 Eastbound / Prairie City Road Slip Ramp Merge (Freeway Merge 6). *Project and alternative traffic would increase at this LOS F freeway merge during the a.m. and p.m. peak traffic hours with project and build alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway merge would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway merge under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4u: Participate in Fair Share Funding of Improvements to Reduce Impacts on the U.S. 50 Eastbound / Prairie City Road Slip Ramp Merge (Freeway Merge 6).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS, the northbound Prairie City Road slip on ramp should start the eastbound auxiliary lane that extends to and drops at the Oak Avenue Parkway off ramp (see mitigation measure 3A.15-4u, w and x), and the southbound Prairie City Road flyover on ramp should be braided over the Oak Avenue Parkway off ramp and start an extended full auxiliary lane to the East Bidwell Street – Scott Road off ramp. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/Prairie City Road slip ramp merge (Freeway Merge 6).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be build.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4u would reduce the significant impact on the U.S. 50 Eastbound / Prairie City Road Slip Ramp Merge from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this merge to operate at an acceptable LOS. With the proposed mitigated design this merge segment will no longer exist, and be replaced with a weaving segment that will operate at LOS F but with a lower traffic density than under the No Project condition.

If Caltrans implements the improvements, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4v Unacceptable LOS at the U.S. 50 Eastbound / Prairie City Road Flyover On Ramp to Oak Avenue Parkway Off Ramp Weave (Freeway Weave 7). *Project and alternative traffic would increase at this LOS F freeway weave during the a.m. and p.m. peak traffic hours with project and build alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway weave would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway weave under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4v: Participate in Fair Share Funding of Improvements to Reduce Impacts on the U.S. 50 Eastbound / Prairie City Road Flyover On Ramp to Oak Avenue Parkway Off Ramp Weave (Freeway Weave 7).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS, the northbound Prairie City Road slip on ramp should start the eastbound auxiliary lane that extends to and drops at the Oak Avenue Parkway off ramp (see mitigation measure 3A.15-4u, v and x), and the southbound Prairie City Road flyover on ramp should be braided over the Oak Avenue Parkway off ramp and start an extended full auxiliary lane to the East Bidwell Street – Scott Road off ramp. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound/Prairie City Road Flyover On Ramp to Oak Avenue Parkway Off Ramp Weave (Freeway Weave 7).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4v would reduce the significant impact on Freeway Weave 7 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this merge to operate at an acceptable LOS. With the proposed mitigated design this weaving segment will no longer exist, and be replaced with a weaving segment that will operate at LOS F but with a lower traffic density than under the No Project condition.

If Caltrans implements the improvements, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4w — Unacceptable LOS at the U.S. 50 Eastbound / Oak Avenue Parkway Loop Ramp Merge (Freeway Merge 8). *Project and alternative traffic would increase at this LOS F freeway merge during the a.m. and p.m. peak traffic hours with project traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway merge would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway merge under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4w: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound / Oak Avenue Parkway Loop Ramp Merge (Freeway Merge 8).

To ensure that Eastbound U.S. 50 operates at an acceptable LOS, the southbound Oak Avenue Parkway loop on ramp should merge with the eastbound auxiliary lane that starts at the southbound Prairie City Road braided flyover on ramp and ends at the East Bidwell Street – Scott Road off ramp (see mitigation measure 3A.15-4u, v and w). Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to U.S. 50 Eastbound/Oak Avenue Parkway Loop Ramp Merge (Freeway Merge 8).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4w would reduce the significant impact on Freeway Merge 8 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this merge to operate at LOS C.

If Caltrans implements the improvements, the impact would be reduced to less than significant.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4x Unacceptable LOS at the U.S. 50 Westbound / Empire Ranch Road Loop Ramp Merge (Freeway Merge 27). *This freeway merge would degrade to an unacceptable LOS F during the a.m. and p.m. peak traffic hours with the project and build alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway merge would degrade from an acceptable LOS D to an unacceptable LOS F during the a.m. and p.m. peak traffic hours with the project and all build alternatives traffic under cumulative (2030) conditions. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4x: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Empire Ranch Road Loop Ramp Merge (Freeway Merge 27).

To ensure that Westbound U.S. 50 operates at an acceptable LOS, the northbound Empire Ranch Road loop on ramp should start the westbound auxiliary lane that ends at the East Bidwell Street – Scott Road

off ramp. The slip on ramp from southbound Empire Ranch Road slip ramp would merge into this extended auxiliary lane. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Empire Ranch Road loop ramp merge (Freeway Merge 27).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4x would reduce the significant impact on Freeway Merge 27 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this on ramp to enter into its own lane and eliminating the direct merge to the freeway mainline. With the elimination of the direct merge movement there is no specific LOS for the mitigated condition.

If Caltrans implements the improvements, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

IMPACT 3A.15-4y Unacceptable LOS at the U.S. 50 Westbound / Prairie City Road Loop Ramp Merge (Freeway Merge 35). *Project and alternative traffic would increase at this LOS F freeway merge during the a.m. and p.m. peak traffic hours with project and build alternative traffic under cumulative (2030) conditions.*

NCP, PP, RIM, CD, RHD

This freeway merge would operate at an unacceptable LOS F during the a.m. and p.m. peak traffic hours with or without project and all alternatives traffic under cumulative (2030) conditions. Project and alternative traffic would increase at this freeway merge under all build alternatives. This is a **significant** impact. The impacts of these alternatives would be similar to that of the Proposed Project.

Mitigation Measure 3A.15-4y: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound / Prairie City Road Loop Ramp Merge (Freeway Merge 35).

To ensure that Westbound U.S. 50 operates at an acceptable LOS, the northbound Prairie City Road loop on ramp should start the westbound auxiliary lane that continues beyond the Folsom Boulevard off ramp. The slip on ramp from southbound Prairie City Road slip ramp would merge into this extended auxiliary lane. Improvements to this freeway segment must be implemented by Caltrans. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other

appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Prairie City Road Loop Ramp Merge (Freeway Merge 35).

Implementation: California Department of Transportation.

Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built.

Enforcement: California Department of Transportation.

Implementation of Mitigation Measure 3A.15-4y would reduce the significant impact on Freeway Merge 35 from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development alternatives under cumulative (2030) conditions to a less-than-significant level, by allowing this on ramp to enter into its own lane and eliminating the direct merge to the freeway mainline . There is no specific resulting mitigated merge LOS because with the on ramp entering its own exclusive lane at the beginning of an auxiliary lane there is no longer a merge.

If Caltrans implements the improvements, the impact would be reduced to a less-than-significant level.

As discussed above, the requirement that the Applicant participate in funding these transportation improvements that are located outside the City of Folsom would mitigate or substantially lessen the project's significant impact on this intersection but the impact would remain **significant and unavoidable**. This conclusion reflects the reality that successful implementation the proposed improvements will require the cooperation of Caltrans, over which the City of Folsom has no control. For this reason, the City of Folsom is conservatively acknowledging the possibility that, despite its own commitment to work with these other agencies, mutually acceptable accommodation may not be reached. Consistent with CEQA Guidelines section 15091, subdivision (a)(2), though, the City of Folsom concludes that these other agencies can and should cooperate with the City in implementing the mitigation.

MITIGATED TRANSPORTATION NETWORK

While the mitigation measures detailed in this document are effective at reducing the level of significance of many transportation impacts, congested conditions would remain in the vicinity of the project, due to the traffic associated with the project as well as extensive development in the site environs and throughout the region. Each mitigation measure address a specific deficiency. However, on a system wide basis, these individual measures are unable to fully mitigate the impacts of the Proposed Project or build alternatives.

As an alternative method of project mitigation, a mitigated transportation network has been developed to address anticipated travel demand in the project area on a systematic basis, rather than a location-by-location approach. The intent is to provide a balanced transportation system, providing efficient movement of people and goods in the study area. Some of the network includes facilities that are not currently identified in area General Plans or in the 2035 MTP, but which would contribute to effectively accommodating anticipated travel demand.

The proposed network includes many improvements intended to systematically mitigate project impacts. The mitigation elements inside the City of Folsom could be implemented by the City. Roadway improvements outside the City of Folsom's jurisdiction would need to be implemented by others. The list of improvements assumed in the mitigated transportation network includes:

- Sibley Street/Blue Ravine Road - Add second northbound left turn lane
- East Bidwell Street/Nesmith Court - Add second westbound right turn lane

- Serpa Way/Iron Point Road - Restripe northbound lane as shared left through lane
- Empire Ranch Road/Iron Point Road - Add a second northbound and southbound left turn lane
- Oak Avenue Parkway/Easton Valley Parkway - Add second southbound right turn lane
- Oak Avenue Parkway/Easton Valley Parkway - Add second southbound right turn lane
- Oak Avenue Parkway/White Rock Road - Add second southbound right turn lane
- Empire Ranch Road/White Rock Road - Add second eastbound right turn lane
- White Rock Road/ Grant Line Road - Grade separation
- White Rock Road - Grant Line Road to Carson Crossing Road - Widened to six lanes
- Grant Line Road - White Rock Road to Jackson Highway (SR 16) - Widened to six lanes
- Empire Ranch Road - White Rock Road to Carson Crossing Road – extend as new four lane road
- "Truck Road" from Grant Line Road to Scott Road (East) – Add a new two lane road (for rock quarry trucks).
- Eastbound U.S. 50 - Prairie City Road to Oak Avenue Parkway – braid Oak Avenue Parkway off-ramp with southbound Prairie City Road flyover on-ramp
- Eastbound U.S. 50 - Prairie City Road to Oak Avenue Parkway – add auxiliary lane from the northbound Prairie City Road slip on-ramp to the Oak Avenue Parkway off-ramp
- Eastbound U.S. 50 - Oak Avenue Parkway to Scott Road– extend auxiliary lane from Scott Road/ East Bidwell Street off-ramp back to the southbound Prairie City Road flyover on-ramp
- Westbound U.S. 50 - Empire Ranch Road to Scott Road - extend auxiliary lane from the Scott Road/East Bidwell Street off-ramp back to the northbound Empire Ranch Road loop on-ramp
- Westbound U.S. 50 - Prairie City Road to Folsom Blvd - extend auxiliary lane from the Folsom Blvd off-ramp is back to the northbound Prairie City Road loop on-ramp

A map of the improvements is shown in Exhibit 3A.15-101. The improvements to eastbound U.S. 50 should be built together as a package. The widening of White Rock Road is included in the 2035 MTP, but not in the Sacramento County General Plan. The widening of Grant Line Road is planned in the Sacramento County General Plan, but not included in the 2035 MTP. Both are in the Sacramento County Roadway Impact Fee Program. The extension of Empire Ranch Road south from White Rock Road to Golden Foothills Parkway, in the El Dorado Hills Business Park, is currently being planned by the El Dorado County / City of Folsom Joint Powers Authority but it is not on the Sacramento County General Plan Circulation diagram.

MITIGATED NETWORK ANALYSIS CONCLUSIONS

Exhibits 3A.15-102 through 3A.15-109 illustrate traffic volumes associated with the development of the project and the mitigated network. Tables 3A.15-34 through 3A.15-42 summarize how the mitigated transportation network would improve the level of service for the proposed project and eliminate most impacts. The widening of White Rock Road diverts traffic off of U.S. 50, and improves the freeway Level of Service.

CITY OF FOLSOM

The mitigated network mitigates the impacts to the intersections of

- Sibley Street / Blue Ravine Road
- East Bidwell Street / Nesmith Court
- Oak Avenue Parkway / Easton Valley Parkway

However, it does not mitigate the impacts to the intersections of

- Oak Avenue Parkway / East Bidwell Street,
- East Bidwell Street / Iron Point Road,
- Scott Road (East) / Easton Valley Parkway

The mitigated network creates a new impact to the intersection of

- Prairie City Road / White Rock Road

A potential mitigation for the Prairie City Road / White Rock Road intersection is replacement of the at grade intersection with a grade separated interchange.

SACRAMENTO COUNTY

The mitigated network mitigates the impacts to the roadway segments of

- Grant Line Road from White Rock Road to Jackson Highway (SR 16),
- Scott Road (West) from White Rock Road to Latrobe Road
- White Rock Road from Grant Line Road to Prairie City Road

However, it does not mitigate the impact to the roadway segment of

- Hazel Avenue from Curragh Downs Drive to U.S. 50 westbound ramp

The new road of Empire Ranch Road from White Rock Road to Carson Crossing Road is deficient at the assumed four lanes.

The mitigated network does not mitigate the impact to the intersection of

- Hazel Avenue / Gold Country Boulevard

CITY OF RANCHO CORDOVA

The mitigated network creates a new impact to the intersection of

- Rancho Cordova Parkway / White Rock Road.

EL DORADO COUNTY

The mitigated network mitigates the impacts to the intersection of

- White Rock Road / Carson Crossing Road.

CALTRANS

The mitigated network mitigates the impacts to the

- Eastbound Prairie City Road slip on-ramp merge
- Eastbound Prairie City Road flyover on to Oak Avenue Parkway off weave
- Eastbound Oak Avenue Parkway loop on-ramp merge
- Westbound Empire Ranch Road loop on-ramp merge
- Westbound Prairie City Road loop on-ramp merge

The mitigated network mitigates the impacts to the Eastbound U.S. 50 freeway segment of

- Rancho Cordova Parkway to Hazel Avenue
- Prairie City Road to Oak Avenue Parkway

However, it only decreases the impacts to the Eastbound U.S. 50 freeway segments of

- Zinfandel Drive to Sunrise Boulevard
- Folsom Boulevard to Prairie City Road

And the mitigated network does not mitigate the impact to the intersection of

- Hazel Avenue / Tributary- WB U.S. 50 Ramps

3A.15.4 CUMULATIVE QUARRY TRUCK TRAFFIC

Three aggregate quarries are proposed for the area south of the SPA. The Teichert and Walltown (Granite) quarries would be located south of White Rock Road along a proposed extension of Scott Road (East), and the DeSilva Gates quarry would be located along Scott Road (West). The only study of the potential impact of these quarry operations that is currently available is the Teichert Quarry Draft Environmental Impact Report. All three quarries are expected to be in full operation by the year 2030 and the truck trips described in that DEIR were added to the cumulative traffic volumes.

Aggregate, concrete, and hot asphalt mix would be distributed to construction sites and concrete product manufacturing facilities throughout Sacramento County, western El Dorado County, eastern Yolo County and northern San Joaquin County. On a peak day, 12,660 trucks trips would be generated by the three quarries, according to the Teichert Quarry DEIR. The assumed quarry truck trip generation can be seen in Table 3A.15-43. Trucks typically operate from 6 AM to 4 PM. There would not usually be any quarry trucks operating in the PM peak hour; therefore, the analysis in this document does not include the future quarry truck traffic during the cumulative PM peak hour. The Teichert Quarry DEIR estimates that there would be 814 truck trips in the AM peak hour. Trucks from the Teichert and Granite quarries would access the roadway system by a new southern extension of Scott Road (East). De Silva Gates trucks would access the roadway network via Scott Road (West), according to the Teichert Quarry DEIR.

The Teichert Quarry DEIR assigned 47% of the truck trips through the Folsom South of U.S. 50 SPA. The distribution is shown on Exhibit 3A.15-110. Trucks travelling to U.S. 50 and to the City of Folsom were assumed to travel on Prairie City Road and Scott Road. The City of Folsom considers the proposed number of daily quarry truck trips on this Specific Plan roadways to be in excess of an acceptable number due to potential air quality and noise impacts. The City wants to minimize the number of quarry truck trips on roads inside or adjacent to the proposed SPA because of their potential impacts to pavement, air quality and noise, as well as being considered to be incompatible with its dense smart-growth urban character.

Table 3A.15-43
Estimated Trip Generation from East County Mining Applications

Time Period	Vehicle Type	Teichert		Granite		DeSilva-Gates		All		
		Enter	Exit	Enter	Exit	Enter	Exit	Enter	Exit	Total

Source: Teichert Quarry Traffic Impact Study

The Proposed Project would add several new roadway facilities in the project area not included in the Teichert Quarry DEIR, some of which would act as logical routes for quarry truck traffic. In particular, the proposed Oak Avenue Parkway extension would likely accommodate some of these truck trips. A revised trip distribution was estimated, and is shown in Exhibit 3A.15-111. This distribution is not considered acceptable to the City of Folsom, but it reflects a logical distribution of truck trips. This distribution has been used in the estimation of cumulative traffic volumes in the project vicinity.

To minimize project transportation impacts to the SPA, the mitigated network was developed. One part of the mitigated network would be the construction of a quarry truck road that would extend east from Grant Line Road and travel south of the Prairie City State Vehicular Recreation Area, cross Scott Road (West) and end at the proposed Scott Road (East) extension near the Teichert and Walltown (Granite) quarries. All quarry truck traffic headed to or from Grant Line Road or White Rock Road west of Grant Line Road would likely use this proposed quarry truck road. The revised truck distribution used for the mitigated network is shown in Exhibit 3A.15-112.

3A.15.5 ALTERNATIVE QUARRY TRUCK ANALYSIS CONCLUSIONS

To quantify the potential impact of quarry truck traffic on the SPA, several alternative quarry truck scenarios were analyzed:

- Cumulative No Project, No Quarry Trucks
- Cumulative Proposed Project, No Quarry Trucks
- Cumulative Proposed Project, Assumed Quarry Truck Distribution
- Cumulative Proposed Project, Mitigated Network Quarry Truck Distribution
- Cumulative Proposed Project, “Local Trucks Only” Quarry Truck Distribution

The “Local Trucks Only” distribution reroutes all trucks going to or from U.S. 50 via White Rock Road. The “Local Trucks Only” distribution is shown in Exhibit 3A.15-113.

The results of the analyses are summarized in Tables 3A.15-44 through 3A.15-51. This analysis is presented to inform the public and decision makers regarding the potential range of effects of quarry truck trips on the roadway network in the project vicinity.

CITY OF FOLSOM

Compared to the Cumulative Proposed Project scenario (with the Assumed Quarry Truck Distribution), elimination of quarry trucks altogether would not result in any fewer intersection impacts. Similarly, allowing only local quarry trucks to use City of Folsom roads would not eliminate any impacts to intersections.

Compared to the "Cumulative Proposed Project, No Quarry Trucks" scenario, the addition of quarry trucks would cause three intersections on White Rock Road at Prairie City Road, Scott Road (West) and Scott Road (east) to degrade to LOS D conditions in the am peak hour.

SACRAMENTO COUNTY

If there were no quarry trucks, there would not be a project impact to the intersection of Grant line Road / White Rock Road. If there were no quarry trucks, there would not be project impacts to the roadway segment of Grant Line Road between Kiefer Road and Jackson Highway.. Allowing only local quarry trucks to use City of Folsom roads would not eliminate roadway segment impacts to Grant Line Road and White Rock Road.

Compared to the "Cumulative Proposed Project, No Quarry Trucks" scenario, the addition of quarry trucks would cause the segments of White Rock Road from Prairie City Road to Scott Road (East) to operate at LOS F conditions. While the segments of Grant Line Road between White Rock Road and Kiefer Boulevard would operate at LOS F conditions without quarry trucks, their addition would cause operations on this segment of Grant Line Road to degrade substantially.

CITY OF RANCHO CORDOVA

Compared to the Cumulative Proposed Project scenario (with the Assumed Quarry Truck Distribution), elimination of quarry trucks altogether would not result in fewer intersection or roadway segment impacts. Allowing only local quarry trucks to use City of Folsom roads would create one additional impact at the Grant Line Road / Centennial Road Intersection. A potential way to prevent an impact at this location under this scenario would be to build a grade separated interchange at this location instead of an at-grade intersection.

EL DORADO COUNTY

Compared to the Cumulative Proposed Project scenario (with the Proposed Quarry Truck Distribution), elimination of quarry trucks altogether would not result in fewer intersection impacts. Allowing only local quarry trucks to use City of Folsom roads would not eliminate any impacts to intersections.

CALTRANS

Compared to the Cumulative Proposed Project scenario (with the Proposed Quarry Truck Distribution), elimination of quarry trucks altogether would not result in any fewer intersection, freeway segment, merge / diverge or weave impacts. Allowing only local quarry trucks to use City of Folsom roads would not eliminate any impacts to intersections, freeway segments, merge / diverge or weaving areas.

INDEPENDENT QUARRY TRUCK MANAGEMENT PLAN

Currently Sacramento County, the City of Folsom, the City of Rancho Cordova, El Dorado County, Caltrans, the Capital Southeast Connector JPA and the quarry applicants are jointly working on a quarry truck management plan to address the issues associated with quarry truck traffic. The goals of that plan are as follows:

- To plan, phase, fund, and implement roadway improvements needed to accommodate the mobility needs of the east county quarries, Greencycle and the traveling public to meet the given demand.
- To consider creative transportation solutions that are sensitive to affected existing and future land uses while minimizing out of way travel.
- To promote stakeholder collaboration and cooperation.

A technical analysis for the Truck Management Plan has been prepared, which involves the following elements:

- Estimating the amount of truck traffic generated from the proposed quarries and the distribution of that traffic
- Identifying a set of potential truck access scenarios and analyzing traffic operations under each scenario
- Determining the general roadway improvements that would be needed to accommodate the estimated truck traffic
- The Truck Management Plan is not an EIR and will not determine mitigation measures for the quarries. However, that study is striving to identify the roadway improvements that will likely be needed to avoid traffic congestion and operational issues caused by quarry truck traffic.

Much of the analysis in the Truck Management Plan focused on projected 2030 conditions. The 2030 analysis assumed full implementation of the roadway system contained in the proposed Folsom SOI area and the proposed Sacramento County General Plan Update near the East County quarries, which is substantially different than the limited number of two-lane roadways that currently serve the East County area. However, the timing of future roadway improvements in the vicinity of the quarries depends on the timing of future residential and commercial development in the East County area, which is uncertain. The Truck Management Plan thus also discusses the roadway improvements that may be needed if the one or more of the quarries go forward ahead of significant residential and commercial development in the Folsom SOI area.

The Truck Management Plan identified the need for two types of near-term roadway improvements:

- Capacity improvements needed to maintain acceptable traffic levels of service
- Operational improvements, such as extra width at intersections that would be needed to provide adequate turning radius for quarry trucks

If a substantial amount of aggregate production occurs prior to significant development in the East County area, the analysis indicated the potential need for three types of near-term capacity improvements:

1) Widening the following two-lane roadways to four lanes when volumes exceed acceptable levels:
    - Scott Road from White Rock Road to U.S. 50 and/or Prairie City Road from White Rock Road to U.S. 50, depending on the selected truck routing plan
    - White Rock Road from Scott Road to Grant Line Road (or construction of an east-west truck access road parallel to White Rock Road from the quarries to Grant Line Road)

- Grant Line Road from White Rock Road and Douglas Road

2) The addition of auxiliary lanes or at least acceleration lanes on westbound U.S. 50 from Scott Road and Folsom Boulevard

3) The addition of traffic signals and turn lanes at the following intersections that would have concentrations of truck volumes:

   - White Rock Road/Scott Road (East)
   - White Rock Road/Prairie City Road and White Rock Road/Grant Line Road (or construction of an east-west truck access road parallel to White Rock Road from the quarries to Grant Line Road)
   - Grant Line Road and Jackson Highway (SR 16)

   The East County roadways serving the quarries currently have two lanes with no shoulders and in some locations have poor vertical or horizontal curves. At many intersections, there is inadequate width for trucks to turn without flowing into opposing travel lanes. The locations where near-term operational improvements would be needed include:

   - White Rock Road/Scott Road (East) – extra width for truck turning movements
   - White Rock Road/Prairie City Road – potentially extra width for truck turning movements, if Prairie City Road has significant trucks in selected truck routing plan
   - Prairie City Road and U.S. 50 – widen northbound to westbound loop on-ramp and provide westbound acceleration lane on U.S. 50, if Prairie City Road has significant trucks in selected truck routing plan

   There is uncertainty about the distribution of future truck traffic and how it may impact roadways in the vicinity of the quarry sites. It would be important to implement monitoring stations to collect real time traffic data. The best locations for these monitoring stations are as follows:

   - White Rock Road west of Grant Line Road
   - White Rock Road east of Grant Line Road
   - White Rock Road west of Scott Road (East)
   - White Rock Road east of Scott Road (East)
   - Scott Road (East) north of White Rock Road
   - Prairie City Road north of White Rock Road
   - Grant Line Road south of White Rock Road

   It would also be important to install CCTV surveillance cameras at key intersections to allow real time monitoring at the County Traffic Operations Center. The likely locations for these cameras are as follows:

   - White Rock Road/Scott Road (East)
   - White Rock Rd/Prairie City Road
   - Grant Line Rd/Potential East-West Truck Access Road

Notes: LOS = level of service; V/C = volume-to-capacity
[1] V/C ratio is shown for signalized intersections. Delay is shown for unsignalized intersections.
[2] Worst-case delay reported for unsignalized, side-street-stop intersections; average intersection delay reported for all-way-stop intersections. Both delays are reported in seconds per vehicle.
Bold indicates deficiency.
