ABSTRACT

This joint Draft Environmental Impact Report/Draft Environmental Impact Statement (DEIR/DEIS) documents the analysis of the potential effects of implementing each of six alternative land use scenarios for a mixed-use development in the approximately 3,500-acre Folsom South of U.S. 50 Specific Plan area, in eastern Sacramento County, California. This abstract is provided in compliance with National Environmental Policy Act (NEPA) requirements. The EIR/EIS documents the existing condition of environmental issues and resources in and around areas considered for development, and potential impacts on those issues and resources as a result of implementing the alternatives. The land development alternatives considered in detail are: (1) No Project; (2) No USACE Permit; (3) Proposed Project (Applicants' Preferred Alternative); (4) Resource Impact Minimization; (5) Centralized Development; and (6) Reduced Hillside Development. The DEIR/DEIS also evaluates in detail 11 off-site alternatives to provide potable water conveyance and treatment in support of the proposed land use development in the specific plan area.

The DEIR/DEIS for the Folsom South of U.S. 50 Specific Plan project is available for a NEPA public comment and review period of 60 days from the date of publication of the notice of availability in the Federal Register. A copy can also be found on the Internet at http://www.spk.usace.army.mil/organizations/cespk-co/regulatory/index.html.

Your written comments should be postmarked 60 days from the date of publication of the notice of availability in the Federal Register. The notice of availability is expected to be published in the Federal Register on July 9, 2010. Please submit and address your written comments on the DEIS to the U.S. Army Corps of Engineers, Regulatory Branch, at the address noted above by September 10, 2010.

NOTE TO REVIEWERS

Reviewers should provide AECOM or the U.S. Army Corps of Engineers (USACE), the NEPA lead agency, with their comments during the review period of the DEIS. This will enable USACE to analyze and respond to the comments at one time and to use the information acquired in preparation of the Final Environmental Impact Statement (FEIS), thus avoiding undue delay in the decision-making process. Reviewers have an obligation to structure their participation in the NEPA process so that it is meaningful and alerts the agency to reviewers' positions and contentions. *Vermont Yankee Power Corp. v. NRDC,* 435 U.S. 519, 533 (1978). Environmental objections that could have been raised at the draft stage may be waived if not raised until after completion of the FEIS. *City of Angoon v. Hodel* (9th Circuit, 1986) and *Wisconsin Heritages, Inc. v. Harris,* 490 F. Supp. 1334, 1338 (E.D. Wis. 1980). Comments on the DEIS should be specific and should address the adequacy of the statement and the merits of the alternatives discussed (40 CFR 1503.3).

EXECUTIVE SUMMARY

ES.1 INTRODUCTION

This executive summary highlights the major areas of importance in the environmental analysis for the proposed Folsom South of Highway 50 Specific Plan project, as required by Section 15123 of the California Environmental Quality Act (CEQA) Guidelines (State CEQA Guidelines) and 40 Code of Federal Regulations (CFR) Section 1502.12 of the National Environmental Policy Act (NEPA). As stated in California Code of Regulations (CCR) Section 15123(a) of the State CEQA Guidelines, "[a]n EIR shall contain a brief summary of the proposed action and its consequences. The language of the summary should be as clear and simple as reasonably practical." As stated in NEPA Section 1502.12, "each environmental impact statement shall contain a summary which adequately and accurately summarizes the statement. The summary shall stress the major conclusions, areas of controversy (including issues raised by agencies and the public), and the issues to be resolved (including the choice among alternatives)." As required by the State CEQA Guidelines and NEPA regulations, this executive summary includes (1) a summary description of the proposed project, (2) a synopsis of environmental impacts and recommended mitigation measures (Table ES-1), (3) identification of the alternatives evaluated, and (4) a discussion of the areas of controversy associated with the project. For additional detail regarding specific issues, please consult Chapter 2, "Alternatives"; Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures"; and Chapter 4, "Other Statutory Requirements."

ES.2 LEAD AND COOPERATING AGENCIES

This document is a joint draft environmental impact report/draft environmental impact statement (DEIR/DEIS) prepared for the Folsom South of Highway 50 Specific Plan project (the "proposed action" for purposes of NEPA and the "proposed project" for purposes of CEQA, hereinafter referred to as "the project").

The City of Folsom (City) is the lead agency for the project under CEQA, and the U.S. Army Corps of Engineers (USACE), Sacramento District, is the Federal lead agency under NEPA. The U.S. Bureau of Reclamation (Reclamation) is a Cooperating Agency under NEPA.

ES.3 TYPE OF ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT

This EIR/EIS contains an analysis at a program level. For some issue areas, sufficient data were available for a more detailed level of analysis. Where this analysis was performed, the topic section begins with a statement that impacts would be the same for individual phases of development as for the project as a whole.

ES.4 REQUESTED ENTITLEMENTS

The following entitlements are requested from the City and USACE for the Proposed Project. Additional approvals, permits, and authorizations are listed in Chapter 1, "Introduction and Statement of Purpose and Need."

City of Folsom

Adoption of the Proposed Project, as well as action alternatives under consideration, requires approval of the following City entitlements:

- certification of the EIR/EIS and Mitigation Monitoring and Reporting Program (MMRP),
- amendment of the Folsom General Plan,
- adoption of a Public Facilities Financing Plan,

- adoption of the Folsom Plan Area Specific Plan,
- possible approval of development agreements between the City and project applicant(s),
- approval of large-lot tentative maps, and
- pre-zoning of the project site.

Future City entitlement approvals may include, but are not limited to, the following:

- use permits,
- approval of tentative parcel and subdivision maps,
- design review,
- lot line adjustments,
- engineering improvement plans,
- planned development permits,
- grading plans, and
- Development Agreement between the City and future project applicant(s).

In addition to the City approvals listed above, approval by the Sacramento Local Agency Formation Commission (LAFCo) would also be required.

U.S. Army Corps of Engineers

The project applicant(s) are also seeking a Federal permit from USACE pursuant to Section 404 of the Clean Water Act (CWA) for the discharge of fill material into waters of the United States. The evaluation of the proposed project requires the USACE ensure compliance with Section 106 of the National Historic Preservation Act of 1966, as amended, Section 7 of the Endangered Species Act, and other applicable laws.

In addition to the authorizations and approvals requested from the City and USACE, permits and other approval actions from the following Federal, state, regional, and local agencies may be required:

- U.S. Environmental Protection Agency
- U.S. Fish and Wildlife Service
- U.S. Bureau of Reclamation
- National Marine Fisheries Service
- California Department of Education
- California Department of Fish and Game
- California Department of Transportation
- California Department of Public Health
- California State Historic Preservation Office
- Central Valley Regional Water Quality Control Board (Region 5)
- Sacramento Local Agency Formation Commission
- County of Sacramento
- City of Rancho Cordova
- Sacramento Metropolitan Air Quality Management District

ES.5 PROJECT CHARACTERISTICS

ES.5.1 PROJECT LOCATION

The project site includes the Specific Plan Area (SPA), and a Water Facilities Study Area. The SPA is located in eastern Sacramento County, south of U.S. Highway 50 (U.S. 50), east of Prairie City Road, North of White Rock Road, and west of the El Dorado County Line (see Exhibits 2-1 and 2-2). The Water Facilities Study Area includes the Natomas Central Mutual Water Company (NCMWC) service area, portions of the Sacramento River,

and pipeline alignments and water treatment plant (WTP) locations which extend from the community of Freeport through central and eastern Sacramento County to the SPA.

ES.5.2 ELEMENTS OF THE PROJECT

The project applicant(s)—the South Folsom Property Owners Group—are requesting annexation into the City of Folsom, and approval of various discretionary entitlements in support of a specific plan for a mixed-use development and supporting on- and off-site roadways and infrastructure (project). The specific plan covers an area in eastern Sacramento County, south of U.S. 50, and adjacent to the existing Folsom city limits. The specific plan supports a combination of employment-generating uses, retail and supporting services, recreational uses, and a broad range of residential uses and associated infrastructure and roads on approximately 3,510-acres that is located entirely within the City's sphere of influence, but currently under jurisdiction of Sacramento County. The project site, however, encompasses a larger area: it includes the entire area proposed for annexation, including U.S. 50 right-of-way and proposed interchange areas, for a total of approximately 3,584 acres. The project site is located south of U.S. 50, north of White Rock Road, east of Prairie City Road (a small area extends west of Prairie City Road at the southwest corner of the project site), and west of the Sacramento/El Dorado County line (see Exhibits 2-1 and 2-2 in Chapter 2, "Alternatives").

The Proposed Project includes 10,210 residential units at various densities on a total of 1,477.2 acres; 362.8 acres designated for commercial and industrial use, including a regional shopping center; public/quasi-public uses; elementary, middle, and high schools on 179.3 acres; 121.7 acres of community and neighborhood parks; stormwater detention basins; 1,053.1 acres of open-space areas and open-space preserves; and major roads with landscaping.

Several off-site infrastructure facilities (intersection expansions to allow access to and from U.S. 50 and the SPA, an overpass of U.S. 50, two roadway connections and sewer pipelines from the Folsom Heights property into El Dorado Hills, a sewer force main connection to the existing City system, a detention basin, and water pipelines and facilities) are proposed to serve project development and are addressed in this DEIR/DEIS.

Based on current water demand assumptions and implementation of reasonable conservation measures in years when water supplies could be subjected to dry-year reductions of up to 25%, the project would require not more than 5,600 acre-feet[1] of water per year (AFY). The City is proposing Off-site Water Facilities that would involve the permanent assignment to the City of the contractual entitlement to Central Valley Project (CVP) contract entitlement water totaling not more than 8,000 AFY[2] from NCMWC, diverting this water supply from the Sacramento River, and conveying this water to the SPA.

In addition, this project would include the City purchasing from Sacramento County Water Agency (SCWA) dedicated capacity within the Freeport Regional Water Project (Freeport Project), which would serve as the point of diversion (POD) on the Sacramento River and partial conveyance pathway for not more than 6,000 AFY purchased from NCMWC. The City proposes to add the Freeport POD to the assigned CVP water to facilitate the diversion of these supplies at the existing Freeport Project diversion. The City proposes to pump and convey the assigned NCMWC CVP water supply through the Freeport Project diversion facility and conveyance pipeline to the point where SCWA and East Bay Municipal Utilities District (EBMUD) pipeline split or the bifurcation point. The City would then construct new water supply conveyance infrastructure from the bifurcation point to the SPA.

Provision of water service to the project would involve the following actions by the City:

- taking an assignment for up to 8,000 AFY of CVP surface water from NCMWC (which is currently delivered in July and August in accordance with NCMWC's irrigation demands);

[1] An acre-foot of water contains 325,851 gallons; one million gallons is about 3 acre-feet.
[2] NCMWC's CVP water contract is subject to a dry-year provision whereby total deliveries can be reduced by up to 25%.

- rescheduling the existing CVP July/August delivery schedule to a year-round municipal and industrial (M&I) schedule;

- entering into an agreement with SCWA to convey the water acquired by the City from NCMWC through the Freeport Project, to facilitate the integration of the Off-site Water Facilities with existing Freeport Project diversion and water conveyance facilities; and

- Constructing conveyance, pump, storage, and treatment facilities, including booster pump station(s), water treatment and storage facilities, and conveyance facilities.

Consistent with the requirements of CEQA and NEPA, the City is evaluating several conveyance alternatives to enable the delivery of not more than 6,000 AFY of CVP water assigned by NCMWC to the SPA. Each alternative includes optional route alignments and/or operational features (e.g., WTPs and associated storage facilities) to cover the range of feasible alternatives available to the City. Exhibits 2-25, 2-27, 2-28, and 2-29 in Chapter 2, "Alternatives," illustrate the potential locations of water supply and conveyance infrastructure to serve the SPA.

Information regarding the location, design, and operation of the various project components is presented in detail in Chapter 2, "Alternatives."

ES.6 SUMMARY OF SIGNIFICANT IMPACTS AND MITIGATION MEASURES

Table ES-1 displays a summary of significant impacts and proposed mitigation measures that would avoid, eliminate, minimize, or reduce potential impacts. In the table, the level of significance of the impact following implementation of each mitigation measure is identified. Effects that would occur under each alternative development scenario on Table ES-1 are identified as follows: PP (Proposed Project), RIM (Resource Impact Minimization), CD (Centralized Development), RHD (Reduced Hillside Development), NF (No Federal Action), and NP (No Project). For impacts related to the water supply portion of the project, ten numbered alternatives are analyzed. In Table ES-1, the impact and its significance conclusion is followed by the mitigation requirement. For detailed descriptions of project impacts and mitigation measures, please see Sections 3.1 through 3.17 A and B in Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures."

ES.7 ALTERNATIVES

The State CEQA Guidelines (CCR Section 15126.6) and the NEPA Council on Environmental Quality (CEQ) Regulations (40 CFR 15012.14) require that an EIR/EIS describe a range of reasonable alternatives to the proposed project that could feasibly attain the basic objectives of the project and avoid and/or lessen the environmental effects of the project. Chapter 2, "Alternatives," of this EIR/EIS provides a comparative analysis between the Proposed Project/Action and four "Land" alternatives, as well as comparative analysis between ten "Water" alternatives. The "Land" alternatives describe a range of possible land use plans for the SPA, and the "Water" alternatives describe a range of potential water facility options which could be used to convey the necessary water supply to the SPA. The No Project/No Action Alternative (hereinafter referred to as the "No Project Alternative") as required under CEQA and NEPA and a No USACE Permit Alternative as required by USACE under NEPA is also evaluated in Chapter 2.

ES.7.1 NO PROJECT ALTERNATIVE

Under the No Project Alternative, the SPA would not be annexed to the City of Folsom; instead, it would remain under the jurisdiction of Sacramento County. This alternative assumes that existing land uses at the project site (i.e., livestock grazing) would continue, including construction of up to 44 rural residences on 80-acre parcels as permitted under the adopted Sacramento County General Plan designations and zoning. Furthermore, no off-site water facilities would be constructed under this alternative. This analysis uses existing site conditions at the time that the Notice of Preparation/Notice of Intent was published (September 2008) as the "existing conditions"

portion of the "no project" scenario (see State CEQA Guidelines CCR Section 15126.6[e][2]) to allow consideration of a full range of alternatives. Remediation of contaminated soil and groundwater on the Aerojet General Corporation parcel along the western property boundary is a separate action that will continue either with or without project implementation.

ES.7.2 NO USACE PERMIT ALTERNATIVE

This alternative is designed to avoid the placement of dredged or fill material into waters of the U.S., including wetlands, thus eliminating the need for a USACE Section 404 CWA permit. As a result, there would be no direct impacts to waters of the U.S. under this alternative, compared to 46.3 combined acres of fill under the total Proposed Project (i.e., including both land development and off-site water facilities). This alternative would require compliance with Section 10 of ESA. Under this alternative, 1,506.1 acres of the project site would be designated as open space, compared to 1,057 acres under the Proposed Project Alternative. This alternative also would require more expensive/time-consuming, methods of construction for roadways and utilities. Under this alternative, approximately 3,837 fewer residential housing units would be constructed, and approximately 131 fewer acres would be used for commercial/industrial development, than under the Proposed Project. The acreage proposed for park use would be reduced to 84.8 acres under this alternative.

ES.7.3 RESOURCE IMPACT MINIMIZATION ALTERNATIVE

This alternative would include a larger area of high-quality biological habitat in the proposed preserve area than under the Proposed Project Alternative, and would also preserve all of the on-site cultural resources that would be eligible for listing on the California Register of Historical Resources and National Register of Historic Places. A Section 404 CWA permit would still be required under this alternative, as it would involve the placement of fill material into 26.47 acres of waters of the U.S., 13.03 fewer acres than would be filled by the Proposed Project Alternative. An additional 375 acres of land across the project site would be designated as open space. A total of approximately 1,429 acres, approximately 40% of the project site, would become a protected wetland preserve. Areas of the project site with higher concentrations of cultural resources, including areas on the northwestern portion of the project site would also remain in open space under this alternative. The total acreage of residential development would be reduced by approximately 205 acres and approximately 2,245 fewer residential units would be constructed. Overall density would decrease (average density across the residentially designated area would be approximately 6 dwelling units per acre (du/ac), compared to 6.65 du/ac under the Proposed Project Alternative). Commercial and industrial development sites would be reduced by approximately 113 acres. Development of park land would be reduced to 105.7 acres. The types of land uses and general on- and off-site infrastructure and roadway improvements would remain the same as under the Proposed Project Alternative.

ES.7.4 CENTRALIZED DEVELOPMENT ALTERNATIVE

This alternative would preserve approximately 75% of the eastern part of the project site, which lies within the Sierra Nevada foothills, in its current undeveloped state. Commercial development would still occur along the south side of U.S. 50 within the foothills. It would also entail about 1,000 fewer equivalent dwelling units (EDUs) than the Proposed Project. This alternative would fill 37.06 acres of waters of the U.S., 2.48 acres fewer than would be filled under the Proposed Project Alternative. The Centralized Development Alternative envisions a higher density of residential development on a smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. The acreage of commercial and industrial development would be similar in this alternative compared to the Proposed Project Alternative. The acreage proposed for park use is reduced to 118.7 acres in this alternative, including local parks which are included in acreage totals for residential and mixed-use designations. The types of land uses and general on- and off-site infrastructure improvements under the Centralized Development Alternative would remain the same as under the Proposed Project Alternative. A 1,464.4-acre area would be dedicated to open space (approximately 407 acres more than under the Proposed Action Alternative).

ES.7.5 REDUCED HILLSIDE DEVELOPMENT ALTERNATIVE

This alternative would reduce the developed area on the eastern portion of the project site, which lies within the Sierra Nevada foothills, leaving more of this area in its current undeveloped state for aesthetic, biological, and cultural resource protection purposes. It would also entail about 1,300 additional EDUs compared to the Proposed Project, with a much higher density of development within the central portion of the project site, thus reducing potential impacts related to traffic and air quality. The Reduced Hillside Development Alternative would fill 42.69 acres of waters of the U.S., 3.19 acres more than would be filled under the Proposed Project Alternative. The Reduced Hillside Development Alternative envisions a greater density of residential development on a slightly smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. The total acreage of residential development would be reduced by approximately 64 acres, but the density would be increased. The acreage of commercial and industrial development would be increased by less than 20 acres. The acreage proposed for park use (including local parks which are included in acreage totals for residential and mixed-use designations) is increased to 170.9 acres in this alternative. The types of land uses and general on- and off-site infrastructure and roadway improvements under the Reduced Hillside Development Alternative would remain the same as under the Proposed Project. A 1,057-acre area would be dedicated to open space (the same size as under the Proposed Project).

ES.7.6 WATER SUPPLY ALTERNATIVES

The Water Supply alternatives evaluated at an equal level of detail in this EIR/EIS consist of the following (see Chapter 2, "Alternatives" for additional detail):

- No USACE Permit Off-site Water Facility Alternative
- Proposed Off-site Water Facility Alternative PA – Raw Water Conveyance – Grant Line Road Alignment and On-site WTP
- Off-site Water Facility Alternative 1 – Raw Water Conveyance – Grant Line Road Alignment and White Rock WTP
- Off-site Water Facility Alternative 1A – Raw Water Conveyance – Grant Line Road Route Variation Alignment and White Rock WTP
- Off-site Water Facility Alternative 2 – Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP
- Off-site Water Facility Alternative 2A – Treated Water Conveyance – Douglas Road Route Variation Alignment and Vineyard SWTP
- Off-site Water Facility Alternative 2B – Treated Water Conveyance – North Douglas Tanks Variation Alignment and Vineyard SWTP
- Off-site Water Facility Alternative 3 – Raw Water Conveyance – Douglas Road Alignment and White Rock WTP
- Off-site Water Facility Alternative 3A – Raw Water Conveyance – Douglas Road Route Variation Alignment and White Rock WTP
- Off-site Water Facility Alternative 4 – Raw Water Conveyance to Folsom Boulevard Alignment and Folsom Boulevard WTP

- Off-site Water Facility Alternative 4A – Raw Water Conveyance to Folsom Boulevard – Route Variation Alignment and Folsom Boulevard WTP

ES 7.7 INTEGRATION OF "LAND" AND "WATER" ALTERNATIVES FOR DEVELOPMENT

Under the No Project Alternative, the SPA could be developed with up to 44 rural residences on 80-acre parcels as currently zoned under the Sacramento County General Plan, and no off-site water facilities would be constructed because each rural resident would be responsible for developing his or her on-site well. Therefore, for purposes of this EIR/EIS, the No Project Alternative is evaluated in the 3A "Land" sections.

Under the No USACE Permit Alternative, there would be no placement of dredged or fill material into waters of the U.S. (including wetlands) from either the "Land" or "Water" portions of the project, thus eliminating the need for a USACE Section 404 CWA permit. In order to achieve "no fill," no development in the SPA would occur within 50 feet of a water of the United States, the water treatment plant (regardless of whether it is located off-site or on-site) would not be constructed within 50 feet of a water of the United States, and the off-site water conveyance pipeline would use trenchless construction methods (e.g., horizontal directional drilling or jack-and-bore) where the pipeline route intersected any water of the United States. Therefore, only the No USACE Permit Off-site Water Facility Alternative could be selected if the No USACE Permit "Land" Alternative were selected for development of the SPA.

Any of the other 10 off-site water alternatives listed above and described in detail in Chapter 2, "Alternatives" could ultimately be implemented for either the Resource Impact Minimization, Centralized Development, or Reduced Hillside Development Alternative. Because the off-site water facilities are different from development of the SPA and would occur in locations that are further removed spatially from the SPA, the impacts of these water facilities are evaluated in the 3B "Water" sections of this EIR/EIS. However, the City and the USACE wish to make clear to the reader that the "project" as a whole consists of both development of the SPA and off-site facilities necessary to provide water in support of the SPA development. Thus, when considering impacts of the "project" as a whole, it is necessary to consider both the 3A and 3B impacts taken together.

ES.7.8 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The State CEQA Guidelines require identification of an environmentally superior alternative from among the proposed project and the alternatives evaluated. If the No Project Alternative is environmentally superior, CEQA requires identification of the "environmentally superior alternative" other than the No Project Alternative from among the proposed project and the alternatives evaluated. Federal NEPA regulations also recommend that an environmentally preferred alternative be identified; however, under NEPA, that alternative does not need to be identified until the final record of decision is issued. Therefore, the discussion in this section of the environmentally superior alternative is intended to satisfy only the State CEQA requirements.

As discussed in detail in Chapter 2, "Alternatives" The No Project Alternative includes (1) no annexation of the SPA to the City, (2) potential development of up to 44 rural residences in the SPA under the existing Sacramento County zoning AG-80, and (3) no construction of any off-site water facilities. Therefore, "no project," from both a "Land" and "Water" perspective, is evaluated as one combined No Project Alternative in the 3A "Land" sections of this DEIR/DEIS. The No Project Alternative would be the Environmentally Superior Alternative. This alternative provides the greatest opportunity for avoidance and/or substantial reduction in the significant environmental impacts of the project. However, this alternative would not meet the project purpose and need, nor would it meet any of the project objectives, as identified in Chapter 1 of this DEIR/DEIS.

Other than the No Project Alternative, either the No USACE Permit, Resource Impact Minimization, or Centralized Development Alternatives could be considered the Environmentally Superior Alternative for the "Land" portion of the project.

Off-site Water Facility Alternative 2B would be considered the Environmentally Superior Alternative for the "Water" portion of the project.

ES.8 KNOWN AREAS OF CONTROVERSY

CCR Section 15123 of the State CEQA Guidelines and 40 CFR Section 1502.12 of the NEPA regulations require that a summary of an EIR/EIS identify areas of controversy known to the lead agency, including issues raised by agencies and the public. During the public comment period for the notice of preparation/notice of intent, various comment letters were received regarding the project. Appendix B of the EIR/EIS includes a summary of the public scoping process as well as summaries of the comments received in writing and at the public meetings held on September 25, 2008. In general, areas of potential controversy known to the City, USACE, and the project applicant(s) include biological resources, circulation (traffic and alternative transportation methods), air quality, noise, hydrology and water quality, hazardous materials, water supply, provision of public services, and provision of public utilities. These issues were considered in the preparation of this EIR/EIS and, where appropriate, are addressed in the environmental impact analyses presented in Chapters 3 and 4.

ES.9 PUBLIC PARTICIPATION AND ADDITIONAL STEPS IN THE CEQA/NEPA REVIEW PROCESS

This EIR/EIS is being distributed to interested agencies, stakeholder organizations, and individuals. This distribution ensures that interested parties have an opportunity to express their views regarding the environmental effects of the project, and to ensure that information pertinent to permits, authorizations, and approvals is provided to decision makers for the lead agencies and CEQA responsible and trustee agencies. This document is available for review by the public during normal business hours at Folsom City Hall, 50 Natoma Street, Folsom, CA 95630 and by appointment at USACE, 1325 J Street, Sacramento, CA 95814-2922. The document will also be available on the City's website at http://www.folsom.ca.us/depts/community_development/default.asp and the USACE website at http://www.spk.usace.army.mil/organizations/cespk-co/regulatory/EISs/EIS-index.html. The DEIR is being distributed for a 45-day period that will end on August 16. The DEIS is being distributed for a 60-day review period that will end on September 7, 2010.

For CEQA purposes, written comments to the City of Folsom must be postmarked no later than August 16, 2010. However, the USACE will continue to accept comments for NEPA purposes until the ROD is issued. Written comments should be sent to the following addresses:

Gail Furness de Pardo
City of Folsom
Community Development Department
50 Natoma Street
Folsom, CA 95630
email: gdepardo@folsom.ca.us

Lisa Gibson
U.S. Army Corps of Engineers, Regulatory Branch
1325 J Street, Room 1480
Sacramento, CA 95814-2922
E-mail: Lisa.M.Gibson2@ usace.army.mil

If comments are provided via e-mail, please include the project title in the subject line, attach comments in MS Word format, and include the commenter's U.S. Postal Service mailing address.

A joint public meeting/hearing on the DEIR/DEIS will be conducted by the City and USACE on August 2, 2010 from 5 p.m. to 7 p.m. at the Folsom Community Center, at 52 Natoma Street in Folsom. The City of Folsom

Planning Commission will also conduct a public hearing on the DEIR and draft specific plan at its regular meeting on Wednesday, August 4, 2010 at 6:30 p.m. in the City Council Chambers at 50 Natoma Street. It is not necessary to provide testimony during the public hearing; comments on the DEIR/DEIS will be accepted throughout the meeting and will be recorded at the public comment table and via court reporter. Comments may also be submitted throughout the comment period as described above.

Once all comments have been assembled and reviewed, responses will be prepared to address significant environmental issues that have been raised in the comments. The responses will be included in a final EIR/EIS.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.1 AESTHETICS - LAND		
3A.1-1: Substantial Adverse Effect on a Scenic Vista. Project implementation would result in the degradation of the visual quality of a scenic vista. ON-SITE

NP: No mitigation measures required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.1-1: Construct and Maintain a Landscape Corridor Adjacent to U.S. 50. The project applicant(s) for all project phases shall fund, construct, and maintain a landscaped corridor within the SPA, south of U.S. 50. This corridor shall be 50 feet wide, except that the landscaped corridor width shall be reduced to 25 feet adjacent to the proposed regional mall. Landscaping plans and specifications shall be approved by Caltrans and the City of Folsom, and constructed by the project applicant(s) before the start of earthmoving activities associated with residential or commercial units. Landscaped areas would not be required within the preserved oak woodlands. As practicable, landscaping shall primarily contain native and/or drought tolerant plants. Landscaped corridors shall be maintained in perpetuity to the satisfaction of the City of Folsom.

Implementation: Project applicant(s) of all project phases.

Timing: 1. Plans and specifications: before approval of grading plans and building permits

2. Construction: before the start of earthmoving activities associated with residential and commercial units

3. Maintenance: in perpetuity

Enforcement: City of Folsom Community Development Department and Caltrans

Significance after Mitigation: significant and unavoidable

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.1-4: Temporary, Short-Term Degradation of Visual Character for Developed Project Land Uses During Construction. Project implementation would involve four phases of construction over a 20-year-buildout period. Construction activity would involve the temporary and short-term use of staging areas for construction equipment and materials, which would be visible to adjacent project land uses that have already been developed.	Land	**NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct significant, no indirect
NP: No mitigation measures are required. **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.1-4: Screen Construction Staging Areas.** The project applicant(s) for all project phases shall locate staging and material storage areas as far away from sensitive biological resources and sensitive land uses (e.g., residential areas, schools, parks) as feasible. Staging and material storage areas shall be approved by the appropriate agency (identified below) before the approval of grading plans and building permits for all project phases and shall be screened from adjacent occupied land uses in earlier development phases to the maximum extent practicable. Screens may include, but are not limited to, the use of such visual barriers such as berms or fences. The screen design shall be approved by the appropriate agency to further reduce visual effects to the extent possible. Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries shall be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, and Caltrans). Implementation: Project applicant(s) of all project phases. Timing: Before approval of grading plans and building permits and during construction for all project phases. Enforcement: 1. For those improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department. 2. For the two local roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Community Services Department. 3. For the U.S. 50 interchange improvements: Caltrans. ***Significance after Mitigation: significant and unavoidable***		
3A.1-5: Creation of a New Source of Substantial Light or Glare that would Adversely Affect Day or Nighttime Views in the Area New Light and Glare. Project implementation would require lighting of new development, which would cause new and increased light and glare.	Land	**NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct significant, no indirect
NP: No mitigation measures are required. **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.1-5: Establish and Require Conformance to Lighting Standards and Prepare and Implement a Lighting Plan.** To reduce impacts associated with light and glare, the City shall: ▸ Establish standards for on-site outdoor lighting to reduce high-intensity nighttime lighting and glare as part of the Folsom Specific Plan design		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

guidelines/standards. Consideration shall be given to design features, namely directional shielding for street lighting, parking lot lighting, and other substantial light sources, that would reduce effects of nighttime lighting. In addition, consideration shall be given to the use of automatic shutoffs or motion sensors for lighting features to further reduce excess nighttime light.

- Use shielded or screened public lighting fixtures to prevent the light from shining off of the surface intended to be illuminated.

To reduce impacts associated with light and glare, the project applicant(s) of all project phases shall:

- Shield or screen lighting fixtures to direct the light downward and prevent light spill on adjacent properties.
- Place and shield or screen flood and area lighting needed for construction activities, nighttime sporting activities, and/or security so as not to disturb adjacent residential areas and passing motorists.
- For public lighting in residential neighborhoods, prohibit the use of light fixtures that are of unusually high intensity or brightness (e.g., harsh mercury vapor, low-pressure sodium, or fluorescent bulbs) or that blink or flash.
- Use appropriate building materials (such as low-glare glass, low-glare building glaze or finish, neutral, earth-toned colored paint and roofing materials), shielded or screened lighting, and appropriate signage in the office/commercial areas to prevent light and glare from adversely affecting motorists on nearby roadways.
- Design exterior on-site lighting as an integral part of the building and landscape design in the Folsom Specific Plan area. Lighting fixtures shall be architecturally consistent with the overall site design.
- Lighting of off-site facilities within the City of Folsom shall be consistent with the City's General Plan standards.
- Lighting of the off-site detention basin shall be consistent with Sacramento County General Plan standards.
- Lighting of the two local roadway connections from Folsom Heights off-site into El Dorado Hills shall be consistent with El Dorado County General Plan standards.

A lighting plan for all on- and off-site elements within the each agency's jurisdictional boundaries (specified below) shall be submitted to the relevant jurisdictional agency for review and approval, which shall include the above elements. The lighting plan may be submitted concurrently with other improvement plans, and shall be submitted before the installation of any lighting or the approval of building permits for each phase. The project applicant(s) of all project phases shall implement the approved lighting plan.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases.

Timing: Before approval of building permits for each project phase.

Enforcement:
1. For all on-site and off-site facilities that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For the off-site detention basin: Sacramento County Planning Department.

Mitigation		

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.1-2b: Prepare Landscaping Plan. The City shall develop a landscaping plan for each structural facility site that uses a combination of locally derived native vegetation, earthen features (e.g., boulders), and, if appropriate, topographical separations (e.g., berms) to maximize site appearance and shield the new facilities from nearby sensitive receptors to the extent feasible. In addition to complying with local standards, the landscaping plan shall require the following at each site:

- Vegetation shall be arranged in a hierarchy of plant groupings to enhance the visual and scenic qualities of the site(s). To the extent practical, the design will minimize the need for supplemental irrigation.
- New or replacement vegetation shall be compatible with surrounding vegetation and shall be adaptable to the site with regard to rainfall, soil type, exposure, growth rate, erosion control, and energy conservation purposes.
- Plant materials chosen shall be species which do not present any safety hazards, which allow native flora to reestablish in the area, and which require minimal maintenance, including watering, pest control, and clean-up of litter from fruit and droppings.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Significance after Mitigation: less than significant

3B.1-3: Creation of a New Source of Substantial Light or Glare that would Adversely Affect Day or Nighttime Views in the "Water" Study Area. Implementation of the Off-site Water Facility Alternatives would create new sources of substantial light or glare, which could adversely affect day or nighttime views in the "Water" Study Area. Mitigation		

not located and directed to shine toward or be directly visible from adjacent properties or streets. To the extent possible, the City shall minimize the use of nighttime construction lighting within 500 feet of existing residences. This measure shall be identified on grading plans and in construction contracts.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.1-3b: Prepare and Submit a Lighting Master Plan. The City shall prepare a Lighting Master Plan that covers all Off-site Water Facilities-related outdoor light sources. The Lighting Master Plan shall include the following minimum requirements:

- outdoor lighting shall be properly shielded and installed to prevent light trespass on adjacent properties;
- flood or spot lamps installed as part of the Off-site Water Facilities shall be aimed no higher than 45 degrees above straight down (half-way between straight down and straight to the side) when the source is visible from any off-site residential property or public roadway;
- prohibit the use of harsh mercury vapor, low-pressure sodium, or fluorescent bulbs for public lighting in residential neighborhoods; and
- comply with requirements of local jurisdiction, if applicable.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.2 AIR QUALITY - LAND		
3A.2-1: Generation of Construction Emissions of NO_X and PM_{10}. Construction activities associated with the project would generate intermittent emissions of NO_X and PM_{10}. Because of the large size of the project, construction-generated emissions of NO_X, an ozone precursor, and fugitive PM_{10} dust would exceed SMAQMD-recommended thresholds and would substantially contribute to emissions concentrations that exceed the NAAQS and CAAQS. Thus, project-generated, construction-related emissions of criteria air pollutants and precursors could violate or contribute substantially to an existing or projected air quality violation, expose sensitive receptors to substantial pollutant concentrations, and/or conflict with air quality planning efforts.	Land	**ON-SITE** **NP:** direct LTS, no indirect **NCP, PP, RIM, RHD, CD:** direct significant, no indirect **OFF-SITE** Direct significant, no indirect
ON-SITE **NP:** No mitigation measures required.		
NCP, PP, RIM, RHD, CD: Mitigation Measure 3A.2-1a: Implement Measures to Control Air Pollutant Emissions Generated by Construction of On-Site Elements. To reduce short-term construction emissions, the project applicant(s) for all project phases shall require their contractors to implement SMAQMD's list of Basic Construction Emission Control Practices, Enhanced Fugitive PM Dust Control Practices, and Enhanced Exhaust Control Practices (list below) or whatever mitigation measures are recommended by SMAQMD at the time individual portions of the site undergo construction. In addition to SMAQMD-recommended measures, construction operations shall comply with all applicable SMAQMD rules and regulations. **Basic Construction Emission Control Practices** ▸ Water all exposed surfaces two times daily. Exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads. ▸ Cover or maintain at least two feet of free board space on haul trucks transporting soil, sand, or other loose material on the site. Any haul trucks that would be traveling along freeways or major roadways should be covered. ▸ Use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day. Use of dry power sweeping is prohibited. ▸ Limit vehicle speeds on unpaved roads to 15 miles per hour (mph). ▸ All roadways, driveways, sidewalks, parking lots to be paved should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used. ▸ Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes (as required by the state airborne toxics control measure [Title 13, Section 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

- Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determine to be running in proper condition before it is operated.

Enhanced Fugitive PM Dust Control Practices – Soil Disturbance Areas

- Water exposed soil with adequate frequency for continued moist soil. However, do not overwater to the extent that sediment flows off the site.
- Suspend excavation, grading, and/or demolition activity when wind speeds exceed 20 mph.
- Install wind breaks (e.g., plant trees, solid fencing) on windward side(s) of construction areas.
- Plant vegetative ground cover (fast-germinating native grass seed) in disturbed areas as soon as possible. Water appropriately until vegetation is established.

Enhanced Fugitive PM Dust Control Practices – Unpaved Roads

- Install wheel washers for all exiting trucks, or wash off all trucks and equipment leaving the site.
- Treat site accesses to a distance of 100 feet from the paved road with a 6 to 12-inch layer of wood chips, mulch, or gravel to reduce generation of road dust and road dust carryout onto public roads.
- Post a publicly visible sign with the telephone number and person to contact at the construction site regarding dust complaints. This person shall respond and take corrective action within 48 hours. The phone number of SMAQMD and the City contact person shall also be posted to ensure compliance.

Enhanced Exhaust Control Practices

- The project shall provide a plan, for approval by the City of Folsom Community Development Department and SMAQMD, demonstrating that the heavy-duty (50 horsepower [hp] or more) off-road vehicles to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project wide fleet-average 20% NO_X reduction and 45% particulate reduction compared to the most current California Air Resources Board (ARB) fleet average that exists at the time of construction. Acceptable options for reducing emissions may include use of late-model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. The project applicant(s) of each project phase or its representative shall submit to the City of Folsom Community Development Department and SMAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 hp, that would be used an aggregate of 40 or more hours during any portion of the construction project. The inventory shall include the horsepower rating, engine production year, and projected hours of use for each piece of equipment. The inventory shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs. At least 48 hours prior to the use of heavy-duty off-road equipment, the project representative shall provide SMAQMD with the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman. SMAQMD's Construction Mitigation Calculator can be used to identify an equipment fleet that achieves this reduction (SMAQMD 2007a). The project shall ensure that emissions from all off-road diesel powered equipment used on the SPA do not exceed 40% opacity for more than three minutes in any one hour. Any equipment found to exceed 40 percent opacity (or Ringelmann 2.0) shall be repaired immediately, and the City and SMAQMD shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least weekly, and a monthly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey. SMAQMD staff and/or other officials may conduct periodic site inspections to determine compliance. Nothing in this mitigation measure shall supersede other SMAQMD

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

or state rules or regulations.

- If at the time of construction, SMAQMD has adopted a regulation or new guidance applicable to construction emissions, compliance with the regulation or new guidance may completely or partially replace this mitigation if it is equal to or more effective than the mitigation contained herein, and if SMAQMD so permits. Such a determination must be supported by a project-level analysis and be approved by SMAQMD.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department

Mitigation Measure 3A.2-1b: Pay Off-site Mitigation Fee to SMAQMD to Off-Set NO_X Emissions Generated by Construction of On-Site Elements. Implementation of the Proposed Project or the other four other action alternatives would result in construction-generated NO_X emissions that exceed the SMAQMD threshold of significance, even after implementation of the SMAQMD Enhanced Exhaust Control Practices (listed in Mitigation Measure 3A.2-1a). Therefore, the project applicant(s) shall pay SMAQMD an off-site mitigation fee for implementation of any of the five action alternatives for the purpose of reducing NO_X emissions to a less-than-significant level (i.e., less than 85 lb/day). The specific fee amounts shall be calculated when the daily construction emissions can be more accurately determined: that is, if the City/USACE select and certify the EIR/EIS and approves the Proposed Project or one of the other four other action alternatives, the City and the applicants must establish the phasing by which development would occur, and the applicants must develop a detailed construction schedule. Calculation of fees associated with each project development phase shall be conducted by the project applicant(s) in consultation with SMAQMD staff before the approval of grading plans by the City. The project applicant(s) for all project phases shall pay into SMAQMD's off-site construction mitigation fund to further mitigate construction-generated emissions of NO_X that exceed SMAQMD's daily emission threshold of 85 lb/day. The calculation of daily NO_X emissions shall be based on the cost rate established by SMAQMD at the time the calculation and payment are made. At the time of writing this EIR/EIS the cost rate is $16,000 to reduce 1 ton of NO_X plus a 5% administrative fee (SMAQMD 2008c). The determination of the final mitigation fee shall be conducted in coordination with SMAQMD before any ground disturbance occurs for any project phase. Based on information available at the time of writing this EIR/EIS, and assuming that construction would be performed at a consistent rate over a 19-year period (and averaging of 22 work days per month), it is estimated that the off-site construction mitigation fees would range from $517,410 to $824,149, depending on which alternative is selected. Because the fee is based on the mass quantity of emissions that exceed SMAQMD's daily threshold of significance of 85 lb/day, total fees would be substantially greater if construction activity is more intense during some phases and less intense during other phases of the 19-year build out period, and in any event, based on the actual cost rate applied by SMAQMD. (This fee is used by SMAQMD to purchase off-site emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies.)

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction for all project phases.

Enforcement: The City of Folsom Community Development Department shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Mitigation Measure 3A.2-1c: Perform a Project-Level Analysis to Disclose Projected PM_{10} Emission Concentrations at Nearby Sensitive Receptors Resulting from Construction of On-Site Elements. Prior to construction of each development phase of on-site land uses, the project applicant shall perform a project-level CEQA analysis that includes detailed dispersion modeling of construction-generated PM_{10} to disclose what PM_{10} concentrations would be at nearby sensitive receptors. The dispersion modeling shall be performed in accordance with applicable SMAQMD guidance that is in place at the time the analysis is performed. At the time of writing this EIR/EIS, SMAQMD's most current and most detailed guidance for addressing construction-generated PM_{10} emissions is found in its Guide to Air Quality Assessment in Sacramento County (SMAQMD 2009a). The project-level analysis shall incorporate detailed parameters of the construction equipment and activities, including the year during which construction would be performed, as well as the proximity of potentially affected receptors, including receptors proposed by the project that exist at the time the construction activity would occur.

Implementation: All detailed, project-level analysis shall be performed by the project applicant(s) and fully funded by the project applicant of each development phase. All feasible mitigation shall be also be funded by the project applicant(s).

Timing: Before the approval of all grading plans by the City.

Enforcement: City of Folsom Community Development Department

OFF-SITE

Mitigation Measure 3A.2-1d: Implement SMAQMD's Basic Construction Emission Control Practices during Construction of all Off-site Elements located in Sacramento County. The applicants responsible for the construction of each off-site element in Sacramento County shall require its contractors to implement SMAQMD's Basic Construction Emission Control Practices during construction. A list of SMAQMD's Basic Construction Emission Control Practices is provided under Mitigation Measure 3A.2-1a.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: The project applicant(s) responsible for construction of each off-site element in Sacramento County.

Timing: Before the approval of all grading plans from SMAQMD.

Enforcement:
1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.2-1e: Implement EDCAQMD-Recommended Measures for Controlling Fugitive PM_{10} dust During Construction of the Two Roadway Connections in El Dorado County. Prior to construction of each roadway extension in El Dorado County, the applicants or its contractors shall develop a fugitive dust control plan that is approved by EDCAQMD and the applicants shall require their contractors to implement the dust control measures identified in the EDCAQMD-approved fugitive dust control plan. The fugitive dust control plan shall contain measures that are recommended by EDCAQMD at the time the plan is developed, which may include, but is not limited to, the current list of EDCAQMD-recommended dust control measures provided in Table 3A.2-5 below.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado County).

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Table 3A.2-5
EDCAQMD-Recommend Fugitive Dust Control Measures

Source	Mitigation Measure
Soil Piles	Enclose, cover, or water twice daily all soil piles
	Automatic sprinkler system installed on soil piles
Exposed Surface/Grading	Water all exposed soil twice daily
	Water exposed soil with adequate frequency to keep soil moist at all times
Truck Hauling Road	Water all haul roads twice daily
	Pave all haul roads
Truck Hauling Load	Maintain at least two feet of freeboard
	Cover load of all haul/dump trucks securely

Source: Table 4.12 of EDCAQMD's *Guide to Air Quality Assessment* (EDCAQMD 2002).

Implementation: The project applicant(s) responsible for constructing the roadway connections in El Dorado County.

Timing: Before the approval of grading plans by EDCAQMD.

Enforcement: El Dorado County Development Services Department.

Mitigation Measure 3A.2-1f: Implement SMAQMD's Enhanced Exhaust Control Practices during Construction of all Off-site Elements. Implement SMAQMD's Enhanced Exhaust Control Practices, which are listed in Mitigation Measure 3A.2-1a, in order to control NO_X emissions generated by construction of all off-site elements (in Sacramento and El Dorado Counties, or Caltrans right-of-way).

Implementation: The project applicant(s) responsible for construction of each off-site element in Sacramento and El Dorado counties.

Timing: Before the approval of all grading plans from the respective air district (i.e., SMAQMD or EDCAQMD).

Enforcement:
1. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
2. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.2-1g: Pay Off-site Mitigation Fee to SMAQMD to Off-Set NO_X Emissions Generated by Construction of Off-site Elements. The off-site elements could result in construction-generated NO_X emissions that exceed the SMAQMD threshold of significance, even after implementation of the SMAQMD Enhanced Exhaust Control Practices (listed in Mitigation Measure 3A.2-1a). Therefore, the responsible project applicant(s) for each off-site element in Sacramento County shall pay SMAQMD an off-site mitigation fee for implementation of each off-site element in Sacramento County for the purpose of reducing NO_X emissions to a less-than-significant level (i.e., less than 85 lb/day). The specific fee amounts shall be calculated when the daily construction emissions can be more accurately determined. This calculation shall occur if the City/USACE certify the EIR/EIS and select and approves the Proposed Project or one of the other

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

four other action alternatives, the City, Sacramento County, and the applicants establish the phasing by which construction of the off-site elements would occur, and the applicants develop a detailed construction schedule. Calculation of fees associated with each off-site element shall be conducted by the project applicant(s) in consultation with SMAQMD staff before 'the approval of respective grading plans by Sacramento County. The project applicant(s) responsible for each off-site element in Sacramento County shall pay into SMAQMD's off-site construction mitigation fund to further mitigate construction-generated emissions of NO_X that exceed SMAQMD's daily emission threshold of 85 lb/day. The calculation of daily NO_X emissions shall be based on the cost rate established by SMAQMD at the time the calculation and payment are made. At the time of writing this EIR/EIS the cost rate is $16,000 to reduce 1 ton of NO_X plus a 5% administrative fee (SMAQMD 2008c). The determination of the final mitigation fee shall be conducted in coordination with SMAQMD before any ground disturbance occurs for any project phase. Because the fee is based on the mass quantity of emissions that exceed SMAQMD's daily threshold of significance of 85 lb/day, total fees for construction of the off-site elements would vary according to the timing and potential overlap of construction schedules for off-site elements. This measure applies only to those off-site elements located in SMAQMD's jurisdiction (i.e., in Sacramento County) because EDCAQMD does not offer a similar off-set fee program for construction-generated NO_X emissions in its jurisdiction. (This fee is used by SMAQMD to purchase off-site emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies.)

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: The project applicant(s) of all off-site elements in Sacramento County.

Timing: Before the approval of each grading plan for the off-site elements in Sacramento County.

Enforcement:

1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.
2. For the U.S. 50 interchange improvements: Caltrans shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.

Mitigation Measure 3A.2-1h: Perform a Project-Level Analysis to Disclose Projected PM_{10} Emission Concentrations at Nearby Sensitive Receptors Resulting from Construction of Off-site Elements. Prior to construction of each off-site element located in Sacramento County that would involve site grading or earth disturbance activity that would exceed 15 acres in one day, the responsible agency or its selected consultant shall conduct detailed dispersion modeling of construction-generated PM_{10} emissions pursuant to SMAQMD guidance that is in place at the time the analysis is performed. At the time of writing this EIR/EIS, SMAQMD's most current and most detailed guidance for addressing construction-generated PM_{10} emissions is found in its Guide to Air Quality Assessment in Sacramento County SMAQMD 2009a). SMAQMD emphasizes that PM_{10} emission concentrations at nearby sensitive receptors be disclosed in project-level CEQA analysis. Each project-level analysis shall incorporate detailed parameters of the construction equipment and activities, including the year during which construction would be performed, as well as the proximity of potentially affected receptors, including receptors proposed by the project that exist at the time the construction activity would occur. If the modeling analysis determines that construction activity would result in an exceedance or substantial contribution to the CAAQS and NAAQS at a nearby receptor, then the project applicant(s) shall require their respective contractors to implement additional measures for controlling construction-generated PM_{10} exhaust emission and fugitive PM_{10} dust emissions in accordance with SMAQMD guidance, requirements, and/or rules that apply at

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

the time the project-level analysis is performed. It is likely that these measures would be the same or similar to those listed as Enhanced Fugitive PM Dust Control Practices for Soil Disturbance Areas and Unpaved Roads and Enhanced Exhaust Control Practices included in Mitigation Measure 3A.2-1a. Dispersion modeling is not required for the two El Dorado County roadway connections because the total amount of disturbed acreage is expected to be less than the EDCAQMD screening level of 12 acres.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: All detailed, project-level analysis shall be performed by the responsible lead agency or its selected consultant and funded by the project applicant(s). Implementation of the project-level modeling analysis and any necessary additional mitigation shall be fully funded by the project applicant(s) responsible for each off-site improvement.

Timing:
1. For all off-site improvements within unincorporated Sacramento County: Before the approval of the respective grading plans from the Sacramento County Planning and Community Development Department
2. For the U.S. 50 interchange improvements: Before the approval of construction plans from Caltrans.

Enforcement:
1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

Significance after Mitigation for NO_x emissions: less than significant

Significance after Mitigation for PM_{10} concentrations: significant and unavoidable

3A.2-2: Generation of Long-Term Operational (Regional) Emissions of ROG, and NO_X. Operational area- and mobile-source emissions from project implementation would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS for ozone. In addition, because of the large increase in emissions associated with project build out and the fact that the project is not within an already approved plan (which means that increased emissions would not already be accounted for in applicable air quality plans), project implementation could conflict with air quality planning efforts in the SVAB.

Impact	Land/Water/GPA	Significance
Mitigation		
3A.2-4: Exposure of Sensitive Receptors to Short- and Long-Term Emissions of Toxic Air Contaminants. Project implementation would result in exposure of receptors to short- and long-term emissions of TACs from on-site stationary and mobile sources and from off-site mobile sources.	Land	**ON-SITE** **NP:** no direct or indirect **NCP, PP, RIM, CD, RHD:** direct PS, no indirect (Temporary, Short-Term Emissions from Construction Equipment; Emissions from On-Site Operational Mobile Sources; Land Use Compatibility with Off-site Corporation Yard) Direct LTS, no indirect (Stationary-Source Emissions, TAC Exposure from Remediation Activity, Land Use Compatibility with U.S. 50) **OFF-SITE** Direct PS, no indirect (Temporary, Short-Term Emissions from Construction Equipment) Direct LTS, no indirect (Operational TAC Emissions)
ON-SITE **NP:** No mitigation measures required. **NCP, RIM: Mitigation Measure 3A.2-4a: Develop and Implement a Plan to Reduce Exposure of Sensitive Receptors to Construction-Generated Toxic Air Contaminant Emissions.** The project applicant(s) for all project phases shall develop a plan to reduce the exposure of sensitive receptors to TACs generated by project construction activity associated with buildout of the selected alternative. Each plan shall be developed by the project applicant(s) in consultation with SMAQMD. The plan shall be submitted to the City for review and approval before the approval of any grading plans. The plan may include such measures as scheduling activities when the residences are the least likely to be occupied, requiring equipment to be shut off when not in use, and prohibiting heavy trucks from idling. Applicable measures shall be included in all project plans and specifications for all project phases. The implementation and enforcement of all measures identified in each plan shall be funded by the project applicant(s) for the respective phase of development. Implementation: The project applicant(s) of all project phases. Timing: Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases. Enforcement: City of Folsom Community Development Department. **Mitigation Measure 3A.2-4b: Implement Measures to Reduce Exposure of Sensitive Receptors to Operational Emissions of Toxic Air Contaminants.** The following measures shall be implemented to reduce exposure of sensitive receptors to Toxic Air Contaminants. ▸ Proposed commercial and industrial land uses that have the potential to emit TACs or host TAC-generating activity (e.g., loading docks) shall be located away from existing and proposed on-site sensitive receptors such that they do not expose sensitive receptors to TAC emissions that exceed an incremental increase of 10 in 1 million for the cancer risk and/or a noncarcinogenic Hazard Index of 1.0.		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance

Mitigation

- The multi-family residences planned across from the off-site corporation yard near the southwest corner of the SPA shall be set back as far as possible from the boundary of the corporation yard and/or relocated to another area.
- Where necessary to reduce exposure of sensitive receptors to an incremental increase of 10 in 1 million for the cancer risk and/or a noncarcinogenic Hazard Index of 1.0, proposed commercial and industrial land uses that would host diesel trucks shall incorporate idle reduction strategies that reduce the main propulsion engine idling time through alternative technologies such as, IdleAire, electrification of truck parking, and alternative energy sources for TRUs, to allow diesel engines to be completely turned off.
- Signs shall be posted in at all loading docks and truck loading areas which indicate that diesel-powered delivery trucks must be shut off when not in use for longer than 5 minutes on the premises in order to reduce idling emissions. This measure is consistent with the ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling, which was approved by the California Office of Administrative Law in January 2005.
- Implement the following additional guidelines, which are recommended in ARB's *Land Use Handbook: A Community Health Perspective* (ARB 2005) and are considered to be advisory and not regulatory:
  - Sensitive receptors, such as residential units and daycare centers, shall not be located in the same building as dry-cleaning operations that use perchloroethylene. Dry-cleaning operations that use perchloroethylene shall not be located within 300 feet of any sensitive receptor. A setback of 500 feet shall be provided for operations with two or more machines.
  - Large gasoline stations (defined as facilities with a throughput of 3.6 million gallons per year or greater) and sensitive land uses shall not be sited within 300 feet of each other. Small gasoline-dispensing facilities (less than 3.6 million gallons of throughput per year) and sensitive land uses shall not be sited within 50 feet of each other.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the SMAQMD and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

PP, CD, RHD: Implement Mitigation Measures 3A.24a-4b.

OFF-SITE

Mitigation Measure: Implement Mitigation Measures 3A.2-1a and 3A.2-1b for the off-site improvements in Sacramento County; and Mitigation Measure 3A.2-1f for the off-site improvements in El Dorado County. (Temporary, Short-Term Emissions from Construction Equipment)

Mitigation Measure: No mitigation measures are required. (Operational TAC Emissions)

NP: No mitigation measures required.

NCP, PP, RIM, RHD: Mitigation Measure 3A.2-5: Implement A Site Investigation to Determine the Presence of NOA and, if necessary, Prepare and Implement an Asbestos Dust Control Plan. A site investigation shall be performed to determine whether and where NOA is present in the soil and rock on the SPA. The site investigation shall include the collection of soil and rock samples by a qualified geologist. If the site investigation determines that NOA is present on the SPA then the project applicant shall prepare an Asbestos Dust Control Plan for approval by SMAQMD as required in Section 93105 of the California Health and Safety Code, "Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations." The Asbestos Dust Control Plan shall specify measures, such as periodic watering to reduce airborne dust and ceasing construction during high winds, that shall be taken to ensure that no visible dust crosses the property line. Measures in the Asbestos Dust Control Plan may include but shall not be limited to dust control measures required by Mitigation Measure 3A.2-1a. The project applicant shall submit the plan to the Folsom Community Development Department for review and SMAQMD for review and approval before construction of the first project phase. SMAQMD approval of the plan must be received before any asbestos-containing rock (serpentinite) can be disturbed. Upon approval of the Asbestos Dust Control Plan by SMAQMD, the applicant shall ensure that construction contractors implement the terms of the plan throughout the construction period.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

CD: Implement Mitigation Measure 3A.2-5.

ON-SITE

NP: No mitigation measures required.

NCP, PP, RIM, CD, RHD: Implement Mitigation Measure 3A.2-1a and Mitigation Measure 3A.2-1f to Control Exposure of Sensitive Receptors to Construction-Related Odorous Emissions.

Mitigation Measure 3A.2-6: Implement Measures to Control Exposure of Sensitive Receptors to Operational Odorous Emissions. The project applicant(s) for all project phases shall implement the following measures:

- The odor-producing potential of land uses shall be considered when the exact type of facility that would occupy areas zoned for commercial, industrial, or mixed-use land uses is determined. Facilities that have the potential to emit objectionable odors shall be located as far away as feasible from existing and proposed sensitive receptors.
- The multi-family residences planned across from the off-site corporation yard near the southwest corner of the SPA shall be set back as far as possible from the boundary of the corporation yard and/or relocated to another area. (This measure is also required by Mitigation Measure 3A.2-4b to limit exposure to TAC emissions.)
- Before the approval of building permits, odor control devices shall be identified to mitigate the exposure of receptors to objectionable odors if a potential odor-producing source is to occupy an area zoned for commercial, industrial, or mixed-use land uses. The identified odor control devices shall be installed before the issuance of certificates of occupancy for the potentially odor-producing use. The odor-producing potential of a source and control devices shall be determined in coordination with SMAQMD and based on the number of complaints associated with existing sources of the same nature.
- The deeds to all properties located within the plan area that are within one mile of an on- or off-site area zoned or used for agricultural use (including livestock grazing) shall be accompanied by a written disclosure from the transferor, in a form approved by the City of Folsom, advising any transferee of the potential adverse odor impacts from surrounding agricultural operations, which disclosure shall direct the transferee to contact the County of Sacramento concerning any such property within the County zoned for agricultural uses within one mile of the subject property being transferred.
- Truck loading docks and delivery areas shall be located as far away as feasible from existing and proposed sensitive receptors.

3B.2 AIR QUALITY - WATER		
3B.2-1: Generation of Construction Emissions of NO_X and PM_{10}. Construction of the Off-site Water Facility Alternatives would produce construction-generated emissions of NO_X, an ozone precursor, and fugitive PM_{10} dust would exceed SMAQMD-recommended thresholds and would substantially contribute to emissions concentrations that exceed the NAAQS and CAAQS. Thus, project-generated, construction-related emissions of criteria air pollutants and precursors could violate or contribute substantially to an existing or projected air quality violation and/or expose sensitive receptors to substantial pollutant concentrations.	Water	**NCP, PA, 1, 1A, 3, 3A, 4, & 4A:** direct PS, no indirect (Temporary and Short-Term Construction Emissions) Direct & indirect LTS (Off-site Water Facilities Operations) **2, 2A, & 2B:** direct & indirect LTS
NCP, PA, 1, 1A, 3, 3A, 4, and 4A: Mitigation Measure 3B.2-1a: Construction NO_X Reduction Plan. Consistent with SMAQMD requirements, the City of Folsom shall provide a plan for demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average 20% NO_X reduction. Prior to construction, the City's contractor shall submit to the SMAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used an aggregate of 40 or more hours during any portion of the construction of the Off-site Water Facilities. The inventory shall include the horsepower rating, engine production year, and projected hours of use or fuel throughput for each piece of equipment. The inventory shall be updated and submitted monthly throughout the duration of the

Mitigation		

project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs. At least 48 hours prior to the use of subject heavy-duty off-road equipment, the Off-site Water Facilities representative shall provide SMAQMD with the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction of the Off-site Water Facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department, City of Folsom Community Development Department, and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-1b: Conduct Visible Emissions Testing and if Non-Compliance, Repair Equipment Immediately. Controlling visible emissions from off-road diesel powered equipment. The City shall ensure that emissions from all off-road diesel powered equipment used on the project site do not exceed 40% opacity for more than three minutes in any one hour. Any equipment found to exceed 40% opacity (or Ringelmann 2.0) shall be repaired immediately, and the City and SMAQMD shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least monthly, and a quarterly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department, City of Folsom Community Development Department, and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-1c: Implement Fugitive Dust Control Measures and a Particulate Matter Monitoring Program during Construction. The City shall implement fugitive dust control measures and a particulate matter monitoring program during construction. The City shall ensure implementation of dust control measures and a particulate matter monitoring program during each phase of construction. Dust control measures may include, but are not limited to, the following:

- minimize on-site construction vehicle speeds on unpaved surfaces;

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3B.2-3: Exposure of Sensitive Receptors to Short- and Long-Term Emissions of Toxic Air Contaminants. Implementation of the Off-site Water Facility Alternatives could expose sensitive receptors to short- and long-term emissions of TACs from on-site stationary sources.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct & indirect LTS

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A: Mitigation Measure 3B.2-3a: Cite Pump Siting Buffers Away from Sensitive Receptors. New pumping stations including back-up diesel generators shall be located more than 200 feet away from sensitive receptors. Electrically-powered pumps shall be used to power new pumps, to the extent practicable.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water pumping facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department, City of Folsom Community Development Department and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-3b: Conduct Project-Level DPM Screening and Implement Measures to Reduce Annual DPM to Acceptable Concentrations.

Screening-level DPM assessments shall be conducted for diesel-powered pump operations proposed within 200 feet of residences or other sensitive receptors. These analyses should include exact distances between the receptors and operations, and include the actual DPM emissions for the engines proposed. If the analysis shows an annual average DPM concentration from project operations at residences within 200 feet of the DPM source to be greater than 0.024 $\mu g/m^3$, the engine location shall be moved to a location where the annual average DPM concentration from project emissions at the residences is less than 0.024 $\mu g/m^3$. The acceptable concentration of 0.024 $\mu g/m^3$ was determined using the current OEHHA cancer potency factor and methodology for diesel exhaust (OEHHA 2003). If diesel exhaust concentrations at the affected receptor would be below 0.024 $\mu g/m^3$, then the cancer health risk would be less than 9.9 cancers in a million population.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water pumping facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and

3A.3 BIOLOGICAL RESOURCES - LAND		
3A.3-1: Loss and Degradation of Waters of the U.S., including Wetlands, and Waters of the State. Project implementation would result in the placement of fill material into jurisdictional waters of the U.S., including wetlands subject to USACE jurisdiction under the Federal CWA. Wetlands and other waters of the U.S. that would be affected by project implementation include seeps, vernal pools, seasonal wetlands and seasonal wetland swales, seeps, drainage channels, ditches, and ponds. Waters of the state would also be filled with project implementation.	Land	**ON-SITE** **NP:** LTS **PP:** direct & indirect significant **RIM:** direct & indirect significant **CD:** direct & indirect significant **RHD:** direct & indirect significant **NF:** direct & indirect significant **OFF-SITE** Direct & indirect significant
ON-SITE **PP: Mitigation Measure 3A.3-1a: Secure Clean Water Act Section 404 Permit and Implement All Permit Conditions; Ensure No Net Loss of Functions and Values of Wetlands, Other Waters of the U.S., and Waters of the State.** Before the approval of grading and improvement plans and before any groundbreaking activity associated with each distinct project phase, the project applicant(s) of all project phases requiring fill of wetlands or other waters of the U.S. or waters of the state shall obtain all necessary permits under Sections 401 and 404 of the CWA or the state's Porter-Cologne Act for the respective phase. For each respective phase, all permits, regulatory approvals, and permit conditions for effects on wetland habitats shall be secured before implementation of any grading activities within 250 feet of waters of the U.S. or wetland habitats, including waters of the state, that potentially support Federally listed species. The project applicant(s) shall commit to replace, restore, or enhance on a "no net loss" basis (in accordance with USACE and the Central Valley RWQCB) the acreage of all wetlands and other waters of the U.S. that would be removed, lost, and/or degraded with implementation of project plans for that phase. Wetland habitat shall be restored, enhanced, and/or replaced at an acreage and location and by methods agreeable to USACE, the Central Valley RWQCB, and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 and Section 404

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

permitting processes.

As part of the Section 404 permitting process, a draft wetland mitigation and monitoring plan (MMP) shall be developed for the project on behalf of the project applicant(s). Before any ground-disturbing activities that would adversely affect wetlands and before engaging in mitigation activities associated with each phase of development, the project applicant(s) shall submit the draft wetland MMP to USACE, the Central Valley RWQCB, Sacramento County, El Dorado County, and the City for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be finalized prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of mitigation, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer.

As part of the MMP, the project applicant(s) shall prepare and submit plans for the creation of aquatic habitat in order to adequately offset and replace the aquatic functions and services that would be lost at the SPA, account for the temporal loss of habitat, and contain an adequate margin of safety to reflect anticipated success. Restoration of previously altered and degraded wetlands shall be a priority of the MMP for offsetting losses of aquatic functions on the SPA because it is typically easier to achieve functional success in restored wetlands than in those created from uplands. The MMP must demonstrate how the aquatic functions and values that would be lost through project implementation will be replaced.

The habitat MMP for jurisdictional wetland features shall be consistent with USACE's and EPA's April 10, 2008 Final Rule for Compensatory Mitigation for Losses of Aquatic Resources (33 CFR Parts 325 and 332 and 40 CFR Part 230). According to the Final Rule, mitigation banks should be given preference over other types of mitigation because a lot of the risk and uncertainty regarding mitigation success is alleviated by the fact that mitigation bank wetlands must be established and demonstrating functionality before credits can be sold. This also alleviates temporal losses of wetland function while compensatory wetlands are being established. Mitigation banks also tend to be on larger, more ecologically valuable parcels and are subjected to more rigorous scientific study and planning and implementation procedures than typical permittee-responsible mitigation sites (USACE and EPA, 2008). However, the Final Rule also establishes a preference for compensating losses of aquatic resources within the same watershed as the impact site. The SPA includes portions of the Alder Creek, Buffalo Creek, Coyote Creek, and Carson Creek Watersheds. The majority of the SPA is within the Alder Creek Watershed. Alder Creek and Buffalo Creek are part of the Lower American River Watershed. Carson Creek and Coyote Creek are part of the Cosumnes River Watershed. Mitigation credits may be available within the Cosumnes Watershed, but not within the American River Watershed and not within the sub-watersheds of the SPA. Therefore aquatic habitats may need to be restored or created on the SPA and adjacent off-site lands, within the affected watersheds, in order to successfully replace lost functions at the appropriate watershed scale where loss of function would occur. It is not likely feasible to provide compensatory mitigation for all aquatic resource impacts on site. Therefore, a combination of on-site and off-site permittee-responsible mitigation and mitigation banking would likely be necessary to achieve the no-net-loss standard.

The SPA is located within the service areas of several approved mitigation banks (e.g., Bryte Ranch, Clay Station, Fitzgerald Ranch, and Sunrise Douglas Preservation Bank). The applicants' biological consultant, ECORP, has identified availability of approximately 30 vernal pool credits and 225 seasonal wetland credits at mitigation banks whose service area appears to include the SPA. However, the availability of these credits has not been confirmed and availability is subject to change.

Compensatory mitigation for losses of stream and intermittent drainage channels shall be achieved through in-kind preservation, restoration, or enhancement, as specified in the Final Rule guidelines. The wetland MMP shall address how to mitigate impacts on vernal pool, seasonal swale, seasonal wetland, seep, marsh, pond, and intermittent and perennial stream habitat, and shall describe specific method(s) to be implemented to avoid and/or mitigate any off-site project-related

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

impacts. The wetland compensation section of the habitat MMP shall include the following:

- Compensatory mitigation sites and criteria for selecting these mitigation sites. In General, compensatory mitigation sites should meet the following criteria, based on the Final Rule;
  - located within the same watershed as the wetland or other waters that would be lost;
  - located in the most likely position to successfully replace wetland functions lost on the impact site considering watershed-scale features such as aquatic habitat diversity, habitat connectivity, available water sources and hydrologic relationships, land use trends, ecological benefits, and compatibility with adjacent land uses
- A complete assessment of the existing biological resources in both the on-site preservation areas and off-site compensatory mitigation areas, including wetland functional assessment using the California Rapid Assessment Method (CRAM) (Collins et al. 2008), to establish baseline conditions;
- Specific creation and restoration plans for each mitigation site;
- In kind reference wetland habitats for comparison with compensatory wetland habitats (using performance and success criteria) to document success;
- Description of methodology used to select reference wetlands for comparison;
- Monitoring protocol, including schedule and annual report requirements, and the following elements:
  - ecological performance standards, based on the best available science, that can be assessed in a practicable manner (e.g., performance standards proposed by Barbour et al. 2007). Performance standards must be based on attributes that are objective and verifiable;
  - CRAM conducted annually for 5 years after construction or restoration of compensatory wetlands to determine whether these areas are acquiring wetland functions and to plot the performance trajectory of preserved, restored, or created wetlands over time. CRAM scores for compensatory wetlands shall also be compared against scores for reference wetlands assessed in the same year;
  - CRAM analysis conducted annually for 5 years after any construction adjacent to wetlands preserved on the SPA to determine whether these areas are retaining functions and values. CRAM scores for wetlands preserved on site shall also be compared against scores for reference wetlands assessed in the same year;
  - analysis of CRAM data, including assessment of potential stressors, to determine whether any remedial activities may be necessary;
  - corrective measures if performance standards are not met;
  - monitoring of plant communities as performance criteria (annual measure of success, during monitoring period) and success criteria (indicative of achievement of mitigation habitat requirement at end of monitoring period) for hydrologic function have become established and the creation site "matures" over time;
  - GIS analysis of compensatory wetlands to demonstrate actual acreage of functioning wetland habitat;
  - adaptive management measures to be applied if performance standards and acreage requirements are not being met;
  - responsible parties for monitoring and preparing reports; and

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

- responsible parties for receiving and reviewing reports and for verifying success or prescribing implementation or corrective actions.

An operations and management plan (OMP) for all on- and off-site wetland preservation and mitigation areas shall be prepared and submitted to USACE and USFWS for review and approval prior to the issuance of any permits under Section 404 of the CWA. The plan shall include detailed information on the habitats present within the preservation and mitigation areas, the long-term management and monitoring of these habitats, legal protection for the preservation and mitigation areas (e.g., conservation easement, declaration of restrictions), and funding mechanism information (e.g., endowment).

USACE has determined that the project will require an individual permit. In its final stage and once approved by USACE, the MMP for the project is expected to detail proposed wetland restoration, enhancement, and/or replacement activities that would ensure no net loss of aquatic functions in the project vicinity. Approval and implementation of the wetland MMP shall aim to fully mitigate all unavoidable impacts on jurisdictional waters of the U.S., including jurisdictional wetlands. In addition to USACE approval, approval by the City, Sacramento County, El Dorado County, and the Central Valley RWQCB, as appropriate depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes, will also be required. Approvals from Sacramento County and El Dorado County shall be required for impacts resulting from off-site project elements occurring in these counties, such as the off-site detention basin in Sacramento County and the roadway connections into El Dorado County. To satisfy the requirements of the City and the Central Valley RWQCB, mitigation of impacts on the nonjurisdictional wetlands beyond the jurisdiction of USACE shall be included in the same MMP. All mitigation requirements determined through this process shall be implemented before grading plans are approved. The MMP shall be submitted to USACE and approved prior to the issuance of any permits under Section 404 of the CWA.

Water quality certification pursuant to Section 401 of the CWA will be required before issuance of the record of decision and before issuance of a Section 404 permit. Before construction in any areas containing wetland features, the project applicant(s) shall obtain water quality certification for the project. Any measures required as part of the issuance of water quality certification shall be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans, El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases requiring fill of wetlands or other waters of the U.S. or waters of the state.

Timing: Before the approval of grading or improvement plans or any ground-disturbing activities for any project development phase containing wetland features or other waters of the U.S.. The MMP must be approved before any impact on wetlands can occur. Mitigation shall be implemented on an ongoing basis throughout and after construction, as required.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. U.S. Army Corps of Engineers, Sacramento District; Central Valley Regional Water Quality Control Board as appropriate depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes and in compliance with the City's

Mitigation		

Grading Ordinance (Folsom Municipal Code 14.29), or appropriate county grading ordinance for off-site detention basin and roadway connections from Folsom Heights to El Dorado Hills.

PP: Mitigation Measure 3A.3-1b: Design Stormwater Drainage Plans and Erosion and Sediment Control Plans to Avoid and Minimize Erosion and Runoff to All Wetlands and Other Waters That Are to Remain on the SPA and Use Low Impact Development Features.

To minimize indirect effects on water quality and wetland hydrology, the project applicant(s) of all project phases shall include stormwater drainage plans and erosion and sediment control plans in their improvement plans and shall submit these plans to the City Public Works Department for review and approval. For off-site elements within Sacramento County or El Dorado County jurisdiction (e.g., off-site detention basin and off-site roadway connections to El Dorado Hills), plans shall be submitted to the appropriate county planning department. Before approval of these improvement plans, the project applicant(s) of all project phases shall obtain a NPDES MS4 Municipal Stormwater Permit and Grading Permit, comply with the City's Grading Ordinance and County drainage and stormwater quality standards, and commit to implementing all measures in their drainage plans and erosion and sediment control plans to avoid and minimize erosion and runoff into Alder Creek and all wetlands and other waters that would remain on-site. Detailed information about stormwater runoff standards and relevant City and County regulation is provided in Chapter 3A.9, "Hydrology and Water Quality."

The project applicant(s) of all project phases shall implement stormwater quality treatment controls consistent with the Stormwater Quality Design Manual for Sacramento and South Placer Regions (Sacramento Stormwater Quality Control Partnership 2007). Appropriate runoff controls such as berms, storm gates, off-stream detention basins, overflow collection areas, filtration systems, and sediment traps shall be implemented to control siltation and the potential discharge of pollutants. Development plans shall incorporate Low Impact Development (LID) features, such as pervious strips, permeable pavements, bioretention ponds, vegetated swales, disconnected rain gutter downspouts, and rain gardens, where appropriate. Use of LID features is recommended by the EPA to minimize impacts on water quality, hydrology, and stream geomorphology and is specified as a method for protecting water quality in the proposed specific plan. In addition, free spanning bridge systems shall be used for all roadway crossings over wetlands and other waters that are retained in the on-site open space. These bridge systems would maintain the natural and restored channels of creeks, including the associated wetlands, and would be designed with sufficient span width and depth to provide for wildlife movement along the creek corridors even during high-flow or flood events.

In addition to compliance with City ordinances, the project applicant(s) of all project phases shall obtain a General Construction Stormwater Permit from the Central Valley RWQCB, prepare a Stormwater Pollution Prevention Plan (SWPPP), and implement Best Management Practices (BMPs) to reduce water quality effects during construction. Detailed information about the SWPPP and BMPs are provided in Chapter 3A.9, "Hydrology and Water Quality."

Each project phase shall result in no net change to peak flows into Alder Creek and associated tributaries, or to Buffalo Creek, Carson Creek, and Coyote Creek. The project applicant(s) shall establish a baseline of conditions for drainage on-site. The baseline-flow conditions shall be established for 2-, 5-, 10-, and 20-year storm events. These baseline conditions shall be used to develop monitoring standards for the stormwater system on the SPA. The baseline conditions, monitoring standards, and a monitoring program shall be submitted to USACE and the City for their approval. Water quality and detention basins shall be designed and constructed to ensure that the performance standards, which are described in Chapter 3A.9, "Hydrology and Water Quality," are met and shall be designed as off-stream detention basins. Discharge sites into Alder Creek and associated tributaries, as well as tributaries to Carson Creek, Coyote Creek, and Buffalo Creek, shall be monitored to ensure that preproject conditions are being met. Corrective measures shall be implemented as necessary. The mitigation measures will be satisfied when the monitoring standards are met for 5 consecutive years without undertaking corrective measures to meet the performance standard.

The project applicant(s) shall design a land use plan that moves the proposed on-stream detention basin in the northeast corner of the SPA to a location that is off

Mitigation		

vernal pool habitat. The final habitat MMP shall be consistent with guidance provided in Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans within the Jurisdiction of the Sacramento Field Office, California (USFWS 1996) or shall provide an alternative approach that is acceptable to the City, USACE, and USFWS and accomplishes no net loss of habitat acreage, function, and value.

The project applicant(s) of all project phases shall ensure that there is sufficient upland habitat within the target areas for creation and restoration of vernal pools and vernal pool complexes to provide ecosystem health. The project applicant(s) of all project phases shall identify the extent of indirectly affected vernal pool and seasonal wetland habitat, either by identifying all such habitat within 250 feet of project construction activities or by providing an alternative technical evaluation. If a lesser distance is pursued, this distance shall be approved by USFWS. The project applicant(s) shall preserve acreage of vernal pool habitat for each wetted acre of any indirectly affected vernal pool habitat at a ratio approved by USFWS at the conclusion of the Section 7 consultation. This mitigation shall occur before the approval of any grading or improvement plans for any project phase that would allow work within 250 feet of such habitat, and before any ground-disturbing activity within 250 feet of the habitat. The project applicant(s) will not be required to complete this mitigation measure for direct or indirect impacts that have already been mitigated to the satisfaction of USFWS through another BO or mitigation plan (i.e., if impacts on specific habitat acreage are mitigated by one project phase or element, the project applicant(s) will not be required to mitigate for it again in another phase of the project).

A standard set of BMPs shall be applied to construction occurring in areas within 250 feet of off-site vernal pool habitat, or within any lesser distance deemed adequate by a qualified biologist (with approval from USFWS) to constitute a sufficient buffer from such habitat. Refer to Section 3A.9, "Hydrology and Water Quality - Land" for the details of BMPs to be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any grading or improvement plans, before any ground-disturbing activities within 250 feet of said habitat, and on an ongoing basis throughout construction as applicable for all project phases as required by the mitigation plan, BO, and/or BMPs.

Enforcement:
1. U.S. Army Corps of Engineers, Sacramento District; U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the U.S. 50 interchange improvements: Caltrans.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.3-2b: Avoid Direct Loss of Swainson's Hawk and Other Raptor Nests.
To mitigate impacts on Swainson's hawk and other raptors (including burrowing owl), the project applicant(s) of all project phases shall retain a qualified biologist to conduct preconstruction surveys and to identify active nests on and within 0.5 mile of the SPA and active burrows on the SPA. The surveys shall be conducted before the approval of grading and/or improvement plans (as applicable) and no less than 14 days and no more than 30 days before the beginning of construction

Mitigation		

for all project phases. To the extent feasible, guidelines provided in Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in the Central Valley (Swainson's Hawk Technical Advisory Committee 2000) shall be followed for surveys for Swainson's hawk. If no nests are found, no further mitigation is required.

If active nests are found, impacts on nesting Swainson's hawks and other raptors shall be avoided by establishing appropriate buffers around the nests. No project activity shall commence within the buffer area until the young have fledged, the nest is no longer active, or until a qualified biologist has determined in coordination with DFG that reducing the buffer would not result in nest abandonment. DFG guidelines recommend implementation of 0.25- or 0.5-mile-wide buffers, but the size of the buffer may be adjusted if a qualified biologist and the City, in consultation with DFG, determine that such an adjustment would not be likely to adversely affect the nest. Monitoring of the nest by a qualified biologist during and after construction activities will be required if the activity has potential to adversely affect the nest.

If active burrows are found, a mitigation plan shall be submitted to the City for review and approval before any ground-disturbing activities. The City shall consult with DFG. The mitigation plan may consist of installation of one-way doors on all burrows to allow owls to exit, but not reenter, and construction of artificial burrows within the project vicinity, as needed; however, burrow owl exclusions may only be used if a qualified biologist verifies that the burrow does not contain eggs or dependent young. If active burrows contain eggs and/or young, no construction shall occur within 50 feet of the burrow until young have fledged. Once it is confirmed that there are no owls inside burrows, these burrows may be collapsed.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of grading and improvement plans, before any ground-disturbing activities, and during project construction as applicable for all project phases.

Enforcement:
1. California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.3-2c: Prepare and Implement a Swainson's Hawk Mitigation Plan.
To mitigate for the loss of Swainson's hawk foraging habitat, the project applicant(s) of all project phases shall prepare and implement a Swainson's hawk mitigation plan including, but not limited to the requirements described below.

Before the approval of grading and improvement plans or before any ground-disturbing activities, whichever occurs first, the project applicant(s) shall preserve, to the satisfaction of the City or Sacramento County, as appropriate depending on agency jurisdiction, suitable Swainson's hawk foraging habitat to ensure 1:1 mitigation of habitat value for Swainson's hawk foraging habitat lost as a result of the project, as determined by the City, or Sacramento County, after consultation

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

with DFG and a qualified biologist.

The 1:1 habitat value shall be based on Swainson's hawk nesting distribution and an assessment of habitat quality, availability, and use within the City's planning area, or Sacramento County jurisdiction. The mitigation ratio shall be consistent with the 1994 DFG Swainson's Hawk Guidelines included in the Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (Buteo swainsoni) in the Central Valley of California. Such mitigation shall be accomplished through either the transfer of fee title or perpetual conservation easement. The mitigation land shall be located within the known foraging area and within Sacramento County. The City, or Sacramento County if outside City jurisdiction, after consultation with DFG, will determine the appropriateness of the mitigation land.

Before approval of such proposed mitigation, the City, or Sacramento County for the off-site detention basin, shall consult with DFG regarding the appropriateness of the mitigation. If mitigation is accomplished through conservation easement, then such an easement shall ensure the continued management of the land to maintain Swainson's hawk foraging values, including but not limited to ongoing agricultural uses and the maintenance of all existing water rights associated with the land. The conservation easement shall be recordable and shall prohibit any activity that substantially impairs or diminishes the land's capacity as suitable Swainson's hawk habitat.

The project applicant(s) shall transfer said Swainson's hawk mitigation land, through either conservation easement or fee title, to a third-party, nonprofit conservation organization (Conservation Operator), with the City and DFG named as third-party beneficiaries. The Conservation Operator shall be a qualified conservation easement land manager that manages land as its primary function. Additionally, the Conservation Operator shall be a tax-exempt nonprofit conservation organization that meets the criteria of Civil Code Section 815.3(a) and shall be selected or approved by the City or County, after consultation with DFG. The City, or County, after consultation with DFG and the Conservation Operator, shall approve the content and form of the conservation easement. The City, or County, DFG, and the Conservation Operator shall each have the power to enforce the terms of the conservation easement. The Conservation Operator shall monitor the easement in perpetuity to assure compliance with the terms of the easement.

The project applicant(s), after consultation with the City, or County of jurisdiction, DFG, and the Conservation Operator, shall establish an endowment or some other financial mechanism that is sufficient to fund in perpetuity the operation, maintenance, management, and enforcement of the conservation easement. If an endowment is used, either the endowment funds shall be submitted to the City for impacts on lands within the City's jurisdiction or Sacramento County for the off-site detention basin to be distributed to an appropriate third-party nonprofit conservation agency, or they shall be submitted directly to the third-party nonprofit conservation agency in exchange for an agreement to manage and maintain the lands in perpetuity. The Conservation Operator shall not sell, lease, or transfer any interest of any conservation easement or mitigation land it acquires without prior written approval of the City and DFG. Mitigation lands established or acquired for impacts incurred at the off-site detention basin shall require approval from Sacramento County prior to sale or transfer of mitigation lands or conservation easement.

If the Conservation Operator ceases to exist, the duty to hold, administer, manage, maintain, and enforce the interest shall be transferred to another entity acceptable to the City and DFG, or Sacramento County and DFG depending on jurisdiction of the affected habitat. The City Planning Department shall ensure that mitigation habitat established for impacts on habitat within the City's planning area is properly established and is functioning as habitat by conducting regular monitoring of the mitigation site(s) for the first 10 years after establishment of the easement. Sacramento County shall monitor habitat and ensure success for impacts on habitat at the off-site detention basin.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

project phase with the affected oversight agency(ies) (i.e., Sacramento County and Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of grading, improvement, or construction plans and before any ground-disturbing activity in any project development phase that would affect Swainson's hawk foraging habitat.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2d: Obtain Incidental Take Permit for Impacts on Valley Elderberry Longhorn Beetle and Implement All Permit Conditions. Before each phase of the project, the project applicant(s) shall have a qualified biologist identify any elderberry shrubs within 100 feet of the project footprint and conduct a survey for valley elderberry longhorn beetle exit holes in stems greater than 1 inch in diameter. If no project activity, including grading or use of herbicides, would occur within 100 feet of an elderberry shrub, then no further mitigation shall be required for valley elderberry longhorn beetle in those areas.

If project activities would occur within 100 feet of any elderberry shrubs, consultation with USFWS under Section 7 will be required. No project construction shall proceed in areas potentially containing valley elderberry longhorn beetle until a BO has been issued by USFWS, and the project applicant(s) of all project phases have abided by all pertinent conditions in the BO relating to the proposed construction, including conservation and minimization measures, intended to be completed before on-site construction. Conservation and minimization measures are likely to include preparation of supporting documentation that describes methods for relocation of existing shrubs and maintaining existing shrubs and other vegetation in a conservation area.

Relocation of existing elderberry shrubs and planting of new elderberry seedlings shall be implemented on a no-net-loss basis. Compensatory mitigation for elderberry shrubs that would be removed from their current locations would be developed in consultation with USFWS during the Section 7 consultation process. Compensatory mitigation may include planting replacement elderberry seedlings or cuttings and associated native plants within the open space areas of the SPA, planting replacement elderberry seedlings or cuttings and associated native plants at a suitable off-site location, purchasing credits at an approved mitigation bank, or a combination thereof. Relocated and replacement shrubs and associated native plantings shall be placed in conservation areas providing a minimum of 1,800 square feet per transplanted shrub. These conservation areas shall be preserved in perpetuity as habitat for valley elderberry longhorn beetle. The number of elderberry shrubs that would be affected by implementing the project is expected to be low because there are currently a total of less than 10 shrubs known to be present on the SPA. Ratios for mitigation of valley elderberry longhorn beetle habitat will ultimately be determined through the ESA Section 7 consultation process with USFWS, but shall be a minimum of "no net loss." USFWS uses stem count data, presence or absence of exit holes, and whether the affected elderberry shrubs are located in riparian habitat to determine the number of elderberry seedlings or cuttings and associated riparian vegetation that would need to be planted as compensatory mitigation for affected elderberry longhorn beetle habitat. The final VELB mitigation plan, including transplanting procedures, long-term protection, management of the mitigation areas, and monitoring procedures shall be consistent with the Conservation Guidelines for the Valley Elderberry Longhorn Beetle (USFWS 1999).

The population of valley elderberry longhorn beetles, the general condition of the conservation area, and the condition of the elderberry and associated native plantings in the conservation area must be monitored over a period of either ten consecutive years or for seven years over a 15-year period. A minimum survival

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

rate of at least 60% of the elderberry plants and 60% of the associated native plants must be maintained throughout the monitoring period. Within one year of discovering that survival has dropped below 60%, the project applicant(s) shall replace failed plantings to bring survival above this level. Detailed information on monitoring success of relocated and planted shrubs and measures to compensate (should success criteria not be met) would be required in the BO.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any grading or improvement plans or any ground-disturbing activity within 100 feet of valley elderberry longhorn beetle habitat as applicable for all project phases, and on an ongoing basis as required by BO.

Enforcement:
1. U.S. Army Corps of Engineers, Sacramento District; U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2e: Avoid and Minimize Impacts to Tricolored Blackbird Nesting Colonies.
To avoid and minimize impacts to tricolored blackbird, the project applicant(s) of all project phases shall conduct a preconstruction survey for any project activity that would occur during the tricolored blackbird's nesting season (March 1–August 31). The preconstruction survey shall be conducted by a qualified biologist before any activity occurring within 500 feet of suitable nesting habitat, including freshwater marsh and areas of riparian scrub vegetation. The survey shall be conducted within 14 days before project activity begins.

If no tricolored blackbird colony is present, no further mitigation is required. If a colony is found, the qualified biologist shall establish a buffer around the nesting colony. No project activity shall commence within the buffer area until a qualified biologist confirms that the colony is no longer active. The size of the buffer shall be determined in consultation with DFG. Buffer size is anticipated to range from 100 to 500 feet, depending on the nature of the project activity, the extent of existing disturbance in the area, and other relevant circumstances.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any ground-disturbing activity within 500 feet of suitable nesting habitat as applicable for all project phases.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2f: Avoid and Minimize Impacts to Special-Status Bat Roosts.
The project applicant of all project phases containing potential bat roosting habitat shall retain a qualified biologist to conduct surveys for roosting bats. Surveys shall be conducted in the fall to determine if the mine shaft is used as a hibernaculum and in spring and/or summer to determine if it is used as a maternity or day

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

roost. Surveys shall consist of evening emergence surveys to note the presence or absence of bats and could consist of visual surveys at the time of emergence. If evidence of bat use is observed, the number and species of bats using the roost shall be determined. Bat detectors may be used to supplement survey efforts. If no bat roosts are found, then no further study shall be required.

If roosts of pallid bat or Townsend's big-eared bats are determined to be present and must be removed, the bats shall be excluded from the roosting site before the mine shaft is removed. A mitigation program addressing compensation, exclusion methods, and roost removal procedures shall be developed in consultation with DFG before implementation. Exclusion methods may include use of one-way doors at roost entrances (bats may leave but not reenter), or sealing roost entrances when the site can be confirmed to contain no bats. Exclusion efforts may be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young). The loss of each roost (if any) will be replaced in consultation with DFG and may include construction and installation of bat boxes suitable to the bat species and colony size excluded from the original roosting site. Roost replacement will be implemented before bats are excluded from the original roost sites. Once the replacement roosts are constructed and it is confirmed that bats are not present in the original roost site, the mine shaft may be removed.

Implementation: Project applicant(s) of all project phases containing potential bat roosting habitat.

Timing: Before the approval of removal or fill of the mine shaft on the SPA.

Enforcement: City of Folsom Community Development Department.

RIM, CD, RHD: Implement Mitigation Measures 3A.3-1a, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, and 3A.3-2f.

NF: Implement Mitigation Measures 3A.3-1a, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, and 3A.3-2f.

Mitigation Measure 3A.3-2g: Obtain an Incidental Take Permit under Section 10(a) of ESA; Develop and Implement a Habitat Conservation Plan to Compensate for the Loss of Vernal Pool Habitat. The project applicant(s) for all project phases shall obtain an incidental take permit under Section 10(a) of ESA. No project construction shall proceed in areas supporting potential habitat for Federally listed vernal pool invertebrates, or within adequate buffer areas (250 feet or lesser distance deemed sufficiently protective by a qualified biologist with approval from USFWS), until a BO has been issued by USFWS and the project applicant(s) have abided by conditions in the BO (including all conservation and minimization measures). Conservation and minimization measures are likely to include preparation of supporting documentation describing methods to protect existing vernal pools during and after project construction.

Under the No Federal Action Alternative, interagency consultation under Section 7 of ESA would not occur; therefore, the project applicant(s) would be required to develop a habitat conservation plan to mitigate impacts on Federally listed vernal pool invertebrates. The project applicant(s) shall complete and implement, or participate in, a habitat conservation plan that shall compensate for the loss of acreage, function, and value of affected vernal pool habitat. The habitat conservation plan shall be consistent with the goals of the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005) and must be approved by USFWS.

The project applicant(s) for all project phases shall ensure that there is sufficient upland habitat within the target areas for creation and restoration of vernal pools and vernal pool complexes to provide ecosystem health. The land used to satisfy this mitigation measure shall be protected through a fee title or conservation easement acceptable to the City and USFWS.

The project applicant(s) for all project phases shall identify the extent of indirectly affected vernal pool and seasonal wetland habitat, either by identifying all such habitat within 250 feet of project construction activities or by providing an alternative technical evaluation in support of a lesser indirect impact distance. If a lesser

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

distance is pursued, this distance shall be approved by USFWS. The project applicant(s) shall preserve 2 wetted acres of vernal pool habitat for each wetted acre of any indirectly affected vernal pool habitat. This mitigation shall occur before the approval of any grading or improvement plans for any project phase that would allow work within 250 feet of such habitat, and before any ground-disturbing activity within 250 feet of the habitat. The project applicant(s) will not be required to complete this mitigation measure for direct or indirect impacts that have already been mitigated to the satisfaction of USFWS through another BO or mitigation plan.

A standard set of BMPs shall be applied to construction occurring in areas within 250 feet of off-site vernal pool habitat, or within any lesser distance deemed adequate by a qualified biologist (with approval from USFWS) to constitute a sufficient buffer from such habitat. Refer to Section 3A.9, "Hydrology and Water Quality - Land" for the details of BMPs to be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties or Caltrans).

Implementation: Project applicant(s) of all project phases and on-site and off-site elements.

Timing: Before the approval of any grading or improvement plans, before any ground-disturbing activities within 250 feet of said habitat, and on an ongoing basis throughout construction as applicable for all project phases as required by the habitat conservation plan and/or BO.

Enforcement:
1. U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
5. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2h Obtain an Incidental Take Permit under Section 10(a) of ESA; Develop and Implement a Habitat Conservation Plan to Compensate for the Loss of VELB Habitat. As long as valley elderberry longhorn beetle remains a species protected under ESA, the project applicant(s) of all project phases containing elderberry shrubs shall obtain an incidental take permit under Section 10(a) of ESA for valley elderberry longhorn beetle. No project construction shall proceed in areas potentially containing valley elderberry longhorn beetle until a BO has been issued by USFWS, and the project applicant(s) for all project phases have abided by all pertinent conditions in the BO relating to the proposed construction, including all conservation and minimization measures. Conservation and minimization measures are likely to include preparation of supporting documentation that describes methods for relocation of existing shrubs and maintaining existing shrubs and other vegetation in a conservation area.

Under the No Federal Action Alternative, interagency consultation under Section 7 of ESA would not occur; therefore, the project applicant(s) would be required to develop a habitat conservation plan to mitigate impacts on valley elderberry longhorn beetle. The project applicant(s) shall complete and implement a habitat conservation plan that will compensate for the loss of valley elderberry longhorn beetle. Relocation of existing elderberry shrubs and planting of new elderberry seedlings shall be implemented on a no-net-loss basis. Detailed information on monitoring success of relocated and planted shrubs and measures to compensate (should success criteria not be met) would also likely be required in the BO. Ratios for mitigation of valley elderberry longhorn beetle habitat will ultimately be

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

determined through the ESA Section 10(a) consultation process with USFWS, but shall be a minimum of "no net loss."

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases potentially containing elderberry shrubs.

Timing: Before the approval of any grading or improvement plans or any ground-disturbing activity within 100 feet of valley elderberry longhorn beetle habitat as applicable for all project phases, and on an ongoing basis as required by the habitat conservation plan and/or BO.

Enforcement: 1. U.S. Fish and Wildlife Service

2. City of Folsom Community Development Department.

3. For the U.S. 50 interchange improvements: Caltrans.

OFF-SITE

NCP, PP, RIM, CD, RHD: Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, and 3A.3-2f.

Significance after Mitigation: significant and unavoidable

3A.3-3: Potential Loss or Degradation of Special-Status Plant Populations and Habitat. Project implementation could result in direct removal of special-status plants, if they are present, through loss of suitable habitat or degradation of suitable habitat due to site alteration.	Land	**NP:** LTS **NCP, PP, RIM, CD, RHD:** Direct & indirect potentially significant

NP: No mitigation measures required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.3-3: Conduct Special-Status Plant Surveys; Implement Avoidance and Mitigation Measures or Compensatory Mitigation. To mitigate for the potential loss or degradation of special-status plant species and habitat, the project applicant(s) of all project phases shall adhere to the requirements described below.

- The project applicant(s) of all proposed project phases, including the proposed off-site elements, shall retain a qualified botanist to conduct protocol level preconstruction special-status plant surveys for all potentially occurring species. If no special-status plants are found during focused surveys, the botanist shall document the findings in a letter report to USFWS, DFG, the City of Folsom, Caltrans (for interchange improvements to U.S. 50), El Dorado County (for roadway connections in El Dorado County), and Sacramento County (for the off-site detention basin) and no further mitigation shall be required.
- If special-status plant populations are found, the project applicant(s) of affected project phases shall consult with DFG and USFWS, as appropriate depending on species status, to determine the appropriate mitigation measures for direct and indirect impacts on any special-status plant population that could occur as a result of project implementation. Mitigation measures may include preserving and enhancing existing populations, creation of off-site populations on project mitigation sites through seed collection or transplantation, and/or restoring or creating suitable habitat in sufficient quantities to achieve no net loss of occupied habitat or individuals.

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance

Mitigation

- If potential impacts on special-status plant species are likely, a mitigation and monitoring plan shall be developed before the approval of grading plans or any ground-breaking activity within 250 feet of a special-status plant population. The mitigation plan shall be submitted to Caltrans (for interchange improvements to U.S. 50), El Dorado County (for impacts in roadway connections in El Dorado County), Sacramento County (for impacts in the off-site detention basin footprint), or the City of Folsom (for on-site impacts and all other off-site elements), for review and approval. It shall be submitted concurrently to DFG or USFWS, as appropriate depending on species status, for review and comment. The plan shall require maintaining viable plant populations on-site and shall identify avoidance measures for any existing population(s) to be retained and compensatory measures for any populations directly affected. Possible avoidance measures include fencing populations before construction and exclusion of project activities from the fenced-off areas, and construction monitoring by a qualified botanist to keep construction crews away from the population. The mitigation plan shall also include monitoring and reporting requirements for populations to be preserved on site or protected or enhanced off site.
- If relocation efforts are part of the mitigation plan, the plan shall include details on the methods to be used, including collection, storage, propagation, receptor site preparation, installation, long-term protection and management, monitoring and reporting requirements, and remedial action responsibilities should the initial effort fail to meet long-term monitoring requirements.
- If off-site mitigation includes dedication of conservation easements, purchase of mitigation credits or other off-site conservation measures, the details of these measures shall be included in the mitigation plan, including information on responsible parties for long-term management, conservation easement holders, long-term management requirements, and other details, as appropriate to target the preservation on long term viable populations.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans, El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases and on- and off-site elements.

Timing: Before approval of grading or improvement plans or any ground disturbing activities, including grubbing or clearing, for any project phase, including off-site elements.

Enforcement:
1. U.S. Fish and Wildlife Service, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
5. For the U.S. 50 interchange improvements: Caltrans.

Significance after Mitigation: less than significant

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.3-4: Loss of Sensitive Natural Communities (Not Already Covered under Other Impacts). Project implementation would result in loss of riparian habitat, and valley needlegrass grassland that may be present on the SPA and could be removed by project development. These are natural communities considered sensitive by state and local resource agencies and require consideration under CEQA.	Land	**NP:** LTS **NCP, PP, RIM, CD, RHD:** Direct & indirect significant (Valley Needlegrass: Direct potentially significant)
NP: No mitigation measures required. **NCP, PP, RIM, CD, RHD:** Implement Mitigation Measures 3A.3-1a and 1b. **Mitigation Measure 3A.3-4a: Secure and Implement Section 1602 Streambed Alteration Agreement.** The project applicant(s) of all project phases shall obtain a Section 1602 streambed alteration agreement from DFG for all construction activities that would occur in the bed and bank of Alder Creek and other drainage channels and ponds on the SPA. As a condition of issuance of the streambed alteration agreement, the project applicant(s) for all project phases affecting riparian habitat shall hire a qualified restoration ecologist to prepare a riparian habitat MMP. The draft MMP shall describe specific method(s) to be implemented to avoid and/or compensate for impacts on the stream channel of Alder Creek and other drainage channels within DFG jurisdiction, and the bed and banks of the on-site ponds. Mitigation measures may include establishment or restoration of riparian habitat within the project's open space areas along preserved stream corridors, riparian habitat restoration off-site, or preservation and enhancement of existing riparian habitat either on or off the SPA. The compensation habitat shall be similar in composition and structure to the habitat to be removed and shall be at ratios adequate to offset the loss of riparian habitat functions and services at the SPA. The riparian habitat compensation section of the habitat MMP shall include the following: ▸ compensatory mitigation sites and criteria for selecting these mitigation sites; ▸ complete assessment of the existing biological resources in both the on-site and off-site preservation and restoration areas; ▸ site-specific management procedures to benefit establishment and maintenance of native riparian plant species, including black willow, arroyo willow, white alder, and Fremont cottonwood; ▸ a planting and irrigation program if needed for establishment of native riparian trees and shrubs at strategic locations within each mitigation site (planting and irrigation may not be necessary if preservation of functioning riparian habitat is chosen as mitigation or if restoration can be accomplished without irrigation or planting); ▸ in kind reference habitats for comparison with compensatory riparian habitats (using performance and success criteria) to document success; ▸ monitoring protocol, including schedule and annual report requirements (compensatory riparian habitats shall be monitored for a minimum period of five years); ▸ ecological performance standards, based on the best available science and including specifications for native riparian plant densities, species composition, amount of dead woody vegetation gaps and bare ground, and survivorship; at a minimum, compensatory mitigation planting sites must achieve 80% survival of planted riparian trees and shrubs by the end of the five-year maintenance and monitoring period or dead and dying trees shall be replaced and monitoring continued until 80% survivorship is achieved; ▸ corrective measures if performance standards are not met;

Mitigation		

- responsible parties for monitoring and preparing reports; and
- responsible parties for receiving and reviewing reports and for verifying success or prescribing implementation or corrective actions.

Any conditions of issuance of the Streambed Alteration Agreement shall be implemented as part of project construction activities that adversely affect the bed and bank and riparian habitat associated with Alder Creek and other drainage channels and ponds that are within the project area that is subject to DFG jurisdiction. The agreement shall be executed by the project applicant(s) and DFG before the approval of any grading or improvement plans or any construction activities in any project phase that could potentially affect the bed and bank of Alder Creek and other on-site or off-site drainage channels under DFG jurisdiction and their associated freshwater marsh and riparian habitat.

Mitigation for the U.S. 50 interchange improvements must be coordinated by the project applicant(s) of each applicable project phase with the Caltrans.

Implementation: Project applicant(s) of all project phases and the off-site Prairie City Road and Oak Avenue interchange improvements.

Timing: Before the approval of grading or improvement plans or any construction activities (including clearing and grubbing) that affect the bed and bank or riparian and freshwater marsh habitat associated with Alder Creek and other on-site or off-site drainage channels and ponds.

Enforcement:
1. California Department of Fish and Game,
2. City of Folsom Community Development Department.
3. Caltrans for interchange improvements to U.S. 50.

Mitigation Measure 3A.3-4b: Conduct Surveys to Identify and Map Valley Needlegrass Grassland; Implement Avoidance and Minimization Measures or Compensatory Mitigation. The project applicant(s) of all project phases shall retain a qualified botanist to conduct preconstruction surveys to determine if valley needlegrass grassland is present on the SPA. This could be done concurrently with any special-status plant surveys conducted on site as special-status plant surveys are floristic in nature, i.e. require that all species encountered be identified, and require preparation of a plant community map. If valley needlegrass grassland is not found on the SPA, the botanist shall document the findings in a letter report to the City of Folsom, and no further mitigation shall be required. Valley needlegrass grassland was not found in any of the off-site project elements.

If valley needlegrass grassland is found on the SPA, the location and extent of the community shall be mapped and the acreage of this community type, if any, that would be removed by project implementation shall be calculated. The project applicant(s) for all project phases affecting valley needlegrass grassland shall consult with DFG and the City of Folsom to determine appropriate mitigation for removal of valley needlegrass grassland resulting from project implementation. Mitigation measures may include establishment of valley needlegrass grassland within project's open space areas currently characterized by annual grassland, establishment of valley needlgrass grassland off-site, or preservation and enhancement of existing valley needlegrass grassland either on or off the SPA.

Implementation: Project applicant(s) of all project phases.

Timing: Before approval of grading or improvement plans or any ground-disturbing activities, including grubbing or clearing, for any project phase.

Enforcement:
1. California Department of Fish and Game,
2. City of Folsom Community Development Department.

Significance after Mitigation: less than significant

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

3A.3-5: Loss of Blue Oak Woodland and Individual Oak Trees. Project implementation would result in the removal of 444 acres of blue oak woodland and thousands of individual oak trees meeting the criteria for protection under Folsom Municipal Code and the Sacramento County Tree Ordinance.

ON-SITE

NP: No mitigation measures required.

PP, RHD: Mitigation Measure 3A.3-5: Conduct Tree Survey, Prepare and Implement an Oak Woodland Mitigation Plan, Replace Native Oak Trees Removed, and Implement Measures to Avoid and Minimize Indirect Impacts on Oak Trees Retained On Site. The project applicant(s) of all on- and off-site project phases containing oak woodland habitat or individual trees shall adhere to the requirements described below, which are consistent with those outlined in California Public Resources Code 21083.4.

- The project applicant(s) of all on-site project phases containing oak woodland habitat or individual trees and the off-site Prairie City Road and Oak Avenue interchange improvements to U.S. 50; Rowberry Drive Overcrossing; and the underground sewer force main shall develop a map depicting the tree canopy of all oak woodlands in the survey area and identifying the acreage of tree canopy that would be preserved and the acreage that would be removed. If a tree survey containing this information has already been performed and documented for the construction area, a new tree survey shall not be necessary. A tree permit for removal of oak trees shall be obtained from the City Planning Director. As a condition of the tree removal permit, project applicant(s) shall be required to develop a tree mitigation and preservation plan. The City's Tree Preservation Code requires compensatory mitigation involving one or more of the following elements for removal of protected trees:
  - payment of in-lieu mitigation fees on an inch-for-diameter-inch basis, as determined by the City Council based on the Tree Preservation Code, for purchase, planting, and maintenance of replacement trees and mitigation sites;
  - land dedication for tree planting at a ratio of 0.004 acre of land for every 1 inch of tree dbh removed with a minimum dedication of 5 acres of land unless the dedicated land is contiguous with an existing or planned open space area; or
  - tree planting at ratios based on the dbh of trees removed as specified in the City's Tree Preservation Code (City of Folsom 2009). (For example, the City's established tree replacement ratios require that eight 15-gallon native oak trees be planted for every protected tree removed measuring 6 to 10 inches dbh and that 15 15-gallon native oak trees be planted for every protected tree removed measuring 10 to 15 inches dbh);
  - preservation of existing, sustainable oak stands comparable in dbh sizes and species composition to the protected trees removed.
- To avoid and minimize indirect impacts on protected trees to remain on the SPA, the project applicant(s) of all affected project phases shall install high visibility fencing outside the outer edge of the drip lines of all trees to be retained on the SPA during project construction. The fencing may be installed around groups or stands of trees or whole wooded areas bust must be installed so that the drip lines of all trees are protected. Grading, trenching, equipment or materials storage, parking, paving, irrigation, and landscaping shall be prohibited within the fenced areas (i.e. drip lines of protected trees). If the activities listed cannot be avoided within the drip line of a particular tree, that tree shall be counted as an affected tree and compensatory mitigation shall be provided, or

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

the tree in question shall be monitored for a period of five years and replaced only if the tree appears to be dead or dying within five years of project implementation.

- The project applicant(s) of project phases affecting oak woodland habitat shall retain a qualified restoration ecologist to develop an oak woodland mitigation plan to compensate for the loss of blue oak woodland habitat on the SPA. The plan shall incorporate tree mitigation and preservation measures satisfactory to compensate for the loss of individual trees protected under City Municipal Code, as discussed above, and to replace the acreage and function and values of the blue oak woodland habitat that would be lost on the SPA. The oak woodland mitigation plan shall be developed in consultation with the Sacramento County Planning Department, City of Folsom, and DFG. The plan shall be consistent with the California Oaks Foundation Oak Woodland Mitigation Program (California Oaks Foundation Undated PDF), which is based on a template developed by Tuolumne County, and shall include one or more of the following options, as required by California Public Resources Code 21083.4:
  - Conservation easement and land dedication – protect existing blue oak woodland habitat having similar tree sizes and densities, species composition, site condition, and landscape context to the blue oak woodland to be removed. Oak woodland preservation shall be at an off-site location protected through a conservation easement or fee title dedication to a conservation group approved by DFG and Sacramento County and shall be at a ratio satisfactory to compensate for the loss of acreage and habitat function and value at the SPA.
  - In-lieu fee – contribution to the California Wildlife Conservation Board's Oak Woodlands Conservation Fund, or other mitigation fund established by the County, at a rate of 1 x acreage of affected oak woodland x current land value at time of impact.
  - Planting replacement trees – tree planting and maintenance at an off-site location to be preserved through conservation easement or fee title dedication may be used to mitigate up to 50% of the blue oak woodland impact.
- Tree planting conducted by the project applicant(s) shall occur at a site within Sacramento County that should naturally support blue oak woodland and shall be used to restore former blue oak woodland habitat that has been degraded or removed through human activities. Restoration shall be designed to result in species composition and densities similar to those on the SPA prior to project development.
- The oak woodland mitigation plan prepared by the project applicant(s) shall include a maintenance and monitoring program for any replacement trees. The program shall include monitoring and reporting requirements, schedule, and success criteria. Replacement oak trees shall be maintained and monitored for a minimum of seven years from the date of planting and irrigation shall be provided to planted trees for the first five years after planting. Any replacement trees that die during the monitoring period shall be replaced. The mitigation planting site must achieve 80% survival of planted trees by the end of the seven year maintenance and monitoring period or dead and dying trees shall be replaced and monitoring continued until 80% survivorship is achieved. A security bond sufficient to cover maintenance and monitoring costs for seven years shall be provided to the County Planning Department. The security bond will be forfeited if the project applicant or designated responsible party fails to provide maintenance and monitoring and meet the success criteria.

The project applicants' currently proposed mitigation for impacts on oak trees within the backbone infrastructure components of the SPA and the Oak Avenue/U.S. 50 Interchange is to preserve oak tree canopy area at a ratio of 1.5 to 1 (acres of tree canopy preserved to acres of tree canopy preserved within the proposed open space areas of the SPA).

Mitigation for the U.S. 50 interchange improvements must be coordinated by the project applicant(s) of each applicable project phase with Clatrans.

Implementation: Project applicant(s) of all project phases and off-site elements affecting blue oak woodland and protected trees.

Mitigation		
3B.3 BIOLOGICAL RESOURCES- WATER		
3B.3-1 Loss and Degradation of Waters of the U.S., including Wetlands, and Waters of the State. Construction of the Off-site Water Facility Alternatives has the potential to result in substantial adverse effects to Federally and state-protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to vernal pools and seasonal wetlands) through direct fill or excavation, hydrological interruption, or other indirect impacts. Wetlands, waters of the state, and other waters of the U.S. that would be affected by implementation of the Off-site Water Facility Alternatives include seeps, vernal pools, seasonal wetlands and seasonal wetland swales, drainage channels, ditches, and ponds.	Water	**NCP:** no direct & indirect PS **PA:** PS (Construction Effects w/in Zone 4), direct & indirect LTS (Operational Effects w/in Zones 1, 2, 3, & 4) **1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct & indirect PS
NCP: Implement Mitigation Measure 3B.3-1b and 3A.3-1a. **PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: Mitigation Measure 3B.3-1a: Secure Clean Water Act Section 404 Permit and Implement All Permit Conditions; Ensure No Net Loss of Functions of Wetlands, Other Waters of the U.S., and Waters of the State.** Before the approval of grading and improvement plans and before any groundbreaking activity associated with the Off-site Water Facilities requiring fill of wetlands or other waters of the U.S. or waters of the state, the City shall obtain all necessary permits under Sections 401 and 404 of the CWA or the state's Porter-Cologne Water Quality Control Act for the respective phase. For each respective Off-site Water Facility component, all permits, regulatory approvals, and permit conditions for effects on wetland habitats shall be secured before implementation of any grading activities within 250 feet of waters of the U.S. or wetland habitats, including waters of the state, that potentially support Federally listed species. The City shall commit to replace, restore, or enhance on a "no net loss" basis (in accordance with USACE and the Central Valley RWQCB) the acreage of all wetlands and other waters of the U.S. that would be removed, lost, and/or degraded with implementation of project plans for that phase. Wetland habitat shall be restored, enhanced, and/or replaced at an acreage and location and by methods agreeable to USACE, the Central Valley RWQCB, and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes. As part of the Section 404 permitting process, a draft wetland mitigation and monitoring plan (MMP) shall be developed for the selected Off-site Water Facility Alternative on behalf of the City. Before any ground-disturbing activities that would adversely affect wetlands and before engaging in mitigation activities associated with each phase of development, the City shall submit the draft wetland MMP to USACE and the Central Valley RWQCB for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be approved prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of mitigation, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer. As part of the MMP, the City shall prepare and submit plans for the creation of aquatic habitat in order to adequately offset and replace the aquatic functions and services that would be lost, account for the temporal loss of habitat, and contain an adequate margin of safety to reflect anticipated success. Restoration of previously altered and degraded wetlands shall be a priority of the MMP for offsetting losses of aquatic functions on the project site because it is typically easier to achieve functional success in restored wetlands than in those created from uplands. The MMP must demonstrate how the aquatic functions and values that would be lost through project implementation will be replaced.		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance

Mitigation

The habitat MMP for jurisdictional wetland features shall be consistent with USACE's and EPA's April 10, 2008 Final Rule for Compensatory Mitigation for Losses of Aquatic Resources (33 CFR Parts 325 and 332 and 40 CFR Part 230). According to the Final Rule, mitigation banks should be given preference over other types of mitigation because a lot of the risk and uncertainty regarding mitigation success is alleviated by the fact that mitigation bank wetlands must be established and demonstrating functionality before credits can be sold. This also alleviates temporal losses of wetland function while compensatory wetlands are being established. Mitigation banks also tend to be on larger, more ecologically valuable parcels and are subjected to more rigorous scientific study and planning and implementation procedures than typical permittee-responsible mitigation sites (USACE and EPA 2008). It is not likely feasible to provide compensatory mitigation for all aquatic resource impacts on site. Therefore, a combination of on-site and off-site permittee-responsible mitigation and mitigation banking would likely be necessary to achieve the no-net-loss standard.

Compensatory mitigation for losses of stream and intermittent drainage channels shall be achieved through in-kind preservation, restoration, or enhancement, as specified in the Final Rule guidelines. The wetland MMP shall address how to mitigate impacts on all aquatic resource types and shall describe specific method(s) to be implemented to avoid and/or mitigate any Off-site Water Facility-related impacts. The wetland compensation section of the habitat MMP shall include all the contents identified in Mitigation Measure 3A.3-1A.

USACE has determined that the Off-site Water Facilities may require an individual permit. In its final stage and once approved by USACE, the MMP for the Off-site Water Facilities is expected to detail proposed wetland restoration, enhancement, and/or replacement activities that would ensure no net loss of aquatic functions in the project vicinity. Approval and implementation of the wetland MMP shall aim to fully mitigate all unavoidable impacts on jurisdictional waters of the U.S., including jurisdictional wetlands. To satisfy the requirements of the City and the Central Valley RWQCB, mitigation of impacts on the non-jurisdictional wetlands beyond the jurisdiction of USACE shall be included in the same MMP. All mitigation requirements determined through this process shall be implemented before grading plans are approved. The MMP shall be submitted to USACE and approved prior to the issuance of any permits under Section 404 of the CWA.

Water quality certification pursuant to Section 401 of the CWA will be required before issuance of the Section 404 permit. Before construction in any areas containing wetland features, the City shall obtain water quality certification for the Off-site Water Facilities. Any measures required as part of the issuance of water quality certification shall be implemented.

Implementation: City of Folsom Utilities Department

Timing: Before the approval of grading or improvement plans or any ground-disturbing activities for all the Off-site Water Facilities containing wetland features or other waters of the U.S. The MMP must be approved before any impact on wetlands can occur. Mitigation shall be implemented on an ongoing basis throughout and after construction, as required.

Enforcement: 1. U.S. Army Corps of Engineers, Regional Water Quality Control Board, California Department of Fish and Game.

Mitigation Measure 3B.3-1b: Maximum Use of Trenchless Technology for Conveyance Pipeline Design. Following the selection of a Off-site Water Facility Alternative, the City shall design and route the water conveyance pipeline to avoid waters of the U.S and State, including wetlands and vernal pools, to the maximize extent practical. Where avoidance is not practical, the City shall maximize the use of trenchless technologies (micro-tunneling or jack-and-bore), where feasible.

All trenchless construction crossings will include the preparation of a Frac-Out (or inadvertent return of drilling lubricants) Contingency Plan for tunneling activities that use drilling lubricants (e.g., construction of pipelines using jack-and-bore methods). The purpose of the plan will be to minimize the potential for a

Mitigation		

frac-out associated with tunneling activities, provide for the timely detection of frac-outs, and ensure an organized, timely, and "minimum-impact" response in the event of a frac-out and release of drilling lubricant (i.e., bentonite). Preparation and implementation of a Frac-Out Contingency Plan will be reflected in contract documents.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-Site Water Facilities

Enforcement: 1. U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, Regional Water Quality Control Board, California Department of Fish and Game.

Mitigation Measure 3B.3-1c: Restore All Waters Impacted by Trenching and Temporary Construction Staging Areas to Pre-Project Contours and Conditions. For all water line crossings of waters of the U.S. or State in which the use of trenchless technologies are not feasible, the City shall ensure that all waters impacted by trenching activities are restored to pre-project contours and conditions. In addition, within 30 days following project construction, the City shall ensure that all temporary construction staging areas within waters of the U.S. or State are restored to pre-project contours and conditions.

At minimum, the City shall ensure that the following measures are implemented during construction:

- Conduct trenching and construction activities across drainages during low-flow (e.g., <1 to 2 cfs) or dry periods as feasible;
- If working in active channels, install cofferdam upstream and downstream of stream crossing to separate construction area from flowing waterway;
- Place sediment curtains upstream and downstream of the construction zone to prevent sediment disturbed during trenching activities from being transported and deposited outside of the construction zone;
- Locate spoil sites such that they do not drain directly into the drainages or seasonal wetlands;
- Store equipment and materials away from the drainages and wetland areas. No debris will be deposited within 250 feet of the drainages and wetland areas;
- Prepare and implement a revegetation plan to restore vegetation in all temporarily disturbed wetlands and other waters using native species seed mixes and container plant material that are appropriate for existing hydrological conditions.

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the Off-site Water Facilities requiring fill of wetlands or other waters of the U.S. or waters of the state, the City shall submit a wetland mitigation and monitoring plan (MMP) for the restoration of these waters within the selected water alignment to the USACE and Central Valley RWQCB for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be approved prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of restoration activities, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer.

At minimum, the MMP shall provide the following information:

- A description and drawings showing the existing contours (elevation) and existing vegetation of the waters of the U.S. and State that would be impacted through trenching activities. This information shall include site photographs taken at each impacted water.
- Methods used to ensure that trenching within waters of the U.S. and State do not adversely alter existing hydrology, including the draining of the waters (e.g.,

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A: Mitigation Measure 3B.3-2: Conduct Preconstruction Survey for Western Spadefoot Toad and Northwestern Pond Turtle and if Found, Implement Avoidance and Compensation Measures. Prior to construction, a qualified biologist retained by the City shall conduct protocol-level surveys for the western spadefoot toad and northwestern pond turtle to determine if these species are currently using water features crossed by the selected alignment. If either of these species is detected, then the City shall consult with the DFG (and USFWS if appropriate) to develop additional minimization measures prior to project construction (if necessary). These additional measures may include timing restrictions for groundwater dewatering activities, construction monitoring, and long-term monitoring.

If temporary fencing is used, it shall take the form of silt fencing and temporary plastic construction fencing placed no closer than 25 feet from the edge of the protected habitat. Protective fencing around vernal pools identified as potential habitat for special-status species shall be constructed in a way that allows western spadefoot toad to access these wetlands.

Impacted western spadefoot toad habitat shall be mitigated and compensated in accordance with USFWS and DFG requirements.

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.4 CLIMATE CHANGE – LAND		
3A.4-1: Generation of Temporary, Short-Term Construction-Related GHG Emissions. Project-related construction activities associated with development of the project and off-site elements would result in increased generation of GHG emissions. These emissions would be temporary and short-term and would decline over time as new regulations are developed that address medium- and heavy-duty on-road vehicles and off-road equipment under the mandate of AB 32.	Land	**ON- & OFF-SITE** **NP:** LTS **ON-SITE** **NCP, PP, RIM, CD, RHD:** significant cumulative **OFF-SITE** **NCP, PP, RIM, CD, RHD:** LTS (*Detention Basin and Sewer Force Main Connection*) Significant cumulative (*Prairie City Road Interchange, Rowberry Drive Overcrossing, Oak Avenue Interchange, and Roadway Extensions*)
ON-SITE **NP:** No mitigation measures required. **NCP, PP, RIM, CD, RHD:** Implement Mitigation Measures 3A.2-1a and 3A.2-1b. **Mitigation Measure 3A.4-1: Implement Additional Measures to Control Construction-Generated GHG Emissions.** To further reduce construction-generated GHG emissions, the project applicant(s) of all project phases shall implement all feasible measures for reducing GHG emissions associated with construction that are recommended by SMAQMD at the time individual portions of the site undergo construction. Such measures may reduce GHG exhaust emissions from the use of on-site equipment, worker commute trips, and truck trips carrying materials and equipment to and from the SPA, as well as GHG emissions embodied in the materials selected for construction (e.g., concrete). Other measures may pertain to the materials used in construction. Prior to releasing each request for bid to contractors for the construction of each development phase, the project applicant(s) shall obtain the most current list of GHG reduction measures that are recommended by SMAQMD and stipulate that these measures be implemented in the respective request for bid as well as the subsequent construction contract with the selected primary contractor. The project applicant(s) for any particular development phase may submit to SMAQMD a report that substantiates why specific measures are considered infeasible for construction of that particular development phase and/or at that point in time. The report, including the substantiation for not implementing particular GHG reduction measures, shall be approved by SMAQMD prior to the release of a request for bid by the project applicant(s) for seeking a primary contractor to manage the construction of each development phase. By requiring that the list of feasible measures be established prior to the selection of a primary contractor, this measure requires that the ability of a contractor to effectively implement the selected GHG reduction measures be inherent to the selection process. SMAQMD's recommended measures for reducing construction-related GHG emissions at the time of writing this EIR/EIS are listed below and the project applicant(s) shall, at a minimum, be required to implement the following: ▸ Improve fuel efficiency from construction equipment: • reduce unnecessary idling (modify work practices, install auxiliary power for driver comfort);		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

- perform equipment maintenance (inspections, detect failures early, corrections);
- train equipment operators in proper use of equipment;
- use the proper size of equipment for the job; and
- use equipment with new technologies (repowered engines, electric drive trains).

▸ Use alternative fuels for electricity generators and welders at construction sites such as propane or solar, or use electrical power.

▸ Use an ARB-approved low-carbon fuel, such as biodiesel or renewable diesel for construction equipment. (Emissions of oxides of nitrogen [NO_X] emissions from the use of low carbon fuel must be reviewed and increases mitigated.) Additional information about low-carbon fuels is available from ARB's Low Carbon Fuel Standard Program (ARB 2009b).

▸ Encourage and provide carpools, shuttle vans, transit passes and/or secure bicycle parking for construction worker commutes.

▸ Reduce electricity use in the construction office by using compact fluorescent bulbs, powering off computers every day, and replacing heating and cooling units with more efficient ones.

▸ Recycle or salvage non-hazardous construction and demolition debris (goal of at least 75% by weight).

▸ Use locally sourced or recycled materials for construction materials (goal of at least 20% based on costs for building materials, and based on volume for roadway, parking lot, sidewalk and curb materials).

▸ Minimize the amount of concrete used for paved surfaces or use a low carbon concrete option.

▸ Produce concrete on-site if determined to be less emissive than transporting ready mix.

▸ Use EPA-certified SmartWay trucks for deliveries and equipment transport. Additional information about the SmartWay Transport Partnership Program is available from ARB's Heavy-Duty Vehicle Greenhouse Gas Measure (ARB 2009c) and EPA (EPA 2009).

▸ Develop a SMAQMD-approved plan to efficiently use water for adequate dust control. This may consist of the use of non-potable water from a local source.

In addition to SMAQMD-recommended measures, construction activity shall comply with all applicable rules and regulations established by SMAQMD and ARB.

Implementation: Project applicant(s) during all project phases and on-site and off-site elements.

Timing: Before approval of final maps and building permits for all project phases, including all on- and off-site elements and implementation throughout project construction.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For all on- and off-site project-related activities within the City of Folsom and Sacramento County.
3. For the two roadway extensions into El Dorado Hills: El Dorado County Development Services Department.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
OFF-SITE **Mitigation Measure:** No mitigation measures are required. (*Detention Basin and Sewer Force Main Connection*) **Mitigation Measure:** Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1. (*Prairie City Road Interchange, Rowberry Drive Overcrossing, Oak Avenue Interchange, and Roadway Extensions*) ***Significance after Mitigation: significant and unavoidable***		
3A.4-2: Generation of Long-Term Operational GHG Emissions. Operation of the project over the long term would result in increased generation of GHGs, which would contribute considerably to cumulative GHG emissions.	Land	**ON-SITE** **NP:** LTS **ON-SITE** **NCP, PP, RIM, CD, RHD:** significant cumulative **OFF-SITE** **NCP, PP, RIM, CD, RHD:** LTS
ON-SITE **NP:** No mitigation measures required. **NCP, PP, RIM, CD, RHD:** Implement Mitigation Measure 3A.2-2. **Mitigation Measure 3A.4-2a: Implement Additional Measures to Reduce Operational GHG Emissions.** For each increment of new development within the SPA requiring a discretionary approval (e.g., tentative subdivision map, conditional use permit, improvement plan), the City shall impose mitigation measures that reduce GHG emissions to the extent feasible and to the extent appropriate with respect to the state's progress at the time toward meeting GHG emissions reductions required by the California Global Warming Solutions Act of 2006 (AB 32). The City shall require feasible reduction measures that, in combination with existing and future regulatory measures developed under AB 32, will reduce GHG emissions associated with the operation of future project development phases and supporting roadway and infrastructure improvements that are part of the selected action alternative by an amount sufficient to achieve the 2020-based goal of 4.36 CO_2e/SP/year for development that would become operational on or before the year 2020 and the 2020-based goal of 3.68 CO_2e/SP/year for development that would become operational on or before the year 2030, if it is feasible to do so. The feasibility of potential GHG reduction measures shall be evaluated by the City at the time each phase of development is proposed in order to allow for ongoing innovations in GHG reduction technologies, as well as incentives created in the regulatory environment. For each increment of new development, the City shall submit to the project applicant(s) a list of potentially feasible GHG reduction measures to be considered in the development design. The City's list of potentially feasible GHG reduction measures shall reflect the current state of the regulatory environment, which will continuously evolve under the mandate of AB 32. The project applicant(s) shall then submit to the City a mitigation report that contains an analysis demonstrating which GHG reduction measures are feasible the associated reduction in GHG emissions, and the resulting CO2e/SP/year metric. The report shall also demonstrate why measures not selected are considered infeasible. The City must review and approve the mitigation report for the project applicant(s) to receive the City's discretionary approval for the applicable increment of development. In determining what measures should appropriately be imposed by a local government under the circumstances, the City shall consider the following factors:		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

- the extent to which rates of GHG emissions generated by motor vehicles traveling to, from, and within the SPA are projected to decrease over time as a result of regulations, policies, and/or plans that have already been adopted or may be adopted in the future by ARB or other public agency pursuant to AB 32, or by EPA;
- the extent to which mobile-source GHG emissions, which at the time of writing this EIR/EIS comprise a substantial portion of the state's GHG inventory, can also be reduced through design measures that result in trip reductions and reductions in trip length;
- the extent to which GHG emissions emitted by the mix of power generation operated by SMUD, the electrical utility that will serve the SPA, are projected to decrease pursuant to the Renewables Portfolio Standard required by SB 1078 and SB 107, as well as any future regulations, policies, and/or plans adopted by the federal and state governments that reduce GHG emissions from power generation;
- the extent to which replacement of CCR Title 24 with the California Green Building Standards Code or other similar requirements will result in new buildings being more energy efficient and consequently more GHG efficient;
- the extent to which any stationary sources of GHG emissions that would be operated on a proposed land use (e.g., industrial) are already subject to regulations, policies, and/or plans that reduce GHG emissions, particularly any future regulations that will be developed as part of ARB's implementation of AB 32, or other pertinent regulations on stationary sources that have the indirect effect of reducing GHG emissions;
- the extent to which the feasibility of existing GHG reduction technologies may change in the future, and to which innovation in GHG reduction technologies will continue, effecting cost-benefit analyses that determine economic feasibility; and
- whether the total costs of proposed mitigation for GHG emissions, together with other mitigation measures required for the proposed development, are so great that a reasonably prudent property owner would not proceed with the project in the face of such costs.

In considering how much, and what kind of, mitigation is necessary in light of these factors, the City shall consider the following list of options, though the list is not intended to be exhaustive, as GHG emission reduction strategies and their respective feasibility are likely to evolve over time. These measures are derived from multiple sources including the Mitigation Measure Summary in Appendix B of the California Air Pollution Control Officer's Association (CAPCOA) white paper, CEQA & Climate Change (CAPCOA 2009a); CAPCOA's Model Policies for Greenhouse Gases in General Plans (CAPCOA 2009b); and the California Attorney General's Office publication, The California Environmental Quality Act: Addressing Global Warming Impacts at the Local Agency Level (California Attorney General's Office 2008).

Energy Efficiency

- Include clean alternative energy features to promote energy self-sufficiency (e.g., photovoltaic cells, solar thermal electricity systems, small wind turbines).
- Design buildings to meet CEC Tier II requirements (e.g., exceeding the requirements of the Title 24 [as of 2007] by 35%).
- Site buildings to take advantage of shade and prevailing winds and design landscaping and sun screens to reduce energy use.
- Install efficient lighting in all buildings (including residential). Also install lighting control systems, where practical. Use daylight as an integral part of lighting systems in all buildings.
- Install light-colored "cool" pavements, and strategically located shade trees along all bicycle and pedestrian routes.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Water Conservation and Efficiency

- With the exception of ornamental shade trees, use water-efficient landscapes with native, drought-resistant species in all public area and commercial landscaping. Use water-efficient turf in parks and other turf-dependant spaces.
- Install the infrastructure to use reclaimed water for landscape irrigation and/or washing cars.
- Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls.
- Design buildings and lots to be water-efficient. Only install water-efficient fixtures and appliances.
- Restrict watering methods (e.g., prohibit systems that apply water to nonvegetated surfaces) and control runoff. Prohibit businesses from using pressure washers for cleaning driveways, parking lots, sidewalks, and street surfaces. These restrictions should be included in the Covenants, Conditions, and Restrictions of the community.
- Provide education about water conservation and available programs and incentives.
- To reduce stormwater runoff, which typically bogs down wastewater treatment systems and increases their energy consumption, construct driveways to single-family detached residences and parking lots and driveways of multifamily residential uses with pervious surfaces. Possible designs include Hollywood drives (two concrete strips with vegetation or aggregate in between) and/or the use of porous concrete, porous asphalt, turf blocks, or pervious pavers.

Solid Waste Measures

- Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).
- Provide interior and exterior storage areas for recyclables and green waste at all buildings.
- Provide adequate recycling containers in public areas, including parks, school grounds, golf courses, and pedestrian zones in areas of mixed-use development.
- Provide education and publicity about reducing waste and available recycling services.

Transportation and Motor Vehicles

- Promote ride-sharing programs and employment centers (e.g., by designating a certain percentage of parking spaces for ride-sharing vehicles, designating adequate passenger loading and unloading zones and waiting areas for ride-share vehicles, and providing a Web site or message board for coordinating ride-sharing).
- Provide the necessary facilities and infrastructure in all land use types to encourage the use of low- or zero-emission vehicles (e.g., electric vehicle charging facilities and conveniently located alternative fueling stations).
- At industrial and commercial land uses, all forklifts, "yard trucks," or vehicles that are predominately used on-site at non-residential land uses shall be electric-powered or powered by biofuels (such as biodiesel [B100]) that are produced from waste products, or shall use other technologies that do not rely on direct fossil fuel consumption.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and building permits for all project phases, including all on- and off-site elements.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Enforcement: City of Folsom Community Development Department.

Mitigation Measure 3A.4-2a: Implement Additional Measures to Reduce Operational GHG Emissions. Each increment of new development within the project site requiring a discretionary approval (e.g., proposed tentative subdivision map, conditional use permit), shall be subject to a project-specific environmental review and will require that GHG emissions from construction and operation of each phase of development be reduced by 30% from business-as-usual 2006 emissions and as required by the California Global Warming Solutions Act of 2006 (AB 32).

The City shall require feasible reduction measures that, in combination with existing and future regulatory measures developed under AB 32, will reduce GHG emissions associated with the operation of future project development phases and supporting roadway and infrastructure improvements that are part of the selected action alternative by an amount sufficient to achieve the 2020-based goal of 4.36 CO2e/SP/year for development that would become operational on or before the year 2020 and the 2020-based goal of 3.68 CO2e/SP/year for development that would become operational on or before the year 2030, if it is feasible to do so. The feasibility of potential GHG reduction measures shall be evaluated by the City at the time each phase of development is proposed in order to allow for ongoing innovations in GHG reduction technologies, as well as incentives created in the regulatory environment.

For each increment of new development, the project applicant(s) shall submit to the City a list of feasible energy efficient design standards to be considered in the project-specific environmental review. These energy conservation measures which will be incorporated into the design, construction, and operational aspects of each increment of development, would result in a reduction in overall project energy consumption and GHGs. The project-specific environmental review shall further identify potentially feasible GHG reduction measures to reflect the current state of the regulatory environment, and which will continuously evolve under the mandate of AB 32 and the resulting CO2e/SP/year metric. The City will review and ensure inclusion of the design features in the proposed project before the applicant(s) can receive the City's discretionary approval for the applicable increment of development. In determining what measures should appropriately be imposed by the City under the circumstances, the City shall consider the following factors:

- the extent to which rates of GHG emissions generated by motor vehicles traveling to, from, and within the project site are projected to decrease over time as a result of regulations, policies, and/or plans that have already been adopted or may be adopted in the future by ARB or other public agency pursuant to AB 32, or by EPA;
- the extent to which mobile-source GHG emissions, which at the time of writing this EIR/EIS comprise a substantial portion of the state's GHG inventory, can also be reduced through design measures that result in trip reductions and reductions in trip length;
- the extent to which GHG emissions emitted by the mix of power generation operated by SMUD, the electrical utility that will serve the project site, are projected to decrease pursuant to the Renewables Portfolio Standard required by SB 1078 and SB 107, as well as any future regulations, policies, and/or plans adopted by the federal and state governments that reduce GHG emissions from power generation;
- the extent to which replacement of CCR Title 24 with the California Green Building Standards Code or other similar requirements will result in new buildings being more energy efficient and consequently more GHG efficient;
- the extent to which any stationary sources of GHG emissions that would be operated on a proposed land use (e.g., industrial) are already subject to regulations, policies, and/or plans that reduce GHG emissions, particularly any future regulations that will be developed as part of ARB's implementation of AB 32, or other pertinent regulations on stationary sources that have the indirect effect of reducing GHG emissions;
- the extent to which the feasibility of existing GHG reduction technologies may change in the future, and to which innovation in GHG reduction technologies

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Mitigation		

will continue, effecting cost-benefit analyses that determine economic feasibility; and

- whether the total costs of proposed mitigation for GHG emissions, together with other mitigation measures required for the proposed development, are so great that a reasonably prudent property owner would not proceed with the project in the face of such costs.

In considering how much, and what kind of, measures are necessary in light of these factors, the City shall consider and implement as appropriate, the following non-exclusive and non-exhaustive list of measures. GHG emission reduction strategies and their respective feasibility are likely to evolve over time. These measures are derived from multiple sources including the Mitigation Measure Summary in Appendix B of the California Air Pollution Control Officer's Association (CAPCOA) white paper, *CEQA & Climate Change* (CAPCOA 2009a); CAPCOA's *Model Policies for Greenhouse Gases in General Plans* (CAPCOA 2009b); and the California Attorney General's Office publication, The California Environmental Quality Act: Addressing Global Warming Impacts at the Local Agency Level (California Attorney General's Office 2008).

Energy Efficiency

- Include clean alternative energy features to promote energy self-sufficiency (e.g., photovoltaic cells, solar thermal electricity systems, small wind turbines).
- Design buildings to meet CEC Tier II requirements (e.g., exceeding the requirements of the Title 24 [as of 2007] by 35%).
- Site buildings to take advantage of shade and prevailing winds and design landscaping and sun screens to reduce energy use.
- Install efficient lighting in all buildings (including residential). Also install lighting control systems, where practical. Use daylight as an integral part of lighting systems in all buildings.
- Install light-colored "cool" pavements, and strategically located shade trees along all bicycle and pedestrian routes.

Water Conservation and Efficiency

- With the exception of ornamental shade trees, use water-efficient landscapes with native, drought-resistant species in all public area and commercial landscaping. Use water-efficient turf in parks and other turf-dependant spaces.
- Install the infrastructure to use reclaimed water for landscape irrigation and/or washing cars.
- Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls.
- Design buildings and lots to be water-efficient. Only install water-efficient fixtures and appliances.
- Restrict watering methods (e.g., prohibit systems that apply water to nonvegetated surfaces) and control runoff. Prohibit businesses from using pressure washers for cleaning driveways, parking lots, sidewalks, and street surfaces. These restrictions should be included in the Covenants, Conditions, and Restrictions of the community.
- Provide education about water conservation and available programs and incentives.
- To reduce stormwater runoff, which typically bogs down wastewater treatment systems and increases their energy consumption, construct driveways to single family detached residences and parking lots and driveways of multifamily residential uses with pervious surfaces. Possible designs include Hollywood drives (two concrete strips with vegetation or aggregate in between) and/or the use of porous concrete, porous asphalt, turf blocks, or pervious pavers.
- Comply with any applicable water conservation ordinances.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Solid Waste Measures

- Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).
- Provide interior and exterior storage areas for recyclables and green waste at all buildings.
- Provide adequate recycling containers in public areas, including parks, school grounds, golf courses, and pedestrian zones in areas of mixed-use development.
- Provide education and publicity about reducing waste and available recycling services.

Transportation and Motor Vehicles

- Promote ride-sharing programs and employment centers (e.g., by designating a certain percentage of parking spaces for ride-sharing vehicles, designating adequate passenger loading and unloading zones and waiting areas for ride-share vehicles, and providing a Web site or message board for coordinating ride-sharing).
- Provide the necessary facilities and infrastructure in all land use types to encourage the use of low- or zero-emission vehicles (e.g., electric vehicle charging facilities and conveniently located alternative fueling stations).
- At industrial and commercial land uses, all forklifts, "yard trucks," or vehicles that are predominately used on-site at non-residential land uses shall be electric-powered or powered by biofuels (such as biodiesel [B100]) that are produced from waste products, or shall use other technologies that do not rely on direct fossil fuel consumption.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and/or building permits for all project phases requiring discretionary approval, including all on- and off-site elements.

Enforcement: City of Folsom Community Development Department.

Mitigation Measure 3A.4-2b: Participate in and Implement an Urban and Community Forestry Program and/or Off-Site Tree Program to Off-Set Loss of On-Site Trees. The trees on the project site contain sequestered carbon and would continue to provide future carbon sequestration during their growing life. For all trees that are subject to removal, the project applicant(s) of all project phases shall participate in and provide necessary funding for urban and community forestry program (such as the UrbanWood program managed by the Urban Forest Ecosystems Institute [Urban Forest Ecosystems Institute 2009]) in which wood from any removed trees is harvested for an end-use that would retain its carbon sequestration (e.g., furniture building, cabinet making). For all nonharvestable trees that are subject to removal, the project applicant(s) shall develop and fund an off-site tree program that includes a level of tree planting that, at a minimum, increases carbon sequestration by an amount equivalent to what would have been sequestered by the blue oak woodland during its lifetime. This program shall be funded by the project applicant(s) of each development phase and reviewed for comment by an independent Certified Arborist unaffiliated with the project applicant(s) and shall be coordinated with the requirements of Mitigation Measure 3.3-5, as stated in Section 3A.3, "Biological Resources - Land." Final approval of the program shall be provided by the City. Components of the program may include, but not be limited to, providing urban tree canopy in the City of Folsom, or reforestation in suitable areas outside the City. The California Urban Forestry Greenhouse Gas Reporting Protocol shall be used to assess this mitigation program (CCAR 2008). All unused vegetation and tree material shall be mulched for use in landscaping on the project site, shipped to the nearest composting facility, or shipped to a landfill that is equipped with a methane collection system, or combusted in a biomass power plant. Tree and vegetative material should not be burned

Mitigation		

on- or off-site unless used as fuel in a biomass power plant.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and/or building permits for all project phases requiring discretionary approval, including all on- and off-site elements.

Enforcement: The City of Folsom Community Development Department.

OFF-SITE

Mitigation Measure: No mitigation measures are required.

Significance after Mitigation: cumulatively considerable and significant and unavoidable

3B.4 CLIMATE CHANGE – WATER

3B.4-1: Generation of Short- and Long-term Increases in Greenhouse Gases. Construction and operation of the Off-site Water Facility Alternatives would result in a net increase in greenhouse gas emissions, which would contribute considerably to cumulative GHG emissions.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A:** direct & indirect PS

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A: Mitigation Measure 3B.4-1a: Implement GHG Reduction Measures during Construction. The bid specifications for construction of the Off-site Water Facilities shall require that bidders demonstrate how they will comply with each of the following measures during all construction and demolition activities:

1) Construction vehicles and equipment will be properly maintained at all times in accordance with manufacturer's specifications, including proper tuning and timing of engines. Equipment maintenance records and equipment design specification data sheets shall be kept on-site during construction and demolition activities and subject to inspection by the SMAQMD.
2) Operators will turn off all construction vehicles and equipment and all delivery vehicles when not in use, and not allow idling for more than 5 minutes or for such other more restrictive time as may be required in law or regulation.
3) On-site construction vehicles and equipment will use ARB-certified biodiesel fuel if available (a minimum of B20, or 20 percent of biodiesel) except for those with warranties that would be voided if B20 biodiesel fuel were used. Prior to issuance of grading or demolition permits, the contractor shall provide documentation to the City that verifies whether any equipment is exempt; that a biodiesel supply has been secured; and that the construction contractor is aware that the use of biodiesel is required.
4) A City-approved Solid Waste Diversion and Recycling Plan (or such other documentation to the satisfaction of the City) will be in place for the Off-site Water Facilities that demonstrates the diversion from landfills and recycling of all nonhazardous, salvageable and re-useable wood, metal, plastic and paper products during construction and demolition activities. The Plan or other documentation shall include the name of the waste hauler, their assumed destination for all waste and recycled materials, and the procedures that will be followed to ensure implementation of this measure.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water facilities.

Mitigation		

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department, City of Folsom Community Development Department and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.4-1b Prepare and Implement an Off-site Water Facilities Climate Action Plan. Prior to operation, the City shall have in place a Off-site Water Facilities Climate Action Plan and Greenhouse Reduction Strategy (Plan) that has been adopted by the City following an opportunity for review and recommendation by the SMAQMD. At a minimum, the Plan shall include:

- Designation of Person Responsible for Implementation. The Plan shall designate the name and contact information of the person(s) responsible for ensuring continuous and on-going implementation of the Plan.
- GHG Inventory and Reduction Target. The City shall prepare a complete GHG Inventory for the Offsite Water Facilities components within one year following occupancy and a GHG reduction target based on State guidance.
- Off-site Water Facilities Design Features. The Off-site Water Facilities shall include design features to reduce operational GHG emissions, as well as an estimate of the reduction in GHG emissions that is expected to result from each facility. Initial measures that may be considered include, but are not limited to:
  - design all conditioned occupancies with "cool roofs" using products certified by the Cool Roof Rating Council, and other exposed roof surfaces coated with “cool paints”;
  - design all conditioned occupancies to take advantage of shade through the planting of deciduous canopy-type trees and/or prevailing winds to reduce energy use;
  - make maximum use of EnergyStar-qualified energy efficient appliances, heating and cooling systems, office equipment and lighting products;
  - install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy that has been generated by renewable sources to meet a portion of the electricity needs of the Offsite Water Facilities; and
  - in an effort to reduce GHG emissions from transportation sources, the bid specifications for the Offsite Water Facilities should require that bidders demonstrate that they have given preference to local sources of building materials or offer evidence to support why such local sources have not been used.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department, City of Folsom Community Development Department and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3B.4-2: Effects of Climate Change on the Off-site Water Supply Facilities. Global climate change could result in effects on water quality or water supplies proposed as part of the Off-site Water Facility Alternatives. **NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, 4A:** No mitigation measures are required. ***Significance after Mitigation: Less then Significant***	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A:** Direct LTS, no indirect
3A.5 CULTURAL RESOURCES – LAND		
3A.5-1: Possible Destruction of or Damage to Known Prehistoric and Historic-Era Cultural Resources from Ground-Disturbance or Other Construction-Related Activities. Construction activities during project implementation could result in the destruction of or damage to known prehistoric and historic-era cultural resources that are potentially eligible for or listed on the CRHR or NRHP. **NP:** No mitigation measures are required. **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.5-1a: Prepare, Execute, and Implement a Programmatic Agreement.** For all action alternatives that require Federal permitting and authorization, USACE shall satisfy the requirements of Section 106 of the NHPA. A PA shall be prepared that requires the following measures: ▸ For each development phase of the specific plan and associated Federal permits and authorizations, USACE, as the Federal Section 106 lead (or USACE designee) shall prepare an APE map and shall consult with the SHPO on the APE, as described above. ▸ Once SHPO, USACE, and other consulting parties agree on the project-specific APE, USACE or permit applicant (or designee, as directed by USACE) shall perform an inventory for cultural resources in the phase-specific APE consistent with the Secretary of the Interior's Standards and Guidelines for Identification (48 Federal Register [FR] 44720-23) and submit this inventory to the SHPO and any other relevant consulting parties for review as required under the PA. The same document shall evaluate identified resources for listing on the NRHP per the criteria provided above and the Secretary of the Interior's Standards and Guidelines for Evaluation (48 FR 44723-26). ▸ Once the inventory is complete, USACE (or designee, as directed by USACE) shall prepare a Finding of Effect (FOE) to assess the effect of the buildout of the individual development phase upon identified historic properties by applying the Criteria of Adverse Effect pursuant to 36 CFR 800.5(a) (1). If the FOE identifies adverse effects, the project applicant or USACE, or designee) shall prepare treatment measures and protocols to minimize these impacts to the extent possible. These treatment measures shall be appended to the PA in a treatment plan prepared for the specific project development phase. Treatment measures may include, but are not limited to, avoidance and preservation in places where possible. Where avoidance is not possible or feasible, treatment shall consist of	Land	**NP:** direct PS, no indirect **NCP, PP, CD, RHD:** direct significant, no indirect **RIM:** direct PS, no indirect

CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

either: 1) recovery of a suitable sample of material from archaeological sites that have the potential to contribute to research, or 2) documentation of historic resources to capture their significance and relationship to important historical themes. Documentation of historical resources shall be performed according to the Historic American Building Survey or Historic American Engineering Record (HABS/HAER) specifications or an equivalent standard when existing architecture or engineered features are subject to adverse effects. Where appropriate, treatment plans may specify the preparation and circulation of interpretive brochures, narrative descriptions, and photographic documentation for the general public.

- A geoarchaeological overview of the specific plan area may be stipulated and implemented in the PA, as determined by USACE, in order to assess the likelihood for buried cultural deposits. Focused geoarchaeological studies may be subsequently required for portions of the specific plan area and vicinity of off-site elements that are considered highly sensitive to determine if additional inventory or monitoring should be performed during construction as determined by USACE.
- Resources that may be discovered inadvertently during construction will be handled pursuant to 36 CFR Part 800.13(b) (*Discoveries without prior planning*).

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, and Caltrans) in coordination with USACE and SHPO to ensure that mitigation is consistent with the PA.

Implementation: USACE (or designee) and the project applicant(s) of all project phases (as directed by USACE)

Timing: The PA shall be prepared and executed (signed) prior to issuance of any Federal permit or authorization for any aspect or component of the specific plan project. Preparation of the phase-specific APE and inventory and evaluation of properties within the APE shall be performed prior to any ground-disturbing work in the APE for any Federal permitting or authorization of individual development phases. Implementation of treatment measures for identified historic properties may be performed during construction and ground-disturbing work provided that no ground-disturbing work is performed in the vicinity of resources subject to adverse effects and within an appropriate radius of the resource as determined by USACE, prior to completion of all treatment measures. The exact radius in which construction shall not occur shall be determined based upon the nature of the resource the potential for outlying undiscovered elements of that resource.

Enforcement: USACE and the project applicant(s) of all project phases (as directed by USACE), with oversight by the SHPO.

Mitigation Measure 3A.5-1b: Perform an Inventory and Evaluation of Cultural Resources for the California Register of Historic Places, Minimize or Avoid Damage or Destruction, and Perform Treatment Where Damage or Destruction Cannot be Avoided. Management of cultural resources eligible for or listed on the CRHR under CEQA mirrors management steps required under Section 106. These steps may be combined with deliverables and management steps performed for Section 106 provided that management documents prepared for the PA also clearly reference the CRHR listing criteria and significance thresholds that apply under CEQA. Prior to ground-disturbing work for each individual development phase or off-site element, the applicable oversight agency (City of Folsom, El Dorado County, Sacramento County, or Caltrans), or the project applicant(s) of all project phases, with applicable agency oversight, shall perform the following actions:

- Retain the services of a qualified archaeologist to perform an inventory of cultural resources within each individual development phase or off-site element subject to approval under CEQA. Identified resources shall be evaluated for listing on the CRHR. The inventory report shall also identify locations that are sensitive for undiscovered cultural resources based upon the location of known resources, geomorphology, and topography. The inventory report shall specify

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

the location of monitoring of ground-disturbing work in these areas by a qualified archaeologist, and monitoring in the vicinity of identified resources that may be damaged by construction, if appropriate. The identification of sensitive locations subject to monitoring during construction of each individual development phase shall be performed in concert with monitoring activities performed under the PA to minimize the potential for conflicting requirements.

- For each resource that is determined eligible for the CRHR, the applicable agency or the project applicant(s) of all project phases (under the agency's direction) shall obtain the services of a qualified archaeologist who shall determine if implementation of the individual project development phase would result in damage or destruction of "significant" (under CEQA) cultural resources. These findings shall be reviewed by the applicable agency for consistency with the significance thresholds and treatment measures provided in this EIR/EIS.
- Where possible, the project shall be configured or redesigned to avoid impacts on eligible or listed resources. Alternatively, these resources may be preserved in place if possible, as suggested under California Public Resources Code Section 21083.2.
- Where impacts cannot be avoided, the applicable agency or the project applicant(s) of all project phases (under the applicable agency's direction) shall prepare and implement treatment measures that are determined to be necessary by a qualified archaeologist. These measures may consist of data recovery excavations for resources that are eligible for listing because of the data they contain (which may contribute to research). Alternatively, for historical architectural, engineered, or landscape features, treatment measures may consist of a preparation of interpretive, narrative, or photographic documentation. These measures shall be reviewed by the applicable oversight agency for consistency with the significance thresholds and standards provided in this EIR/EIS.
- To support the evaluation and treatment required under this mitigation measure, the archaeologist retained by either the applicable oversight agency or the project applicant(s) of all project phases shall prepare an appropriate prehistoric and historic context that identifies relevant prehistoric, ethnographic, and historic themes and research questions against which to determine the significance of identified resources and appropriate treatment.
- These steps and documents may be combined with the phasing of management and documents prepared pursuant to the PA to minimize the potential for inconsistency and duplicative management efforts.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: The applicable oversight agency and the project applicant(s) (at the agency's direction) of all project phases

Timing: Before issuance of building permits and ground-disturbing activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.

RIM: Implement Mitigation Measures 3.53A.5-1a and 3.53A.5-1b.

Significance after Mitigation: potentially significant and unavoidable

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

3A.5-2: Possible Destruction of or Damage to Previously Undiscovered Cultural Resources from Ground-Disturbance or Other Construction-Related Activities. Construction activities during project implementation could result in the destruction of or damage to "significant" (under CEQA) undiscovered cultural resources.

Land

NP, NCP, PP, RIM, CD, RHD: direct PS, no indirect

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.5-2: Conduct Construction Personnel Education, Conduct On-Site Monitoring if Required, Stop Work if Cultural Resources are Discovered, Assess the Significance of the Find, and Perform Treatment or Avoidance as Required. To reduce potential impacts to previously undiscovered cultural resources, the project applicant(s) of all project phases shall do the following:

- Before the start of ground-disturbing activities, the project applicant(s) of all project phases shall retain a qualified archaeologist to conduct training for construction workers, to educate them about the possibility of encountering buried cultural resources, and inform them of the proper procedures should cultural resources be encountered.
- As a result of the work conducted for Mitigation Measures 3A.5-1a and 3A.5-1b, if the archaeologist determines that any portion of the SPA or the off-site elements should be monitored for potential discovery of as-yet-unknown cultural resources, the project applicant(s) of all project phases shall implement such monitoring in the locations specified by the archaeologist.
- Should any cultural resources, such as structural features, unusual amounts of bone or shell, artifacts, or architectural remains be encountered during any construction activities, work shall be suspended in the vicinity of the find and the appropriate oversight agency(ies) (identified below) shall be notified immediately. The appropriate oversight agency(ies) shall retain a qualified archaeologist who shall conduct a field investigation of the specific site and shall assess the significance of the find by evaluating the resource for eligibility for listing on the CRHR and the NRHP. If the resource is eligible for listing on the CRHR or NRHP and it would be subject to disturbance or destruction, the actions required in Mitigation Measures 3A.5-1a and 3A.5-1b shall be implemented. The oversight agency shall be responsible for approval of recommended mitigation if it is determined to be feasible in light of the approved land uses, and shall implement the approved mitigation before resuming construction activities at the archaeological site.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before and during ground-disturbing activities.

Enforcement:
1. For actions taken to satisfy the requirements of Section 106: the SHPO and USACE.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
5. For the U.S. 50 interchange improvements: Caltrans. ***Significance after Mitigation: potentially significant and unavoidable***		
3A.5-3: Possible Destruction of or Damage to Interred Human Remains during Construction. Ground-disturbing activities could inadvertently disinter and/or destroy buried human skeletal remains.	Land	**NP, NCP, PP, RIM, CD, RHD:** direct & potentially significant, no indirect
NP, NCP, PP, RIM, CD, RHD: Suspend Ground-Disturbing Activities if Human Remains are Encountered and Comply with California Health and Safety Code Procedures. In accordance with the California Health and Safety Code, if human remains are uncovered during ground-disturbing activities, including those associated with off-site elements, the project applicant(s) of all project phases shall immediately halt all ground-disturbing activities in the area of the find and notify the applicable county coroner and a professional archaeologist skilled in osteological analysis to determine the nature of the remains. The coroner is required to examine all discoveries of human remains within 48 hours of receiving notice of a discovery on private or public lands (California Health and Safety Code Section 7050.5[b]). If the coroner determines that the remains are those of a Native American, he or she must contact the NAHC by phone within 24 hours of making that determination (California Health and Safety Code Section 7050[c]). After the coroner's findings are complete, the project applicant(s), an archaeologist, and the NAHC-designated MLD shall determine the ultimate treatment and disposition of the remains and take appropriate steps to ensure that additional human interments are not disturbed. The responsibilities for acting on notification of a discovery of Native American human remains are identified in Section 5097.9 of the California Public Resources Code. Upon the discovery of Native American remains, the procedures above regarding involvement of the applicable county coroner, notification of the NAHC, and identification of an MLD shall be followed. The project applicant(s) of all project phases shall ensure that the immediate vicinity (according to generally accepted cultural or archaeological standards and practices) is not damaged or disturbed by further development activity until consultation with the MLD has taken place. The MLD shall have at least 48 hours after being granted access to the site to inspect the site and make recommendations. A range of possible treatments for the remains may be discussed: nondestructive removal and analysis, preservation in place, relinquishment of the remains and associated items to the descendants, or other culturally appropriate treatment. As suggested by Assembly Bill (AB) 2641 (Chapter 863, Statutes of 2006), the concerned parties may extend discussions beyond the initial 48 hours to allow for the discovery of additional remains. AB 2641(e) includes a list of site protection measures and states that the project applicant(s) shall comply with one or more of the following requirements: ▸ record the site with the NAHC or the appropriate Information Center, ▸ use an open-space or conservation zoning designation or easement, or ▸ record a document with the county in which the property is located. The project applicant(s) or its authorized representative of all project phases shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the NAHC is unable to identify an MLD or if the MLD fails to make a recommendation within 48 hours after being granted access to the site. The project applicant(s) or its authorized representative may also reinter the remains in a location not subject to further disturbance if it rejects the recommendation of the MLD and mediation by the NAHC fails to provide measures acceptable to the landowner. Ground disturbance in the zone of suspended activity shall not recommence without authorization from the archaeologist.

Mitigation		
3A.7 GEOLOGY, SOILS, MINERALS, AND PALEONTOLOGICAL RESOURCES - LAND		
3A.7-1: Possible Risks to People and Structures Caused by Strong Seismic Ground Shaking. The SPA is located in an area of generally low seismic activity; however, structures in the SPA could be subject to seismic ground shaking from an earthquake along active faults in Lake Tahoe.	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct, PS, No indirect
ON- & OFF-SITE **NP:** No mitigation measures are required.		
ON- & OFF-SITE **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.7-1a: Prepare Site-Specific Geotechnical Report per CBC Requirements and Implement Appropriate Recommendations.** Before building permits are issued and construction activities begin any project development phase, the project applicant(s) of each project phase shall hire a licensed geotechnical engineer to prepare a final geotechnical subsurface investigation report for the on- and off-site facilities, which shall be submitted for review and approval to the appropriate City or county department (identified below). The final geotechnical engineering report shall address and make recommendations on the following: ▸ site preparation; ▸ soil bearing capacity; ▸ appropriate sources and types of fill; ▸ potential need for soil amendments; ▸ road, pavement, and parking areas; ▸ structural foundations, including retaining-wall design; ▸ grading practices; ▸ soil corrosion of concrete and steel; ▸ erosion/winterization; ▸ seismic ground shaking; ▸ liquefaction; and ▸ expansive/unstable soils. In addition to the recommendations for the conditions listed above, the geotechnical investigation shall include subsurface testing of soil and groundwater conditions, and shall determine appropriate foundation designs that are consistent with the version of the CBC that is applicable at the time building and grading permits are applied for. All recommendations contained in the final geotechnical engineering report shall be implemented by the project applicant(s) of each project phase. Special recommendations contained in the geotechnical engineering report shall be noted on the grading plans and implemented as appropriate before construction begins. Design and construction of all new project development shall be in accordance with the CBC. The project applicant(s) shall provide for engineering inspection and certification that earthwork has been performed in conformity with recommendations contained in the geotechnical report.

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
Mitigation Measure 3A.7-1b: Monitor Earthwork during Earthmoving Activities. All earthwork shall be monitored by a qualified geotechnical or soils engineer retained by the project applicant(s) of each project phase. The geotechnical or soils engineer shall provide oversight during all excavation, placement of fill, and disposal of materials removed from and deposited on both on- and off-site construction areas. Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans). Implementation: Project applicant(s) of all project phases. Timing: Before issuance of building permits and ground-disturbing activities. Enforcement: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department. 2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department. 3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department. 4. For the U.S. 50 interchange improvements: Caltrans. ***Significance after Mitigation: less than significant***		
3A.7-2: Seismically-Induced Risks to People and Structures Caused by Liquefaction. Construction activities would not occur in areas subject to liquefaction. **NP, NCP, PP, RIM, CD, RHD:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct LTS, no indirect
3A.7-3: Construction-Related Erosion. Construction activities during project implementation would involve grading and movement of earth in soils subject to wind and water erosion hazard and on steep slopes. **ON- & OFF-SITE** **NP:** No mitigation measures are required. **ON- & OFF-SITE** **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.7-3: Prepare and Implement the Appropriate Grading and Erosion Control Plan.** Before grading permits are issued, the project applicant(s) of each project phase that would be located within the City of Folsom shall retain a California Registered Civil Engineer to prepare a grading and erosion control plan. The grading and erosion control plan shall be submitted to the City Public Works Department before issuance of grading permits for all new development. The plan shall be consistent with the City's Grading Ordinance, the City's Hillside Development Guidelines, and the state's NPDES permit, and shall include the site-specific grading associated with development for all project phases. For the two off-site roadways into El Dorado Hills, the project applicant(s) of that phase shall retain a California Registered Civil Engineer to prepare a grading	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct, PS, no indirect

Impact	Land/Water/GPA	Significance
Mitigation		

and erosion control plan. The grading and erosion control plan shall be submitted to the El Dorado County Public Works Department and the El Dorado Hills Community Service District before issuance of grading permits for roadway construction in El Dorado Hills. The plan shall be consistent with El Dorado County's Grading, Erosion, and Sediment Control Ordinance and the state's NPDES permit, and shall include the site-specific grading associated with roadway development.

For the off-site detention basin west of Prairie City Road, the project applicant(s) of that phase shall retain a California Registered Civil Engineer to prepare a grading and erosion control plan. The grading and erosion control plan shall be submitted to the Sacramento County Public Works Department before issuance of a grading permit. The plan shall be consistent with Sacramento County's Grading, Erosion, and Sediment Control Ordinance and the state's NPDES permit, and shall include the site-specific grading associated with construction of the detention basin.

The plans referenced above shall include the location, implementation schedule, and maintenance schedule of all erosion and sediment control measures, a description of measures designed to control dust and stabilize the construction-site road and entrance, and a description of the location and methods of storage and disposal of construction materials. Erosion and sediment control measures could include the use of detention basins, berms, swales, wattles, and silt fencing, and covering or watering of stockpiled soils to reduce wind erosion. Stabilization on steep slopes could include construction of retaining walls and reseeding with vegetation after construction. Stabilization of construction entrances to minimize trackout (control dust) is commonly achieved by installing filter fabric and crushed rock to a depth of approximately 1 foot. The project applicant(s) shall ensure that the construction contractor is responsible for securing a source of transportation and deposition of excavated materials.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties).

Implementation of Mitigation Measure 3A.9-1 (discussed in Section 3A.9, "Hydrology and Water Quality – Land") would also help reduce erosion-related impacts.

Implementation: Project applicant(s) of all project phases.

Timing: Before the start of construction activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department.
3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Significance after Mitigation: less than significant

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.7-4: Potential Geologic Hazards Related to Construction in Bedrock and Rock Outcrops, and Unstable Soils. Development in the eastern portion of the SPA would occur in steep slopes underlain by bedrock at shallow depths and rock outcrops that could result in geologic hazards during construction.	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct PS, no indirect
ON- & OFF-SITE **NP:** No mitigation measures are required. **ON- & OFF-SITE** **NCP, PP, RIM, CD, RHD:** Implement Mitigation Measure 3A.7-1a. **Mitigation Measure 3A.7-4a: Prepare a Seismic Refraction Survey and Obtain Appropriate Permits for all On-Site and Off-site Elements East of Old Placerville Road.** Before the start of all construction activities east of Old Placerville Road, the project applicant(s) of all project phases shall retain a licensed geotechnical engineer to perform a seismic refraction survey. Project-related excavation activities shall be carried out as recommend by the geotechnical engineer. Excavation may include the use of heavy-duty equipment such as large bulldozers or large excavators, and may include blasting. Appropriate permits for blasting operations shall be obtained from the relevant City or county jurisdiction prior to the start of any blasting activities. Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties). Implementation: Project applicant(s) of all project phases for on-site and off-site elements east of Old Placerville Road. Timing: Before or during earthmoving activities. Enforcement: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department. 2. For the two off-site roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Public Works Department. ***Significance after Mitigation: less than significant***		
3A.7-5: Potential Geologic Hazards Related to Seasonal Subsurface Water Flows from Surface Infiltration. SPA excavation is not expected to encounter groundwater, but seasonal subsurface flows due to surface infiltration, as well as surface infiltration from shallow wells, could adversely affect some of the building foundations at the SPA. Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

3A.7-10: Possible Damage of or Destruction to of Previously Unknown Unique Paleontological Resources during Construction-Related Activities. Portions of the SPA and the off-site detention basin are underlain by paleontologically sensitive rock formations. Therefore, construction activities could damage or destroy previously unknown, unique paleontological resources at the SPA.

Land

ON- & OFF-SITE
NP, NCP, PP, RIM, CD, RHD: direct PS, no indirect

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.7-10: Conduct Construction Personnel Education, Stop Work if Paleontological Resources are Discovered, Assess the Significance of the Find, and Prepare and Implement a Recovery Plan as Required. To minimize potential adverse impacts on previously unknown potentially unique, scientifically important paleontological resources, the project applicant(s) of all project phases where construction would occur in the Ione and Mehrten Formations shall do the following:

- Before the start of any earthmoving activities for any project phase in the Ione or Mehrten Formations, the project applicant(s) shall retain a qualified paleontologist or archaeologist to train all construction personnel involved with earthmoving activities, including the site superintendent, regarding the possibility of encountering fossils, the appearance and types of fossils likely to be seen during construction, and proper notification procedures should fossils be encountered.
- If paleontological resources are discovered during earthmoving activities, the construction crew shall immediately cease work in the vicinity of the find and notify the appropriate lead agency (identified below). The project applicant(s) shall retain a qualified paleontologist to evaluate the resource and prepare a recovery plan in accordance with Society of Vertebrate Paleontology guidelines (1996). The recovery plan may include, but is not limited to, a field survey, construction monitoring, sampling and data recovery procedures, museum storage coordination for any specimen recovered, and a report of findings. Recommendations in the recovery plan that are determined by the lead agency to be necessary and feasible shall be implemented before construction activities can resume at the site where the paleontological resources were discovered.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County).

Implementation: Project applicant(s) of all project phases within the Ione and Mehrten Formations.

Timing: During earthmoving activities in the Ione and Mehrten Formations as shown in Exhibit 3A.7-1.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Significance after Mitigation: less than significant

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3B.7 GEOLOGY, SOILS, AND PALEONTOLOGICAL RESOURCES – WATER		
3B.7-1: Possible Risks to People and Structures Caused by Strong Seismic Ground Shaking. Zone 4 of the "Water" Study Area is located in an area of generally low seismic activity; however, structures constructed as part of the Off-site Water Facility Alternatives could be subject to seismic ground shaking from an earthquake along active faults in the Sierra Nevada.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct PS & no indirect

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: Mitigation Measure 3B.7-1a: Prepare Geotechnical Report(s) for the Off-site Water Facilities and Implement Required Measures.

Facility design for all Off-site Water Facility components shall comply with the site-specific design recommendations as provided by a licensed geotechnical or civil engineer to be retained by the City. The final geotechnical and/or civil engineering report shall address and make recommendations on the following:

- site preparation;
- soil bearing capacity;
- appropriate sources and types of fill;
- potential need for soil amendments;
- road, pavement, and parking areas;
- structural foundations, including retaining-wall design;
- grading practices;
- soil corrosion of concrete and steel;
- erosion/winterization;
- seismic ground shaking;
- liquefaction; and
- expansive/unstable soils.

In addition to the recommendations for the conditions listed above, the geotechnical investigation shall include subsurface testing of soil and groundwater conditions, and shall determine appropriate foundation designs that are consistent with the version of the CBC that is applicable at the time building and grading permits are applied for. All recommendations contained in the final geotechnical engineering report shall be implemented by the City.

Implementation: City of Folsom Utilities Department

Timing: Prior to completion of engineering plans for all Off-site Water Facilities

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site water facilities within Unincorporated Sacramento County or the City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

ON- & OFF-SITE
NCP, PP, RIM, CD, RHD: Complete Investigations Related to the Extent to Which Soil and/or Groundwater May Have Been Contaminated in Areas Not Covered by the Phase I and II Environmental Site Assessments and Implement Required Measures. The project applicant(s) of all project phases shall conduct Phase I Environmental Site Assessments (where an Phase I has not been conducted), and if necessary, Phase II Environmental Site Assessments, and/or other appropriate testing for all areas of the SPA and include, as necessary, analysis of soil and/or groundwater samples for the potential contamination sites that have not yet been covered by previous investigations (as shown in Exhibit 3A.8-1) before construction activities begin in those areas. Recommendations in the Phase I and II Environmental Site Assessments to address any contamination that is found shall be implemented before initiating ground-disturbing activities in these areas.

The project applicant(s) shall implement the following measures before ground-disturbing activities to reduce health hazards associated with potential exposure to hazardous substances:

- Prepare a plan that identifies any necessary remediation activities appropriate for proposed on- and off-site uses, including excavation and removal of on-site contaminated soils, redistribution of clean fill material in the SPA, and closure of any abandoned mine shafts. The plan shall include measures that ensure the safe transport, use, and disposal of contaminated soil and building debris removed from the site. In the event that contaminated groundwater is encountered during site excavation activities, the contractor shall report the contamination to the appropriate regulatory agencies, dewater the excavated area, and treat the contaminated groundwater to remove contaminants before discharge into the sanitary sewer system. The project applicant(s) shall be required to comply with the plan and applicable Federal, state, and local laws. The plan shall outline measures for specific handling and reporting procedures for hazardous materials and disposal of hazardous materials removed from the site at an appropriate off-site disposal facility.
- Notify the appropriate Federal, state, and local agencies if evidence of previously undiscovered soil or groundwater contamination (e.g., stained soil, odorous groundwater) is encountered during construction activities. Any contaminated areas shall be remediated in accordance with recommendations made by the Sacramento County Environmental Management Department, Central Valley RWQCB, DTSC, and/or other appropriate Federal, state, or local regulatory agencies.
- Obtain an assessment conducted by PG&E and SMUD pertaining to the contents of any existing pole-mounted transformers located in the SPA. The assessment shall determine whether existing on-site electrical transformers contain PCBs and whether there are any records of spills from such equipment. If equipment containing PCB is identified, the maintenance and/or disposal of the transformer shall be subject to the regulations of the Toxic Substances Control Act under the authority of the Sacramento County Environmental Health Department.

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County). Implementation: Project applicant(s) of all project phases. Timing: Before and during earthmoving activities Enforcement: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department. 2. For the off-site detention basin west of Prairie City Road: Sacramento County Environmental Management Department. 3. Other regulatory agencies, such as California Department of Toxic Substances Control, or Central Valley Regional Water Quality Control Board, as appropriate. **Mitigation Measure:** Implement Mitigation Measure 3A.9-1 contained in Section 3A.9, "Hydrology and Water Quality - Land" [Acquire Appropriate Regulatory Permits and Prepare and Implement SWPPP and BMPs] ***Significance after Mitigation: less than significant***		
3A.8-3: Potential Development Constraints Due to the Listing on the Cortese List. The SPA contains Area 40, part of the Aerojet Superfund site, which has the potential to create a hazard to public health or the environment. Ongoing remediation activities could delay or limit project development on or near the site of those remediation activities.	Land	**ON-SITE** **NP:** no direct or indirect **ON- & OFF-SITE** **NCP, PP, RIM, CD, RHD:** direct PS, no indirect
ON-SITE **NP:** No mitigation measures are required. **ON- & OFF-SITE** **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.8-3a: Require the Project Applicant(s) to Cooperate with Aerojet and Regulatory Agencies to Preserve, Modify, or Close Existing Groundwater Monitoring Wells.** The project applicant(s) for all project phase(s) that would occur in or adjacent to the Area 40 boundary shall submit copies of tentative maps for residential subdivisions and for nonresidential uses to Aerojet, DTSC, and the Central Valley RWQCB or any successor in interest for review and approval. Aerojet, DTSC, and the Central Valley RWQCB or any successor shall work with the project applicant(s) to establish the preservation, modification, or closure of existing groundwater monitoring wells. If necessary, Aerojet, or any successor may purchase lots from the project applicant(s) to maintain access to monitoring wells. Development shall not proceed within the Area 40 boundary or on lands used for groundwater monitoring and other remediation activities until DTSC and the Central Valley RWQCB have approved Aerojet's or a successor's plan for well preservation, modification, or closure. The project applicant(s) for activities related to the off-site detention basin located outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) with Sacramento County.

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Implementation: Project applicants(s) for activities that would occur in the Area 40 boundary or on areas used for groundwater monitoring and other remediation activities.

Timing: Ongoing to the satisfaction of DTSC and the Central Valley RWQCB.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.8-3b: Coordinate Development Activities to Avoid Interference with Remediation Activities. The project applicant(s) for all project phases that would occur in or adjacent to the Area 40 boundary shall provide notice to Aerojet or any successor in interest and DTSC, the Central Valley RWQCB, and the City of Folsom of the location, nature, and duration of construction activities least 30 days before construction activities begin in areas on or near property with current or planned remediation activities (Area 40). Remedial actions, as required by DTSC, RWQCB, and/or the EPA, may include, but are not limited to:

- deed restrictions on land and groundwater use;
- requirements for building ventilation, heating, and air conditioning design;
- monitoring;
- installation of vertical barriers;
- biological, chemical, and/or physical treatment;
- extraction, and/or
- pump and treat activities.

Before the approval of grading plans which include areas within the Area 40 boundary or the off-site detention basin, the project applicant(s) shall work with Aerojet, DTSC, and the Central Valley RWQCB or any successor to schedule the timing of construction activities to prevent potential conflicts with remediation activities.

The project applicant(s) for activities related to the off-site detention basin located outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) with Sacramento County.

Implementation: Project applicant(s) for activities within the Area 40 boundary or on lands used for monitoring or other remediation-related activities.

Timing: Before the approval of grading plans and during construction activities within the Area 40 boundary, off-site detention basin, or on lands used for monitoring or other remediation-related activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
3. California Department of Toxic Substances Control, Central Valley Regional Water Quality Control Board, Aerojet General Corporation, as appropriate.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Mitigation Measure 3A.8-3c: Provide Written Notification to the City that DTSC-Required Notification Obligations and/or Easements Have Been Fulfilled to Ensure that Construction Activities Do Not Interfere with Remedial Actions.

Pursuant to its oversight over investigations of hazardous substances and determination of remedial action, DTSC establishes, as appropriate, deed restrictions (e.g., restrictions on future groundwater uses or future land uses) or easements (e.g., continued access to groundwater wells and pipelines) on property with associated notice requirements. The project applicant(s) for all such affected project activities, located within the Area 40 boundary, the off-site detention basin, or lands subject to monitoring or other remediation activities shall provide notification in writing to the City (or Sacramento County for the off-site detention basin) that said required DTSC notification obligations have been fulfilled. Evidence of the method of notification required by DTSC shall be submitted to the City before approval of tentative maps or improvement plans.

The project applicant(s) for such affected project activities shall coordinate with the City to include this provision as part of tentative map approval within the Area 40 boundary or lands subject to monitoring or other remediation activities. The project applicant(s) shall coordinate with Sacramento County for such affected project activities pertaining to the off-site detention basin.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County).

Implementation: Project applicant(s) for activities that would occur in the Area 40 boundary or on areas used for groundwater monitoring and other remediation activities.

Timing: Before approval of final maps and/or issuance of permits for sales trailers and model homes within the Area 40 boundary, the off-site detention basin, or lands subject to monitoring or other remediation activities.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Significance after Mitigation: less than significant

3A.8-4: Potential Interference with an Adopted Emergency Response or Emergency Evacuation Plan. Development of the SPA could interfere with adopted emergency plans.	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct LTS, no indirect

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.8-5: Potential for Blast-Related Injury to Construction Workers and the General Public. Development in the SPA would entail the use of explosive materials as part of grading activities in the eastern portion of the SPA that could result in injury to construction workers and the general public.	Land	**ON- & OFF-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct PS, no indirect
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.8-5: Prepare and Implement a Blasting Safety Plan in Consultation with a Qualified Blaster. To reduce the potential for accidental injury or death related to blasting, contractors whose work on the SPA will include blasting shall prepare and implement a blasting safety plan. This plan shall be created in coordination with a qualified blaster, as defined by the Construction Safety and Health Outreach Program, Subpart U, Section 1926.901, and distributed to all appropriate members of construction teams. The plan shall apply to project applicant(s) of all project phases in which blasting would be employed. The plan shall include, but is not limited to: ▸ storage locations that meet ATF standards contained in 27 CFR Part 55; ▸ safety requirements for workers (e.g., daily safety meetings, personal protective equipment); ▸ an accident management plan that considers misfires (i.e. explosive fails to detonate), unexpected ignition, and flyrock; and ▸ measures to protect surrounding property (e.g., netting, announcement of dates of expected blasting, barricades, and audible and visual warnings). Upon completion of a blasting safety plan, the project applicant(s) contractor shall secure any required permits from the City of Folsom Fire Department and the El Dorado County Sheriff's Department for blasting activities in Sacramento County and El Dorado County, respectively. Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado County). Implementation: Project applicant(s) and contractor(s) of all project phases in which blasting would be employed. Timing: At the submission of tentative map applications. Monitoring: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Fire Department. 2. For the off-site roadway connections in El Dorado County: El Dorado County Sheriff's Department. ***Significance after Mitigation: less than significant***		
3A.8-6: Possible Exposure of People to Electric and Magnetic Fields. Residential developments and/or schools would be located near high voltage transmission lines and radio towers, which could expose the general public to EMFs. Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

NCP, PP, RIM, CD, RHD: Mitigation Measure P3A.8-6: Prudent Avoidance and Notification of EMF Exposure. A policy of "prudent avoidance" to EMF exposure shall be incorporated into planning activities for residential developments near the transmission lines, which shall include consideration of up-to-date information on potential hazards of EMF, especially information from the California Public Utilities Commission.

In addition, potential purchasers of properties near the transmission lines shall be made aware of the controversy surrounding EMF exposure. The California Department of Real Estate shall be requested to insert an appropriate disclosure statement into the applicant's final Subdivision Public Report application, which shall be provided to purchasers of properties within 100 feet from the 100-115kV power line easement, or within 150 feet from the 220-230 kV power line easement.

Implementation: Project applicant(s) of all project phases in the vicinity of high-tension transmission lines.

Timing: At the submission of tentative map applications.

Enforcement: 1. City of Folsom Community Development Department.
2. Folsom Cordova Unified School District.

OFF-SITE

NCP, PP, RIM, CD, RHD: No mitigation measures are required.

Significance after Mitigation: less than significant

3A.8-7: Potential for Public Health Hazards from Mosquitoes Associated with Project Water Features. Project implementation would include construction of 16 on-site detention basins and 1 off-site detention basin, which could attract mosquitoes and other waterborne vectors, thereby potentially creating a public health hazard.	Land	**ON-SITE** **NP:** no direct or indirect **ON- & OFF-SITE** **NCP, PP, RIM, CD, RHD:** direct PS, no indirect

ON-SITE

NP: No mitigation measures are required.

ON- & OFF-SITE

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.8-7: Prepare and Implement a Vector Control Plan in Consultation with the Sacramento-Yolo Mosquito and Vector Control District. To ensure that operation and design of the stormwater system, including multiple planned detention basins, is consistent with the recommendations of the Sacramento-Yolo Mosquito and Vector Control District regarding mosquito control, the project applicant(s) of all project phases shall prepare and implement a Vector Control Plan. This plan shall be prepared in coordination with the Sacramento-Yolo Mosquito and Vector Control District and shall be submitted to the City for approval before issuance of the grading permit for the detention basins under the City's jurisdiction. For the off-site detention basin, the plan shall be submitted to Sacramento County for approval before issuance of the grading permit for the off-site detention basin. The plan shall incorporate specific measures deemed sufficient by the City to minimize public health risks from mosquitoes, and as contained within the Sacramento-Yolo Mosquito and Vector Control District BMP Manual (Sacramento-Yolo Mosquito and Vector Control District 2008). The plan shall include, but is not limited to, the following components:

- Description of the project.

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

- Description of detention basins and all water features and facilities that would control on-site water levels.
- Goals of the plan.
- Description of the water management elements and features that would be implemented, including:
  - BMPs that would implemented on-site;
  - public education and awareness;
  - sanitary methods used (e.g., disposal of garbage);
  - mosquito control methods used (e.g., fluctuating water levels, biological agents, pesticides, larvacides, circulating water); and
  - stormwater management (consistent with Stormwater Management Plan).
- Long-term maintenance of the detention basins and all related facilities (e.g., specific ongoing enforceable conditions or maintenance by a homeowner's association).

To reduce the potential for mosquitoes to reproduce in the detention basins, the project applicant(s) shall coordinate with the Sacramento-Yolo Mosquito and Vector Control District to identify and implement BMPs based on their potential effectiveness for SPA conditions. Potential BMPs could include, but are not limited to, the following:

- build shoreline perimeters as steep and uniform as practicable to discourage dense plant growth;
- perform routine maintenance to reduce emergent plant densities to facilitate the ability of mosquito predators (i.e., fish) to move throughout vegetated area;
- design distribution piping and containment basins with adequate slopes to drain fully and prevent standing water. The design slope should take into consideration buildup of sediment between maintenance periods. Compaction during grading may also be needed to avoid slumping and settling;
- coordinate cleaning of catch basins, drop inlets, or storm drains with mosquito treatment operations;
- enforce the prompt removal of silt screens installed during construction when no longer needed to protect water quality;
- if the sump, vault, or basin is sealed against mosquitoes, with the exception of the inlet and outlet, submerge the inlet and outlet completely to reduce the available surface area of water for mosquito egg–laying (female mosquitoes can fly through pipes); and
- design structures with the appropriate pumping, piping, valves, or other necessary equipment to allow for easy dewatering of the unit if necessary (Sacramento Yolo Mosquito and Vector Control District 2008).

The project applicant(s) of the project phase containing the off-site detention basin shall coordinate mitigation for the off-site with the affected oversight agency (i.e., Sacramento County).

Implementation: Project applicant(s) of all project phases containing water features.

Timing: Before issuance of grading permits for the project water features.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the off-site detention basin west of Prairie City Road: Sacramento-Yolo Mosquito and Vector Control District.

Mitigation		
3B.8 HAZARDS AND HAZARDOUS MATERIALS – WATER		
3B.8-1: Accidental Spill from Routine Transport, Use, or Disposal of Hazardous Materials. Accidental spills of hazardous materials could result during routine transport, use, or disposal activities as part of the implementation of the Off-site Water Facility Alternatives.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct & indirect PS (*construction*), direct PS & no indirect (*operations*)

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: Mitigation Measure 3B.8-1a: Transport, Store, and Handle Construction-Related Hazardous Materials in Compliance with Relevant Regulations and Guidelines.

The City shall ensure, through the enforcement of contractual obligations, that all contractors transport, store, and handle construction-related hazardous materials in a manner consistent with relevant regulations and guidelines, including those recommended and enforced by Caltrans, Central Valley RWQCB, local fire departments, and the County environmental health department.

Recommendations shall include as appropriate transporting and storing materials in appropriate and approved containers, maintaining required clearances, and handling materials using applicable Federal, state and/or local regulatory agency protocols. In addition, all precautions required by the Central Valley RWQCB-issued NPDES construction activity stormwater permits shall be taken to ensure that no hazardous materials enter any nearby waterways.

In the event of a spill, the City shall ensure, through the enforcement of contractual obligations, that all contractors immediately control the source of any leak and immediately contain any spill utilizing appropriate spill containment and countermeasures. If required by the local fire departments, the local environmental health department, or any other regulatory agency, contaminated media shall be collected and disposed of at an off-site facility approved to accept such media.

The storage, handling, and use of the construction-related hazardous materials shall be in accordance with applicable Federal, state, and local laws. Construction-related hazardous materials and hazardous wastes (e.g., fuels and waste oils) shall be stored away from stream channels and steep banks to prevent these materials from entering surface waters in the event of an accidental release. These materials shall be kept at sufficient distance (at least 500 feet) from nearby residences or other sensitive land uses. This includes materials stored for expected use, materials in equipment and vehicles, and waste materials.

1, 1A, 3, 3A, 4, & 4A: Mitigation Measure 3B.8-1b: Prepare and Implement a Hazardous Materials Management Plan.

The City shall prepare a Hazardous Materials Management Plan (HMMP) for the proposed WTP. The HMMP shall provide for safe storage, containment, and disposal of chemicals and hazardous materials related to WTP operations, including waste materials. The plan shall include, but shall not be limited to, the following:

- a description of hazardous materials and hazardous wastes;
- a description of handling, transport, treatment, and disposal procedures, as relevant for each hazardous material or hazardous waste;
- preparedness, prevention, contingency, and emergency procedures, including emergency contact information;
- A description of personnel training including, but not limited to: (1) recognition of existing or potential hazards resulting from accidental spills or other releases; (2) implementation of evacuation, notification, and other emergency response procedures; (3) management, awareness, and handling of hazardous materials and hazardous wastes, as required by their level of responsibility;

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.9 HYDROLOGY AND WATER QUALITY - LAND		
3A.9-1: Potential Temporary, Short-Term Construction-Related Drainage and Water Quality Effects. Construction activities during project implementation would involve extensive grading and movement of earth, which would substantially alter on-site drainage patterns and could generate sediment, erosion, and other nonpoint source pollutants in on-site stormwater that could drain to off-site areas and degrade local water quality.	Land	**ON- & OFF-SITE** **NP:** direct & indirect LTS **NCP, PP, RIM, CD, RHD:** direct & indirect significant

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.9-1: Acquire Appropriate Regulatory Permits and Prepare and Implement SWPPP and BMPs. Prior to the issuance of grading permits, the project applicant(s) of all projects disturbing one or more acres (including phased construction of smaller areas which are part of a larger project) shall obtain coverage under the SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ), including preparation and submittal of a project-specific SWPPP at the time the NOI is filed. The project applicant(s) shall also prepare and submit any other necessary erosion and sediment control and engineering plans and specifications for pollution prevention and control to Sacramento County, City of Folsom, El Dorado County (for the off-site roadways into El Dorado Hills under the Proposed Project Alternative). The SWPPP and other appropriate plans shall identify and specify:

- the use of an effective combination of robust erosion and sediment control BMPs and construction techniques accepted by the local jurisdictions for use in the project area at the time of construction, that shall reduce the potential for runoff and the release, mobilization, and exposure of pollutants, including legacy sources of mercury from project-related construction sites. These may include but would not be limited to temporary erosion control and soil stabilization measures, sedimentation ponds, inlet protection, perforated riser pipes, check dams, and silt fences
- the implementation of approved local plans, non-stormwater management controls, permanent post-construction BMPs, and inspection and maintenance responsibilities;
- the pollutants that are likely to be used during construction that could be present in stormwater drainage and nonstormwater discharges, including fuels, lubricants, and other types of materials used for equipment operation;
- spill prevention and contingency measures, including measures to prevent or clean up spills of hazardous waste and of hazardous materials used for equipment operation, and emergency procedures for responding to spills;
- personnel training requirements and procedures that shall be used to ensure that workers are aware of permit requirements and proper installation methods for BMPs specified in the SWPPP; and
- the appropriate personnel responsible for supervisory duties related to implementation of the SWPPP.

Where applicable, BMPs identified in the SWPPP shall be in place throughout all site work and construction/demolition activities and shall be used in all subsequent site development activities. BMPs may include, but are not limited to, such measures as those listed below.

- Implementing temporary erosion and sediment control measures in disturbed areas to minimize discharge of sediment into nearby drainage conveyances, in compliance with state and local standards in effect at the time of construction. These measures may include silt fences, staked straw bales or wattles,

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

sediment/silt basins and traps, geofabric, sandbag dikes, and temporary vegetation.

- Establishing permanent vegetative cover to reduce erosion in areas disturbed by construction by slowing runoff velocities, trapping sediment, and enhancing filtration and transpiration.
- Using drainage swales, ditches, and earth dikes to control erosion and runoff by conveying surface runoff down sloping land, intercepting and diverting runoff to a watercourse or channel, preventing sheet flow over sloped surfaces, preventing runoff accumulation at the base of a grade, and avoiding flood damage along roadways and facility infrastructure.

A copy of the approved SWPPP shall be maintained and available at all times on the construction site.

For those areas that would be disturbed as part of the U.S. 50 interchange improvements, Caltrans shall coordinate with the development and implementation of the overall project SWPPP, or develop and implement its own SWPPP specific to the interchange improvements, to ensure that water quality degradation would be avoided or minimized to the maximum extent practicable.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) during all project phases and on-site and off-site elements.

Timing: Submittal of the State Construction General Permit NOI and SWPPP (where applicable) and development and submittal of any other locally required plans and specifications before the issuance of grading permits for all on-site project phases and off-site elements and implementation throughout project construction.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. For all construction activities subject to the state's Construction General Permit and violators of local ordinances referred to the state for enforcement: Central Valley Regional Water Quality Control Board.

Significance after Mitigation: less than significant

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

3A.9-2: Potential Increased Risk of Flooding and Hydromodification from Increased Stormwater Runoff. Project implementation would increase the amount of impervious surfaces on the SPA, thereby increasing surface runoff. This increase in surface runoff would result in an increase in both the total volume and the peak discharge rate of stormwater runoff, and therefore could result in greater potential for on- and off-site flooding.

Land

ON- & OFF-SITE
NP: direct & indirect LTS
NCP, PP, RIM, CD, RHD: direct & indirect PS

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.9-2: Prepare and Submit Final Drainage Plans and Implement Requirements Contained in Those Plans. Before the approval of grading plans and building permits, the project applicant(s) of all project phases shall submit final drainage plans to the City, and to El Dorado County for the off-site roadway connections into El Dorado Hills, demonstrating that off-site upstream runoff would be appropriately conveyed through the SPA, and that project-related on-site runoff would be appropriately contained in detention basins or managed with through other improvements (e.g., source controls, biotechnical stream stabilization) to reduce flooding and hydromodfication impacts.

The plans shall include, but not be limited to, the following items:

- an accurate calculation of pre-project and post-project runoff scenarios, obtained using appropriate engineering methods, that accurately evaluates potential changes to runoff, including increased surface runoff;
- runoff calculations for the 10-year and 100-year (0.01 AEP) storm events (and other, smaller storm events as required) shall be performed and the trunk drainage pipeline sizes confirmed based on alignments and detention facility locations finalized in the design phase;
- a description of the proposed maintenance program for the on-site drainage system;
- project-specific standards for installing drainage systems;
- City and El Dorado County flood control design requirements and measures designed to comply with them;

  Implementation of stormwater management BMPs that avoid increases in the erosive force of flows beyond a specific range of conditions needed to limit hydromodification and maintain current stream geomorphology. These BMPs will be designed and constructed in accordance with the forthcoming SSQP Hydromodification Management Plan (to be adopted by the RWQCB) and may include, but are not limited to, the following:

  - use of Low Impact Development (LID) techniques to limit increases in stormwater runoff at the point of origination (these may include, but are not limited to: surface swales; replacement of conventional impervious surfaces with pervious surfaces [e.g., porous pavement]; impervious surfaces disconnection; and trees planted to intercept stormwater);
  - enlarged detention basins to minimize flow changes and changes to flow duration characteristics;
  - bioengineered stream stabilization to minimize bank erosion, utilizing vegetative and rock stabilization, and inset floodplain restoration features that provide for enhancement of riparian habitat and maintenance of natural hydrologic and channel to floodplain interactions;
  - minimize slope differences between any stormwater or detention facility outfall channel with the existing receiving channel gradient to reduce flow

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

velocity; and

- minimize to the extent possible detention basin, bridge embankment, and other encroachments into the channel and floodplain corridor, and utilize open bottom box culverts to allow sediment passage on smaller drainage courses.

▸ The final drainage plan shall demonstrate to the satisfaction of the City of Folsom Community Development and Public Works Departments and El Dorado County Department of Transportation that 100-year (0.01 AEP) flood flows would be appropriately channeled and contained, such that the risk to people or damage to structures within or down gradient of the SPA would not occur, and that hydromodification would not be increased from pre-development levels such that existing stream geomorphology would be changed (the range of conditions should be calculated for each receiving water if feasible, or a conservative estimate should be used, e.g., an Ep of 1 ±10% or other as approved by the Sacramento Stormwater Quality Partnership and/or City of Folsom Public Works Department).

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with El Dorado County.

Implementation: Project applicant(s) during all on-site project phases and off-site elements.

Timing: Before approval of grading plans and building permits of all project phases.

Enforcement: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Public Works Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.

Significance after Mitigation: less than significant

3A.9-3: Long-Term Water Quality and Hydrology Effects from Urban Runoff. Project implementation would convert a large area of undeveloped land to residential and commercial uses, thereby changing the amount and timing of potential long-term pollutant discharges in stormwater and other urban runoff to Alder Creek, Buffalo Creek, Coyote Creek, Carson Creek, and other on- and off-site drainages.	Land	**ON- & OFF-SITE** **NP:** direct & indirect LTS **NCP, PP, RIM, CD, RHD:** direct & indirect PS

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.9-3: Develop and Implement a BMP and Water Quality Maintenance Plan. Before approval of the final small-lot subdivision map for all project phases, a detailed BMP and water quality maintenance plan shall be prepared by a qualified engineer retained by the project applicant(s) of all project phases. Drafts of the plan shall be submitted to the City of Folsom and El Dorado County for the off-site roadway connections into El Dorado Hills, for review and approval concurrently with development of tentative subdivision maps for all project phases. The plan shall finalize the water quality improvements and further detail the structural and nonstructural BMPs proposed for the project. The plan shall include the elements described below.

▸ A quantitative hydrologic and water quality analysis of proposed conditions incorporating the proposed drainage design features.

▸ Predevelopment and postdevelopment calculations demonstrating that the proposed water quality BMPs meet or exceed requirements established by the City of Folsom and including details regarding the size, geometry, and functional timing of storage and release pursuant to the '"Stormwater Quality Design

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

Mitigation		

Manual for Sacramento and South Placer Regions" ([SSQP 2007b] per NPDES Permit No. CAS082597 WDR Order No. R5-2008-0142, page 46) and El Dorado County's NPDES SWMP (County of El Dorado 2004).

- Source control programs to control water quality pollutants on the SPA, which may include but are limited to recycling, street sweeping, storm drain cleaning, household hazardous waste collection, waste minimization, prevention of spills and illegal dumping, and effective management of public trash collection areas.
- A pond management component for the proposed basins that shall include management and maintenance requirements for the design features and BMPs, and responsible parties for maintenance and funding.
- LID control measures shall be integrated into the BMP and water quality maintenance plan. These may include, but are not limited to:
  - surface swales;
  - replacement of conventional impervious surfaces with pervious surfaces (e.g., porous pavement);
  - impervious surfaces disconnection; and
  - trees planted to intercept stormwater.
- New stormwater facilities shall be placed along the natural drainage courses within the SPA to the extent practicable so as to mimic the natural drainage patterns. The reduction in runoff as a result of the LID configurations shall be quantified based on the runoff reduction credit system methodology described in "Stormwater Quality Design Manual for the Sacramento and South Placer Regions, Chapter 5 and Appendix D4" (SSQP 2007b) and proposed detention basins and other water quality BMPs shall be sized to handle these runoff volumes.

For those areas that would be disturbed as part of the U.S. 50 interchange improvements, it is anticipated that Caltrans would coordinate with the development and implementation of the overall project SWPPP, or develop and implement its own SWPPP specific to the interchange improvements, to ensure that water quality degradation would be avoided or minimized to the maximum extent practicable.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with El Dorado County and Caltrans.

Implementation: Project applicant(s) during all on-site project phases and off-site elements.

Timing: Prepare plans before the issuance of grading permits for all project phases and off-site elements and implementation throughout project construction.

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department and Public Works Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Department of Transportation.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation		
3B.9 HYDROLOGY AND WATER QUALITY – WATER		
3B.9-1: Potential Temporary, Short-Term Construction-Related Drainage and Water Quality Effects. Construction of the Off-site Water Facilities could generate discharges to surface water resources that could potentially violate water quality standards or waste discharge requirements.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct & indirect PS (construction-related water quality)

NCP, PA, 1, 1A, 3, 3A, 4, & 4A: Mitigation Measure 3B.9-1a: Acquire Appropriate Regulatory Permits and Prepare and Implement SWPPP and BMPs. The City shall prepare a SWPPP specific to the selected Off-site Water Facility Alternative and secure coverage under SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ). The SWPPP shall identify specific actions and BMPs relating to the prevention of stormwater pollution from project-related construction sources by identifying a practical sequence for site restoration, BMP implementation, contingency measures, responsible parties, and agency contacts. The SWPPP shall reflect localized surface hydrological conditions and shall be reviewed and approved by the City prior to commencement of work and shall be made conditions of the contract with the contractor selected to build the Off-site Water Facilities. The SWPPP shall incorporate control measures in the following categories:

- soil stabilization and erosion control practices (e.g., hydroseeding, erosion control blankets, mulching, etc.;
- dewatering and/or flow diversion practices, if required (see Mitigation Measure 3B.9-1b);
- sediment control practices (temporary sediment basins, fiber rolls, etc.);
- temporary and post-construction on- and off-site runoff controls;
- special considerations and BMPs for water crossings, wetlands, drainages, and vernal pools;
- monitoring protocols for discharge(s) and receiving waters, with emphasis placed on the following water quality objectives: dissolved oxygen, floating material, oil and grease, pH, and turbidity;
- waste management, handling, and disposal control practices;
- corrective action and spill contingency measures;
- agency and responsible party contact information, and
- training procedures that shall be used to ensure that workers are aware of permit requirements and proper installation methods for BMPs specified in the SWPPP.

The SWPPP shall be prepared by a qualified SWPPP practitioner with BMPs selected to achieve maximum pollutant removal and represent the best available technology that is economically achievable. Emphasis for BMPs shall be placed on controlling discharges of oxygen-depleting substances, floating material, oil and grease, acidic or caustic substances or compounds, and turbidity. Performance and effectiveness of these BMPs shall be determined either by visual means where applicable (i.e., observation of above-normal sediment release), or by actual water sampling in cases where verification of contaminant reduction or elimination, (inadvertent petroleum release) as required to determine adequacy of the measure.

Implementation: City of Folsom Utilities Department

Mitigation

Timing: Development of the SWPPP prior to construction of all Off-site Water Facilities and implementation throughout construction.

Enforcement:
1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure 3B.9-1b: Properly Dispose of Hydrostatic Test Water and Construction Dewatering in Accordance with the Central Valley Regional Water Quality Control Board. All hydrostatic test water and construction dewatering shall be discharged to an approved land disposal area or drainage facility in accordance with Central Valley RWCQB requirements. The City or its construction contractor shall provide the Central Valley RWQCB with the location, type of discharge, and methods of treatment and monitoring for all hydrostatic test water discharges. Emphasis shall be placed on those discharges that would occur directly to surface water bodies.

Implementation: City of Folsom Utilities Department

Timing: Incorporation measures into SWPPP prior to construction and implementation throughout construction, as appropriate.

Enforcement:
1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b.

Implementation: City of Folsom Utilities Department

Timing: Incorporation of measures into SWPPP prior to construction and implementation throughout construction.

Enforcement:
1. Central Valley Regional Water Quality Control Board.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

2, 2A, 2B: Implement Mitigation Measure 3B.9-1a and 3B.9-1b.

Significance after Mitigation: less than significant

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3B.9-2: Exceedance of Surface Water Quality Standards during Operation. The operation of the Off-site Water Facilities could result in changes to the quality of surface water resources that could potentially violate water quality standards or waste discharge requests.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** no direct & indirect LTS
NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: No mitigation measures are required. ***Significance after Mitigation: less than significant***		
3B.9-3: Alteration of Drainage Patterns Resulting in Off-site Flooding and/or Erosion. The Off-site Water Facilities could result in the alteration of existing drainage patterns thereby increasing the rate or amount of surface runoff in a manner that could result in substantial flooding and/or erosion or siltation on- or off-site.	Water	**NCP, PA, 1, 1A, 3, 3A:** direct PS & no indirect **4, 4A:** direct & indirect PS **2, 2A, 2B:** direct & indirect LTS
NCP, PA, 1, 1A, 3, 3A, 4, & 4A: Mitigation Measure 3B.9-3a: Prepare and Implement Drainage Plan(s) for Structural Facilities. The City shall prepare a Drainage Plan for the selected Off-site Water Facility WTP and shall incorporate measures to maintain off-site runoff during peak conditions to pre-construction discharge levels. The Drainage Plan shall provide both short- and long-term drainage solutions to ensure the proper sequencing or drainage facilities during and following construction. The City shall evaluate options for on-site detention including, but not limited to, providing temporary storage within a portion or portions of proposed paved areas, linear infiltration facilities along the site perimeter, and/or other on-site opportunities for detention, retention, and/or infiltration facilities. Design specifications for the detention, retention, and/or infiltration facilities shall provide sufficient storage capacity to accommodate the 10-year, 24-hour storm event. In addition, the Drainage Plan shall delineate the overland release path for flows generated by a 100-year frequency storm, so that structural pad elevations for buildings, containment facilities, storage tank, and container storage areas are placed a minimum of one foot above the property's highest frontage curb elevation. Implementation: City of Folsom Utilities Department Timing: Development of the Drainage Plan prior to start of construction. Enforcement: 1. Central Valley Regional Water Quality Control Board. 2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department. 3. For improvements within unincorporated Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.		
Mitigation Measure 3B.9-3b: Ensure the Provision of Sufficient Outlet Protection and On-site Containment. Energy dissipaters, vegetated rip-rap, soil protection, and/or other appropriate BMPs shall be included within all storm-drain outlets to slow runoff velocities and prevent erosion at discharge locations for the WTP. A long-term maintenance plan shall be implemented for all drainage discharge control devices. The WTP layout shall also include sufficient on-site containment and pollution-control devises for drainage facilities to avoid the off-site release of water quality pollutants, oil and grease.

3B.10-1: Conflict with Applicable Water Resource Management and Facility Plans, Policies, or Regulations. Implementation of the Off-site Water Facility Alternatives would not conflict with applicable water resource management and facility plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. **NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A:** direct & indirect LTS
3B.10-2: Conflict with Applicable Local Agency Land Use Plans, Policies, or Regulations. Implementation of the Off-site Water Facility Alternatives could conflict with an applicable land use plan, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect.	Water	**NCP, PA:** consistent direct & indirect LTS **1, 1A, 3, 3A:** inconsistent direct & indirect significant **2, 2A, 2B:** consistent direct & indirect LTS **4, 4A:** consistent direct & indirect LTS (*location*), potentially inconsistent (*planning*)
1, 1A, 3, 3A, 4, & 4A: Mitigation Measure 3B.10-2: Acquire Development Approvals for Off-site WTPs. The City shall implement one of the two following options to enable development of the White Rock WTP under Off-site Water Facility Alternatives 1, 1A, 3, and 3A: (1) Annexation and Pre-Zoning to Public Use. The City shall file an application with Sacramento LAFCo to amend its sphere of influence to include the White Rock WTP and City Corporation Yard, if applicable. The application shall include a statement describing that the sphere of influence amendment is necessary to ensure the provision of adequate water supply, distribution, and treatment for planned development with the Folsom SPA. Subject to LAFCo approval of the sphere of influence amendment, the City shall prepare an application to annex and prezone the White Rock WTP site for Public Use. As part of the White Rock WTP site's design, spacing opportunities between the WTP facilities and adjacent land use shall be maximized to encourage open space continuity and disruption to adjacent agricultural areas. Prior the annexation approval, the City shall provide LAFCo with the following: (a) dedications of rights-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping/open space for the protection of adjoining and nearby properties. or (2) Obtain County Use Permit or General Plan Amendment. The City shall file an application with Sacramento County for a Use Permit to allow the operation of the proposed WTP within the AG-80 zone. The City shall comply with the conditions of the Use Permit, so that the WTP site is developed consistent with County requirements in terms of the following: (a) dedications of right-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping for the protection of adjoining and nearby properties. Alternatively, the City may file an application for a General Plan Amendment and Rezone to designate the White Rock WTP site for Public Use. In addition to complying with the requirements of the Public zone, the City shall develop the site consistent with the County's for the following: (a) dedications of right-of-way; (b) improvements for vehicle access; (c) the placement of structures and their associated height; and (d) landscaping for the protection of adjoining and nearby properties.

3A.11 NOISE - LAND		
3A.11-1: Temporary, Short-Term Exposure of Sensitive Receptors to Increased Equipment Noise from Project Construction. Project implementation would result in temporary, short-term construction activities associated with development of residential, commercial, schools, and park uses, supporting roadways, and other infrastructure improvements. Project-related construction activities could expose existing off-site and future on-site sensitive receptors to temporary noise levels that exceed the applicable noise standards and/or result in a substantial increase in ambient noise levels. **NP:** No mitigation measures are required. **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.11-1: Implement Noise-Reducing Construction Practices, Prepare and Implement a Noise Control Plan, and Monitor and Record Construction Noise near Sensitive Receptors.** To reduce impacts associated with noise generated during project-related construction activities, the project applicant(s) and their primary contractors for engineering design and construction of all project phases shall ensure that the following requirements are implemented at each work site in any year of project construction to avoid and minimize construction noise effects on sensitive receptors. The project applicant(s) and primary construction contractor(s) shall employ noise-reducing construction practices. Measures that shall be used to limit noise shall include the measures listed below: ▸ Noise-generating construction operations shall be limited to the hours between 7 a.m. and 7 p.m. Monday through Friday, and between 8 a.m. and 6 p.m. on Saturdays and Sundays. ▸ All construction equipment and equipment staging areas shall be located as far as possible from nearby noise-sensitive land uses. ▸ All construction equipment shall be properly maintained and equipped with noise-reduction intake and exhaust mufflers and engine shrouds, in accordance with manufacturers' recommendations. Equipment engine shrouds shall be closed during equipment operation. ▸ All motorized construction equipment shall be shut down when not in use to prevent idling. ▸ Individual operations and techniques shall be replaced with quieter procedures (e.g., using welding instead of riveting, mixing concrete off-site instead of on-site).	Land	**ON-SITE** **NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct significant, no indirect **OFF-SITE** **PP:** direct significant, no indirect **NCP, RIM, CD, RHD:** direct LTS, no indirect

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
▸ Noise-reducing enclosures shall be used around stationary noise-generating equipment (e.g., compressors and generators) as planned phases are built out and future noise sensitive receptors are located within close proximity to future construction activities. ▸ Written notification of construction activities shall be provided to all noise-sensitive receptors located within 850 feet of construction activities. Notification shall include anticipated dates and hours during which construction activities are anticipated to occur and contact information, including a daytime telephone number, for the project representative to be contacted in the event that noise levels are deemed excessive. Recommendations to assist noise-sensitive land uses in reducing interior noise levels (e.g., closing windows and doors) shall also be included in the notification. ▸ To the extent feasible, acoustic barriers (e.g., lead curtains, sound barriers) shall be constructed to reduce construction-generated noise levels at affected noise-sensitive land uses. The barriers shall be designed to obstruct the line of sight between the noise-sensitive land use and on-site construction equipment. When installed properly, acoustic barriers can reduce construction noise levels by approximately 8–10 dB (EPA 1971). ▸ When future noise sensitive uses are within close proximity to prolonged construction noise, noise-attenuating buffers such as structures, truck trailers, or soil piles shall be located between noise sources and future residences to shield sensitive receptors from construction noise. ▸ The primary contractor shall prepare and implement a construction noise management plan. This plan shall identify specific measures to ensure compliance with the noise control measures specified above. The noise control plan shall be submitted to the City of Folsom before any noise-generating construction activity begins. Construction shall not commence until the construction noise management plan is approved by the City of Folsom. Mitigation for the two off-site roadway connections into El Dorado County must be coordinated by the project applicant(s) of the applicable project phase with El Dorado County, since the roadway extensions are outside of the City of Folsom's jurisdictional boundaries. Implementation: Project applicant(s) and primary contractor(s) of all project phases. Timing: Before and during construction activities on the SPA and within El Dorado Hills. Enforcement: 1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department. 2. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department. ***Significance after Mitigation: significant and unavoidable***		
3A.11-2: Temporary, Short-Term Exposure of Sensitive Receptors to Increased Traffic Noise Levels from Project Construction. Project implementation would result in temporary increases in on- and off-site roadway traffic noise associated with project construction. Construction-generated traffic could expose sensitive receptors to noise levels along on- and off-site roadways that exceed the applicable noise standards and/or result in a substantial increase in ambient noise levels. **NP, NCP, PP, RIM, CD, RHD:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Land	**NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct LTS, no indirect

ON- & OFF-SITE

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.11-3: Implement Measures to Prevent Exposure of Sensitive Receptors to Groundborne Noise or Vibration from Project Generated Construction Activities.

- To the extent feasible, blasting activities shall not be conducted within 275 feet of existing or future sensitive receptors.
- To the extent feasible, bulldozing activities shall not be conducted within 50 feet of existing or future sensitive receptors.
- All blasting shall be performed by a blast contractor and blasting personnel licensed to operate in the State of California.
- A blasting plan, including estimates of vibration levels at the residence closest to the blast, shall be submitted to the enforcement agency for review and approval prior to the commencement of the first blast.
- Each blast shall be monitored and documented for groundbourne noise and vibration levels at the nearest sensitive land use and associated recorded submitted to the enforcement agency.

Implementation: Project applicant(s) and primary contractor(s) of all project phases.

Timing: Before and during bulldozing and blasting activities on the SPA and within El Dorado Hills and the County of Sacramento

Enforcement:
1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections off-site into El Dorado Hills: El Dorado County Development Services Department.
3. For the off-site detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.

ON-SITE

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.11-4: Implement Measures to Prevent Exposure of Sensitive Receptors to Increases in Noise from Project-Generated Operational Traffic on Off-site and On-Site Roadways.

To meet applicable noise standards as set forth in the appropriate General Plan or Code (e.g., City of Folsom, County of Sacramento, and County of El Dorado) and to reduce increases in traffic-generated noise levels at noise-sensitive uses, the project applicant(s) of all project phases shall implement the following:

- Obtain the services of a consultant (such as a licensed engineer or licensed architect) to develop noise-attenuation measures for the proposed construction of on-site noise-sensitive land uses (i.e., residential dwellings and school classrooms) that will produce a minimum composite Sound Transmission Class (STC) rating for buildings of 30 or greater, individually computed for the walls and the floor/ceiling construction of buildings, for the proposed construction of on-site noise-sensitive land uses (i.e., residential dwellings and school classrooms).
- Prior to submittal of tentative subdivision maps and improvement plans, the project applicant(s) shall conduct a site-specific acoustical analysis to determine predicted roadway noise impacts attributable to the project, taking into account site-specific conditions (e.g., site design, location of structures, building characteristics). The acoustical analysis shall evaluate stationary- and mobile-source noise attributable to the proposed use or uses and impacts on nearby noise-sensitive land uses, in accordance with adopted City noise standards. Feasible measures shall be identified to reduce project-related noise impacts. These measures may include, but are not limited to, the following:
  - limiting noise-generating operational activities associated with proposed commercial land uses, including truck deliveries;
  - constructing exterior sound walls;
  - constructing barrier walls and/or berms with vegetation;
  - using "quiet pavement" (e.g., rubberized asphalt) construction methods on local roadways; and,
  - using increased noise-attenuation measures in building construction (e.g., dual-pane, sound-rated windows; exterior wall insulation).

Implementation: Project applicant(s) of all project phases.

Timing: During project construction activities at noise-sensitive receptors on the SPA; at the existing noise-sensitive receptors on Empire Ranch Road from Broadstone Parkway to Iron Point Road; and at the existing noise-sensitive receptors on Latrobe Road from White Rock Road to Golden Foothills Parkway

Enforcement:
1. For all noise-sensitive receptors that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For all noise-sensitive receptors in El Dorado Hills: El Dorado County Development Services Department.
3. For all noise-sensitive receptors in the vicinity the off-site detention basin west of Prairie City Road: Sacramento County Planning and

ON-SITE

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.11-5: Implement Measures to Reduce Noise from Project-Generated Stationary Sources.

The project applicant(s) of all project phases shall implement the following measures to reduce the effect of noise levels generated by on-site stationary noise sources that would be located within 600 feet of any noise-sensitive receptor:

- Routine testing and preventive maintenance of emergency electrical generators shall be conducted during the less sensitive daytime hours (i.e., 7:00 a.m. to 6:00 p.m.). All electrical generators shall be equipped with noise control (e.g., muffler) devices in accordance with manufacturers' specifications.
- External mechanical equipment associated with buildings shall incorporate features designed to reduce noise emissions below the stationary noise source criteria. These features may include, but are not limited to, locating generators within equipment rooms or enclosures that incorporate noise-reduction features, such as acoustical louvers, and exhaust and intake silencers. Equipment enclosures shall be oriented so that major openings (i.e., intake louvers, exhaust) are directed away from nearby noise-sensitive receptors.
- Parking lots shall be located and designed so that noise emissions do not exceed the stationary noise source criteria established in this analysis (i.e., 50 dB for 30 minutes in every hour during the daytime [7 a.m. to 10 p.m.] and less than 45 dB for 30 minutes of every hour during the night time [10 p.m. to 7 a.m.]). Reduction of parking lot noise can be achieved by locating parking lots as far away as possible from noise sensitive land uses, or using buildings and topographic features to provide acoustic shielding for noise-sensitive land uses.

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
▸ Loading docks shall be located and designed so that noise emissions do not exceed the stationary noise source criteria established in this analysis (i.e., 50 dB for 30 minutes in every hour during the daytime [7 a.m. to 10 p.m.] and less than 45 dB for 30 minutes of every hour during the night time [10 p.m. to 7 a.m.]). Reduction of loading dock noise can be achieved by locating loading docks as far away as possible from noise sensitive land uses, constructing noise barriers between loading docks and noise-sensitive land uses, or using buildings and topographic features to provide acoustic shielding for noise-sensitive land uses. Implementation: Project applicant(s) of all project phases. Timing: Before submittal of improvement plans for each project phase, and during project operations for testing of emergency generators. Enforcement: City of Folsom Community Development Department. **OFF-SITE** No mitigation measures are required. ***Significance after Mitigation: less than significant***		
3A.11-6: Single-Event Aircraft Noise. New noise sensitive land uses proposed in the Specific Plan area could be exposed to noise from aircraft overflights. Overflights would not result in interior noise levels that create sleep disturbance. **NP, NCP, PP, RIM, CD, RHD:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Land	**ON-SITE** **NP, NCP, PP, RIM, CD, RHD:** direct LTS, no indirect **OFF-SITE** No direct or indirect
3A.11-7: Compatibility of Proposed On-Site Land Uses with the Ambient Noise Environment. Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Mitigation Measure 3B.11-1c: Maximize the Use of Noise Barriers. Construction contractors shall locate fixed construction equipment (such as compressors and generators) and construction staging areas as far as possible from nearby residences. If feasible, noise barriers shall be used at the construction site and staging area. Temporary walls, stockpiles of excavated materials, or moveable sound barrier curtains would be appropriate in instances where construction noise would exceed 90 dBA and occur within less than 50 feet from a sensitive receptor. The final selection of noise barriers will be subject to the City's approval and shall provide a minimum 10 dBA reduction in construction noise levels.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1d: Prohibit Non-Essential Noise Sources During Construction. No amplified sources (e.g., stereo "boom boxes") shall be used in the vicinity of residences during project construction.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.11-1e: Monitor Construction Noise and Provide a Mechanism for Filing Noise Complaints. An on-site complaint and enforcement manager shall track and respond to noise complaints. The City shall also provide a mechanism for residents, businesses, and agencies to register complaints with the City if construction noise levels are overly intrusive or construction occurs outside the required hours.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facility components

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3A.12 PARKS AND RECREATION - LAND		
3A.12-1: Sufficiency of Proposed Parkland to Meet Increased Demand and Potential Increased Use and Deterioration of Existing Facilities. Residential development proposed for the SPA would require 5 acres of parkland per 1,000 residents to meet the adopted City of Folsom standards. Increased population could increase the demand on existing neighborhood and community parks such that the physical deterioration of the existing facilities could occur or be accelerated. **NP, NCP, PP, RIM, CD, RHD:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Land	**ON-SITE** **NP:** indirect LTS, no direct **NCP, PP, RIM, CD, RHD:** direct LTS, no indirect **OFF-SITE** No direct or indirect
3A.12-2: Increased Use and Potential Physical Deterioration of Existing Off-site Local or Regional Park Facilities. Project implementation would result in a large number of new residents, which would increase the use and could cause the potential physical deterioration of existing off-site local and regional park facilities. **NP, NCP, PP, RIM, CD, RHD:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Land	**Direct** impacts are analyzed in Impact 3A.12-1. **ON-SITE** **NP:** indirect LTS **NCP, PP, RIM, CD, RHD:** indirect LTS **OFF-SITE** No indirect
3B.12 PARKS AND RECREATION - WATER		
3B.12-1: Temporary Disruptions to Existing Recreational Facilities and Opportunities. Implementation of the Off-site Water Facilities could temporarily disrupt trail, golf course, or park facility access.	Water	**NCP, PA, 1, 1A, 2, 2A, 3, 3A, 4 & 4A:** direct PS, no indirect **2B:** no impacts
NCP, PA, 1, 1A, 2, 2A, 3, 3A, 4 & 4A: Mitigation Measure 3B.12-1: Provide for Continued Recreational Access as Identified in Mitigation Measure 3.14-1a. As part of the Traffic Control Plan identified in Mitigation Measure 3.14-1a, the City shall ensure that trail access is maintained throughout the construction period through the use of detours. Proper signage shall be included in multiple locations, where necessary, to provide advance notice to hikers and equestrian riders of up-comings construction activities. Implementation: City of Folsom Utilities Department		

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)

3A.14 PUBLIC SERVICES - LAND		
3A.14-1: Temporary Reduction in Emergency Response Services during Construction. Project implementation could obstruct roadways in the project vicinity during construction, potentially obstructing or slowing emergency vehicles attempting to access the area.	Land	**NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct significant, no indirect
NP: No mitigation measures are required. **NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.14-1: Prepare and Implement a Construction Traffic Control Plan.** The project applicant(s) of all project phases shall prepare and implement traffic control plans for construction activities that may affect road rights-of-way. The traffic control plans must follow any applicable standards of the agency responsible for the affected roadway and must be approved and signed by a professional engineer. Measures typically used in traffic control plans include advertising of planned lane closures, warning signage, a flagperson to direct traffic flows when needed, and methods to ensure continued access by emergency vehicles. During project construction, access to existing land uses shall be maintained at all times, with detours used as necessary during road closures. Traffic control plans shall be submitted to the appropriate City or County department or the California Department of Transportation (Caltrans) for review and approval before the approval of all project plans or permits, for all project phases where implementation may cause impacts on traffic. Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties and Caltrans). Implementation: Project applicant(s) of all project phases. Timing: Before the approval of all relevant plans and/or permits and during construction of all project phases. Enforcement: 1. For those roadways that would be annexed into the City of Folsom: City of Folsom Public Works Department. 2. For those roadways that would remain under the control of Sacramento County: Sacramento County Department of Transportation. 3. For the two off-site roadway connections into El Dorado Hills: El Dorado County Department of Transportation. 4. For U.S. 50 interchange improvements: Caltrans. ***Significance after Mitigation: less than significant***

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.14-2: Incorporate California Fire Code; City of Folsom Fire Code Requirements; and EDHFD Requirements, if Necessary, into Project Design and Submit Project Design to the City of Folsom Fire Department for Review and Approval. To reduce impacts related to the provision of new fire services, the project applicant(s) of all project phases shall do the following, as described below.

1. Incorporate into project designs fire flow requirements based on the California Fire Code, Folsom Fire Code (City of Folsom Municipal Code Title 8, Chapter 8.36), and other applicable requirements based on the City of Folsom Fire Department fire prevention standards. Improvement plans showing the incorporation automatic sprinkler systems, the availability of adequate fire flow, and the locations of hydrants shall be submitted to the City of Folsom Fire Department for review and approval. In addition, approved plans showing access design shall be provided to the City of Folsom Fire Department as described by Zoning Code Section 17.57.080 ("Vehicular Access Requirements"). These plans shall describe access-road length, dimensions, and finished surfaces for firefighting equipment. The installation of security gates across a fire apparatus access road shall be approved by the City of Folsom Fire Department. The design and operation of gates and barricades shall be in accordance with the Sacramento County Emergency Access Gates and Barriers Standard, as required by the City of Folsom Fire Code.
2. Submit a Fire Systems New Buildings, Additions, and Alterations Document Submittal List to the City of Folsom Community Development Department Building Division for review and approval before the issuance of building permits.

In addition to the above measures, the project applicant(s) of all project phases shall incorporate the provisions described below for the portion of the SPA within the EDHFD service area, if it is determined through City/El Dorado County negotiations that EDHFD would serve the 178-acre portion of the SPA.

3. Incorporate into project designs applicable requirements based on the EDHFD fire prevention standards. For commercial development, improvement plans showing roadways, land splits, buildings, fire sprinkler systems, fire alarm systems, and other commercial building improvements shall be submitted to the EDHFD for review and approval. For residential development, improvement plans showing property lines and adjacent streets or roads; total acreage or square footage of the parcel; the footprint of all structures; driveway plan views describing width, length, turnouts, turnarounds, radiuses, and surfaces; and driveway profile views showing the percent grade from the access road to the structure and vertical clearance shall be submitted to the EDHFD for review and approval.
4. Submit a Fire Prevention Plan Checklist to the EDHFD for review and approval before the issuance of building permits. In addition, residential development requiring automation fire sprinklers shall submit sprinkler design sheet(s) and hydraulic calculations from a California State Licensed C-16 Contractor.

The City shall not authorize the occupancy of any structures until the project applicant(s) have obtained a Certificate of Occupancy from the City of Folsom Community Development Department verifying that all fire prevention items have been addressed on-site to the satisfaction of the City of Folsom Fire Department

Mitigation		
3A.15 TRAFFIC AND TRANSPORTATION - LAND		
3A.15-1: Increases to Peak-Hour and Daily Traffic Volumes, Resulting in Unacceptable Levels of Service. Implementation of development of the Project or build alternatives would cause an increase in a.m. peak-hour, p.m. peak-hour, and/or daily traffic volumes on area roadways, resulting in unacceptable LOS and warranting the need for improvements such as traffic signals and additional lanes.	Land	**NP:** no impact **NCP, PP, RIM, CD, RHD:** direct SU

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Project Participation in Funding Transportation Improvements

a. Within and adjacent to the project boundaries, the Applicant shall construct all feasible physical improvements necessary and available to reduce the severity of the project's significant transportation-related impacts, which may be subject to fee credits and/or reimbursement, coordinated by the City, from other fee-paying development projects if available with respect to roads or other facilities that would also serve those non-project fee-paying development projects Funding of improvements on the perimeter of the project boundaries will be shared with other development/jurisdictions.

b. Outside the project boundaries, the Applicant shall be responsible for the project's fair share of feasible physical improvements necessary and available to reduce the severity of the project's significant transportation-related impacts within the City of Folsom, in other jurisdictions and on State facilities, based on "cumulative plus project conditions." For purposes of this measure, "cumulative plus project conditions" refers to development authorized under the project as well as development consistent with approved general plans, specific plans, and other entitlements in the City and other jurisdictions. In cases where the project's fair share contribution is identified, the share will be based on the project's relative contribution to traffic growth under "cumulative plus project conditions." The project's contribution toward such improvements may take any, or some combination, of the following forms:

   1. Construction of roads, road improvements, or other transportation facilities outside the boundaries of the project, subject in some instances to fee credit against other improvements necessitated by the project or future reimbursement, coordinated by the City, from other fee-paying development projects if available where the roads or improvements at issue would also serve those non-project fee paying development projects;
   2. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation facilities to be built or improved within the City, consistent with the City's Capital Improvement Program ("CIP");
   3. The payment of other adopted regional impact fees that would provide improvements to roadways, intersections and/or interchanges that are affected by multiple jurisdictions, except where the project applicant's payments of other fees or construction of improvements within the City of Folsom creates credit against the payment of regional impact fees;
   4. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation facilities and/or improvements within affected jurisdictions outside of Folsom, which payments to the City of Folsom and transmittal of fees to other agencies would occur through one or more enforceable agreements provided that for each required improvement, there is a reasonable mitigation plan that ensures that (i) the fees collected from the project will be used for their intended purposes, and (ii) the improvements will actually be built within a reasonable period of time, and
   5. The payment of impact fees to the City of Folsom in amounts that constitute the project's fair share contributions to the construction of transportation

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

facilities and/or improvements on federal or state highways or freeways needed in part because of the project, to be made available to the California Department of Transportation ("Caltrans") if and when Caltrans and the City of Folsom enter into an enforceable agreement consistent with state law provided that, for each required improvement, Caltrans has a reasonable mitigation plan that ensures that (i) the fees collected from the project will be used for their intended purposes, and (ii) the improvements will actually be built within a reasonable period of time.

c. In pursuing a single agreement or multiple agreements with any jurisdictions outside of the City of Folsom that will be affected by traffic from the project in order to effectuate proposed mitigation measures for improvements outside the City of Folsom, the City will seek to negotiate in good faith with these other jurisdictions to enter into fair and reasonable arrangements with the intention of achieving, within a reasonable time period after approval of the project's, commitments for (i) the provision of adequate "fair share" mitigation payments from the project for out-of-jurisdiction traffic impacts and impacts on federal and state freeways and highways, and (ii) reciprocal payments from regional development projects to the City of Folsom to address cumulative "fair share" mitigation payments towards federal and state freeways and highways for transportation-related facilities and/or improvements within the City of Folsom necessitated by the development within the region. It is intended that these agreements shall permit the participating agencies flexibility in providing cross-jurisdictional credits and reimbursements consistent with the general "fair share" mitigation standard, and require an updated model run incorporating the best available information in order to obtain the most accurate, up-to-date impact assessment feasible and to generate the most accurate, up-to-date estimates of regional fair share contributions. Best efforts should be made to secure funding from federal, state and regional sources. These agreements, moreover, should also include provisions that allow for periodic updates to the traffic modeling on which fair share payment calculations depend in order to account for (i) newly approved projects cumulatively contributing to transportation-related impacts and that therefore should contribute to the funding of necessary improvements (ii) additional physical improvements necessitated in whole or in part by newly approved projects, (iii) changing cost calculations for the construction of needed improvements based on changes in the costs of materials, labor, and other inputs.

d. If transportation improvements required to be constructed as mitigation are constructed prior to project implementation, the project will pay its fair share portion for those improvements.

e. In considering individual projects within the project area (e.g., small-lot tentative subdivision maps or similar discretionary non-residential approvals), the City of Folsom shall identify required improvements, and shall base its calculations for such projects' fair share payments, based on the most recent traffic modeling (i.e., modeling that accounts for (i) newly approved projects cumulatively contributing to transportation-related impacts and that therefore should contribute to the funding of necessary improvements, (ii) additional physical improvements necessitated in whole or in part by newly approved projects, and (iii) changing cost calculations for the construction of needed improvements based on changes in the costs of materials, labor, and other inputs).

3A.15-1i: Unacceptable LOS at the Grant Line Road/White Rock Road Intersection (Sacramento County Intersection 3). Delay at the unsignalized Grant Line Road/White Rock Road intersection would increase delay by more than 5 seconds during the a.m. and p.m. peak hours.

Land

NCP, PP, RIM, CD, RHD: significant

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-1i: Participate in Fair Share Funding of Improvements to Reduce Impacts on the Grant Line Road/White Rock Road Intersection and to White Rock Road widening between the Rancho Cordova City limit to Prairie City Road (Sacramento County Intersection 3). Improvements must be made to ensure that the Grant Line Road/White Rock Road intersection operates at an acceptable LOS. The currently County proposed White Rock Road widening project will widen and realign White Rock Road from the Rancho Cordova City limit to the El Dorado County line (this analysis assumes that the Proposed Project and build alternatives will widen White Rock Road to five lanes from Prairie City road to the El Dorado County Line). This widening includes improvements to the Grant Line Road intersection and realigning White Rock Road to be the through movement. The improvements include two eastbound through lanes, one eastbound right turn lane, two northbound left turn lanes, two northbound right turn lanes, two westbound left turn lanes and two westbound through lanes. This improvement also includes the signalization of the White Rock Road and Grant Line Road intersection. With implementation of this improvement, the intersection would operate at an acceptable LOS A. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the Grant Line Road/White Rock Road intersection (Sacramento County Intersection 3).

Implementation: Sacramento County Public Works Department.

Timing: Before project build out. Design of the White Rock Road widening to four lanes, from Grant Line Road to Prairie City Road, with intersection improvements has begun, and because this widening project is environmentally cleared and fully funded, it's construction is expected to be complete before the first phase of the Proposed Project or alternative is built.

Enforcement: Sacramento County Public Works Department

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.15-1gg: Unacceptable LOS at the U.S. 50 Westbound/Prairie City Road Ramp Merge (Freeway Merge 33). This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour.	Land	**NCP, PP, RIM, CD, RHD:** significant
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-1gg: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound/Prairie City Road Direct Ramp Merge (Freeway Merge 33). To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Prairie City Road direct ramp merge, an auxiliary lane to the Folsom Boulevard off ramp diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Westbound/Prairie City Road direct ramp merge (Freeway Merge 33). Implementation: Caltrans Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built. Enforcement: Caltrans ***Significance after Mitigation: significant and unavoidable***		
3A.15-1hh: Unacceptable LOS at the U.S. 50 Westbound/Folsom Boulevard Diverge (Freeway Diverge 34). This freeway diverge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour, and degrade from an acceptable LOS D to an unacceptable LOS F during the p.m. peak hour.	Land	**NCP, PP, RIM, CD, RHD:** significant
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-1hh: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Eastbound/Folsom Boulevard Diverge (Freeway Diverge 34). To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Folsom Boulevard Diverge, an auxiliary lane from the Prairie City Road loop ramp merge must be constructed. Improvements to this freeway segment must be implemented by Caltrans. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements, as may be determined by a nexus study or other appropriate and reliable mechanism paid for by applicant, to reduce the impacts to the U.S. 50 Eastbound / Folsom Boulevard diverge (Freeway Diverge 34). Implementation: Caltrans Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built. Enforcement: Caltrans ***Significance after Mitigation: significant and unavoidable***

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.15-1ii: Unacceptable LOS at the U.S. 50 Westbound/Hazel Avenue Ramp Merge (Freeway Merge 38). This freeway merge would experience an increase in density under unacceptable LOS F conditions during the a.m. peak hour.	Land	**NCP, PP, RIM, CD, RHD:** significant
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-1ii: Participate in Fair Share Funding of Improvements to Reduce Impacts on U.S. 50 Westbound/Hazel Avenue Direct Ramp Merge (Freeway Merge 38). To ensure that Westbound U.S. 50 operates at an acceptable LOS at the Hazel Avenue direct ramp merge, an auxiliary lane to the Sunrise Boulevard off ramp diverge must be constructed. This auxiliary lane improvement is included in the proposed 50 Corridor Mobility Fee Program. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to the U.S. 50 Westbound/Hazel Avenue direct ramp merge (Freeway Merge 38). Implementation: Caltrans Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built. Enforcement: Caltrans ***Significance after Mitigation: significant and unavoidable***		
3A.15-2: Increased Demand for Single-Occupant Automobile Travel in the Project Area. Project implementation would increase demand for single-occupant automobile travel on area roadways and intersections causing roadway and intersection impacts.	Land	**NCP, PP, RIM, CD, RHD:** significant
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-2: Develop Commercial Support Services and Mixed-use Development Concurrent with Housing Development, and Develop and Provide Options for Alternative Transportation Modes. The project applicant(s) for all project phases shall develop commercial and mixed-use development concurrent with housing development, to the extent feasible in light of market realities and other considerations, to internalize vehicle trips. Pedestrian and bicycle facilities shall be implemented to the satisfaction of the City Public Works Department. To further minimize impacts from the increased demand on area roadways and intersections, the project applicant(s) for all project phases shall develop and implement safe and secure bicycle parking at schools and commercial centers to promote alternative transportation uses and reduce the volume of single-occupancy vehicles using area roadways and intersections. Implementation: City of Folsom and Applicant(s) Timing: Before approval of improvement plans for all project phases. Enforcement: City of Folsom Public Works Department. The project applicant(s) for all project phases shall participate in capital improvements and operating funds for transit service to increase the percent of travel by transit. The project's fair-share participation and the associated timing of the improvements and service shall be identified in the project conditions of approval and/or the project's development agreement. Improvements and service shall be coordinated, as necessary, with Folsom Stage Lines and Sacramento RT.

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		

Implementation: City of Folsom, Regional Transit, and Applicant(s)

Timing: As a condition of project approval and/or as a condition of the development agreement for all project phases.

Enforcement: City of Folsom Public Works Department.

Mitigation Measure 3A.15-2b: Participate in the City's Transportation System Management Fee Program. The project applicant(s) for all project phases shall pay an appropriate amount into the City's existing Transportation System Management Fee Program to reduce the number of single-occupant automobile travel on area roadways and intersections.

Implementation: City of Folsom and Applicant(s)

Timing: Concurrent with construction for all project phases.

Enforcement: City of Folsom Public Works Department.

Mitigation Measure 3A.15-2c: Participate with the 50 Corridor Transportation Management Association. The project applicant(s) for all project phases shall join and participate with the 50 Corridor Transportation Management Association to reduce the number of single-occupant automobile travel on area roadways and intersections.

Implementation: 50 Corridor Transportation Management Association and Applicant(s)

Timing: Concurrent with construction for all project phases.

Enforcement: City of Folsom Public Works Department.

Significance after Mitigation: significant and unavoidable

3A.15-3: Potential Impacts Associated with the City's Transportation Impact Fee Program. The City of Folsom has a transportation impact fee program to implement roadway facilities (those identified in the City General Plan for implementation before Year 2030) within the city limits. However, this fee program does not cover the new roadway facilities that will be needed due to the Proposed Project or alternative.	Land	**NCP, PP, RIM, CD, RHD:** significant

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-3: Pay Full Cost of Identified Improvements that Are Not Funded by the City's Fee Program.

In accordance with Measure W, the project applicant(s) for all project phases shall provide fair-share contributions to the City's transportation impact fee program to fully fund improvements only required because of the Specific Plan.

Implementation: City of Folsom and Applicant(s)

Timing: As a condition of project approval and/or as a condition of the development agreement for all project phases.

Enforcement: City of Folsom Public Works Department.

Mitigation		
Implementation: Sacramento County Department of Transportation. Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built. Enforcement: Sacramento County Department of Transportation. **RIM:** No mitigation measures are required. ***Significance after Mitigation: less than significant***		
3A.15-4l: Unacceptable LOS on Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segment s 12-13) under Cumulative (2030) Conditions. Operation of these deficient roadway segments degrade with the V/C ratio increasing by more than 0.05 with project and alternative traffic under cumulative (2030) conditions.	Land	**NCP, PP, RIM, CD, RHD:** significant
NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.15-4l: Participate in Fair Share Funding of Improvements to Reduce Impacts on Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segment s 12-13). To improve operation on Hazel Avenue between Curragh Downs Drive and the U.S. 50 westbound ramps, this roadway segment could be widened to eight lanes. This improvement is inconsistent with Sacramento County's general plan because the county's policy requires a maximum roadway cross section of six lanes. Analysis shown later indicates that improvements at the impacted intersection in this segment can be mitigated (see Mitigation Measure 3A.15-4q). Improvements to impacted intersections on this segment will improve operations on this roadway segment and, therefore; mitigate this segment impact. The applicant shall pay its proportionate share of funding of improvements to the agency responsible for improvements, based on a program established by that agency to reduce the impacts to Hazel Avenue between Curragh Downs Drive and U.S. 50 Westbound Ramps (Sacramento County Roadway Segments 12-13). Implementation: Sacramento County Department of Transportation. Timing: Before project build out. A phasing analysis should be performed prior to approval of the first subdivision map to determine during which project phase the improvement should be built. Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance

Mitigation

- Maintaining alternate one-way traffic flow past the lay down area and site access when feasible.
- Heavy trucks and other construction transport vehicles shall avoid the busiest commute hours (7 a.m. to 8 a.m. and 5 p.m. to 6 p.m. on weekdays).
- The City shall provide a minimum 72-hour advance notice of access restrictions for residents, businesses, and local emergency response agencies. This shall include the identification of alternative routes and detours to enable for the avoidance of the immediate construction zone.
- The City, in cooperation with its contractor(s), shall provide a phone number and community contact for inquiries about the schedule of the Off-site Water Facilities throughout the construction period. This information will be posted in a local newspaper, via the City's web site, or at City Hall and will be updated on a monthly basis.
- To the extent practical depending the alignment of the selected Off-site Water Facility Alternative, the City shall maximize opportunities for coordinated construction and installation of the conveyance pipeline with other planned roadway improvement projects.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.15-1b: Assess Pre-Off-site Water Facilities Roadway Conditions.

Prior to construction, the City's construction contractor(s) shall be responsible for assessing current road conditions for Off-site Water Facilities-related haul routes including the local access roads and develop post construction road restoration requirements. As part of the encroachment permitting process, an agreement shall be entered into with applicable jurisdictions prior to construction that details post construction road restoration requirements. Staff with the City of Rancho Cordova and Sacramento County shall review the post construction restoration standards for each of the affected roadways. The City shall perform roadway repairs or rehabilitation as necessary such that post construction requirements are met.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

ON-SITE

NP: No mitigation measures are required.

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.16-4: Submit Proof of Adequate EID Off-Site Wastewater Conveyance Facilities and Implement EID Off-Site Infrastructure Service Systems or Ensure That Adequate Financing Is Secured. Before the approval of the final map and issuance of building permits for all project phases, the project applicant(s) of all project phases shall obtain proof from EID that an adequate wastewater conveyance system either has been constructed or is ensured through the use of bonds or other sureties. The project applicants of all project phases shall submit this proof to the City of Folsom. EID off-site wastewater conveyance infrastructure sufficient to provide adequate service to project shall be in place for the amount of development identified in the tentative map before approval of the final map and issuance of building permits for all project phases, or their financing shall be ensured to the satisfaction of the City.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and issuance of building permits for any project phase.

Enforcement: City of Folsom Community Development Department and City of Folsom Public Works Department.

Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
3A.16-5: Increased Demand for El Dorado Hills Wastewater Treatment Plant Facilities. Project implementation would result in increased generation of wastewater. Collected wastewater flows from the 189-acre EID portion of the SPA would ultimately be transported to the El Dorado Hills WWTP for treatment and disposal.	Land	**ON-SITE** **NP:** no direct or indirect **NCP, PP, RIM, CD, RHD:** direct & indirect PS **OFF-SITE** No direct or indirect
ON-SITE **NP:** No mitigation measures are required. **PP: Mitigation Measure 3A.16-5: Demonstrate Adequate El Dorado Hills Wastewater Treatment Plant Capacity.** The project applicant(s) of all project phases shall demonstrate adequate capacity at the El Dorado Hills WWTP for new wastewater flows generated by project development. This shall involve preparing a tentative map–level study and paying connection and capacity fees as identified by EID. Approval of the final map and issuance of building permits for all project phases shall not be granted until the City verifies adequate El Dorado Hills WWTP capacity is available for the amount of development identified in the tentative map. Implementation: The project applicant(s) of all project phases. Timing: Before approval of final maps and issuance of building permits for any project phases involving the El Dorado Hills WWTP. Enforcement: City of Folsom Community Development Department and City of Folsom Public Works Department. **RIM, CD, RHD, NF:** Implement Mitigation Measure 3A.16-6. **OFF-SITE** No mitigation measures are required. ***Significance after Mitigation: potentially significant and unavoidable***		
3A.16-6: Short-Term Generation of Solid Waste during Project Construction. Project construction would generate short-term construction-related debris and waste.	Land	**ON-SITE** **NP:** direct LTS, no indirect **NCP, PP, RIM, CD, RHD:** direct LTS, no indirect **OFF-SITE** No direct or indirect

3B.16-5: Potential Inefficient Energy Consumption. Construction and operation of the Off-site Water Facilities could result in the inefficient consumption of energy thereby adversely affecting current and future energy conservation efforts.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct PS
NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: Implement Mitigation Measures 3B.4-1a and 3B.4-1b. ***Significance after Mitigation: less than significant***		
3B.17 GROUNDWATER - WATER		
3B.17-1: Exceedance of Water Quality Standards and Requirements for Groundwater. The Off-site Water Facilities could generate discharges to or contribute to the depletion of groundwater resources thereby potentially directly and indirectly violating water quality standards or waste discharge requirements.	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct PS & no indirect
NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A: Mitigation Measure 3B.17-1a: Implement Construction Dewatering Best Management Practices. During construction at site locations containing high groundwater, if groundwater from dewatering activities cannot be contained within the construction area (e.g. pipeline corridor, WTP), it shall be pumped to an authorized onsite land area, existing detention facilities, or Baker tanks or equivalent with sufficient capacity to control the volume of groundwater. Tanks shall be equipped with either a gel coagulant, a filter system, or other containment to remove sediment. The Off-site Water Facilities Stormwater Pollution Prevention Plan (SWPPP) shall include BMPs, as appropriate, to retain, treat, and dispose of groundwater from dewatering activities. Measures shall include, but not limited to, the following: ▸ temporarily retain pumped groundwater, as appropriate, to reduce turbidity and concentrations of suspended sediments before discharge to surface waterways; ▸ convey pumped groundwater to a suitable land disposal area capable of percolating flows; and/or

Mitigation		
▸ incorporate other applicable measures from the Caltrans Storm Water Quality Handbook, Section 7: Dewatering Operations (2004). Implementation: City of Folsom Utilities Department Timing: Prior to and during construction Enforcement: 1. California Department of Fish and Game or Regional Water Quality Control Board 2. City of Folsom Community Development Department. 3. Sacramento County Planning Department or City of Rancho Cordova Planning Department for improvements within their respective jurisdictions. **Mitigation Measure 3B.17-1b: Implement a Dewatering Discharge Monitoring Program.** A groundwater discharge monitoring program shall be implemented to ensure that receiving water quality does not exceed levels that would impact aquatic resources and agricultural use. If monitoring reveals that water quality would impact these beneficial uses, discharges to surface waterways shall be reduced or diluted to acceptable levels, or terminated. If discharges are reduced or terminated, groundwater shall be disposed through land application. Groundwater collected during dewatering shall be tested for contamination prior to disposal and comply with Central Valley RWQCB requirements. Implementation: City of Folsom Utilities Department Timing: Prior to and during construction Enforcement: 1. California Department of Fish and Game or Regional Water Quality Control Board 2. City of Folsom Community Development Department. 3. Sacramento County Planning Department or City of Rancho Cordova Planning Department for improvements within their respective jurisdictions. ***Significance after Mitigation: less than significant***		
3B.17-2: Depletion of Groundwater Supplies Through Pumping. The Off-site Water Facilities is unlikely to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater levels. **NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct LTS & no indirect

Mitigation		
3B.17-3: Alteration of Surface Water Hydrology through Substantial Groundwater Pumping. Substantial groundwater pumping from the Excelsior Well Field required by Off-site Water Facilities operations could alter existing surface hydrology. **NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** No mitigation measures are required. ***Significance after Mitigation: less than significant***	Water	**NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, & 4A:** direct LTS & no indirect
3A.18 WATER SUPPLY - LAND		
3A.18-1: Increased Demand for Water Supplies. Project water demands would require the acquisition of surface water entitlements from the Natomas Central Mutual Water Company to provide a reliable water supply.	Land	**ON-SITE** **NP:** no direct or indirect **NCP, PP, RIM, CD, RHD:** direct PS **OFF-SITE** Direct LTS, indirect impacts evaluated throughout EIR/EIS

NCP, PP, RIM, CD, RHD: Mitigation Measure 3A.18-1: Submit Proof of Surface Water Supply Availability.

a. Prior to approval of any small-lot tentative subdivision map subject to Government Code Section 66473.7 (SB 221), the City shall comply with that statute. Prior to approval of any small-lot tentative subdivision map for a proposed residential project not subject to that statute, the City need not comply with Section 66473.7, or formally consult with any public water system that would provide water to the affected area; nevertheless, the City shall make a factual showing or impose conditions similar to those required by Section 66473.7 to ensure an adequate water supply for development authorized by the map.

b. Prior to recordation of each final subdivision map, or prior to City approval of any similar project-specific discretionary approval or entitlement required for nonresidential uses, the project applicant(s) of that project phase or activity shall demonstrate the availability of a reliable and sufficient water supply from a public water system for the amount of development that would be authorized by the final subdivision map or project-specific discretionary nonresidential approval or entitlement. Such a demonstration shall consist of information showing that both existing sources are available or needed supplies and improvements will be in place prior to occupancy.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and issuance of building permits for any project phases.

Enforcement: City of Folsom Community Development Department and City of Folsom Public Works Department.

Significance after Mitigation: less than significant

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
CUMULATIVE - LAND		
Land Use Compatibility with High-Volume Arterial Roadways. When quarry truck trips are added to modeled roadway segments before the year 2030, traffic volumes within 400 feet of sensitive receptors that would be constructed in the SPA could result in exposure of those receptors to high levels of toxic air contaminants (see Table 4-4). Therefore, this direct impact would be potentially significant. No indirect impacts would occur.	Land	

Cumulative Mitigation Measure AIR-1-Land: Implement Measures to Reduce Exposure of Sensitive Receptors to Operational Emissions of Toxic Air Contaminants from Quarry Truck Traffic.

The City of Folsom does not have direct jurisdiction over the Teichert, DeSilva Gates, or Walltown quarry project applicants as these projects are located within the unincorporated portion of the County of Sacramento. The City's authority to control the activities of the quarry trucks includes restrictions or actions that would be applicable within the City's jurisdictional boundaries. For example, the City could designate truck routes through the City consistent with California Vehicle Code section 21101(c), including truck routes in the Folsom South of U.S. 50 project area, so as to prohibit or limit quarry trucks' use of City roads adjacent to areas where projected truck traffic volumes would otherwise result in exposure of sensitive receptors to operational emissions of toxic air contaminants from quarry truck traffic and/or traffic safety hazards. If this approach is selected by the City, then prior to the approval of the first tentative subdivision map or any other discretionary project approval that would place sensitive receptors along any roads the quarry trucks could use to access U.S. 50, the City's traffic department and consultants shall analyze and propose to the City Council for approval designated truck routes from the quarries through City jurisdiction to access U.S. 50 that would allow a level of truck traffic that would avoid any potentially significant impact on sensitive receptors from toxic air contaminant emissions within the Folsom South of U.S. 50 project area, as well as any other existing or planned uses that would contain sensitive receptors, so as to ensure that the risk of cancer to sensitive receptors is no more than 296 in one million (or such different threshold of significance recommended by SMAQMD or ARB at the time, if any) as may be determined by a Health Risk Assessment (HRA) paid for by the applicant.

As an alternative to designating truck routes, the following measures could be voluntarily implemented by the quarry project applicant(s) (Teichert, DeSilva Gates, and Granite [Walltown]) to reduce exposure of sensitive receptors to TACs generated by quarry truck traffic and are encouraged:

- The quarry project applicant(s) should meet with the City of Folsom to discuss mitigation strategies, implementation, and cost.
- A site-specific, project-level screening analysis and/or Health Risk Assessment (HRA) should be conducted by the City of Folsom and funded by the quarry truck applicant(s) for all proposed sensitive receptors (e.g., residences, schools) in the SPA that would be located along the sides of roadway segments that are identified in Table 4-4 as being potentially significant under any of the analyzed scenarios. Each project-level analysis shall be performed according to the standards set forth by SMAQMD for the purpose of disclosure to the public and decision makers. The project-level analysis shall account for the location of the receptors relative to the roadway, their distance from the roadway, the projected future traffic volume for the year 2030 (including the proportion of diesel trucks), and emission rates representative of the vehicle fleet for the year when the sensitive land uses would first become operational and/or occupied. If the incremental increase in cancer risk determined by in the HRA exceeds 296 in one million (or a different threshold of significance recommended by SMAQMD or ARB at the time, if any), then project design mitigation should be employed, which may include the following:

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance

Mitigation

- Increase the setback distance between the roadway and affected receptor. If this mitigation measure is determined by the City of Folsom to be necessary, based on the results of the HRA, the quarry truck applicant(s) should pay the Folsom South of 50 Specific Plan project applicant(s) and the City of Folsom a fee that shall serve as compensation for lost development profit and lost City tax revenues, all as determined by the parties. Said mitigation fee shall be determined in consultation with the quarry project applicant(s), the Folsom South of 50 Specific Plan project applicant(s), and the City of Folsom. No quarry trucks shall be allowed to pass on any roadway segment immediately adjacent to or within the SPA until said mitigation fees are paid.
- Implement tiered tree planting of fine-needle species, such as redwood, along the near side of the roadway segments and, if feasible, along the roadway 500 feet in both directions of the initial planting (e.g., 500 feet north and south of a roadway that runs east-west) to enhance the dispersion and filtration of mobile-source TACs associated with the adjacent roadway. These trees should be planted at a density such that a solid visual buffer is achieved after the trees reach maturity, which breaks the line of sight between U.S. 50 and the proposed homes. These trees should be planted before occupation of any affected sensitive land uses. This measure encourages the planting of these trees in advance of the construction of potentially affected receptors to allow the trees to become established and progress toward maturity. The life of these trees should be maintained through the duration of the quarry projects. The planting, cost, and ongoing maintenance of these trees should be funded by the quarry project applicant(s).
- To improve the indoor air quality at affected receptors, implement the following measures before the occupancy of the affected residences and schools:
  - equip all affected residences and school buildings developed in the SPA with High Efficiency Particle Arresting (HEPA) filter systems at all mechanical air intake points to the interior rooms;
  - use the heating, ventilation, and air conditioning (HVAC) systems to maintain all residential units under positive pressure at all times;
  - locate air intake systems for HVAC as far away from roadway air pollution sources as possible; and
  - Develop and implement an ongoing education and maintenance plan about the filtration systems associated with HVAC for residences and schools.

To the extent this indoor air quality mitigation would not already be implemented as part of the Folsom South of 50 Specific Plan project development, this mitigation should be paid for by the quarry project applicant(s) before any quarry trucks are allowed to pass on any roadway that is within 400 feet of any residence or school within the SPA.

Implementation: The project applicant(s) of the Folsom South of 50 Specific Plan project.

Timing: Prior to approval of first tentative map or discretionary approval within SPA that would place sensitive receptors along roadways that quarry trucks would reasonably use to access U.S. Highway 50.

Enforcement: City of Folsom Community Development Department.

Significance after Mitigation: less than significant

Table ES-1
Summary of Impacts and Mitigation Measures

Impact	Land/Water/GPA	Significance
Mitigation		
CUMULATIVE - NOISE		
Compatibility of Sensitive Land Uses with the Ambient Noise Environment. The 60-dB L_{dn}/CNEL noise contours for adjacent roadways (i.e., U.S. 50, White Rock Road, and Prairie City Road) with the inclusion of projected quarry truck trips completely encompass the SPA. Even considering that a typical 6-foot sound wall would reduce noise levels from approximately 5-6 dB and for each additional foot of wall another 1 dB (Caltrans 1998), and incorporating the maximum setback distance feasible, noise levels would still exceed applicable standards at those sensitive uses proposed as part of the project. Thus, the incremental contribution of the "Land" portion of the project to this significant cumulative impact would be cumulatively considerable.	Land	

Cumulative Mitigation Measure Noise-1-Land: Implement Measures to Reduce Exposure of Sensitive Receptors to Increased Traffic Noise Levels from Quarry Truck Traffic.

The City of Folsom does not have direct jurisdiction over the Teichert, DeSilva Gates, or Walltown quarry project applicants as these projects are located within the unincorporated portion of the County of Sacramento. The City's authority to control the activities of the quarry trucks includes restrictions or actions that would be applicable within the City's jurisdictional boundaries. For example, the City could designate truck routes through the City consistent with California Vehicle Code section 21101(c), including truck routes in the Folsom South of U.S. 50 project area, so as to prohibit or limit quarry trucks' use of City roads adjacent to areas where projected truck traffic volumes would otherwise result in exposure of sensitive receptors to operational noise from quarry truck traffic and/or traffic safety hazards. If this approach is selected by the City, then prior to the approval of the first tentative subdivision map or any other discretionary approval that would place sensitive receptors along any roads the quarry trucks could use to access U.S. 50, the City's traffic department and consultants shall analyze and propose to the City Council for approval designated truck routes from the quarries through City jurisdiction to access U.S. 50 that would allow a level of truck traffic that would avoid any potentially significant impact on sensitive receptors from truck traffic noise within the Folsom South of U.S. 50 project area, as well as any other existing or planned uses that would contain sensitive receptors, so as to ensure that sensitive receptors are not exposed to interior noise levels in excess of 45 dBA, or increases in interior noise levels of 3 dBA or more, whichever is more restrictive.

As an alternative to designating truck routes, the following measures could be voluntarily implemented by the quarry project applicant(s) (Granite [Walltown], Teichert, and DeSilva Gates) to reduce exposure of new sensitive receptors developed in the SPA to increases in traffic noise levels generated by quarry truck traffic, and are encouraged.

- The quarry project applicant(s) should meet with the City of Folsom to discuss mitigation strategies, implementation, and cost.
- A site-specific, project-level screening analysis should be conducted by the City of Folsom and funded by the quarry truck applicant(s) for all proposed sensitive receptors (e.g., residences, schools) in the SPA that would be located along the sides of roadway segments that are identified in Table 4-8 as being potentially significant under any of the analyzed scenarios. The analysis should be conducted using an approved three dimensional traffic noise modeling program (i.e., TNM or SoundPlan). Each project-level analysis should be performed according to the standards set forth by the City of Folsom for the purpose

Mitigation		

of disclosure to the public and decision makers. The project-level analysis should account for the location of the receptors relative to the roadway, their distance from the roadway, and the projected future traffic volume for the year 2030 (including the percentage of heavy trucks). If the incremental increase in traffic noise levels are determined to exceed the threshold of significance recommended by the City of Folsom, then design mitigation should be employed, which may include the following:

- Model the benefits of soundwalls (berm/wall combination) along the quarry truck hauling roadways and affected receptors not to exceed a total height of eight feet (two-foot berm and six-foot concrete mason wall). If this mitigation measure is determined by the City of Folsom to be inadequate, additional three dimensional traffic noise modeling should be conducted with the inclusion of rubberized asphalt at the expense of the quarry truck applicant(s). No quarry trucks should be allowed to pass on any roadway segment immediately adjacent to or within the SPA until said mitigation has been agreed upon by the City of Folsom and fees for construction of said mitigation are paid by the quarry truck applicant(s).
- Implement the installation of rubberized asphalt (quiet pavement) on roadway segments adjacent to sensitive receptors that carry quarry trucks if soundwalls do not provide adequate reduction of traffic noise levels. The inclusion of rubberized asphalt would provide an additional 3 to 5 dB of traffic noise reduction. The cost of construction using rubberized asphalt should be borne by the quarry truck applicant(s). Said mitigation fee should be determined in consultation with the quarry project applicant(s), the Folsom South of 50 Specific Plan project applicant(s), and the City of Folsom. No quarry trucks should be allowed to pass on any roadway segment immediately adjacent to or within the SPA until said mitigation fees are paid.
- To improve the indoor noise levels at affected receptors, implement the following measures before the occupancy of the affected residences and schools:
  - Conduct an interior noise analysis once detailed construction plans of residences adjacent to affected roadways are available to determine the required window package at second and third floor receptors to achieve the interior noise level standard of 45 dB L_{dn} without quarry trucks.
  - Determine the interior quarry truck traffic noise level increases at second and third floor receptors adjacent to affected roadways compared to no quarry truck conditions. Window package upgrades are expected to be necessary due to the traffic noise level increases caused by quarry trucks along affected roadways. Quarry truck applicant(s) should pay for the cost of window package upgrades (increased sound transmission class rated windows) required to achieve the interior noise level standard of 45 dB L_{dn} with the inclusion of quarry truck traffic.

Implementation: The project applicant(s) of the Folsom South of 50 Specific Plan project.

Timing: Prior to approval of first tentative map or discretionary approval within SPA that would place sensitive receptors along roadways that quarry trucks would reasonably use to access U.S. Highway 50.

Enforcement: City of Folsom Community Development Department.

Significance after Mitigation: less than significant

NP (No Action/No Project) NCP (No USACE Permit) PP (Proposed Project) RIM (Resource Impact Minimization)
CD (Centralized Development) RHD (Reduced Hillside Development) PA (Preferred Off-site Water Facility Alternative)

B (Beneficial) NI (No impact) LTS (Less than significant) PS (Potentially significant) S (Significant) SU (Significant and unavoidable)

1 INTRODUCTION AND STATEMENT OF PURPOSE AND NEED

This document is a joint environmental impact report/environmental impact statement (EIR/EIS) prepared for the Folsom South of Highway 50 Specific Plan project (the "Proposed Project" for purposes of the California Environmental Quality Act [CEQA] and the "Proposed Action" for purposes of the National Environmental Policy Act [NEPA]). This EIR/EIS has been prepared by both the City of Folsom (City), as lead agency under CEQA, and the U.S. Army Corps of Engineers (USACE), Sacramento District, as Federal lead agency under NEPA. The EIR/EIS is a joint document intended to comply with both CEQA and NEPA. See California Code of Regulations (CCR), Title 14, Division 6, Chapter 3 (State CEQA Guidelines), Section 15222 ("Preparation of Joint Documents"); and Code of Federal Regulations (CFR), Title 40, Sections 1502.25, 1506.2, and 1506.4 (authority for combining federal and state environmental documents). See also 33 CFR Part 230 (USACE NEPA regulations) and 33 CFR Part 325, Appendix B ("NEPA Implementation Procedures for the [USACE] Regulatory Program").

In its initial form, an EIR/EIS is composed primarily of a draft document known as a draft EIR/EIS (DEIR/DEIS), and the lead agencies' written responses to public and public-agency comments on the draft document. This DEIR/DEIS evaluates the potential adverse impacts on the human and natural environment resulting from implementation of the proposed Folsom South of Highway 50 Specific Plan project (proposed project). In this document, "Proposed Project" refers to the Proposed Project Alternative, and "project" refers to one or all of the project alternatives. The DEIR/DEIS proposes mitigation measures and alternatives that may reduce or avoid the significance of such adverse impacts. Following public review of the DEIR/DEIS, a final EIR/EIS (FEIR/FEIS) will be prepared, in which the joint lead agencies will provide responses to comments relating to the analysis provided in the DEIR/DEIS.

This EIR/EIS has been prepared to evaluate the environmental impacts associated with implementing a specific plan. A specific plan is a legislative development plan prepared in accordance with California planning statutes found in Government Code Section 65450 et seq. and the City's Municipal Code Chapter 17.37. The goal of the specific plan is to establish a development framework for land use, resource protection, circulation, public utilities and services, design, and implementation. The project includes adoption of the specific plan itself and implementation of the associated development proposal. This DEIR/DEIS has been prepared under the direction of the City and USACE and in accordance with the requirements of CEQA and NEPA identified above.

This introductory chapter of the DEIR/DEIS provides information on the following:

- a brief synopsis of the land use portion of the project requiring environmental analysis (the "Land" project description follows in Chapter 2, "Alternatives");
- a brief synopsis of the off-site water supply and conveyance portion of the project requiring environmental analysis (the "Water" project description follows in Chapter 2, "Alternatives");
- history and planning context of the project;
- project purpose and need and project objectives for the "Land" and "Water" portions of the project;
- type, purpose, and intended uses of the DEIR/DEIS;
- scope and focus of the DEIR/DEIS;
- agency roles and responsibilities and required permits and approvals;
- organization of the DEIR/DEIS;
- documents relied on in the DEIR/DEIS; and
- standard terminology and acronyms.

1.1 PROJECT REQUIRING ENVIRONMENTAL ANALYSIS

The project requiring environmental analysis includes two components; a land use component, and an analysis of the off-site water supply facilities required to support the proposed land uses. Because the project purpose, objectives, and alternatives are different for the "Land" and "Water" portions of the project, they are presented separately in this EIR/EIS.

1.1.1 LAND

The project applicant(s) of the "Land" portion of the project—the South Folsom Property Owners Group—are requesting annexation into the City of Folsom, and approval of various discretionary entitlements in support of a specific plan for a mixed-use development and supporting on- and off-site roadway and infrastructure improvements (project). The specific plan covers an area in eastern Sacramento County, south of U.S. 50, and adjacent to the existing Folsom city limits. The specific plan supports a combination of employment-generating uses, retail and supporting services, recreational uses, and a broad range of residential uses and associated infrastructure and roads on approximately 3,510-acres that is located entirely within the City's sphere of influence. The "Specific Plan Area," or SPA, described throughout this EIR/EIS includes the entire area proposed for annexation, including U.S. 50 highway right-of-way and interchange areas, for a total of approximately 3,584 acres. The project site is located south of U.S. 50, north of White Rock Road, east of Prairie City Road (a small area extends west of Prairie City Road at the southwest corner of the project site), and west of the Sacramento/El Dorado County line (see Exhibits 2-1 and 2-2 in Chapter 2, "Alternatives").

The Proposed Project Alternative includes 10,210 residential units at various densities on approximately 1,477 acres; approximately 363 acres are designated for commercial and industrial use, including a regional shopping center; public/quasi-public uses; elementary, middle, and high schools on approximately 179 acres; approximately 122 acres of community and neighborhood parks; stormwater detention basins; approximately 1,053 acres of open-space areas and open-space preserves; and major roads with landscaping.

Several off-site infrastructure facilities (intersection expansions to allow access to and from U.S. 50 and the SPA, an overpass of U.S. 50, two roadway connections and sewer pipelines from the Folsom Heights property into El Dorado Hills, a sewer force main connection to the existing City system, a detention basin, and water pipelines and facilities) are proposed to serve project development and are addressed in this DEIR/DEIS.

1.1.2 WATER

Based on current water demand assumptions and implementation of reasonable conservation measures in years when water supplies could be subjected to dry-year reductions of up to 25%, the SPA would require not more than 5,600 acre-feet[1] of water per year (AFY). To provide a reliable water supply for the project, the City is proposing the permanent assignment of not more than 8,000 AFY[2] of Central Valley Project (CVP) contract water from the Natomas Central Mutual Water Company (NCMWC), diverting this water supply from the Sacramento River at the Freeport Regional Water Project (Freeport Project), and conveying this water to the SPA through new potable water infrastructure.

In addition, the project would include the City purchasing from Sacramento County Water Agency (SCWA) a portion of its dedicated capacity within the Freeport Project, which would serve as the point of diversion (POD) on the Sacramento River and partial conveyance pathway for not more than 5,600 AFY purchased from NCMWC. The City proposes to add the Freeport POD to the assigned CVP water to facilitate the diversion of these supplies at the existing Freeport Project diversion. The City proposes to pump and convey the assigned NCMWC CVP water supply through the Freeport Project diversion facility and conveyance pipeline to the point where the SCWA and the East Bay Municipal Utilities District (EBMUD) pipeline splits (or bifurcation point). The City would then construct new water supply conveyance infrastructure from the bifurcation point to the SPA.

Ten conveyance alternatives are analyzed in this EIR/EIS at an equal level of detail, as required under NEPA. These ten conveyance alternatives are described in more detail in Chapter 2, "Alternatives." Overall, each of the ten "Water" action alternatives would involve the following actions in conjunction with the City taking assignment for up to 8,000 AFY of CVP surface water from NCMWC:

[1] An acre-foot of water contains 325,851 gallons; one million gallons is about 3 acre-feet.
[2] NCMWC's CVP water contract is subject to a dry-year provision whereby total deliveries can be reduced by up to 25%.

- rescheduling the existing CVP July and August delivery schedules to a year-round municipal and industrial (M&I) schedule;

- entering into an agreement with SCWA to convey the water acquired by the City from NCMWC through the Freeport Project, to facilitate the integration of the Offsite Water Facilities with existing Freeport Project diversion and water conveyance facilities; and

- constructing conveyance, pump, storage, and treatment facilities, including booster pump station(s), water treatment and storage facilities, and conveyance facilities.

Consistent with the requirements of CEQA and NEPA, the City is evaluating several conveyance alternatives in this EIR/EIS to enable the delivery of not more than 6,000 AFY of CVP water assigned by NCMWC to the SPA. Each alternative includes optional route alignments and/or operational features (e.g., water treatment plants [WTP] and associated storage facilities) to cover the range of feasible alternatives available to the City.

1.1.3 PROJECT GEOGRAPHIES

The project undergoing environmental analysis in this EIR/EIS includes "Land" and "Water" components. Different portions of the project would occur in and would affect different geographical areas. The following geographic area descriptions are used in this EIR/EIS:

- **Specific Plan Area –** This refers to the area which would be annexed by the City of Folsom as part of the project. Most "On-site" analyses in the "Land" portion of the EIR/EIS address conditions in the SPA. The Specific Plan actually defines the future land uses for a slightly smaller area, excluding the U.S. Highway 50 right-of-way.

- **Off-site Improvements –** This refers to the location of certain off-site improvements required to support the proposed land use changes, including a proposed detention basin west of Prairie City Road, roadway and interchange improvements along U.S. 50 (at Prairie City Road, Oak Avenue, Rowberry Drive, Scott Road, and Empire Ranch Road); a sewer line extension across U.S. 50 to an existing pump station along Iron Point Road; and sewer and roadway extensions into El Dorado Hills.

- **"Water" Study Area –** This refers to the regional area studied for the various water supply facilities and operations required under the alternatives in the "Water" portion of the EIR/EIS. The "Water" Study Area encompasses areas in east-central portions of Sacramento County where new potable water supply facilities would be constructed under a variety of alternative configurations, the Freeport Project facilities, the NCMWC service area, and the portions of the lower Sacramento River.

- **General Plan Amendment Area –** This refers to the area within the current City of Folsom where the density ranges of general plan land use designations would be changed by the project.

Please refer to Exhibit 2.1 for an illustration of these areas and their relationship to one another.

1.2 PROJECT HISTORY AND PLANNING CONTEXT

In 2001, the Sacramento Local Agency Formation Commission (LAFCo) designated the undeveloped land south of U.S. Highway 50 between Prairie City Road, White Rock Road, and the El Dorado County line as part of the City's sphere of influence. The City entered into a Memorandum of Understanding (MOU) with Sacramento County prior to approval of the SPA application by Sacramento LAFCo. The intent of the MOU is to serve as a guide for sound regional long-range planning efforts relative to the annexation of the SPA. The MOU outlines a comprehensive planning process for the project site, including public participation with various stakeholders and the general public. It also addresses a number of issues including water supply, transportation, air quality, schools, and open space that were later incorporated into language found in Measure W and subsequently the City Charter

(described in more detail below). The MOU led to LAFCo Resolution 1196, approving the City's sphere of influence amendment.

LAFCo Resolution 1196 requires that the planning process for the project site include:

- **City General Plan Revisions.** Revise and update the City's general plan in accordance with California State law.

- **City General Plan Housing Element.** Obtain a certification of substantial compliance from the California Department of Housing and Community Development consistent with California Government Code section 65585(d) or (h). The City shall establish in its approved Housing Element that it has or will meet its regional share housing needs for all income levels for the second and third Housing Element revisions, as defined in California Government Code section 65588.

- **Land Use Designations.** Adopt appropriate land use designations for all property within the adopted Sphere of Influence area.

- **Pre-zoning.** Pre-zone the property consistent with California Government Code Section 56375 and the Folsom General Plan.

- **Comprehensive Planning.** Develop comprehensive planning of the project site that demonstrates well planned, orderly development that avoids the premature conversion of open space.

- **Master Service Agreement.** In any application to annex the property, the City is to submit a Master Services Element that identifies a program for implementation and financing for major infrastructure and services components needed to support the proposed distribution, location, extent, and intensity of proposed land uses. The Master Services Element must identify a water supply source and the process for securing sufficient water supplies to serve the annexed area.

- **Local Roadway Improvements.** Prepare a plan for necessary improvements to each jurisdiction's roadway network to accommodate increased traffic from the project site in cooperation with Sacramento and El Dorado Counties. This plan must include a list of improvements, responsible jurisdiction, phasing plan, and clearly defined financing mechanism. Implementation of this plan must result in service levels on local roadways consistent with each jurisdiction's general plan.

- **Regional Roadway Improvements.** The City, in cooperation with Caltrans, Sacramento County, El Dorado County, the El Dorado County Transportation Commission, and the Sacramento Area Council of Governments (SACOG), must identify traffic and transportation measures that are needed to mitigate potential impacts on regional transportation facilities from proposed development within the project site. The City must also identify a funding mechanism to construct the traffic and transportation measures necessary to fully mitigate impacts from the project site, and a timeline for the construction of improvements. As soon as reasonably possible, these improvements should be programmed into the Metropolitan Transportation Plan and Metropolitan Transportation Improvement Program.

- **Transit Master Plan.** Prepare a Transit Master Plan consistent with the City's General Plan. The master plan must identify bus transit routes, bus turnouts, pedestrian shelters, bus transfer stations, alignments for rail service, and the location of rail service stations.

- **Bikeway Master Plan.** Prepare a Bikeway Master Plan consistent with the City's General Plan. The master plan must identify bikeway and pedestrian facilities on the project site consistent with the goals and policies of the City's general plan and incorporate bikeway designs for Prairie City Road and White Rock Road to be equivalent, or better, than those in the Sacramento City/County Bikeway Master Plan.

- **Drainage Master Plan.** Conduct hydraulic and hydrologic modeling of that portion of Alder Creek which transverses the project site. A Drainage Master Plan must be prepared and address flood hazards, identify flood protection measures, and document no net increase in downstream floodwater surface elevations.

- **Habitat Mitigation Strategy.** Document of the City's multi-species habitat mitigation strategy (Habitat Conservation Plan [HCP]) for the project site. The strategy must address mitigation of impacts on habitat and biological resources that meets Federal and State regulatory requirements. The City may fulfill these requirements through participation in South Sacramento County HCP process.

- **Surface and Groundwater Contamination.** Document that on-site surface contamination has been remediated to Federal and State regulatory standards, and that groundwater contamination has been remediated or is being remediated effectively prior to annexation of any property owned by Aerojet General Corporation.

- **Water Supply.** Demonstrate that the City has a sufficient water supply to serve existing customers, future customers within the existing service area, and all proposed uses within the project site in compliance with the terms and conditions of the Water Forum Agreement. This demonstration must be sufficient for LAFCo to determine water availability per California Government Code section 56668(k).

- **Wastewater Facilities.** Demonstrate the timely availability of wastewater transmission and treatment capacity to serve existing customers, future customers within the existing service area, and all proposed uses within the project site.

- **Special Districts.** Meet and confer with the El Dorado Irrigation District (EID), the Sacramento Metropolitan Fire District, and any other special districts regarding impacts on these districts, including fiscal and operational impacts and loss of property tax revenue. With respect to EID, the City must not request any detachment from the EID service area.

- **School Mitigation.** Incorporate feasible school mitigation requirements into development agreements.

- **Mitigation Monitoring.** Comply with the mitigation measures identified in environmental review for expansion of sphere of influence boundary and adopted pursuant to CEQA by LAFCo Resolution LAFC 1193, including:

    - Establish necessary roadway improvements and financing mechanisms;
    - Implement requirements to reduce air quality emissions by 35%;
    - Prepare an Air Quality Plan;
    - Complete tree surveys and implement tree protection measures;
    - Complete biological surveys and adopt avoidance and mitigation policies;
    - Minimize incompatibility impacts on historic landscapes;
    - Implement hazardous materials plans;
    - Investigate and remediate railroad right-of-way, mining, and radio/transfer sites;
    - Define the Alder Creek 100-year floodplain; and
    - Identify secure sufficient water supplies.

In November 2004, following a series of visioning workshops, the City's Measure W (City Ordinance No. 1022) passed with support from 69% of the City voters. With the passage of Measure W, the City Charter was amended to require the Folsom City Council to take certain actions prior to LAFCo approval of annexation. These actions are related to each of the issue areas described below:

- **Water Supply.** Identify and secure the sources of water supply to serve the SPA without reducing the existing water supply currently serving users to the north of U.S. 50, and at no cost to existing City residents.

- **Transportation.** Adopt an Infrastructure Funding and Phasing Plan for the construction of roadways and transportation improvements that are necessary to reduce traffic impacts resulting from development of the SPA. The timing of the construction of the transportation improvements shall be tied to the anticipated rate of growth and associated traffic impacts. Existing City residents shall not be required to pay fees for the construction of any new transportation improvements required to serve the SPA.

- **Open Space.** Maintain 30% of the SPA as natural open space to preserve oak woodlands and sensitive habitat areas. Natural open space cannot include active park sites, residential yard areas, golf courses, parking lots, or their associated landscaping.

- **Schools.** Submit a plan to the Folsom Cordova Unified School District for the funding and construction of all necessary school facilities for the SPA so that City residents north of U.S. 50 are not required to pay for the construction of new school facilities serving the SPA and existing schools are not overcrowded by development of the SPA.

- **Development Plan.** Adopt a General Plan Amendment to serve as the blueprint for development within the SPA. The General Plan Amendment will only be adopted after the completion and certification of an environmental impact report.

- **Public Notice.** Every registered voter in the City must be mailed a notice of time, place, and date of the public meetings and hearings before the Planning Commission and City Council. The notice must include a summary of the SPA proposal with the full proposal and associated environmental review available for public review at the City Clerk's office, at all Folsom public libraries, and on the City's Web site.

- **Implementation.** All existing City plans, policies, ordinances, and other legislative acts must be amended as necessary, as soon as possible, and in the time and manner required by state law, including CEQA, to ensure consistency between the Charter Amendment and those plans, policies, and other provisions.

In 2004, the City launched a visioning process to seek community input about the future plans for the City's sphere of influence area. Approximately 200 residents of the City and nearby El Dorado County attended a series of meetings facilitated by a professional planning consultant. At those meetings, the participants addressed a range of issues including land use, open space, transportation, and financing. Their recommendations resulted in a series of five possible development scenarios, which were reviewed by the Folsom City Council at its January 25, 2005 meeting. Since that time, the land use plan for the SPA has continued to undergo refinements, and has evolved into the Proposed Project Alternative shown in Exhibit 2-3 in Chapter 2, "Alternatives." The Proposed Project Alternative, along with four alternative land use development plans and a No Project Alternative (development under the existing Sacramento County land use and zoning designations), are evaluated in an equal level of detail, as required under NEPA in this EIR/EIS.

1.3 PROJECT PURPOSE, NEED, AND OBJECTIVES

The Proposed Project Alternative has been formulated to achieve the purpose, objectives, and needs summarized below. State CEQA Guidelines CCR Section 15124(b) requires that the project description contain a clear statement of the project objectives, including the underlying purpose of the project. NEPA regulations (40 CFR 1502.13) require that an EIS contain a statement of the purpose and need that "briefly specif[ies] the underlying purpose and need to which the agency is responding in proposing the alternatives, including the proposed action." The statement of objectives is important under CEQA in helping the City (State lead agency under CEQA), and the statement of purpose and need is important under NEPA in helping USACE (Federal lead agency under NEPA), to develop a reasonable range of alternatives to the Proposed Project Alternative for evaluation in the EIR/EIS.

1.3.1 PROJECT PURPOSE AND NEED

The City and USACE each view the project purpose from the purview of their responsibilities. The City is interested in the orderly development of lands within its planning boundaries/sphere of influence and ensuring that that the City has adequate water supplies for trust development. USACE's interest extends to its permit authority with respect to regulation of waters of the U.S., including wetlands.

PROJECT PURPOSE AND NEED: CITY OF FOLSOM CONSIDERATIONS

The purpose of the Folsom South of Highway 50 Specific Plan project is to provide a mixed-use, master-planned community within an area south of U.S. 50 that would be annexed to the City of Folsom, and also to secure a reliable water supply consistent with the requirements of Measure W and objectives of the Water Forum Agreement and the necessary off-site conveyance infrastructure to facilitate the planned development of the SP. In accordance with local and regional plans, including the City's General Plan and SACOG Blueprint and Smart Growth Principles, the project would expand the City's current sphere of influence south of U.S. 50 in a manner that would foster orderly urban development and discourage leapfrog development and urban sprawl. The project would provide both jobs and housing and would generate a positive fiscal impact for the City.

PROJECT PURPOSE AND NEED: U.S. ARMY CORPS OF ENGINEERS

The project purpose, as considered by USACE, is to construct a large scale, mixed-use development, with associated infrastructure, within eastern Sacramento County.

1.3.2 PROJECT NEEDS AND OBJECTIVES

LAND

Outlined below are the main project needs and objectives defined by the project applicant(s) for the Proposed Project. These objectives are specific to the "Land" portion of the project, and are important for the selection and consideration of CEQA alternatives.

1. Be consistent with the City of Folsom's General Plan and implement SACOG Smart Growth Principles.

2. Expand the City's boundaries based on the ultimate boundaries of development that the City can reasonably control and service, and do so in a manner that would foster orderly urban development and discourage leapfrog development and urban sprawl.

3. Annex those parcels of land adjacent to the City limit and within the City's Sphere of Influence whose development could have significant visual, traffic, public service, and environmental impacts on the City so that the City may influence the ultimate development of those parcels.

4. Provide a large-scale mixed-use and mixed-density residential housing development within the City of Folsom, south of U.S. 50.

5. Develop several distinct neighborhoods within the project site, connected by a substantial open space area and recreational trail network.

6. Provide neighborhood- and regional-serving retail areas within the project site.

7. Provide a mix of housing types within the project site to diversify the City's housing stock.

8. Provide a combined high school/middle school and the appropriate elementary schools on-site sufficient to meet the needs of the project.

9. Provide the appropriate number and size of on-site community and neighborhood parks sufficient to meet the needs of the project.

10. Generate positive fiscal impacts for the City through development within the project site.

WATER

The project objectives for the "Water" portion of the project include the following:

1. Secure a sufficient and reliable water supply consistent with the requirements of Measure W and objectives of the Water Forum Agreement to support planned development within the SPA, which the City estimates to be 5,600 acre-feet per year.

2. Construct the necessary water supply delivery and treatment infrastructure to ensure the safe and reliable delivery of up to 5,600 acre-feet per year to the SPA.

1.4 INTENDED USES AND TYPE OF ENVIRONMENTAL IMPACT REPORT/ ENVIRONMENTAL IMPACT STATEMENT

1.4.1 CALIFORNIA ENVIRONMENTAL QUALITY ACT

According to the State CEQA Guidelines (14 CCR Section 15064[f][1]), preparation of an EIR is required whenever a project may result in a significant environmental impact. An EIR is an informational document used to inform public agency decision makers and the general public of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project that could feasibly attain most of the basic objectives of the project while substantially lessening or avoiding any of the significant environmental impacts. Public agencies are required to consider the information presented in the EIR when determining whether to approve a project.

CEQA requires that state and local government agencies consider the environmental effects of projects over which they have discretionary authority before taking action on those projects (California Public Resources Code [California PRC] Section 21000 et seq.). CEQA also requires that each public agency avoid or mitigate to less-than-significant levels, wherever feasible, the significant environmental effects of projects it approves or implements. If a project would result in significant and unavoidable environmental impacts that cannot be feasibly mitigated to less-than-significant levels, the project can still be approved, but the lead agency's decision makers must issue a "statement of overriding considerations" explaining in writing the specific economic, social, or other considerations that they believe make those significant effects acceptable.

1.4.2 NATIONAL ENVIRONMENTAL POLICY ACT

NEPA provides an interdisciplinary framework for Federal agencies to develop information that will help them to take environmental factors into account in their decisionmaking (42 United States Code [USC] 4321, 40 CFR 1500.1). According to NEPA, an EIS is required whenever a proposed major Federal action (e.g., a proposal for legislation or an activity financed, assisted, conducted, or approved by a Federal agency) would result in significant effects on the quality of the human environment.

Much of the development contemplated by the proposed specific plan is dependent upon Federal action because such development would require Federal permits for one or more of the following activities: (i) discharges of fill material into waters of the U.S., (ii) activities affecting plant or animal species protected by the Federal Endangered Species Act (ESA) (16 USC 1531 et seq.), (iii) activities affecting cultural resources that are listed or are eligible for listing in the National Register of Historic Place (NRHP) for compliance with Section 106 of the National Historic Preservation Act of 1966, as amended (NHPA) (16 USC 470). The "Water" portion of the project requires the Federal Bureau of Reclamation's (Reclamation's) approval of an assignment of a CVP water

supply from NCMWC to the City. An EIS is an informational document used by Federal agencies in making decisions. An EIS is intended to provide full and open disclosure of environmental consequences prior to agency action; an interdisciplinary approach to project evaluation; objective consideration of all reasonable alternatives; application of measures to avoid or reduce adverse impacts; and an avenue for public and agency participation in decision-making (40 CFR 1502.1). NEPA defines mitigation as avoiding, minimizing, rectifying, reducing, or compensating for significant effects of the proposed action (40 CFR 1508.20).

NEPA requires that a lead agency "include (in an EIS) appropriate mitigation measures not already included in the proposed action or alternatives" (40 CFR 1502.14[f]). An EIS shall also include discussions of "means to mitigate adverse environmental impacts (if not fully covered under Section 1502.14[f])." In preparing a record of decision under 40 CFR 1505.2, a lead agency is required to "[s]tate *whether* all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted, and if not, why they were not. A monitoring and enforcement program shall be adopted and summarized where applicable for *any* mitigation." (Italics added.)

Individual project development phases may require further environmental analysis and additional agency approvals when tentative maps or other future discretionary applications are submitted after adoption of the specific plan, particularly if site-specific issues peculiar to certain parcels were not addressed at the broader program level of analysis found in this EIR/EIS. See Section 1.4.3 below and Section 2.3.1 in Chapter 2, "Alternatives."

1.4.3 PROGRAM ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT

This EIR/EIS includes a program-level, or "first-tier," analysis for the project, consistent with California PRC Sections 21083.3, 21093, and 21094; Title 14 CCR Sections 15152 and 15168; and 40 CFR 1500.4(i), 1502.4(b), and 1502.20, among others. A program EIR addresses a series of related actions characterized as one large project.

This program-level or "programmatic" analysis evaluates the requested actions as they relate to the proposed land use designations for the overall specific plan (refer to Chapter 2, "Alternatives," for further detail on the overall project).

The program-level analysis considers the broad environmental effects of the overall specific plan. This program EIR/EIS also identifies performance standards (e.g., setbacks, measures to protect biological and other sensitive resources) and mitigation measures that would apply to all subsequent, future project development phases under the specific plan (as conditions of approval). These performance standards will be incorporated into the Folsom Specific Plan to avoid or reduce impacts to the degree feasible. In addition, the program-level analysis addresses the cumulative impacts of development of the project and analyzes a reasonable range of alternative land use maps at an equal level of detail. A No Project Alternative is also analyzed as required by CEQA and NEPA (same as the No Action Alternative), as well as a No Federal Action (no USACE Department of the Army Clean Water Act [CWA] Section 404 permit) Alternative as required by USACE NEPA regulations.

In addition to the programmatic analysis described above, this EIR/EIS also includes an additional detailed level of analysis of specific topic areas that is beyond the program level. Those issues that contain this additional level of detailed analysis are: Aesthetics; Cultural Resources; Environmental Justice; Geology, Soils, Minerals, and Paleontological Resources; Hazards and Hazardous Materials; and Land Use Planning and Agricultural Resources. Where this additional detailed analysis has been conducted, a statement that impacts under the additional level of detailed analysis would be same as those under the program level analysis is included at the beginning of each topic area.

CALIFORNIA ENVIRONMENTAL QUALITY ACT COMPLIANCE FOR SUBSEQUENT PROJECT DEVELOPMENT PHASES

Development of the SPA is expected to occur in multiple phases (See Section 2.3.1, "Project Phasing" in Chapter 2, "Alternatives"). To move forward with a specific phase, the project applicant(s) intend to submit a tentative subdivision map/improvement plan for each project development phase. At that time, the City will require compliance with the Folsom Specific Plan performance standards and mitigation measures set forth in this EIR/EIS and incorporated into the Folsom Specific Plan for each tentative subdivision map/improvement plan as conditions of approval. Those future phases may require further environmental review. CEQA includes a number of different but complementary means for streamlining environmental review consistent with an approved general plan, specific plan, or zoning action. More than one of these provisions might apply to future entitlements within the adopted SPA. (See California PRC Section 21083.3 [streamlined review for projects consistent with general plans, community plans, or zoning actions for which an EIR was prepared]; 14 CCR Section 15183 [same]; California PRC Sections 21093 and 21094 [tiering]; 14 CCR Section 15152 [same]; California Government Code Section 65457 [CEQA exemption for residential projects within a specific plan for which an EIR was prepared]; and 14 CCR Section 15182 [same].) The extent of environmental review, if any, for future development entitlements will depend on a number of factors, including the streamlining provision of CEQA that seems most applicable to a particular proposed entitlement; consistency of the proposed development with the adopted specific plan; and the extent to which the programmatic analysis, performance standards, and mitigation measures have anticipated and accounted for the site-specific impacts of the requested entitlements.

1.5 SCOPE AND FOCUS OF THE ENVIRONMENTAL IMPACT REPORT/ ENVIRONMENTAL IMPACT STATEMENT

Pursuant to CEQA, the State CEQA Guidelines, and NEPA, the discussion of potential effects on the environment in this EIR/EIS is focused on those impacts that the City and USACE have determined may be potentially significant.

On September 12, 2008, the City issued a notice of preparation (NOP) (Appendix B) to inform agencies and the general public that a joint EIR/EIS was being prepared, and invited comments on the scope and content of the document and participation at a public scoping meeting. The NOP was published in the State Clearinghouse and was mailed to approximately 15 state agencies. It was also posted on the City's website. The NOP was circulated for 45 days as mandated by CEQA. The public-comment period for the NOP closed on October 27, 2008.

On September 12, 2008, USACE issued a notice of intent (NOI) (Appendix B) to inform agencies and the general public that a joint EIR/EIS was being prepared and invited comments on the scope and content of the document. At that time USACE announced that it had developed a public-involvement program allowing opportunities for public participation and involvement in the NEPA process. The NOI also provided information on the date and time of the public scoping meeting. The NOI was published in the *Federal Register*, Vol. 73, No. 178, on September 12, 2008. There is no mandated time limit to receive written comments in response to the NOI under NEPA.

The City and USACE jointly held a public scoping meeting to solicit input from the community and public agencies to be considered in project design, alternatives selection, and on the scope and content of the EIR/EIS. The meeting was held on September 25, 2008 at 5:00 p.m. at the Folsom Public Library in Folsom, California. Fourteen people, including individuals and representatives from the public and private sectors, attended the meeting.

Appendix B of this EIR/EIS contains a table listing the substantive comments received on the NOP/NOI. Copies of the comment letters follow the table in Appendix B.

This EIR/EIS includes an evaluation of 17 environmental issue areas and other CEQA- and NEPA-mandated issues (e.g., cumulative impacts, growth-inducing impacts) for the "Land" analysis. The 17 environmental issue areas for the "Land" analysis are as follows:

- aesthetics;
- air quality;
- biological resources;
- climate change;
- cultural resources;
- environmental justice (required under NEPA);
- geology, soils, minerals, and paleontological resources;
- hazards and hazardous materials;
- hydrology and water quality;
- land use planning and agricultural resources;
- noise;
- parks and recreation;
- population, employment, and housing (socioeconomics under NEPA);
- public services;
- traffic and transportation;
- water supply; and
- utilities and service systems.

For several topic areas under the "Land" portion of the analysis, significant and potentially significant impacts would be reduced to a less-than-significant level after implementation of mitigation measures required in this EIR/EIS. These topic areas include cultural resources; environmental justice; hazards and hazardous materials; hydrology and water quality; parks and recreation; population, employment, and housing; and public services.

For the "Water" analysis, 15 environmental issue areas were analyzed. The environmental issue areas for the "Water" analysis are as follows:

- aesthetics;
- air quality;
- biological resources;
- climate change;
- cultural resources;
- environmental justice (required under NEPA);
- geology, soils, and paleontological resources;
- groundwater;
- hazards and hazardous materials;
- hydrology and water quality;
- land use planning and agricultural resources;
- noise;
- parks and recreation;
- traffic and transportation; and
- utilities and service systems.

For several topic areas under the "Water" portion of the analysis, significant and potentially significant impacts would be reduced to a less-than-significant level after implementation of mitigation measures required in this EIR/EIS. These topic areas include biological resources; cultural resources; environmental justice; geology, soils, and paleontological resources; hazards and hazardous materials; hydrology and water quality; land use and agricultural resources; noise; parks and recreation; traffic and transportation; and utilities and service systems. CEQA and NEPA allow a lead agency to limit a discussion of the environmental effects in an EIR/EIS when the effects are not considered potentially significant. For the "Land" and "Water" analyses, there were topic areas that were not expected to have any significant project-specific or cumulative impacts when compared to existing conditions, and for which no further analysis was conducted for this EIR/EIS, as discussed further in Chapter 2, "alternatives." Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures," provides a brief explanation as to the City's reasoning for not carrying these resource topics forward into the environmental analysis of the "Land" and "Water" portions of the project.

1.6 AGENCY ROLES AND RESPONSIBILITIES

USACE will use this EIS/EIR in exercising its regulatory authority under Section 404 of the Clean Water Act. It also may be used as an informational document by Federal cooperating agencies, such as Reclamation, that could have permitting or approval authority for aspects of the project.

This EIS/EIR will be used by the City of Folsom and CEQA responsible and trustee agencies to ensure that they have met the requirements of CEQA before deciding whether to approve or permit project elements over which they have jurisdiction. It may also be used by other state and local agencies, which may have an interest in resources that could be affected by the project, or that have jurisdiction over portions of the project.

1.6.1 LEAD AGENCIES

The City of Folsom is the State lead agency for the project under CEQA, and USACE, Sacramento District, is the Federal lead agency under NEPA. The City has the principal responsibility for approving and carrying out the project and for ensuring that the requirements of CEQA have been met. USACE has the principal responsibility for making Clean Water Act Section 404 permit decisions and ensuring that the requirements of NEPA have been met. The EIR/EIS may also be used by other Federal, state, regional, and local agencies, which may have an interest in resources that could be affected by the project, or that have jurisdiction over portions of the project.

The following are the entitlements requested from the City for the project:

- certification of the EIR/EIS and Mitigation Monitoring and Reporting Program,
- amendment of the Folsom General Plan,
- amendment of the Folsom Zoning Ordinance,
- adoption of the Folsom Specific Plan,
- adoption of a Public Facilities Financing Plan,
- approval of large-lot tentative maps,
- application to LAFCo for annexation of the project site to the City of Folsom, and
- possible approval of development agreements between the City and project applicant(s).

The project applicant(s) are requesting these approvals to accommodate proposed development on lands they control (i.e., lands owned). However, some approvals would apply to all lands in the SPA. It is anticipated that the City will also rely on this EIR/EIS for approval of other future discretionary entitlements and permits (e.g., small-lot tentative subdivision maps, design review approvals, use permits). The City will rely on this document to the degree that it adequately addresses the impacts of future development on the site (i.e., for specific issue areas where more detailed analysis was conducted). The City is the project proponent and lead agency for implementation of the water supplies and off-site water facilities necessary to satisfy the water demands of the SPA. The City will rely on this document to the degree that it adequately addresses the impacts of the specific manner in which those supplies and facilities are implemented. Depending on the final locations of specific facilities, the City may need to conduct supplemental environmental analysis of the specific issues presented.

The Proposed Action represents a Federal action because it would require one or more of the following Federal permits and authorizations:

- Department of the Army permit under Section 404 of the CWA for discharges of dredge or fill material into waters of the U.S.,

- ESA Section 7 consultation leading to issuance of a Biological Opinion and possible incidental-take statement for activities affecting endangered species,

- NHPA Section 106 consultation leading to the preparation of a Programmatic Agreement and/or Memorandum of Agreement (MOA) for activities affecting a cultural resource listed in or eligible for listing in the NRHP, and

- Reclamation approval of the assignment of NCMWC's entitlement of up to 8,000 AFY of CVP surface water to the City.

1.6.2 TRUSTEE, RESPONSIBLE, AND COOPERATING AGENCIES

Under CEQA, a trustee agency is a state agency that has jurisdiction by law over natural resources that are held in trust for the people of the State of California. One trustee agency, the California Department of Fish and Game, meets that definition with respect to resources potentially affected by the project.

Under CEQA, a responsible agency is an agency other than the lead agency that has legal responsibility for carrying out or approving a project or elements of a project (California PRC Section 21069).

Under NEPA, a cooperating agency is any Federal agency other than the lead agency that has jurisdiction by law or special expertise with respect to any environmental impact involved in an action requiring an EIS. Reclamation is serving as a cooperating agency under NEPA because it would use this EIS/EIR in determining whether to approve the assignment of 8,000 AFY of water to the City of Folsom.

Responsible and cooperating agencies are encouraged to actively participate in the CEQA and NEPA processes of the lead agencies, review the CEQA and NEPA documents of the lead agencies, and use the documents when making decisions on the project. In 2008, USACE sent letters to various Federal, state, and regional agencies requesting their participation as a Federal cooperating agency under NEPA. At the time of this writing, only Reclamation has responded to USACE requesting to serve as a Federal cooperating agency.

Several agencies other than the City and USACE have jurisdiction over the implementation of the elements of the project, as identified below.

FEDERAL AGENCIES

- U.S. Department of the Interior, Bureau of Reclamation (Cooperating Agency)
- U.S. Environmental Protection Agency
- U.S. Fish and Wildlife Service
- National Marine Fisheries Service

STATE TRUSTEE AND RESPONSIBLE AGENCIES

- California Air Resources Board
- California Department of Education
- California Department of Fish and Game
- California Department of Health Services
- California Department of Toxic Substances Control
- California Department of Transportation
- State Water Resources Control Board
- Central Valley Regional Water Quality Control Board
- Native American Heritage Commission
- State Historic Preservation Officer

REGIONAL AND LOCAL RESPONSIBLE AGENCIES

- Natomas Central Mutual Water Company
- Folsom Cordova Unified School District
- County of Sacramento
- Sacramento Local Agency Formation Commission
- El Dorado Irrigation District
- El Dorado Hills Fire Department

- County of El Dorado
- Sacramento Metropolitan Fire District
- Sacramento County Water Agency
- City of Rancho Cordova
- Sacramento County Municipal Services Agency

1.6.3 REGULATORY REQUIREMENTS, PERMITS, AUTHORIZATIONS, AND APPROVALS FOR "LAND" AND "WATER"

The following list identifies permits and other approval actions and authorizations needed from Federal, state, regional, and local agencies for which this EIR/EIS may be used during these agencies' decision-making processes. The following may be under the purview of regulatory agencies other than the lead agencies.

FEDERAL ACTIONS/PERMITS

- **U.S. Army Corps of Engineers:** Department of the Army permit under Section 404 of the CWA for discharges of dredge or fill material into waters of the U.S. Consultation for impacts on cultural resources pursuant to Section 106 of the National Historic Preservation Act. Consultation for impacts on Federally listed species pursuant to Section 7 of the ESA.

- **U.S. Bureau of Reclamation:** approval of Assignment of 8,000 AFY from NCMWC to City of Folsom, Water Service Contract Amendment for Change in Water Supply Delivery Schedule from Agriculture to M&I, and approval of an Encroachment Permit for Folsom South Canal Crossing.

- **U.S. Environmental Protection Agency:** reviewing the EIS, filing, and noticing; concurrence with Section 404 CWA permit.

- **U.S. Fish and Wildlife Service:** ESA consultation and issuance of incidental-take authorization for the take of Federally listed endangered and threatened species.

- **National Marine Fisheries Service:** ESA consultation and issuance of incidental-take authorization for the take of Federally listed endangered and threatened species.

STATE ACTIONS/PERMITS

- **California Department of Education:** approval of new school sites for which state funding is sought.

- **California Department of Fish and Game, Sacramento Valley—Central Sierra Region:** California Endangered Species Act (CESA) consultation and issuance of take authorization (if needed) (California Fish and Game Code Section 2081), streambed alteration agreement (California Fish and Game Code Section 1602), and protection of raptors (California Fish and Game Code Section 3503.5).

- **California Department of Transportation:** encroachment permits.

- **Central Valley Regional Water Quality Control Board (Region 5):** National Pollutant Discharge Elimination System (NPDES) construction stormwater permit (NOI to proceed under General Construction Permit) for disturbance of more than 1 acre; discharge permit for stormwater; general order for dewatering; and Section 401 CWA certification or waste discharge requirements; Clean Water Act, Section 401 Water Quality Certification; NPDES permit coverage for hydrostatic testing of pipeline (coverage expected under General Order for Low Threat Discharges to Surface Water)

- **State Historic Preservation Officer (SHPO):** approval of a Programmatic Agreement and/or MOU for Section 106 compliance with the National Historic Preservation Act.

- **California Department of Public Health:** approval of an amendment to the City's Public Water System Permit.

REGIONAL AND LOCAL ACTIONS/PERMITS

- **Sacramento Local Agency Formation Commission:** approval of annexation to the City of Folsom.
- **Sacramento Metropolitan Air Quality Management District:** authority to construct (for devices that emit air pollutants), health risk assessment, and Air Quality Management Plan consistency determination.
- **Sacramento County Water Agency:** approval for dedicated capacity in SCWA's Freeport Project Pipeline Facility,
- **Sacramento County:** approval of roadway encroachment permit for pipeline construction, tree removal permit (if needed), rezoning, use permit, and parcel map application for new WTP, approval of grading permit.
- **City of Rancho Cordova:** roadway encroachment permit for pipeline construction, tree removal permit (if needed), rezoning, use permit, and parcel map application for new Folsom Boulevard WTP.

1.7 PUBLIC PARTICIPATION AND ADDITIONAL STEPS IN THE CALIFORNIA ENVIRONMENTAL QUALITY ACT/NATIONAL ENVIRONMENTAL POLICY ACT REVIEW PROCESS

This DEIR/DEIS is being distributed to interested agencies, stakeholder organizations, and individuals. This distribution ensures that interested parties have an opportunity to express their views regarding the environmental effects of the project, and to ensure that information pertinent to permits and approvals is provided to decision makers for the lead agencies, NEPA cooperating agencies, and CEQA responsible and trustee agencies. This document is available for review by the public during normal business hours at Folsom City Hall, 50 Natoma Street, Folsom, CA 95630. The DEIR is being distributed for a 45-day period that will end on August 16. The DEIS is being distributed for a 60-day review period that will end on September 7, 2010.

Under CEQA, written comments on the DEIR must be postmarked no later than August 16, 2010. The review period under NEPA will end on September 7, 2010; however, the USACE will continue to accept comments on the DEIS until the ROD is issued. Comments should be sent to the following addresses:

Gail Furness de Pardo
City of Folsom
50 Natoma Street
Folsom, CA 95630
E-mail: gdepardo@folsom.ca.us

Lisa Gibson
U.S. Army Corps of Engineers, Sacramento District, Regulatory Branch
1325 J Street, Room 1480
Sacramento, CA 95814-2922
E-mail: Lisa.M.Gibson2@usace.army.mil

If comments are provided via e-mail, please include the project title in the subject line, attach comments in MS Word format, and include the commenter's U.S. Postal Service mailing address.

A joint public meeting/hearing on the DEIR/DEIS will be conducted by the City and USACE on August 2, 2010 from 5 p.m. to 7 p.m. at the Folsom Community Center, at 52 Natoma Street in Folsom. The City of Folsom Planning Commission will also conduct a public hearing on the DEIR and draft specific plan at its regular meeting

on Wednesday, August 4, 2010 at 6:30 p.m. in the City Council Chambers at 50 Natoma Street. It is not necessary to provide testimony during the public meeting/hearing; comments on the DEIR/DEIS will be accepted throughout the meeting/hearing and will be recorded at the public comment table. Written comments may also be submitted throughout the comment period as described above.

Once all comments have been assembled and reviewed, responses will be prepared to address significant environmental issues that have been raised in the comments. The responses will be included in a FEIR/FEIS.

1.8 ORGANIZATION OF THIS ENVIRONMENTAL IMPACT REPORT/ENVIRONMENTAL IMPACT STATEMENT

The content and format of this EIR/EIS are designed to meet the requirements of CEQA, the State CEQA Guidelines, the requirements of NEPA, the NEPA regulations issued by the Council on Environmental Quality (CEQ), and USACE NEPA regulations, as well as Appendix B to those regulations (NEPA implementation). The EIR/EIS is organized into the following chapters so that the reader can easily obtain information about the project and its specific environmental issues.

- The **cover sheet** identifies lead and any cooperating agencies, contact information for the lead agency contact person, the title of the project and its location, a brief description of the project, a brief abstract, and comment submission information.

- The **Executive Summary** presents an overview of the project and alternatives and associated environmental impacts/consequences; a listing of environmental impacts/consequences and mitigation measures; and impact conclusions regarding growth inducement, irreversible environmental changes, and known areas of controversy and issues to be resolved.

- **Chapter 1, "Introduction and Statement of Purpose and Need,"** explains the CEQA and NEPA processes; lists the lead, cooperating, responsible, and trustee agencies that may have discretionary authority over the project; specifies the underlying project purpose, need, and objectives to which the lead agencies are responding in considering the Proposed Project and project alternatives (both the "Land" and "Water" components); outlines the organization of the document; and provides information on public participation.

- **Chapter 2, "Alternatives,"** presents the Proposed Project Alternative and the alternatives to the Proposed Project for the "Land" portion of the project, and the Preferred Off-site Water Facilities Alternative and other alternatives for the "Water" portion of the project. This chapter contains the project description and describes the project characteristics and components, supporting on- and off-site infrastructure and roadway improvements, and required entitlements for each land use alternative. This chapter also describes the proposed Folsom Specific Plan and identifies the performance standards that will be incorporated into the specific plan and to which subsequent, tentative maps and improvement plans would be required to adhere to when submitted. This chapter provides a description of each alternative in comparison with the Proposed Project Alternative, and describes alternatives considered but eliminated from further consideration.

- **Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures,"** is divided into "A" and "B" sections which describe the setting, impacts and mitigation measures for the "Land" and "Water" portions of the project, respectively. The introduction to Chapter 3 explains the approach to the affected environment (i.e., environmental setting), presents the assumptions used in the environmental analysis, and provides definitions of the types of environmental effects. Each of the remaining sections in Chapter 3 is devoted to a particular issue area and describes the baseline, or existing conditions, and the regulatory setting, then provides an analysis of impacts at an equal level of detail for all project alternatives and mitigation measures that would avoid or eliminate significant impacts or reduce them to a less-than-significant level, where feasible and available.

- **Chapter 4, "Other Statutory Requirements," includes the list of cumulative projects/con**text for the assessment of cumulative impacts, growth-inducing effects, irreversible or irretrievable commitment of

resources, relationship between short-term uses of the environment and maintenance and enhancement of long-term productivity, and unavoidable adverse environmental effects of the Proposed Project and alternatives under consideration ("Land" and "Water").

- **Chapter 5, "References and Organizations and Persons Consulted,"** provides a bibliography of sources cited in the EIR/EIS and identifies the names and affiliations of persons who provided information used in preparing the document and provides information about public involvement.

- **Chapter 6, "Report Preparers,"** lists individuals who were involved in preparing this EIR/EIS.

- **Chapter 7, "Index,"** contains the NEPA-required index for easy reference of to**pics and issues.**

- **Technical appendices conta**in the background information that supports the EIR/EIS.

1.9 DOCUMENTS INCORPORATED BY REFERENCE

This EIR/EIS incorporates by reference several previously prepared environmental documents and technical reports. The documents are identified below along with a brief discussion as to how they relate to the Off-site Water Facilities.

- **Freeport Regional Water Project EIR/EIS – (State Clearinghouse [SCH] No. 20020321320.** SCWA and EBMUD prepared an EIR/EIS in 2002 for the implementation of the Freeport Regional Water Project (Freeport Project), which included the construction and operation of a water supply project to meet regional water supply needs. The main objectives of the Freeport Project were to: (1) support acquisition of additional surface water entitlements for SCWA to promote efficient conjunctive use of groundwater in its Zone 40 service area, (2) construct facilities to enable delivery of existing and anticipated surface water entitlements to SCWA's Zone 40 and EBMUD's respective service areas, and (3) improve EBMUD system reliability and operational flexibility during droughts, catastrophic events, and scheduled major maintenance at Pardee Dam Reservoir.

  This EIR/EIS incorporates by reference the previously certified EIR/EIS and supplemental permit documentation prepared for the Freeport Project. That previously certified EIR/EIS analyzes the potential physical environmental effects of constructing and operating the Freeport Project, which is currently nearing completion. The Freeport Project major facilities include: an intake structure/pumping plant on the Sacramento River near Freeport; a raw water pipeline in Sacramento and San Joaquin counties; and SCWA's Vineyard Surface Water Treatment Plant (Vineyard SWTP) in central Sacramento County. SCWA's use of the Freeport Project is also considered in Reclamation's Operations Criteria and Plan for the Long-Term Operation of the CVP/State Water Project (SWP) (Reclamation 2008) and the supporting Biological Opinion (BO) issued by the U.S. Fish and Wildlife Service (USFWS) (USFWS 2009)

  This EIR/EIS incorporates by reference the Freeport Project EIR/EIS analysis of these water conveyance and intake facilities and does not revisit issues associated with the construction or operation of the existing Freeport Project facilities. A description of the potential Offsite Water Facility Alternatives the City is proposing to integrate into the existing Freeport Project is provided in Chapter 2, "Alternatives" of this EIR/EIS. The complete Freeport Project EIR/EIS may be downloaded from: http://www.freeportproject.org/nodes/project/environmental.php.

- **Zone 40 Water Supply Master Plan EIR (SCH No. 2002122068) and Zone 40 Water System Infrastructure Plan.** SCWA prepared an EIR for the 2002 Zone 40 Water Supply Master Plan, which identifies future water demands within the Zone 40 Service Area and the water supply facilities necessary to accommodate projected demand. The Water Supply Master Plan provides policy direction at a programmatic level with the associated EIR broadly evaluating the construction and operation of new surface, groundwater, and recycled water supply facilities required for production, treatment, storage, and conveyance to areas within Zone 40. This EIR/EIS incorporates by reference the analysis of groundwater impacts resulting from

the implementation of the Zone 40 Water Supply Master Plan along with the potential indirect impacts to the Cosumnes River.

SCWA's Water System Infrastructure Plan provides more project level detail required for the implementation of SCWA's preferred alternative and fills in the gaps of associated smaller infrastructure requirements. This includes describing facility construction and phasing, including operational requirements from existing conditions through ultimate build-out of the Zone 40 water system.

These two documents are available for download at:
http://www.msa.saccounty.net/waterresources/files/Files.asp.

- **White Rock Road Widening Project, Phases A, B, and C, EIR – (SCH No. 2007122088).** This EIR was prepared for the White Rock Road Widening Project to analyze and the potential environmental effects of widening the existing roadway and related improvements between Rancho Cordova and the Sacramento/El Dorado County line. Several of the Offsite Water Facility conveyance alignments follow the future planned alignment for White Rock Road, northeast of its intersection with Grant Line Road. This EIR/EIS acknowledges the potential that the Offsite Water Facility could be constructed concurrently with the White Rock Road widening project for this section of the corresponding conveyance alternatives. The complete widening project EIR may be downloaded from: http://www.dera.saccounty.net/.

- **Easton Project EIR – (SCH No. 2005062128).** The Easton Project, approved by the County of Sacramento, includes the build out of two communities, Glenborough at Easton and Easton Place, on approximately 1,390 acres stretching from Hazel Avenue on the west to Prairie City Road on the east. These communities would consist of a range of mixed commercial/office, a transit-oriented village, and open space and park uses. Alternative alignments of the offsite water facility considered in this EIR/EIS would follow the Easton Valley Parkway alignment, which is proposed as the main thoroughfare through Easton Project. This EIR/EIS acknowledges the potential that the Offsite Water Facility could be constructed concurrently with the construction of Easton Valley Parkway for this section of the corresponding conveyance alternative. The complete Easton Project EIR may be downloaded from: http://www.dera.saccounty.net/.

- **Zone 40 Central Surface and Groundwater Treatment Plant, Pipelines and Corporation Yard Negative Declaration – (SCH No 2004092050).** SCWA prepared this environmental document to assess the environmental effects of constructing the 78-acre Vineyard SWTP, an associated corporation yard, groundwater treatment facilities, and a treated water pipeline along portions of Florin and Excelsior Roads to serve SCWA's Northern Service Area. This treated water pipeline is commonly referred to as the Northern Service Area pipeline and is integrated into Offsite Water Facility Alternative 2B. Construction of these combined facilities was scheduled to begin in 2007 and ended in mid-2010. Offsite Water Facility alternatives evaluated in this EIR/EIS include the potential connection to facilities analyzed in this environmental document. The Zone 40 document may be reviewed at SCWA's main office during normal business hours.

- **Sacramento County General Plan Update Draft EIR – (SCH No. 2007082086).** Sacramento County is currently in the process of updating its General Plan and released a draft EIR for the General Plan Update in August of 2009. Major changes contemplated in the General Plan Update include four growth strategies: infill development, buildout of planned communities, revitalization of commercial corridors and, new growth areas. In conjunction with the new growth areas identified, the County is also proposing to expand the Urban Policy Area (UPA), which identifies specific areas within the unincorporated County where growth will occur.

- According to the draft EIR, the total anticipated increase in water demand between the No Project Scenario and the General Plan Update is 31,633 AFY, but does not factor in future demands from the Cities of Elk Grove, Rancho Cordova, and Folsom. Based on this increase in projected water use, the draft EIR concludes that additional water supplies would be needed and, if these demands were supplied entirely by groundwater, this would result in an exceedance of the Central Sacramento Groundwater Basin's sustainable yield of 273,000 AFY. This EIR/EIS assumes that these new demands would be met solely by groundwater under future cumulative conditions and incorporates by the reference the supporting analysis of potential

groundwater impacts along with the required mitigation. This document may be downloaded from: http://www.dera.saccounty.net/PublicNotices/SQLView/ProjectDetails/tabid/71/Default.aspx?ProjectID=31418.

1.10 STANDARD TERMINOLOGY, ACRONYMS, AND ABBREVIATIONS

1.10.1 STANDARD TERMINOLOGY

The following standard terminology is used in this EIR/EIS to refer to elements of the project (both "Land" and "Water" components):

- **Specific plan** refers to the Folsom Specific Plan.
- **Project** refers to the Folsom South of U.S. 50 project, including the combined project site, the area upon which the related off-site improvements are to be located, the area of the General Plan Amendment, and the Off-Site Water Facilities Study Area. Use of "project" can refer to one or all of the alternatives.
- **Proposed Project** refers specifically to the Proposed Project Alternative for the "Land" analysis.
- **Preferred Alternative** refers specifically to the Preferred Off-Site Water Facility Alternative for the "Water" analysis.

1.10.2 ACRONYMS AND ABBREVIATIONS

The following acronyms and abbreviations are used in this EIR/EIS.

Table 1-1
Acronyms and Other Abbreviations

Term	Definition
°F	degrees Fahrenheit
µg/L	micrograms per liter
2020 Master Plan	*Sacramento Regional Wastewater Treatment Plant 2020 Master Plan*
2020 Master Plant EIR	*Sacramento Regional Wastewater Treatment Plant 2020 Master Plan Final Environmental Impact Report*
AB	Assembly Bill
AC	Asbestos Cement
ACM	asbestos-containing material
ADA	Americans with Disabilities Act
ADT	Average daily traffic
AEP	annual exceedance probability
AFY	Acre-feet per year
ALERT	Automated Local Evaluation in Real Time
Alquist-Priolo Act	Alquist-Priolo Earthquake Fault Zoning Act
ALUP	Airport Land Use Plan
APE	area of potential effects

Table 1-1
Acronyms and Other Abbreviations

Term	Definition
APN	Assessor Parcel Number
ARB	California Air Resources Board
Area 40	Aerojet Superfund site
AST	Above-ground Storage Tank
ATCM	Asbestos Airborne Toxic Control Measure
ATV	all-terrain vehicle

2 ALTERNATIVES

2.1 INTRODUCTION

This chapter describes the Proposed Project and a range of reasonable alternatives to the Proposed Project Alternative consistent with the requirements of California Code of Regulations (CCR) Sections 15124 and 15126.6 and 40 Code of Federal Regulations (CFR) 1502.14.

The project includes several components which affect different geographic areas. These components are described in more detail below:

- The "Land" component addresses proposed land use changes in the City of Folsom's sphere of influence area. The land use component includes two geographical areas:
    - the "Folsom Specific Plan Area" (SPA), which refers to the sphere of influence area where land use decisions would be governed by the proposed Folsom Plan Area Specific Plan, and
    - the "Off-site Improvements," which refer to various areas outside of the sphere of influence area where utility or roadway improvements would be constructed to support the proposed land use changes.
- The "Water" component addresses the facilities required to provide and convey a water supply to the proposed development. The "Water" Study Area is used to describe the areas which could be affected by the proposed "Water" components.
- A General Plan Amendment would be required as part of the project. This General Plan Amendment is described in more detail in Section 2.17, but would include increases in permitted General Plan densities in some areas of the existing City of Folsom. These areas are described as the "General Plan Amendment Area." A discussion of the environmental effects of the General Plan Amendment is included in Section 3A.10, "Land Use and Agricultural Resources – Land."

Exhibit 2-1 illustrates the various geographic areas and descriptors which will be used throughout this EIR/EIS. Discussion of the Proposed Project and alternatives under consideration is divided into two sections, for "Land" and "Water," because the alternatives for "Water" are different from those for "Land."

The five "Land" alternatives evaluated at an equal level of detail in this draft document, known as a draft environmental impact report/draft environmental impact statement (draft EIR/EIS), are as follows:

- No Project Alternative
- No USACE Permit Alternative
- Proposed Project (Applicants' Proposed Alternative)
- Resource Impact Minimization Alternative
- Centralized Development Alternative
- Reduced Hillside Development Alternative

The "Water" project components are evaluated in eleven separate Off-site Water Facility Alternatives at an equal level of detail in this draft EIR/EIS and include:

- No USACE Permit Off-site Water Facility Alternative – Raw Water Conveyance – Grant Line Road Alignment and On-site WTP
- Proposed Off-site Water Facility Alternative – Raw Water Conveyance – Grant Line Road Alignment and On-site WTP

- Off-site Water Facility Alternative 1 – Raw Water Conveyance – Grant Line Road Alignment and White Rock WTP
- Off-site Water Facility Alternative 1A – Raw Water Conveyance – Grant Line Road Route Variation Alignment and White Rock WTP
- Off-site Water Facility Alternative 2 – Treated Water Conveyance – Douglas Road Alignment and Vineyard Surface Water Treatment Plant (SWTP)
- Off-site Water Facility Alternative 2A – Treated Water Conveyance – Douglas Road Route Variation Alignment and Vineyard SWTP
- Off-site Water Facility Alternative 2B – Treated Water Conveyance – North Douglas Tanks Variation Alignment and Vineyard SWTP
- Off-site Water Facility Alternative 3 – Raw Water Conveyance – Douglas Road Alignment and White Rock WTP
- Off-site Water Facility Alternative 3A – Raw Water Conveyance – Douglas Road Route Variation Alignment and White Rock WTP
- Off-site Water Facility Alternative 4 – Raw Water Conveyance to Folsom Boulevard Alignment and Folsom Boulevard WTP
- Off-site Water Facility Alternative 4A – Raw Water Conveyance to Folsom Boulevard – Route Variation Alignment and Folsom Boulevard WTP

These alternatives were developed by the City of Folsom (City) and the U.S. Army Corps of Engineers (USACE), Sacramento District, after review of scoping comments received on the notice of preparation (NOP) and notice of intent (NOI) and voiced at scoping meetings. The alternatives are based on the project purpose, alternatives screening criteria (described below), and results of the draft Section 404(b)(1) alternatives analysis (Appendix L). As requested by USACE, this document also evaluates a No USACE Permit Alternative. These alternatives represent a reasonable range of alternatives to the Proposed Project, consistent with California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) requirements. The Proposed Project and alternatives under consideration (with the exception of the No Project Alternative required by CEQA) have each been formulated to feasibly accomplish most of the basic objectives of the project as discussed in Chapter 1, "Introduction and Statement of Purpose and Need," of this EIR/EIS, and could avoid or substantially lessen one or more of the significant effects.

A summary comparison of these alternatives, as well as identification of the "environmentally superior alternative," required under CEQA is provided in Section 2.9 of this chapter.

2.2 CEQA/NEPA REQUIREMENTS FOR PROJECT DESCRIPTION AND EVALUATION OF ALTERNATIVES

2.2.1 CEQA REQUIREMENTS

PROJECT DESCRIPTION

The guiding principles for the content of a project description in an EIR are provided by the State CEQA Guidelines (14 CCR Section 15124). Section 15124 states that "[t]he description of the project shall contain the

following information, but should not supply extensive detail beyond that needed for evaluation and review of the environmental impact." The contents of a project description shall include:

- the precise location and boundaries of the Proposed Project Alternative, preferably on a detailed topographic map, along with the general location of the project on a regional map;
- a statement of the objectives sought by the Proposed Project Alternative, including the underlying purpose of the project, designed to assist the lead agency in the formulation of alternatives and preparation of findings or a statement of overriding considerations, if necessary;
- a general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities; and
- a statement briefly describing the intended uses of the EIR, including (to the extent the information is known to the lead agency) a list of the agencies that are expected to use the EIR in their decision-making, a list of permits and other approvals required to implement the project, and a list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies.

This section, while combined with the alternatives analysis required by CEQA and NEPA, also fulfills all of the requirements of CEQA for a project description by describing the Proposed Project Alternative (applicant's proposed alternative).

FOCUS OF THE EIR ALTERNATIVES ANALYSIS

The guiding principles for the selection of alternatives for analysis in an EIR are provided by the State CEQA Guidelines (14 CCR Section 15126.6). CCR Section 15126.6 states that the alternatives analysis must:

- describe a range of reasonable alternatives to the project that could feasibly attain most of the basic objectives of the project but would substantially lessen or avoid any of the significant effects of the project;
- focus on alternatives capable of avoiding or substantially lessening any of the significant environmental impacts of the Proposed Project Alternative, even if they may be more costly or could otherwise impede some of the project's objectives; and
- evaluate the comparative merits of the alternatives.

The focus, definition, and number of alternatives evaluated in this EIR/EIS are governed by the "rule of reason" in accordance with CCR Section 15126.6 of the State CEQA Guidelines. That is, the range of alternatives presented in the EIR/EIS is limited to potentially feasible alternatives that will foster infirmed decisionmaking and public participation. An EIR need not, however, consider every conceivable alternative to the project.

In addition to the guiding principles for selection of alternatives set forth above, the State CEQA Guidelines require that an EIR evaluate a "No Project Alternative," to provide the decision makers and the public with an overview of what could reasonably be expected to occur if the proposed Folsom South of U.S. Highway 50 Specific Plan project were not approved and implemented (see Section 2.4 below). The State CEQA Guidelines also require that an EIR identify alternatives that were considered for evaluation but eliminated from further consideration (see Section 2.9–2.11 below), and that the EIR identify the "environmentally superior alternative." Consideration of the other CEQA-mandated requirements is provided in Chapters 3 and 4 of this EIR/EIS.

SCREENING CRITERIA

Consistent with the requirements of CEQA, the City used the CEQA project objectives identified in Chapter 1, "Introduction and Statement of Purpose and Need," as criteria to screen the alternatives that should be considered

in this EIR/EIS and to determine whether the alternatives would avoid or substantially lessen any of the significant environmental impacts of the project.

2.2.2 NEPA REQUIREMENTS

FOCUS OF THE EIS ALTERNATIVES ANALYSIS

The NEPA Council on Environmental Quality (CEQ) Regulations (40 CFR 1502.14) require that an EIS include:

- an exploration and objective evaluation of reasonable alternatives;
- identification of the alternatives considered but eliminated from detailed study, along with a brief discussion of the reasons that these alternatives were eliminated;
- substantial treatment of each alternative considered in detail, including the Proposed Action (Proposed Project), to allow reviewers to evaluate the comparative merits of the proposed action (i.e., proposed project) and alternatives;
- include any reasonable alternative not within the lead agency's jurisdiction;
- consideration of the No Action Alternative;
- identification of the agency's preferred alternative, if any; and
- appropriate mitigation measures not already included in the proposed action or alternatives.

Additionally, USACE NEPA regulations require identification and consideration of a No Department of the Army Section 404 of the Clean Water Act (CWA) permit alternative, which is referred to in the EIR/EIS as the No USACE Permit Alternative.

Alternatives to the Proposed Project Alternative that were considered and evaluated in this EIR/EIS are described below. Consideration of the other NEPA-mandated requirements is provided in Chapters 3 and 4 of this EIR/EIS.

Unlike CEQA, which permits the evaluation of alternatives to occur in less detail than is provided for the Proposed Project Alternative, NEPA requires the analysis of alternatives to occur at a substantially similar level of detail as that devoted to the proposed action. The NEPA Regulations (40 CFR 1502.14) require agencies to rigorously explore and objectively evaluate all reasonable alternatives and to devote substantial treatment to each alternative considered, including the Proposed Project Alternative.

SCREENING CRITERIA

The following screening criteria are in compliance with the U.S. Environmental Protection Agency (EPA) Section 404(b)(1) Guidelines (40 CFR, 2301 et seq.), which are the substantive criteria used by USACE in evaluating discharges of fill material into waters of the U.S. under Section 404 of the CWA. The guidelines require that the following four criteria be satisfied for USACE to make a decision that a proposed discharge is in compliance:

- The discharge must be the Least Environmentally Damaging Practicable Alternative (LEDPA).
- The discharge must not violate any water quality standard or toxic effluent standard, or jeopardize the continued existence of a threatened or endangered species.
- The discharge must not result in a significant degradation of the waters of the U.S.

- Appropriate and practicable steps must be taken that will minimize potential adverse impacts of the discharge on the aquatic ecosystem.

Before USACE can issue a permit, it must find that the requirements of the Section 404(b)(1) Guidelines have been satisfied. The key criterion and the focus of the alternatives analysis is the requirement that the discharge be the LEDPA. USACE considers practicable alternatives to include, but not to be limited to:

- on-site activities that do not include a discharge into waters of the U.S. or ocean waters; and
- discharges of dredged or fill material at other locations in waters of the U.S. or ocean waters.

Criteria which are used to determine whether there are practicable alternatives include the availability of areas that are not presently owned by the applicant that could be reasonably obtained, used, expanded, or managed to fulfill the basic purpose of the proposed activity (after considering cost, existing technology, and logistics) and whether an alternate project location that does not require access or proximity to or siting within the special aquatic site in question to fulfill its basic purpose (i.e., that is not water dependent) is available. Practicable alternatives that do not involve special aquatic sites are presumed to be available unless clearly demonstrated otherwise. Where the activity associated with a discharge is proposed for a special aquatic site (as defined under Section 404(b)(1) Guidelines) does not require access, proximity or siting within the special aquatic site to fulfill its basic purpose all practicable alternatives to the proposed discharge that do not involve a discharge into a special aquatic site are presumed to have less adverse impacts on the aquatic ecosystem, unless clearly demonstrated.

The key provisions in the language are "practicability" and "overall project purpose." An alternative is considered to be practicable if it is available to the applicant and capable of being accomplished by the applicant after consideration of costs, existing technology, and logistics, in light of the overall project purpose. As stated in Chapter 1, "Introduction and Statement of Purpose and Need," USACE has determined that the overall purpose of the project is to provide a large-scale mixed-use community with associated infrastructure, within the Urban Services Boundary in eastern Sacramento County If a practicable alternative is identified that would have less adverse impacts on the aquatic ecosystem and would not have other significant adverse environmental consequences, then USACE would be unable to issue a permit for the Proposed Project.

2.3 "LAND" PORTION OF THE PROJECT

Section 2.3 describes those facilities that would be developed as part of the "Land" portion of the project under the various alternatives considered and evaluated in this EIR/EIS. (Facilities that would be developed as part of the "Water" portion of the project are described later in this chapter in Sections 2.4 through 2.8.)

2.3.1 PROPOSED PROJECT ALTERNATIVE

INTRODUCTION

This section describes the Proposed Project Alternative for the "Land" portion of the project. The Proposed Project Alternatives for both the "Land" and "Water" portions of the project have been formulated to achieve the project purpose, objectives, and needs of the project, as discussed in Chapter 1, "Introduction and Statement of Purpose and Need," of this EIR/EIS.

The South Folsom Property Owners Group–the project applicant(s), are seeking adoption by the City of the proposed *Folsom Plan Area Specific Plan* (specific plan), hereinafter referred to as the "Folsom South of U.S. 50 Specific Plan project" or the "Proposed Project" and associated entitlements discussed in greater detail below. The Folsom South of 50 Specific Plan project would be a mixed-use development on approximately 3,510 acres in the Folsom sphere of influence, immediately south of the Folsom city limits. The total area that would be annexed into the City would be 3,584 acres, and also includes portions of the U.S. Highway 50 (U.S. 50) right-of-way. The area to be annexed into the City is referred to through this EIR/EIS as the SPA. A copy of the draft

Folsom Plan Area Specific Plan is available for review at the City of Folsom offices located at 50 Natoma Street, Folsom, CA 95630 and is also attached to this EIR/EIS as Appendix N. The project applicant(s) are also seeking authorization and permit(s) from USACE to place dredged or fill material into waters of the U.S.

PROGRAM LEVEL ANALYSIS AND ADDITIONAL DETAILED ANALYSIS

As discussed in Chapter 1 (Section 1.4.3), this EIR/EIS includes a program-level, or "first-tier," analysis for the project and considers the broad environmental effects of adoption and implementation of the Folsom Specific Plan. The specific plan and the EIR/EIS include performance standards and mitigation measures that would apply to all subsequent, future project development phases under the specific plan (as conditions of approval) in the SPA. For information on project phasing, please refer to Section 2.3.1.

In addition to the programmatic analysis described above, this EIR/EIS also includes an additional detailed analysis of certain specific issue areas for the Proposed Project Alternative. Where such an analysis has been conducted, a statement is provided at the start of each issue area in the 3A "Land" sections that impacts would be the same under the additional level of detailed analysis as they would under the programmatic level of analysis.

The extent of environmental review, if any, for future development entitlements will depend on a number of factors as described in Chapter 1 (Section 1.4.3).

This section refers to the "project" as the "Proposed Project" since it encompasses the Proposed Project Alternative.

REGIONAL LOCATION

The SPA is generally located in eastern Sacramento County, south of U.S. 50, immediately south of the Folsom city limits (Exhibits 2-1 and 2-2). The SPA lies south of U.S. 50, north of White Rock Road, east of Prairie City Road (a small area extends west of Prairie City Road at the southwest corner of the SPA), and west of the Sacramento/El Dorado County line.

The City of Folsom and the SPA are in the Sierra Nevada foothills, at the eastern edge of the alluvial Sacramento Valley. The Sierra Nevada province is characterized by steep-sided hills and narrow, rocky stream channels. This province consists of Pliocene and older deposits that have been uplifted as a result of plate tectonics, granitic intrusion, and volcanic activity. Subsequent glaciation and additional volcanic activity are factors that led to the east-west orientation of stream channels. The Sacramento Valley is a nearly flat alluvial plain that extends almost 180 miles from the Sacramento–San Joaquin Delta on the south to Redding on the north, and approximately 50 miles from the Sierra Nevada foothills on the east to the Coast Range on the west. Climate in the Folsom area is characterized by warm, dry summers with an almost complete absence of rain, and mild winters with relatively light rains.

A large portion of the SPA is currently being used as pastureland for cattle grazing. Surrounding land uses include facilities owned by Aerojet General Corporation and associated buffer lands to the west; U.S. 50 with urbanized development within the existing Folsom city limits to the north; residential development to the east; and agricultural and grazing land uses to the south.

Access to the SPA would be provided via the existing White Rock Road, Prairie City Road, and Scott Road. Both Prairie City Road and Scott Road provide existing access to the site from U.S. 50, which is limited-access. Proposed roadways which would serve the SPA include Oak Avenue and Empire Ranch Road (both of which have proposed interchanges with U.S. 50), and the proposed Easton Valley Parkway, which would provide an east-west connection to the SPA.

Project Site Location Map **Exhibit 2-2**

REQUESTED ENTITLEMENTS

The following entitlements are requested from the City and USACE for the Proposed Project Alternative. Additional approvals, permits, and authorizations are listed in Chapter 1, "Introduction and Statement of Purpose and Need." The entitlements necessary for the off-site water facilities are discussed in Section 2.13.2 of this EIR/EIS.

City of Folsom

Adoption of the Proposed Project Alternative, as well as action alternatives under consideration, contemplates approval of the following City entitlements:

- certification of the EIR/EIS and Mitigation Monitoring and Reporting Program (MMRP),
- amendment of the Folsom General Plan,
- adoption of the Folsom Plan Area Specific Plan,
- adoption of a Public Facilities Financing Plan,
- potential approval of development agreements between the City and project applicant(s),
- approval of large-lot tentative maps, and
- pre-zoning of the SPA.

Future City entitlement approvals may include, but are not limited to, the following:

- use permits,
- approval of tentative parcel and subdivision maps,
- design review,
- lot line adjustments,
- engineering improvement plans,
- planned development permits,
- grading plans, and
- Development Agreement between the City and future project applicant(s).

Each of these requested entitlements and approvals is described in turn below.

- **Certification of the EIR/EIS and Mitigation Monitoring and Reporting Program.** After preparation of the Final EIR/EIS, the City will consider certification of the EIR/EIS and MMRP. The Final EIR/EIS will respond to significant environmental comments raised during review of the Draft EIR/EIS and will document any project modifications, corrections, or revisions to the environmental impacts or mitigation measures of the Proposed Project Alternative. The MMRP will outline what actions must be taken, as conditions of approval, to comply with the EIR/EIS, and the timing and responsibilities for conducting and monitoring the various mitigation activities.

- **General Plan Amendments and Annexation to the City of Folsom.** The City of Folsom would adopt a General Plan Amendment, with several components. The General Plan Amendment would:

    - define the compatible land uses for the SPA;

    - propose annexation of the entire approximately 3,584-acre SPA into the City of Folsom's territory;

    - modify densities for Single Family, Multi-Family Medium Density, and Multi-Family High Density General Plan land use designations throughout the City of Folsom (See Section 2.17, "General Plan Amendment" for more details);

    - amend the General Plan by adding a Mixed Use land use category; and

- amend the City's transportation Level of Service (LOS) policy for the SPA (this change would not affect the existing city).

Prior to approval of annexation by the Sacramento Local Agency Formation Commission (LAFCo), the project applicant(s) must demonstrate that the Proposed Project Alternative meets the conditions established in the Memorandum of Understanding (MOU) between the City and Sacramento, Sacramento County, and Resolution 1196 of the Sacramento LAFCo Approving the City of Folsom Sphere of Influence Amendment Application. These conditions are listed below.

- Revise and update the City's General Plan in accordance with State law.

- Obtain a certification of substantial compliance from the California Department of Housing and Community Development consistent with California Government Code Section 65585(d) or (h). The City shall establish in its approved Housing Element that it has or will meet its regional share housing needs for all income levels for the second and third Housing Element revisions, as defined in California Government Code Section 65588.

- Adopt appropriate land use designations for all property within the sphere of influence area.

- Prezone the property consistent with California Government Code Section 56375 and the Folsom General Plan.

- Apply comprehensive planning of the SPA.

- Provide a program for implementation and financing for major infrastructure and services components, including identification of the source of water supplies to serve the annexed area.

- Ensure collaborative participation by the public and stakeholders including Sacramento and El Dorado Counties, and the Folsom Cordova Unified School District.

- Prepare a plan for necessary improvements to each jurisdiction's roadway network to accommodate increased traffic from the SPA, in cooperation with Sacramento and El Dorado Counties. This plan must include a list of improvements, phasing plan, and clearly defined financing mechanism. Implementation of this plan must result in service levels on local roadways consistent with each jurisdiction's general plan.

- Identify traffic and transportation measures which are needed to mitigate potential impacts on regional transportation facilities from proposed development within the SPA. The City must also identify a funding mechanism to construct the traffic and transportation measures necessary to fully mitigate impacts from the SPA, and a timeline for the construction of improvements. As soon as reasonably possible, these improvements should be programmed into the Metropolitan Transportation Plan and Metropolitan Transportation Improvement Program.

- Prepare a Transit Master Plan and a Bikeway Master Plan to delineate transit routes and bikeways in the SPA, consistent with the goals and policies of the City's General Plan.

- Preparation of a Drainage Master Plan for the SPA that includes hydrologic modeling along Alder Creek, documenting no net increase in downstream floodwater surface elevations;

- Document the City's multi-species habitat mitigation strategy (Habitat Conservation Plan [HCP]) for the SPA (may be fulfilled through City participation in Southeast Sacramento County HCP process).

- Document that on-site surface contamination has been remediated, and that groundwater contamination has been remediated or is being remediated effectively prior to annexation of any property owned by Aerojet General Corporation.

- Demonstrate that the City has a sufficient water supply to serve existing customers in compliance with the Water Forum agreements, and all proposed uses within the SPA per California Government Code Section 56668(k);

- Demonstrate the timely availability of wastewater transmission and treatment capacity.

- Meet and confer with special districts regarding impacts to operations.

- Where permitted by law, incorporate feasible school mitigation requirements into development agreements.

- Comply with mitigation measures identified in environmental review for expansion of sphere of influence boundary.

- Mitigate for oak woodland and habitat preservation, including 30% preservation of natural open space within the annexed area.

- Demonstrate that services can be provided in compliance with the City's General Plan.

- Establish revenue sharing agreements with Sacramento County establishing the apportionment of future tax revenues in the SPA.

► **Folsom Specific Plan Adoption.** The specific plan is intended to provide a comprehensive land use, policy, and regulatory document to govern all future development in the SPA. The specific plan excludes the area of proposed interchanges with U.S. 50 because no land use designations are proposed in these areas. The goal of the specific plan is to establish a development framework for land use, resource protection, circulation, public utilities and services, design, and implementation. Development of the specific plan (i.e., the Proposed Project Alternative under the CEQA process) and the subsequent entitlement process provides for a sequence of community input and government review to ensure that development occurs in a logical, consistent, and timely manner.

Specific plans are an implementation mechanism for new-growth areas authorized, but not mandated, by California statute (California Government Code Section 65451 et seq.). The content of a specific plan is defined in California Government Code Section 64541(a), which specifies the following in detail:

- the distribution, location, and extent of the uses of the land, including open space, within the area covered by the plan;

- the proposed distribution, location, extent, and intensity of major components of public and private transportation, sewage, water drainage, solid-waste disposal, energy, and other essential facilities proposed to be located within the area covered by the plan and needed to support the land uses described in the plan;

- standards and criteria by which development would proceed, and standards for the conservation, development, and utilization of natural resources, where applicable; and

- a program of implementation measures including regulations, programs, public-works projects, and financing measures necessary to carry out the above-listed criteria.

Under state law, the specific plan implements and must be consistent with the goals, policies, and objectives of the approving local agency's general plan. Here, the project is intended to be consistent with the *Folsom General Plan* (City General Plan), as adopted on October 31, 1988 and amended through September 12, 2008 (the date of the project's NOP). All subsequent entitlements and approvals relating to land or infrastructure in the plan area (i.e., SPA), including but not limited to subdivisions, public-works projects, prezones, rezones, and conditional use permits, are required to be consistent with the specific plan if the specific plan is to be used as the entitling document. Once the specific plan is adopted, the maximum extent of development in the SPA will have been determined and cannot be exceeded. However, development intensity and residential density within individual communities in the SPA may be transferred from lower density areas to higher density areas, with City approval, provided that the maximum limits set forth in the specific plan are not exceeded.

- **Public Facilities Financing Plan.** A Public Facilities Financing Plan has been prepared and included as part of the Folsom Plan Area Specific Plan, and would be adopted by the City Council before the approval of any tentative map within theSPA. The Financing Plan would define the specific mechanisms required to fund capital costs of all infrastructure necessary as a result of specific plan buildout. The Financing Plan would define funding for the maintenance of new infrastructure and public services needed by the future residents and business locating within the SPA.

- **Development Agreement.** The project applicant(s) intend to enter into a Development Agreement or Agreements with the City pursuant to California Government Code Section 65864 et seq. at the time of specific plan adoption. The agreement would set forth many, if not all, of the applicant(s)' obligations to the City and other public agencies with regard to the project, including but not limited to construction, maintenance, and financial responsibilities. The agreement would also set forth the City's other project obligations, including but not limited to processing of subsequent entitlement applications, formation of financing mechanisms (including but not limited to Mello-Roos districts), and the vesting of development entitlements. Pursuant to applicable Government Code provisions, public hearings at both the City Planning Commission and City Council would be held on the proposed Development Agreement before the City Council takes any action. The specific terms and conditions of any such development agreements are subject to negotiation and approval of the parties.

- **Pre-zoning.** The City of Folsom would pre-zone the SPA prior to annexation.

U.S. Army Corps of Engineers

The Proposed Action represents a Federal action because it would require Federal permits and authorizations for one or more of the following activities: issuance of a Section 404 CWA permit for discharges into waters of the U.S.; Section 106 review of impacts to cultural and historical resources, and issuance of a biological opinion and incidental-take statement pursuant to Section 7 of the Federal Endangered Species Act (ESA) for potential take of endangered or threatened species.

Sacramento Local Agency Formation Commission

Implementation of the Proposed Project Alternative or any of the action alternatives requires approval of annexation of the SPA to the City of Folsom by the Sacramento LAFCo.

PROPOSED FOLSOM SOUTH OF 50 SPECIFIC PLAN LAND USES

As described below, the Proposed Project Alternative would include a range of housing types, employment centers, open space, and recreation opportunities, as well as support services such as roadway improvements, support infrastructure, and utilities. Land uses are described below and shown in Table 2-1 and Exhibit 2-3. Exhibit 2-4 illustrates the proposed zoning districts which would be pre-zoned in the SPA.

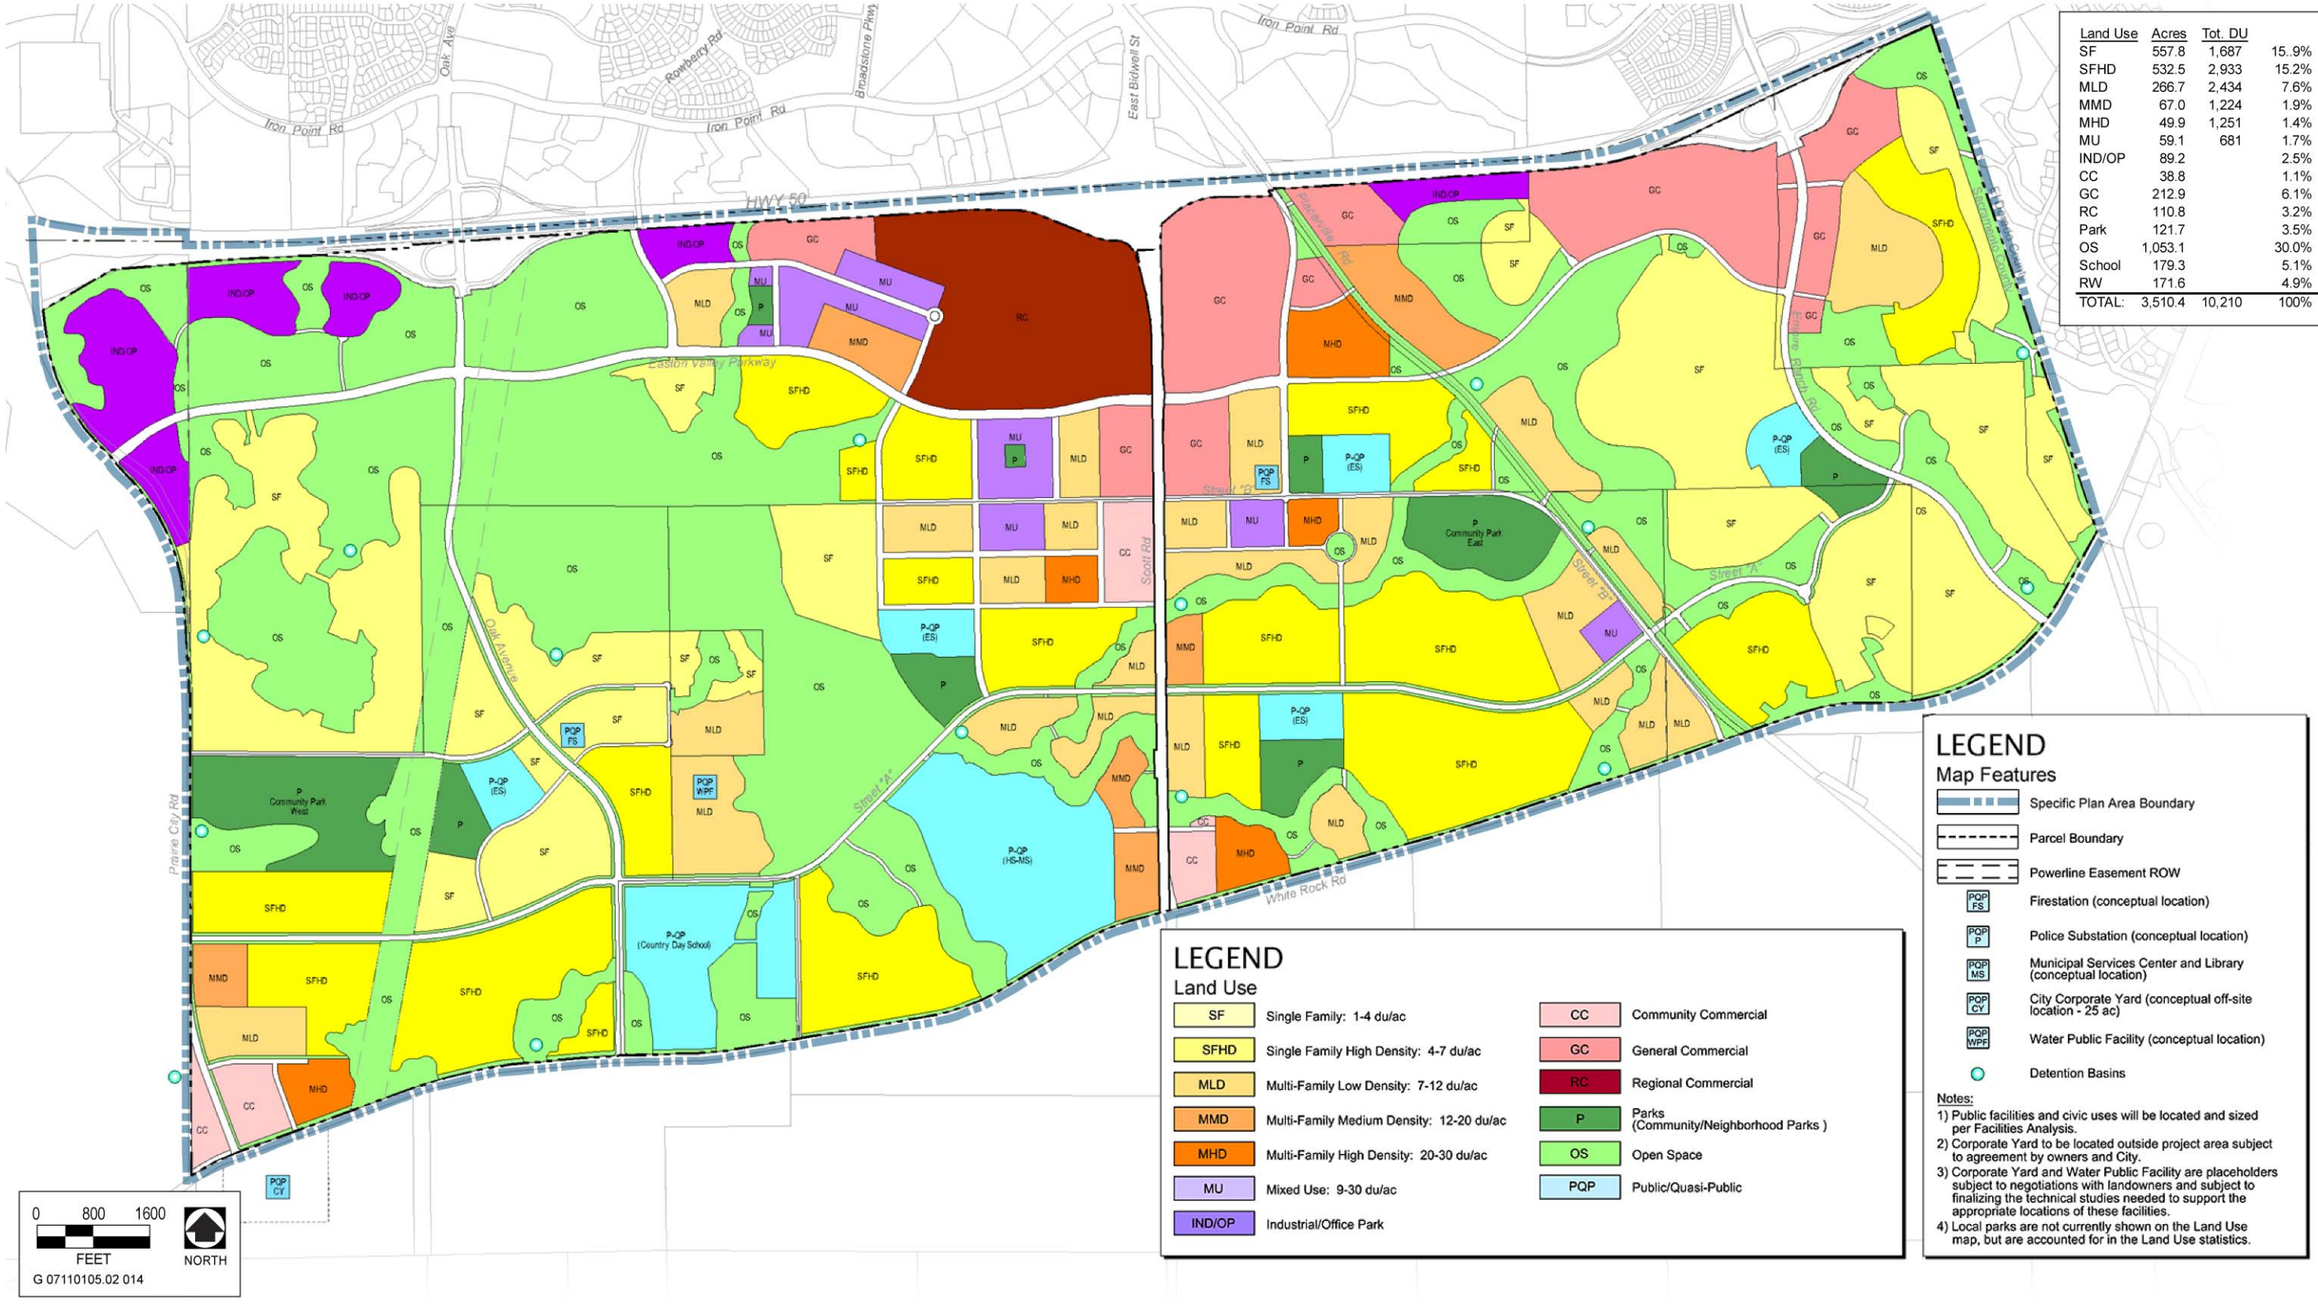
Table 2-1 Acres of Proposed Folsom South of U.S. 50 Specific Plan Project Land Uses		
Land Use	Dwelling Units/Acre	Total Acres
Single Family	1–4	557.8
Single Family High Density	4–7	532.5
Multi-Family Low Density	7–12	266.7
Multi-Family Medium Density	12–20	67.0
Multi-Family High Density	20–30	49.9
Mixed-Use District	9–30	59.1
Office Park		89.2
Community Commercial		38.8
General Commercial		212.9
Regional Commercial		110.8
Parks – Community West		44.5
Parks – Community East		26.1
Parks – Neighborhood		47.6
Parks – Local		3.5
High School-Middle School		79.6
Elementary School		51.0
Country Day School		48.7
Circulation Improvements		171.6
Open Space		1,053.1
Specific Plan Area Total		**3,510.4**
Other Areas Proposed for Annexation		73.6
"**Land" Project Total**		**3,584**
Source: Torrance Planning 2009		

Buildout of the Proposed Project Alternative would be split into four development phases, is anticipated to occur over an approximately 20-year period, and would include the elements described below.

Residential and Mixed-Use

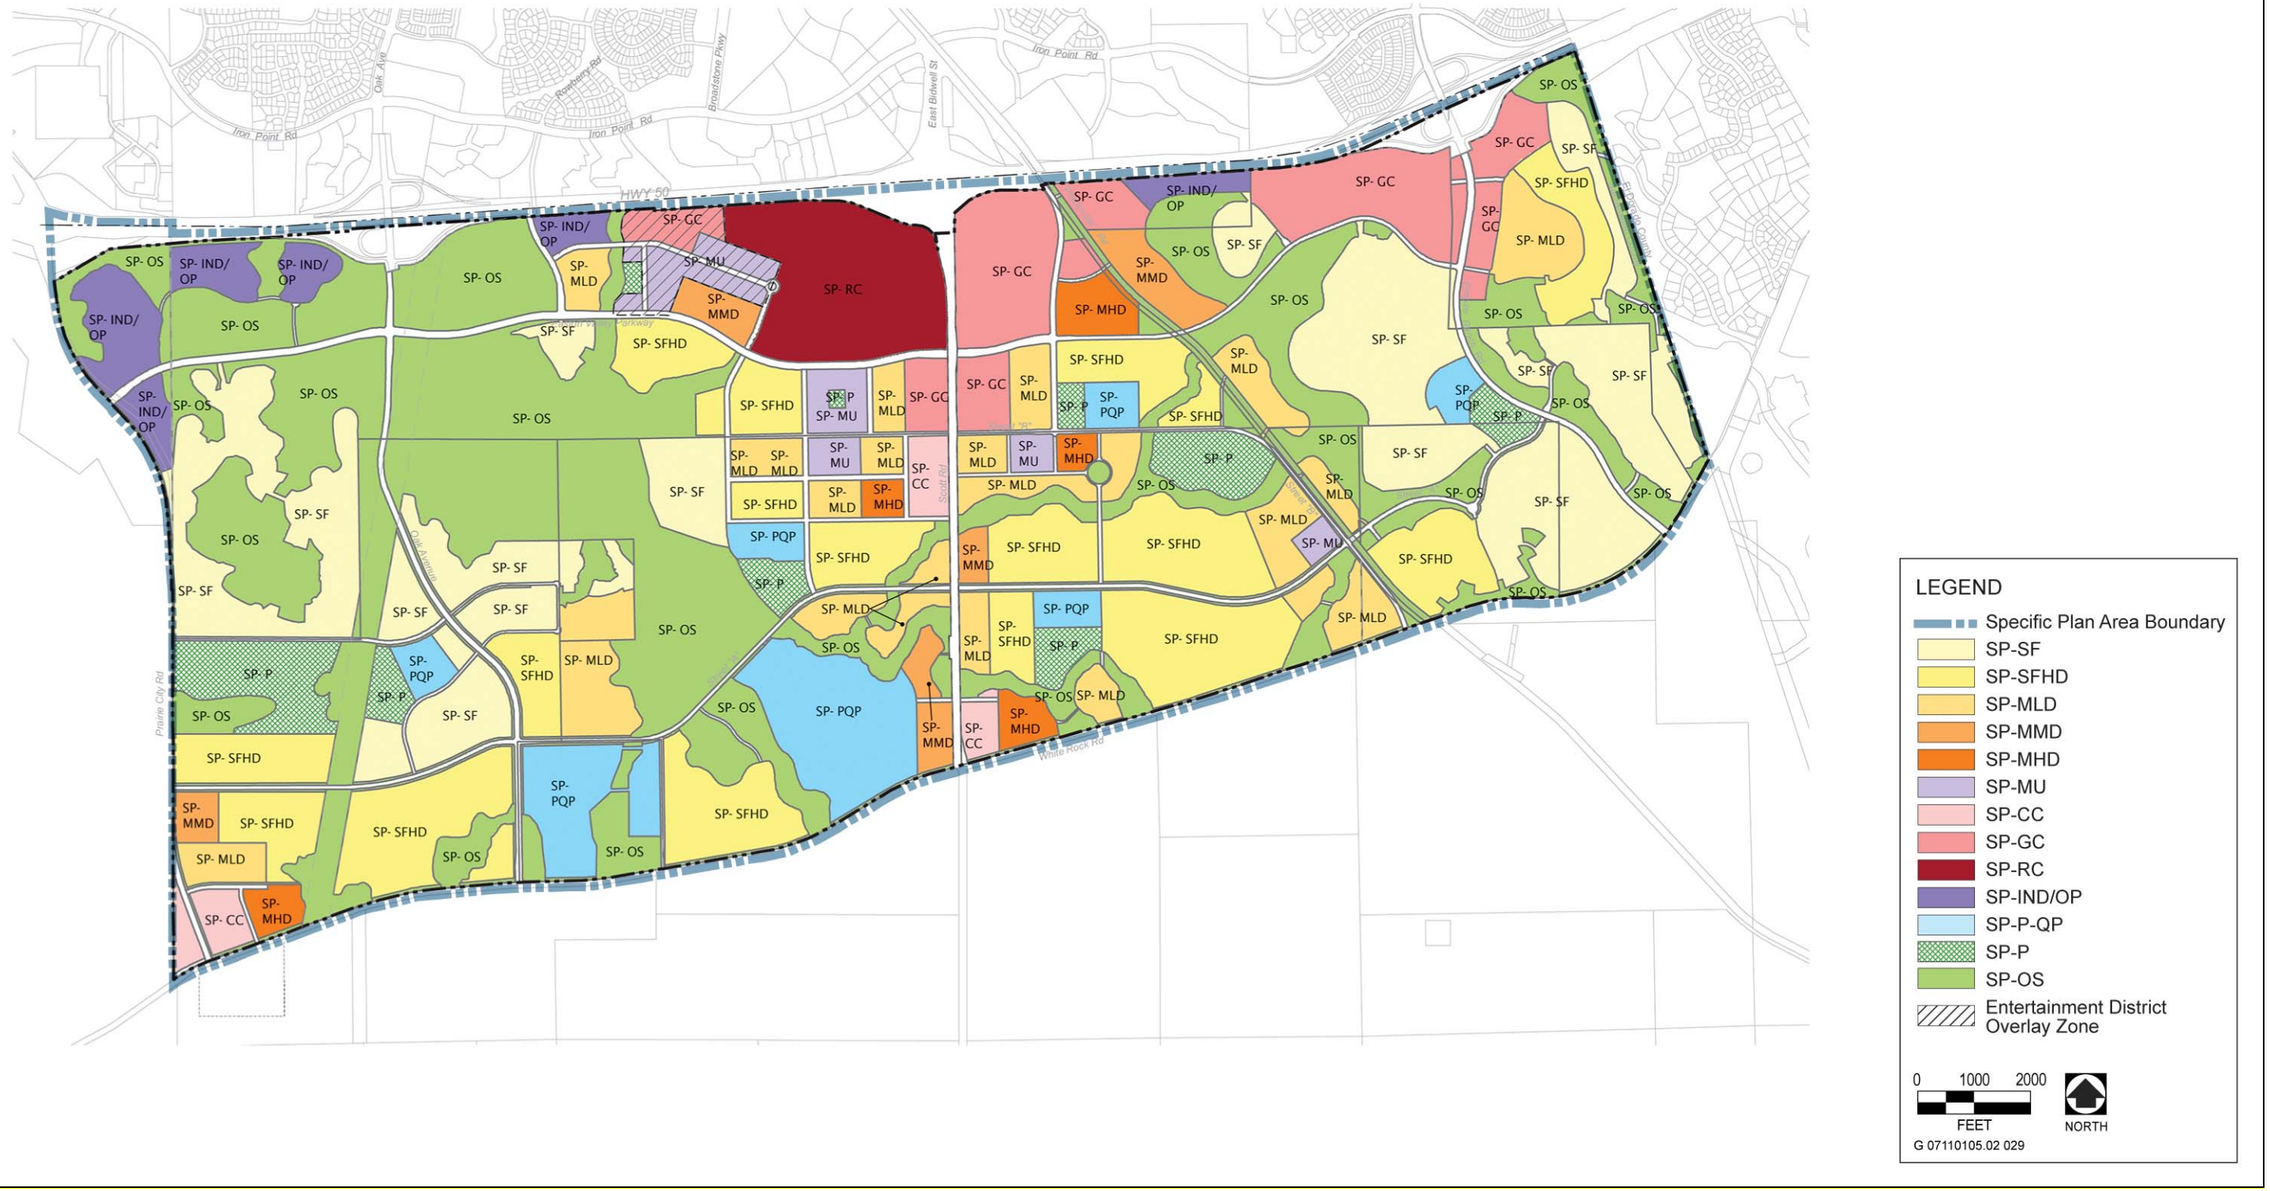
The Proposed Project Alternative provides for the construction of approximately 10,210 dwelling units in five residential land use classifications on 1,477.2 acres. The proposed densities are as follows:

- Single Family, with a permitted density range of 1–4 dwelling units per acre (du/ac) and a desired density of 3 du/ac;
- Single Family High Density, with a permitted density range of 4–7 du/ac and a desired density of 5 du/ac;
- Multi-Family Low Density, with a permitted density range of 7–12 du/ac and a desired density of 9 du/ac;



Source: MacKay & Somps 2009

Folsom South of 50 Conceptual Land Use Plan (Proposed Project Alternative) **Exhibit 2-3**



Source: Torrence Planning 2010

Proposed Zoning Districts **Exhibit 2-4**

- Multi-Family Medium Density, with a permitted density range of 12–20 du/ac and a desired density of 18 du/ac; and

- Multi-Family High Density, with a permitted density range of 20–30 du/ac and a desired density of 25 du/ac.

A total of 1,477.2 acres are proposed for residential development. In addition, 59.1 acres are proposed for a Mixed-Use District, which would include both residential and commercial uses. This district's proposed density range is 9–30 du/ac, with a desired density of 12 du/ac.

Commercial/Industrial

The Proposed Project Alternative includes 451.7 acres of land designated for commercial/industrial use, under the commercial land use classifications of Office Park, Community Commercial, General Commercial, and Regional Commercial (Table 2-1). Three office park areas are proposed along U.S. 50. Community Commercial sites, covering a total of 38.8 acres, are proposed for the intersection of Prairie City and White Rock Roads, and at two locations along Scott Road. 212.9 acres of General Commercial uses are proposed in the central and eastern portion of the SPA along U.S. 50, and on Scott Road in the northern portion of the SPA. A Regional Commercial district (shopping centers) is proposed for 110.8 acres at the southwest corner of Scott Road and U.S. 50.

Parks and Recreation

The Proposed Project Alternative includes a total of 121.7 acres of parks. With 10,210 dwelling units proposed, and a projected population of 24,335 (based on people-per-unit ratios of 2.92 for single-family residences and 1.94 for multi-family residences), this represents 5 acres of parkland per 1,000 residents. Two community parks, totaling 70.6 acres, would provide communitywide recreational facilities serving multiple neighborhoods. An additional 47.6 acres of neighborhood parks are proposed. These parks would be smaller than the community parks, ranging in size between three and ten acres, and would be linked to neighborhoods and services by trails and bicycle facilities. Each of the proposed school sites is located adjacent a proposed neighborhood park in order to provide joint use opportunities. An additional 3.5 acres of local parks would be designated within residential areas as tentative maps are approved. These local parks would serve the recreational needs of the immediately surrounding areas. In addition to the proposed park area, multi-use trails would be appropriate within some open space areas of the SPA, as discussed in "Open Space," below.

Open Space

The Proposed Project Alternative includes 1,053.1 acres of land designated as open space. Measure W, passed by Folsom voters in 2004, amended the Folsom City Charter to require that 30% of the plan area be maintained as natural open space.

Alder Creek, which flows in a northwesterly direction across the western half of the SPA, is entirely encompassed within open space in the plan area. Multi-use trails connect the plan area's proposed residential and commercial areas to services and schools, and provide an alternative to automobile use. The proposed specific plan highlights the importance of visual connections to open space areas; roadways are to be placed along the boundaries of open space areas where possible, with clear visibility at access points to trails.

Stormwater Management

Project implementation would include development of about 3,500 acres of land, most of which has not been previously developed. Drainage watercourses are needed to effectively drain the site, control flooding, and provide recreation and water quality benefits to the proposed development. Exhibit 2-5 shows the proposed pattern of stormwater drainage in the SPA at buildout. A network of conveyance pipes, inlets, manholes, and regulating structures would deliver runoff to the aforementioned system components (Exhibit 2-5).

Alder Creek and several tributaries flow across the SPA, along with several additional intermittent and ephemeral drainage watercourses on-site. The SPA lies within the Lower American and Upper Cosumnes Watersheds. Although most of the SPA has not been mapped for flood risk by the Federal Emergency Management Agency (FEMA), the SPA has been studied by the California Department of Water Resources (DWR) under its Awareness Flood Mapping Program, and the area along Alder Creek has been designated as Awareness Floodplain by DWR. The area along Alder Creek as it flows through the SPA has been designated by the Sacramento County Department of Water Resources as lying within a 100-year (0.01 Annual Exceedance Probability [AEP] floodplain.

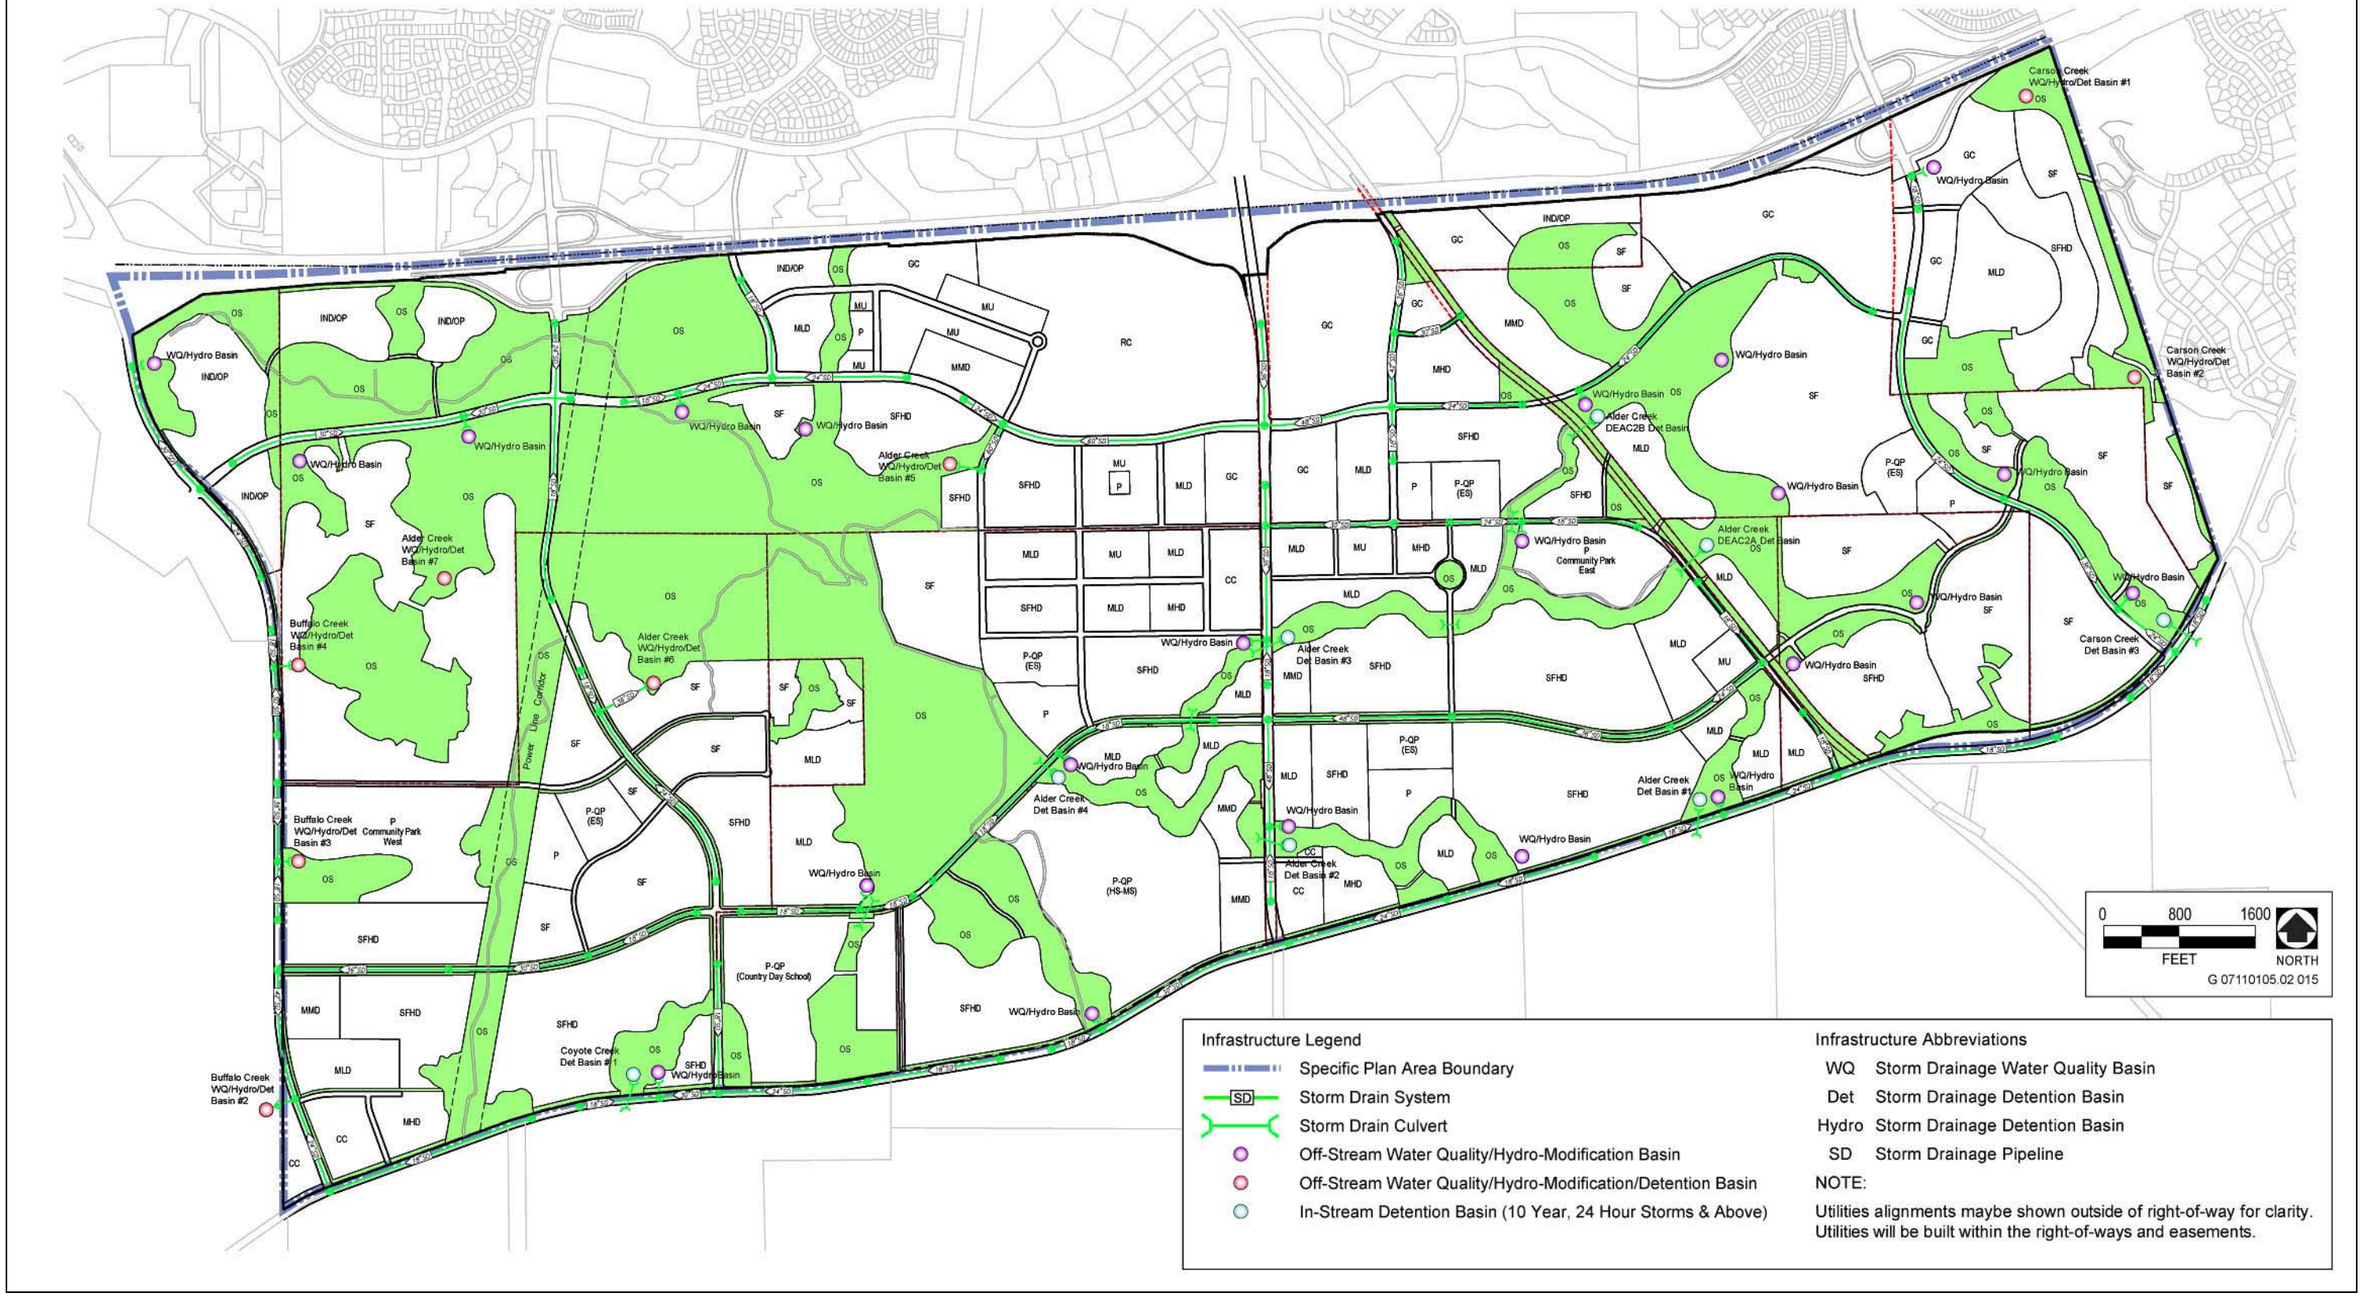
The SPA includes portions of the Alder Creek, Buffalo Creek, Coyote Creek, and Carson Creek Watersheds. Water currently flows off-site via Alder Creek, three outfalls to Buffalo Creek on the western boundary of the SPA, one outfall to Coyote Creek on the southern boundary of the SPA, and three outfalls to Carson Creek on the southern and eastern boundaries of the SPA. Water flows onto the SPA from three off-site developments north of U.S. 50, and from undeveloped properties to the south of the SPA.

Alder Creek originates outside and to the south of the SPA and flows across the SPA in a northwesterly direction. Downstream of the SPA, the Alder Creek and Buffalo Creek Watersheds flow west into areas of undeveloped vernal pool grassland and oak woodland with some scattered industrial development with roadways, utilities, and drainage conveyance systems. The Buffalo Creek and Coyote Creek Watersheds originate in the SPA in the southwest corner. The Coyote Creek Watershed flows south from the SPA into undeveloped grazing lands with vernal pools. The Carson Creek Watershed flows through the eastern portion of the SPA and flows off the site into undeveloped grazing lands to the south and residential development to the east. The Alder Creek Watershed drains into Lake Natoma and the American River. Buffalo Creek is also part of the Lower American River Watershed. Carson Creek and Coyote Creek both ultimately flow into the Cosumnes River.

The Buffalo Creek and Coyote Creek Watersheds consist primarily of gently rolling terrain with slopes ranging from 0% to 15% and ground elevations ranging from approximately 300 to 380 feet above mean sea level in the SPA. The Alder Creek Watershed consists of gently rolling and hilly terrain with slopes from 0% to 30% and ground elevations ranging from 240 feet above mean sea level in the northwest to 770 feet in the northeast. The Carson Creek Watershed consists of hilly terrain with slopes ranging from 5% to 30% and ground elevations from approximately 440 to 800 feet above mean sea level in the eastern portion of the SPA.

A preliminary grading plan has been developed that accommodates needs for on-site stormwater detention, incorporates preferred alignments for roadways, and joins with existing conditions at the project boundaries. A stormwater system consisting of surface swales, catch basins, drainage inlets, underground pipes, and detention basins has been developed for the Proposed Project Alternative. These stormwater facilities would be constructed along the natural drainage courses within the SPA to mimic natural drainage patterns. The stormwater system has been designed to collect and convey 100-year (0.01 AEP) storm events. The proposed drainage and detention facilities would detain flows exiting the site such that 10-year (0.1 AEP) and 100-year (0.01 AEP) flow events would remain at or below existing conditions flows.

The Proposed Project Alternative would employ a Low Impact Development (LID) stormwater management system that would increase infiltration potential, evaporation, and surface storage while reducing excess stormwater runoff. A LID stormwater management system treats stormwater at its source rather than at a centralized collection site or pond. LID systems reduce runoff volume and rate by maximizing infiltration capacity through the use of undisturbed areas, on-site water management facilities, and functional landscaping to capture runoff at its source. Decentralizing stormwater collection can reduce pollutants because as stormwater travels from its source, it can pick up pollutants that can reduce water quality in receiving bodies. By allowing stormwater infiltration at its source, it does not have the opportunity to pick up pollutants as it travels to a centralized and distant collection system. Pollutant reduction is also achieved by minimizing paved surfaces in the SPA. The following elements may be included as part of the Proposed Project Alternative LID system:



Source: RRM Design Group 2008

Conceptual Drainage Plan **Exhibit 2-5**

bioretention facilities, infiltration trenches, dry wells, landscape/buffer strips, and swales (grassed, bio retention, and/or wet). Specific features to be included would be determined between the project applicant(s) and the City.

The majority of the Alder Creek streambed through the SPA would be preserved in the open space land use designation as part of the site development plan, as would many of the other drainage channels and swales. Grading would be required in some of the open-space tract to contain seasonal flows to an active channel and more reliably define the extent of the 100-year (0.01 AEP) floodplain in this area. Construction of several roadway crossings are proposed over Alder Creek, however, and detention basins would be constructed in on-site drainage watercourses. During smaller events, runoff would be conveyed within the creek banks while larger flows would utilize up to the design depth of the detention basins. Sixteen detention and water quality basins are proposed throughout the SPA. These basins are sized to hold both the required detention volume, and an additional water quality volume. Exhibit 2-5 illustrates the locations of detention basins. As shown on Exhibit 2-5, one detention basin is proposed to be located off-site, immediately west of Prairie City Road.

The City's Public Works Department provides stormwater services in Folsom. The SPA is not currently served with stormwater infrastructure. The Proposed Project Alternative would include stormwater infrastructure designed to collect and convey 100-year (0.01 AEP) storm events. The proposed infrastructure includes surface swales, catch basins, drainage inlets, underground pipes, and detention basins. Stormwater runoff would be collected in the proposed system, and discharged into Alder Creek, Buffalo Creek, Carson Creek, and Coyote Creek. Exhibit 2-5 illustrates the conceptual stormwater system for the SPA.

Waters of the U.S., Including Wetland Impacts and Avoidance

A total of 84.94 acres of waters of the U.S. are located within the SPA. Additionally, 1.30 acres of waters were identified on the site that USACE determined to be nonnavigable, isolated, and intrastate waters with no apparent interstate commerce connection. Table 2-2 presents acreage of waters of the U.S., with detail shown for vernal pools, seasonal wetland swales, seasonal wetlands, freshwater marsh, freshwater seeps, ponds, stream channels, intermittent drainage channels, and ditches.

Table 2-2
Waters of the U.S., Including Wetlands in the SPA

Wetland Type	Existing Acres	Acres Filled By Proposed Project Implementation (Direct Impact)	Acres Avoided by Proposed Project Implementation	Acres Fragmented by Proposed Project Implementation (Indirect Impact)
Vernal pool	4.64	2.92	1.72	0.00
Seasonal wetland	4.66	3.87	0.78	0.00
Seasonal swale	25.48	17.63	7.85	0.00
Seep	10.80	4.48	6.33	0.17
Marsh	0.21	0.07	0.14	0.016
Ponds	6.87	1.17	5.71	0.088
Stream channel	17.19	3.38	13.81	0.012
Drainage channel	11.72	4.47	7.25	0.00
Ditch	1.96	1.40	0.55	0.00
Willow Scrub	0.11	0.11	0.00	0.00
Total Waters of the U.S.	**83.64**	**39.50**	**44.14**	0.29
Isolated Waters	1.30	1.25	0.05	0.00
Grand Total	**84.94**	**40.75**	**44.19**	**0.29**

Source: ECORP Consulting, Inc. 2009 and 2010

The Proposed Project Alternative includes 1,050 acres of open space that would contain preserve areas intended to preserve and protect aquatic features, sensitive habitat areas, and cultural resources. Development impacts on wetland habitats and other waters of the U.S. within the preserve areas would be avoided. The boundaries of the preserve areas would be determined during the wetland permitting process. The open space would be distributed throughout the SPA, but concentrated primarily in the western portion of the site where oak woodlands and Alder Creek are present. Most of the stream channels and intermittent drainage channels are included in proposed open space corridors. As shown in Table 2-2, a total of 44.19 acres of waters of the U.S. and wetlands would be preserved in the SPA, including most of Alder Creek.

In addition to the waters of the U.S. that would be avoided, preserved, and protected (described above) in the open space areas, additional acreage of wetland habitat would be created within the open space areas as compensatory mitigation for impacts elsewhere in the SPA.

The open space designation includes oak woodlands, riparian corridors, landscape parkways 30 feet in width or greater, slope areas, and wetland and stream and drainage channel habitats. Buffers of at least 75 feet are included in the open space design to protect preserved habitats from adjacent development. No grading, trails, or improvements would be allowed within the first 25 feet of buffer, but temporary disturbance associated with contour grading, mitigation planting, trails, benches, and other passive recreational amenities may occur in the outer 50 feet of buffer. Allowed uses within designated open space are designed to be consistent with the preservation and enhancement of natural open space and habitat features. These uses include passive outdoor recreation, such as hiking, walking, horseback riding, and bicycling on designated walkways and trails. Trailheads, restroom facilities, educational and interpretive signage, and similar facilities to enhance public enjoyment of the open space would also be allowed, as well as maintenance of stormwater systems and other utilities.

Wetland Preserve Mitigation and Monitoring Plan

A draft mitigation and monitoring plan (MMP) for the wetland preserve and additional mitigation areas has been developed by ECORP Consulting, Inc. (ECORP) on behalf of the project applicant(s) and is attached as Appendix N. An operations and management plan (O&M plan) is also being prepared for the project by ECORP on behalf of the project applicant(s). Both the MMP and the O&M plan would need to be reviewed and approved by USACE before implementation or work in waters of the U.S. The MMP outlines the monitoring methods and success criteria of compensatory wetland and riparian habitat while the O&M plan lists the responsibilities of the Preserve Steward, as well as the tasks required to ensure the long-term viability of the functions and values of the preserve.

Schools

The Proposed Project Alternative also includes approximately 130.6 acres designated for schools, including five elementary school sites, and one middle and high school site. Each elementary school site consists of 10.0 acres, with 79.0 acres for the middle and high school site. In addition to the public school sites, an approximately 50-acre parcel is planned for either a private or public school.

All of the public school sites would be part of the Folsom Cordova Unified School District (FCUSD). The proposed schools, along with adjacent community parks, would be jointly used by FCUSD and the Folsom Parks and Recreation Department. Funding would be provided through state bonds and local bonds and developer fees.

Buildout of the Folsom South of 50 Specific Plan development would generate approximately 4,999 pupils in grades K–12. Of this total, 2,807 pupils would be in grades K–5; 1,017 would be in grades 6–8; and 1,073 would be in grades 9–12 and continuation high school. An additional 102 pupils in grades K–12 would be enrolled in special education programs. FCUSD based these projections on the proposed land use designations and yield rates generated from similar types of development.

The timeline for construction of the proposed schools would coincide with the project applicant(s)' buildout schedule, which is dependent upon market trends for new homes.

Public Utilities and Services

Public services, utilities, and other infrastructure improvements would be needed to support the Proposed Project Alternative as outlined in the proposed specific plan. The project applicant(s) have initiated coordination with the various service providers regarding provision of these services on an as-needed basis. Table 2-3 provides details on the necessary off-site improvements.

Table 2-3
Folsom South of U.S. 50 Specific Plan Off-site Infrastructure Improvements

Improvement	Approved/Existing CEQA Coverage?
Off-site water conveyance	No
Sewer force main connection underground from SPA to interceptor on Iron Point Road North of U.S. 50	No
EID Sewer connections to existing facilities in El Dorado Hills	No
Detention basin (west of Prairie City Road)	No
Prairie City Road improvements	No
White Rock Road improvements	No
Prairie City Road/U.S. 50 Interchange improvements (North of U.S. 50)	Yes
Oak Avenue/U.S. 50 Interchange	No
Rowberry Drive Overcrossing	No
Scott Road/U.S. 50 Interchange improvements (North of U.S. 50)	Yes
Empire Ranch Road/U.S. 50 Interchange improvements (North of U.S. 50)	Yes
Roadway connections from Folsom Heights property into El Dorado Hills	No
Sewer force main connections within roadway connections from Folsom Heights property into El Dorado Hills	No

Sources: MacKay & Somps 2008; data compiled by AECOM in 2009

A municipal services facility is proposed for the SPA. This facility would provide a range of services to residents of the SPA and of the City of Folsom as a whole, including "city hall" type facilities such as meeting rooms and offices, and could also provide space for a branch library facility. Two fire stations are also proposed in the SPA.

Fire and Police Protection

Fire protection services would be provided by the City of Folsom's Fire Department. The majority of the SPA is currently in the jurisdiction of the Sacramento Metro Fire District, but the City would seek detachment from the District in conjunction with its annexation proposal. An approximately 178-acre area in the northeastern portion of the SPA is currently served by the El Dorado Hills Fire Department. The City of Folsom and the El Dorado Hills Fire Department are negotiating whether this area will be transferred to the jurisdiction of the Folsom Fire Department. Two fire stations are included as part of the Proposed Project Alternative. The final size and location of these fire stations will be determined following response time analysis studies, but the conceptual locations for these facilities are near the intersection of Oak Avenue and Street "A," and east of the intersection of Scott Road and Street "B." A fire training facility may be paired with one of the two fire stations; the size and location of these facilities would be determined during the development phase of the project. (See Exhibit 2-3.)

Police protection would be handled by the City's Police Department. The facilities needs for law enforcement and protection would be determined by that department. An on-site police station is conceptually located north of Street "B" and east of Scott Road, with a conceptual police service center in the regional mall. (See Exhibit 2-3.)

On-site Water

The City of Folsom Utilities Department, Water Division would provide water service to the majority of the SPA. In the EID service area (illustrated in Exhibit 2-6), EID would provide water service. No water infrastructure is currently present in the SPA; a conceptual diagram of water distribution infrastructure is presented on Exhibit 2-7. Under the terms of Measure W, adopted by Folsom voters in 2004 and incorporated into the City's Charter as Section 7.08, a new water source for the project area must be identified and provided at no cost to existing Folsom residents, so that the existing water supply currently serving users to the north of U.S. 50 is not reduced. Sections 2.12 through 2.15 below provide a detailed description of the "Water" portion of the project, including information on the source of the water, and off-site conveyance improvements.

The Proposed Project Alternative includes installation of a non-potable water distribution system ("purple pipe" system). This system would be used to route non-potable water to parks and landscaped areas, reducing the use of drinking water for irrigation in the SPA. There currently is no recycled water supply to use within the SPA, but installation of the distribution system would expedite implementation of such a supply when it is available.

The project would conform to the 2007 requirements of Best Management Practices (BMPs) from the California Urban Water Conservation Memorandum of Understanding (or later edition if applicable). These BMPs could include: performing site-specific landscape and interior water surveys; conducting public information campaigns and school education programs; adopting a water waste ordinance; and identifying opportunities for installation of dedicated irrigation meters, monitoring progress through billing, and providing site-specific assistance for accounts 20% over budget. The California Urban Water Conservation BMPs would have a long-term affect on the City's ability to manage water use throughout the SPA. To the extent that the City requires installation of dedicated irrigation meters in the SPA, a monitoring and survey program would provide an opportunity to ensure that landscape water demands are achieving desired water conservation targets. The City's water conservation coordinator would be assigned to manage water conservation programs and City staff will be authorized to enforce the water waste ordinance. Through targeted outreach, the City can encourage continued customer use of highly efficient appliances and irrigation systems, emphasize the need to retain efficient landscape plantings, and minimize otherwise wasteful uses.

Sewer

Sanitary sewer service for the SPA would be provided by the City of Folsom Wastewater Division.
The Wastewater Division discharges its wastewater into County systems; Sacramento Regional County Sanitation District (SRCSD) and County Sanitation District No. 1 (CSD-1) for conveyance and treatment at SRCSD regional facility. An approximately 189-acre portion of the SPA east of Empire Ranch Road is in the El Dorado Irrigation District (EID) service area. Sanitary sewer service in this area would be provided by EID, through connection with the existing EID system in El Dorado Hills, with wastewater being conveyed to the El Dorado Hills WWTP. Exhibit 2-6 illustrates the location of the EID service area.

No sanitary sewer facilities are currently present in the SPA. Exhibit 2-8 presents a conceptual diagram of on-site sewer facilities. Sewer facilities would include both gravity-fed mains and force-mains, as well as several pump stations. Connection to the City's existing wastewater system would proceed off-site along Oak Avenue, joining the existing system on Iron Point Road west of Oak Avenue.

Electricity

Electrical service would be provided by Sacramento Municipal Utility District (SMUD). All electrical lines under 69 kilovolts (kV) would be routed underground within the rights-of-way of streets in the SPA. SMUD has

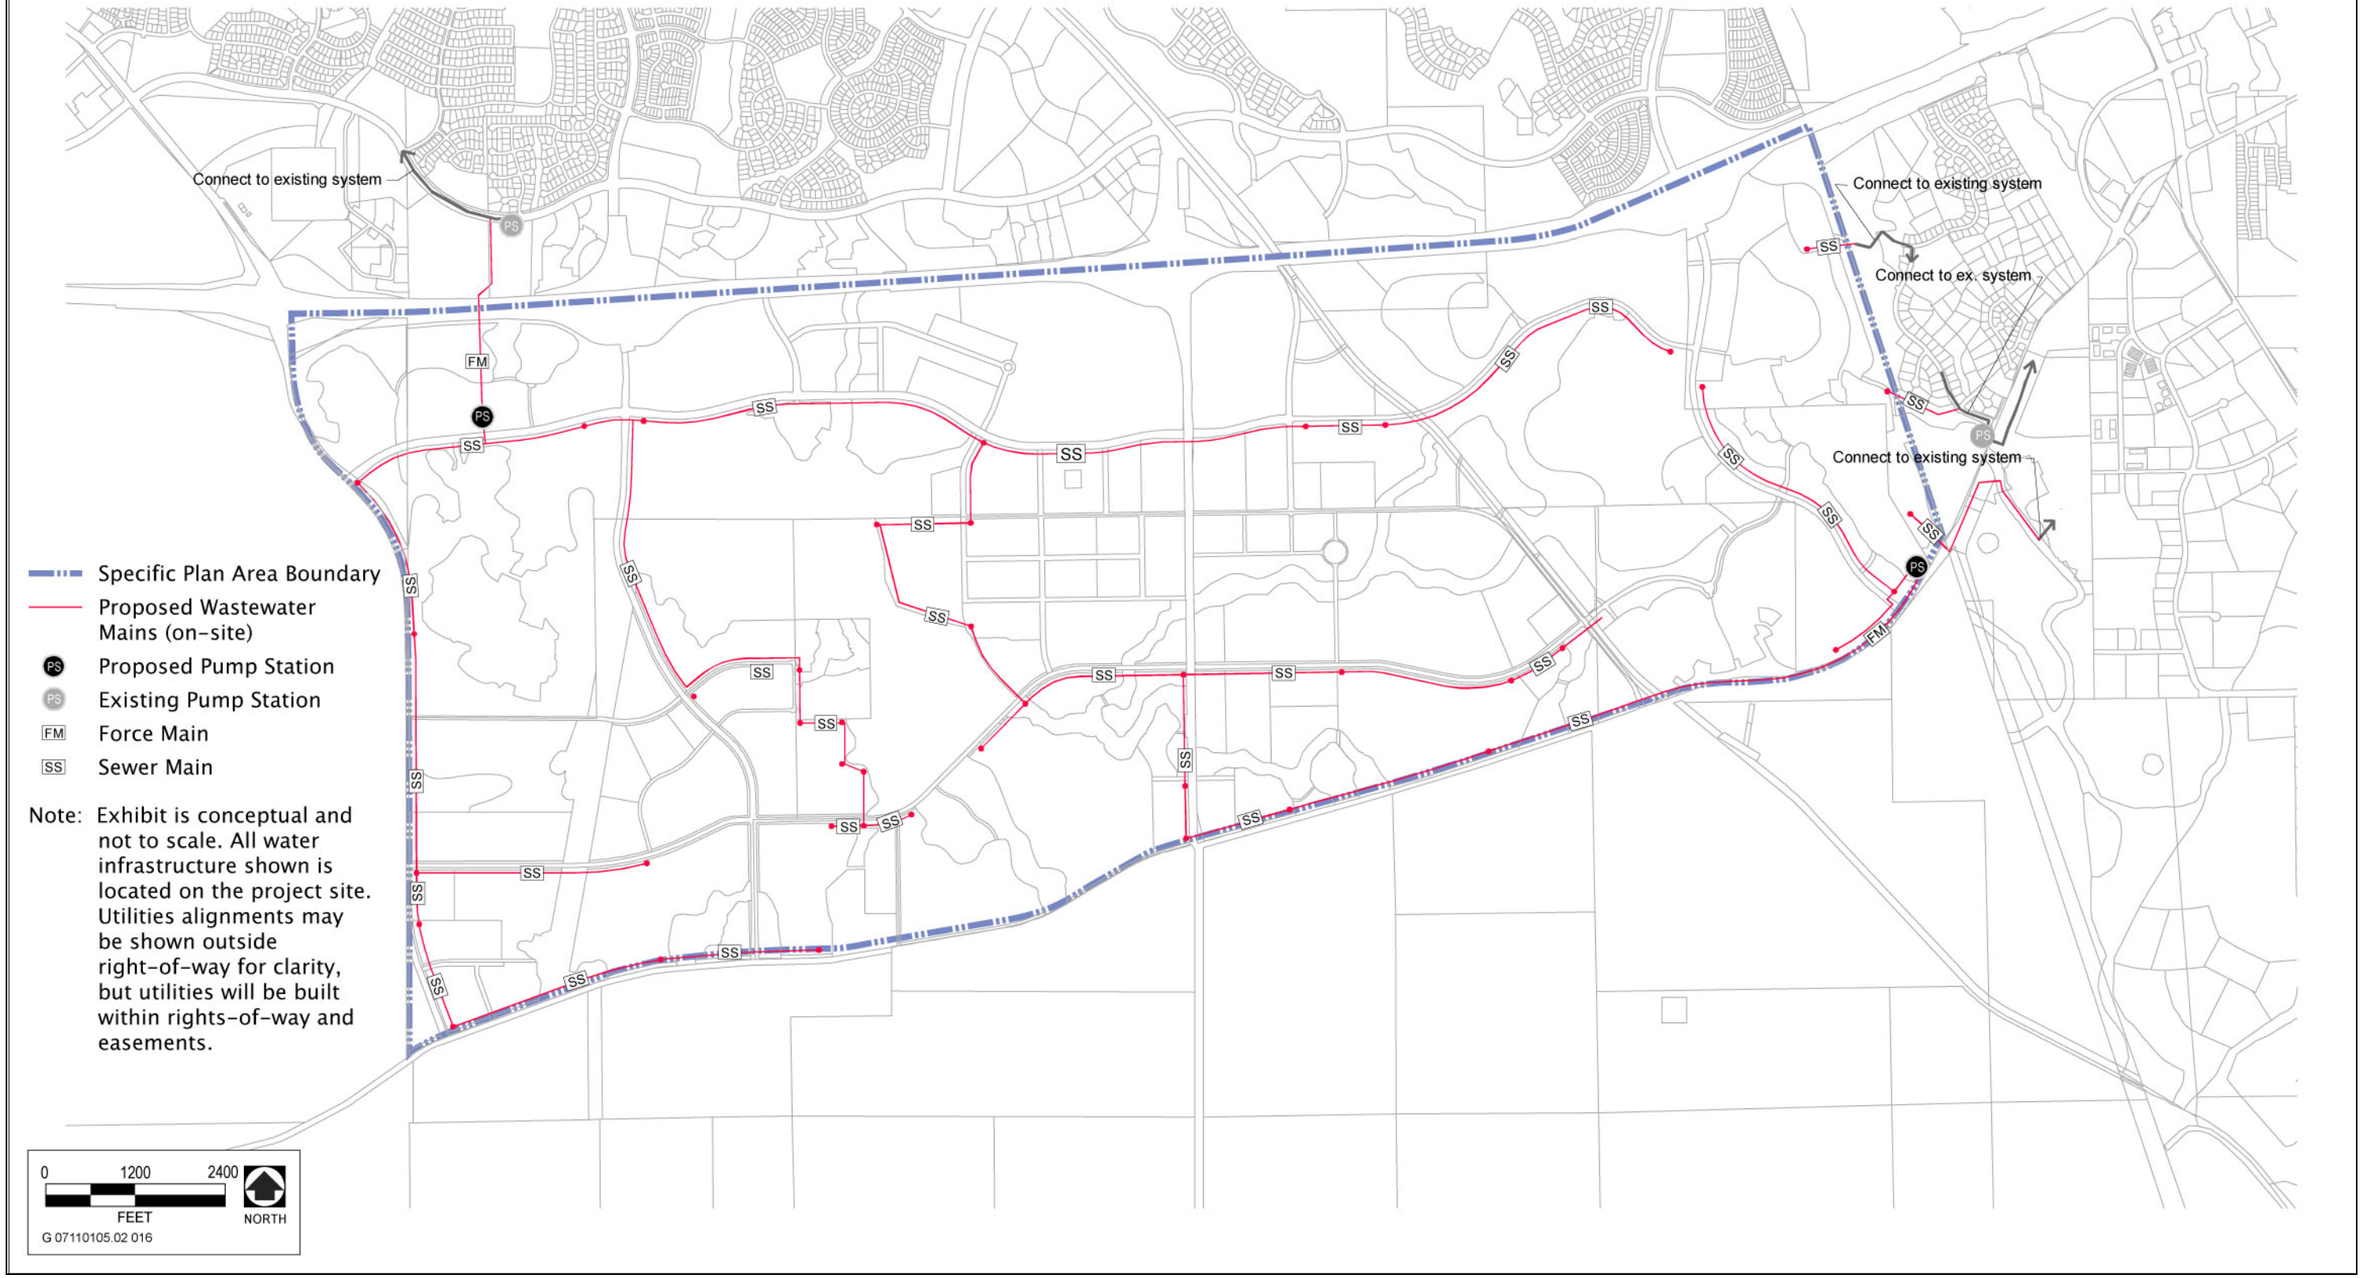
Conceptual On-site Water Conveyance **Exhibit 2-7**



Source: RRM Design Group 2008, MacKay & Somps 2009

Conceptual Wastewater Diagram **Exhibit 2-8**

indicated that backbone electrical improvements necessary to support the project would include construction of three electric substations. The exact locations for these substations have not been defined; however, the approximate locations would be near the intersection of Easton Valley Parkway and Rowberry Drive, near the intersection of White Rock and Scott Roads, and along Placerville Road north of Easton Valley Parkway. These substations would be served by extensions of existing 69-kV overhead lines.

The project applicant(s) are currently working with SMUD to develop detailed design plans for electrical service to the SPA.

Natural Gas

Natural gas service would be provided by Pacific Gas & Electric Company (PG&E), and would be routed underground within the rights-of-way of streets in the SPA. The project applicant(s) is currently working with PG&E to develop detailed design plans for natural-gas service to the SPA, but one or more transmission pipelines and two natural gas regulator stations would be constructed in the SPA to serve buildout of the project.

Telephone

AT&T has existing underground and overhead telephone service in the vicinity of the SPA. AT&T would extend lines and construct facilities to serve the SPA concurrently with development phases.

Solid Waste Disposal

The City's Solid Waste Division would provide pickup and disposal of solid waste in the SPA.

Circulation Improvements

As shown in Exhibit 2-9, the Proposed Project Alternative includes the development of an estimated 171.6 acres of major roadways and associated landscaping within the SPA. Access and circulation within the SPA would be provided through the construction of the following primary roadways:

White Rock Road is a regional connector which forms the southern boundary of the SPA, and provides an alternative travel route parallel to U.S. 50. White Rock Road would be a 5-lane roadway with a 28-foot wide median to accommodate a future sixth traffic lane, if needed. A 50-foot-wide landscape parkway (including a 12-foot Class I bicycle trail) would buffer development in the SPA from White Rock Road.

- Easton Valley Parkway would be a regional roadway and transit corridor parallel to U.S. 50. The street section for Easton Valley Parkway would vary from two- to six-lanes, with a median of 16 to 38 feet. Four lanes (with Class II bicycle lanes on both sides of the road, a 6-foot wide meandering sidewalk on the south side of the street, and a Class I bike path on the north side of the street. No sidewalk will be provided on the north side of Easton Valley Parkway from Rowberry Road to Prairie City Road) are proposed from Prairie City Road to the western end of the proposed Regional Commercial center. Six lanes are proposed from the Regional Commercial center to Placerville Road (with eight-foot sidewalks on each side of the road), and two lanes east of Placerville Road (with 5-foot wide Class II bicycle lanes on both sides of the road, a separate 12-foot-wide class I bike path on the south side of the road, and a six-foot sidewalk on the north side). A Class II bicycle lane would run the length of Easton Valley Parkway in the SPA. Right of way for two lanes is reserved for dedicated transit service at the level of bus rapid transit, and eventually for light rail when demand justifies the service.

- Prairie City Road is a local arterial connecting U.S. 50 and White Rock Road along the western boundary of the SPA. Prairie City Road would be a 4 to 6 lane major arterial with 16-foot-wide center median. Class II bicycle lanes would be provided in each direction, with six-foot-wide sidewalks along both sides of the

roadway. Six lanes are proposed from U.S. 50 to Easton Valley Parkway, with a four-lane roadway continuing from Easton Valley Parkway to White Rock Road. Empire Ranch Road would be extended from U.S. 50 to White Rock Road on the eastern portion of the SPA. Six lanes are proposed from U.S. 50 to Easton Valley Parkway, with four lanes proposed from Easton Valley Parkway to White Rock Road. The Empire Ranch Road corridor would include Class II bicycle lanes in each direction, and six-foot sidewalks on both sides of the road.

- Oak Avenue would extend from U.S. 50 to White Rock Road, providing an alternative to existing north-south routes. Four lanes are proposed for Oak Avenue, with a 16-foot-wide center median. Class II bicycle lanes are proposed in each direction, with six-foot-wide sidewalks proposed on both sides of the road.

- Scott Road would be extended from U.S. 50 south to White Rock Road. Six lanes are proposed between U.S. 50 and Street B, with four lanes proposed between Street B and White Rock Road. Class II bicycle lanes and six-foot-wide sidewalks are proposed in each direction.

- Street B would connect Placerville Road to White Rock Road with two travel lanes, Class II bicycle lanes in each direction, and 15-foot-wide sidewalks on each side of the road. The corridor would contain a 38-foot-wide center median for limited left-turn movements and future transit use east of Scott Road.

- Placerville Road would extend from a U.S. 50 undercrossing to White Rock Road. The roadway would range from two to four lanes, with Class II bicycle lanes in each direction. A 38-foot-wide median is proposed from Easton Valley Parkway to Street B to accommodate future transit use. Sidewalk widths would be 15-feet south of Easton Valley Parkway, with six-foot sidewalk and 12-foot wide Class I bike paths constructed on other portions of the route.

- Rowberry Drive would extend from a U.S. 50 overpass to Easton Valley Parkway, with four travel lanes, Class II bicycle lanes in both directions, and six-foot-wide sidewalks on both sides of the road.

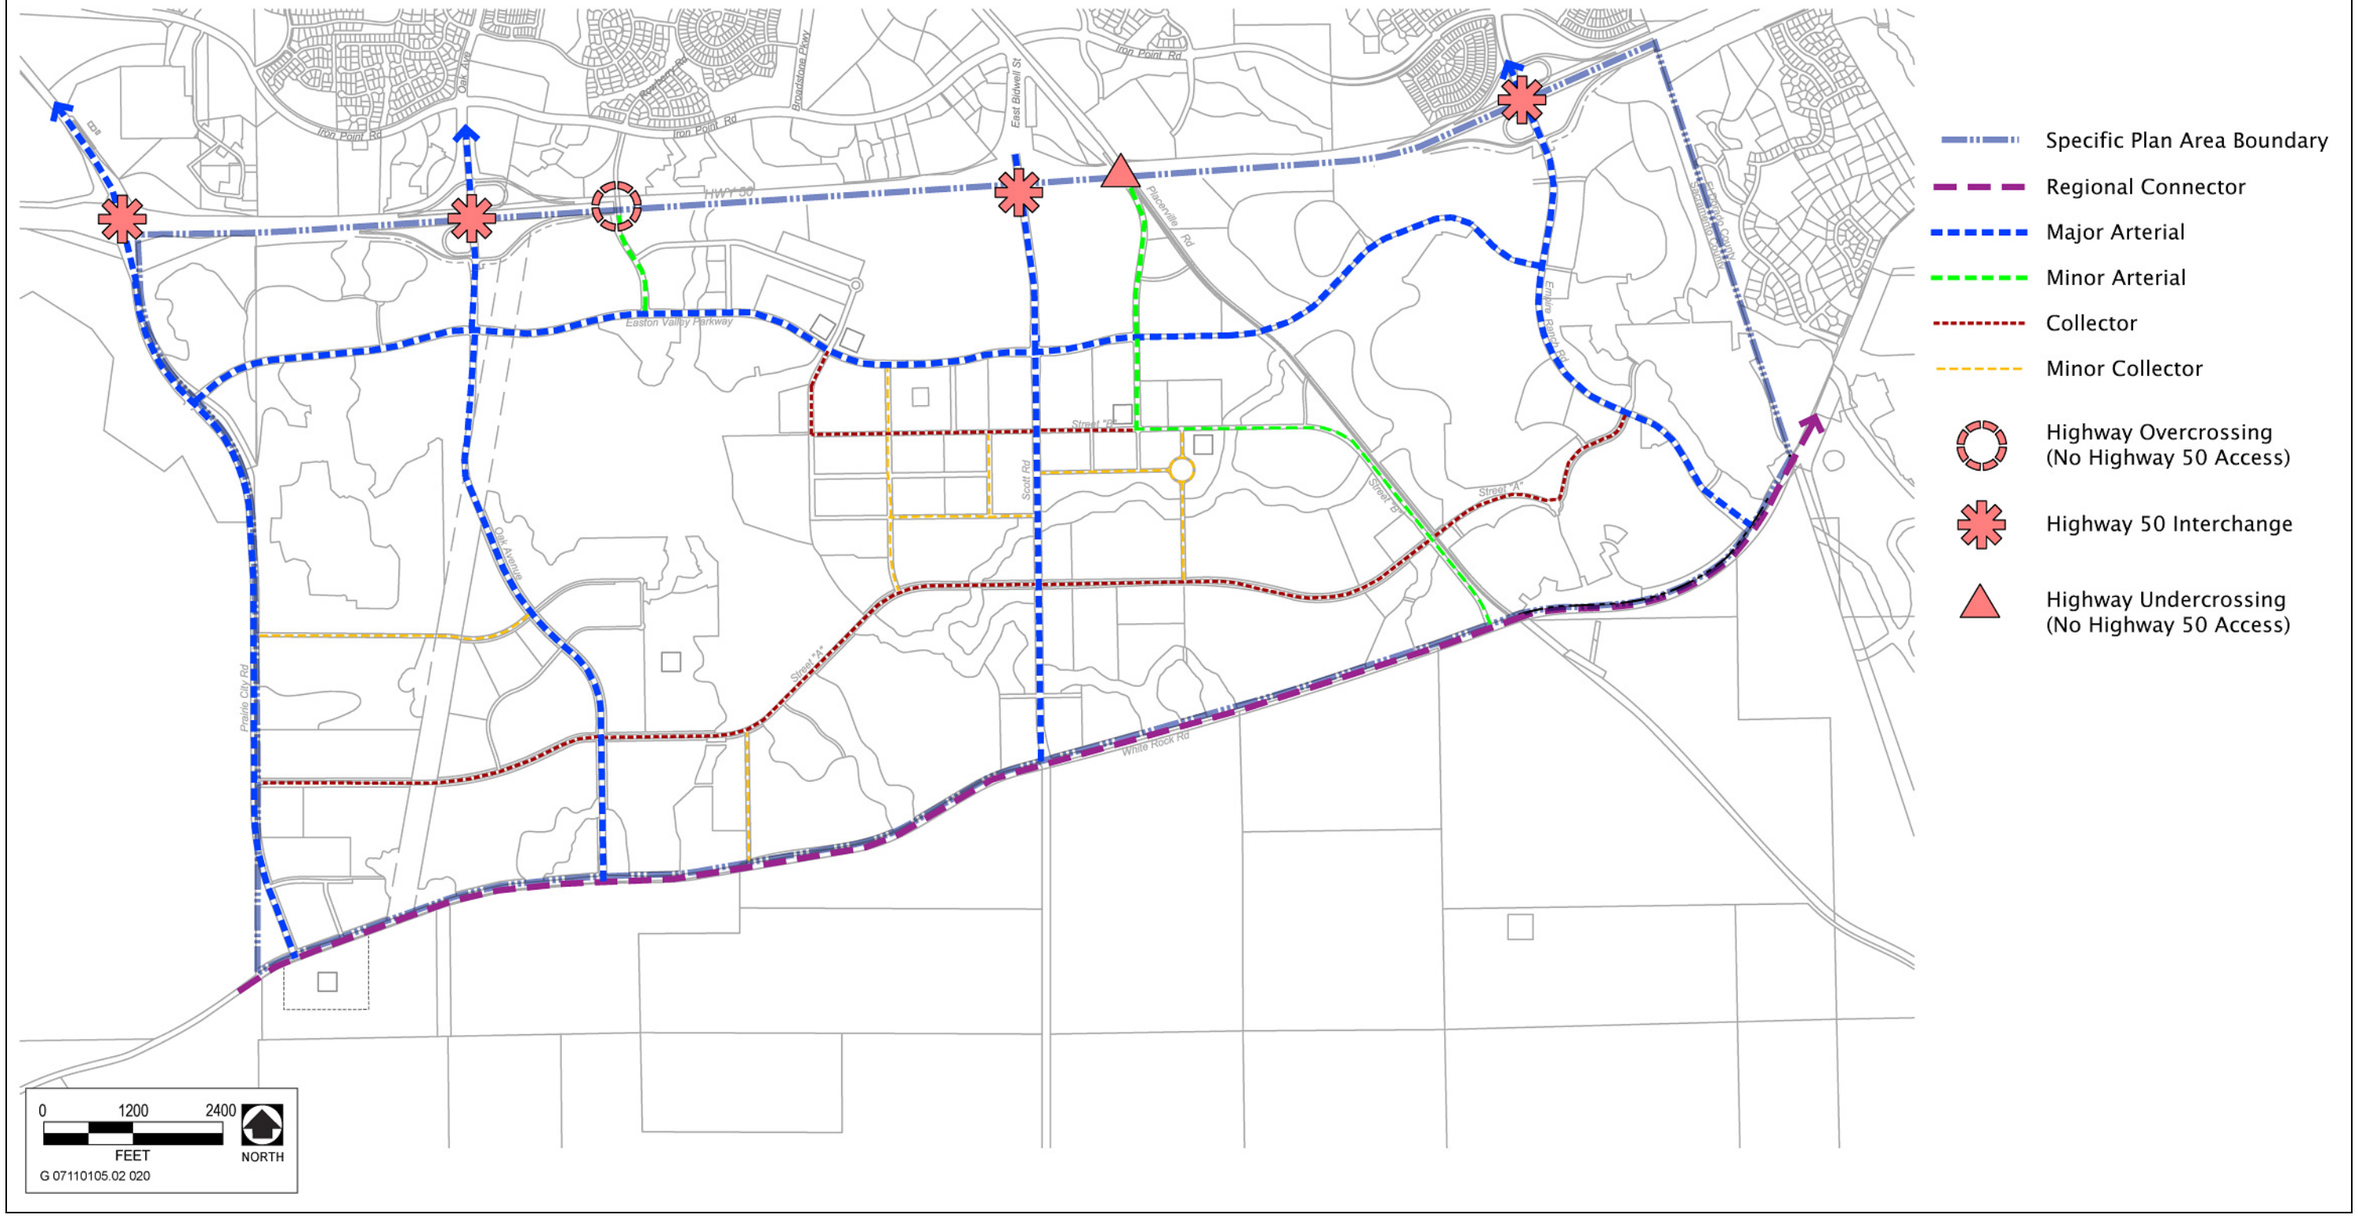
- Street A would connect Prairie City Road on the west with Empire Ranch Road on the east. Two travel lanes, with Class II bicycle lanes in both directions, six-foot-wide sidewalks on both sides of the road are proposed for Street A.

In addition to the principal roadways, a number of different types of local roadways are proposed. In the Town Center area, roads would be two-lanes with either parallel or angle parking on both sides and 10-foot-wide sidewalks. Alleys in the Town Center would be 20 feet wide, with no parking permitted.

In residential areas, entry roads would include two travel lanes, Class II bicycle lanes in both directions, and 5-foot-wide sidewalks. Internal roadways would have two travel lanes, with 5-foot-wide parking lanes on both sides, and five foot sidewalks on both sides. In hillside neighborhoods, local streets would have two travel lanes, with no parking or sidewalks. One-way roads with one travel lane and a parking lane and sidewalk on one side may be permitted in hillside neighborhoods.

In addition to on-site transportation improvements, the project applicant(s) would be required to pay their fair share of various regional and local roadway improvements, which are discussed in Chapter 3A.15, “Traffic and Transportation – Land.”

As shown in Exhibit 2-10, the Proposed Project Alternative would include the development of bicycle and pedestrian trails within the SPA. In addition to sidewalks and recreational trails in the open space areas, Class I paved off-street bike paths would be provided along White Rock Road, and 5-foot-wide Class II bicycle lanes would be provided on major roadways as described above. 12-foot-wide multi-use trails would be provided along portions of several roadways, including Easton Valley Parkway, Prairie City Road, Oak Avenue, and Street A.



Source: RRM Design Group 2008

Conceptual Circulation Diagram **Exhibit 2-9**

The Proposed Project Alternative would also include a proposed "transit corridor," which would connect with proposed Bus Rapid Transit (BRT) service to the west of the SPA along Easton Valley Parkway. As shown on Exhibit 2-10, the proposed transit corridor would extend from the western project boundary along Easton Valley Parkway, turning south on Placerville Road, and then turning east and south onto Street B, terminating at White Rock Road. Proposed roadways along this transit corridor would include 38-foot-wide medians to permit later addition of dedicated bus lanes.

OFF-SITE "LAND" IMPROVEMENTS

Several off-site land development improvements (in addition to the off-site water facilities discussed in Sections 2.10 through 2.12 of this chapter) would be necessary to serve development in the SPA under the Proposed Project. These improvements would include:

- a sewer pipeline connection extending from the SPA to an existing SRCSD pump station on Iron Point Road;
- improvements to the existing interchange at U.S. 50 and Prairie City Road (improvements for traffic from the south only);
- a new interchange at U.S. 50 and Oak Avenue (Proposed Project includes improvements for traffic from the south only);
- a new overcrossing of U.S. 50 at Rowberry Drive;
- improvements to the existing interchange at U.S. 50 and Scott Road/East Bidwell Street (improvements for traffic from the south only);
- a new interchange at U.S. 50 and Empire Ranch Road (improvements for traffic from the south only); and
- Construction of a detention basin on the west side of Prairie City Road.

Exhibit 2-11 illustrates the locations of proposed off-site land development improvements associated with development of the SPA. Analysis of these improvements is addressed under "On-site and Off-site Elements" in the impact discussions contained within the 3A "Land" sections of Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures" of this EIR/EIS.

PROJECT PHASING

As discussed above in Section 1.2, both LAFCo Resolution 1196 and the City's Measure W require the SPA project applicants to develop phasing plans for certain improvements. In conjunction with their development of those plans, the SPA project applicants have developed an estimate of a schedule on which units within the SPA would be developed. This estimated schedule has five increments of units is discussed in the Public Facilities Financing Plan and the enclosed water supply assessment. While that schedule is currently the project applicants' best estimate of the pace of development within the SPA, that schedule is subject to change depending on market conditions and individual applicants' preferences for how to develop their respective properties.

This estimated schedule of development, however, does not indicate where specific units will be developed geographically at specific times. As Exhibit 2-12 illustrates, the SPA project applicants have developed a generalized geographic depiction of four phases of construction (north, east, south and west). At the time of writing of this EIR/EIS, however, information on the order in which development of these geographic phases of SPA would occur was not available. It therefore would be speculative for this EIR/EIS to analyze development of any particular phase of the SPA as occurring before or separate from any other particular phase.

2.3.2 No Project Alternative

Under this alternative, the project as a whole would not be developed or implemented—meaning that none of the development proposed for the SPA would be constructed, and no off-site water facilities would be constructed. However, the No Project Alternative assumes that existing land uses in the SPA would continue, including 80-acre agricultural development as permitted under the adopted Sacramento County General Plan designations and zoning, which would permit the construction of up to 44 individual rural residences on 80-acre parcels zoned for agricultural use. This analysis uses existing site conditions at the time that the NOP was published (September 2008) as the "existing conditions" portion of the "no project" scenario (see State CEQA

Guidelines Section 15126.6[e][2]) to allow consideration of a full range of alternatives. Remediation of contaminated soil and groundwater on the Aerojet General Corporation parcel along the western property boundary is a separate action that will continue either with or without project implementation.

Under the No Project Alternative, the SPA would not be annexed into the City of Folsom. Instead, it would remain within and under the jurisdiction of, Sacramento County. Although Chapter 3.0, "Affected Environment, Environmental Consequences, and Mitigation Measures," discusses the impacts related to the No Project Alternative, it is not appropriate in this EIR/EIS to propose mitigation measures for the No Project Alternative, because the City of Folsom has no authority or jurisdiction over any actions which would occur in the SPA under this alternative. In addition, this alternative would result in no impacts to wetlands or other waters of the U.S. (as compared to a total of 39.5 acres filled for the "Land" portion of the project and 6.8 acres filled for the "Water" portion of the project for a grand total of 46.3 acres filled by the project as a whole). Because no impacts would occur, the USACE would have no authority over any actions that would occur in the SPA under this alternative.

Although the Sacramento County General Plan contains goals and policies intended to protect many sensitive resources, such as cultural and biological resources, most of those goals and policies do not apply to land that is zoned and designated for agricultural use, because continued agricultural activities and agricultural land is a valuable resource in and of itself that is encouraged and protected by Sacramento County. The goal of Sacramento County's Agricultural Element as stated in its General Plan is to "maintain the County's agricultural lands, and (their) agricultural productivity…" and "disruption of one resource value for another is an historic pattern of land development in the County," which the County is now trying to avoid. As further discussed in the Sacramento County General Plan, the County recognizes that while all resources are valuable, it is not always possible to achieve a balance between protecting agricultural land owners' right to farm, and protecting other sensitive resources. The analysis of the No Project/No Action Alternative in this EIR/EIS assumes that "normal agricultural activities" would continue in the SPA; based on the soil types in the SPA, those activities would consist of dryland farming (i.e., livestock grazing), which is consistent with the historic use of the SPA over the last 100 years.

Consistent with CEQA requirements, this No Project Alternative is evaluated in this EIR/EIS. The No Project Alternative would not meet the CEQA project purpose, need, or objectives of the proposed Folsom South of Highway 50 Specific Plan project as described in Chapter 1, "Introduction and Statement of Purpose and Need."

2.3.3 No USACE Permit Alternative

This alternative was designed to avoid the placement of dredged or fill material into waters of the U.S. (including wetlands) from both the "Land" and "Water" portions of the project, thus eliminating the need for a USACE Section 404 CWA permit. As a result, there would be no fill of waters of the U.S. under this alternative, compared to 46.3 combined acres of fill under the total Proposed Project (i.e., including both land development and off-site water facilities). This alternative, however, would likely still require that the applicants consult with the USFWS and the National Marine Fisheries Service (NMFS) to ensure compliance with Section 9 of the ESA. A conceptual land use map showing development areas and jurisdictional wetlands

Conceptual Project Phasing Plan **Exhibit 2-12**

with a 50-foot-wide avoidance buffer in the SPA is provided in Exhibit 2-13. Proposed backbone infrastructure improvements in this alternative are illustrated in Exhibit 2-14. Under this alternative, 1,506.1 acres of the SPA would be designated as open space, compared to 1,057 acres under the Proposed Project Alternative. This alternative also would require more expensive/time-consuming, methods of construction for roadways and utilities. Under this alternative, approximately 3,837 fewer residential housing units would be constructed, and approximately 131 fewer acres would be used for commercial/industrial development, than under the Proposed Project Alternative. The acreage proposed for park use is reduced to 84.8 acres in this alternative. Tables 2-4 and 2-5 list the total estimated residential, commercial, and industrial development under this alternative. The off-site water facilities in this alternative would avoid fill of waters of the U.S. by using horizontal directional drilling (i.e., jack-and-bore) construction methods along the pipeline alignment and by siting the water treatment plant in a location that would avoid fill of waters of the U.S.

Table 2-4
Summary Comparison of Residential Development under the No USACE Permit Alternative and the Proposed Project Alternative

2.3.4 RESOURCE IMPACT MINIMIZATION ALTERNATIVE

This alternative would include additional areas of high-quality biological habitat in the proposed preserve area, and would also preserve all of the on-site cultural resources that would be eligible for listing on the California Register of Historical Resources/National Register of Historic Places. Exhibit 2-15 illustrates the conceptual land use plan for the Resource Impact Minimization Alternative, and Exhibit 2-16 illustrates proposed backbone

infrastructure improvements. A summary comparison of the long-term environmental benefits to be gained, or adverse impacts to be avoided, among all alternatives is provided at the end of this chapter; detailed comparisons are provided within each section of Chapter 3, "Affected Environment, Environmental Consequences, and Mitigation Measures."

Under the Resource Impact Minimization Alternative, project components would be reconfigured to avoid many of the impacts on waters of the U.S., including wetlands and high-quality biological habitat, and the level of residential development would be decreased to reduce the amount of project-generated traffic, air quality emissions, and noise. A permit for wetland fill would still be required under this alternative; 26.47 acres of waters of the U.S. would be filled, 13.03 fewer acres than would be filled by the Proposed Project Alternative. An additional 375 acres of land across the SPA would be designated as open space.

A total of 1,429 acres, approximately 40% of the SPA, would become a protected wetland preserve. Areas of the SPA with higher concentrations of cultural resources, including areas on the northwestern portion of the SPA would also remain in open space in this alternative. The total acreage of residential development would be reduced by approximately 205 acres and approximately 2,245 fewer residential units would be constructed. Overall density would decrease (average density across the residentially designated area would be approximately 6 du/ac, compared to 6.65 du/ac under the Proposed Project Alternative). Commercial and industrial development sites would be reduced by approximately 113 acres. Development of park land would be reduced to 105.7 acres. The types of land uses and general on- and off-site infrastructure improvements would remain the same as under the Proposed Project Alternative. Tables 2-6 and 2-7 list the total estimated residential, commercial, and industrial development under this alternative.

Table 2-6
Summary Comparison of Residential Development under the Resource Impact Minimization Alternative and the Proposed Project Alternative

2.3.5 CENTRALIZED DEVELOPMENT ALTERNATIVE

This alternative would preserve approximately 75% of the eastern part of the SPA, which lies within the Sierra Nevada foothills, in its current undeveloped state. Commercial development would still occur along the south side of U.S. 50 within the foothills. It would also entail about 1,000 fewer equivalent dwelling units (EDUs) than the Proposed Project Alternative. This alternative was developed to reduce potential impacts to biological, cultural, and visual resources. Exhibit 2-17 illustrates the conceptual land use plan for the Centralized Development Alternative, and Exhibit 2-18 illustrates proposed backbone infrastructure improvements. This alternative would fill 37.06 acres of waters of the U.S., 2.48 acres fewer than would be filled under the Proposed Project Alternative.

The Centralized Development Alternative envisions a higher density of residential development on a smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. The total acreage of residential development would be reduced by approximately 387 acres, but total number of residential units would be reduced by only 1,186, resulting in a higher overall density per acre (7.85 du/ac in the Centralized Development Alternative compared to 6.65 du/ac in the Proposed Project Alternative). The acreage of commercial and industrial development would be similar in this alternative compared to the Proposed Project Alternative. The acreage proposed for park use is reduced to 118.7 acres in this alternative, including local parks which are included in acreage totals for residential and mixed-use designations. The types of land uses and general on- and off-site infrastructure improvements under the Centralized Development Alternative would remain the same as under the Proposed Project Alternative. A 1,464.4-acre area would be dedicated to open space (approximately 407 acres more than under the Proposed Action Alternative) is also designated under the Centralized Development Alternative. Tables 2-8 and 2-9 list the total estimated development under this alternative.

Table 2-8
Summary Comparison of Residential Development under the Centralized Development Alternative and the Proposed Project Alternative

Land Use Type	Centralized Development Alternative			Proposed Project Alternative		
	Acres	du/ac[1]	Units	Acres	du/ac[1]	Units

Multi-Family High Density	30.5	25	764	49.9	25	1,251
Mixed Use	36.1	12	433	59.1	12	681
Total	**1,149.4**		**9,026**	**1,536.3**		**10,210**

Note:
[1] du/ac = dwelling units per acre
Source: MacKay & Somps 2008

2.3.6 REDUCED HILLSIDE DEVELOPMENT ALTERNATIVE

This alternative would reduce the developed area on the eastern portion of the SPA, which lies within the Sierra Nevada foothills, leaving more of this area in its current undeveloped state for aesthetic, biological, and cultural resource purposes. It would also entail about 1,343 additional EDUs compared to the Proposed Project Alternative, with a much higher density of development within the central portion of the SPA, thus reducing potential impacts related to traffic and air quality. Exhibit 2-19 illustrates the proposed land use plan for the Reduced Hillside Development Alternative, and proposed backbone infrastructure improvements are illustrated

Table 2-9 Summary Comparison of Commercial and Industrial Development under the Centralized Development Alternative and the Proposed Project Alternative		
Land Use Type	Centralized Development Alternative Acres	Proposed Project Alternative Acres
Office Park	112.8	89.2
Community Commercial	15.4	38.9
General Commercial	186.6	213.1
Regional Commercial	133.6	110.8
Total	**448.4**	**452**
Source: MacKay & Somps 2008		

in Exhibit 2-20. The Reduced Hillside Development Alternative would fill 42.69 acres of waters of the U.S., 3.19 acres more than would be filled under the Proposed Project Alternative.

Although low density on a particular property may reduce the levels of impacts occurring on or emanating from the property, low densities can be considered an inefficient use of finite land resources. In areas with growing populations, low-density development coupled with increasing market demand can result in development being pushed outward toward other areas on the urban periphery, with the long-term consequence of more overall loss of habitat, open space, and farmland. In this alternative, the land use mix includes more residential areas at higher densities, and relatively less low-density single-family residential development. Although these higher densities may result in greater localized impacts on resources, the overall area of disturbance is reduced by concentrating development in particular locations. Sacramento County has experienced demographic pressure reflecting an increasing statewide population and intrastate migration from the San Francisco Bay Area and southern California, and the City is interested in furthering its goals and objectives of providing a mix of affordable housing and new jobs to its residents; therefore, developing the site with a higher density, centralized land use pattern would focus market demand for development into an area near existing development, infrastructure, and services while increasing the amount of land which remains as open space. Traffic modeling also shows that higher density development results in a reduction in vehicle miles traveled and associated greenhouse gas emissions.

The Reduced Hillside Development Alternative envisions a greater density of residential development on a slightly smaller footprint compared to the Proposed Project Alternative, resulting in more dwelling units per acre. The total acreage of residential development would be reduced by approximately 64 acres, but the density would be increased such that approximately 1,343 additional residential units would be constructed. The acreage of commercial and industrial development would be increased by less than 20 acres. The acreage proposed for park use (including local parks which are included in acreage totals for residential and mixed-use designations) is increased to 170.9 acres in this alternative. The types of land uses and general on- and off-site infrastructure improvements under the Reduced Hillside Development Alternative would remain the same as under the Proposed Project Alternative. A 1,057-acre area would be dedicated to open space (the same size as under the Proposed Project Alternative) is also designated under the Reduced Hillside Development Alternative. Tables 2-10 and 2-11 list the total estimated development under this alternative.

This alternative would include policies to reduce water use, including indoor water use and reduced-water landscapes. The other “Land” alternatives already assume water use reductions near the state of the art. The additional water conservation policies in this alternative are feasible because the increased number of units in this alternative generate more funding and fees for water conservation improvements. Fewer landscaped areas would be irrigated, and more native plantings and low-water demand plantings (including natural non-irrigated groundcover) would be used. A 50% reduction in irrigated landscape area would be required compared to the Proposed Project.

2.3.7 "LAND" ALTERNATIVES CONSIDERED AND ELIMINATED FROM FURTHER CONSIDERATION

Alternatives which were considered and eliminated from further consideration in this EIR/EIS for detailed review include alternatives rejected as part of the Section 404(b)(1) alternatives information (attached to this EIR/EIS in Appendix L) and an off-site alternative.

The Section 404(b)(1) on-site alternatives information includes six additional on-site alternatives. These alternatives are all based on the Proposed Project Alternative, with each of the six alternatives adding additional areas of avoidance of waters of the U.S., including wetlands. The Additional Avoidance Alternative includes all of the proposed additional avoidance areas; the remaining alternatives each include a smaller portion of the proposed additional avoidance areas from the Additional Avoidance Alternative. Section 404(b)(1) alternatives which were considered but not carried forward for further analysis in this EIR/EIS are described in greater detail below.

ADDITIONAL AVOIDANCE ALTERNATIVE

The Additional Avoidance Alternative would include the following additional areas where waters of the U.S., including wetlands, would be avoided:

- an intermittent drainage in the southwest portion of the SPA, in Community Commercial, Multi-Family Low Density, and Single Family High Density areas between the existing electrical transmission line easement and Prairie City Road;

- an intermittent drainage and seasonal swale on the north-central portion of the SPA, in Regional Commercial, General Commercial, and Single Family High Density areas on both sides of Scott Road at Easton Valley Parkway;

- an artificial-made ditch on the western portion of the SPA, in a Single Family area south of Easton Valley Parkway and west of the electrical transmission line easement; and

- an intermittent drainage in an Open Space area near the northeast corner of the SPA.

Implementation of the Additional Avoidance Alternative would reduce the acreage of impacted waters of the U.S., including wetlands, by 4.26 acres. However, this alternative would also remove the frontage for the Regional Commercial parcel along both Scott Road and Easton Valley Parkway. The loss of street frontage and the changes to the shape of the parcel would render the primary retail component of the project infeasible. Without a feasible regional commercial project component, this alternative would not meet Objective 7 (provide neighborhood- and regional-serving retail areas within the SPA) and potentially would not meet Objective 11 (generate positive fiscal impacts for the City through development within the SPA).

Implementation of this alternative would require construction of additional bridges, parking garages and utilization horizontal directional drilling methods, which would substantially increase costs of this alternative. In addition, this alternative would remove the frontage for the Regional Commercial parcel along both Scott Road and Easton Valley Parkway. The loss of street frontage and the changes to the shape of the parcel due to a wide wetland corridor would reduce the development by 26.6 acres. The proposed Regional Commercial site was designed in coordination with Regional Mall developers to determine the most efficient dimensions and site configuration for development. The applicants have provided evidence from several regional mall developers that construction of the wetland corridor would make development of a regional mall infeasible. Without a feasible regional commercial project component, this alternative would not meet Objective 7 (provide neighborhood- and regional-serving retail areas within the SPA) and potentially would not meet Objective 11 (generate positive fiscal impacts for the City through development within the SPA).

Because development of this alternative would not be reasonable or practicable due to costs and logistics, this alternative was rejected from consideration under NEPA ((please refer to Appendix L, which contains the Section 404(b)(1) Alternatives Information, for a more detailed description of the practicality of this alternative)

CARPENTER RANCH AVOIDANCE ALTERNATIVE

The Carpenter Ranch Avoidance Alternative would include the following additional area where wetlands would be avoided:

- an intermittent drainage and seasonal swale on the north-central portion of the SPA, in Regional Commercial, General Commercial, and Single Family High Density areas on both sides of Scott Road at Easton Valley Parkway.

Implementation of the Carpenter Ranch Avoidance Alternative would reduce the acreage of impacted wetlands and waters by 2.88 acres. In addition, implementation of this alternative would result in similar cost and logistic constraints as the Additional Avoidance Alternative, as described above. Without a feasible regional commercial project component, this alternative would not meet Objective 7 (provide neighborhood- and regional-serving retail areas within the SPA) and potentially would not meet Objective 11 (generate positive fiscal impacts for the City through development within the SPA).

Because development of this alternative would not be reasonable or practicable due to costs and logistics, this alternative was rejected from consideration under NEPA ((please refer to Appendix L, which contains the Section 404(b)(1) Alternatives Information, for a more detailed description of the practicality of this alternative). It was eliminated from further detailed study under CEQA because it would not achieve the key CEQA project objectives (listed in Chapter 1, "Introduction and Statement of Purpose and Need").

REGIONAL COMMERCIAL AVOIDANCE ALTERNATIVE

The Regional Commercial Avoidance Alternative would include the following additional area where wetlands would be avoided:

- a seasonal swale on the north-central portion of the SPA, in Regional Commercial and Single Family High Density areas on both sides of Scott Road at Easton Valley Parkway.

Implementation of the Regional Commercial Avoidance Alternative would reduce the acreage of impacted wetlands and waters by 2.50 acres. In addition, implementation of this alternative would result in similar cost and logistic constraints as the Additional Avoidance Alternative, as described above. Without a feasible regional commercial project component, this alternative would not meet Objective 7 (provide neighborhood- and regional-serving retail areas within the SPA) and potentially would not meet Objective 11 (generate positive fiscal impacts for the City through development within the SPA).

Because development of this alternative would not be reasonable or practicable due to costs and logistics, this alternative was rejected from consideration under NEPA ((please refer to Appendix L, which contains the Section 404(b)(1) Alternatives Information, for a more detailed description of the practicality of this alternative). It was eliminated from further detailed study under CEQA because it would not achieve the key CEQA project objectives (listed in Chapter 1, "Introduction and Statement of Purpose and Need").

WESTERN RESIDENTIAL AVOIDANCE ALTERNATIVE

The Western Residential Avoidance Alternative would include the following additional area where wetlands would be avoided:

- an artificial-made ditch on the western portion of the SPA, in a Single Family area south of Easton Valley Parkway and west of the electrical transmission line easement.

Implementation of the Western Residential Avoidance Alternative would reduce the acreage of impacted wetlands and waters by 0.31 acres, and reduce the developable area by 14.3 acres. Due to the hilly terrain of the site, implementation of this alternative would result in the creation of an isolated portion of the development which would require the construction of a sanitary sewer pump station and force main. Construction of a pump station would increase costs and would increase potential environmental impacts that may result from a pump system failure. This alternative would require the construction of an additional street access to allow for a connection to Oak Aveny Parkway, as at least two points of access to a development area for emergency vehicle and evacuation routes are required by City Ordinance. Construction of this additional street would impact the open space area and result in the removal of oak woodland habitat. In addition, under this alternative, the construction of homes surrounded by a preserve area would result in adverse impacts to the preserved waters, reducing and potentially eliminating the functions of the surrounding waters.

Because implementation of this project would result in additional impacts to sensitive oak woodland habitat while only preserving 0.311 acres of man-made ditch and intermittent stream which would still be indirectly impacted, this alternative was, rejected from consideration under NEPA ((please refer to Appendix L, which contains the Section 404(b)(1) Alternatives Information, for a more detailed description of the practicality of this alternative).

It was eliminated from further detailed study under CEQA because it would not achieve the key CEQA project objectives (listed in Chapter 1, "Introduction and Statement of Purpose and Need").

OFF-SITE "LAND" ALTERNATIVES

Off-site alternatives are usually considered in environmental documents when one of the means to avoid or eliminate the significant impacts of a project is to develop it in a different available location. To be considered feasible by the City, development on potential off-site locations must be able to fulfill the project purpose and attain most of the basic objectives of the Folsom South of U.S. Highway 50 project. To satisfy the project applicant(s)' and the City's project objectives under CEQA, a large undeveloped site within the City of Folsom, or within the City's sphere of influence, would be needed. To satisfy USACE's project purpose under NEPA, a large undeveloped site elsewhere in eastern Sacramento County would be needed that could be reasonably obtained, used, or expanded.

Policy LU 81 of the Sacramento County General Plan provides very limited conditions under which the County can expand the Urban Service Boundary (USB), which would be necessary if the Proposed Project Alternative were constructed in an off-site location anywhere other than on lands south of Jackson Highway/State Route 16 or west of Grant Line Road. When considering such a proposal, the County must make several findings, including a finding that there is insufficient land within the USB to accommodate the project's 20-year demand for urban uses. If all of the criteria are not met, the County Board of Supervisors must approve moving the USB by a 4/5 vote. Since enactment of this policy in 1993, the board has never approved an application for any project of even a moderate size outside the USB.

The identification of off-site alternative land development locations was limited to those locations that could satisfy certain criteria. First, as discussed above, the geographic area for off-site alternatives was limited to areas within the Sacramento County USB. In addition to the policy reasons discussed above, the USB was chosen as an appropriate geographic boundary because locating the project outside of the existing USB would require massive expansion of infrastructure that is not currently planned.

Next, proximity of off-site alternatives to major transportation corridors was a consideration of site selection. This criterion was established to implement key project needs and objectives, including a large retail center. A location along a major arterial, preferably adjacent to a freeway, is preferable for a retail project of this size; however, suitable available sites meeting this criterion were not identified because no undeveloped, uncommitted sites are currently available that meet this criterion. However, other off-site locations not meeting this criterion have been identified, although not preferable.

Areas encompassing a size similar to the proposed development footprint of the SPA (2,500 acres) were considered preferable to provide similar residential and commercial use capacities. Although the SPA is approximately 3,500 acres, approximately 1,050 acres would be set aside as open space and therefore project development would occur on approximately 2,450 acres. However, to satisfy the NEPA objectives, smaller sites in eastern Sacramento County were considered as long as they were deemed appropriate to accommodate a "large-scale" mixed-use development including both residential and commercial components. Although smaller sites (as small as 1,500 acres) were considered, these sites would not be preferred because they would not accommodate the same volume and density of residential and commercial uses as the proposed development footprint. Furthermore, while these smaller sites might meet the USACE's NEPA purpose and need, they would not meet the City of Folsom's CEQA purpose and need.

The primary obstacle in identifying an off-site land development alternative that otherwise satisfies the primary criteria discussed above is aggregating enough parcels to create a project of an adequate size. It is infeasible to aggregate numerous small parcels to create a project of sufficient size and of a contiguous nature. Furthermore, all of the undeveloped parcels within the City of Folsom combined do not amount to more than 100 acres of developable land. Therefore, the only available uncommitted land that is of sufficient size to accommodate the

proposed development is located outside of the City of Folsom's current boundaries or sphere of influence and, therefore does not meet the City's project objectives. Identifying parcels in eastern Sacramento County would be logistically challenging for the City of Folsom because those parcels would be outside of the City's Sphere of Influence area.

The majority of undeveloped land in eastern Sacramento County and within the USB is within the City of Rancho Cordova and unincorporated portions of Sacramento County east of Grant line Road. Several large, undeveloped tracts of land were identified in these areas but were ultimately eliminated as potential off-site alternative locations because they are currently undergoing project-level planning for separate projects (e.g., Sunrise Douglas Community Plan area, Mather Field Redevelopment, Easton Planning Area, SunCreek Specific Plan area). These projects include Arboretum, Cordova Hills, Excelsior Estates, Glenborough at Easton and Easton Place, Mather East and Mather Field, Rio del Oro, the Ranch at Sunridge, and Vineyard Springs, all of which currently have (or will soon have [i.e., reasonably foreseeable] development applications filed with the applicable jurisdiction. A complete list of the projects planned on the undeveloped parcels initially identified as potential off-site alternative land development locations, as well as their existing acreage of waters of the U.S., is provided in Table 4-5, page 4-32 of Chapter 4, "Other Statutory Requirements" as part of the cumulative impacts discussion for biological resources. The locations of these planned projects are shown in Exhibit 2-21.

The Folsom South of U.S. 50 Specific Plan SPA represents the only available major undeveloped land area in Folsom's sphere of influence that is capable of providing substantial job opportunities and a mix of uses, and that would fulfill the project applicant(s)' and the City's project purpose and attain most of the basic project objectives. The majority of undeveloped land in the project vicinity is currently undergoing project-level planning for separate projects (e.g., Sunrise Douglas Community Plan area, Mather Field Redevelopment, Easton Planning Area, SunCreek Specific Plan area). These areas are not available to accommodate the project because they are committed to future development, are outside the City's jurisdictional boundaries, and thus unavailable to the City of Folsom. However, there is one area within the USB in eastern Sacramento County that could potentially meet the project's purpose under NEPA, but would not meet the City project purpose because it would be located outside of the City's jurisdictional boundaries. However, because this site may meet the USACE defined purpose and need, it was further evaluated to determine if the site is practicable for development, would impact fewer acres of waters of the U.S. than the Proposed Project, and if it is available.

Qualitative Impact Assessment of Off-site Land Development Alternative

For biological resources, the screening analysis of the off-site location was based on:

- searches of the California Native Plant Society's (CNPS's) electronic database and the California Natural Diversity Database (CNDDB),
- review and interpretation of aerial photographs of the sites,
- AECOM biologists' knowledge of biological resources occurring in the vicinity of the SPA, and
- review of relevant literature.

Exhibit 2-22 shows the location of natural communities at the off-site alternative location. Habitats were initially mapped on aerial photographs at a scale of 1 inch = 400 feet, then digitized and quantified using ArcGIS. Table 2-12 shows the approximate acreage of natural communities present at the off-site alternative location.

Location of Planned Projects Related to Biological Resources **Exhibit 2-21**

Table 2-12
Natural Community Types at the Off-Site Land Development Alternative

Community Type	Acreage[1]
Vernal pool grassland[2]	2,379.1
Vernal pool complex[3]	28.0
Vernal Pool	9.1
Vernal Swales	17.3
Orchard	34.7
Disturbed	32.6
Seasonal wetland	8.1
Low density development	55.4
Cottonwood woodland	7.7
Streams/Creeks (seasonal drainages)	8.70
Pond	5.9
Total	**2,586.6**

Notes:
[1] Acreages are not exact because the numbers have been rounded to the nearest tenth of an acre.
[2] No delineation of waters of the U.S. that would enable quantification of an exact acreage of vernal pools in the study area for the off-site alternative location was conducted for this analysis. There are likely additional vernal pools and swales within this grassland area that were not visible on the aerial imagery.
[3] Vernal pool complexes are systems of interconnected vernal pools and vernal swales.
Source: Data compiled by AECOM in 2010

Summary

The off-site land development alternative location consists of 15 parcels comprising approximately 2,587 acres located southwest of the SPA and east of the City of Rancho Cordova in unincorporated Sacramento County. The site is located just west of the eastern Sacramento County USB line and Scott Road and is bounded by Grant Line Road on the west. The site is accessible via Douglas Road to Grant Line Road. No other improved roads exist on or provide access to the off-site alternative location.

The off-site alternative location is characterized primarily by vernal pool grassland habitat. All of the vernal pool grassland cover contains scattered vernal pools, or vernal pool complexes (i.e., systems of interconnected vernal pools and swales), interspersed within a grassland matrix (Exhibit 2-22). The western portion of the off-site alternative location has the highest concentration of vernal pools and swales visible on the aerial imagery. Because it is not possible to determine the full extent of vernal pools present from aerial photography alone, the information presented herein regarding vernal pools and swales is considered a rough estimate. Seasonal tributaries to Coyote Creek, Carson Creek, and Deer Creek are also present. All of the drainage channels on the site are seasonal and appear to be unvegetated. In the northwest portion of the site there is a disturbed area that was used to store mine tailings (cobble). The cobble piles have been removed from the site, but rows of cottonwood trees are still present in the basins that existed between the piles of cobble. The ground formerly occupied by cobble mine tailings is currently barren and disturbed. One pond, created from impoundment of a Coyote Creek tributary, and one pond created from impoundment of a Carson Creek tributary are also present on the site. There are four rural residential in holdings, or low density developments, on the site and some orchards near the northwest boundary.

Sensitive Natural Communities

The vernal pools and vernal swales scattered throughout the vernal pool grassland habitat, as well as the seasonal drainage channels, seasonal wetlands, ponds, streams, and cottonwood woodland would all be considered sensitive natural communities, some of which are subject to USACE jurisdiction under Section 404 of the CWA, Central Valley Regional Water Quality Board jurisdiction under the Porter-Cologne Act, and/or California Department of Fish and Game jurisdiction under Section 1602 of the California Fish and Game Code.

Special-Status Species

The off-site alternative location is situated within the Buffalo Creek Quadrangle, which was included in the database search for the Proposed Project Alternative, as were seven out of the eight surrounding quadrangles. To account for species documented in all surrounding quadrangles, AECOM biologists also conducted CNDDB and CNPS electronic database searches for the Carbondale Quadrangle. Results of the database searches were then used to compare the potential for special-status species to occur at the off-site alternative site locations with the potential for them to occur in the SPA. The results are discussed below.

Special-Status Plant Species

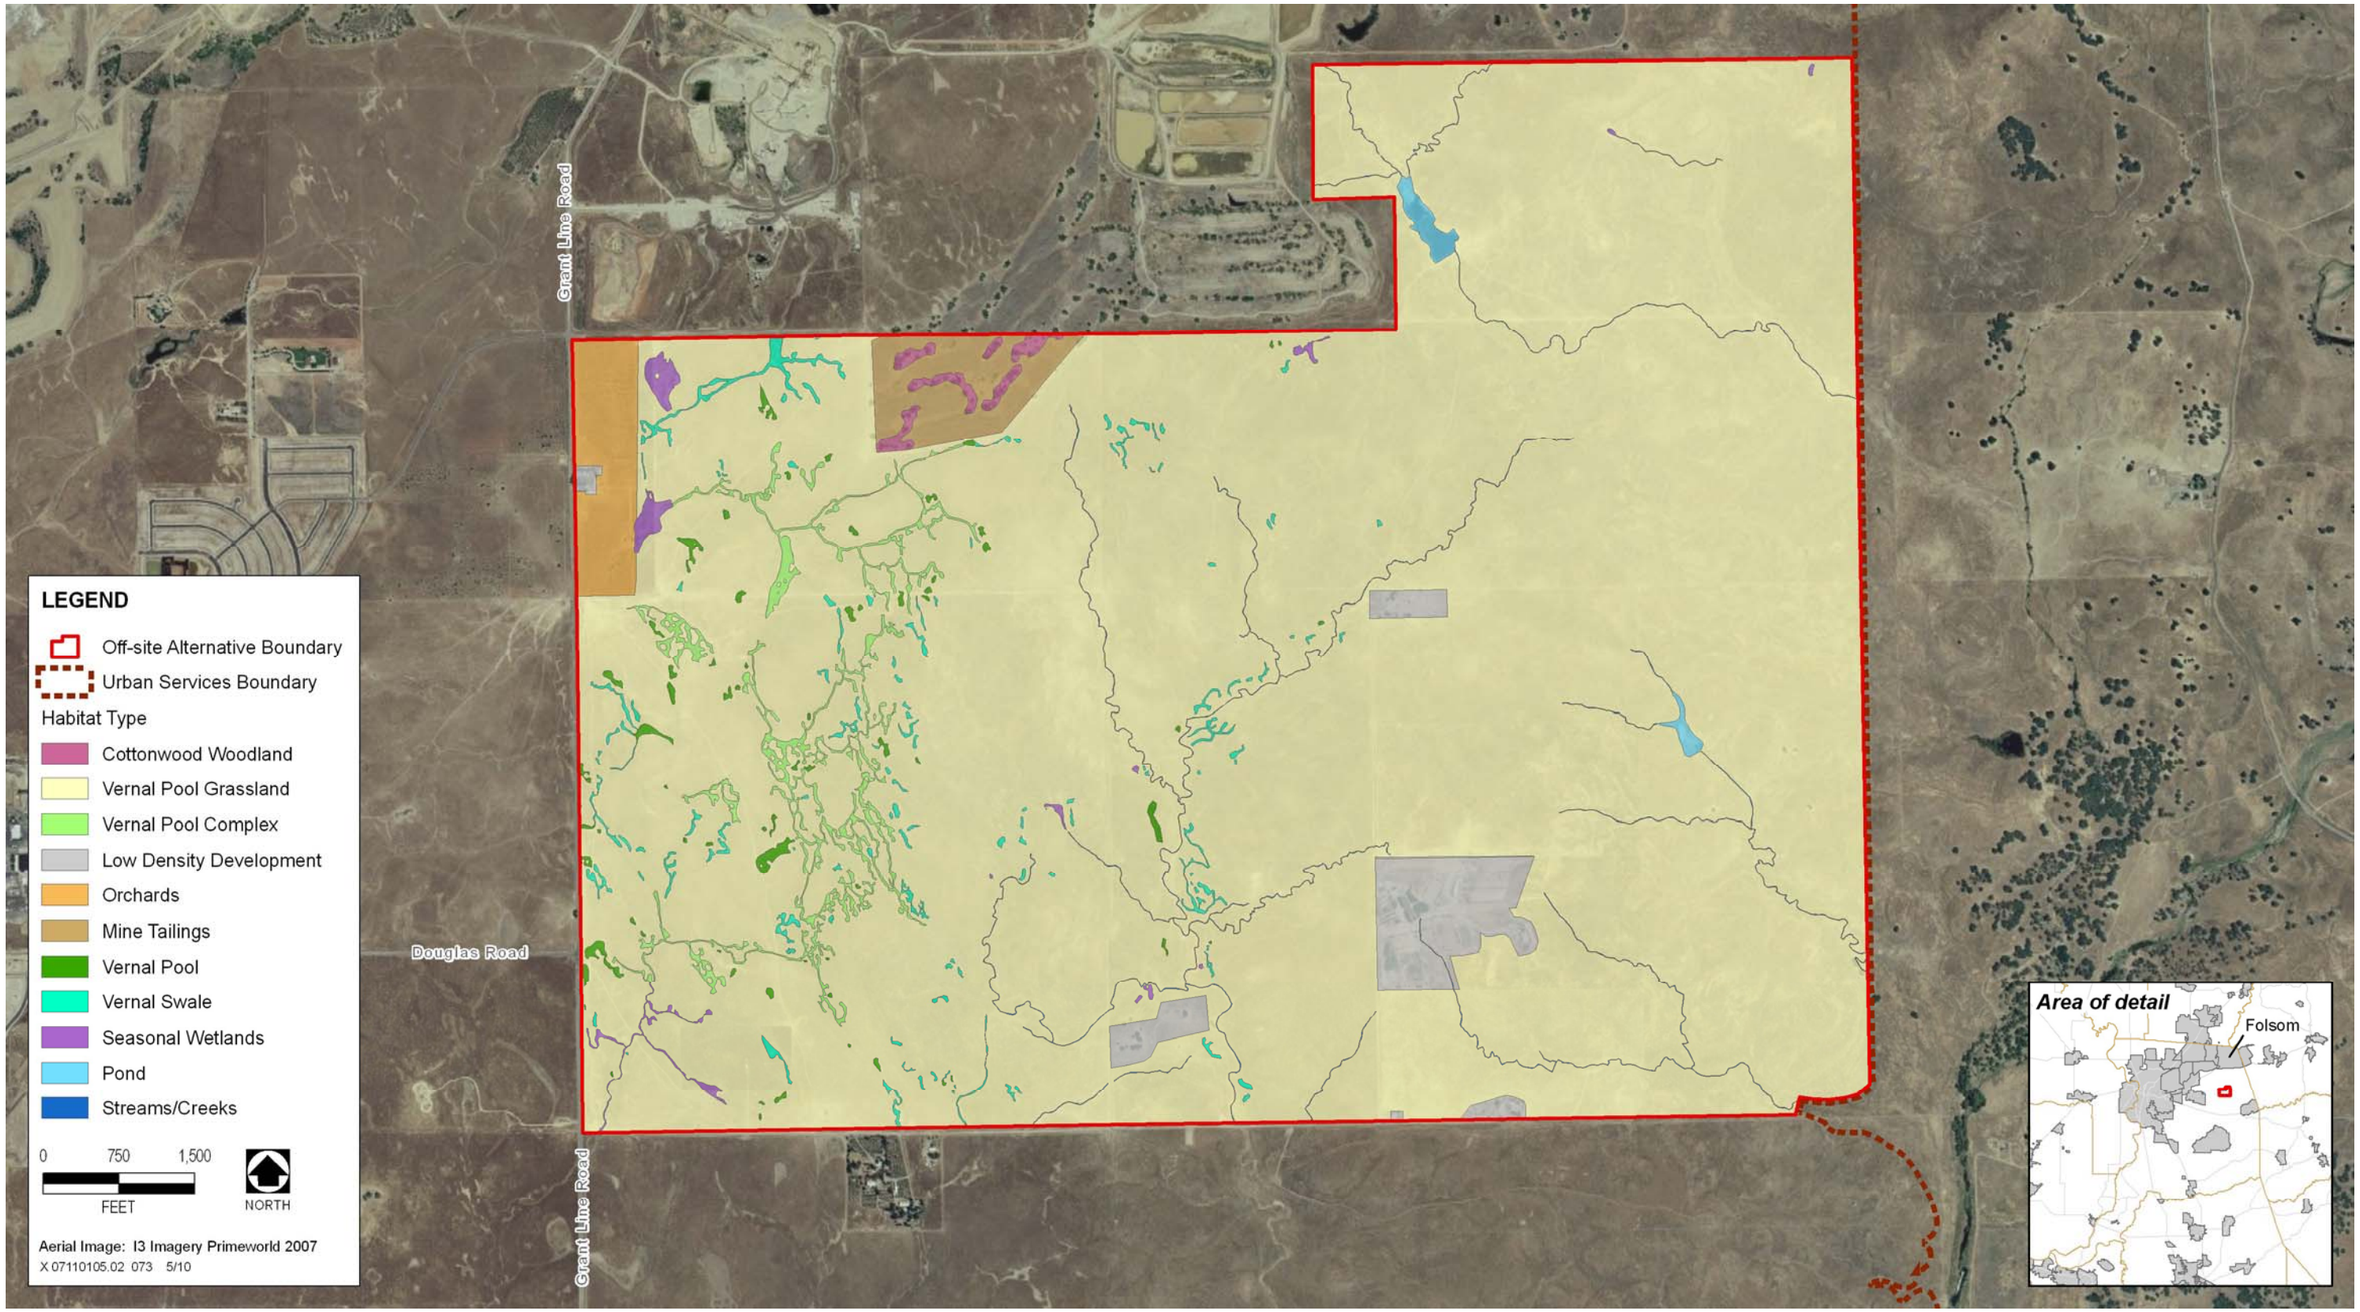
All of the same special-status plant species that are known from or have potential to occur in the SPA (see Table 3A.4-1 in Section 3A.4 “Biological Resources – Land” of this EIR/EIS) also have potential to occur on the off-site alternative location because habitat for these species is present at both locations.

Special-Status Wildlife Species

The off-site alternative location contains vernal pool grassland and could potentially support the same vernal pool invertebrates as the SPA (see Table 3A.4-2 in Section 3A.4, “Biological Resources – Land,” of this EIR/EIS). Because the analysis of the off-site location is based on interpretation of aerial photographs, it is unknown whether elderberry shrubs are present that could support valley elderberry longhorn beetle. However, elderberry shrubs could be present in the cottonwood woodland or in other stands of trees and shrubs found on the site. All of the special-status species associated with grassland and wetland habitats that are known from or have potential to occur in the SPA also could occur at the off-site alternative location because the same grassland and wetland habitat types are present. Although oak woodland and riparian habitats are not present at the off-site alternative, there are isolated and small stands of oak trees and patches of cottonwood woodland that provide potential nest sites for raptors, and burrowing owls could nest in the grassland habitat.

Impacts

Development of the off-site alternative location would be expected to result in significant adverse impacts on common and sensitive natural communities and special-status species. Species and communities affected would be similar to those affected in the SPA; however, the acreages affected by community differ and no oak woodland would be affected because it does not exist at the off-site location (see Table 2-12 and Exhibit 2-22). A total of 77.1 acres of potential waters of the U.S. were mapped on the off-site land alternative location from aerial photograph interpretation. Because vernal pools and swales and other waters of the U.S. are dispersed throughout the off-site location, it would not be possible to avoid impacts on all these aquatic resources and still meet the project purpose and need of a large-scale development similar to the Proposed Project Alternative. Therefore, it is estimated that development of a substantially similar size at the off-site location would result in direct fill of at least 75% of the wetlands and other waters of the U.S. present and indirect impacts to the remaining wetlands. Waters of the U.S. likely to be filled as a result of developing the off-site alternative location include 40.8 acres of vernal pools and swales, 6.1 acres of seasonal wetland, and 6.5 acres of seasonal drainage channels. Therefore, the low-end estimate of direct impacts on waters of the U.S. is approximately 53 acres—14 acres more than would be filled as a result of development in the SPA. Other habitats that would be removed at the off-site alternative



Source: Sacramento Area Council of Governments 2004, Sacramento County 2008, AECOM 2009

Off-site Land Development Alternative – Natural Communities

Exhibit 2-22

location include 7.7 acres of cottonwood woodland and 2,379 acres of vernal pool grassland habitat that likely includes additional vernal pools and swales that were not visible on the aerial imagery.

In addition, development at the off-site land development location of substantially similar size within the County USB would be expected to result in other environmental impacts (related to traffic, air quality, noise) similar to those of the Proposed Project Alternative. Undeveloped areas in the region are used primarily for agriculture, the region is experiencing substantial growth in traffic, and it is in nonattainment of air quality standards. Consequently, any major development in Sacramento County would be expected to generate significant agricultural, traffic, and air quality impacts, and any development that adds significant levels of traffic to regional roadways would contribute to a substantial increase in noise levels. Although the Folsom SPA contains sensitive biological resources (including vernal pools and oak woodland), the alternative site also contains protected wetlands and other waters of the U.S.; thus, similar impacts on biological resources would result on the off-site alternative location. While the off-site alternative location does not support oak woodland, it is expected to contain far greater acreage of vernal pools since nearly the entire site is covered with vernal pool grassland. In addition, the alternative site would be more distant than the Folsom SPA from freeways and urban areas, requiring construction of additional on- and off-site utility and transportation infrastructure to serve the alternative site.

Given that there are no feasible alternative sites that can meet the Folsom South of U.S. 50 CEQA project objectives, and that the only off-site land development alternative available for NEPA project objectives would have substantially greater impacts to wetlands (including vernal pools) as compared to the Proposed Project Alternative, an off-site land development alternative is not evaluated further in this EIR/EIS.

2.4 "WATER" PORTION OF THE PROJECT

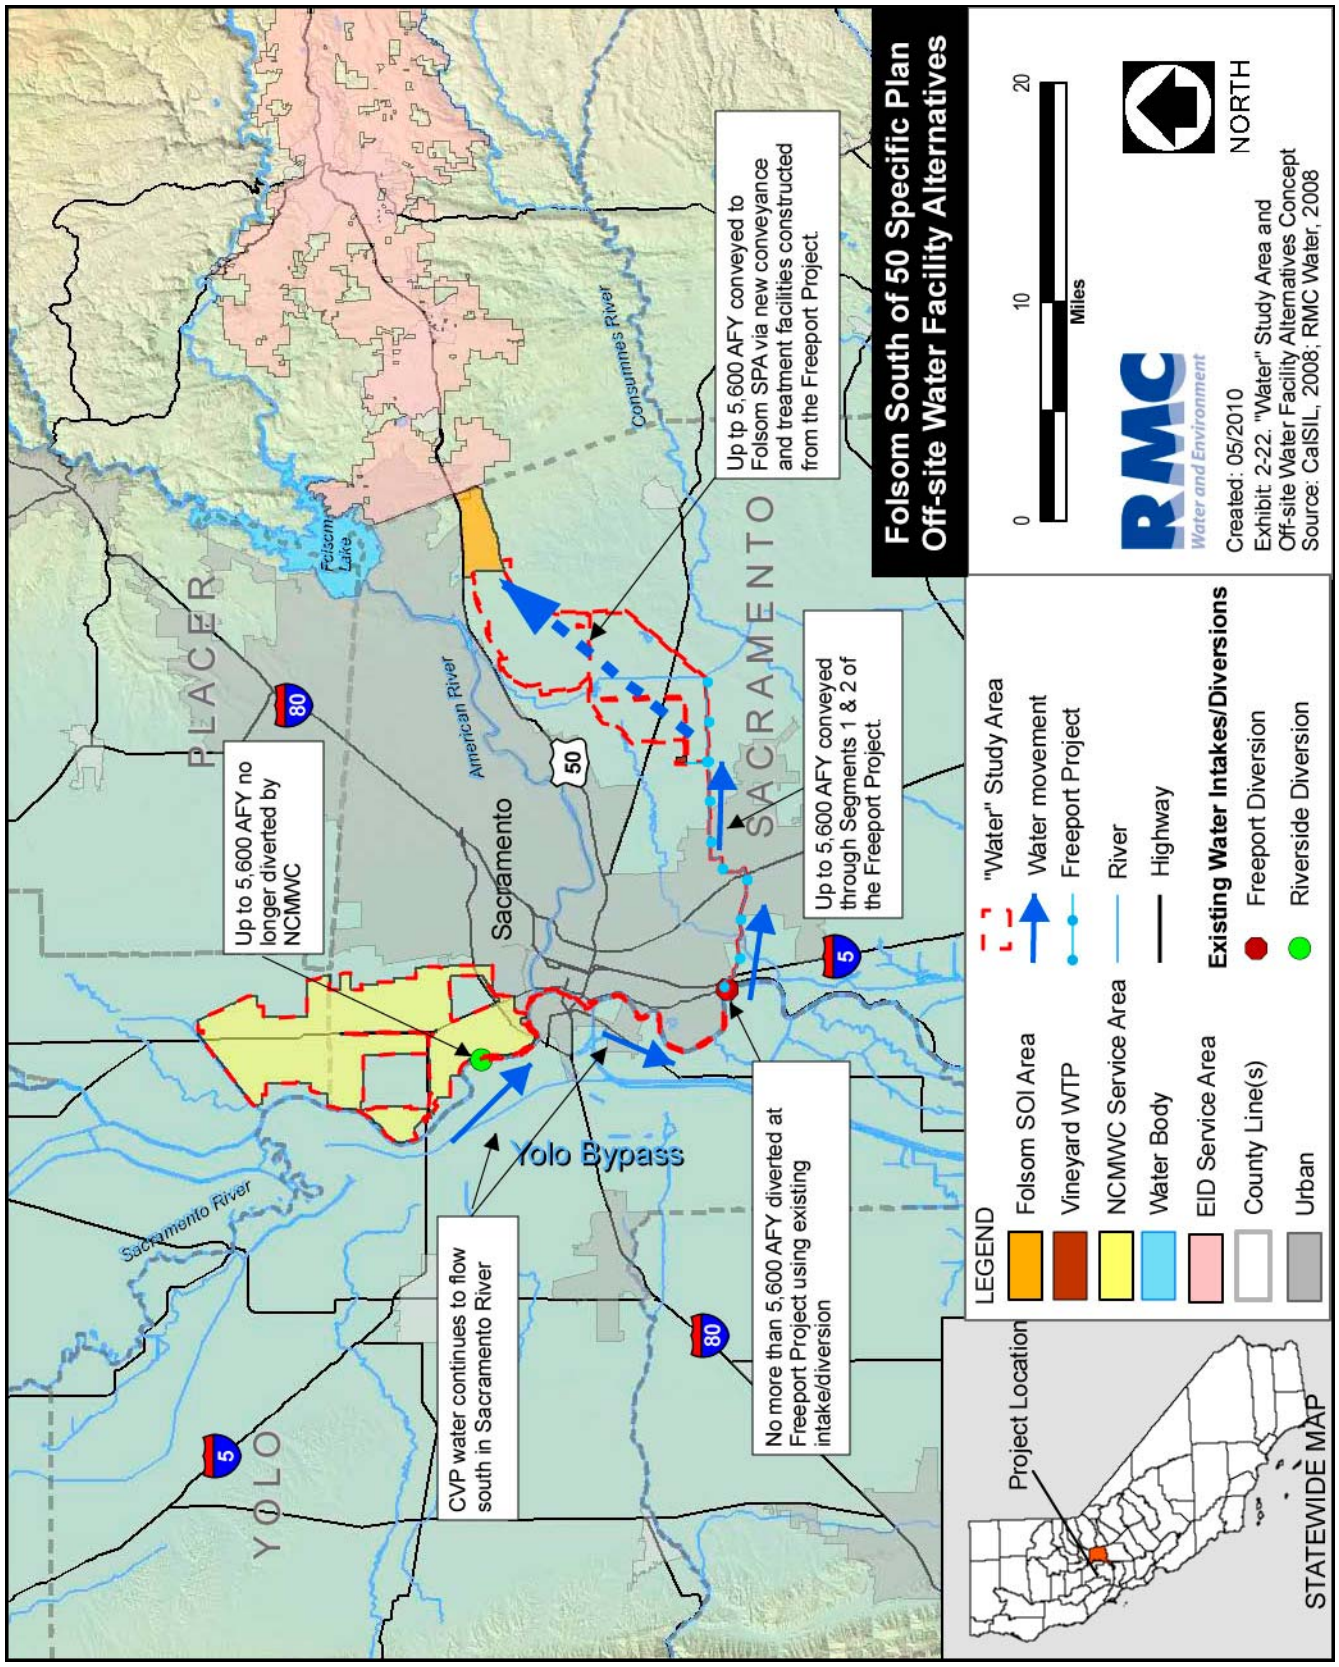
All of the "Water" alternatives considered in this EIR/EIS involve construction and operation of new off-site conveyance and/or treatment infrastructure within east-central portions of Sacramento County to support new development within the SPA. The City has formulated a series of "Water" alternatives, referred to in the EIR/EIS as Off-site Water Facility Alternatives, which would involve the connection of this new water infrastructure to the Freeport Regional Water Project (Freeport Project) to enable for diversion of Central Valley Project (CVP) water at the Sacramento River.

To capture all the components associated with the Off-site Water Facility Alternatives, the "Water" Study Area encompasses approximately 40,000-acres within the lower Sacramento Valley, east of the Sacramento River (see Exhibit 2-23). As shown in Exhibit 2-23 and 2-24, the Natomas Central Mutual Water Company (NCMWC) service area is located east of the Sacramento River and north of the City of Sacramento in the northern section of the "Water" Study Area. The City and Folsom Specific Plan Area are located along U.S. 50 and situated near the eastern Sacramento County line, approximately 25 miles east of the Sacramento River, and within the eastern-most portion of the "Water" Study Area (see Exhibits 2-24 and 2-25).

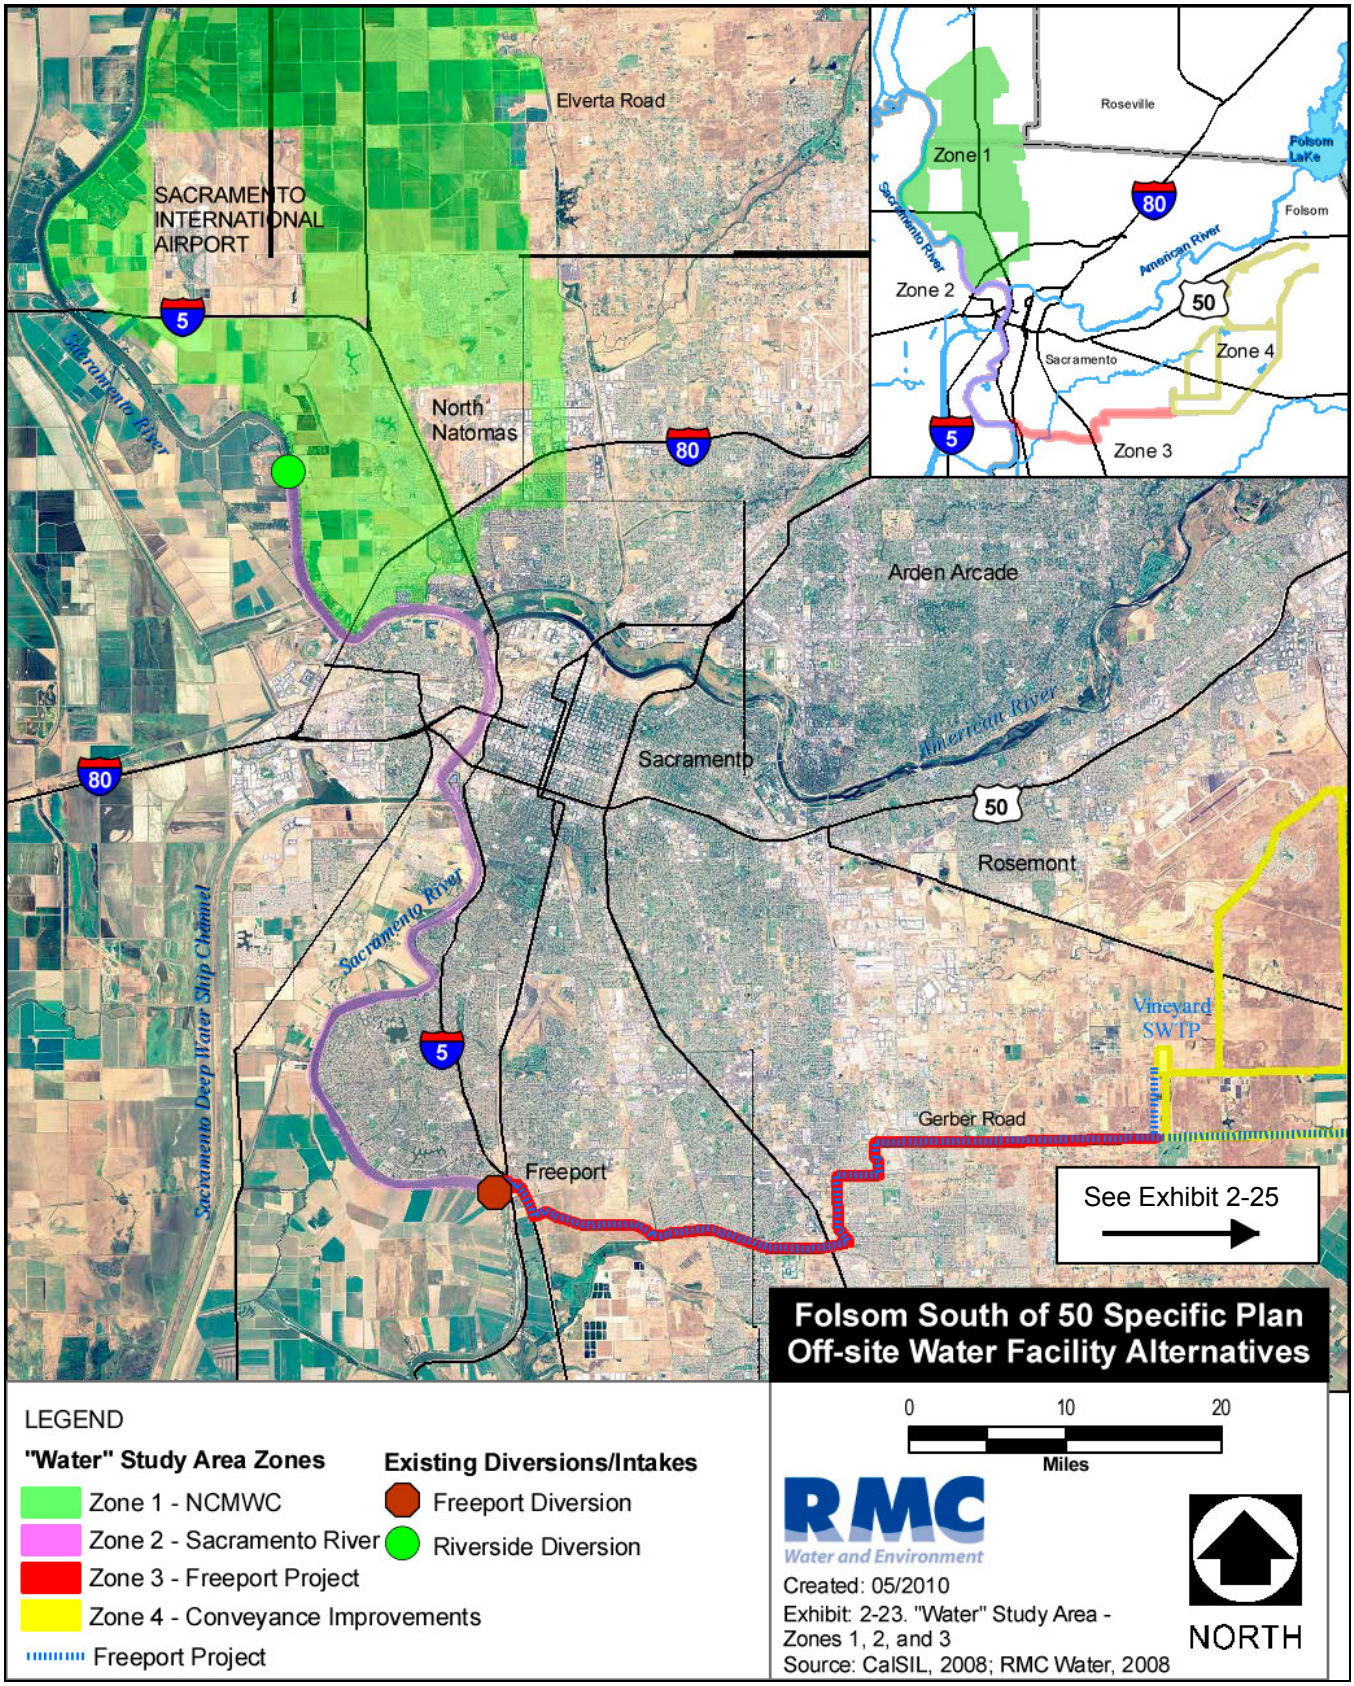
Exhibits 2-23 and 2-24 illustrate the western and eastern portions of the "Water" Study Area, respectively, which for the purposes of discussion in this EIR/EIS analysis, is divided into four smaller zones. Each of these four zones are described below:

- **Zone 1** includes the approximately 37,160-acre NCMWC service area, which depicts the northern extent of the "Water" Study Area. Zone 1 is included in the "Water" Study Area to cover potential operational changes within NCMWC's service area. No facility improvements are proposed in Zone 1 as part of the Off-site Water Facility Alternatives.

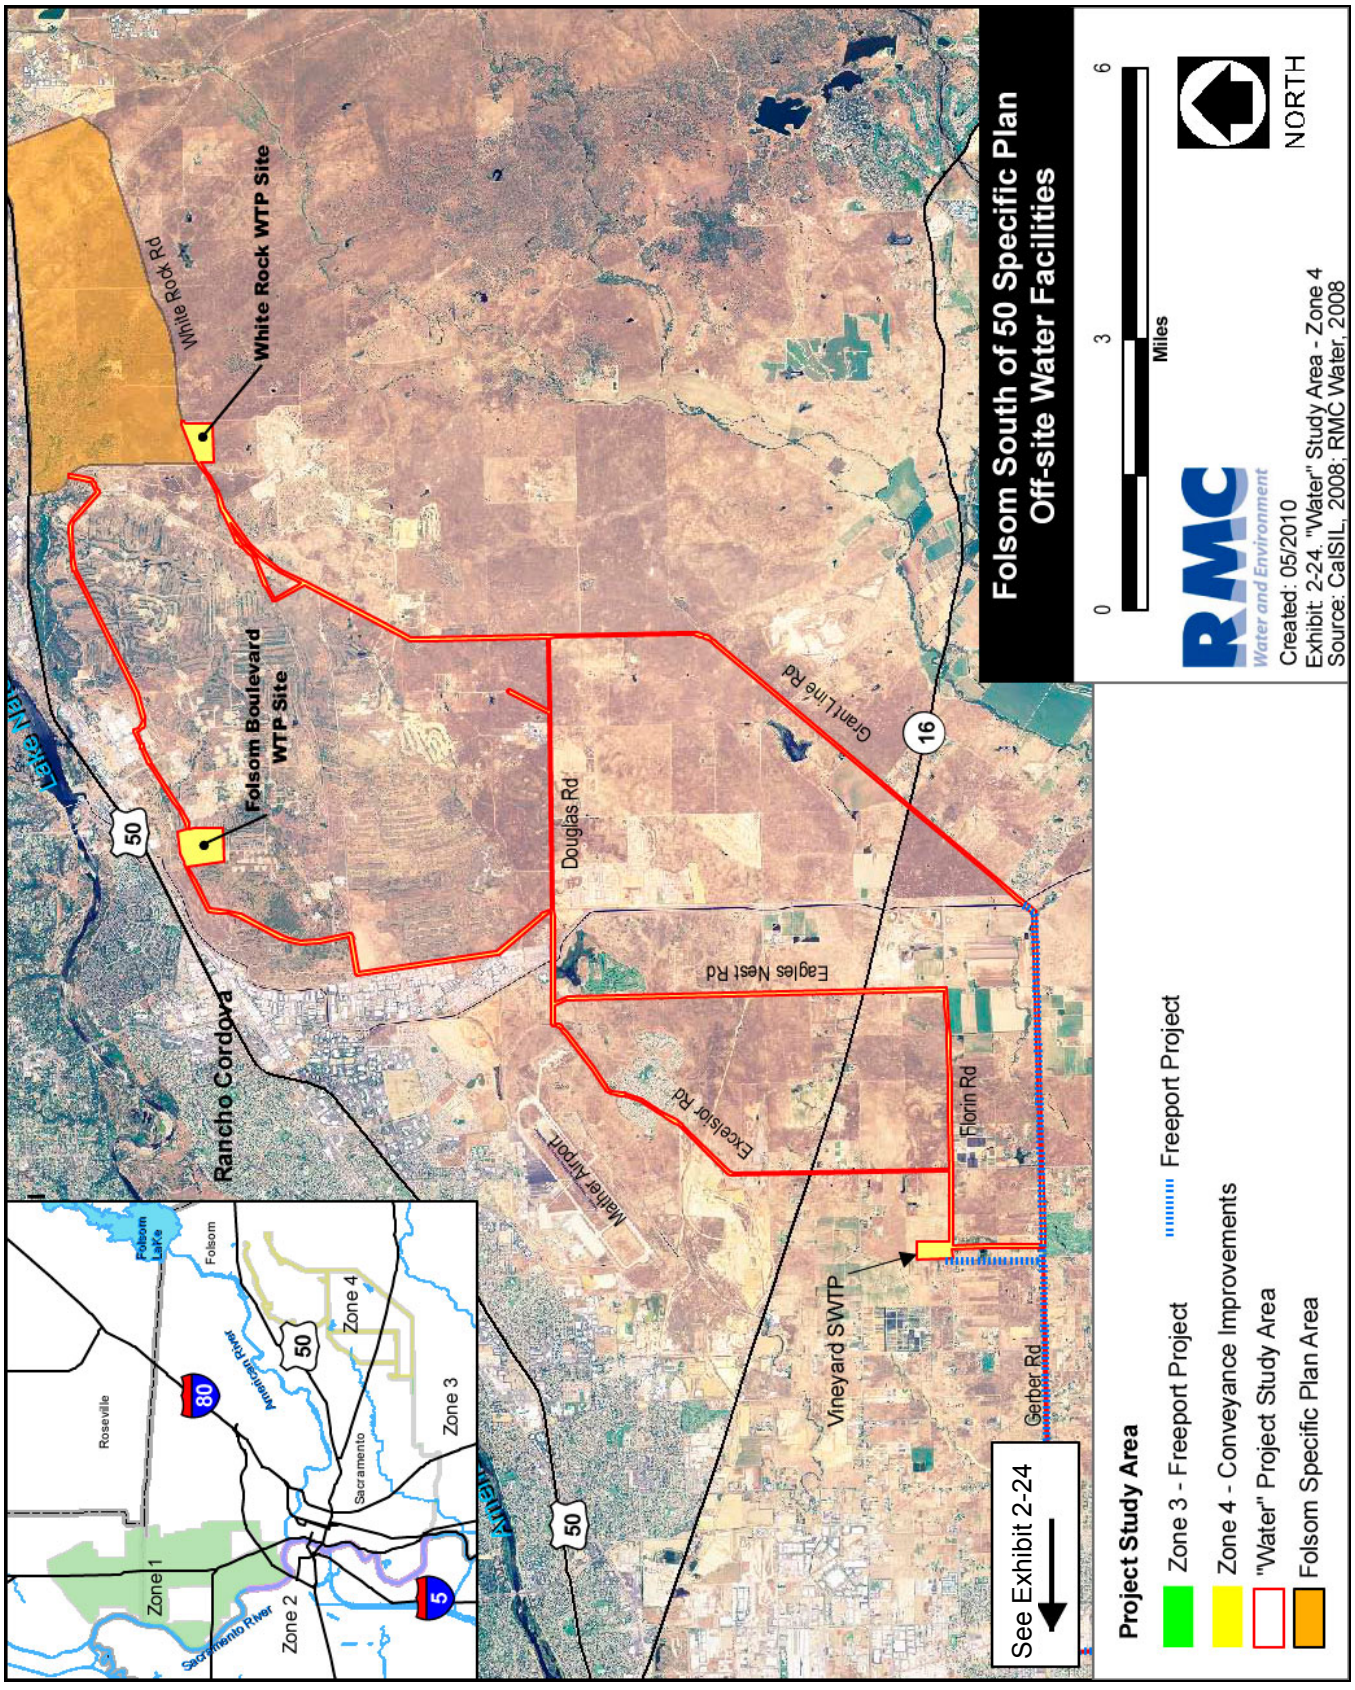
- **Zone 2** is the section of the Sacramento River between River Miles 48 and 66; an approximately 1,200-acre area. Under the "Water" project alternatives, surface water would not be diverted by the NCMWC and rather would continue to flow south along this section of the river prior to diversion at the Freeport Project intake



Regional Map and "Water" Project Concept **Exhibit 2-23**



"Water" Study Area – Zones 1, 2, and 3 **Exhibit 2-24**



"Water" Study Area – Zone 4 **Exhibit 2-25**

facility. Zone 2 is included in the "Water" Study Area to cover changes in river hydrology as a result of the Off-site Water Facility Alternatives. No facility improvements are proposed in Zone 2 as part of the Off-site Water Facility Alternatives.

- **Zone 3** corresponds with the existing Freeport Project, which encompasses an approximately 155-acre linear area. The Freeport Project begins on the eastern bank of the Sacramento River, near the Town of Freeport. As shown in Exhibit 2-25, the western extent of the Freeport Project starts in the Town of Freeport, west of Interstate 5 (I-5) and extends from the intake facility to the north on Freeport Boulevard and then east/ southeast on Meadowview Road. At the Mack/Power Inn Road intersection, the Freeport Project continues east on Elsie Road for a short distance and then north on Wilbur to the Gerber Road/Wilbur Way intersection. At Gerber Road, the Freeport Project extends east to the Folsom South Canal (FSC). Zone 3 of the "Water" Study Area is included to cover potential operational changes to the Freeport Project as a result of the Off-site Water Facility alternatives. No physical changes to Zone 3 are contemplated.

- **Zone 4** contains the new conveyance facilities that would be constructed as part of the Off-site Water Facility Alternatives, and extends from at or near the Freeport Project's bifurcation[1] point at an area that roughly corresponds with the intersection of Vineyard Road and Gerber Road on the southwest (Latitude–38° 28' 53.94" N, Longitude 121° 18' 57.82" W) to the northeast to the intersection of White Rock and Prairie City Roads on the northeast (Latitude–38° 36' 52.71" N, Longitude–121° 8' 57.97" W) (see Exhibit 2-26). Zone 4 covers a total area of approximately 1,377-acres. The "Water" Alternative conveyance routes or Off-site Water Facility Alternatives are described below in Section 2.13 of this chapter.

2.5 EXISTING AND FUTURE WATER DEMAND

Development proposed for the SPA would include up to 10,210 mixed-density residential homes (11,553 in the Reduced Hillside Development Alternative), approximately 7.4 million square feet of retail and office uses, and supporting public facilities (e.g., schools, fire stations). These uses are projected to generate a population of up to 26,544 and result in a total projected water demand estimated at 5,543 acre-feet per year (AFY), rounded up to 5,600 AFY (Tully and Young 2009). Table 2-13 provides a summary of the proposed water use within the SPA. A complete breakdown of water-unit demands and the factors used in their determination is provided Water Supply Assessment for the Folsom Specific Plan in Appendix M1.

Table 2-13
Folsom Specific Plan Estimated Water Demands

Land Use ID	Area (acres)	Dwelling Units	Indoor (Potable) – Annual Demand (AF)	Outdoor (Non-Potable) – Annual Demand (AF)	Total Demands – Annual Demand (AF)
Folsom Specific Plan Area Totals					
Total Residential	**1,510**	**10,210 (11,553)**	**1,958**	**1,610**	**3,648**
Total Nonresidential	**2,013**	--	**398**	**1,428**	**1,898**
Total	**3,510**	**10,210 (11,553)**	**2,315**	**3,038**	**5,546 (5,600)**

Notes: ID = Identification; AF = acre-feet; AFY = acre-feet per year

Complete breakdown of water demand is provided in Appendix M1.

[1] Demands are based on normal-year rainfall conditions.

[2] Normal-year demand rounded up to 5,600 AFY to account for dry-year demands (5%)

[3] 11,553 units would only be included in the Reduced Hillside Development Alternative with a corresponding reduction in outdoor water use.

Source: Tully & Young 2009

[1] The Freeport Regional Water Project provides water to both the Sacramento County Water Agency (SCWA) and East Bay Municipal Utility District (EBMUD). "Bifurcation" refers to the point in the Freeport Project where the joint facilities end and SCWA's dedicated pipeline and EBMUD's dedicated pipeline begin.

As shown in Table 2-13 the SPA includes a small area within the El Dorado Irrigation District's (EID) service area. The "Water" portion of the project includes sufficient water supplies to serve the less than 300 AFY demand within EID's service area in the SPA. In this context, this EIR/EIS assumes that the City would provide treated water to EID for service within its portion within the SPA. Further, this EIR/EIS does not address any off-site improvements required by EID to facilitate its own and separate plans for future water service within portions of the SPA that fall within EID's service area. Such facilitates could require separate environmental analyses and review once such details are available.

As part of developing the SPA's projected annual water demands, the City has also determined an average daily demand of 6.5 million gallons per day (mgd). Using a maximum-day peaking factor of 1.9 as described in Appendix M1, buildout within the SPA would result in a maximum daily demand of 9.5 mgd. A capacity of 10 mgd is assumed for the purposes of this EIR/EIS analysis to provide a conservative estimation (e.g., high) of infrastructure requirements. Based on current estimates, the City expects that peak-water demands would be experienced for a limited duration of approximately 5 days or fewer annually.

2.6 "WATER" ALTERNATIVES

The "Water" project would entail the construction and operation of one of the Off-site Water Facility Alternatives described in this section. It is important to note that each of the Off-site Water Facility Alternatives would provide a reliable long-term supply and conveyance system for any one of the "Land" alternatives. Detailed below are the descriptions of the Off-site Water Facility Alternatives that are being evaluated at an equal level of detail in this EIR/EIS, as required by NEPA. A complete listing and screening process for other water supply and conveyance alternatives considered in this EIR/EIS, but not carried forward for equal-level analysis, is described in Section 2.15 below.

Each of the Off-site Water Facility Alternatives would consist of the acquisition of not more than 8,000 AFY of CVP contract entitlement water from the NCMWC, permanent assignment of the CVP contract entitlement water to the City, and diversion of the CVP water from the Sacramento River using the existing Freeport Project intake/diversion and conveyance facilities. The City would then construct a new pipeline that would convey water from the Freeport Project to the SPA. The capacity requirements for the "Water" portion of the project assume that all demands would be met with potable water. Although non-potable water infrastructure would be required for development within the SPA, to date, a reliable source of non-potable water has not been sufficiently developed to include in this EIR/EIS analysis. Therefore, for purposes of this EIR/EIS, it is assumed that all demands within the SPA would be served with potable water until a viable non-potable source is identified and secured. As a result, additional, separate environmental analyses would be required for the implementation of a non-potable water supply program within the SPA and extension of related infrastructure, when such a supply is known and available.

2.6.1 COMPONENTS COMMON TO ALL "WATER" ALTERNATIVES

This section describes the conveyance facilities and water supply components that are common to all the Off-site Water Facility Alternatives analyzed in this EIR/EIS. These common components include the source water supply from NCMWC, integration with the Freeport Project, the need for new pumping facilities, and the provision of sufficient water treatment capacity and distribution facilities within the SPA. Additionally, each of Off-site Water Facility Alternatives assumes the absence of any non-potable supplies. These topics are described in further below.

SOURCE WATER

The City is proposing to acquire not more than 8,000 AFY of CVP contract entitlement water from the NCMWC, which would be put to beneficial use within the SPA. This water supply consists of a long-term, CVP water entitlement from the NCMWC under Contract No. 14-06-200-885A-R-1 (NCMWC CVP Contract) with the U.S.

Bureau of Reclamation (Reclamation). The City is an existing CVP contractor within the American River Unit and, upon annexation into the City, the SPA would be within the CVP water rights place of use (POU). NCMWC's CVP contract supply originates from the Shasta/Trinity River Division of the CVP and is currently diverted and applied to agricultural lands in northern Sacramento County and southern Sutter County. The project applicant(s) are proposing to enter into an agreement with the NCMWC whereby the CVP contract entitlement water would be permanently assigned to the City and this water supply would be provided by Reclamation for diversion from the Sacramento River. NCMWC's current CVP contract provides surface water during the months of July and August and includes a shortage provision of up to 25% during critically-dry years.

The City is proposing to modify the existing delivery schedule with Reclamation to a year-round municipal and industrial (M&I) schedule to allow for a more consistent diversion of 6,000 AFY of the 8,000 AFY over the course of a given year. The contract water would be made available by NCMWC reducing its surface water diversions/pumping during the irrigation season by approximately 33 to 465 cubic feet per second (cfs) at the Riverside Pumping Plant. This water supply would then remain in the Sacramento River and flow approximately 20 miles downstream for diversion by the City at the existing Freeport Project diversion facility, which is described below. This overall concept is illustrated in Exhibit 2-22.

The CVP contract supplies acquired by the City as part of the Off-site Water Facility Alternatives would more than meet demands associated with all phases of development within the SPA during normal and dry years (for information on project phasing, please refer to Section 2.3.1). This higher quantity of water is required to factor in the 25% reduction that could occur in dry years thereby reducing the quantity delivered to 6,000 AFY. This shortage provision could leave a margin of only 400 AFY between the demands of the SPA at build-out and the available surface water supply. In recognition of this surplus, which ranges from 400 AFY in dry years up to 2,400 AFY, the City intends to make these supplies available to the NCMWC for diversion for irrigation. Any additional water not required by NCMWC would be put to beneficial use according to the provisions of the CVP water service contract and Central Valley Project Improvement Act (CVPIA), House Resolution (HR) 429, Public Law 102-575.

Natomas Central Mutual Water Company

NCMWC currently serves about 33,200 acres in Sacramento and Sutter Counties. Exhibit 2-22 illustrates the boundaries of the NCMWC service area. NCMWC maintains appropriative water rights to the Sacramento River pursuant to Water Right Licenses 1050, 2814, 3109, 3110, and 9794 and Permit 19400. NCMWC and Reclamation signed Settlement Contract No. 14-06-200-885A-R-1 to address the CVP's effect on those licenses and that permit under that contract. NCMWC diverts base supply[2] and CVP water[3] from the Sacramento River. This contract is effective through March 31, 2045. This contract obligates Reclamation to deliver the base supply of 98,000 AFY and "Project Water" supply of 22,000 AFY for a combined total of 120,200 AFY.

NCMWC's Renewal Contract, among many other CVP contracts, was recently challenged in *Natural Resources Defense Council v. Kempthorne*, Case No. 05-CV-01207 (Eastern District of California). In that case, the U.S. District Court for the Eastern District of California (United States District Court) upheld NCMWC's Renewal Contract and found that Reclamation had no discretion to reduce NCMWC's water supplies in executing the Renewal Contract. NCMWC's current contract includes a shortage provision of up to 25%[4]. Given that the NCMWC's renewed CVP contract contains an up to 25% shortage provision during dry years and the fact that

[2] Base supply means the amount of water Reclamation delivers to the NCMWC, a Settlement Contractor, during the period of April through October each year, free of charge in recognition of their unquantified water rights, which existed prior to the construction of the CVP.

[3] CVP Water is subject to all requirements of the Federal Reclamation Law, including pricing regulations.

[4] The Sacramento River Index is the sum of the unimpaired runoff of four rivers: the Sacramento River above Bend Bridge near Red Bluff (Station SBB), Feather River inflow to Oroville Reservoir (station FTO), Yuba River at Smartville (Station YRS) and American River inflow to Folsom reservoir (Wtation AMF). In applying the Sacramento Valley 40-30-30 Index, a water-year with an Index equal to or less than 5.4 MAF is classified as "critical."

these supplies would be diverted north of the Sacramento-San Joaquin Delta (Delta), the City has assumed that no additional reductions in the amount of water delivered would occur even with factoring in climate change. A study prepared by Wagner and Bonsignore (2007) indicates that based on existing 2007 cropping patterns within NCMWC's service area, NCMWC has sufficient surface water supplies to transfer up to 8,000 AFY without adversely affecting NCMWC's ability to meet irrigation demands with surface water. Based on this finding, it is reasonable to expect that no supplemental groundwater pumping would be required by landowners within the NCMWC to augment the surface supplies assigned to the City. The complete Wagner and Bonsignore report is included in Appendix M2 of this EIR/EIS for further reference.

Integration with Freeport Project Facilities

The City has identified the existing Freeport Project as the proposed point of diversion (POD) on the Sacramento River for the Off-site Water Facility Alternatives. The Freeport Project is a facility jointly owned by Sacramento County Water Agency (SCWA) and the East Bay Municipal Utilities District (EBMUD) and is permitted to divert and convey up to 185 mgd of surface water to their respective service areas. SCWA has a dedicated capacity within the Freeport Project of 85 mgd with EBMUD owning the remaining 100 mgd of capacity. The City and SCWA have entered into a MOU (See Appendix M3) for the City to acquire the right to use 6.5 mgd on average of dedicated capacity in the SCWA's 85 mgd portion of the Freeport Project. This MOU would also allow for additional capacity to accommodate limited peaking conditions. To provide a basis for the assessment of worst-case conditions, the analysis provided in this EIR/EIS assumes peaking operations of up to 10 mgd.

As part of the Off-site Water Facility Alternatives and pursuant to Section 4.3 of the Second Amended Joint Exercise of Powers Agreement Concerning the Freeport Regional Water Authority, the City would enter into an Agreement for Delivery of Water (Delivery Agreement) with SCWA for the right to use up to an average of 6.5 mgd of SCWA's Freeport Project dedicated capacity. Under the Delivery Agreement, SCWA would wheel[5] the NCMWC's CVP contract supplies from the Sacramento River through the Freeport Project and to the bifurcation point where SCWA's and EBMUD's joint facilities end. Of the Freeport Project's major facilities, the Off-site Water Facility Alternatives would use capacity within one or more of the following:

- Freeport Intake Facility – The intake facility is located near the Town of Freeport. It includes a pumping plant that contains eight separate pumps capable of diverting water from a well located behind a 180-foot long fish screen, designed to comply with criteria developed by the California Department of Fish and Game (DFG) and NMFS in order to allow migrating Delta smelt, Chinook salmon, steelhead, and other native fish species to pass by the intake diversion without the risk of entrainment. The intake facility connects to a pipeline that conveys water to SCWA and EBMUD; and

- Raw Water Pipelines – Raw water pipelines carrying water from the intake facility to the Vineyard Surface WTP (SWTP) or FSC:

    - Pipeline Segments 1 and 2, 185 mgd capacity (84-inch) pipelines from the intake facility to the turnout to the Zone 40 Surface WTP or bifurcation,

    - Pipeline Segment 4, an 85 mgd capacity (66-inch) pipeline from the bifurcation to the Vineyard SWTP.

The EIR/EIS for the Freeport Project (see Section 1.9) analyzed impacts associated with the construction and operation of the Sacramento River diversion/intake structure and associated raw or untreated water conveyance pipelines. The Freeport Project EIR/EIS is incorporated by reference into this EIR/EIS (see Section 1.9) and documents the environmental effects of diverting of up to 185 mgd (or 568 AF) of surface water from the Sacramento River during all river hydraulic conditions. Pursuant to State Water Resources Control Board (SWRCB) Application No. 30454, SCWA's total diversions at Freeport are permitted for up to 286 cfs, but not to exceed 71,000 AFY. On average, however, SCWA's diversions are initially estimated more on the order of

[5] "Wheeling" is the transmission of water owned by one entity through the facilities owned by another.

21,700 AFY in 2010. The Off-site Water Facilities would operate within SCWA's permitted diversion rates and would not require any increase in the Freeport Project's currently permitted diversion capacity. For this reason, no physical changes to the Freeport Project's diversion and pump structure and conveyance pipeline are contemplated as part of the "Water" portion of the project.

Pump Station

One raw or treated-water booster pumping station would need to be constructed at the City's Off-site Water Facility's connection with the Freeport Project to provide sufficient operating pressure within the transmission main. Under a treated-water transmission main scenario, the connection point would occur at the Vineyard SWTP, some point along SCWA's proposed North Service Area (NSA) pipeline, or the existing Douglas Treated-Water Storage Tanks (Douglas Tanks) within the North Douglas II development. The pumping station would consist of a concrete facility that would operate via electricity. The ultimate horsepower (HP) requirements are currently estimated at 1700 HP for the longest routes. The number and type of pumps will depend on detailed design criteria, which is currently unavailable. At times, the pumps may operate 24-hours a day, seven days a week. The pump station structure(s) would be designed so that additional pumps can be installed. A standby generator would be installed in an enclosure to operate up to two pumps during a power outage. At this time, a precise location for the pump station has not been selected. However, the City anticipates that this facility would be in close proximity to the associated connection point to the Freeport Project facilities under of the Off-site Water Facility Alternatives.

Water Treatment and Treated-Water Transmission Facilities

Water treatment would be provided for the Off-site Water Facilities through the construction of a new Water Treatment Plant (WTP) or the purchasing of capacity within SCWA's Vineyard SWTP. Details regarding these water treatment options are provided under the respective Off-site Water Facility Alternatives for which they would be developed. In relation to the construction of new water treatment facilities, two alternative site locations have been identified outside the SPA as part of the City's preliminary investigation and analyzed in separate alternatives. In addition to these two off-site locations, there continues to be a potential for the WTP to be constructed within the SPA. If located within the SPA, the On-site WTP would be constructed at a location immediately northeast of the intersection of Oak Avenue and Street "A" (see Exhibit 2-7). Environmental effects resulting from new development within the SPA are analyzed in the "Land" sections of Chapter 3 of this EIR/EIS. At the time of writing this EIR/EIS, the City is considering a range of treatment options ranging from conventional to advanced treatment. Additionally, the exact placement of the WTP on each of the off-site properties under consideration has not been determined and, therefore, the City has considered full-build-out of either WTP site as part of its analysis.

Depending on the conveyance alignment and WTP site location ultimately chosen, the Off-site Water Facilities would enter the SPA along Prairie City Road either from White Rock Road to the south or from an unnamed, dirt road that bisects the northern section of the Aerojet property, immediately west of the SPA and south of U.S. 50. This existing dirt roadway corresponds with the planned alignment for the Easton Valley Parkway. The treated-water transmission infrastructure proposed for areas within the SPA is described in the "Land" sections of this EIR/EIS.

Non-Potable Water Facilities

The proposed Folsom Specific Plan includes policies that encourage the installation of non-potable water infrastructure for new development within the SPA (see Section 12.5). In conjunction with the "Water" portion of the project, the City is actively seeking sources of non-potable water supplies for use in non-potable applications (i.e., landscape irrigation) within the SPA. Potential sources of non-potable water include local groundwater, recycled water from EID, and/or treated groundwater from Aerojet, among others. However, at the time of the preparation of this EIR/EIS, details regarding these sources and any associated facilities are insufficient to

facilitate analysis within this EIR/EIS. The City expects to prepare separate, subsequent environmental documentation for actions and improvements associated with future non-potable water improvements for the SPA.

2.6.2 Proposed Off-site Water Facility Alternative – Gerber/Grant Line Road Alignment and On-site WTP

Under the Proposed Off-site Water Facility Alternative, the City would integrate its water supply conveyance facilities with SCWA by purchasing an average of 6.5 mgd, plus an appropriate peaking factor, of dedicated capacity within the Freeport Project and wheeling raw water through Pipeline Segments 1 and 2 of the Freeport Project. As previously indicated and for purposes of analyses, the City has assumed that this capacity could be temporarily increased up to 10 mgd to accommodate periods of peak demands.

Under the Proposed Off-site Water Facility Alternative, the City would construct a new 30-inch, raw-water conveyance pipeline that would connect with the pump station located in an area just northeast of the bifurcation. As shown in Exhibit 2-25, the raw-water pipeline would extend northeast approximately 16.5 miles from the bifurcation to the SPA. This pipeline length would result in a corridor under consideration of approximately 401-acres. An exact alignment has not been selected and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-26. In reality, a temporary construction easement would be more on the order of 60 feet with a permanent easement of approximately 10 feet to facilitate access by maintenance vehicles. Construction of the pipeline may involve two methods of pipeline construction: open-cut trenching and trenchless construction. Trenchless construction could be used to traverse creeks or waterways, drainages, major roadway intersections, or railroad rights-of-way.

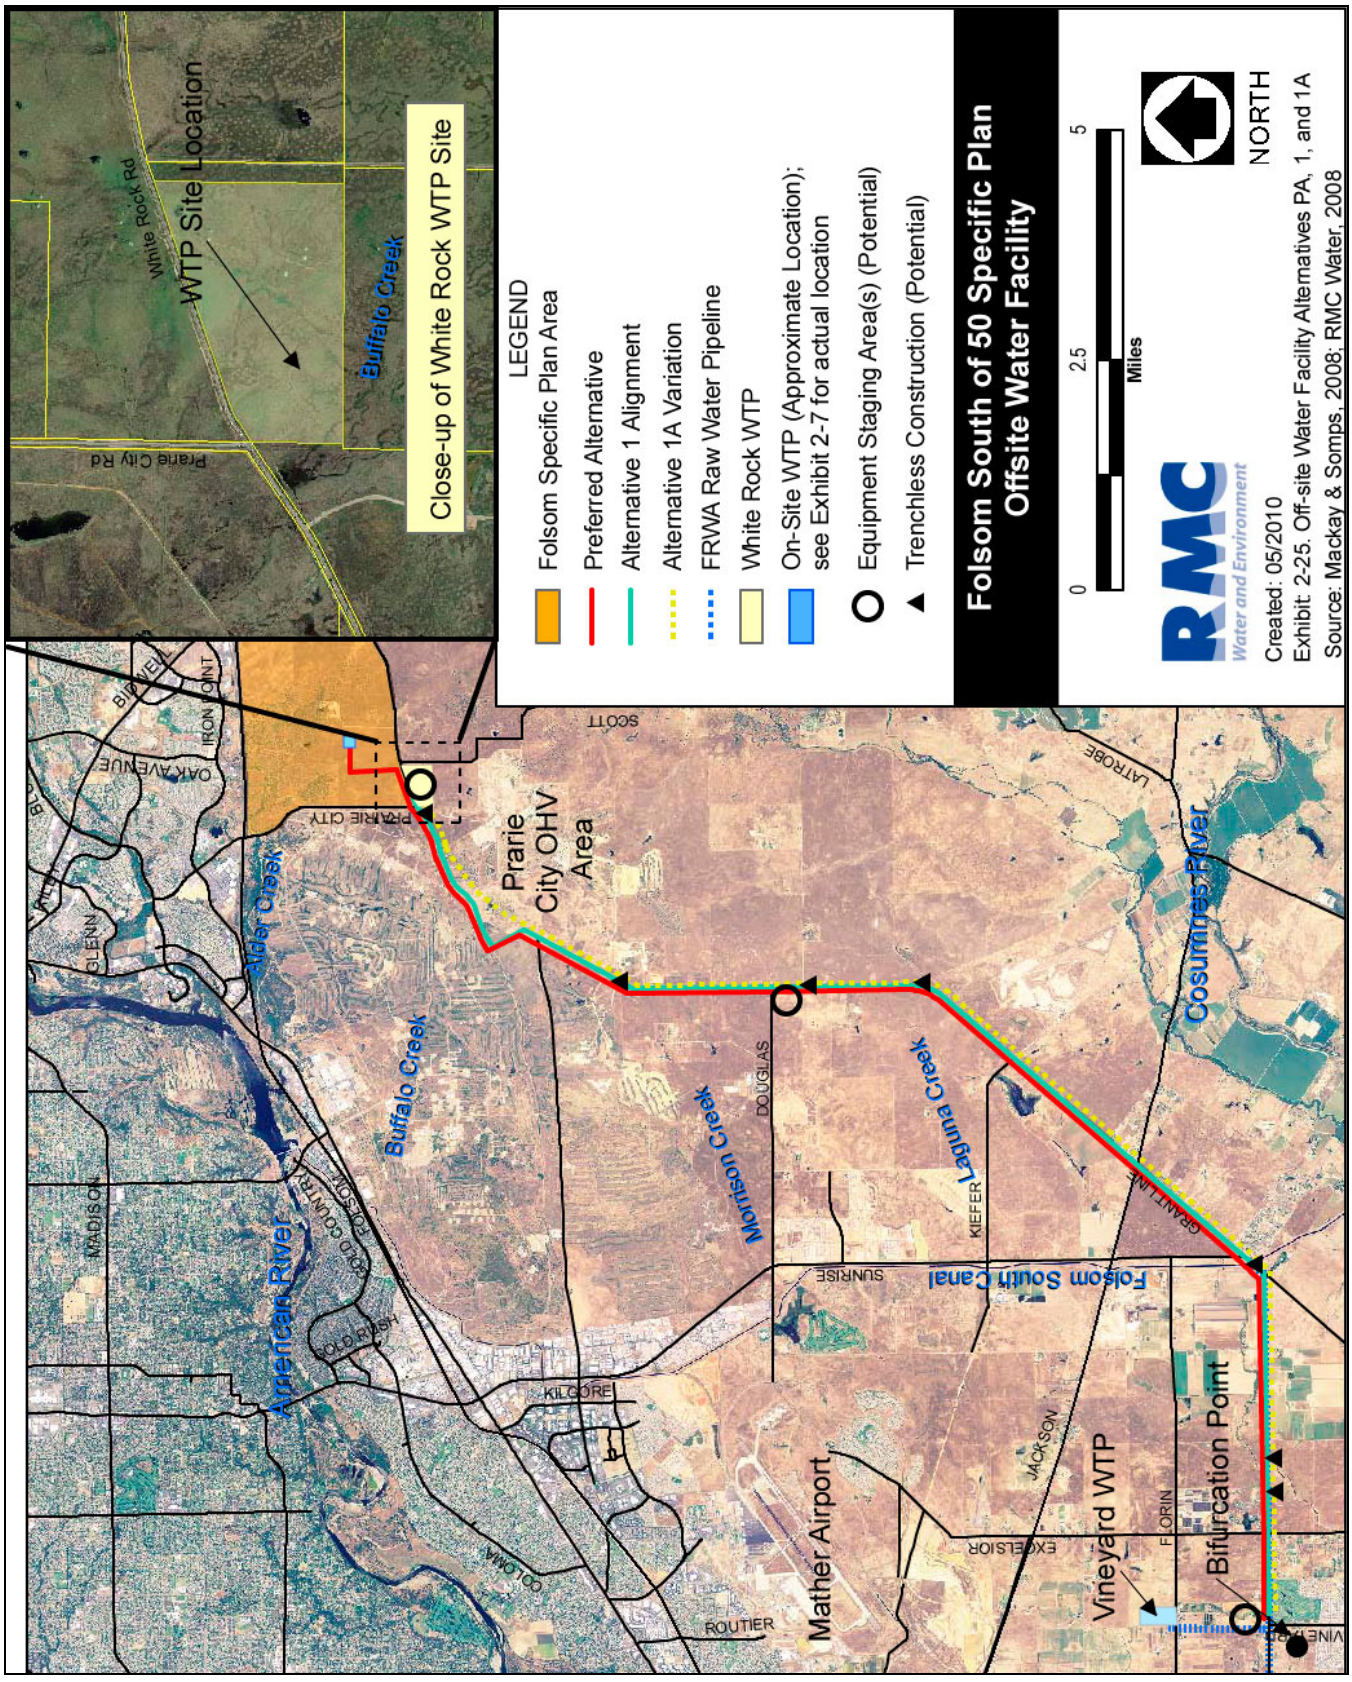
Near the bifurcation, at the intersection of Vineyard and Gerber Roads, the City would construct a 10-mgd capacity, raw water pump station to create the necessary operating pressure within the conveyance pipeline. As previously indicated, the pump station would operate on electricity with a total rated capacity of 1,700 HP. From the pump station, the conveyance pipeline under this alternative would parallel Pipeline Segment 4 of the Freeport Project along Gerber Road to Excelsior Road and from there traverse cross country to the FSC. The pipeline would then cross the FSC where it would intersect with Grant Line Road. The method of crossing the FSC will be determined in coordination with Reclamation. At Grant Line Road, the conveyance pipeline would transition to the north before intersecting White Rock Road. Once on White Rock Road, the alignment follows the roadway east to a newly constructed extension of Oak Avenue. At Oak Avenue, the conveyance pipeline would extend into the SPA to a new, approximately 10-acre On-site WTP.

The On-site WTP would be constructed within the SPA at the approximate location shown in Exhibits 2-7 and 2-26. A treated-water main would be constructed from the On-site WTP to connect with the backbone water infrastructure within the SPA. Under this alternative, the On-site WTP would have an ultimate capacity of approximately 10 mgd.

Water Treatment Processes. The WTP would use conventional and/or advanced treatment technologies to treat water supplies from the Sacramento River that meet the drinking water quality objectives specified in Title 22 of the California Code of Regulations. These regulations specify drinking water quality standards (e.g., maximum contaminant levels (MCLs) for biological contaminants, disinfection by-products, lead, copper, radioactivity, and inorganic and organic chemicals (e.g., pesticides and herbicides). In addition, a residual disinfectant level would be maintained in the water supply to insure that the water remains free of pathogens. The residual disinfection level would be maintained in compliance with applicable drinking water regulations.

The following components may be used at the WTP:

- chemical oxidation system;
- rapid mixing system;



Proposed Off-site Water Facility and Off-site Water Facility Alternatives 1 and 1A **Exhibit 2-26**

- pre-treatment system (flocculation/sedimentation);
- filtration system;
- chemical storage and feed systems;
- filter backwash water supply system;
- wash-water recovery and sludge thickening system;
- sludge dewatering system;
- operations and maintenance building;
- site electrical and control systems improvements; and
- site/civil improvements.

Exhibit 2-27 shows a conceptual layout of the On-site WTP facility, including anticipated major physical features. The WTP facilities would be constructed of concrete and the exterior painted. The grit basins, flow split, flocculation and sedimentation basins, filters, equalization basins, and backwash clarification would be open-water areas. Membrane filtration may be considered as an alternative to the conventional treatment process. The administration/operations building, maintenance building, chemical building, electrical building, and treated water pump station(s) would be enclosed structures, constructed of concrete masonry units or steel. Buildings would be faced with materials such as stucco or split-face block. Steel structures would be painted to blend with the existing environment.

Most WTP staff would be on site during typical working hours, 7:00 am to 5:00 pm. Staffing levels and operator qualifications would comply with applicable regulatory requirements.

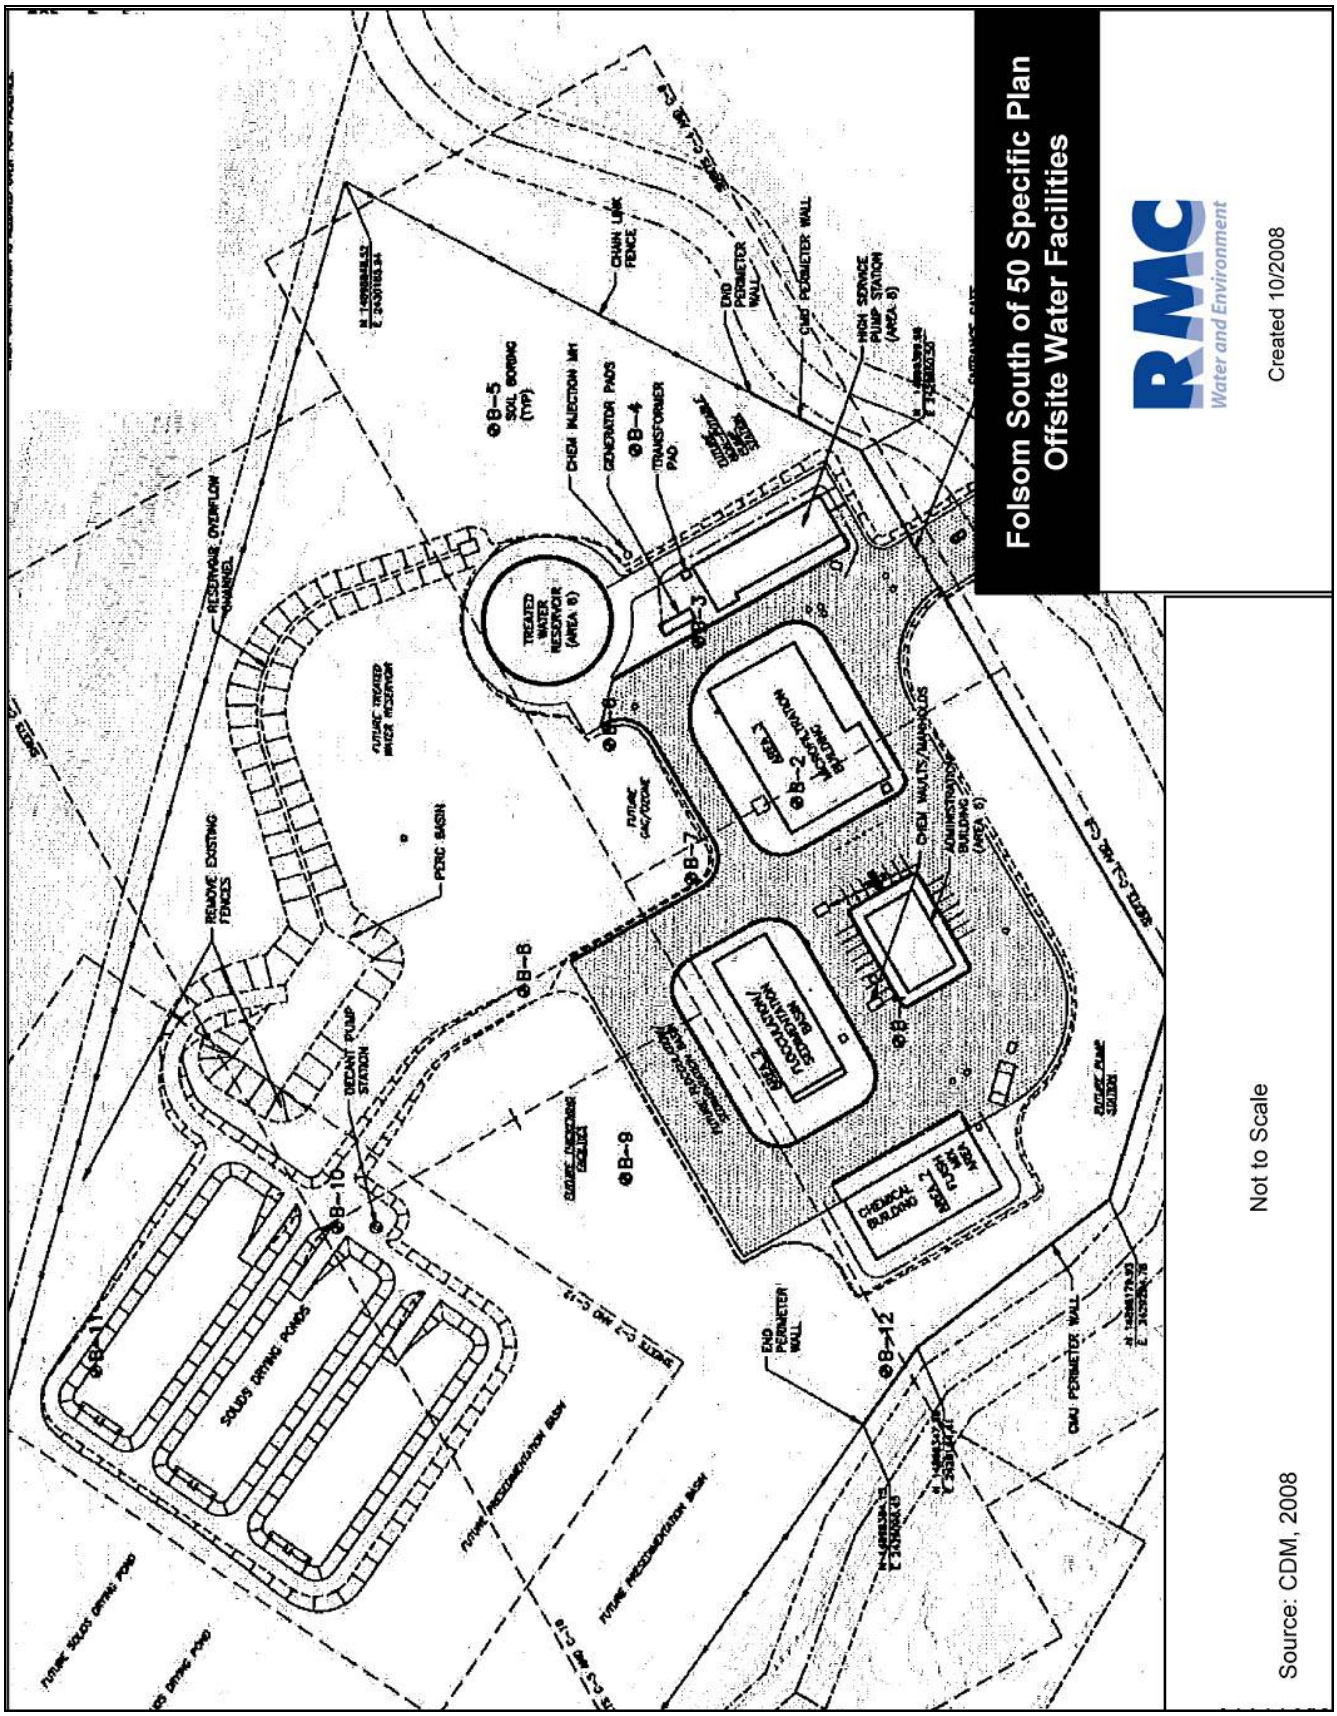
Waste from the water treatment process would include grit from the grit basins, sludge removed from the sedimentation basins, filter backwash water, filter-to-waste water, sampling water, and sludge lagoon decant water. This waste would be treated with a polymer and then stored in an equalization basin. Solids from the grit and equalization basins and sludge from the sedimentation basin would be sent to sludge lagoons for drying. Lagoons would be constructed to allow for cycling and settling periods. Dried sludge would be transported to a locally-certified landfill or other suitable location for ultimate disposal. The lagoons would be routinely cleaned, and the dried sludge removed as needed.

Chemicals anticipated that would be stored and used at the WTP are identified in Table 2-15.

Table 2-15
Water Treatment Chemical Use and Storage

Chemical	Purpose	Form	Estimated Storage Quantity
Aluminum sulfate (Alum)	Coagulation	Liquid	< 20,000 gallons
Cationic polymer	Coagulation aid	Liquid	< 300 gallons
Sodium hydroxide	Neutralizing agent	Liquid	< 3,000 gallons
Anionic polymer/ non-Ionic polymer	Flocculation aid and filter aid	Solid or Liquid	< 6,000 pounds
Activated carbon	Taste and odor, organic control	Solid	< 40,000 pounds
32+ 1 Sodium hypochlorite	Disinfection residual	Liquid	< 10,000 gallons
Citric acid	Membrane cleaning	Liquid	< 400 gallons
Sodium bisulfite	Membrane cleaning	Liquid	< 100 gallons
Oxygen		Liquid	< 5,000 gallons

Source: RMC Water and Environment 2010



Conceptual Water Treatment Plant Layout **Exhibit 2-27**

2.6.3 No USACE Permit Off-Site Water Facility Alternative

The No USACE Permit Off-site Water Facility Alternative would involve the same facilities described under the Proposed Off-site Water Facility Alternative above, and the conveyance pipeline would follow a similar route. However, the No USACE Permit Off-site Water Facility Alternative would avoid all direct impacts (i.e., fill) of waters of the U.S., which include wetlands, through the incorporation of trenchless construction technologies. Construction staging areas and the entry/exits for all trenchless construction activities would also be sited within non-sensitive areas and a minimum of 50 feet from waters of the U.S. At each location where trenchless construction would occur, the City would use a single or combination of trenchless technologies, including but not limited to, microtunneling, horizontal directional drilling (HDD), or jack-in-bore, to avoid these jurisdictional features. The new water treatment plant, regardless of its location, would not be placed within 50 feet of any waters of the U.S., including wetlands. Similar to the other "Water" Alternatives, all construction activities would occur within the 200-foot corridor under consideration for northeastern portions of Zone 4 of the "Water" Study Area.

2.6.4 Off-site Water Facility Alternative 1. Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP

Under Off-site Water Facility Alternative 1, the City would construct facilities similar to those proposed under the Proposed Off-site Water Facility Alternative and described in Section 2.13.3. The City would integrate its water supply conveyance facilities with the Freeport Project and wheel raw water through Pipeline Segments 1 and 2 of the Freeport Project. Under Off-site Water Facility Alternative 1, the City would construct a new 30-inch, raw-water conveyance pipeline that would connect with the pump station located in an area just northeast of the bifurcation. As shown in Exhibit 2-26, the raw-water pipeline would extend northeast approximately 15.3 miles from the bifurcation to a new WTP south of the SPA. This pipeline length would result in a corridor under consideration of approximately 372 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-26.

Similar to the Proposed Off-site Water Facility Alternative, a 10-mgd capacity, raw water pump station would be constructed near the Freeport Project bifurcation and would include a rated horsepower of 1,700 HP. From the pump station, the conveyance pipeline under this alternative would follow the same alignment as the Preferred Alternative up to a new WTP located southeast of the intersection of White Rock Road and Prairie City Road, at a City-proposed Corporation Yard. The White Rock WTP would be constructed on a 10-acre portion of a 68-acre parcel, Assessor's Parcel Number (APN) 072-006-0052, and to the south of the City's proposed Corporation Yard. A treated-water main would be constructed from the White Rock WTP to connect with the backbone water infrastructure within the SPA. Under this alternative, the White Rock WTP would have an ultimate capacity of approximately 10 mgd.

Treatment process and facilities under this alternative would be similar to those described for the Proposed Off-site Water Facility Alternative. At this time, the City has not determined whether it would annex the WTP site into its jurisdiction or whether it would seek development entitlements through Sacramento County and, therefore, the environmental analysis considers both options.

2.6.5 Off-site Water Facility Alternative 1A. Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP

Off-site Water Facility Alternative 1A consists of a variation in the conveyance pipeline alignment for Off-site Water Facility Alternative 1. All other features of this alternative, including the WTP and pump station, would be similar to that of Off-site Water Facility Alternative 1. As shown in Exhibit 2-26, Off-site Water Facility Alternative 1A would realign the conveyance pipeline alignment so that it deviates from White Rock Road prior

to the first curve north of the intersection of White Rock Road and Grant Line Road (see Exhibit 2-26). The pipeline would travel north-northeast along a property line boundary, prior to re-intersecting with the Off-site Water Facility Alternative 1 alignment on the current White Rock Road right-of-way. Off-site Water Facility Alternative 1A would reduce the length of pipeline by approximately a quarter of a mile when compared to Off-site Water Facility Alternative 1. This pipeline length of 15.2 miles would result in a corridor under consideration of approximately 364 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-26.

2.6.6 Off-site Water Facility Alternative 2. Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP

Under Off-site Water Facility Alternative 2, the City would purchase 6.5 mgd, on average, of capacity within the Freeport Project and Vineyard SWTP[6]. This capacity would be augmented with additional peaking capacity of up to 10 mgd within the Freeport Project and Vineyard SWTP, which is located on an 80-acre site on Florin Road between Bradshaw and Excelsior Roads, instead of constructing a new WTP. SCWA is nearing the completion of the Vineyard SWTP, which is initially designed to treat up to 50 mgd for SCWA's Zone 40 Northern Service Area, and expected to start operation in fall 2011.

In addition to purchasing capacity within the Vineyard SWTP, this alternative would involve the construction of a new pumping facility and treated-water conveyance pipeline approximately 17.4 miles in length. This pipeline length results in a corridor under consideration of approximately 423 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-28. The pumping facility would be constructed according to the parameters identified for the Proposed Off-site Water Facility Alternative and located on-site at the Vineyard SWTP. The electrical load requirements for the pumping facility under this alternative would be slightly less than Off-site Water Facility Alternative 1 and are currently estimated at 1,670 HP.

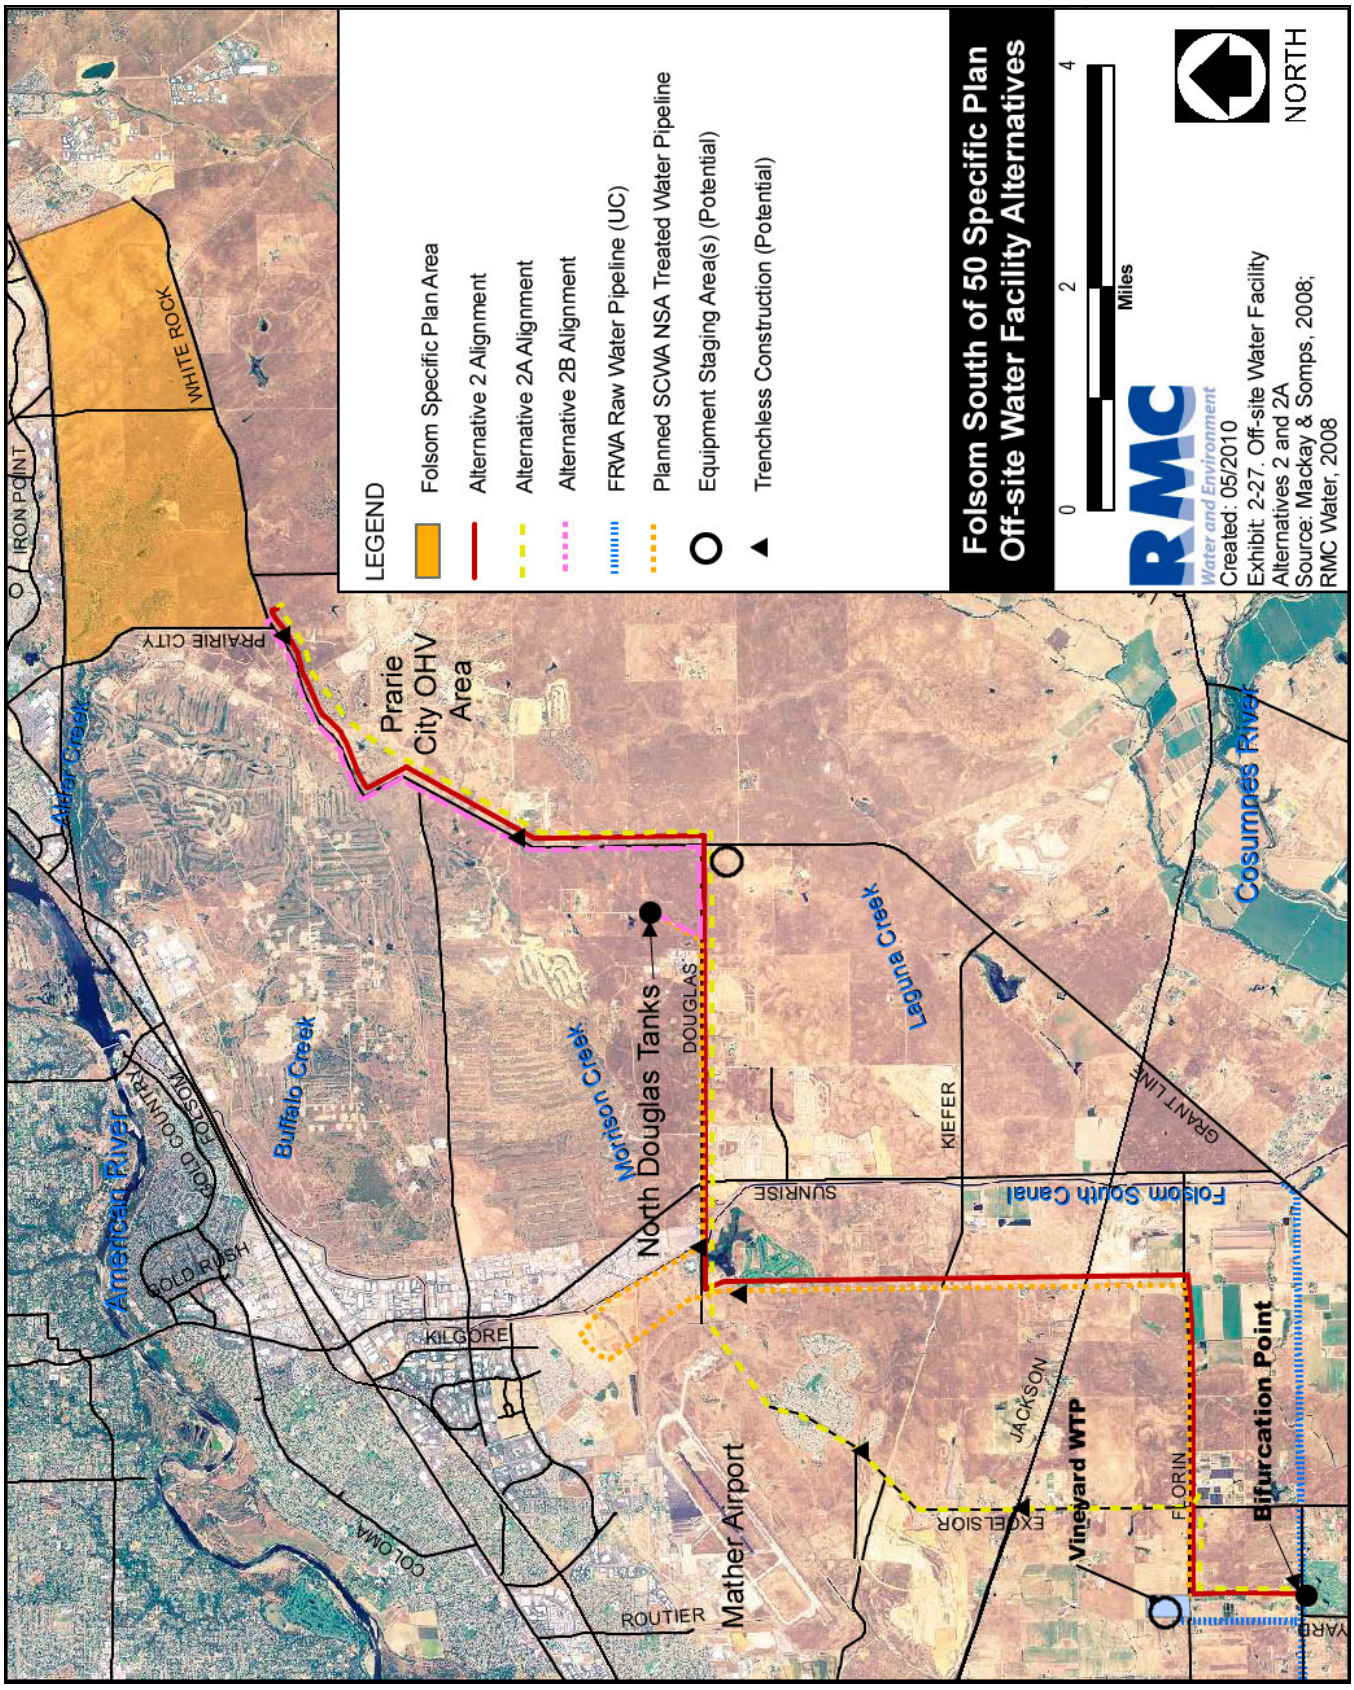
From the Vineyard SWTP, the alignment would extend from Florin Road east to Eagles Nest Road, at which point, the alignment would extend north to Douglas Road (see Exhibit 2-28). Once at Grant Line road, the alignment would follow the same route as Off-site Water Facility Alternative 1. At the terminus of the conveyance alignment, this alternative would connect to new equalization facilities sited within the SPA instead of a new WTP as described for Off-site Water Facility Alternative 1. The equalization facilities are described below.

Equalization Facilities

As part of Off-site Water Facility Alternative 2, the City may construct a 4-million-gallon (MG) ground-based storage tank within the SPA and an associated pumping station on approximately 1-acre. The equalization tanks would be sited with the storage tanks identified to the northeast of the intersection of Road A and Oak Avenue within the SPA (see Exhibit 2-7) and would consist of pre-stressed concrete similar to existing City-owned tanks. The tank height would be no more than three stories or approximately 30 feet.

Pumping and backup power generation would be part of the on-site water distribution infrastructure constructed in conjunction with new development within the SPA. Chemical re-treatment facilities may also be constructed, if determined necessary. To achieve the tank foundation elevation, the existing ground surface at the site may

[6] For the purposes of differentiating between the City's proposed WTP under several of the Off-site Water Facility Alternatives and SCWA's existing Vineyard SWTP, separate acronyms are used to clearly distinguish between these facilities.



Off-site Water Facility Alternatives 2, 2A, and 2B **Exhibit 2-28**

require excavations of up to 10 feet beneath the ground surface. The exterior wall facing would be painted or other architectural treatment administered as desired for aesthetic purposes.

2.6.7 Off-site Water Facility Alternative 2A. Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP

Off-site Water Facility Alternative 2A involves a variation in the conveyance route alignment for Off-site Water Facility Alternative 2 (see Exhibit 2-28). All other features associated within this alternative would be the same as Off-site Water Facility Alternative 2. Under Off-site Water Facility Alternative 2A, the conveyance pipeline alignment would deviate from the Off-site Water Facility Alternative 2 route at the intersection of Florin and Excelsior Roads and travel north along Excelsior Road to Mather Boulevard. At the intersection with Douglas Road, this alignment would travel back to the east and follow the Off-site Water Facility Alternative 2 alignment east to Grant Line Road where it would then travel north to White Rock Road. Unlike Off-site Water Facility Alternative 2, this alternative would follow the Off-site Water Facility Alternative 1A alignment north of the intersection of Grant Line Road and White Rock Road and follow it to the SPA where it would directly connect with the equalization facility. The length of this alignment would be approximately 16.3 miles thereby resulting in a corridor under consideration of approximately 390 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-28.

Equalization facilities constructed under this alternative would be similar to those described for Off-site Water Facility Alternative 2.

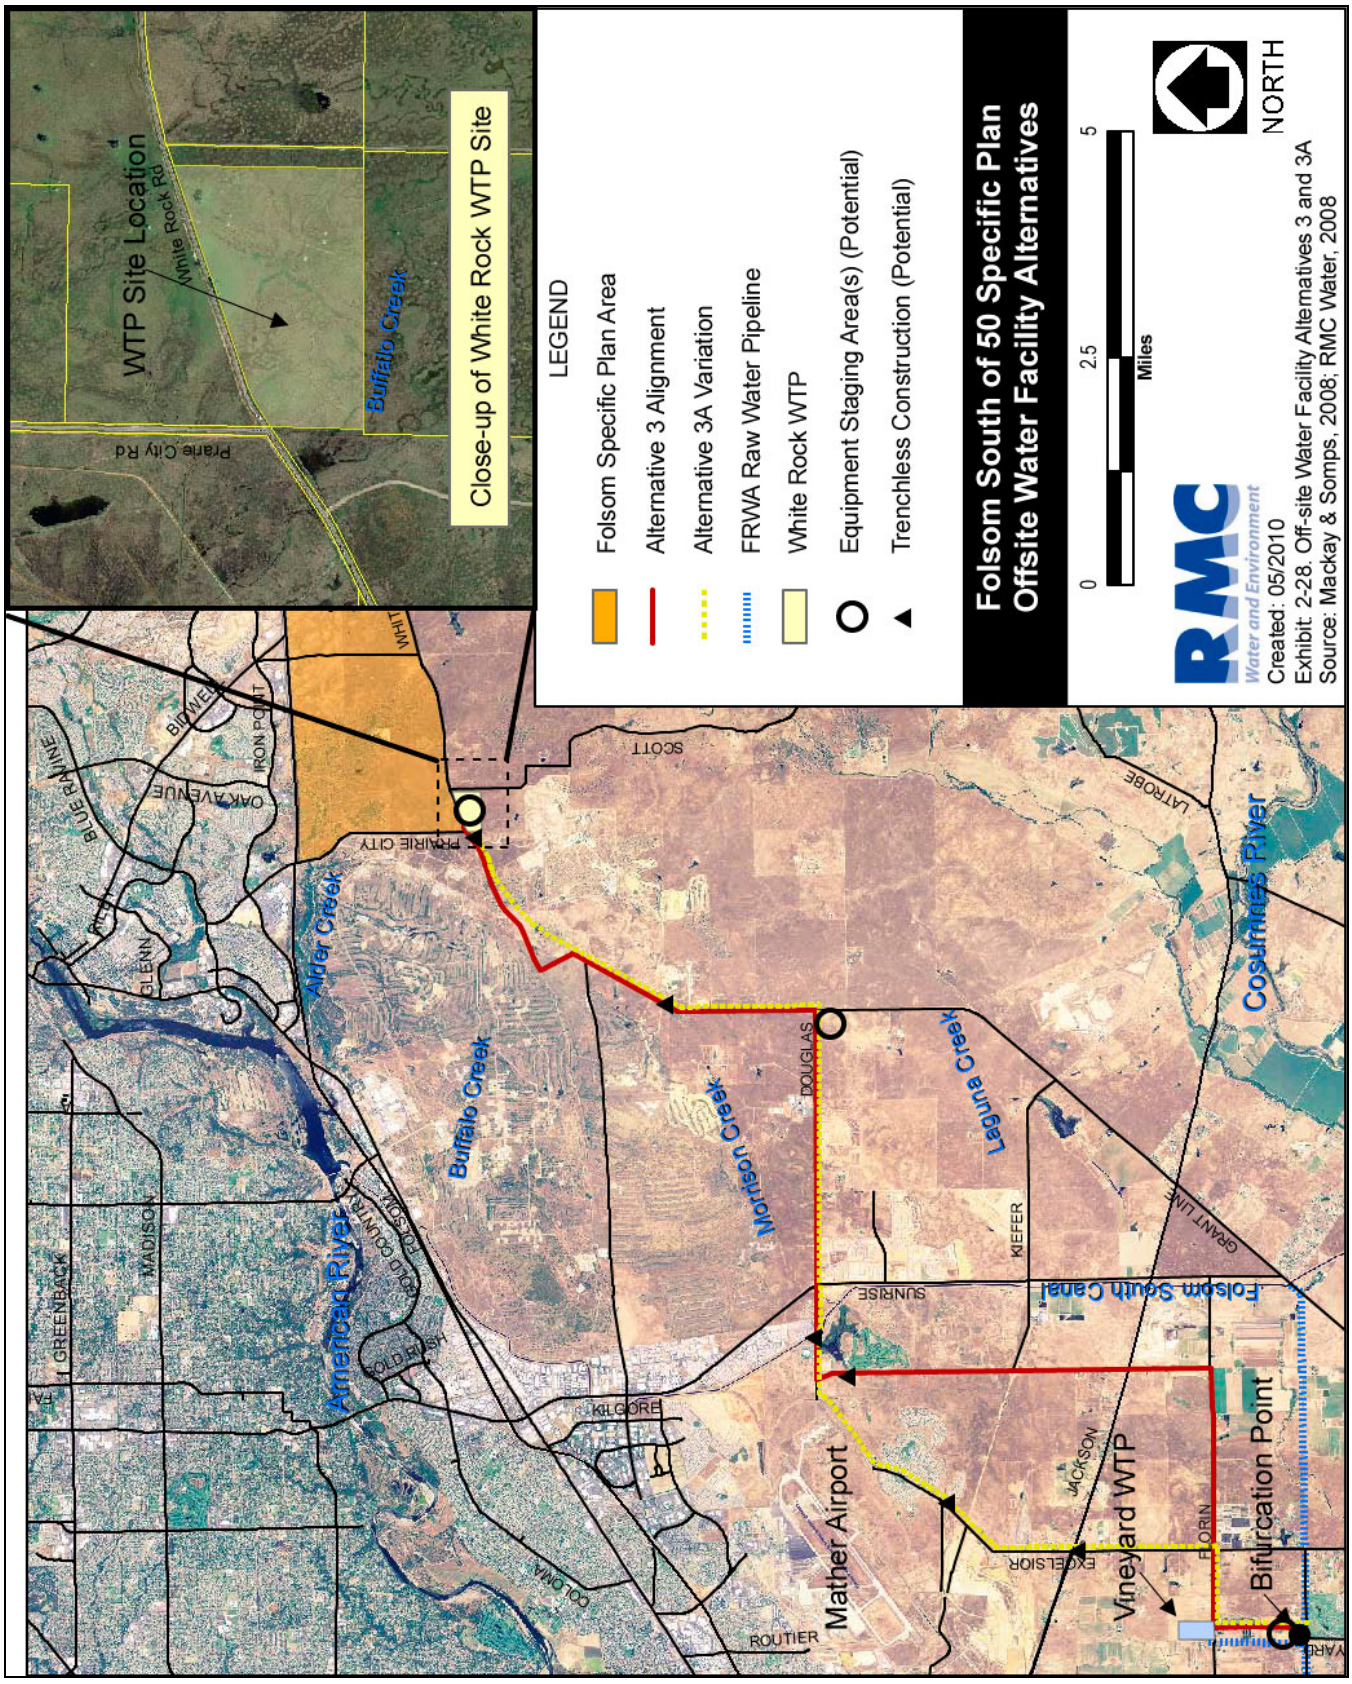
2.6.8 Off-site Water Facility Alternative 2B. Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP

Off-site Water Facility Alternative 2B involves a shortened variation in the conveyance alignment as described for Off-site Water Facility Alternative 2 and would connect to the North Douglas Water Tanks (North Douglas Tanks), which were constructed by SCWA to serve areas within Sunrise Douglas Community Plan area, and extend south along Ivan Way to Douglas Road (see Exhibit 2-28). The alignment would then follow the same route as Off-site Water Facility Alternative 2 to the SPA. All other features associated with this alternative would be the similar to those described for Off-site Water Facility Alternative 2 with treatment provided at the Vineyard SWTP and equalization facilities within the SPA. By constructing the conveyance alignment from the North Douglas Tanks, the length of the pipeline is reduced to approximately 6 miles, thereby resulting in a corridor under consideration of approximately 157 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-28.

Under this alternative, construction of the pumping facility would occur according to the parameters identified for Off-site Water Facility Alternative 1 and located on the existing North Douglas Tanks site. The electrical load requirements for the pumping facility under this alternative are currently estimated at 1,100 HP. Similar to Off-site Water Facility Alternative 2, the conveyance alignment under this alternative would directly connect with the Equalization Tanks within the specific land area.

2.6.9 Off-site Water Facility Alternative 3. Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP

Off-site Water Facility Alternative 3 involves the construction of a raw-water conveyance pipeline from the bifurcation point to the White Rock WTP site south of the intersection of White Rock and Prairie City Roads. As shown in Exhibit 2-29, the Off-site Water Facility Alternative 3 raw water conveyance alignment would



Off-site Water Facility Alternatives 3 and 3A **Exhibit 2-29**

follow the same alignment as described for the treated-water pipeline in Off-site Water Facility Alternative 2. This would result in a pipeline length of 17.4 miles and a corridor under consideration of approximately 423 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-29.

The pump station would be constructed at the same site location and according to the same parameters as identified for Off-site Water Facility Alternative 1. The main difference under Off-site Water Facility Alternative 3 would be that, rather than connecting directly to the equalization facilities within the SPA, this alternative would involve the construction of a new, 10-acre White Rock WTP at the same location as described in Off-site Water Facility Alternative 1. The treatment process under this alternative would be the same as those described for Off-site Water Facility Alternative 1. In addition, similar to Off-site Water Facility Alternative 1, a new treated water pipeline would be constructed from the WTP, which would connect with water backbone infrastructure within the SPA.

2.6.10 Off-site Water Facility Alternative 3A. Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP

Off-site Water Facility Alternative 3A is only differentiated from Off-site Water Facility Alternative 3 by an alternate raw-water conveyance alignment (see Exhibit 2-29). The main difference under this alternative would be that the raw water conveyance alignment would follow the same alignment as described for Off-site Water Facility Alternative 2A. Under this alternative, the City would construct a new, 10-acre White Rock WTP, similar to that described for Off-site Water Facility Alternative 1. This would result in a pipeline length of 16.3 miles and a corridor under consideration of approximately 389 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-29.

2.6.11 Off-site Water Facility Alternative 4. Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP

Off-site Water Facility Alternative 4 would entail the construction of a raw water conveyance pipeline from the bifurcation pump station north to a new WTP located south of Folsom Boulevard – or the Folsom Boulevard WTP – and east of Sunrise Boulevard (see Exhibit 2-30). The raw-water pump station would be constructed according to the same parameters as described for the Proposed Off-site Water Facility Alternative. This would result in a total pipeline length of 19.4 miles and a corridor under consideration of approximately 469.6 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-30.

The raw water pipeline would follow the same alignment as Off-site Water Facility Alternative 3 alignment north to Douglas Road and travel east. Along Douglas Road, the Off-site Water Facility Alternative 4 alignment would deviate from Off-site Water Facility Alternative 3 and transition back to the north at Sunrise Boulevard. From Sunrise Boulevard, the alignment extends north in a cross-country alignment along the western boundary of the Rio del Oro Specific Plan area to White Rock Road. At White Rock Road, the alignment would travel east for a short distance to the southwestern corner of the Aerojet Property (see Exhibit 2-30). The alignment is currently planned to conform to the planned Rancho Cordova Parkway, which will serve as main arterial roadway through the proposed Westborough at Easton project.

Just south of the FSC, the raw water conveyance pipeline would turn back to the east along an existing dirt road to the Folsom Boulevard WTP. Under this alternative, the City would construct the Folsom Boulevard WTP with an

Off-site Water Facility Alternatives 4 and 4A **Exhibit 2-30**

ultimate capacity of approximately 10 mgd on a 10-acre portion of a 118-acre parcel (APN 072-025-1075) south of Folsom Boulevard. Water treatment processes proposed under this alternative would be the same as those described for the Proposed Off-site Water Facility Alternative and illustrated in Exhibit 2-27. At this time, the City has not determined whether it would annex the WTP site into its jurisdiction or whether it would seek development entitlements through the City of Rancho Cordova or Sacramento County depending on timing and, therefore, the environmental analysis considers both options.

From the Folsom Boulevard WTP, the City would construct a new treated-water conveyance pipeline that would travel east along an existing dirt road south of Folsom Boulevard (see Exhibit 2-30). The treated water alignment would follow the existing dirt road, which parallels U.S. 50 to the south, to Prairie City Road. At Prairie City Road, the treated-water alignment would connect with an equalization facility or directly with water backbone infrastructure within the SPA. The existing direct road conforms to the planned roadway alignment for the Easton Valley Parkway.

2.6.12 Off-site Water Facility Alternative 4A. Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP

Alternative 4A would include a minor variation to the raw-water pipeline route described for Off-site Water Facility Alternative 4 (see Exhibit 2-30). Similar to Off-site Water Facility Alternative 3A, this alternative would deviate from the Off-site Water Facility Alternative 4 route at the intersection of Florin and Excelsior Roads and travel north along Excelsior Road and Mather Boulevard. At the intersection with Douglas Road, this alignment would travel back to the east and rejoin the Off-site Water Facility Alternative 4 raw-water alignment east of Eagles Nest Road. The remainder of this alignment and the associated facilities would be identical to those described for Off-site Water Facility Alternative 4. This would result in a total pipeline length of 18.3 miles and a corridor under consideration of approximately 444 acres. Similar to the Proposed Off-site Water Facility Alternative, an exact alignment has not been selected for this alternative and, therefore, this alternative considers a 200-foot-wide corridor or a 100-foot-wide buffer off the roadway centerline along the alignment as shown in Exhibit 2-30.

2.7 Construction of Off-site Water Facility Alternatives

Construction of the selected Off-site Water Facility Alternative would begin in early 2011 (assuming receipt of all environmental clearances, permits, and approvals) with construction of the water treatment facilities starting shortly thereafter. Pipeline construction rates would vary, but would progress at a rate of approximately 200 to600 feet per day. With the inclusion of a WTP, the duration of construction is anticipated to last up to 30 months or through mid- to late-2013.

2.7.1 Treated and Raw Surface Water Conveyance Pipelines

Excavating and installing the untreated and treated water pipelines would require establishing a temporary construction corridor to provide access for equipment, materials laydown, excavated earth and bedding storage, and pipeline trench earthwork. The new pipeline facilities would be installed in existing and, in limited instances, newly acquired rights-of-way and would be completely buried. Manholes or buried blind flanged tees would be installed at regular intervals (approximately 1/4 to 1/2 mile) to provide access for sampling testing, inspection, maintenance, and repair. A few isolation valves (used to close segments of the pipeline) may be installed at regular intervals to close off segments of the pipeline for maintenance, repair, and emergency in breakage situations.

To consider the worst-case scenario for the analysis, it has been assumed that the maximum pipeline diameter (30 inches) would be constructed. Installation of the pipeline would require a permanent easement and an

additional construction easement. Generally, permanent easements are three times the width of the trench. A temporary construction easement of up to 60 feet wide would be required to permit the movement of construction equipment except for narrower sections to reflect the available right-of-way. The permanent easement for the conveyance pipeline(s) would be approximately 10 feet wide to facilitate access by maintenance vehicles.

Construction of the pipeline may involve two methods of pipeline construction: open-cut trenching and trenchless construction. Trenchless construction would be used to traverse creeks or waterways, major intersections, and railroad rights-of-way. These two methods are described in the following discussion.

CONSTRUCTION EQUIPMENT AND STAGING AREAS

At various locations along the construction route, staging areas would be required to store pipe, construction equipment, and other construction-related material. Staging areas would be established along the pipeline route(s) where space is available. In some cases, staging areas may be used for the duration of the construction of the "Water" portion of the project. In other cases, as pipeline construction moves along the route, the staging area would be moved to minimize hauling distances and avoid disrupting any one area for extended periods of time. Potential staging areas include vacant private and public land and parking lots and are identified for each Off-site Water Facility Alternative in Exhibits 2-2, 2-28, 2-29, and 2-30. Staging areas would not be located in sensitive habitat areas unless they would be permanently lost due to subsequent development or facility siting. For staging areas on private property, temporary easements would be required. For staging areas on public property, encroachment permits could be required.

TRIP GENERATION

It has been assumed for this EIR/EIS that the most intense construction activities would occur during early 2011 through 2012, assuming receipt of all environmental clearances, permits, and approvals. To characterize and analyze potential construction impacts, the City has identified a maximum crew size, truck trips, and worker trips, based on expected excavation volumes and quantities of imported materials. The typical crew size for each construction phase would be 10–20 people, plus inspectors. It is expected that up to 22 people could be present during the most intense construction periods for any one crew. Work hours would be governed by permits issued by regulatory agencies and by the applicable noise ordinance, but these are not expected to be restrictive because the area contains few residences. To the extent feasible, construction would occur in the dry months to minimize environmental effects.

During peak excavation, trenching, and earthwork activities and assuming up to three construction crews working simultaneously, the Off-site Water Facility Alternatives could generate up to 66 round-trip truck trips per day during the height of construction. In addition, daily haul truck trips could range from 20 to 30 round trips per day at the height of construction. Roadways that would be used by construction traffic would be contingent on the alignment ultimately selected.

CONSTRUCTION DEWATERING AND HYDROSTATIC TESTING

All raw- and treated-water conveyance pipelines would undergo hydrostatic testing, prior to operation, using water from locally available sources including: local water districts/agencies (e.g., SCWA) or groundwater. The pipeline(s) would be filled with water and pressurized to 1.5 times the operating pressure and maintained at that pressure for a minimum of eight hours to identify any leaks prior to operation. Water used during hydrostatic testing and, if required, construction dewatering would be disposed of via the following methods in compliance with Central Valley RWQCB requirements:

- discharge into sanitary sewer systems; or

- discharge into detention basins, agricultural fields, and, if necessary storm drains, drainage ditches, creeks, or rivers (carbon filtering or other form of water conditioning may be required).

The method to be used would be determined based on the availability and capacity of the systems in the area, requirements of governing agencies, and the quality of the water following hydrostatic testing and/or dewatering. Water quality would be measured from the water source prior to use and after use during discharge to assure that water quality is not compromised as a result of the test. All hydrostatic testing water and dewatering would be discharged using a flow manifold and energy dissipater to control the rate of discharge and to minimize erosion and turbidity to meet the standards set forth under the terms and conditions of the National Pollutant Discharge Elimination System (NPDES), General Construction Permit, and the General Permit for Dewatering and Other Low Threat Discharges to Surface Waters issued by the Central Valley RWQCB.

EXISTING UTILITIES

The City's contractors would implement an Underground Services Alert to identify existing underground utilities and service connections prior to commencing any excavation work. The exact utility locations would be determined by hand-excavated test pits dug at locations determined and approved by the construction manager (also referred to as pot-holing). Temporary disruption of service may be required to allow for construction. Service on such lines would not be disrupted until prior approval is received from the construction manager and the affected utility service provider.

2.7.2 WATER TREATMENT AND STORAGE FACILITIES

Construction of the City-Owned WTP at the On-site WTP, White Rock WTP, or Folsom Boulevard WTP would begin in late 2011 or early 2012, assuming receipt of all environmental clearances, permits, and approvals. The duration of construction is anticipated to last about 18–24 months. Typical construction activities involved in the construction of the WTP facilities would include: site preparation, excavation and sitework, paving, installation of structural facilities, architectural design and landscaping, electrical/instrumentation, and start-up and testing.

2.8 "WATER" ALTERNATIVES CONSIDERED AND ELIMINATED FROM FURTHER CONSIDERATION

The City has considered numerous potential water supplies and conveyance alternatives as part of the "Water" project to support planned development within the SPA that are consistent with the requirements of Measure W. The State CEQA Guidelines (CCR Section 15126.6[d]) emphasize the selection of a range of reasonable alternatives and an adequate assessment of these alternatives to allow for comparative analysis. The "B," or "Water" sections of Chapter 3 in this EIS/EIR analyze the potential impacts of constructing and operating the "Water" portion of the project under one of ten of the Off-site Water Facility Alternatives at an equal level of detail as required by NEPA. Each of the Off-site Water Facility Alternatives would involve the use of CVP Water purchased from the NCMWC, use of the Freeport Project diversion/intake facility, and conveyance capacity within multiple reaches of the Freeport Project.

In this instance, to meet the requirements of both CEQA and NEPA for the analysis of alternatives, the City has used a three-tiered methodology in its evaluation of numerous of water supply and conveyance alternatives for the Folsom Specific Plan. At the first tier, the City considered a wide range of water supply and conveyance alternatives with the premise that the supply needed to demonstrate a firm yield of 5,600 AFY to meet all water demands within the SPA. Several of these "Water" alternatives were eliminated from further consideration since they were not considered sufficiently developed at the time of the writing of this EIR/EIS. The alternatives were also eliminated from further consideration based on institutional concerns, technical short-comings, and concerns regarding long-term reliability.

"Water" alternatives carried beyond this initial alternatives screening are analyzed in Chapters 3 and 4. The second tier "Water" alternatives are identified as Water Supply Options in this EIR/EIS and specifically discussed in Section 3A.18, "Water Supply – Land." The Water Supply Options considered at this intermediate tier are qualitatively analyzed commensurate with the requirements of CEQA, but were not carried forward for equal-level of analysis as required by NEPA, and are thus, not analyzed in Chapter 3 of this EIR/EIS.

The third tier of alternatives analysis under the City's methodology provides an equal-level of analysis as required under NEPA for the Off-site Water Facility Alternatives. The "B," or "Water" sections of Chapter 3 analyze the potential construction and operational affects of the Off-site Water Facility Alternatives. The primary reasoning for carrying the NCMWC's CVP supply forward into the third tier of analysis is based on the findings of the Water Supply Assessment (WSA), provided in Appendix M1, which identified this supply as the most reliable of the all supplies evaluated.

2.8.1 Screening Process and Results for "Water" Alternatives

The selection of "Water" alternatives, including optional water supply sources, to support the Folsom Specific Plan development was based on several factors including their ability to meet the project objectives identified in Chapter 1, "Introduction," current and projected reliability under a variety of water years, and their proximity to the SPA. The alternatives screening process consisted of two major steps:

Step 1: Define the range of water supplies and conveyance facilities along with their availability to facilitate comparative evaluation under the first tier of the alternatives analysis.

Step 2: Evaluate each alternative water supply in consideration of the following criteria:

- **Technical and Engineering and Feasibility.** An alternative must be technically and physically feasible. An alternative must be based on existing and accepted state-of-the-art engineering concepts and cannot be based on experimental technologies. Also, an alternative must not be dependent upon either the availability or acquisition of site locations that cannot be reasonably assured.

- **Raw-Water Quality.** An alternative must provide a water supply or, have the capability of providing a water supply that protects water quality and meets or exceeds State and Federal water quality standards or other applicable water quality standards associated with its use.

- **Environmental Fatal Flaw.** An alternative cannot have environmental impacts that are so significant as to negate the positive attributes of the alternative or, simply transfer potential environmental impacts from one location to another.

- **Economic Feasibility.** An alternative cannot be economically impractical or infeasible. An alternative should be economically attractive such that the total direct costs to the customers and purveyors are minimized and do not significantly exceed the costs of alternatives with similar benefits. Similarly, an alternative cannot result in excessive operation and maintenance costs.

- **Long-term Reliability.** An alternative must be capable of supplying raw-water reliably year round and on a long-term basis.

- **Public Health and Safety.** An alternative should be able to meet all existing and anticipated future State and Federal health and safety requirements.

- **Timing.** An alternative must be capable of being implemented within a reasonable timeframe such that the benefits and needs of the project are not unduly delayed.

- **Institutional.** An alternative cannot possess significant uncertainty that all permits, licenses, or other logistical requirements can be reasonably obtained.

Beyond the Off-site Water Facility Alternatives, which are described in Section 2.13 and would involve the use of CVP water from NCMWC, ten potential "Water" alternatives were reviewed against the criteria listed under Step 2. The range of other "Water" alternatives considered as part of the first tier of analysis under the City's alternatives analysis methodology included the following:

- Groundwater from the Central Sacramento Groundwater Basin
- Diversion of Un-Appropriated American River Water
- Conservation of Existing Entitlements and Water System Retrofit
- Water Supply and Delivery from the El Dorado Irrigation District
- Other Senior Sacramento River Water Right Holders
- Non-Potable Water Supplies
- Water Supply Exchange with Sacramento Municipal Utilities District
- New Sacramento River Diversion and Water Rights
- Use of East Bay Municipal Utility District's Capacity in Freeport Project
- Higher CVP Allocation From NCMWC

POTENTIAL "WATER" ALTERNATIVES NOT CONSIDERED FURTHER IN THIS EIR/EIS

A number of "Water" alternatives were initially considered but eliminated based on further evaluation in conjunction with Step 2. Those "Water" alternatives that were found to be technically feasible and consistent with the City's objectives were carried forward either as potential Off-site Water Facility Alternatives as described in Section 2.13 or as Water Supply Options, which are described and qualitatively assessed in Section 3B.18, "Water Supply." Those "Water" alternatives eliminated from additional consideration are identified below along with the City's reasons of why the potential alternative was not carried forward for additional analysis in this EIR/EIS.

New Sacramento River Diversion and Water Rights

A new Sacramento River diversion and water rights application was determined to be infeasible based on a number of critical reasons. First and most importantly, a new diversion structure on the Sacramento River would no longer take advantage of the existing Freeport diversion facility thereby resulting in direct impacts to the Sacramento River. Construction of a new diversion facility would result in greater environmental impacts to biological resources along the Sacramento River, fisheries, and water quality within the river as compared to the Off-site Water Facility Alternatives. Additionally, the operation of an additional diversion structure could contribute to greater cumulative impacts to Delta inflows and water quality as compared to the Off-site Water Facility Alternatives. Based on these considerations, the City concluded that this "Water" alternative would result in greater environmental impacts when compared to the Off-site Water Facility Alternatives.

Beyond the operational and physical impacts of a new diversion, a new diversion facility and the additional length of conveyance pipeline(s) would add substantially to the cost of this alternative. Based on the added structural facilities, the additional cost would render the project cost-prohibitive.

Further, the completion of the application process for securing new water rights to the Sacramento River would not guarantee the City a secured water supply within the timeframe required for approval of the Folsom Specific Plan. The water rights application process can take several years to complete and there is no level of certainty in terms of whether the SWRCB would approve the application. Based on these circumstances, a new Sacramento River water right would be less certain when compared to the NCMWC's CVP water supply proposed under the Off-site Water Facility Alternatives. For these collective reasons, this "Water" alternative was not carried forward for additional consideration in this EIR/EIS.

Diversion of Unappropriated American River Water

This "Water" alternative would involve the application to the SWRCB for new a new water right permit to appropriate surface water from the American River for diversion at Lake Natoma using the City's existing turnout on the FSC. This alternative was ultimately determined infeasible for a variety of reasons. First, the level of certainty for acquiring newly appropriated American River water supplies was considered low given other pending applications along the American River which, if approved by the SWRCB, could have priority over any newly filed water rights application under this alternative. With the recent revocation of Reclamation's Water Right Permits 16209 and 16212 for the Auburn-Folsom South Unit of the CVP (or the Auburn Dam Project; SWRCB Order WR 2008–0045), it is reasonable for the City to recognize the possibility of appropriating a fraction of this supply and putting it to beneficial use. Water right permits 16209 for up to 100 cfs and 16212 for up to 900 cfs included municipal supply as a beneficial use. However, even though the water supply required for the SPA represents a fraction of this supply, it would take several years for completion of the application process with SWRCB in order to secure this water supply and, therefore, the availability of this water supply within the timeframe necessary for the overall project is unlikely.

Unlike the Off-site Water Facility Alternatives, this alternative would involve the direct diversion of up to 6,000 AFY of surface water from the Lower American River through the FSC. Although this represents a relatively small proportion of total daily flows within the Lower American River, it is possible that the additional diversion under this option could affect flows within the Lower American River and water temperatures, especially during times of low flow. A number of fish species of primary management concern use the Lower American River during one or more of their life stages and include fall-run Chinook salmon, steelhead, splittail, American shad, and striped bass.

Water temperatures within the Lower American River already exceed regulatory standards during the months of August through October in most years. The biological opinion (BO) for Reclamation's Operations Criteria and Plan (OCAP) for Long-Term CVP/California State Water Project (SWP) Operations indicates that effects on steelhead are pronounced due to the inability to consistently provide suitable temperatures for various life stages and flow-related effects caused by operations. The BO's Reasonable and Prudent Alternative (RPA) prescribes a flow management standard, a temperature management plan, additional technological fixes to temperature control structures, and, in the long term, a passage at Nimbus and Folsom Dams to restore steelhead to native habitat (OCAP BO 2009). However, based on this existing condition combined with the fact that these improvements would likely not be in operation in time for this alternative's operation, it is reasonable to conclude that with incrementally less water, these exceedances could be more severe or last for longer durations under this "Water" alternative.

Given these circumstances combined with the City's voluntarily participation in the Water Forum Agreement (WFA), the City decided not to pursue this "Water" alternative due potential conflicts with the WFA. More specifically, the WFA specifically discourages new diversions along the Lower American River, if an agency can reasonably demonstrate an alternate location. Given that the City has identified the Off-site Water Facility Alternatives, which involve diversion of surface water from the Sacramento River, and the City's desire to continue to be an active member in the Water Forum, this "Water" alternative was considered too uncertain to be carried forward for additional analysis.

Water Supply and Delivery from El Dorado Irrigation District

A small portion of the SPA is located within the EID service area. For this reason, the City initially considered water supplies from EID as a potential source of potable water for the Folsom Specific Plan. EID has two water

contracts with Reclamation, for a total of 32,000 AFY from the South Fork of the American River, along with an application submitted for a Fazio Water[7] contract.

Based on information contained in El Dorado County's General Plan Update EIR (2004), existing water demand for EID is estimated to range from 37,000–38,000 AFY. EID currently has a system firm yield[8] of 43,280 AFY. However, current projections for build-out of the recently adopted general plan suggest that demands within EID's service area could increase up to 80,000 AFY thereby potentially resulting in major surface water shortages within EID's service area and the need to develop additional surface water supplies. This water supply impact was identified as a significant in El Dorado County's General Plan EIR (2004).

In response to this anticipated shortfall in water supply, the El Dorado County Water Agency (EDCWA), with the assistance of EID and the other water purveyors in the county, has prepared the EDCWA Water Plan, which is intended to provide a blueprint for actions and facilities needed to address El Dorado County's projected water shortages into the future. One source under consideration in EDCWA's Plan is 15,000 AFY of new CVP M&I contract water for El Dorado County allocated under Fazio Water contract. This new CVP water would be taken directly from Folsom Reservoir, or exchanged for non-CVP water to be diverted from the American River upstream of Folsom Reservoir.

However, this additional water is intended to serve areas within El Dorado County and not areas within Sacramento County as Public Law 101-514 separately allocates new CVP water to SCWA. This water supply is still undergoing environmental review and has not been sufficiently developed to a point where it could be considered reliable to support development within the SPA. Additionally, the development of new CVP water supplies within El Dorado County will require the construction of the necessary supporting infrastructure (e.g., dams) to facilitate the capture and storage of these new supplies. These facilities could result in physical environmental impacts that would likely be greater in extent and severity when compared to those associated within the Off-site Water Facility Alternatives.

For these reasons, a water supply and delivery alternative involving EID was not carried forward for further consideration in this EIR/EIS due to uncertainty whether EID would have enough supply to serve the entire SPA.

Non-Potable Water Supplies

In its pursuit of water supplies for the Folsom Specific Plan development, the City considered several non-potable sources including process water from Granite's proposed Walltown Quarry, Groundwater Extraction and Treatment (GET) Water from Aerojet, and recycled water from SRCSD. At the time of writing of this EIR/EIS, none of these sources has materialized to a point where they could be considered for the purposes of environmental analysis based on existing institutional issues. Further, the use of non-potable water supplies would only address one sector of demand within the Folsom Specific Plan and would not address the potable water supply demand component of the proposed development.

Beyond these institutional issues, the use of recycled water within the SPA would require the construction of necessary conveyance infrastructure to facilitate delivery. At this time, the location and capacity for these conveyance facilities has not been determined. While it can be reasonably assumed that the pipelines would be installed within existing road utility easements, there may also be a need to construct additional facilities at the SCRSD Regional Wastewater Treatment Plant, or an additional scalping plant[9] at another, undetermined location.

---

[7] Fazio Water - Public Law 101-514 (Section 206), of the Water Resources Development Act of 1990 authorized and directed the Secretary of the Interior to enter into a M&I water service contract with local public water purveys including the City, SCWA, EID and others. Specific allocations of Fazio Water are discussed in Sections 3.2B and 3.3B.

[8] EID defines its firm yield as the amount of water that is available for it to use from a source in 95 out of 100 years with existing facilities, while incurring shortages of no more than 20% annually in 5 out of 100 years (EDCWA 2003a).

[9] Satellite reclaimed water production plants that withdraw wastewater from trunk sewers and produce reclaimed water, usually returning the biosolids and any excess water produced back to the sewer.

A scalping plant option would require several miles of easements for pipelines, while modifications at SCRSD's existing treatment plant could require up to ten of miles of easements.

The securing of these easements and construction of associated pipeline facilities would have physical environmental effects similar to those of the Off-site Water Facility Alternatives. However, without a conceptual alignment and operational understanding for these facilities, a comparative analysis under CEQA and NEPA is not feasible at this time. As a result, separate environmental analysis would be required for any non-potable water infrastructure intended to serve the SPA.

East Bay Municipal Utilities District's Capacity within the Freeport Project

Under this "Water" alternative, the City would wheel its CVP water through the Freeport Project using a portion (e.g., 6.5 mgd) of EBMUD's allocated capacity. In concept, an alternative using EBMUD's allocated supply within the Freeport Project would look similar to the Proposed Off-site Water Facility Alternative or Off-site Water Facility Alternative 1. However, rather than constructing a pump facility at the bifurcation point, the City would construct the pumping facility at the FSC. The alignment from this location would then resemble that of Proposed Off-site Water Facility Alternative or Off-site Water Facility Alternative 1 by following Grant Line Road north to the On-site WTP or White Rock WTP immediately south of the SPA.

This "Water" alternative was rejected from further consideration for two primary reasons. First, based on information contained in the Freeport Project EIR, EBMUD's operations at Freeport require full use of the its allocated capacity three out of every ten years. This would eliminate capacity for the City during these three years and would create, for the City, an infeasible need to secure sufficient storage capacity, either above or below ground, to enable for continued service during these three years when capacity within the Freeport Project would otherwise be unavailable. The need to store up to 25,500 AF for three years, especially if the facility were above-ground, would result in a substantially greater footprint when compared to the Off-site Water Facility Alternatives.

Secondly, in preliminary negotiations with EBMUD, EBMUD has been adamant that any capacity allocated to the City within the Freeport Project must be replaced or augmented throughout the remainder of EBMUD's portion of the Freeport Project, which extends south to the Mokelumne River. This arrangement would be required to ensure that EBMUD's service area is not adversely affected by a loss in conveyance capacity. Based on the City's initial investigation, the level of improvements necessary to augment the capacity purchased by the City would render this alternative cost prohibitive. For these reasons, this "Water" alternative was not carried forward for further analysis in this EIR/EIS.

Water Supply Exchange with Sacramento Municipal Utility District

Under this alternative, the City would purchase up to 8,000 AFY of CVP Water from NCMWC and exchange this water supply with SMUD for up to 8,000 AFY of their CVP Water from the American River. SMUD has an existing water service contract with Reclamation that expires in 2012 for delivery of a maximum of 75,000 AFY via the FSC.

SMUD currently has two primary water uses: (1) decommissioning Rancho Seco Nuclear Plant; and (2) cooling requirements at the Cosumnes Power Plant. At the Rancho Seco Nuclear Plant, water is currently diverted from the FSC for dilution of treated-radioactive wastewater, which is subsequently discharged to Clay Creek. The current NPDES Permit (R5-2007-0016) indicates that over time the reduction in the volume of radioactive liquid waste will also result in a corresponding reduction in the quantity of dilution water. The actual reduction in water use resulting from this activity is unknown.

For the Cosumnes Power Plant, SMUD uses approximately 5,300 AFY to meet both phases of the Power Plant's cooling and process water requirements (SMUD 2002). Based on these operational considerations, the City has

assumed that SMUD would be capable of exchanging up to 8,000 AFY of its existing CVP water from the American River.

Under this alternative, the City would construct raw and treated water facilities similar to those described for Water Supply Option 2, as described in more detail in Section 3B.18, "Water Supply", to facilitate diversion of the exchanged water from the FSC at the City's existing turnout. The City would then purchase capacity within EBMUD's dedicated portion of the Freeport Project to wheel up to 8,000 AFY of NCMWC water supply into the FSC. SMUD would then take delivery of the water from its existing intake downstream on the FSC.

In addition to the agreements identified for the Off-site Water Facility Alternatives, this alternative would require an additional agreement with SMUD to facilitate the exchange beyond that described for the Off-site Water Facilities Alternatives. In addition, capacity within EBMUD's portion of the Freeport Project would be required instead of SCWA's. Given that negotiations between the City and SMUD and EBMUD regarding any exchange option remain preliminary at the time of the preparation of this EIR/EIS, this alternative was not considered sufficiently developed to enable for analysis within this EIR/EIS.

Higher Central Valley Project Allocation from Natomas Central Mutual Water Company

The City considered allocations of CVP Water of up to 15,000 AFY from NCMWC during the course of its evaluation. After completing intensive water demand analysis for the SPA, the City determined that 8,000 AFY would be sufficient to serve the SPA development when considering the potential for reductions during dry years. Acquiring any additional supplies could have potential growth implications and, therefore, were not pursued.

2.9 CITY OF FOLSOM GENERAL PLAN AMENDMENT

2.9.1 CHANGES TO PERMITTED DENSITY RANGES

Adoption of the Proposed Project Alternative, the Resource Impact Minimization Alternative, the Centralized Development Alternative, the Reduced Hillside Development Alternative, or the No USACE Permit Alternative would require changes to the density ranges of several City of Folsom General Plan land use designations to accommodate the proposed residential units. The City of Folsom uses a single set of general plan land use designations throughout its jurisdiction, so these changes would alter the permitted density ranges in several areas of the existing City. The following designations would be altered:

- Single Family: existing density range is 2–4 units per acre, proposed density range would be 1–4 units per acre.
- Multi-Family Medium Density: existing density range is 12–18 units per acre, proposed density range would be 12–20 units per acre.
- Multi-Family High Density: existing density range is 18–25 units per acre, proposed density range would be 20–30 units per acre.

These changes would result in an increase of the potential maximum population in some areas of the existing City. A discussion of the potential impacts of this change is included in Section 3A.10, "Land Use and Agricultural Resources – Land."

2.9.2 CHANGES TO THE TRAFFIC LEVEL OF SERVICE STANDARD

The Folsom Specific Plan proposes an amended Level of Service (LOS) policy within the project area (the portion of the City of Folsom to be located south of U.S. 50), as follows:

> The City should strive to achieve at least a traffic Level of Service "C" within the Folsom South of US 50 Specific Plan. For roadways and intersections within the Specific Plan, LOS "D" conditions may be considered on a case by case basis if improvements required to meet LOS "C" exceeds the "normally accepted maximum" improvements established by the City. Complete Streets principles require that streets and intersections be designed with all transportation modes in mind, and that the road widths, delays, and safety impacts to pedestrians and bicycles make larger roadways and intersections incompatible with this philosophy. Coupled with the limited reduction in vehicular delay that such improvements would provide, the City has determined that the benefits of excessively wide roadways and intersections do not outweigh the impacts to the community. Therefore, "normally accepted maximum" improvements on arterial roadways include three through-lanes in each direction; and at intersections includes two left-turn lanes, three through-lanes and one right-turn lane on an approach.

The existing City of Folsom General Plan Policy 17.17, which addresses traffic LOS standards, will not change within the existing City of Folsom boundaries (i.e., north of U.S. 50).

2.10 INTEGRATION OF "LAND" AND "WATER" ALTERNATIVES FOR DEVELOPMENT

Under the No Project Alternative, the SPA could be developed with up to 44 rural residences on 80-acre parcels as currently zoned under the Sacramento County General Plan, and no off-site water facilities would be constructed because each rural resident would be responsible for developing his or her on-site well. Therefore, for purposes of this EIR/EIS, the No Project Alternative is evaluated in the 3A "Land" sections.

Under the No USACE Permit Alternative, there would be no placement of dredged or fill material into waters of the U.S. (including wetlands) from either the "Land" or "Water" portions of the project, thus eliminating the need for a USACE Section 404 CWA permit. In order to achieve "no fill," no development in the SPA would occur within 50 feet of a water of the United States, the water treatment plant (regardless of whether it is located off-site or on-site) would not be constructed within 50 feet of a water of the United States, and the off-site water conveyance pipeline would use trenchless construction methods (e.g., horizontal directional drilling or jack-and-bore) where the pipeline route intersected any water of the United States. Therefore, only the No USACE Permit Off-site Water Facility Alternative could be selected if the No USACE Permit "Land" Alternative were selected for development of the SPA.

Any of the other 10 off-site water alternatives described above could ultimately be implemented for either the Resource Impact Minimization, Centralized Development, or Reduced Hillside Development Alternative. Because the off-site water facilities are different from development of the SPA and would occur in locations that are further removed spatially from the SPA, the impacts of these water facilities are evaluated in the 3B "Water" sections of this EIR/EIS. However, the City and the USACE wish to make clear to the reader that the "project" as a whole consists of both development of the SPA and off-site facilities necessary to provide water in support of the SPA development. Thus, when considering impacts of the "project" as a whole, it is necessary to consider both the 3A and 3B impacts taken together.

2.11 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

The State CEQA Guidelines require identification of an environmentally superior alternative from among the proposed project and the alternatives evaluated. Federal NEPA guidelines also recommend that an environmentally preferred alternative be identified; however, under NEPA, that alternative does not need to be identified until the final record of decision is published. Therefore, the discussion in this section of the environmentally superior alternative is intended to satisfy only the state CEQA requirements.

2.11.1 "LAND" ALTERNATIVES

Table 2-16 shows the overall level of significance for each issue area, and provides a comparison of CEQA significance determinations among the action alternatives (No USACE Permit, Proposed Project, Resource Impact Minimization, Reduced Hillside Development, Centralized Development) and the No Project Alternative for each of the 17 environmental issues evaluated in this EIR/EIS.

The No Project Alternative is defined in Chapter 2, "Alternatives" of this EIR/EIS as (1) no annexation of the SPA to the City, (2) potential development of up to 44 rural residences in the SPA under the existing Sacramento County zoning AG-80, and (3) no construction of any off-site water facilities. Therefore, "no project," from both a "Land" and "Water" perspective, is evaluated as one combined No Project Alternative in the 3A "Land" sections of this EIR/EIS. As shown in Table 2-16, the No Project Alternative would be the Environmentally Superior Alternative. This alternative provides the greatest opportunity for avoidance and/or substantial reduction in the significant environmental impacts of the project. However, this alternative would not meet the project purpose and need, nor would it meet any of the project objectives, as identified in Chapter 1 of this EIR/EIS.

In the event that the "No Project" Alternative is considered the environmentally superior alternative, the State CEQA Guidelines (CCR Section 15126[d][3]) require the identification of an environmentally superior "build alternative." As shown in Table 2-16, all five of the action alternatives (No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development) would have the same overall significance after mitigation in each of the issue areas. However, as described in more detail in the impact analysis contained in Sections 3A.1 through 3A.18, the following differences can be summarized:

- The No USACE Permit Alternative would avoid filling any jurisdictional waters of the U.S., including wetlands. This alternative would also result in the lowest GHG emissions, and has the lowest water demand of any of the five action alternatives.
- The Resource Impact Minimization Alternative would generate the lowest amount of PM_{10} and NO_x emissions among the five action alternatives. This alternative would preserve the most known cultural resources of any of the five action alternatives.
- The Centralized Development Alternative would preserve the largest amount of the hillside within the Sierra Nevada foothills among the five action alternatives. This alternative would also have the least amount of hazards from geologic conditions and soil erosion among the five action alternatives.

Therefore, for the reasons stated above, either the No USACE Permit, Resource Impact Minimization, or Centralized Development Alternative could be considered the "environmentally superior alternative" under CEQA for the "Land" portion of the project.

2.11.2 "WATER" ALTERNATIVES

As described above in Section 2.9.1, because no off-site water facilities would be constructed under the No Project Alternative, the combined impacts of "Land" and "Water" under are evaluated in Section 2.9.1 above and throughout the 3A "Land" sections of this DEIR/EIS.

Construction-related effects identified for the Proposed Off-site Water Facility Alternative and Off-site Water Facility Alternatives NCP, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A would be similar; however, the intensity of those activities is expected to be substantially less under Off-site Water Facility Alternative 2B and NCP. Off-site Water Facility Alternatives NCP, PA, 1, 1A, 2, 2A, 3, 3A, 4, and 4A would require much longer conveyance alignments as compared to Off-site Water Facility Alternative 2B. The No USACE Permit Off-site Water Facility Alternative would avoid potential direct impacts to waters of the U. S. and direct impacts to special status vernal pool species that could occur under the Proposed Off-site Water Facility Alternative and Off-site Water Facility

Table 2-16
Comparison of Impacts of the Proposed Project - Land After Mitigation Implementation to Those of the Alternatives Under Consideration[1]

Environmental Issue	Alternative					
	No Project	No USACE Permit	Proposed Project	Resource Impact Minimization	Centralized Development	Reduced Hillside Development
Aesthetics	LTS	S&U	S&U	S&U	S&U but lesser than Proposed Project and the other action alternatives	S&U

Table 2-16
Comparison of Impacts of the Proposed Project - Land After Mitigation Implementation to Those of the Alternatives Under Consideration[1]

Environmental Issue	Alternative					
	No Project	No USACE Permit	Proposed Project	Resource Impact Minimization	Centralized Development	Reduced Hillside Development
Population, Employment, and Housing	LTS	LTS	LTS	LTS	LTS	LTS
Public Services	LTS	LTS	LTS	LTS	LTS	LTS
Traffic and Transportation	LTS	S&U	S&U	S&U	S&U	S&U
Utilities and Service Systems	LTS	LTS	LTS	LTS	LTS	LTS
Water Supply	NI	LTS and has lowest water demand of action alts	LTS	LTS	LTS	LTS

Notes: LTS = less than significant, NI = no impact, PS = potentially significant, S = significant, SU = significant and unavoidable

[1] The overall impact conclusion for each issue area for each alternative was determined as follows: Separate tables were created for each issue area, and within each alternative, the number of each of the significance conclusions (LTS, PS, S, or NI) before the implementation of mitigation measures was added up and totaled. The significance conclusion that occurred the greatest number of times within each issue area was determined to be the overall impact conclusion for that alternative. For example, if there were four impacts determined to be LTS and two impacts determined to be PS, the impact conclusion would be LTS. In cases where the numbers were the same (i.e., two impacts determined to be LTS and two impacts determined to be PS), the more severe impact was used; in the case of this example, it would be PS. Impacts that are identified in the DEIR/DEIS as being SU after mitigation only because the mitigation is outside of the jurisdiction of the lead agency were assumed to be reduced to LTS for purposes of determining the environmentally superior alternative.

Source: Data compiled by AECOM in 2010

Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4 and 4A. Off-site Water Facility Alternative 2B would avoid some of the more extensive wetland and, potentially, vernal pool impacts that could occur under the Proposed Off-site Water Facility Alternative and Off-site Water Facility Alternatives 1 and 1A. Table 2-17 provides a comparison of CEQA significance determinations among the Off-site Water Facility Alternatives.

Of the action alternatives described in Section 2.13 and analyzed in Chapter 3, Off-site Water Facility Alternative 2B is considered environmentally superior due to its further integration within existing water treatment facilities (e.g., Vineyard SWTP), and a substantially reduced conveyance alignment from the North Douglas Tanks. Alternative 2B would minimize many of the air quality and noise concerns associated with the placement of a WTP adjacent to areas planned for medium- and high-density residential housing, and would also avoid potential indirect and/or direct impacts to special status species, wetlands, and vernal pools along Eagles Nest, Excelsior, and Florin Roads. The No USACE Permit Alternative would provide for the avoidance of direct impacts to special status vernal pool species and waters of the U. S.; however, indirect impacts to waters of the U.S. would still occur, and the No USACE Permit Alternative would not achieve the reduction in air quality, noise, and land use impacts that would be achieved under Off-site Water Facility Alternative 2B.

Therefore, Off-site Water Facility Alternative 2B is considered environmentally superior for purposes of CEQA when compared to the Proposed Off-site Water Facility Alternative, the No USACE Permit Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 2, 2A, 3, 3A, 4, and 4A for both the construction and operation of the "Water" project.

3 AFFECTED ENVIRONMENT, ENVIRONMENTAL CONSEQUENCES, AND MITIGATION MEASURES

3.1 APPROACH TO THE ENVIRONMENTAL ANALYSIS

3.1.1 INTRODUCTION

The California Environmental Quality Act (CEQA) Guidelines (State CEQA Guidelines) require an environmental impact report (EIR) to include an evaluation of potentially significant effects on the physical environment associated with the project and to identify feasible mitigation for those effects. All phases of the project, including planning, acquisition, development, and operation, including all off-site infrastructure and roadway improvements are evaluated in the analysis. California Code of Regulations (CCR) Title 14, Section 15126.2 (14 CCR Section 15126.2) states that:

> An EIR shall identify and focus on the significant environmental effects of the proposed project. In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced. Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. The discussion should include relevant specifics of the area, the resources involved, physical changes, alterations to ecological systems, and changes induced in population distribution, population concentration, and human use of the land (including commercial and residential development), health and safety problems caused by the physical changes, and other aspects of the resource base such as water, historical resources, scenic quality, and public services. The EIR shall also analyze any significant environmental effects the project might cause by bringing development and people into the area affected.

An EIR must also discuss inconsistencies between the Proposed Project and applicable general plans and regional plans (14 CCR Section 15125[d]).

According to 14 CCR Section 15126.4, an EIR must describe potentially feasible measures that could avoid or minimize significant adverse impacts (CCR Section 15126.4[a][1]) and feasible and practicable measures that are fully enforceable through permit conditions, agreements, or other legally binding process (CCR Section 15126.4[a][2]). Mitigation measures are not required for effects that are found to be less than significant.

The Council on Environmental Quality (CEQ) regulations for implementing the National Environmental Policy Act (NEPA) (the "NEPA regulations") specify that a Federal agency preparing an environmental impact statement (EIS) must consider the effects of the proposed action and alternatives under consideration on the environment; these include effects on ecological, aesthetic, and historical and cultural resources, and economic, social, and health effects (defined below). An EIS must also discuss possible conflicts with the objectives of Federal, state, regional, and local adopted land use plans, policies, or controls for the area concerned; energy requirements and conservation potential; urban quality; the relationship between short-term uses of the environment and long-term productivity; and irreversible or irretrievable commitments of resources. An EIS must identify relevant, reasonable mitigation measures that are not already included in the proposed action or alternatives under consideration that could avoid, minimize, rectify, reduce, eliminate, or compensate for the project's adverse environmental effects (40 Code of Federal Regulations [CFR] 1502.14, 1502.16, 1508.8).

This draft document is known as a draft EIR/EIS (DEIR/DEIS). The following discussion introduces Chapter 3 of this EIR/EIS, which addresses the affected environment, environmental consequences, and mitigation measures for each environmental issue area, and explains the organization and general assumptions used in the analysis.

The reader is referred to the individual technical sections regarding specific assumptions and methodology and significance criteria (thresholds of significance) used in the analysis and determination of significance of impacts.

3.1.2 INTEGRATION OF "LAND" AND "WATER" ALTERNATIVES FOR DEVELOPMENT

Because the project includes both "Land" and "Water" components which have distinct sets of alternatives, the analysis in this chapter is split between "Land" sections (Sections 3A.1 through 3A.17) and "Water" sections (Sections 3B.1 through 3B.18).

Under the No Project Alternative, (1) the SPA would not be annexed to the City of Folsom, (2) the SPA could be developed with up to 44 rural residences as currently zoned under the Sacramento County General Plan AG-80, and (3) no off-site water facilities would be constructed. Therefore, for purposes of this EIR/EIS, "no project" from both a "Land" and "Water" perspective is evaluated as one combined No Project Alternative in the 3A "Land" sections.

Under the No USACE Permit Alternative, there would be no placement of dredged or fill material into waters of the U.S. (including wetlands) from either the "Land" or "Water" portions of the project, thus eliminating the need for a USACE Section 404 CWA permit. In order to achieve "no fill," no development in the SPA would not occur within 50 feet of a water of the United States, the water treatment plant (regardless of whether it is located on- or off-site) would not be constructed within 50 feet of a water of the United States, and the off-site water conveyance pipeline would use horizontal directional drilling (i.e., jack-and-bore) construction methods where the route intersected any water of the United States. Therefore, only the No USACE Permit "Water" Alternative could be implemented if the No USACE Permit "Land" Alternative were selected for development of the SPA.

Any of the other 10 off-site water alternatives described Chapter 2, "Alternatives," could ultimately be implemented for either the Resource Impact Minimization, Centralized Development, or Reduced Hillside Development Alternatives in the SPA. Because the off-site water facilities are different from development of the SPA and would occur in locations that are further removed spatially and temporally from the SPA, the impacts of these off-site water facilities are evaluated in the 3B "Water" sections of this EIR/EIS. However, the City and the USACE wish to make clear to the reader that the "project" as a whole consists of both development of the SPA and off-site facilities necessary to provide water in support of SPA development. Thus, when considering impacts of the "project" as a whole, it is necessary to consider both the 3A and 3B impacts taken together.

Each of the 3A and 3B Sections of this EIR/EIS present a discussion of existing conditions, environmental impacts associated with implementation of the Proposed Project and alternatives under consideration, mitigation measures to avoid or reduce the level of impact, and residual significant impacts (i.e., impacts that would be significant and unavoidable despite the imposition of feasible mitigation measures). Issues evaluated in these sections consist of a full range of environmental topics originally identified for review in the notice of preparation (NOP) prepared under CEQA requirements for the project and identified in scoping comments on the NOP and notice of intent (NOI), as required under NEPA. The NOP and NOI are included within the scoping report prepared for the project (Appendix B). Each of the 3A and 3B Sections include the components described below.

3.1.3 SECTION CONTENTS AND DEFINITION OF TERMS

For ease of reference and to prevent confusion, the environmental setting, impacts, and mitigation measures required by CEQA have been prepared largely using NEPA terminology (e.g., affected environment, environmental consequences, and mitigation measures) but all sections comply with CEQA and NEPA regulations. The terms "Effect" and "Impact" are synonymous as used herein (40 CFR 1508.8). This chapter is organized by issue area, generally corresponding to topics in the CEQA Environmental Checklist (State CEQA Guidelines Appendix G, as amended), with the addition of "Environmental Justice," which is required in the NEPA analysis pursuant to Presidential Executive Order 12898. As described below, each section follows the same format.

AFFECTED ENVIRONMENT

The "Affected Environment" subsection provides an overview of the baseline physical environmental conditions (i.e., the environmental baseline) on the project study sites, and surrounding areas as appropriate, in accordance with NEPA regulations (40 CFR 1502.10) and 14 CCR Section 15125, at the time the NOP was published on September 12, 2008.

This approach is consistent with the State CEQA Guidelines (14 CCR Section 15125. NEPA requires a description of the Affected Environment, which is the environment of the area(s) to be affected or created by the alternatives under consideration. The baseline physical conditions required under CEQA will ensure compliance with the NEPA requirement for Affected Environment. This approach also has the virtue of avoiding the potential confusion that might result from using different baselines for CEQA and NEPA purposes.

REGULATORY FRAMEWORK

The "Regulatory Framework" subsection identifies the plans, policies, laws, regulations, and ordinances that are relevant to each topical section and describes required authorizations, permits, and other approvals necessary to implement the project. As noted above, the EIR/EIS needs to address possible conflicts between the Proposed Project or alternatives under consideration and the objectives of Federal, state, regional, or local formally adopted land use plans, policies, or controls for the area.

Conflicts with any Federal, state, or local formally adopted land use plans, policies, or controls for the area are considered appropriate topics under NEPA and must be addressed in the EIS (40 CFR 1502.16[c]). The City has analyzed the project for consistency with the policies of the adopted City General Plan for the action alternatives, and for consistency with the policies of the adopted Sacramento County General Plan for the No Project Alternative and for the water supply and conveyance alternatives, since the project site would not be annexed into the City of Folsom under this alternative, and the water supply and conveyance alternatives occur in areas that would remain under Sacramento County jurisdiction. Some of the water supply and conveyance alternatives also include project components that would be located within the City of Rancho Cordova. According to State CEQA Guidelines CCR Section 15125(d), an EIR "shall discuss any inconsistencies between the proposed project and applicable general plans and regional plans." Although the EIR/EIS discusses inconsistencies with applicable plans and policies for several jurisdictions, the final authority for interpreting policy statements and determining the project's consistency with adopted policies rests with the governing body of the jurisdiction in question, either the City Council or the County Board of Supervisors.

The project would affect a variety of geographical areas, and several general plans are applicable to different parts of the project, including the Folsom General Plan, the Sacramento County General Plan, and the El Dorado County General Plan. For some issue areas there may not be any applicable policies of a particular jurisdiction's general plan based on the type of improvements or changes proposed within that jurisdiction. Where this is the case, the "Regulatory Framework" section includes a note that there are no applicable policies from this jurisdiction's general plan.

ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

The "Environmental Consequences and Mitigation Measures" subsection identifies the impacts of the project on the existing human and natural environment, in accordance with the State CEQA Guidelines (CCR Sections 15125 and 15143) and NEPA regulations (40 CFR 1502.16). The following discussions are included in this subsection.

- **Thresholds of Significance** provide criteria established by the lead agencies to define at what level an impact would be considered significant in accordance with CEQA. Thresholds may be quantitative or qualitative; they may be based on examples found in CEQA regulations or the State CEQA Guidelines; scientific and

factual data relative to the lead agency's jurisdiction; legislative or regulatory performance standards of Federal, state, regional, or local agencies relevant to the impact analysis; City goals, objectives, and policies (e.g., City General Plan); views of the public in the affected area; the policy/regulatory environment of affected jurisdictions; or other factors. Generally, however, the thresholds of significance used are derived from Appendix G of the State CEQA Guidelines, as amended; a Federal agency's NEPA regulations, where defined; factual or scientific information and data; and regulatory standards of Federal, state, regional, and local agencies. These thresholds also include the factors taken into account under NEPA to determine the significance of the action in terms of the context and the intensity of its effects.

- **Analysis Methodology** describes the methods, process, procedures, and/or assumptions used to formulate and conduct the impact analysis.

- **Impact Analysis** provides an assessment of the potential impacts of the project (including off-site infrastructure and roadway improvements) and alternatives on the affected environment. This assessment also specifies why impacts are found to be significant and unavoidable, significant or potentially significant, or less than significant, or why there is no environmental impact. Some of the potential impacts that may result from implementation of the Proposed Project and action alternatives may be temporary and short-term effects resulting from construction activities. However, impacts related to most agricultural and open space land conversion; modification and loss of habitats, including fill of waters of the U.S.; and disturbance of cultural resources would be permanent. The program-level impact analysis, which covers the entire 3,510-acre project area, is prepared in accordance with the State CEQA Guidelines (CCR Sections 15152 and 15168) and NEPA regulations (40 CFR 1500.4[i], 1502.4[b], and 1502.20).

- **Project impacts** are organized under "Impacts and Mitigation Measures," and "Cumulative Impacts." In some 3A "Land" topic sections, impacts have been analyzed at an additional level of detail beyond program-level analysis. Where this additional level of impact analysis was conducted, a statement that impacts under the additional detailed analysis would be the same as impacts under the program-level analysis is presented at the beginning of each 3A "Land" topic area. Project impacts are organized into three categories: direct, indirect, and cumulative impacts. Direct impacts are those that would be caused by the action and would occur at the same time and place. Indirect effects are reasonably foreseeable consequences that may occur at a later time, or at a distance that is removed from the project site. Examples of indirect effects include growth-inducing effects and other effects related to changes in land use patterns, population density, or growth rate, and related effects on the physical environment. A cumulative impact is an impact that would result from the incremental impact of the action when compounded with other past, present, and reasonably foreseeable future actions. Cumulative impacts associated with the project are discussed in a separate chapter in the EIS/EIR (Chapter 4, "Other Regulatory Requirements").

  The impacts are listed numerically and sequentially throughout each section. For example, impacts in Section 3A.3 are identified as 3A.3-1, 3A.3-2, and so on and are identified by the alternative that is applicable to the impact. For example, for the "Land" portion of the project, "NP" refers to the No Project Alternative, "NCP" refers to the No USACE Permit Alternative, "PP" refers to the Proposed Project Alternative, "RIM" refers to the Resource Impact Minimization Alternative, "CD" refers to the Centralized Development Alternative, and "RHD" refers to the Reduced Hillside Development Alternative. For the "Water" portion of the project, the alternatives are referred to as the "Proposed Off-Site Water Facility Alternative;" and Off-Site Water Facility Alternatives 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A.

  An impact statement precedes the discussion of each impact and provides a summary of the impact. The discussion that follows the impact statement includes the evidence on which a conclusion is based regarding the level of impact. Impact conclusions are made using the significance criteria described above and include consideration of the "context" of the action and the "intensity" (severity) of its effects in accordance with NEPA guidance (40 CFR 1508.27).

The level of impact of the Proposed Project Alternative and alternatives under consideration is determined by comparing estimated effects with baseline conditions. Under CEQA, the environmental setting as it exists at the time the NOP is published (as defined above and as described in the "Affected Environment" sections of Chapter 3) normally represents baseline physical conditions. Under NEPA, the No Action Alternative (expected future conditions without the project) is the baseline against which the effects of a Proposed Action and action alternatives are compared. Although, in some instances, a NEPA "no action" scenario can involve significant anticipated changes to existing conditions based on actions taken by nonfederal parties, here the NEPA no action scenario is the same as the CEQA no project scenario. This approach, being conservative from an impact assessment standpoint, is permissible under NEPA and avoids any confusion that might be caused if this document used separate CEQA and NEPA baselines. Expected future conditions without the project would be development of up to 44 individual rural residences on 80-acre parcels in the SPA as contemplated under the existing Sacramento County General Plan, and no off-site water facilities would be constructed.

- **Mitigation measures** to avoid, minimize, rectify, reduce, or compensate for significant and potentially significant impacts of the project, in accordance with the State CEQA Guidelines (14 CCR Sections 15370, 15002[a][3], 15021[a][2], and 15091[a][1]) and with NEPA regulations (40 CFR Part 1508, Section 20), where feasible, are recommended for each significant impact. Each mitigation measure is identified numerically to correspond with the number of the impact being reduced by the measure. For example, Impact 3.3-1 would be mitigated by Mitigation Measure 3.3-1. Where no mitigation is required because the impact conclusion is "less than significant," then the statement "no mitigation measures are required" is provided. Where no feasible mitigation is available to reduce impacts to a less-than-significant level, the impacts are identified as remaining "significant and unavoidable" and the statement "no mitigation measures are available" is provided with an explanation. (In some cases, all feasible and available mitigation measures are not sufficient to reduce an impact to a "less-than-significant" level. When this occurs, the impacts are described as remaining "significant and unavoidable.") No mitigation measures are proposed for the No Project Alternative; in this alternative, the project site would not be annexed by the City of Folsom, and the City has no authority or jurisdiction over any actions that would occur on the project site in this alternative. As discussed in Chapter 2, "Alternatives" the No Project Alternative assumes that the historic agricultural activities in the SPA would continue (i.e., livestock grazing) and no off-site water facilities would be constructed; therefore, no wetlands would be filled. Significant and unavoidable impacts are also summarized in Chapter 4, "Other Statutory Requirements," under the subsection "Significant and Unavoidable Adverse Impacts."

- The **Residual Significant Impacts** subsection identifies any significant impacts that would still be significant even after implementation of the mitigation measures.

3.1.4 TERMINOLOGY USED TO DESCRIBE IMPACTS

IMPACT LEVELS

The EIR/EIS for the project uses the following terminology to denote the significance of environmental impacts of the project:

- **No impact** indicates that the construction, operation, and maintenance of the project would not have any direct or indirect effects on the environment. It means no change from existing conditions. This impact level does not need mitigation.

- A **less-than-significant impact** is one that would not result in a substantial or potentially substantial adverse change in the physical environment. This impact level does not require mitigation, even if feasible, under CEQA.

- A **significant impact** is defined by CEQA Section 21068 as one that would cause "a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project." Levels of significance can vary by project, based on the change in the existing physical condition. This EIR/EIS uses the CEQA definition of significant impact because it is more stringent than that of NEPA. Under CEQA, mitigation measures or alternatives to the Proposed Project must be provided, where feasible, to reduce the magnitude of significant impacts.

- A **potentially significant impact** is one that, if it were to occur, would be considered a significant impact as described above; however, the occurrence of the impact cannot be immediately determined with certainty. For CEQA purposes, a potentially significant impact is treated as if it were a significant impact.

- A **significant and unavoidable impact** is one that would result in a substantial or potentially substantial adverse effect on the environment, and that could not be reduced to a less-than-significant level even with any feasible mitigation. Under CEQA, a project with significant and unavoidable impacts could proceed, but the lead agency would be required to prepare a "statement of overriding considerations" in accordance with State CEQA Guidelines CCR Section 15093, explaining why the lead agency would proceed with the project in spite of the potential for significant impacts.

- A **beneficial impact** is an impact that is considered to cause a positive change or improvement in the environment and for which no mitigation measures are required.

- An impact may have a level of significance that is too uncertain to be reasonably determined, which would be designated **too speculative for meaningful evaluation**, in accordance with State CEQA Guidelines Section 15145. Where some degree of evidence points to the reasonable potential for a significant effect, the EIR/EIS may explain that a determination of significance is uncertain, but is still assumed to be "potentially significant," as described above. In other circumstances, after thorough investigation, the determination of significance may still be too speculative to be meaningful. This is an effect for which the degree of significance cannot be determined for specific reasons, such as because aspects of the impact itself are either unpredictable or the severity of consequences cannot be known at this time.

IMPACT MECHANISMS

Mechanisms that could cause impacts are discussed for each issue area. General categories of impact mechanisms are construction of the project and activities related to future operations, as described in Chapter 2, "Alternatives."

If the project is approved, site work could begin as early as 2011. The environmental analysis focuses on baseline at the time the NOP was published (2008). The project is expected to be built out over approximately 20 years. Project effects fall into the following three categories:

- A **temporary effect** would occur only during construction or demolition activities. The environmental analysis addresses potentially significant impacts from the direct effects of construction at the project site, including but not limited to: demolition of existing structures and buildings, direct effects associated with site development and required on- and off-site infrastructure and roadway improvements, and indirect construction impacts associated with the proposed construction staging areas, fill activities, and construction traffic.

- A **short-term effect** would last from the time construction ceases to within 3 years following construction.

- A **long-term effect** would last longer than 3 years following completion of construction. In some cases, a long-term effect could be considered a permanent effect.

- A **direct effect** is an effect that would be caused by an action and would occur at the same time and place as the action.

- An **indirect effect** is an effect that would be caused by an action but would occur later in time, or at another location, yet is reasonably foreseeable in the future.

In accordance with California Public Resources Code Section 21081.6(a), the City Council, if it approves the project, will adopt a mitigation monitoring and reporting program (MMRP) at the time that it certifies the EIR. The City Council will also be required to adopt findings identifying each significant effect of the project and the extent to which feasible mitigation measures have been adopted. (California Public Resources Code Section 21081.) USACE will also issue a record of decision (ROD) that will reflect USACE's final decision, the rationale behind the decision, and a commitment to monitoring and mitigation. According to Section 1505.2 of the NEPA regulations adopted by the CEQ, the ROD must do all of the following:

(a) State what the decision was.

(b) Identify all alternatives considered by the agency in reaching its decision, specifying the alternative or alternatives which were considered to be environmentally preferable. An agency may discuss preferences among alternatives based on relevant factors including economic and technical considerations and agency statutory missions. An agency shall identify and discuss all such factors including any essential considerations of national policy which were balanced by the agency in making its decision and state how those considerations entered into its decision.

(c) State whether all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted, and if not, why they were not. A monitoring and enforcement program shall be adopted and summarized where applicable for any mitigation.

The following terms are also used in the impact analysis:

- A **cumulative impact** is a project impact that is cumulatively considerable (and thus significant) when compounded with impacts from other past, present, and reasonably foreseeable future projects. A project's incremental effects are not "cumulatively considerable" solely because other projects would have a significant cumulative impact; rather, the project would also need to contribute considerably to worsening these impacts.

- **Construction** applies to activities associated with ground disturbance, construction of new structures and supporting infrastructure and roadways, and the demolition of existing structures and buildings.

- **No mitigation measures are required** is stated in the discussion of mitigation if the impact is considered minimal or less than significant and does not require mitigation.

- **No feasible mitigation measures are available** is stated in the discussion of mitigation if the impact is considered significant and unavoidable, and there is no feasible mitigation available to reduce the magnitude of the impact to a less-than-significant level.

3.1.5 Topics with Less Than Significant or No Impacts from the Project That are Not Carried Forward for Further Analysis in the EIR/EIS

Land

The "Land" sections of this chapter analyze all of the required topic areas under CEQA. With respect to NEPA analysis, a discussion of Indian Trust Assets is excluded from the "Land" discussions. Indian Trust Assets are legal interests in property or rights held by the United States for Indian Tribes or individuals. Trust status originates from rights imparted by treaties, statutes, or executive orders. Examples of Indian Trust Assets are lands, including reservations and public domain allotments; minerals; water rights, hunting and fishing rights, or other natural resources; and money or claims. Assets can be real property, physical assets, or intangible property

rights. Indian Trust Assets cannot be sold, leased, or otherwise alienated without Federal approval. Indian Trust Assets do not include things in which a tribe or individuals have no legal interest such as off-reservation sacred lands or archaeological sites in which a tribe has no legal property interest. No Indian Trust Assets have been identified within the Folsom sphere of influence or adjacent areas. As a result, the "Land" components of the project would have no adverse effects on Indian Trust Assets.

Tribal lands are lands that have been deeded to tribes or upon which tribes have a historical claim. There are no such lands within the Folsom sphere of influence, therefore, this issue is not addressed further in this EIR/EIS.

WATER

Based on an objective review of the Off-site Water Facility Alternatives, including responses to the NOP, a number of resource areas are not expected to have any significant program-level or cumulative impacts, when compared to existing conditions. This EIR/EIS does not contain any further analysis of the impacts of the "Water" components on the issue areas identified below. For each issue area, a brief explanation is provided for why these issue areas are not carried forward into the environmental analysis of the Off-site Water Facility Alternatives. Because these issue areas are excluded from further analysis, there is no section 3B.13, "Population, Employment, and Housing" and therefore is not analyzed for the "Water" components). The discussion of public services impacts of the "Water" components is grouped with "Utilities and Service Systems" in Section 3B.16, therefore, there is no Section 3B.14.

Mineral Resources

Sacramento County contains a wide variety of mineral resources. Both the U.S. Geological Survey and California Geological Survey have evaluated the potential locations and production capacity of various types of extractive resources throughout Sacramento County. A review of available County mineral resource maps indicates that facilities proposed as part of the "Water" components would not impede access to these delineated mineral resources within the eastern portions of Sacramento County. Although portions of the conveyance pipeline alternatives would travel in close proximity to several areas identified as containing mineral resources classified as Mineral Resource Zone (MRZ)-2; given that these alignments would be confined to the existing road right-of-way, their location would not contribute to any increased losses in the availability of known mineral resources. Based on these circumstances, no impact is expected and no mitigation is required.

Population and Housing

No single- or multi-family residential homes are located on the alternative water treatment plant (WTP) sites or within the Off-site Water Facility Alternative conveyance pipeline alignments. The water facilities would be generally constructed in roadway rights-of-way, and so would not affect planned housing units. As a result, the "Water" portion of the project would not displace existing housing or a substantial number of people necessitating the construction of replacement housing elsewhere. Thus, no impact would occur and no mitigation is required.

Issues related to the "Water" component's potential to facilitate growth-inducing and related secondary impacts are addressed in Chapter 4, "Other Required Analyses."

Public Services

The "Water" components of the project would not directly generate population growth or require new public services. The "Water" components would allow the City to provide water service to new development within the Folsom SPA, consistent with the requirements of Measure W. New development within the SPA will be subject to the requirements of the Folsom Specific Plan, which identifies performance standards and funding mechanisms to support the demand for the kinds of public services that would support new residents within the SPA, such as schools, parks, fire, police, or other public facilities. In this context, the "Water" components would have no adverse impacts on existing public services and no mitigation is required.

Issues related to the provision of emergency access and response is addressed in Section B3.15, "Traffic and Transportation – Water," of this chapter.

Indian Trust Assets

No Indian Trust Assets have been identified in the Offsite Water Facilities Study Area. As a result, the "Water" components of the project would have no adverse effects on Indian Trust Assets. Tribal lands are lands that have been deeded to tribes or upon which tribes have a historical claim. There are no such lands within the Offsite Water Facilities' area of potential effect or Study Area, therefore, this issue is not addressed further in this EIR/EIS.

3.1.6 MITIGATION MEASURES OUTSIDE LEAD AGENCY JURISDICTION

Improvements in the Off-site Water Facilities Study Area described in the "Water" sections of Chapter 3 (and some off-site improvements described in the "Land" sections) are outside the jurisdiction of the City of Folsom. These improvements would fall under the jurisdiction of other agencies, including Sacramento and El Dorado Counties, the City of Rancho Cordova, the City of Sacramento, and the California Department of Transportation (Caltrans). Neither the City of Folsom nor the project applicant(s) could control the timing or implementation of project components or mitigation measures which would take place outside of the City of Folsom's jurisdiction. Although the City would be responsible for implementing mitigation measures associated with the water supply facilities, nearly all of the improvements and mitigation actions necessary to provide water to the project site require improvements that would occur outside of the City of Folsom jurisdictional boundaries. In cases where the City is responsible for implementing mitigation outside of its jurisdiction, the City is also responsible for coordinating with the affected jurisdiction(s) to ensure that the mitigation measures proposed in this EIR/EIS may be implemented as described.

This page intentionally left blank.

3A.1 AESTHETICS – LAND

This section contains a program-level evaluation of visual resources. However, impacts to visual resources would be the same under each individual development phase as under the program (entire SPA) analysis.

3A.1.1 AFFECTED ENVIRONMENT

VISUAL ASSESSMENT AND VISUAL QUALITY CRITERIA

The aesthetic quality of an area is determined through the variety and contrasts of the area's visual features, the character of those features, and the scope and scale of the scene. The aesthetic quality of an area depends on the relationships between its features and their importance in the overall view. Evaluating scenic resources requires a method that characterizes visual features, assesses their quality in relation to the visual character of the surrounding area, and identifies their importance to the individuals viewing them. This process is derived from established procedures for visual assessment developed by Federal agencies, and is commonly used for a variety of project types.

Both natural and created features in a landscape contribute to its visual quality. Landscape characteristics influencing visual quality include geologic, hydrologic, botanical, wildlife, recreation, and urban features. Several sets of criteria have been developed for defining and evaluating visual quality. The criteria developed by the Federal Highway Administration in 1981, which are used in this analysis, include the concepts of vividness, intactness, and unity. According to these criteria, none of these is itself equivalent to visual quality; all three must be considered high to indicate high quality. These terms are defined as follows:

- "Vividness" is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns.

- "Intactness" is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements.

- "Unity" is the visual coherence and compositional harmony of the landscape considered as a whole.

The analysis of visual resources for this project uses a qualitative approach for characterizing and evaluating the visual resources of the areas that could be affected by the project. The quality of views of areas that could be affected by the project is evaluated based on the relative degree of vividness, intactness, and unity apparent in views. Viewer sensitivity, also considered in relation to these criteria, is a function of several factors, including the following:

- visibility of the landscape,
- proximity of viewers to the visual resources,
- frequency and duration of views,
- number of viewers,
- types of individuals and groups of viewers, and
- viewers' expectations as influenced by their activity.

The viewer's distance from landscape elements plays an important role in the determination of an area's visual quality. Landscape elements are considered higher or lower in visual importance based on their proximity to the viewer. Generally, the closer a resource is to the viewer, the more dominant, and therefore visually important, it is to the viewer. The U.S. Forest Service (USFS) separates landscapes into foreground, middleground, and background views. Although this should be considered on a case-by-case basis, in general, the foreground is characterized by clear details (within 0.25 or 0.5 mile from the viewer); the middleground is characterized by loss of clear texture within a landscape creating a uniform appearance (foreground to 3–5 miles in the distance); and

the background extends from the middleground to the limit of human sight (USFS 1974). The USFS foreground, middleground, and background view approach is used in this analysis.

REGIONAL SETTING

The SPA is located in eastern Sacramento County, immediately south of the Folsom city limits. The SPA is generally bounded by U.S. Highway 50 (U.S. 50) to the north, White Rock Road to the south, Prairie City Road to the west, and the Sacramento/El Dorado County line to the east.

The SPA is located partially within in the Sierra Nevada foothills and partially within the eastern edge of the Sacramento Valley. The Sierra Nevada foothills consist of gently rolling terrain that grades upward to the east into the higher mountain elevations. The Sacramento Valley is a nearly flat alluvial plain that extends almost 180 miles from the Sacramento–San Joaquin Delta on the south and the city of Redding on the north, and approximately 50 miles from the Sierra Nevada mountains on the east and the Coast Range on the west.

VISUAL CHARACTER OF THE SPA

Visual Character

The SPA consists of over 3,500 acres of undeveloped grasslands that is currently used for cattle grazing. The City of Folsom is located to the north (Viewpoint 1, Exhibit 3A.1-1), the community of El Dorado Hills is located to the east (Viewpoint 2, Exhibit 3A.1-1), land owned by Aerojet General Corporation is located to the west (Viewpoint 3, Exhibit 3A.1-1), and undeveloped land within the unincorporated area of Sacramento County is located south of the SPA (Viewpoint 4, Exhibit 3A.1-1). In the background, the Rancho Seco Nuclear Generating Station (a decommissioned nuclear power plant), appears on the skyline to the south; on clear days, the skyscrapers of downtown Sacramento are visible to the southwest; the Sierra Nevada mountain range can be seen to the southeast; and the Coast Range is within view to the west (Viewpoint 5, Exhibit 3A.1-1).

Developed land north and east of the SPA consists of large residential and commercial developments, several of which are currently under construction. Neighborhoods and shopping centers are generally concentrated as units, and are separated by areas of open space. General visual uniformity between developments exists with use of color schemes that tend to be limited to browns, reds, and neutrals (Viewpoint 6, Exhibit 3A.1-1).

The SPA, as a whole, contains high levels of vividness, intactness, and unity. Because the visual character of this SPA is of high quality, and it is part of a large stretch of undeveloped land along U.S. 50 in eastern Sacramento County that contains oak woodlands and rock outcroppings, it is considered to be a scenic vista.

Sensitive Viewers

As described above, viewer sensitivity is related to the values and opinions of a particular group and can be generally characterized by the viewer activity, awareness, and local significance of a site. The SPA can be seen by two types of sensitive viewer groups: travelers on roadways and people within the City of Folsom.

Travelers include both the drivers and passengers on the following routes:

- U.S. 50 (Viewpoint 7, Exhibit 3A.1-1);
- Prairie City Road (Viewpoint 8, Exhibit 3A.1-1);
- White Rock Road (Viewpoint 9, Exhibit 3A.1-1);
- Scott Road (Viewpoint 10, Exhibit 3A.1-1); and
- Placerville Road (Viewpoint 11, Exhibit 3A.1-1).

Landscapes and Viewpoints **Exhibit 3A.1-1**

Viewpoint 1: Viewpoint from the central lowlands, looking north towards the City of Folsom. Ephemeral drainage and oak trees are visible in the foreground, and Scott Road is visible in the middleground. (AECOM 2009)

Viewpoint 2: Viewpoint from the rolling hills area in the eastern portion of the SPA looking southeast toward the community of El Dorado Hills in the middleground. Rock outcroppings are visible in the foreground. (AECOM 2009)

Representative Photographs (Viewpoints 1 and 2) **Exhibit 3A.1-1**

Viewpoint 3: Viewpoint from the oak woodlands at the western SPA boundary, looking northwest toward the entrance to Aerojet General Corporation facilities west of the SPA. Prairie City Road is in the foreground, oak woodlands on Aerojet General Corporation property are in the middleground, and the City of Folsom is visible in the background. (AECOM 2009*)*

Viewpoint 4: View from the rolling hills in the eastern portion of the SPA, looking south. An ephemeral drainage, a dirt road, and agricultural fencing are located in the foreground, the central lowlands and oak woodland areas of the SPA are located in the middleground, and the Sacramento Valley is located in the background. (AECOM 2009)

Representative Photographs (Viewpoints 3 and 4) **Exhibit 3A.1-1**

Viewpoint 5: View from the rolling hills looking west. The central and eastern lowlands, and oak woodlands on the SPA are visible in the middleground. The Sacramento Valley and the Coast Range are located in the background. (AECOM 2009)

Viewpoint 6: View from the rolling hills near the El Dorado County line towards the community of El Dorado Hills and the Stonebrier residential development. (AECOM 2009)

Representative Photographs (Viewpoints 5 and 6) **Exhibit 3A.1-1**

Viewpoint 7: View from the north side of U.S. 50 looking toward the SPA. Note the oak woodlands in the middleground and high-voltage electrical transmission lines and towers in the background. (AECOM 2009)

Viewpoint 8: View from Prairie City Road looking south. Alder Creek is visible in the foreground, the oak woodlands area of the SPA is located on the left side of the photograph, and Aerojet General Corporation property (which is part of the Easton development project) is located on the right side of the photograph. (AECOM 2009)

Representative Photographs (Viewpoints 7 and 8) **Exhibit 3A.1-1**

Viewpoint 9: View of the SPA from White Rock Road looking west. Note the quartz rock outcropping on the right side of the photograph. The central lowlands, eastern lowlands, and oak woodlands are located in the middleground of the photograph. (AECOM 2009)

Viewpoint 10: View of the SPA from Scott Road looking northwest. The central lowlands are located in the foreground and middleground, and the City of Folsom is located in the background. (AECOM 2009)

Representative Photographs (Viewpoints 9 and 10) **Exhibit 3A.1-1**

Viewpoint 11: View of the SPA from Scott Road looking northeast. Note the radio towers in the middleground, located within the rolling hills area. The City of Folsom is partially visible in the background. (AECOM 2009)

Viewpoint 12: View of the radio towers located within the rolling hills in the eastern portion of the SPA. (AECOM 2009)

Representative Photographs (Viewpoints 11 and 12) **Exhibit 3A.1-1**

Viewpoint 13: View from Handy Family Park, located within the City of Folsom. The middleground contains a view of the central lowlands and oak woodlands portion of the SPA. The Coast Range is located in the background. (AECOM 2009)

Viewpoint 14: View from Town Center Boulevard in El Dorado Hills. The radio towers located within the rolling hills area of the SPA are within view in the middleground of the photograph. (AECOM 2009)

Representative Photographs (Viewpoints 13 and 14) **Exhibit 3A.1-1**

Viewpoint 15: View of oak trees and water feature within the oak woodlands area of the central portion of the SPA. (AECOM 2009)

Viewpoint 16: View of Alder Creek from within the SPA, looking east. (AECOM 2009)

Representative Photographs (Viewpoints 15 and 16) **Exhibit 3A.1-1**

Viewpoint 17: View within the oak woodland area of the SPA, looking east. Electrical transmission lines in the foreground are oriented in an east-west direction, and the high-voltage electrical transmission lines in the middleground are oriented in a north-south direction. (AECOM 2009)

Viewpoint 18: View of the SPA from within the oak woodlands. Note rock outcroppings. (AECOM 2009)

Representative Photographs (Viewpoints 17 and 18) **Exhibit 3A.1-1**

Viewpoint 19: View from Prairie City Road, looking east toward the eastern lowlands area of the SPA. Note the scattered oak trees, high-voltage electrical transmission lines, and electrical transmission towers. (AECOM 2009)

Viewpoint 20: View from Prairie City Road looking toward on-site monitoring wells, used to assess the status of remediation of the Area 40 Superfund Site. (AECOM 2009)

Representative Photographs (Viewpoints 19 and 20) **Exhibit 3A.1-1**

Viewpoint 21: View from within the central lowlands portion of the SPA, east of Scott Road. Note the rock outcroppings and agricultural fencing in the foreground, and oak woodlands in the background. (AECOM 2009)

Viewpoint 22: View from Placerville Road looking south onto the eastern portion of the SPA. Note the electrical power lines and railroad tracks. (AECOM 2009)

Representative Photographs (Viewpoints 21 and 22) **Exhibit 3A.1-1**

Viewpoint 23: View from Scott Road looking west toward the oak woodlands on the SPA. Note the agricultural fencing and rock outcroppings in the foreground. (AECOM 2009)

Viewpoint 24: View from the oak woodlands, just east of the high-voltage electrical transmission lines, looking east. The radio towers in the rolling hills are visible on the horizon, and U.S. 50 is within view on the left side of the photograph. (AECOM 2009)

Representative Photographs (Viewpoints 23 and 24) **Exhibit 3A.1-1**

Viewpoint 25: View from Scott Road, south of White Rock Road, looking toward the eastern side of the SPA. Middleground views include the central lowland and the radio towers on the rolling hills. (AECOM 2009)

Representative Photographs (Viewpoint 25) **Exhibit 3A.1-1**

Sensitive viewer groups within the city of Folsom, community of El Dorado Hills, and unincorporated portions of Sacramento County include:

- Residents (Viewpoint 13, Exhibit 3A.1-1); and
- Employees and patrons at businesses (Viewpoint 14, Exhibit 3A.1-1).

For the purposes of this discussion, the SPA is separated into four distinct landscape areas: oak woodlands, western lowlands, central lowlands, and rolling hills (see Exhibit 3A.1-1). The following is a discussion of each landscape area that considers visual quality and viewer sensitivity.

Oak Woodlands

Visual Character

The oak woodlands are located in the northwestern portion of the SPA. The landscape of this area is characterized by low hills covered with oak trees, and narrow valleys containing ephemeral drainages and creeks (Viewpoint 14, Exhibit 3A.1-1). Views from within the oak woodlands are generally limited to the foreground, and include oak trees, Alder Creek, drainages, ponds, swales, and grassy hills. High-voltage electrical transmission lines and towers run through the middle of this area in a north-south direction, and electrical transmission lines on wooden poles run in an east-west direction (Viewpoint 17, Exhibit 3A.1-1). These are visible from certain viewpoints, although the topography and concentration of trees in this area provides a barrier against these encroachments from the majority of perspectives. Similarly, the City of Folsom and U.S. 50, visible to the north, and radio towers equipped with lights to provide airspace safety are located on the rolling hills area to the east, are visible only from certain locations within the oak woodlands, and are not substantial encroachments on far-reaching views (Viewpoint 24, Exhibit 3A.1-1). In addition, one rural residence is located within the south-eastern corner of the

oak woodlands; however, it is not visible from any existing public roadways or people located within the city of Folsom.

Because the oak woodlands are located within gently rolling terrain, the edges of this area and some peaks in elevation provide broad views of thousands of acres of open space. Although development exists to the east of the SPA, it is not visible to viewers within the oak woodlands, and the resulting view is that of vast undeveloped land. The southern edge of the oak woodlands provides a middleground view of the eastern lowland and a background of gently rolling grasslands. This presents the viewer with a sense of continuous, undeveloped open space covered in low-lying vegetation. Although industrial buildings on Aerojet General Corporation property are visible at some locations across Prairie City Road, views to the west are dominated by oak woodlands and grass-covered hills. (Viewpoint 8, Exhibit 3A.1-1.) The oak woodlands are viewed by travelers on U.S. 50, Prairie City Road south of U.S. 50, rural residents near and within the SPA, and people in the southern portion of the City of Folsom. It is an area of high visual quality. The visual assessment criteria for the oak woodlands landscape area are provided below.

- **Vividness:** The oak woodlands are essentially covered in vegetation consisting of grasslands and tree cover. This landscape is traversed by numerous water features including seasonal wetlands, stock ponds, creeks, ephemeral drainage, and most notably Alder Creek, located at the northern extent of the oak woodlands (Viewpoint 16, Exhibit 3A.1-1). The vividness of this landscape remains year-round. During the winter months, the oak trees lose their leaves and the annual grasses become green, while during summer months when the oak trees are covered in leaves, the grasses lose their color, becoming light brown. In contrast, the alluvial plain created by Alder Creek remains vegetated year-round, and provides an undeveloped riparian landscape. Vegetation near Alder Creek includes oak trees, shrubs such as blackberry, and riparian vegetation including cattails. Two sets of electrical transmission lines travel through the oak woodlands: one in a north-south (high-voltage lines) direction and the other in an east-west direction. The north-south line is the larger encroachment of the two, consisting of two sets of towers standing well above the tree line, as compared to the east-west line, which tends to blend in the with the surrounding landscape (Viewpoint 17, Exhibit 3A.1-1). Although these electrical transmission lines are substantial encroachments on the oak woodland landscape from points where they are visible, in general they do not impede the view. Because the oak woodlands offer a memorable landscape that provides a distinct pattern within the project vicinity, it is considered to have high levels of vividness.

- **Intactness:** As described above, two sets of electrical transmission lines exist within the oak woodlands. These, in addition to agricultural accessories, including fences and dirt roadways, disrupt the integrity of the landscape. However, the oak woodlands cover approximately one-quarter of the SPA, and although both sets of electrical transmission lines bisect this area and other encroachments exist, the trees and topography generally obstruct their view. In addition, water features such as ponds, Alder Creek, and seasonal wetlands, compliment the landscape and provide a sense of visual order (Viewpoint 18, Exhibit 3A.1-1). Therefore, although encroachments exist within the oak woodlands, due to their locations and the nature of the landscape, they do not substantially degrade the visual integrity of the area.

- **Unity:** Unity within the oak woodlands is marked by gently rolling hills covered with trees, grasses, and a variety of water features. Similar to the discussion above, encroachments, including electrical transmission lines, dirt roadways, and agricultural accessories do not substantially disrupt the coherence of the view. The overall view of the oak woodlands provides a sense of visual coherence and compositional harmony.

Viewer Sensitivity

Travelers on U.S. 50, Prairie City Road, and White Rock Road; residents and people within the City of Folsom; and a rural residence located on the SPA, have a clear view of the oak woodland area (Viewpoint 8, Exhibit 3A.1-1). Encroachments may be visible to the motorist, but do not intrude upon the landscape to a degree that would destroy the vividness, intactness, or unity of the site. In addition, the view of the SPA is located along the

longest stretch of undeveloped land on U.S. 50 within eastern Sacramento County, of which several miles are oak woodlands, which is viewed every day by thousands of motorists traveling into and out of Sacramento during the daily working commute. For these reasons, viewer sensitivity is considered to be high.

Western Lowlands

Visual Character

The western lowlands are located in the southeastern portion of the SPA. The landscape of this area is characterized by less topographical variation than other areas of the SPA (i.e., oak woodlands and rolling hills), and is covered with annual grasses and scattered trees (Viewpoint 19, Exhibit 3A.1-1). Views within the western lowlands are generally limited to the middleground and background, due to the generally flat land. Foreground views are limited to annual grasses and scattered trees. Views to the south and east of the western lowlands provide a continuation of open space. To the west, scattered industrial buildings, dirt piles, and chain-link fencing, located on Aerojet General Corporation property, are visible. These industrial buildings and structures are located more than one-quarter mile from the edge of the SPA, and while they are visible, they are not a substantial disruption to the views from the area as a whole. In the background, the City of Folsom is visible to the north; and on clear days, one can see the Sierra Nevada mountain range to the east and Mount Diablo to the southwest. As described below, the vividness, unity, and intactness are considered to be of high value. The visual assessment criteria for the western lowlands landscape area are provided below.

- **Vividness:** As described above, the western lowlands are characterized by a relatively flat area of the SPA, covered with annual grasses and scattered trees. Various encroachments exist in this part of the SPA, including fencing for agricultural purposes, electrical transmission lines, and monitoring wells installed in Area 40 (a Federally listed Superfund Site) (Viewpoint 20, Exhibit 3A.1-1). However, these items are located in close proximity to each other in the western portion of the site and do not provide a substantial distraction to the landscape as a whole. Furthermore, views from the SPA adjacent to White Rock Road and Prairie City Road provide an expansive view of agricultural land to the south and east, characterized by flat vegetation and terrain. Certain vantage points in this area offer a rare opportunity to view undisturbed open space with a clear view of the Sacramento Valley to the south, the undeveloped foothills of the Sierra Nevada mountains to the east, and oak woodlands to the north.

- **Intactness:** As described above, multiple encroachments exist within the western lowlands (Viewpoint 19, Exhibit 3A.1-1). However, the majority of this area provides vast views of undeveloped grasslands, which most people would consider to be aesthetically pleasing. Although encroachments exist, they are few in number, and are concentrated in the western portion of the western lowlands area, resulting in an overall highly intact landscape.

- **Unity:** The western lowlands as a landscape provide a viewer with high levels of visual coherence. This area is exemplary of California's Central Valley rangeland, including gently rolling hills, which contrasts with development in the area. Although there are several encroachments within the area, they are few in number and do not detract from the overall sense of unity; furthermore, the area is essentially surrounded by open space, allowing for scenery with high levels of visual coherence and compositional harmony.

Viewer Sensitivity

Viewers of the western lowlands include travelers along Prairie City Road and White Rock Road. Viewers on both roads can see encroachments (fences and electrical transmission lines) from certain vantage points that degrade the view. However, the general experience of driving on both Prairie City Road and White Rock Road includes far-reaching views of pristine, gently rolling hills covered in annual grasses, and the presence of the Sierra Nevada and Coast Range in the distance. Motorists are likely to find this area to be highly aesthetically pleasing and a welcome change to dense development in nearby areas; thus, viewer sensitivity is considered to be high.

Central Lowlands

Visual Character

The central lowlands are located in the middle portion of the SPA. The landscape of this area is characterized by gently rolling hills covered with annual grasses and scattered trees, water features, and rock outcroppings (Viewpoint 21, Exhibit 3A.1-1). Foreground views consist of far-reaching grassland, rock outcroppings, agricultural fencing, scattered ruins of former structures, various ephemeral drainages, and ponds. Middle ground views consist of farmland to the south, oak woodlands to the west, the City of Folsom and U.S. 50 to the north, and the rolling hills area of the SPA to the east. In the background, the Sierra Nevada mountains are visible to the east, and Mount Diablo is within view to the southwest. As described below, the vividness, intactness, and unity of this area is considered to be of high value. The visual assessment criteria for the central lowlands landscape area are provided below.

- **Vividness:** The central lowlands are characterized by a relatively flat area of the SPA that is covered with annual grasses and the occasional oak tree. In contrast to the western lowlands, the central lowlands have more topographical variation, and contain more water features, agricultural accessories, and rock outcroppings. Encroachments consist of agricultural fencing, electrical transmission lines, remnants of buildings, Scott Road, Placerville Road, and abandoned railroad tracks (Viewpoint 22, Exhibit 3A.1-1). However, even with these encroachments, the majority of this area provides expansive views of undeveloped grasslands dotted with rock outcroppings and oak woodlands (Viewpoint 23, Exhibit 3A.1-1). The view is memorable and highly vivid.

- **Intactness:** As described above, fencing, electrical transmission lines, building remnants, roadways, and abandoned railroad tracks encroach upon the landscape of this area. These types of structures often exist within agricultural land and do not act as a substantial distraction to the landscape as a whole. Furthermore, the topography of the area shields views of these encroachments at many locations within the area, resulting in high levels of intactness.

- **Unity:** The shallow hills and valleys, water features, and agricultural features within the central lowlands provide a classic view of California annual grassland. This area has high levels of unity.

Viewer Sensitivity

Travelers along U.S. 50 have views of both the developed City of Folsom to the north and the open space at the SPA to the south. Some motorists and passengers may be visually drawn toward the large buildings, lighting, and other human-made structures within the City of Folsom. However, the central lowlands appear as the beginning of the Sierra Nevada mountains while traveling east, and of the Sacramento Valley while traveling west. Due to the change in landscape, viewers are likely to be drawn toward the SPA, rather than the City of Folsom while traveling adjacent to this area. Similarly, travelers on the majority of Scott and Placerville Roads have expansive views of the entire SPA, which most people would consider to be highly aesthetically pleasing. In addition, the City of Folsom, located north of the SPA, has been developed at a higher elevation than the central lowlands area, and many homes and businesses contain windows that face toward the SPA. This orientation indicates a visual preference toward the SPA, and therefore high viewer sensitivity.

Rolling Hills

Visual Character

The rolling hills area is located in the eastern portion of the SPA, in the foothills of the Sierra Nevada mountains. The landscape of this area is characterized by steep hills and shallow narrow valleys, containing ephemeral drainages and creeks, and covered with annual grasses and scattered oak trees (Viewpoint 22, Exhibit 3A.1-1). Foreground views consist of grassland, rock outcroppings, agricultural accessories, various ephemeral drainages,

and ponds. Middleground views consist of farmland to the south and west, the City of Folsom and U.S. 50 to the north, and the community of El Dorado Hills to the east. In the background, the Sierra Nevada mountains are visible to the southeast, grasslands and agricultural fields to the south, and the Coastal Range to the west. On a clear day, skyscrapers within the City of Sacramento, and Mount Diablo, are visible to the southwest. As described below, the vividness, intactness, and unity of this area is considered to be of high value. The visual assessment criteria for the rolling hills landscape area are provided below.

- **Vividness:** The rolling hills are covered in annual grasses, scattered trees, and several ephemeral drainages and perennial marshes. The hills offer a vantage point for views of the Sacramento Valley, and thousands of acres of undeveloped grasslands and oak woodlands. Views toward this portion of the SPA provide striking and distinctive views of essentially pristine rolling hills. Motorists, in particular, are likely to appreciate the contrast between this portion of the SPA and nearby developed land. The rolling hills are a unique feature, bordered on the north and east with developments, and open space and farmland to the south and west. This area is considered to be highly vivid.

- **Intactness:** Radio towers equipped with lighting to provide airspace safety are located in the northeastern corner of the rolling hills are visible due to placement at a relatively higher elevation than the rest of the SPA (Viewpoint 11, Exhibit 3A.1-1). As with other areas within the SPA, fencing and dirt roads also act as encroachments. However, the landscape is generally unchanged from its natural state. With the exception of the immediate land surrounding the radio towers and corresponding service road, there is no grading or other human-caused alteration to this area. Because the existing encroachments are minor, this area is considered to have high levels of intactness.

- **Unity:** As discussed above, the rolling hills are essentially free from discernible encroachments. The landscape is characterized by grassy hillsides, exemplary of the Sierra Nevada foothills. With the exception of the northern and eastern edge of this area where one may be visually drawn toward nearby developments, the landscape as a whole contains high levels of visual coherence and compositional harmony.

Viewer Sensitivity

Travelers along U.S. 50 may be visually drawn toward development within the City of Folsom to the north. However, the presence of unaltered open space is likely to be appreciated in a region that has become increasingly more developed in recent years. Additionally, nearby housing units are directed toward the SPA, which is likely due to the spectacular view offered by the SPA as a whole. The rolling hills area is integral to this view, as it contains only a minimal amount of grading and the radio towers. Most people would look upon this area with appreciation for its natural beauty. Viewer sensitivity is considered to be high.

SCENIC ROADWAY DESIGNATION

Scott Road, from White Rock Road south to Latrobe Road, is a designated scenic corridor in the Sacramento County General Plan (Exhibit 3A.1-1, Viewpoint 25). While this portion of Scott Road is not located within the SPA, the rolling hills, central lowlands, and western lowlands of the SPA are visible from the scenic corridor. According to the Scenic Highways Element of the Sacramento County General Plan, the visual character of the roadway, characterized as grasslands and cattle-grazing lands, was considered to be particularly scenic and thus warranted scenic corridor protection.

3A.1.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

No Federal plans, policies, regulations, or laws are applicable to the Proposed Project or alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

California Department of Transportation

The California Department of Transportation (Caltrans) manages the California Scenic Highway Program. The goal of the program is to preserve and protect scenic highway corridors from changes that would affect the aesthetic value of the land adjacent to designated highways. However, there are no state-designated scenic highways in the vicinity of the SPA (Caltrans 2008).

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

The following goals and policies of the Sacramento County General Plan (1993) are applicable only to the Proposed Project and the other alternatives under consideration.

Conservation Element

GOAL: Open space lands in Sacramento permanently protected through coordinated use of regulation, acquisition, density transfer, and incentive programs.

- **Policy OS-1:** Permanently protect, as open space, areas of natural resource value, including wetlands preserves, riparian corridors, woodlands, and floodplains.

- **Policy OS-2:** Maintain open space and natural areas that are interconnected and of sufficient size to protect biodiversity, accommodate wildlife movement and sustain ecosystems.

Scenic Highways Element

GOAL 1: To preserve and enhance the aesthetic quality of scenic roads without encouraging unnecessary driving by personal automobile.

- **Policy 10:** To provide scenic corridor protection for Scott Road from White Rock Road south to Latrobe Road, Michigan Bar Road, and Twin Cities Road from Highway 160 east to Highway 99.

El Dorado County General Plan

The following goals and policies of the El Dorado County General Plan (2004) are applicable only to the two local roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goals and policies that are applicable to the No Project Alternative or the other four action alternatives.

Land Use Element

Topography and Native Vegetation

- **Policy 2.3.1.1:** The County shall continue to enforce the tree protection provisions in the Grading Erosion and Sediment Control Ordinance and utilize the hillside road standards.

Hillsides and Ridge Lines

- **Policy 2.3.2.1:** Disturbance of slopes thirty (30) percent or greater shall be discouraged to minimize the visual impacts of grading and vegetation removal.

Corridor Viewsheds

- **Policy 2.6.1.2:** Until such time as the Scenic Corridor Ordinance is adopted, the County shall review all projects within designated State Scenic Highway corridors for compliance with State criteria.

Lighting Standards

- **Policy 2.8.1.1:** Development shall limit excess nighttime light and glare from parking area lighting, signage, and buildings. Consideration will be given to design features, namely directional shielding for street lighting, parking lot lighting, sport field lighting, and other significant light sources, that could reduce effects from nighttime lighting. In addition, consideration will be given to the use of automatic shutoffs or motion sensors for lighting features in rural areas to further reduce excess nighttime light.

Conservation and Open Space Element

Wetlands

- **Policy 7.3.3.5:** Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.

City of Folsom General Plan

The following goals and policies of the City of Folsom General Plan (1993) are applicable to the Proposed Project and the other four action alternatives. There are no City of Folsom goals and policies that are applicable to the No Project Alternative.

Open Space and Conservation Element

- **Policy 1.1:** New developments shall preserve and/or enhance to the maximum degree feasible, the existing natural vegetation, landscape features and open space, consistent with the Goals and Policies of this Plan.

- **Policy 1.2:** Existing viewsheds and opportunities for viewsheds should be incorporated into the design of new developments.

- **Policy 3.2:** Developments should be compatible with the natural features and the buildings that surround them. Compatibility will be measured by the size and configuration of buildings in a project, the use of materials and landscaping, the preservation of existing vegetation and landscape features, and the location of entrance and exit routes on the SPA.

- **Policy 6.1:** The Sphere of Influence shall include those parcels of land adjacent to the city limit whose development could have significant visual, traffic, service and environmental impacts on Folsom so that the City may influence the ultimate development of those parcels.

City of Folsom Hillside Development Guidelines

On February 14, 1995, the City of Folsom Planning Department adopted Resolution No. 4604—Hillside Development Guidelines—the purpose of which is to illustrate key design principles and issues that City staff will use in evaluating applications for development of any site within hillside areas of the City. The guidelines address street design, grading, site design, parking, drainage, architecture, landscaping, visual impact, and preservation of natural features, and are based on the City's Hillside Development Procedures and Standards Ordinance (Ordinance No. 798).

3A.1.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to aesthetic resources if they would do any of the following:

- have a substantial adverse effect on a scenic vista;
- substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- substantially degrade the existing visual character or quality of the site and its surroundings; or
- create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

Analysis Methodology

This visual impact analysis is based on field observations conducted by AECOM in February 2009 and a review of maps and aerial photographs. Analysis of the project's impacts was based on evaluation of the changes to the existing visual resources that would result from project implementation. In making a determination of the extent and implications of the visual changes, consideration was given to:

- specific changes in the visual composition, character, and valued qualities of the affected environment;
- the visual context of the affected environment;
- the extent to which the affected environment contained places or features that have been designated in plans and policies for protection or special consideration; and
- the numbers of viewers, their activities, and the extent to which these activities are related to the aesthetic qualities affected by the project-related changes.

It should be noted that an assessment of visual quality is a subjective matter, and reasonable people can disagree as to whether alteration in the visual character of the SPA would be adverse or beneficial. For this analysis, a conservative approach was taken, and the potential for substantial change to the visual character of the SPA is generally considered a significant impact.

Impact Analysis

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Action/No Project), NCP (No USACE Permit), PP (Proposed Project), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.1-1 Substantial Adverse Effect on a Scenic Vista. *Project implementation would result in the degradation of the visual quality of a scenic vista.*

On-Site and Off-Site Elements

NP

The high scenic quality of the landscape at the SPA is based on the existing vast views of grasslands, rolling hills, and oak woodlands. The No Project Alternative could include development of up to approximately 44 residential units and associated agricultural land uses in Sacramento County under the existing AG-80 zoning, but no off-site water facilities would be developed. The development of rural housing and associated agricultural activities would not substantially degrade the scenic quality of the SPA, because the general character would remain intact. Under the No Project Alternative, scenic vistas in the SPA would generally remain the same as under the existing conditions. Therefore, this **direct** impact would be **less-than-significant. No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, RHD

A scenic vista is generally considered a view of an area that has remarkable scenery or of a resource that is endemic to the area. The SPA is located on approximately 3,500 acres of undeveloped open space. The scenery consists of grasslands on rolling hills and narrow valleys, waterways, and oak woodlands. Existing development is generally limited to the perimeter, and includes agricultural fencing, electrical transmission lines, and radio towers. Because the SPA contains high levels of vividness, intactness, and unity, and due to its location along U.S. 50 where it is seen by thousands of motorists, viewer sensitivity is considered to be high. This region is part of the Sierra Nevada foothills and the Central Valley, and is exemplary of those landscapes and of resources that are endemic to the area.

Project implementation would substantially degrade this scenic vista. The compositional harmony of this area relies upon the flow of oak woodlands, to gently rolling grasslands, to steep vegetation-covered hillsides. The No USACE Permit, Proposed Project, Resource Impact Minimization, and Reduced Hillside Development Alternatives would include a minimum of 30% open space pursuant to the LAFCo Resolution, which would therefore provide preservation of the existing scenic qualities on over 1,000 acres of the SPA. However, the scenic qualities of the SPA are reliant on coherence between the different landscape types (see Viewpoint 21, Exhibit 3A.1-1.) Furthermore, while implementation of the No USACE Permit or Resource Impact Minimization Alternative would result in an additional several hundred acres of open space as compared to the Proposed Project Alternative, they would not result in substantially less alteration of scenic vistas. Views along nearby roadways would change to housing developments, schools, and general commercial endeavors. In addition, viewsheds that include the SPA are part of thousands of acres of open space that would no longer exist. Instead, this area would contain development that would substantially degrade the existing scenic view of the landscape. This area would become of similar visual quality to nearby developed land, and would no longer be considered a unique or scenic vista.

Because the project-related alterations would have a substantial adverse effect on a scenic vista, this **direct** impact is **significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.1-1: Construct and Maintain a Landscape Corridor Adjacent to U.S. 50.

The project applicant(s) for all project phases shall fund, construct, and maintain a landscaped corridor within the SPA, south of U.S. 50. This corridor shall be 50 feet wide, except that the landscaped corridor width shall be reduced to 25 feet adjacent to the proposed regional mall. Landscaping plans and specifications shall be approved by Caltrans and the City of Folsom, and constructed by the project applicant(s) before the start of earthmoving activities associated with residential or commercial units. Landscaped areas would not be required within the preserved oak woodlands. As practicable, landscaping shall primarily contain native and/or drought tolerant plants. Landscaped corridors shall be maintained in perpetuity to the satisfaction of the City of Folsom.

Implementation: Project applicant(s) of all project phases.

Timing: 1. Plans and specifications: before approval of grading plans and building permits

2. Construction: before the start of earthmoving activities associated with residential and commercial units

3. Maintenance: in perpetuity

Enforcement: City of Folsom Community Development Department and Caltrans

CD

The Centralized Development Alternative would contain approximately 40% more open space than the Proposed Project Alternative. Development would be concentrated toward the center of the SPA, leaving the oak woodlands and rolling hills portions less developed than under the Proposed Project Alternative. However, because commercial development in the rolling hills would still occur south of U.S. 50, the majority of the sensitive viewers (commuters traveling along U.S. 50), would likely consider the scenic qualities to be degraded. Viewers within the community of El Dorado Hills and motorists traveling within the southern portion of Scott Road (past the commercial development) and along White Rock Road would see the preserved view of the hillside.

The existing SPA is considered to be of high quality. This designation is reliant on sweeping views of the Central Valley, and the vividness, intactness, and unity of the existing SPA as a whole. Although preservation of the majority of the rolling hills and oak woodlands would leave certain scenic vistas within the SPA, in general, scenic views would be substantially altered. This impact would be **direct** and **significant. No indirect** impacts would occur **[*Lesser*]**.

Mitigation Measure: Implement Mitigation Measure 3A.1-1.

Off-Site Elements

The proposed off-site detention basin would be located on Aerojet General Corporation property, west of Prairie City Road. This landscape is similar to the western lowlands with the exception of an approximately 8-foot-high chain link fence surrounding its perimeter. The detention basin would be constructed with bermed sides, and would therefore appear as a steeply graded hill of bare soil. Although this would degrade the landscape, this area is not particularly scenic due to fencing and industrial buildings visible in the background. Because the area associated with the detention basin is not a scenic vista, impacts associated with construction of the detention basin would be **direct** and **less than significant**. **No indirect** impacts would occur.

The proposed freeway interchange improvements, the El Dorado County road connections, and the Rowberry Drive Overcrossing would be located in areas that are currently surrounded by existing urban development that

does not contain a scenic vista. Therefore, the impacts would be **direct** and **less than significant**. **No indirect** impacts would occur.

Construction of the proposed sewer force main underneath U.S. 50 would require digging a trench for pipeline placement, then back filling and completely covering all disturbed ground. Because these impacts would be short-term, temporary impacts, and no longer visible upon completion of construction, and because they would occur in a developed urban area that does not contain a scenic vista, they would be **direct** and **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternative would permanently and substantially alter the scenic vista at the SPA. Implementation of Mitigation Measure 3A.1-1 would reduce the impact of substantial alteration of a scenic vista, but not to a less-than-significant level. No other feasible mitigation measures are available to reduce impacts associated with the alteration of scenic vistas from project development to a less-than-significant level. Therefore, this impact remains **significant and unavoidable**.

IMPACT 3A.1-2 Damage to Scenic Resources Within a Designated Scenic Corridor. *Project implementation could damage the character of the viewshed from a County-designated scenic corridor.*

On-Site and Off-Site Elements

NP

Although the SPA does not contain, nor is it visible from, a state-designated scenic highway, Scott Road south of White Rock Road is a designated scenic corridor in Sacramento County because it is considered to be located within an especially scenic rural portion of Sacramento County. The Scenic Highways Element of the Sacramento County General Plan describes views from this roadway as consisting of grasslands and cattle-grazing lands. The No project alternative could include development of up to approximately 44 residential units and associated agricultural land uses in Sacramento County under the existing AG-80 zoning, but would not include the construction of any off-site water facilities. However, the development of up to 44 rural residences scattered over 3,500 acres would have little or no impact on the existing grasslands and cattle-grazing lands in the SPA; therefore, this **direct** impact would be **less-than-significant**. **No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

Views of the SPA from Scott Road, south of White Rock Road, consist of grasslands on rolling hills and scattered oak trees. Encroachments of these views are generally limited to agricultural fencing, electrical transmission lines, and radio towers; all of which are typical of rural landscapes. As discussed above under the No Project Alternative, the Scenic Highways Element of the Sacramento County General Plan describes views from this roadway to consist of grasslands and cattle-grazing lands. These views are exemplary of rural Sacramento County landscape.

Project implementation would substantially damage views from the portion of Scott Road designated as a scenic corridor. The Proposed Project and the other four action alternatives would result in conversion of the existing grassland and cattle grazing land to urban development over several thousand acres. After project implementation, the site would contain views of housing developments, landscaping, and alteration of topography from grading activities that would no longer provide exemplary views of rural Sacramento County landscape that would

substantially damage the existing character of the landscape. These views would damage the scenic character of the northern portion of Scott Road.

Because the project-related alterations would have a substantial damage on scenic resources within a County-designated scenic corridor, this **direct** impact would be **significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No feasible mitigation measures are available.

Off-Site Elements

The off-site elements would not be visible from the portion of Scott Road that is designated as a scenic corridor in the Sacramento County General Plan. Therefore, there would be **no direct** or **indirect impact**.

Mitigation Measure: No mitigation measures are required.

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives would permanently and substantially alter the scenic character of the SPA from open space to urban development, and would therefore substantially damage the viewshed from the northern portion of Scott Road. These changes are inherent to the change from a rural to urban development pattern, and no feasible mitigation measures are available to reduce impacts associated with the damage of scenic resources within a County-designated scenic corridor. Therefore, this impact remains **significant and unavoidable**.

IMPACT 3A.1-3 Substantial Degradation of Existing Visual Character or Quality of the Site and its Surroundings. *Project implementation would substantially degrade the visual character of the SPA through conversion of rolling hills and oak woodland to developed urban uses.*

On-Site and Off-Site Elements

NP

The No Project Alternative could include development of up to approximately 44 residential units and associated agricultural land uses in Sacramento County under the existing AG-80 zoning, but no off-site water facilities would be constructed. Because the site is generally suitable only for dryland farming (i.e., livestock grazing), agricultural activities are likely to be similar to those already occurring on the SPA. However, the additional rural residences, agricultural buildings, and other agricultural development that could occur would still degrade the visual character of the SPA from open space to rural housing and associated agricultural land uses, although to a much lesser extent than under the Proposed Project. Therefore, this **direct** impact would be **significant. No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RHD, RIM

The SPA consists of approximately 3,500 acres of grasslands and oak woodlands set on undeveloped rolling hills. Under the Proposed Project, Resource Impact Minimization, Reduced Hillside Development, and No USACE Permit Alternatives, substantial alterations would occur to all landscape areas within the SPA. At full buildout, the visual character of the SPA would consist of developed urban land uses with small areas of open space and parks. The majority of the existing oak woodlands in the central portion of the SPA would also be retained.

SPA development, upon annexation to the City of Folsom, is required to preserve at least 30% as natural open space. Under the No USACE Permit and Resource Impact Minimization Alternatives, open space preservation

would be increased by several hundred acres. This would be driven primarily by avoidance of existing water features (i.e., wetlands) and would entail less commercial and residential developments. However, the visual character would not be substantially more preserved than the Proposed Project. Although there would be an overall increase in open space preservation, this would generally occur as pathways between residential and commercial development. Motorists on surrounding roadways and other sensitive viewers would no longer have views of expansive grasslands within the SPA. Increasing the space between dwelling units, schools, and other buildings would not substantially decrease the resulting degradation of visual character within the SPA.

Implementation of the No USACE Permit, Proposed Project, Resource Impact Minimization, and Reduced Hillside Development Alternatives would result in conversion of grassy hillsides to urban areas, generally consisting of housing units and commercial developments. Views would be permanently altered to urban development, substantially degrading viewsheds located on Scott Road, Placerville Road, White Rock Road, U.S. 50, and for people located within the community of El Dorado Hills, the City of Folsom, and nearby rural residences.

Reasonable people may differ as to the aesthetic value of undeveloped grasslands and oak woodlands, and whether development of urban uses in the SPA would constitute a substantial degradation of the existing visual character or quality of the site and its surroundings. However, given the large scale of this urban development and the rural nature of its setting, a conservative approach has been taken for this analysis, and the degradation of visual character at the SPA is considered to be substantial, and impacts on visual resources from project implementation are considered to be **direct** and **significant. No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3A.1-1 and 3A.7-4.

CD

The Centralized Development Alternative would preserve a substantial portion of the rolling hills in the eastern portion of the SPA. To achieve this preservation, the residential development that would be constructed on the hillside under the other action alternatives would be shifted to the central portion of the SPA. However, commercial development would still occur on the hillsides along U.S. 50. Because of the commercial development in the rolling hills that would occur south of U.S. 50, the majority of the sensitive viewers, which are commuters traveling along U.S. 50, would not be able to see any preserved viewshed. Only those motorists traveling further south on Scott Road (past the proposed commercial development) or motorists along White Rock Road would see the preserved view of the hillside.

At full build-out, approximately 75% of the rolling hills area would be preserved under this alternative, thus keeping a substantial portion of the SPA as open space and preserving its visual character. However, the remaining two-thirds of the SPA would still be developed with urban uses. The sweeping view of the Central Valley, coupled with oak woodlands and grass-covered hillsides, creates the visual character of the SPA as a whole. By developing the central and western lowlands, these views would no longer exist as they do now. Housing units, commercial developments, and other structures would take the place of open space. Development in the central portion of the SPA would disrupt the existing landscape components, alter the visual coherence, and create substantial encroachments on viewsheds, all of which would degrade the visual character of the SPA. Therefore, this impact is considered **direct** and **significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.1-1 and 3A.7-4.

Off-Site Elements

The landscape at the proposed detention basin site is similar to the western lowlands with the exception of an approximately 8-foot-high chain link fence. The detention basin would be constructed with bermed sides, and would therefore appear as a steeply graded hill. The basin would be highly visible to motorists traveling on White

Rock Road and Prairie City Road, and would result in a **direct, significant** impact from degradation of the existing visual character. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No feasible mitigation measures are available.

The proposed freeway interchange improvements, El Dorado County road connections, and the Rowberry Drive Overcrossing would be built in landscaped areas that are already surrounded by urban development. Construction of these features would not substantially alter the visual character because the footprint of these features is already located with a developed area. Therefore, this **direct** impact would be **less than significant**. Construction of the proposed force main underneath U.S. 50 would require digging a trench for pipeline placement, then back filling and completely covering all disturbed ground. Because these impacts would be temporary, short-term impacts, and no longer visible upon completion of construction, and would occur in an area that already consists of urban development, they would be **direct** and **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measures 3A.1-1 and 3A.7-4 would reduce significant impacts associated with substantial adverse effects on a scenic vista under the No USACE Permit, Proposed Project, Resource Impact Minimization, and Reduced Hillside Development, and Alternatives by reducing the extent of grading within the SPA and providing a 50-foot-wide landscaped corridor between U.S. 50 and the SPA. However, views of new housing developments, schools, and general commercial endeavors would only be slightly obstructed and hillside grading would remain pronounced. Once open space is converted to urban land uses, it is a permanent change in land use and to the visual character. Project implementation would still substantially alter a scenic vista. Therefore, this direct is considered **significant and unavoidable**.

IMPACT 3A.1-4 Temporary, Short-Term Degradation of Visual Character for Developed Project Land Uses During Construction. *Project implementation would involve four phases of construction over a 20-year-buildout period. Construction activity would involve the temporary and short-term use of staging areas for construction equipment and materials, which would be visible to adjacent project land uses that have already been developed.*

On-Site and Off-Site Elements

NP

The No Project Alternative could include development of up to approximately 44 residential units and associated agricultural land uses in Sacramento County under the existing AG-80 zoning, but no off-site water facilities would be constructed. Development of these 44 rural residences would be minor considering the size of the SPA, would be scattered over approximately 3,500 acres, would involve very small amounts of scattered construction activity at different times, and views during construction would likely be blocked by the varied topography and oak woodlands. Therefore, this **direct** impact would be **less than significant. No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

The presence and movement of heavy construction equipment and staging areas could temporarily degrade the existing visual character and/or quality of the SPA and surrounding area for existing developed land uses. Project implementation would involve four phases of similar types of construction over a 20-year-buildout period. During this time, adjacent project development, including sensitive land uses such as residential housing, schools, and parks, would be occupied while construction is occurring in a different phase.

Construction activities would require the use of various types of equipment, such as scrapers, graders, dozers, and trucks as well as signs, cones, and trash receptacles. Project construction would involve the temporary use of fenced staging areas for construction equipment and materials. Although these staging areas would be located in disturbed areas, construction equipment and materials would be visible to residents, employees at existing businesses, and at parks and school sites over a 20-year duration.

Thus, construction activities would temporarily degrade the existing visual character of the SPA in the vicinity of developed areas. This impact is **direct** and **significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.1-4: Screen Construction Staging Areas.

The project applicant(s) for all project phases shall locate staging and material storage areas as far away from sensitive biological resources and sensitive land uses (e.g., residential areas, schools, parks) as feasible. Staging and material storage areas shall be approved by the appropriate agency (identified below) before the approval of grading plans and building permits for all project phases and shall be screened from adjacent occupied land uses in earlier development phases to the maximum extent practicable. Screens may include, but are not limited to, the use of such visual barriers such as berms or fences. The screen design shall be approved by the appropriate agency to further reduce visual effects to the extent possible.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries shall be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, and Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before approval of grading plans and building permits and during construction for all project phases.

Enforcement:

1. For those improvements that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.

2. For the two local roadway connections from Folsom Heights into El Dorado Hills: El Dorado County Community Services Department.

3. For the U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measure 3A.1-4 would reduce significant impacts associated with temporary visual-quality degradation for developed land uses from concurrent construction staging areas under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives by providing visual screening. However, because screening may not always be feasible (i.e., projects covering a large area or tall buildings); this temporary, short-term impact is considered **potentially significant and unavoidable**. Additionally, some of the off-site elements fall under the jurisdiction of El Dorado County or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.1-5 Creation of a New Source of Substantial Light or Glare that would Adversely Affect Day or Nighttime Views in the Area. *Project implementation would require lighting of new development, which would cause new and increased light and glare.*

On-Site and Off-Site Elements

NP

The No Project Alternative could include development of up to approximately 44 rural residential units in Sacramento County under the existing AG-80 zoning, but no off-site water facilities would be constructed. Development of the 44 rural residences would be scattered over approximately 3,500 acres, the amount of new light and glare would be minimal, and most views would be blocked by the varied topography and oak woodlands. Therefore, this **direct** impact is considered **less than significant. No indirect** impacts would occur. ***[Lesser]***

NCP, PP, RIM, CD, RHD

Light associated with urban development can result in spillover lighting and glare effects. Spillover lighting is artificial lighting that spills over onto adjacent properties and could cause an annoyance to neighboring residents by disturbing sleep patterns. Glare is intense light that shines directly, or is reflected off a surface, into a person's eyes. Use of building materials such as reflective glass and polished surfaces can cause glare. During daylight hours, the amount of glare depends on the intensity and direction of sunlight. Glare is particularly acute at sunrise and sunset because of the low angle of the sun in the sky.

Currently, the SPA consists of grasslands and oak woodlands, with a few utility-related structures (e.g., electrical transmission lines, radio towers). With the exception of lighting used on tall structures for airspace safety purposes and one on-site rural residence, there are currently no artificial light installations. Implementation of proposed development would require lighting for roadways; commercial, office, and industrial buildings; parking lots; residences; and other public facilities such as schools and parks. In addition, nighttime lighting or the presence of reflective surfaces on buildings in the commercial, office, and industrial areas (e.g., reflective window glazing) may result in light and glare shining onto motorists on U.S. 50, White Rock Road, Placerville Road, Scott Road, and Prairie City Road, and to residences within the City of Folsom and the community of El Dorado Hills.

Because of the scale of proposed development and because project implementation would introduce a substantial quantity of light into a rural landscape, overall light and glare effects are considered **significant** and **direct**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.1-5: Establish and Require Conformance to Lighting Standards and Prepare and Implement a Lighting Plan.

To reduce impacts associated with light and glare, the City shall:

- Establish standards for on-site outdoor lighting to reduce high-intensity nighttime lighting and glare as part of the Folsom Specific Plan design guidelines/standards. Consideration shall be given to design features, namely directional shielding for street lighting, parking lot lighting, and other substantial light sources, that would reduce effects of nighttime lighting. In addition, consideration shall be given to the use of automatic shutoffs or motion sensors for lighting features to further reduce excess nighttime light.

- Use shielded or screened public lighting fixtures to prevent the light from shining off of the surface intended to be illuminated.

To reduce impacts associated with light and glare, the project applicant(s) of all project phases shall:

- Shield or screen lighting fixtures to direct the light downward and prevent light spill on adjacent properties.
- Place and shield or screen flood and area lighting needed for construction activities, nighttime sporting activities, and/or security so as not to disturb adjacent residential areas and passing motorists.
- For public lighting in residential neighborhoods, prohibit the use of light fixtures that are of unusually high intensity or brightness (e.g., harsh mercury vapor, low-pressure sodium, or fluorescent bulbs) or that blink or flash.
- Use appropriate building materials (such as low-glare glass, low-glare building glaze or finish, neutral, earth-toned colored paint and roofing materials), shielded or screened lighting, and appropriate signage in the office/commercial areas to prevent light and glare from adversely affecting motorists on nearby roadways.
- Design exterior on-site lighting as an integral part of the building and landscape design in the SPA. Lighting fixtures shall be architecturally consistent with the overall site design.
- Lighting of off-site facilities within the City of Folsom shall be consistent with the City's General Plan standards.
- Lighting of the off-site detention basin shall be consistent with Sacramento County General Plan standards.
- Lighting of the two local roadway connections from Folsom Heights off-site into El Dorado Hills shall be consistent with El Dorado County General Plan standards.

A lighting plan for all on- and off-site elements within the each agency's jurisdictional boundaries (specified below) shall be submitted to the relevant jurisdictional agency for review and approval, which shall include the above elements. The lighting plan may be submitted concurrently with other improvement plans, and shall be submitted before the installation of any lighting or the approval of building permits for each phase. The project applicant(s) of all project phases shall implement the approved lighting plan.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases.

Timing: Before approval of building permits for each project phase.

Enforcement:

1. For all on-site and off-site facilities that would be located within the City of Folsom: City of Folsom Neighborhood Services Department and City of Folsom Community Development Department.
2. For the off-site detention basin: Sacramento County Planning Department.
3. For the two local roadways off-site into El Dorado Hills: El Dorado County Community Services Department.

Implementation of Mitigation Measure 3A.1-5 would reduce significant impacts associated with effects from new sources of light and glare to a **less-than-significant** level under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives by establishing on-site lighting standards in the specific plan, requiring conformance with established general plan standards, and requiring the project applicant(s) of all project phases to prepare and implement lighting plan. However, some of the off-site elements (two roadway connections in El Dorado County and detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.1-6 New Skyglow Effects. *Project implementation would require lighting of new development that would result in the generation of new and increased skyglow effects, obscuring views of stars, constellations, and other features of the night sky.*

On-Site and Off-Site Elements

NP

Skyglow is artificial lighting from urbanized uses that alters the rural landscape and, in sufficient quantity, lights up the nighttime sky, thus reducing the visibility of astronomical features. The No Project Alternative could include development of up to approximately 44 rural residential units in Sacramento County under the existing AG-80 zoning, but no off-site water facilities would be constructed under this alternative. Development of these 44 rural residences would be scattered over approximately 3,500 acres, and the amount of nighttime lighting would be minimal (likely limited to security lighting at front or back doorways). Therefore, this **direct** impact is considered to be **less than significant. No indirect** impacts would occur. ***[Lesser]***

NCP, PP, CD, RHD, RIM

The SPA consists of undeveloped agricultural grazing land, radio towers on the hillside, and electrical transmission lines. Existing light sources are associated with one rural residence and lighting on utility towers to provide airspace security. The existing land uses are not a substantial source of nighttime lighting. Therefore, these areas generate no substantial sources of skyglow into the night sky. However, a substantial increase in the amount of nighttime light would result from the development of the SPA with urban land uses including residences, commercial and industrial land uses, and schools and parks over approximately 2,500 acres, which would obscure views of the stars, constellations, and other features of the night sky.

Because project implementation would introduce a substantial quantity of nighttime light over a large area of a rural landscape that is essentially dark under existing conditions, overall skyglow effects are considered a **significant** and **direct** impact. **No indirect** impacts would occur.

Mitigation Measure: Implement Mitigation Measure 3A.1-5.

Implementation of Mitigation Measure 3A.1-5 would partially reduce significant impacts associated with effects from skyglow under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives. Mitigation Measure 3A.1-5 would require the development and implementation of an on-site lighting plan and by requiring conformance with general plan standards for the off-site facilities. However, because of the scale and location of the SPA and the off-site elements, screening or shielding of light fixtures to direct light downward or the use of low-pressure sodium or other lighting would not reduce the effects of new skyglow on the night sky to a less-than-significant level. Therefore, impacts would remain **significant and unavoidable**.

3A.1.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of mitigation measures contained in this section would reduce impacts associated with new light and glare to a less-than-significant level. Impacts related to substantial alteration of a scenic vista, damage to designated scenic corridor, and substantial degradation of visual character due to development would be significant and unavoidable because no feasible mitigation measures are available to reduce these impacts to a less-than-significant level. Implementation of Mitigation Measure 3A.1-4 would help to reduce the temporary, short-term degradation of visual character during construction; however, additional feasible mitigation measures are not available to reduce these impacts to a less-than-significant level. Although Mitigation Measure 3A.1-5 may reduce impacts associated with the new skyglow effect, additional feasible mitigation measures are not available to reduce these impacts to a less-than-significant level. Therefore, these impacts would remain potentially significant and unavoidable.

In addition, some of the off-site elements (two roadway connections in El Dorado County and detention basin in Sacramento County) fall under the jurisdiction of El Dorado and Sacramento Counties; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these off-site elements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of El Dorado and Sacramento Counties, Impacts 3A.1-4 and 3A.1-5 are considered potentially significant and unavoidable for off-site improvements which would be located in Sacramento or El Dorado County jurisdiction.

This section was prepared by RMC Water and Environment.

3B.1 AESTHETICS – WATER

This section provides a description of the existing visual and aesthetic resources within the "Water" Study Area. In the context of the actions proposed as part of the Off-site Water Facility Alternatives, emphasis is placed on portions of the "Water" Study Area where physical environmental changes would occur. As provided in Chapter 2, "Alternatives," physical improvements associated with the Off-site Water Facility Alternatives are limited to areas within Zone 4; whereas no physical improvements are proposed within Zones 1, 2, or 3. For this reason, the "Aesthetics" analysis for the "Water" project is focused primarily on Zone 4. Secondary emphasis is also placed on Zone 2 in the context of the potential changes in flow that could occur within the Sacramento River as a result of long-term operation of the Off-site Water Facilities.

3B.1.1 AFFECTED ENVIRONMENT

VISUAL ASSESSMENT AND VISUAL QUALITY CRITERIA

The analysis of visual resources for the Off-site Water Facility Alternatives uses a qualitative approach for characterizing and evaluating the visual resources as described in Section 3A.1. This approach applies specific criteria developed by the Federal Highway Administration in 1981 that include the concepts of vividness, intactness, and unity. According to these criteria, none of these is itself equivalent to visual quality; all three must be considered high to indicate high quality. These terms are defined as follows:

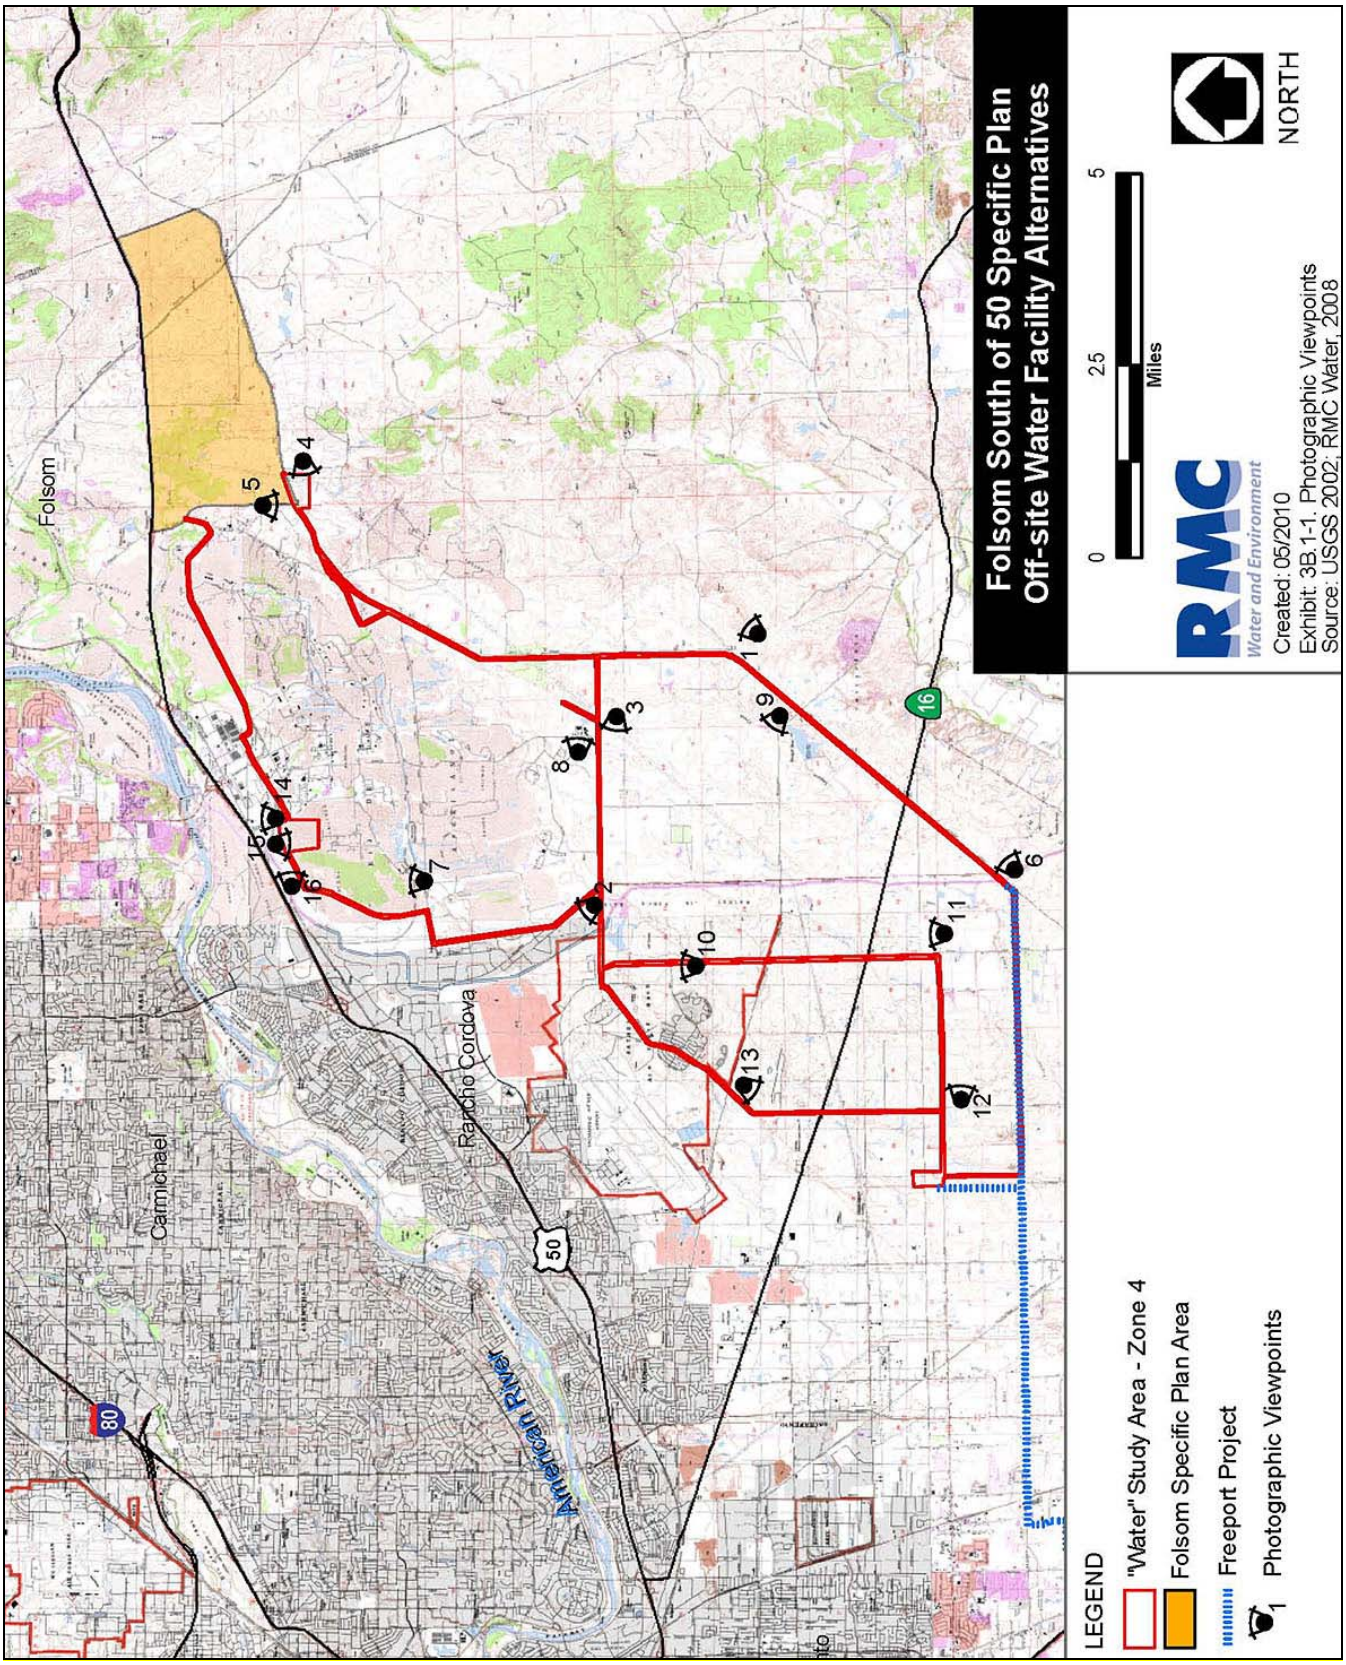
- "Vividness" is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns.
- "Intactness" is the visual integrity of the natural and human-built landscape and its freedom from encroaching elements.
- "Unity" is the visual coherence and compositional harmony of the landscape considered as a whole.

REGIONAL SETTING

The regional setting description provided in Section 3A.1 would also generally apply to the "Water" Study Area. Improvements proposed as part of the Off-site Water Facility Alternatives span portions of eastern Sacramento Valley near the base of the Sierra Nevada foothills. The terrain within this portion of the valley gradually transitions from relatively level areas, west of Grant Line Road, to undulating and rolling hills further east (see Viewpoint 1, Exhibit 3B.1-1). In general, the landscape within Zone 4 is undergoing a transition from rural and agricultural uses to more urban uses including residential, commercial, and industrial uses.

VISUAL CHARACTER WITHIN ZONE 4 OF THE "WATER" STUDY AREA

Urban forms of development within Zone 4 of the "Water" Study Area are generally west of Sunrise Boulevard and north of Douglas Road (see Viewpoint 2, Exhibit 3B.1-1). Views from any given location may include commercial and industrial facilities, office parks, residential subdivisions, roadway and utility corridors, agricultural fields, creek and river corridors, mine tailings, and views of the Sierra Nevada foothills (see Viewpoint 3, Exhibit 3B.1-1). Low-level hill features, large trees, and existing buildings limit long-range views in many locations.



Viewpoints from within Zone 4 of the "Water" Study Area **Exhibit 3B.1-1**

Prominent features within the eastern portions of Zone 4 include a joint Sacramento Municipal Utilities District SMUD) and Pacific Gas and Electric (PG&E) power transmission line corridor, which is situated to the east of Grant Line Road and diagonally bisects the White Rock WTP site (see Viewpoint 4, Exhibit 3B.1-1). The visual character along White Rock, Grant Line, and Prairie City Roads within the "Water" Study Area is rural with intermixed industrial uses, such as security fencing around the Aerojet property, graded dirt roads, and large aggregate processing facilities (see Viewpoint 5, Exhibit 3B.1-1). Undeveloped, rural grassland comprises the largest part of the foreground views in the eastern portion of the Off-site Water Facilities Study Area, with scattered trees and rural residences in the background (see Viewpoint 6, Exhibit 3B.1-1).

Areas to the north of Douglas Road, west of Grant Line Road, and south of Folsom Boulevard have been substantially altered by historic gold mining activities that occurred approximately 50 to 100 years ago. These areas are comprised of mine tailings, which consist of piles of cobblestones laid down in rows, thereby forming a long series of shallow ridges (see Viewpoints 7, Exhibit 3B.1-1). In certain areas, these dredge tailings form broad mounds that are up to 30 feet tall with vegetation, primarily consisting of cottonwood trees, shrubs, and annual grasses growing in depressional areas between the dredge tailings. The 15-story concrete Security Park building is also a prominent feature in this area, just north of Douglas Road (see Viewpoint 8, Exhibit 3B.1-1).

Approximately 2 miles west of Grant Line Road along Douglas Road, the most prominent features to the south include new residential development and associated construction equipment in the Anatolia housing development (see Viewpoint 9, Exhibit 3B.1-1). Sunrise Boulevard and a commercial and industrial corridor are located in the central portion of Zone 4 of the "Water" Study Area (see Viewpoint 2, Exhibit 3B.1-1). Prominent visual features along Sunrise include corrugated metal and concrete buildings, heavy equipment, transport trucks, metal storage bins painted various colors, chain-link fencing, and high-mast lighting. Some of the buildings are partially screened by trees and shrubs. Further west are Mather Regional Park and Mather Airport (see Viewpoint 10, Exhibit 3B.1-1).

Further south and along Gerber, Excelsior, Florin, and Eagles Nest Roads, the visual resources of Zone 4 of the "Water" Study Area consist of grazing lands, dotted with vernal pools, irrigated farmlands, nurseries, rural residences, and natural vegetation along the creeks (see Viewpoints 11, 12, and 13, Exhibit 3B.1-1). However, this area is rapidly changing from a rural, pastoral landscape of rangeland and open space to an urbanized landscape. Currently, there is limited built landscape, consisting mainly of ranchettes, electrical towers, overhead utility lines supported generally by single wood poles, and two-lane roads (e.g., Florin Road, Gerber Road). However, these areas are planned for urban forms of development based on current land use maps being developed in conjunction with the County's General Plan Update.

In the northern section of Zone 4, Folsom Boulevard near U.S. 50 is characterized by the visually intensive Folsom Auto Mall to the northwest; woodlands and the light rail track to the southeast; and U.S. 50 (including on-ramps and off-ramps) to the north (see Viewpoint 14, Exhibit 3B.1-1). Numerous other existing light sources are located along the Folsom Boulevard corridor and include overhead street lights, overhead fixtures at the light rail station and parking lot, outdoor security lighting in the apartment complex and the mobile home park, and lighted signs, parking lot lights, and exterior lights at the Nimbus Winery shopping center. To the south of Folsom Boulevard and in the vicinity of the Folsom Boulevard WTP, the landscape retains an opened space and rural character (see Viewpoints 15 and 16, Exhibit 3B.1-1).

The visual assessment criteria for the Zone 4 landscape area are provided below.

- **Vividness:** The vividness of the Zone 4 landscape is marked by large expanses of annual grasslands with distinct stands of oak and eucalyptus trees, scattered rural residences, vernal pools and wetlands, and/or roadways/above-ground utilities present in the foreground. Along the eastern edge of Zone 4, two sets of electrical transmission lines dominate the foreground: one in a north-south (high-voltage lines) direction and the other in an east-west direction. The north-south line is the larger of the two and consists of two sets of towers standing well above the undulating hillslopes (Viewpoint 4, Exhibit 3B.1-1). Although these electrical

transmission lines are substantial encroachments on the Zone 4 landscape and are readily visible from multiple vantages, in general they do not impede the view. However, since views from multiple vantages within the Zone 4 landscape provide an expansive view of agricultural and open space lands to the south and east along with similar views within the southern portions of Zone 4, the Zone 4 landscape is considered to have high levels of vividness.

- **Intactness:** As described above, two sets of electrical transmission lines exist within the eastern portion of the Zone 4 landscape. These, in addition to agricultural accessories, including fences and dirt roadways, disrupt the integrity of the landscape. These types of structures often exist within agricultural land and do not act as a substantial distraction to the landscape as a whole. However, when combined within new and existing development in central portions of the Zone 4 landscape (e.g., Security Park structure), these encroachments contribute to a moderate level of intactness.

- **Unity:** The Zone 4 landscape is exemplary of California's Central Valley rangeland, including gently rolling hills, which contrasts with development in the western portions of Zone 4. Although there are several encroachments within the Zone 4 landscape, they do not detract from the overall sense of unity; especially in eastern portions of the Zone 4 landscape. The Zone 4 landscape is essentially surrounded by open space to the east and urban development to the west allowing for moderate levels of visual unity.

Sensitive Viewers

As described in Section 3A.1, viewer sensitivity is related to the values and opinions of a particular group and can be generally characterized by the viewer activity, awareness, and local significance of a site. The "Water" Study Area can be seen by two types of sensitive viewer groups: travelers on roadways and people within the City of Folsom. Travelers include both the drivers and passengers on the following routes:

- White Rock Road (Viewpoints 4, 5, and 7, Exhibit 3B.1-1);
- Scott Road (Viewpoints 4 and 5, Exhibit 3B.1-1);
- Douglas Road (Viewpoints 2, 3, and 8, Exhibit 3B.1-1);
- Prairie City Road (Viewpoint 5, Exhibit 3B.1-1);
- Folsom Boulevard (Viewpoints 14, 15, and 16, Exhibit 3B.1-1);
- Grant Line Road (Viewpoints 1, 6, and 9, Exhibit 3B.1-1);
- Sunrise Boulevard (Viewpoints 2 and 7, Exhibit 3B.1-1);
- Jackson Highway (SR 16) (Viewpoint 6, Exhibit 3B.1-1);
- Florin Road (Viewpoint 12, Exhibit 3B.1-1);
- Eagles Nest Road (Viewpoints 10 and 11, Exhibit 3B.1-1);
- U.S. 50 (Viewpoints 13 and 15, Exhibit 3B.1-1); and
- Excelsior Road (Viewpoints 13, Exhibit 3B.1-1).

Sensitive viewer groups within the cities of Folsom and Rancho Cordova, the community of El Dorado Hills, and unincorporated portions of Sacramento County include:

- Residents (Viewpoints 3, 6, 9, 12, 13, and 14, Exhibit 3B.1-1); and

- Employees and patrons at businesses (Viewpoints 2, 8, and 10, Exhibit 3B.1-1).Visual Character within Zone 2 of the "Water" Study Area.

Zone 2 of the "Water" Study Area includes portions of the Sacramento River between NCMWC's service area and Freeport. The visual character of Zone 2 is dominated by riverine elements, including the river surface, which varies between 10 and 20 feet mean sea level, steep levee banks and riparian vegetation, docks and marines, and bridge overcrossings. Portions of the Zone 2 contain dense vegetation, which may include an assortment of shrubs and trees along the riverside of the levee, such as at Discovery Park in the City of Sacramento and along the Garden Highway north of Bryte Bend Park in the City of West Sacramento. Other locations are completely

Viewpoint 1: Viewpoint from Grant Line Road looking east-northeast towards the foothills of the Sierra Nevada. Grant Line Road, property fencing, and local utilities are visible in the foreground. Small clusters of oak and eucalyptus trees are visable in the background. (RMC, 2008)

Viewpoint 2: Viewpoint from Douglas Road, looking north towards existing development along the Sunrise Boulevard corridor. Existing structures are visible in the background. Undeveloped lands within the Rio del Oro Specific Plan Area to the east. (RMC, 2008)

Representative Photographs 1 and 2 **Exhibit 3B.1-1**

Viewpoint 3: Viewpoint from Douglas Road looking west towards the Sunrise Boulevard corridor. Douglas Road, recently constructed low-density residential housing, traffic signlas, and local utilities are visible in the foreground. (RMC, 2008)

Viewpoint 4: Viewpoint from Scott Road, looking west across the northern portions of the White Rock WTP site. Existing electrical transmission lines and oak trees are visible in the middleground. (RMC, 2008)

Representative Photographs 3 and 4 **Exhibit 3B.1-1**

Viewpoint 5: Viewpoint from Priare City Road looking south towards White Rock Road. Security fencing along the Aerojet property along with rural dirt roads used for fuel breaks are visible in the foreground. The eletrical transmission lines and lattice structures are visable in the middleground. (RMC, 2008)

Viewpoint 6: Viewpoint from Grant Line Road, looking northeast. Annual grasslands dominate the foreground with local distributiion lines and clusters of oak trees visible in the middleground. Hilslopes of the Sierra fothills are visable in the background. (RMC, 2008)

Representative Photographs 5 and 6 **Exhibit 3B.1-1**

Viewpoint 7: Viewpoint from White Rock Road looking north at the Aerojet Property. Remnant dredge tailings are present in the foreground and middleground. Rocket testing facilities are slightly visable in the background. (RMC, 2008)

Viewpoint 8: Viewpoint from Douglas Road, looking east. Industrial areas north of Dougals Road and local above-ground utilities are visible in the middleground. The Sierra foothills are visable in the background. (RMC, 2008)

Representative Photographs 7 and 8 **Exhibit 3B.1-1**

Viewpoint 9: Viewpoint from Grant Line Road looking north at new residential development in the background within the Sunrise-Douglas Community Plan Area to the northwest. Annual grasslands and associated vernal pool complexes are present in the foreground and middleground. (RMC, 2008)

Viewpoint 10: Viewpoint from Eagles Nest Road, looking north. The south end of Mather Regional Park and Golf Course are visible in the middleground. (RMC, 2008)

Representative Photographs 9 and 10 **Exhibit 3B.1-1**

Viewpoint 11: Viewpoint from Eagles Nest Road looking north. Annual grasslands and agricultural grazing lands are present in the foreground and middleground. Oak tree canopies are visable in the background. (RMC, 2008)

Viewpoint 12: Viewpoint from Florin Road looking east. Agricultural grazing, local electrical distribution lines, and roadside ditches are visible in the middleground. Rural residences are visable in the background. (RMC, 2008)

Representative Photographs 11 and 12 **Exhibit 3B.1-1**

Viewpoint 13: Viewpoint from Excelsior Road looking south. Agricultural lands, local electrical distribution lines, and rural residences and associated landscaping are present in the foreground. (RMC, 2008)

Viewpoint 14: Viewpoint from Folsom Boulevard looking north. U. S. Highway 50 and existing sound walls, Folsom Boulevard and landscaped median, and low-density residential housing are visible in the foreground. (RMC, 2008)

Representative Photographs 13 and 14 **Exhibit 3B.1-1**

Viewpoint 15: Viewpoint from the Beck's Furniture parking lot looking south at the Folsom Boulevard WTP Site. Annual grassland, dredge tailings, and oak trees are present in the foreground and middleground. (RMC, 2008)

Viewpoint 16: Viewpoint from Folsom Boulevard at Buffalo Creek, looking east. U. S. Highway 50, Folsom Boulevard, the Light Rail tracks, and Buffalo Creek are visible in the foreground. (RMC, 2008)

Representative Photographs 15 and 16 **Exhibit 3B.1-1**

devoid of vegetation or limited to ruderal or annual grassland vegetation. North of Freeport, urban areas generally dominate the riverfront and extend up through to the Cities of West Sacramento and Sacramento and are comprised of a wide range of land uses, including heavy and light industrial, waterfront marinas, and high- and low-density residential housing. A uniform and undeveloped, riverine corridor emerges north of Sacramento and continues north to I-5. This riparian landscape transitions north of I-5 to residential housing along the levee north through the NCMWC service area.

The visual assessment criteria for the Zone 2 landscape area are provided below.

- **Vividness:** The vividness of the Zone 2 landscape is marked by large expanses of open water bordered by riparian trees and clusters of residential, commercial, and industrial development. Since views from multiple vantages within the Zone 2 landscape provide an expansive views of riverine habitats, the Zone 2 landscape is considered to have high levels of vividness.

- **Intactness:** As described above, the Zone 2 landscape consists of riverine habitats that are partially disrupted by existing structures, roadways, and bridges. However, these types of structures can often complement natural riverine habitats and do not act as a substantial distraction to the landscape as a whole. The Zone 2 landscape is considered to have a high level of intactness.

- **Unity:** The Zone 2 landscape is exemplary of the Sacramento River corridor and, although there are several encroachments within the Zone 2 landscape, they do not detract from the overall sense of unity; especially in northern portions of the Zone 2 landscape. The Zone 2 landscape is essentially surrounded by open space to the west and urban development to the east allowing for high levels of visual unity.

NIGHTTIME VIEWS OF ZONE 4 OF THE "WATER" STUDY AREA

Nighttime views in Zone 4 of the Off-site Water Facilities Study Area include lights from commercial corridors along Folsom and Sunrise Boulevards, commercial and office uses in the Cities of Rancho Cordova and Folsom, vehicle lights from local roadways; and lighting fixtures on industrial and commercial buildings and structures within and outside the Off-site Water Facilities Study Area. Few to no light sources are located on the undeveloped lands east of Prairie City Road or south White Rock Road, east of Grant Line Road. The exception to this is several large aggregate processing facilities along Scott and Grant Line Roads.

SCENIC HIGHWAYS AND CORRIDORS

Sacramento County contains one eligible route for the State Scenic Highway Program. This route is referred to as River Road (State Routes 160 and 84), which runs along the Sacramento River levees in the Delta from the Sacramento city limits at the northern edge of Freeport to the southern tip of the Delta at the Antioch Bridge. Although the Sacramento River borders SR 160, including portions of Zone 2 of the Off-site Water Facilities Study Area, no physical improvements are proposed in the Sacramento River and therefore, no further consideration of this roadway is necessary.

Scott Road, from White Rock Road south to Latrobe Road, is a designated scenic corridor in the Sacramento County General Plan.

3B.1.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

No Federal plans, policies, regulations, or laws are applicable to the Off-site Water Facility Alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to visual resources are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.1, "Aesthetics – Land:"

- California Scenic Highway Program

No other State plans, policies, regulations, or laws are applicable to the Off-site Water Facility Alternatives under consideration.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County General Plan

The Sacramento County General Plan Land Use Element includes policies to diminish the aesthetic and safety impacts of glare by minimizing reflecting surfaces, shading and directing overhead light fixtures away from residences, and requiring exterior lighting to be low-intensity and only used where necessary for safety and security purposes (Sacramento County 1993). The Open Space Element also contains policies to protect open space with the intent of preserving natural and scenic areas and encourage preservation of open space in developed areas for its scenic qualities. The Land Use, Open Space, and Conservation Elements of the County's General Plan are described in Sections 3A.1, "Aesthetics – Land," and 3A.10, "Land Use and Agricultural Resources – Land." Additional applicable polices specific to the placement of the White Rock WTP are identified below.

Objective: Low glare external building surfaces and light fixtures that minimize reflected light and focalize illumination.

- **LU-22.** Exterior building materials on nonresidential structures shall be composed of a minimum of 50 percent low-reflectance, non-polished finishes.

- **LU-23.** Bare metallic surfaces such as pipes, flashing, vents, and light standards on new construction shall be painted so as to minimize reflectance.

- **LU-24.** Require overhead light fixtures to be shaded and directed away from adjacent residential areas.

- **LU-25.** Require exterior lighting to be low-intensity and only used where necessary for safety and security purposes.

Objective: Appropriate urban and rural development clustered to provide open space resource protection.

- **OS-11.** Permit development clustering in rural areas where grouping units at a higher density would create an open space buffer protecting intensive farming activities, provided that:

    a. Clustered residential lots are adjacent to and comparable in lot size to existing agricultural areas.

    b. Septic disposal systems are not concentrated in a manner which increases the potential for groundwater contamination.

    c. General Plan policies pertaining to floodplain or natural preserves would not preclude development of the proposed use in the area to be protected as open space.

    d. The project complies with any applicable development credits transfer ordinance relating to density bonuses.

e. Development rights for the open space area are permanently dedicated and appropriate long-term management is provided for by either a public agency, private homeowners association, or other appropriate entity.

f. The overall average density of the project is comparable to the average lot sizes in the area.

CITY OF RANCHO CORDOVA GENERAL PLAN

The City of Rancho Cordova General Plan provides policies for the preservation and enhancement of the City. The following policies and plans are applicable to portions of the Off-site Water Facilities Study Area that cross the City limits of Rancho Cordova:

Folsom South Canal Roadmap

The Folsom South Canal Partners was formed to explore ways to enhance the Folsom South Canal and the relationship to its surroundings. The Folsom South Canal Roadmap compiles information about the canal, outlines the goals and vision of the Partners, identifies a framework for future partnerships and agreements, and informs and guides a more detailed future planning effort. The Folsom South Canal Partners includes Caltrans, the City of Rancho Cordova, GenCorp, Sacramento County, Sacramento County Regional Parks, and Sacramento Regional Transit.

Rancho Cordova Design Guidelines

The Citywide Design Guidelines identify objectives, standards, and guidelines that are intended to encourage, promote, and require high-quality, pedestrian-oriented development while allowing flexibility in the design solutions. Design concepts of project and community identity and public gathering places should be applied to the City's parks and open space areas.

- **Policy UD.1.4** – Develop vibrant urban cores (village centers and local town centers) as the primary activity centers of each district within the City.

- **Policy UD.1.5** – Encourage project compatibility, interdependence, and support with neighboring uses, especially between commercial and mixed-use centers and the surrounding residential neighborhoods. Uses should relate to one another with pedestrian connections, shared parking, landscaping, public spaces, and the orientation and design of buildings.

- **Policy UD.3.1** – Ensure quality design of new development and redevelopment with an integrated architectural style.

- **Policy UD.3.4** – Require the provision of public art in all public and private development and redevelopment projects.

- **Policy UD.4.2** – Design new development to be compatible with surrounding development in ways that contribute to the desired character of the City and District.

3B.1.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its

impact. For the purposes of this analysis, the City's proposed Off-site Water Facilities would result significant environmental effects to visual resources and aesthetics if they would:

- have a substantial adverse effect on a scenic vista;
- substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic building within a state scenic highway;
- substantially degrade the existing visual character or quality of the site and its surroundings; or
- create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

ANALYSIS METHODOLOGY

This visual impact analysis is based on field observations conducted by RMC Water and Environment (RMC) in October 2008 and a review of local maps (e.g., general plans) and aerial photographs. Similar to the assessment of visual resources in Impact 3A.1-1, this analysis uses a common methodology that entails three key steps: (1) identifying the visual character and quality of visual resources within the Off-site Water Facilities Study Area; (2) identifying the type, exposure, and sensitivity of viewers; and (3) identifying the potential change in visual resources. All three of these elements are considered when determining the level of visual impact resulting from the Off-site Water Facilities. The actual impacts of the Off-site Water Facilities were determined based on potential changes to existing environmental conditions in the context of the applied significance criteria, as provided below. Where appropriate, the City has also considered approved, future projects that are not constructed to account for potential adverse affects to approved, adjacent land uses that are not reflected in existing environmental conditions.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Scenic Highways—As provided in the description of the affected environment, no scenic highways are identified within Zone 4 of the Off-site Water Facilities Study Area. Therefore, physical improvements associated with all the Off-site Water Facility alternatives would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic building within a state or locally-designated scenic highway. Based on this context, no impact would occur and this EIR/EIS provides no additional discussion of this issue area.

IMPACT 3B.1-1 Substantial Adverse Effect on a Scenic Vista. *Implementation of the Off-site Water Facility Alternatives would not result in the degradation of the visual quality of a scenic vista.*

NCP, PA, 2, 2A, and 2B

No formally designated scenic vistas exist within the "Water" Study Area, according to the Sacramento County General Plan (1993) and, therefore, the Off-site Water Facilities would not result in an adverse impact to a scenic vista. However, eastern portions of Zone 4 of the "Water" Study Area are readily visible from hillsides to the northeast and open space areas along Scott Road south of White Rock Road are identified as a scenic corridor in the Sacramento County General Plan. Additionally, views to the south of the Folsom Lake State Recreation Area (SRA) include the eastern portions of Zone 4 of the "Water" Study Area. Construction activities and, to a lesser extent, permanent facilities proposed as part of the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 2, 2A, and 2B would be visible from these ridgelines and the SRA.

Under the No USACE Permit Alternative and Proposed Off-site Water Facility Alternative, most of the above ground facilities would be contained within the SPA and, therefore, the impact discussion related to new development within the SPA is provided in Section 3A.1, "Aesthetics – Land." Facilities outside the SPA under the No USACE Permit Alternative and Proposed Off-site Water Facility Alternative would be mainly limited to buried pipelines and the booster pumping station. Similarly, new, permanent above-ground facilities would be limited under Off-site Water Facility Alternatives 2, 2A, and 2B by further integrating the City's water supply infrastructure with SCWA. Based on these considerations, **direct** and **indirect** impacts to existing scenic vistas under these alternatives would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

1, 1A, 3, 3A, 4, and 4A

Construction activities and permanent facilities proposed as part of the Off-site Water Facility Alternatives 1, 1A, 3, and 3A (e.g., WTP) would be visible from these ridgelines and the SRA. Views of and through the Off-site Water Facilities Study Area would be altered by new above-ground facilities, landscaping, and other site improvements where proposed. However, it is expected that new Off-site Water Facilities structures would be partially masked by intervening topography, existing vegetation, and development within the Folsom SPA. Given

that the conveyance pipeline under any alternative would be installed underground and its trench backfilled, this Off-site Water Facility feature would not be visible at the close of construction.

Based on these considerations, the scenic impact of new structural facilities proposed as part of the Off-site Water Facilities would be minor and more sparsely spaced than existing structures within the viewshed. As described in the affected environment discussion, these existing structures include power transmission lines, aggregate processing facilities, and commercial and industrial buildings that already impair the quality of the viewshed. Given the degree of this existing impairment, the change to the landscape as a result of the Off-site Water Facilities would be considered minor and, therefore, would not constitute a substantial adverse effect. In addition, once constructed, the Off-site Water Facilities would appear visually similar and consistent with the existing and planned development within the "Water" Study Area. Based on these factors, the **direct** and **indirect** impacts related to alteration of a scenic vista under Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A are considered **less than significant**. ***[Greater]***

Mitigation Measures: No mitigation measures are required.

IMPACT 3B.1-2 Substantial Degradation of Existing Visual Character or Quality of the "Water" Study Area. *Implementation of the Off-site Water Facility Alternatives could substantially degrade the existing visual character or quality of the "Water" Study Area and its surroundings.*

NCP, PA, 1, 1A, 3, and 3A

The Off-site Water Facilities would include several new facilities that would result in minor changes to the existing landscape and visual character of portions of Zone 4 of the "Water" Study Area. By virtue that the proposed conveyance pipeline would be installed underground and not visible at the surface following construction, this Off-site Water Facilities feature would have no long-term visual impacts. Although construction activities associated with the conveyance pipeline would result in disruptions to the visual character of areas in close proximity to the alignment, these disruptions would be temporary and dispersed along the conveyance alignment. Construction of the conveyance pipeline would involve temporary negative aesthetic effects, including clearing and grading as well as the presence of construction equipment and materials. Off-site Water Facilities construction activities would result in temporary exposure of graded surfaces, construction debris, and the presence of construction equipment and heavy truck traffic. Following construction, the surface would be restored to preproject conditions and no substantial changes to the existing visual character of areas within close proximity to the conveyance alignments are anticipated.

In relation to the WTP, these Off-site Water Facility Alternatives would involve the construction of several new facilities that would change the existing visual character of the of the On-site WTP or White Rock WTP site(s). From White Rock and Prairie City Roads, the WTP structures that would be most noticeable include: new water storage tank(s), the proposed gravity thickener tanks, the proposed dewatering building, and new office/ maintenance building(s). Once constructed, the On-site and White Rock WTP site(s) would have an industrial appearance that would blend with the SPA and overhead transmission line corridor.

Although the Off-site Water Facilities would change the visual character of the WTP site, the extent and magnitude of this change is not considered substantial in relation to other adjacent uses, which include OHV use and aggregate mining. However, the design of the WTP could be inconsistent with the development proposed within the Folsom SPA. In addition, the WTP would be located outside and to the south of the delineated Urban Services Boundary as proposed in the current Sacramento County General Plan Update and the WTP could degrade the existing visual character of the study area in the vicinity of the urban-rural interface that will ultimately transition through the WTP site. Therefore, the **direct** and **indirect** impacts from implementation of the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, and 3A are considered **potentially significant**. ***[Similar]***

Mitigation Measure 3B.1-2a: Enhance Exterior Appearance of Structural Facilities.

The external appearance of above-ground facilities, including the choice of color and materials, shall seek to reduce the visual impact of the proposed WTP, pump station, and above-ground storage tank facilities. Bright reflective materials and colors shall be avoided. As appropriate, the exterior design of these facilities should follow design guidelines provided in applicable land use plans. Minimum exterior design requirements shall include, but are not limited to, the following:

- painting (with earth-colored tones) of structural façades to blend with surrounding land uses,
- use of fencing or structural materials similar to those used by nearby land uses,
- installation of berms and/or landscaping around the facility (see Mitigation Measure 3B.2-2b for additional detail), and
- clustering of structural facilities to maximize open space buffering.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.1-2b: Prepare Landscaping Plan.

The City shall develop a landscaping plan for each structural facility site that uses a combination of locally derived native vegetation, earthen features (e.g., boulders), and, if appropriate, topographical separations (e.g., berms) to maximize site appearance and shield the new facilities from nearby sensitive receptors to the extent feasible. In addition to complying with local standards, the landscaping plan shall require the following at each site:

- Vegetation shall be arranged in a hierarchy of plant groupings to enhance the visual and scenic qualities of the site(s). To the extent practical, the design will minimize the need for supplemental irrigation.
- New or replacement vegetation shall be compatible with surrounding vegetation and shall be adaptable to the site with regard to rainfall, soil type, exposure, growth rate, erosion control, and energy conservation purposes.
- Plant materials chosen shall be species which do not present any safety hazards, which allow native flora to reestablish in the area, and which require minimal maintenance, including watering, pest control, and clean-up of litter from fruit and droppings.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

2, 2A, and 2B

The discussion provided for Proposed Off-site Water Facility Alternative and Off-site Water Facility Alternatives 1 and 1A as it relates to the construction and operation of the proposed conveyance pipeline would also apply to Off-site Water Facility Alternatives 2, 2A, and 2B. However, these alternatives would not involve the construction of a new WTP and, therefore, the impacts identified for the WTP under the Proposed Off-site Water Facility Alternative and Alternatives 1 and 1A would not apply to Off-site Water Facility Alternatives 2, 2A, and 2B. However, storage tank and pump station facilities under Off-site Water Facility Alternatives 2, 2A, and 2B could substantially alter the visual character of Zone 4 of the "Water" Study Area. Both **direct** and **indirect** impacts would be **potentially significant**. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.1-2a and 3B.2-2b.

4 and 4A

The discussion provided for the Proposed Off-site Water Facility Alternative and Off-site Water Facility Alternatives 1 and 1A as it relates to the construction and operation of the proposed conveyance pipeline would also apply to Off-site Water Facility Alternatives 4 and 4A. Under Off-site Water Facility Alternatives 4 and 4A, the Folsom Boulevard WTP would be constructed south of Folsom Boulevard and within an undeveloped portion of the Aerojet Property, just south of Becks Furniture. This area is planned for various forms of urban development in conjunction with the Westborough Specific Plan. As a result, the design of the Folsom WTP could be inconsistent with other existing development proposed in the surrounding vicinity of the Folsom Boulevard WTP site. Therefore, **direct** and **indirect** impacts associated with the implementation of Off-site Water Facility Alternatives 4 and 4A would be **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.1-2a and 3B.2-2b.

Implementation of Mitigation Measures 3B.1-2a and 3B.1-2b would reduce potentially significant direct and indirect impacts associated with visual quality degradation to a **less-than-significant** level by ensuring structural elements of the WTP, pump stations, and storage tanks blend with the development patterns proposed for the Folsom SPA and within adjacent jurisdictions through the provision of visual screening.

IMPACT 3B.1-3 Creation of a New Source of Substantial Light or Glare that would Adversely Affect Day or Nighttime Views in the "Water" Study Area. *Implementation of the Off-site Water Facility Alternatives would create new sources of substantial light or glare, which could adversely affect day or nighttime views in the "Water" Study Area.*

Construction can involve numerous potential sources of nighttime lighting, including earthmoving and other construction equipment, temporary construction trailers, employee vehicles, and flood and security lighting. Nighttime construction along the conveyance alignments could adversely affect single-family residences along Gerber, Florin, Excelsior, Grant Line, Eagles Nest, and Grant Line Roads and could interfere with the nighttime vision of drivers using these roadways. Because nighttime construction lighting could adversely affect nearby residents and drivers on adjacent roads, this **direct** impact would be **potentially significant**. **No indirect** impacts would result. ***[Similar]***

The WTP under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Alternatives 1, 1A, 3, and 3A would be constructed in an undeveloped area that has minimal to no existing sources of light and glare. As a result, the WTP would generate new sources of night lighting and glare within an area that currently lacks these sources, thereby, incrementally increasing the amount of light generated within the immediate vicinity of the WTP. Although light generated by the WTP would be typical of similar industrial development to the south, such as existing aggregate processing, by virtue that the new source of illumination would originate from a different location, potentially affecting previously unaffected residences. This **direct** impact would be **potentially significant**. **No indirect** impacts would result. ***[Similar]***

Mitigation Measure 3B.1-3a: Conform to Construction Lighting Standards.

The City shall limit construction to daylight hours to the extent possible. If nighttime lighting or construction is necessary, the City shall ensure that unshielded lights, reflectors, or spotlights are not located and directed to shine toward or be directly visible from adjacent properties or streets. To the extent possible, the City shall minimize the use of nighttime construction lighting within 500 feet of existing residences. This measure shall be identified on grading plans and in construction contracts.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:

1. For structural improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.

3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

Mitigation Measure 3B.1-3b: Prepare and Submit a Lighting Master Plan.

The City shall prepare a Lighting Master Plan that covers all Off-site Water Facilities-related outdoor light sources. The Lighting Master Plan shall include the following minimum requirements:

- outdoor lighting shall be properly shielded and installed to prevent light trespass on adjacent properties;

- flood or spot lamps installed as part of the Off-site Water Facilities shall be aimed no higher than 45 degrees above straight down (half-way between straight down and straight to the side) when the source is visible from any off-site residential property or public roadway;

- prohibit the use of harsh mercury vapor, low-pressure sodium, or fluorescent bulbs for public lighting in residential neighborhoods; and
- comply with requirements of local jurisdiction, if applicable.

Implementation: City of Folsom Utilities Department

Timing: Prior to approval of grading plans and building permits for WTP, pump stations, and storage tank facilities.

Enforcement:
1. For structural improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For structural improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department.
3. For structural improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department.

2, 2A, and 2B

The discussion provided for Proposed Off-site Water Facility Alternative and Alternatives 1 and 1A in relation to pipeline construction and potential for sources of nighttime lighting to disrupt adjacent residences and vehicle traffic would apply to Off-site Water Facility Alternatives 2, 2A, and 2B. The implementation of the recommended mitigation would be required to minimize these direct impacts to a less-than-significant level. In contrast, these alternatives do not include the construction of a new WTP, but could involve the use of nighttime lighting at the pump station and storage facilities. For this reason, this **direct** impact is considered **potentially significant**. **No indirect** impact would result. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.1-3a and 3B.1-3b.

4 and 4A

The discussion provided for the Proposed Off-site Water Facility Alternative in relation to pipeline construction and potential for sources of nighttime lighting to disrupt adjacent residences and vehicle traffic would apply to Off-site Water Facility Alternatives 4 and 4A.

In relation to the Folsom Boulevard WTP site under these alternatives, the WTP would be constructed on an undeveloped site that is bordered by several existing sources of light and glare, including commercial billboards, street lamps along Folsom Boulevard and within the Aerojet Property, and lighting sources associated with adjacent commercial and industrial facilities. These uses would generally not be sensitive to new sources of light and glare. However, as indicated in Section 3B.10, "Land Use and Agricultural Resources – Water," planned uses adjacent to the WTP include medium- and high-density residential uses. As a result, the development of the WTP under Off-site Water Facility Alternatives 4 and 4A would generate sources of nighttime light and glare that may be disruptive to the residential areas planned adjacent to site and, therefore this **direct** impact would be **potentially significant**. **No indirect** impacts would result. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3B.1-3a and 3B.1-3b.

Implementation of Mitigation Measures 3B.1-3a and 3B.1-3b would reduce potentially significant impacts associated with the temporary use of construction lighting to a **less-than-significant** level through adherence to

construction lighting standards and preparation and implementation of a lighting master plan for operational, above-ground facilities.

3B.1.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of the mitigation measures contained in this section would reduce impacts associated with the appearance of the new structural facilities and associated new light and glare to a less-than-significant level. Impacts related to substantial alteration of a scenic vista and damage to designated scenic corridor would be less than significant and no additional mitigation measures are required. Based on these conclusions, implementation of the Off-site Water Facility Alternatives would not result in residual significant unavoidable impacts to the visual character of the "Water" Study Area or add substantial amounts of light and glare.

3A.2 AIR QUALITY – LAND

3A.2.1 AFFECTED ENVIRONMENT

The SPA is located in Sacramento County, California, which is under the jurisdiction of the Sacramento Metropolitan Air Quality Management District (SMAQMD). SMAQMD is the primary local agency with respect to air quality for all of Sacramento County. Sacramento County is within the Sacramento Valley Air Basin (SVAB), which also includes all of Butte, Colusa, Glenn, Shasta, Sutter, Tehama, Yolo, and Yuba Counties, the western portion of Placer County, and the eastern portion of Solano County. Off-site elements of the project are located in Sacramento and El Dorado Counties, for which air quality is also regulated by the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (ARB); at a local level, air quality in these two counties is regulated by SMAQMD and the El Dorado County Air Quality Management District (EDCAQMD), respectively. Each of these agencies develops rules, regulations, policies, and/or goals to comply with applicable legislation. Although EPA regulations may not be superseded, both state and local regulations may be more stringent. Applicable regulations associated with criteria air pollutant, TAC, and odor emissions are described separately below. Air quality in this area is determined by such natural factors as topography, climate, and meteorology, in addition to the presence of existing air pollution sources and conditions. These factors are discussed below.

TOPOGRAPHY, CLIMATE, AND METEOROLOGY

The SVAB is relatively flat, bordered by mountains to the east, west, and north. Air flows into the SVAB through the Carquinez Strait, the only breach in the western mountain barrier, and moves across the Sacramento–San Joaquin River Delta, bringing with it pollutants from the heavily populated San Francisco Bay Area. The climate is characterized by hot, dry summers and cool, rainy winters. Periods of dense and persistent low-level fog that are most prevalent between storms are characteristic of SVAB winter weather. From May to October, the region's intense heat and sunlight lead to high ozone concentrations. Summer inversions are strong and frequent, but are less troublesome than those that occur in the fall. Autumn inversions, formed by warm air subsiding in a region of high pressure, have accompanying light winds that do not provide adequate dispersion of air pollutants.

Most precipitation in the area results from air masses that move in from the Pacific Ocean during the winter months. These storms usually move from the west or northwest. More than half the total annual precipitation falls during the winter rainy season (November–February); the average winter temperature is a moderate 49 degrees Fahrenheit (°F). During the summer, daily temperatures range from 50°F to more than 100°F. The inland location and surrounding mountains shelter the area from much of the ocean breezes that keep the coastal regions moderate in temperature.

Regional flow patterns affect air quality patterns by moving pollutants downwind of sources. Localized meteorological conditions, such as moderate winds, disperse pollutants and reduce pollutant concentrations. An inversion layer develops when a layer of warm air traps cooler air close to the ground. Such temperature inversions hamper dispersion by creating a ceiling over the area and trapping air pollutants near the ground. During summer mornings and afternoons, these inversions are present over the SPA. During summer's longer daylight hours, plentiful sunshine provides the energy needed to fuel photochemical reactions between reactive organic gases (ROGs) and oxides of nitrogen (NO), which results in ozone formation.

In the winter, temperature inversions dominate during the night and early morning hours but frequently dissipate by afternoon. The greatest pollution problems during this time of year are from carbon monoxide (CO) and NO_X. High CO concentrations occur on winter days with strong surface inversions and light winds. CO transport is extremely limited.

The local meteorology of the project area is represented by measurements recorded at the Folsom Dam station. The normal annual precipitation, which occurs primarily from November through March, is approximately 24 inches (Western Regional Climate Center 2009). January temperatures range from an average minimum of 37.9°F

to an average maximum of 53.7°F. July temperatures range from an average minimum of 60.3°F to an average maximum of 94.5°F (Western Regional Climate Center 2009). The predominant wind direction and speed is from the south-southwest at approximately 10 mph (ARB 1994).

EXISTING AIR QUALITY—CRITERIA AIR POLLUTANTS

California and National Ambient Air Quality Standards

ARB and EPA currently focus on the following air pollutants as indicators of ambient air quality: ozone, CO, nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM), and lead. Because these are the most prevalent air pollutants known to be deleterious to human health and extensive health-effects criteria documents are available, they are commonly referred to as "criteria air pollutants."

EPA has established primary and secondary national ambient air quality standards (NAAQS) for the following criteria air pollutants: ozone, CO, NO_2, SO_2, respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), and lead. The primary standards protect the public health and the secondary standards protect public welfare. In addition to the NAAQS, ARB has established California ambient air quality standards (CAAQS) for sulfates, hydrogen sulfide, vinyl chloride, visibility-reducing particulate matter, and the above-mentioned criteria air pollutants. In most cases the CAAQS are more stringent than the NAAQS. Differences in the standards are generally explained by the health-effects studies considered during the standard-setting process and the interpretation of the studies. In addition, the CAAQS incorporate an additional margin of safety to protect sensitive receptors, particularly children and infants (ARB 2009a). The NAAQS and CAAQS as discussed above are listed in Table 3A.2-1.

Ozone

Ozone is a photochemical oxidant, a substance whose oxygen combines chemically with another substance in the presence of sunlight, and the primary component of smog. Ozone is not directly emitted into the air but is formed through complex chemical reactions between precursor emissions of ROGs and NO_X in the presence of sunlight. ROGs are volatile organic compounds (VOCs) that are photochemically reactive. ROG emissions result primarily from incomplete combustion and the evaporation of chemical solvents and fuels. NO_X are a group of gaseous compounds of nitrogen and oxygen that results from the combustion of fuels.

A highly reactive molecule, ozone readily combines with many different components of the atmosphere. Consequently, high levels of ozone tend to exist only while high ROG and NO_X levels are present to sustain the ozone formation process. After the precursors have been depleted, ozone levels rapidly decline. Because these reactions occur on a regional scale, ozone is a regional pollutant.

Ozone located in the upper atmosphere (stratosphere) acts in a beneficial manner by shielding the earth from harmful ultraviolet radiation that is emitted by the sun. However, ozone located in the lower atmosphere (troposphere) is a major health and environmental concern. Meteorology and terrain play a major role in ozone formation. Generally, low wind speeds or stagnant air coupled with warm temperatures and clear skies provide the optimum conditions for ozone formation. As a result, summer is generally the peak ozone season. Because of the reaction time involved, peak ozone concentrations often occur far downwind of the precursor emissions. In general, ozone concentrations over or near urban and rural areas reflect an interplay of emissions of ozone precursors, transport, meteorology, and atmospheric chemistry (Godish 2004).

Table 3A.2-1
Summary of Ambient Air Quality Standards and Attainment Designations

Pollutant	Averaging Time	California		National Standards[1]		
		Standards [2,3]	Attainment Status (Sacramento County) [4]	Primary [3,5]	Secondary [3,6]	Attainment Status (Sacramento County) [7]
Ozone	1 hour	0.09 ppm (180 µg/m^3)	N	–	–	–
	8 hours	0.07 ppm (137 µg/m^3)	–	0.08 ppm (157 µg/m^3)	Same as primary standard	N
Carbon monoxide (CO)	1 hour	20 ppm (23 mg/m^3)	A	35 ppm (40 mg/m^3)	–	U/A
	8 hours	9 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)		
Nitrogen dioxide (NO_2) [8]	Annual arithmetic mean	0.030 ppm (56 µg/m^3)	–	0.053 ppm (100 µg/m^3)	Same as primary standard	U/A
	1 hour	0.18 ppm (338 µg/m^3)	A	–		–
Sulfur dioxide (SO_2)	Annual arithmetic mean	–	–	0.030 ppm (80 µg/m^3)	–	U
	24 hours	0.04 ppm (105 µg/m^3)	A	0.14 ppm (365 µg/m^3)	–	
	3 hours	–	–	–	0.5 ppm (1,300 µg/m^3)	
	1 hour	0.25 ppm (655 µg/m^3)	A	–	–	–
Respirable particulate matter (PM_{10})	Annual arithmetic mean	20 µg/m^3	N	-	Same as primary standard	N
	24 hours	50 µg/m^3		150 µg/m^3		
Fine particulate matter ($PM_{2.5}$)	Annual arithmetic mean	12 µg/m^3	N	15 µg/m^3	Same as primary standard	U/A
	24 hours	–	–	35 µg/m^3		
Lead [9]	30-day average	1.5 µg/m^3	A	–	–	–
	Calendar quarter	–	–	1.5 µg/m^3	Same as primary standard	
Sulfates	24 hours	25 µg/m^3	A	No national standards		
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m^3)	U			
Vinyl chloride [9]	24 hours	0.01 ppm (26 µg/m^3)	U/A			

Table 3A.2-1
Summary of Ambient Air Quality Standards and Attainment Designations

Pollutant	Averaging Time	California		National Standards[1]		
		Standards [2,3]	Attainment Status (Sacramento County) [4]	Primary [3,5]	Secondary [3,6]	Attainment Status (Sacramento County) [7]
Visibility-reducing particle matter	8 hours	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more (0.07—30 miles or more for Lake Tahoe) because of particles when the relative humidity is less than 70%.	U		No national standards	

Notes: $\mu g/m^3$ = micrograms per cubic meter; ppm = parts per million.

[1] National standards (other than those for ozone and particulate matter and those based on annual averages or annual arithmetic means) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. The PM_{10} 24-hour standard is attained when 99% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. The $PM_{2.5}$ 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the U.S. Environmental Protection Agency for further clarification and current Federal policies.

[2] California standards for ozone, CO (except Lake Tahoe), SO_2 (1- and 24-hour), NO_2, particulate matter, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[3] Concentration expressed first in units in which it was issued (i.e., parts per million [ppm] or micrograms per cubic meter [$\mu g/m^3$]). Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; "ppm" in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[4] Unclassified (U): The data are incomplete and do not support a designation of attainment or nonattainment.
Attainment (A): The state standard for that pollutant was not violated at any site in the area during a 3-year period.
Nonattainment (N): There was at least one violation of a state standard for that pollutant in the area.

[5] National primary standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[6] National secondary standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[7] Nonattainment (N): Any area that does not meet (or that contributes to ambient air quality in a nearby area that does not meet) the national primary or secondary ambient air quality standard for the pollutant.
Attainment (A): Any area that meets the national primary or secondary ambient air quality standard for the pollutant.
Unclassifiable (U): Any area that cannot be classified on the basis of available information as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant.

[8] On February 19, 2008, the Office of Administrative Law approved a new NO_2 ambient air quality standard that lowers the 1-hour standard to 0.19 ppm and establishes a new annual standard of 0.030 ppm. These changes became effective March 20, 2008.

[9] ARB has identified lead and vinyl chloride as toxic air contaminants with no threshold of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

Source: ARB 2008a, ARB 2008b

The adverse health effects associated with exposure to ozone pertain primarily to the respiratory system. Scientific evidence indicates that ambient levels of ozone affect not only sensitive receptors, such as asthmatics and children, but healthy adults. Exposure to ambient levels of ozone ranging from 0.10 part per million (ppm) to 0.40 ppm for 1–2 hours has been found to substantially alter lung functions by increasing respiratory rates and pulmonary resistance, decreasing tidal volumes (the amount of air inhaled and exhaled), and impairing respiratory mechanics. Ambient levels of ozone above 0.12 ppm are linked to such symptoms as throat dryness, chest tightness, headache, and nausea. In addition to these adverse health effects, evidence exists relating ozone exposure to an increase in the permeability of respiratory epithelia; such increased permeability leads to an increased response of the respiratory system to challenges and a decrease in the immune system's ability to defend against infection (Godish 2004).

In 1997, EPA promulgated a new 8-hour standard in recognition of impacts resulting from daylong exposure. On April 15, 2004, EPA designated areas of the country that exceed the 8-hour standard ozone standard as nonattainment. The designations were in place as of February 2009. These designations have triggered new planning requirements for the 8-hour standard.

On-road motor vehicles and other mobile sources are by far the largest contributors to NO_X emissions. According to the 2008 emissions inventory for Sacramento County, approximately 58% of NO_X emissions in Sacramento County are generated by on-road motor vehicles (ARB 2009b). More stringent mobile source emission standards and cleaner burning fuels have largely contributed to the decline in NO_X emissions. ROG emissions have been decreasing for the last 30 years because of more stringent motor vehicle standards and new rules for control of ROG from various industrial coating and solvent operations (ARB 2008c). Even so, the ozone problem in the SVAB ranks among the most severe in the state. Peak ozone values in the SVAB have not declined as quickly over the last several years as they have in other urban areas. The peak 8-hour indicator remained fairly constant from 1987 to 1990. Since 1990, the peak 8-hour indicator has decreased slightly, and the overall decline for the 20-year period is almost 13%. Looking at the number of days above the state and national standards, the trend is much more variable. However, the number of 8-hour exceedance days has declined by more than 50% since 1988 (ARB 2008c).

Nitrogen Dioxide

NO_2 is a brownish, highly reactive gas that is present in all urban environments. The major human-made sources of NO_2 are combustion devices, such as boilers, gas turbines, and mobile and stationary reciprocating internal combustion engines. Combustion devices emit primarily nitric oxide (NO), which reacts through oxidation in the atmosphere to form NO_2 (EPA 2009a). The combined emissions of NO and NO_2 are referred to as NO_X and reported as equivalent NO_2. Because NO_2 is formed and depleted by reactions associated with photochemical smog (ozone), the NO_2 concentration in a particular geographical area may not be representative of the local NO_X emission sources.

Inhalation is the most common route of exposure to NO_2. Because NO_2 has relatively low solubility in water, the principal site of toxicity is in the lower respiratory tract. The severity of the adverse health effects depends primarily on the concentration inhaled rather than the duration of exposure. An individual may experience a variety of acute symptoms, such as coughing, difficulty with breathing, vomiting, headache, and eye irritation, during or shortly after exposure. After a period of approximately 4–12 hours, an exposed individual may experience chemical pneumonitis or pulmonary edema with breathing abnormalities, cough, cyanosis, chest pain, and rapid heartbeat. Severe, symptomatic NO_2 intoxication after acute exposure has occasionally been linked with prolonged respiratory impairment with such symptoms as chronic bronchitis and decreased lung function (EPA 2009a).

Carbon Monoxide

CO is a colorless, odorless, and poisonous gas produced by incomplete burning of carbon in fuels, primarily from mobile (transportation) sources. In fact, 56% of the nationwide CO emissions are from on-road mobile sources

and 22% from non-road engines and vehicles such as construction equipment and boats. Other sources of CO emissions include industrial processes (such as metals processing and chemical manufacturing), residential wood burning, and natural sources such as forest fires.

CO enters the bloodstream through the lungs by combining with hemoglobin, which normally supplies oxygen to the cells. However, CO combines with hemoglobin much more readily than oxygen does, resulting in a drastic reduction in the amount of oxygen available to the cells. Adverse health effects associated with exposure to CO concentrations include such symptoms as dizziness, headaches, and fatigue. CO exposure is especially harmful to individuals who suffer from cardiovascular and respiratory diseases (EPA 2009a).

The highest CO concentrations are generally associated with cold, stagnant weather conditions that occur during winter. In contrast to problems caused by ozone, which tends to be a regional pollutant, CO problems tend to be localized.

Sulfur Dioxide

SO_2 is produced by such stationary sources as coal and oil combustion, steel mills, refineries, and pulp and paper mills. The major adverse health effects associated with SO_2 exposure pertain to the upper respiratory tract. SO_2 is a respiratory irritant; constriction of the bronchioles occurs with inhalation of SO_2 at 5 ppm or more. On contact with the moist mucous membranes, SO_2 produces sulfurous acid, which is a direct irritant. Concentration rather than duration of exposure is an important determinant of respiratory effects. Exposure to high SO_2 concentrations may result in edema of the lungs or glottis and respiratory paralysis.

Particulate Matter

Respirable particulate matter with an aerodynamic diameter of 10 micrometers or less is referred to as PM_{10}. PM_{10} consists of particulate matter emitted directly into the air, such as fugitive dust, soot, and smoke from mobile and stationary sources; construction operations; fires and natural windblown dust; and particulate matter formed in the atmosphere by condensation and/or transformation of SO_2 and ROG (EPA 2009a). Fine particulate matter ($PM_{2.5}$) is a subgroup of PM_{10}, consisting of smaller particles that have an aerodynamic diameter of 2.5 micrometers or less (ARB 2008c).

The adverse health effects associated with PM_{10} depend on the specific composition of the particulate matter. For example, health effects may be associated with metals, polycyclic aromatic hydrocarbons (PAH), and other toxic substances adsorbed onto fine particulate matter (referred to as the "piggybacking effect") or with fine dust particles of silica or asbestos. Generally, effects may result from both short-term and long-term exposure to elevated concentrations of PM_{10} and may include breathing and respiratory symptoms, aggravation of existing respiratory and cardiovascular diseases, alterations to the immune system, carcinogenesis, and premature death (EPA 2008a). $PM_{2.5}$ poses an increased health risk because the particles can deposit deep in the lungs and may contain substances that are particularly harmful to human health. Direct emissions of PM_{10} and $PM_{2.5}$ increased in the SVAB 1975 and 2005 and are projected to continue increasing through 2020 (ARB 2008c).

Direct emissions of both PM_{10} and $PM_{2.5}$ increased in the SVAB between 1975 and 2005 and are projected to increase through 2020. These emissions are dominated by area wide sources, primarily because of development. Direct emissions of PM from mobile and stationary sources have remained relatively steady (ARB 2008c).

Lead

Lead is a metal found naturally in the environment as well as in manufactured products. The major sources of lead emissions have historically been mobile and industrial sources. As a result of the phase-out of leaded gasoline (discussed in detail below), metal processing is currently the primary source of lead emissions. The highest levels of lead in air are generally found near lead smelters. Other stationary sources are waste incinerators, utilities, and lead-acid battery manufacturers.

Twenty years ago, mobile sources were the main contributor to ambient lead concentrations in the air. In the early 1970s, EPA set national regulations to gradually reduce the lead content in gasoline. In 1975, unleaded gasoline was introduced for motor vehicles equipped with catalytic converters. EPA banned the use of leaded gasoline in highway vehicles in December 1995 (EPA 2009a).

As a result of EPA's regulatory efforts to remove lead from gasoline, emissions of lead from the transportation sector have declined dramatically (by 95% between 1980 and 1999), and levels of lead in the air decreased by 94% between 1980 and 1999. Of all lead emissions, transportation sources, primarily airplanes, contribute only 13%. A recent National Health and Nutrition Examination Survey reported a 78% decrease in the levels of lead in human blood between 1976 and 1991. This dramatic decline can be attributed to the move from leaded to unleaded gasoline (as well as the removal of lead from soldered cans) (EPA 2009a).

The decrease in lead emissions and ambient lead concentrations over the past 25 years is California's most dramatic success story with regard to air quality management. The rapid decrease in lead concentrations can be attributed primarily to phasing out the lead in gasoline. This phase-out began during the 1970s, and subsequent ARB regulations have virtually eliminated all lead from gasoline now sold in California. All areas of the state are currently designated as attainment for the state lead standard (EPA does not designate areas for the national lead standard). Although the ambient lead standards are no longer violated, lead emissions from stationary sources still pose "hot spot" problems in some areas. As a result, ARB identified lead as a toxic air contaminant.

California and National Area Designations

Criteria air pollutant concentrations are measured at several monitoring stations in the SVAB. The Folsom-Natoma Street station is the closest monitoring station to the SPA with recent data for ozone, NO_2, and PM_{10}. The When data was not available at the Natoma Street station, as determined by ARB, air pollutant monitoring data was obtained from the Del Paso Manor station in Sacramento, which is the next closest monitoring station to the SPA. In general, the ambient air quality measurements from these monitoring stations are representative of the air quality in the vicinity of the SPA. Table 3A.2-2 summarizes the air quality data from the most recent 3 years for these two monitoring stations.

Both ARB and EPA use this type of monitoring data to designate the attainment status with respect to the CAAQS and NAAQS, respectively, for criteria air pollutants. The purpose of these designations is to identify those areas with air quality problems and thereby initiate planning efforts for improvement. The three basic designation categories are "nonattainment," "attainment," and "unclassified." The "unclassified" designation is used in an area that cannot be classified on the basis of available information as meeting or not meeting the standards. The Natomas Street station is "unclassified."

EXISTING AIR QUALITY—TOXIC AIR CONTAMINANTS

A toxic air contaminant (TAC), or in Federal terms a hazardous air pollutant (HAP), is defined as an air pollutant that may cause or contribute to an increase in mortality or in serious illness, or that may pose a hazard to human health. TACs are usually present in minute quantities in the ambient air; however, their high toxicity or health risk may pose a threat to public health even at low concentrations. In general, for those TACs that may cause cancer, there is no concentration that does not present some risk. In other words, there is no threshold level below which adverse health impacts may not be expected to occur. This contrasts with the criteria air pollutants for which acceptable levels of exposure can be determined and for which the ambient standards have been established (Table 3A.2-1).

According to the *California Almanac of Emissions and Air Quality 2008 Edition* (ARB 2008c), the majority of the estimated health risk from TACs can be attributed to relatively few compounds, the most important being PM from diesel-fueled engines (diesel PM). Diesel PM differs from other TACs in that it is not a single substance, but

Table 3A.2-2
Summary of Annual Ambient Air Quality Data (2006–2008)

	2006	2007	2008
Ozone			
Maximum concentration (1-hour/8-hour average, ppm)	0.133/0.110	0.129/0.123	0.166/0.123
Number of days state 1-hour standard exceeded	31	13	38
Number of days national 1-hour/8-hour standard exceeded	1/42	1/21	5/50
Nitrogen Dioxide (NO_2)			
Maximum concentration (1-hour, ppm)	0.044	0.049	0.042
Annual average concentration (ppm)	0.008	0.007	0.007
Number of days state 1-hour standard exceeded	0	0	0
Carbon Monoxide (CO) [a]			
Maximum concentration (1-hour/8-hour average, ppm)	4.4/3.49	3.5/2.90	2.9/2.49
Number of days state standard exceeded	0	0	0
Number of days national standard exceeded	0	0	0
Fine Particulate Matter ($PM_{2.5}$) [a]			
Maximum concentration ($\mu g/m^3$) [b]	78.0	61.0	74.4
Number of days national standard exceeded (measured [c])	19	22	8
Number of days national standard exceeded (estimated)	19.3	26.1	24.1
Respirable Particulate Matter (PM_{10})			
Maximum concentration ($\mu g/m^3$) [d]	67.0	75.0	72.0
Number of days state standard exceeded (measured) [c]	7	5	2
Number of days national standard exceeded (measured) [c]	0	0	0

Notes: $\mu g/m^3$ = micrograms per cubic meter; ppm = parts per million

[a] Data was obtained from the Del Paso Manor monitoring station in Sacramento, which is the closest monitoring station to the SPA that monitors for CO and $PM_{2.5}$.

[b] Maximum concentration shown are based on national monitoring methods.

[c] Measured days are those days that an actual measurement was greater than the level of the state daily standard or the national daily standard. Measurements are typically collected every 6 days. Calculated days are the estimated number of days that a measurement would have been greater than the level of the standard had measurements been collected every day. The number of days above the standard is not necessarily the number of violations of the standard for the year.

[d] Maximum concentrations shown are based on state monitoring methods.

Sources: ARB 2009c, EPA 2009b

rather a complex mixture of hundreds of substances. Although diesel PM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, and lubricating oil, and whether an emission control system is present. Unlike the other TACs, no ambient monitoring data are available for diesel PM because no routine measurement method currently exists. However, ARB has made preliminary concentration estimates based on a PM exposure method. This method uses the ARB emissions inventory's PM_{10} database, ambient PM_{10} monitoring data, and the results from several studies on chemical speciation to estimate concentrations of diesel PM. In addition to diesel PM, benzene, 1, 3-butadiene, acetaldehyde, carbon tetrachloride, hexavalent chromium, *para*-dichlorobenzene, formaldehyde, methylene

chloride, and perchloroethylene are the TACs for which data are available that pose the greatest existing ambient risk in California.

Diesel PM poses the greatest health risk among these 10 TACs mentioned. Based on receptor modeling techniques, ARB estimated its health risk to be 360 excess cancer cases per million people in the SVAB. Since 1990, the health risk associated with diesel PM has been reduced by 52%. Overall, levels of most TACs, except for *para*-dichlorobenzene and formaldehyde, have gone down since 1990 (ARB 2008c).

EXISTING AIR QUALITY—NATURALLY OCCURRING ASBESTOS

In addition, naturally occurring asbestos (NOA), which was identified as a TAC in 1986 by ARB, is located in many parts of California and is commonly associated with ultramafic rocks (Clinkenbeard et al. 2002). Asbestos is the common name for a group of naturally occurring fibrous silicate minerals that can separate into thin but strong and durable fibers. Ultramafic rocks form in high-temperature environments well below the surface of the earth. By the time they are exposed at the surface by geologic uplift and erosion, ultramafic rocks may be partially to completely altered into a type of metamorphic rock called serpentinite. Sometimes the metamorphic conditions are right for the formation of chrysotile asbestos or tremolite-actinolite asbestos in the bodies of these rocks or along their boundaries (Churchill and Hill 2000).

For individuals living in areas of NOA, there are many potential pathways for airborne exposure. Exposures to soil dust containing asbestos can occur under a variety of scenarios, including children playing in the dirt; dust raised from unpaved roads and driveways covered with crushed serpentine; grading and earth disturbance associated with construction activity; rock blasting; quarrying; gardening; and other human activities. For homes built on asbestos outcroppings, asbestos can be tracked into the home and can also enter as fibers suspended in outdoor air. Once such fibers are indoors, they can be entrained into the air by normal household activities, such as vacuuming (as many respirable fibers will simply pass through vacuum cleaner bags).

People exposed to low levels of asbestos may be at elevated risk (e.g., above background rates) of lung cancer and mesothelioma. The risk is proportional to the cumulative inhaled dose (quantity of fibers), and also increases with the time since first exposure. Although there are a number of factors that influence the disease-causing potency of any given asbestos (such as fiber length and width, fiber type, and fiber chemistry), all forms are carcinogens.

At the request of SMAQMD, the California Geological Survey (formerly the California Division of Mines and Geology) prepared a report called the *Relative Likelihood for the Presence of Naturally Occurring Asbestos in Eastern Sacramento County, California* (Higgins and Clinkenbeard 2006). According to the map presented in this report more than half of the SPA is located in "areas moderately likely to contain NOA." Although geologic conditions are more likely for asbestos formation in particular areas identified by the map, the presence thereof is not certain. (See Section 3A.7, "Geology, Soil, Minerals, and Paleontological Resources – Land" for additional information regarding NOA.)

EXISTING AIR QUALITY—ODORS

Typically odors are regarded as an annoyance rather than a health hazard. However, manifestations of a person's reaction to foul odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache).

With respect to odors, the human nose is the sole sensing device. The ability to detect odors varies considerably among the population and overall is quite subjective. Some individuals have the ability to smell minute quantities of specific substances; others may not have the same sensitivity but may have sensitivities to odors of other substances. In addition, people may have different reactions to the same odor; in fact, an odor that is offensive to one person (e.g., from a fast-food restaurant) may be perfectly acceptable to another. It is also important to note that an unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. This is

because of the phenomenon known as odor fatigue, in which a person can become desensitized to almost any odor and recognition only occurs with an alteration in the intensity.

Quality and intensity are two properties present in any odor. The quality of an odor indicates the nature of the smell experience. For instance, if a person describes an odor as flowery or sweet, then the person is describing the quality of the odor. Intensity refers to the strength of the odor. For example, a person may use the word "strong" to describe the intensity of an odor. Odor intensity depends on the odorant concentration in the air. When an odorous sample is progressively diluted, the odorant concentration decreases. As this occurs, the odor intensity weakens and eventually becomes so low that the detection or recognition of the odor is quite difficult. At some point during dilution, the concentration of the odorant reaches a detection threshold. An odorant concentration below the detection threshold means that the concentration in the air is not detectable by the average human.

3A.2.2 REGULATORY FRAMEWORK

CRITERIA AIR POLLUTANTS

Federal Plans, Policies, Regulations, and Laws

At the Federal level, EPA has been charged with implementing national air quality programs. EPA's air quality mandates are drawn primarily from the Federal Clean Air Act (CAA), which was enacted in 1970. The most recent major amendments made by Congress were in 1990.

The CAA required EPA to establish primary and secondary NAAQS (Table 3A.2-1). The CAA also required each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The Federal Clean Air Act Amendments of 1990 (CAAA) added requirements for states with nonattainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The SIP is modified periodically to reflect the latest emissions inventories, planning documents, and rules and regulations of the air basins as reported by their jurisdictional agencies. EPA has responsibility for reviewing all state SIPs to determine conformation to the mandates of the CAAA and determine whether implementation will achieve air quality goals. If EPA determines a SIP to be inadequate, a Federal Implementation Plan (FIP) that imposes additional control measures may be prepared for the nonattainment area. Failure to submit an approvable SIP or to implement the plan within the mandated time frame may result in application of sanctions to transportation funding and stationary air pollution sources in the air basin.

In addition, general conformity requirements were adopted by Congress as part of the CAAA and were implemented by EPA regulations in 1993. General conformity requires that all Federal actions conform to the SIP as approved or promulgated by EPA. The purpose of the general conformity program is to ensure that actions taken by the Federal government do not undermine state or local efforts to achieve and maintain NAAQS. Before a Federal action is taken, it must be evaluated for conformity with the SIP. All reasonably foreseeable emissions, both direct and indirect, predicted to result from the action are taken into consideration and must be identified as to location and quantity. If it is found that the action would create emissions above *de minimis* threshold levels specified in EPA regulations, or if the activity is considered regionally significant because its emissions exceed 10% of an area's total emissions, the action cannot proceed unless mitigation measures are specified that would bring the project into conformance.

General conformity applies in both Federal nonattainment and maintenance areas. Within these areas, it applies to any Federal action not specifically exempted by the CAA or EPA regulations. Emissions from construction activities are also included. General conformity does not apply to projects or actions that are covered by the transportation conformity rule. If a Federal action falls under the general conformity rule, the Federal agency responsible for the action is responsible for making the conformity determination. In some instances, a state will make the conformity determination under delegation from a Federal agency. Private developers are not

responsible for making a conformity determination, but can be directly affected by a determination. General conformity with respect to the project will be determined within the record of decision.

State Plans, Policies, Regulations, and Laws

ARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA). The CCAA, which was adopted in 1988, required ARB to establish CAAQS (Table 3A.2-1). The CCAA requires that all local air districts in the state endeavor to achieve and maintain the CAAQS by the earliest practical date. The act specifies that local air districts should focus particular attention on reducing the emissions from transportation and areawide emission sources, and provides districts with the authority to regulate indirect sources.

Other ARB responsibilities include overseeing compliance with California and Federal laws by local air districts, approving local air quality plans, submitting SIPs to EPA, monitoring air quality, determining and updating area designations and maps, and setting emissions standards for new mobile sources, consumer products, small utility engines, off-road vehicles, and fuels.

ARB and local air pollution control districts are currently developing plans for meeting new national air quality standards for ozone and $PM_{2.5}$. California's adopted 2007 State Strategy was submitted to EPA as a revision to the SIP in November 2007 (ARB 2008d).

Regional and Local Plans, Policies, Regulations, and Laws

Sacramento Metropolitan Air Quality Management District

SMAQMD attains and maintains air quality conditions in Sacramento County through a comprehensive program of planning, regulation, enforcement, technical innovation, and promotion of the understanding of air quality issues. The clean-air strategy of SMAQMD includes the preparation of plans for the attainment of ambient air-quality standards, adoption and enforcement of rules and regulations concerning sources of air pollution, and issuance of permits for stationary sources of air pollution. SMAQMD also inspects stationary sources of air pollution and responds to citizen complaints, monitors ambient air quality and meteorological conditions, and implements programs and regulations required by the CAA and amendments thereof (CAAA), and the CCAA.

SMAQMD's *Guide to Air Quality Assessment in Sacramento County* is an advisory document that provides lead agencies, consultants, and project applicant(s) with uniform procedures for addressing air quality in environmental documents. A new version of the guide was released in December 2009 and supersedes the version released in July 2004 (SMAQMD 2009a). The new version of the guide does not include the development of new thresholds of significance; however, it does include updated methodologies for evaluating potential impacts and refined list of recommended mitigation measures. In addition, the guide contains the following applicable components:

- criteria and thresholds for determining whether a project may have a significant adverse air quality impact;
- specific procedures and modeling protocols for quantifying and analyzing air quality impacts;
- methods available to mitigate air quality impacts; and
- information for use in air quality assessments and environmental impact reports (EIRs) that will be updated more frequently such as air quality data, regulatory setting, climate, and topography.

As mentioned above, SMAQMD adopts rules and regulations. All projects are subject to SMAQMD rules and regulations in effect at the time of construction. Specific rules applicable to the construction of the project may include, but are not limited to, the following:

- **Rule 201: General Permit Requirements.** Any project that includes the use of equipment capable of releasing emissions to the atmosphere may require permit(s) from SMAQMD before equipment operation. The applicant, developer, or operator of a project that includes an emergency generator, boiler, or heater should contact SMAQMD early to determine whether a permit is required, and to begin the permit application process. Portable construction equipment (e.g., generators, compressors, pile drivers, lighting equipment) with an internal combustion engine over 50 horsepower (hp) are required to have a SMAQMD permit or ARB portable equipment registration.

- **Rule 403: Fugitive Dust.** The developer or contractor is required to control dust emissions from earthmoving activities or any other construction activity to prevent airborne dust from leaving the SPA.

- **Rule 417: Wood Burning Appliances.** The developer or contractor is prohibited from installing any new, permanently installed, indoor or outdoor, uncontrolled fireplaces in new or existing developments.

- **Rule 442: Architectural Coatings.** The developer or contractor is required to use coatings that comply with the volatile organic compound (VOC) content limits specified in the rule.

- **Rule 902: Asbestos.** The developer or contractor is required to notify SMAQMD of any regulated renovation or demolition activity. Rule 902 contains specific requirements for surveying, notification, removal, and disposal of asbestos-containing material.

In addition, effective as of October 10, 2005, if modeled construction-generated emissions for a project are not reduced to SMAQMD's threshold of significance (85 pounds per day [lb/day]) by the application of the standard construction mitigation, then an off-site construction mitigation fee is recommended. The fee must be paid before a grading permit can be issued. This fee is used by SMAQMD to purchase off-site emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies. SMAQMD provides a Mitigation Fee Calculator for determining the fee for construction projects when off-site mitigation is needed (SMAQMD 2009b).

El Dorado County Air Quality Management District

EDCAQMD attains and maintains air quality conditions in El Dorado County in a manner similar to that described above for SMAQMD (e.g., planning, regulation, and enforcement). Refer to the discussion of SMAQMD above for further detail.

Specific EDCAQMD rules applicable to the off-site elements may include, but are not limited to:

- **Rule 202: Visible Emissions.** A person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than 3 minutes in any 1 hour which is as dark or darker in shade as that designated as number 1 on the Ringelmann Chart, as published by the U.S. Bureau of Mines.

- **Rule 205: Nuisance.** A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons, or to the public, or which endanger the comfort, repose, health or safety of any such persons, or the public, or which cause to have a natural tendency to cause injury or damage to business or property. This rule does not apply to odors emanating from agriculture operations necessary for the growing of crops or raising of fowl or animals.

- **Rule 215: Architectural Coatings.** The rule concerns emissions of VOCs associated with the application of architectural coatings.

- **Rule 223: Fugitive Dust—General Requirements.** The purpose of this Rule is to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce or mitigate fugitive dust emissions.

- **Rule 223-1: Fugitive Dust—Construction, Bulk Material Handling, Blasting, Other Earthmoving Activities and Carryout and Trackout Prevention.** The purpose of this Rule is to reduce the amount of particulate matter entrained in the ambient air as a result of anthropogenic (man-made) fugitive dust sources by requiring actions to prevent, reduce or mitigate fugitive dust emissions.

- **Rule 223-2: Fugitive Dust –Asbestos Hazard Mitigation.** The purpose of this rule is to reduce the amount of asbestos particulate matter entrained in the ambient air as a result of any construction or construction related activities, that disturbs or potentially disturbs naturally occurring asbestos by requiring actions to prevent, reduce or mitigate asbestos emissions.

- **Rule 224: Cutback Asphalt Paving Material.** This rule concerns the discharge to the atmosphere of VOCs caused by the use or manufacture, mixing, storage and application of Cutback or Emulsified asphalt for paving, road construction or road maintenance.

- **Rule 501: General Permit Requirement.** This rule provides an orderly procedure for the review of new sources of air pollution and the orderly review of the modification and operation of existing sources through the issuance of permits. Procedures for issuing, modifying, or renewing Title V permits to operate for stationary sources which are subject to Rule 522 Title V – Federal Operating Permit Program, shall also be consistent with the procedures specified in that rule.

Air Quality Plans

SMAQMD, in coordination with the air quality management districts and air pollution control districts of El Dorado, Placer, Solano, Sutter, and Yolo Counties (including EDCAQMD), prepared and submitted the 1994 *Air Quality Attainment Plan* (AQAP) in compliance with the requirements set forth in the CCAA, which specifically addressed the nonattainment status for ozone and, to a lesser extent, CO and PM_{10}.

The CCAA also requires a triennial assessment of the extent of air quality improvements and emission reductions achieved through the use of control measures. As part of the assessment, the attainment plan must be reviewed and, if necessary, revised to correct for deficiencies in progress and to incorporate new data or projections. The requirement of the CCAA for a first triennial progress report and revision of the 1991 AQAP was fulfilled with the preparation and adoption of the 1994 Ozone Attainment Plan (OAP). The OAP stresses attainment of ozone standards and focuses on strategies for reducing reactive organic gases (ROG) and oxides of nitrogen (NO). It promotes active public involvement, enforcement of SMAQMD rules and regulations, public education in both the public and private sectors, development and promotion of transportation and land use programs designed to reduce vehicle miles traveled (VMT) in the region, and implementation of control measures for stationary and mobile sources. The OAP became part of the SIP in accordance with the requirements of the CAAA and amended the 1991 AQAP. However, at that time, the region could not show that the national ozone (1-hour) standard would be met by 1999. In exchange for moving the deadline to 2005, the region accepted a designation of "severe nonattainment" coupled with additional emissions requirements on stationary sources. Additional triennial reports were also prepared in 1997, 2000, 2003, and 2006 in compliance with the CCAA and act as incremental updates.

Sacramento County and the western portion of El Dorado County are also part of the Sacramento Federal Ozone Nonattainment Area (SFNA), which also comprises of Yolo County and portions of Placer, and Solano Counties. As a nonattainment area, the region is also required to submit rate-of-progress milestone evaluations in accordance with the CAAA. Milestone reports were prepared for 1996, 1999, 2002, and most recently in 2006 for the 8-hour ozone standard. These milestone reports include compliance demonstrations that the requirements have been met for the SFNA. The AQAPs and reports present comprehensive strategies to reduce emissions of ROG, NO_X, and PM_{10} from stationary, area, mobile, and indirect sources. Such strategies include the adoption of rules

and regulations; enhancement of CEQA participation; implementation of a new and modified indirect-source review program; adoption of local air quality plans; and control measures for stationary, mobile, and indirect sources.

The Sacramento region was classified by EPA on June 15, 2004, as a "serious" nonattainment area for the national 8-hour ozone standard with an attainment deadline of June 15, 2013. Emission reductions needed to achieve the air quality standard were identified based on air quality modeling. An evaluation of proposed new control measures and associated ROG and NO_X emission reductions concluded that no set of feasible controls was available to provide the needed emission reductions before the attainment deadline year. Given the magnitude of the shortfall in emission reductions and the schedule for implementing new control measures, the earliest possible attainment demonstration year for the Sacramento region is determined to be the "severe" area deadline of 2019.

Section 181(b)(3) of the CAA permits a state to request that EPA reclassify a nonattainment area to a higher classification and extend the time allowed for attainment. This process is appropriate for areas that must rely on longer term strategies to achieve the emission reductions needed for attainment.

The board of directors for each of the five air districts (including SMAQMD and EDCAQMD) that compose the SFNA requested that ARB submit a formal request for voluntary reclassification from "serious" to "severe" for the 8-hour ozone nonattainment area with an associated attainment deadline of June 15, 2019. ARB submitted that request on February 14, 2008.

On March 24, 2008, EPA published in the *Federal Register* a finding of Failure to Submit the 2011 Reasonable Further Progress Plan for the SFNA. The failure to submit finding triggered the following sanctions clocks:

- **Offset sanctions:** More stringent emission mitigation requirements for new and modified businesses, "major stationary sources," if a complete plan is not submitted within 18 months after EPA's finding of failure to submit the plan.

- **Federal highway funding sanctions:** Prohibiting transportation projects from receiving Federal transportation funding if a complete plan is not submitted within 24 months after EPA findings.

The sanctions clocks will stop after the air districts (including SMAQMD and EDCAQMD) submit the 2011 Reasonable Further Progress Plan and EPA accepts the plan as complete. The *Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan* (SMAQMD 2008a) was published and a public meeting was held in March 2009 to consider approval of the SIP (SMAQMD 2008b). EPA has not yet approved the plan at of the time of writing this EIR/EIS and SMAQMD I waiting for EPA to make a completeness finding (Anderson, pers. comm., 2009).

Although the region has made significant progress in reducing ozone, a problem has arisen with regard to another requirement set forth in the CAA. The region's transportation plan must conform and thus show that it does not harm the region's chances of attaining the ozone standard. The SIP is tied to a "motor vehicle emissions budget;" transportation planners must ensure that emissions anticipated from plans and improvement programs remain within this budget. The instance where no conformity determination can be made is known as conformity lapse. This occurred in October 2004. This Sacramento Regional Nonattainment Area 8-Hour Ozone Rate-of-Progress Plan (February 2006) proposes to update the allowable motor vehicle emissions budgets used to demonstrate that projected regional emissions with all of the new transportation projects will conform to the levels established in the air quality plan.

Sacramento County General Plan

The following goals, objectives, and policies from the Sacramento County General Plan (Sacramento County 1993) regarding air quality are applicable to the on-site and off-site project elements under the Proposed Project

Alternative and the other four action alternatives. There are no Sacramento County General Plan policies related to air quality that would apply to the No Project Alternative.

GOAL: Air Quality which protects and promotes the public health, safety, welfare, and environmental quality of the community.

Objective: The integration of air quality planning with the land use, transportation and energy planning processes.

Objective: A safe and healthful environment for pollution sensitive residential land uses and sensitive receptors.

Objective: A reduction in motor vehicle emissions through a decrease in the average daily trips and VMT.

Objective: Compliance with Federal and state air quality standards.

Objective: A reduction in releases of ozone depleting compounds in order to ensure the protection of the stratospheric ozone layer.

Objective: A reduction in motor vehicle emissions through increasing reliance on electric and other clean alternative fuel and low emission vehicles.

- **Policy AQ-1:** Minimize air pollutant emissions from Sacramento County facilities and operations.
- **Policy AQ-2:** Use ARB, SMAQMD and Sacramento Area Council of Governments (SACOG) guidelines for Sacramento County facilities and operations in order to comply with mandated measures to reduce emissions from fuel consumption, energy consumption, surface coating operations, and solvent usage.
- **Policy AQ-3:** Promote optimal air quality benefits through energy conservation measures in new development.
- **Policy AQ-4:** Support SMAQMD's development of improved ambient air quality monitoring capabilities and the establishment of standards, thresholds and rules to more adequately address the air quality impacts of proposed project plans and proposals.
- **Policy AQ-5:** Require BACT to reduce air pollution emissions.
- **Policy AQ-6:** Provide disincentives for single-occupant vehicle trips through parking supply and pricing controls in areas where supply is limited and alternative transportation modes are available so as not to cause economic disruption, or through other measures identified by SMAQMD and incorporated into regional plans.
- **Policy AQ-7:** Support the use of demand management and pricing controls as near-term measures for attaining AQAP goals and policies.
- **Policy AQ-8:** Implement the Sacramento City/County Bikeways Master Plan.
- **Policy AQ-9:** Secure adequate funding for Regional Transit so that transit is a viable transportation alternative. Development shall pay its fair share of the cost of transit facilities required to serve the project.
- **Policy AQ-10:** Provide incentives for the use of transportation alternatives, including a program for the provision of financial incentives for builders that construct ownership housing within a quarter mile of existing and proposed light rail stations.

- **Policy AQ-11:** Require as a building standard the installation of electrical service in all new residential development that can be used for the overnight charging of electrical vehicles.

- **Policy AQ-12:** The County shall establish an incentive based program for the installation of electrical service for recharging electrical vehicles in public and private parking facilities sufficient to meet demand.

- **Policy AQ-13:** Require the consideration of high occupancy vehicle (HOV) lanes in all street and highway widening and new construction projects for arterials and wider rights-of-way.

- **Policy AQ-14:** Develop a model County employee trip reduction program which may include, but not be limited to, flexible and compressed work schedules, commuter matching services, telecommuting, preferential carpool/vanpool parking, carpool/vanpool and transit subsidies, and all other commute alternative incentives.

- **Policy AQ-15:** All new major indirect sources of emissions shall be reviewed and modified or conditioned to achieve a reduction in emissions. This indirect source review program will be developed in coordination with SACOG and SMAQMD, and include the following features:

    - A 15% reduction in emissions from the level that would be produced by a base-case project assuming full trip generation per the current Institute of Transportation Engineers (ITE) Trip Generation Handbook.

    - A focus on cost-effectiveness measured in terms of cost per ton of pollutant avoided.

    - A list of cost-effective measures to be developed, maintained, and annually reviewed by SMAQMD.

    - A maximum expenditure cap which will be computed for each indirect source on the basis of factors including, but not limited to, total emissions and project value.

    - A process for obtaining a waiver from the 15% requirement if it is found that a lower level of reduction is all that can be achieved with cost-effective measures and offsets, or that achieving the full 15% reduction would cost more than expenditure cap.

    - An exception for projects which have already undergone the indirect source review at some point in the development approval process.

    - A procedure to give full credit for other measures required in a project that may also achieve a reduction in emissions.

- **Policy AQ-16:** Support intergovernmental efforts directed at stricter tailpipe emissions standards.

- **Policy AQ-17:** Require that development projects be located and designed in a manner which will conserve air quality and minimize direct and indirect emission of air contaminants.

- **Policy AQ-18:** Encourage employment-intensive development, having the potential to employ 200 or more employees, where adequate transit service is planned, and discourage such development where adequate transit service is not planned.

- **Policy AQ-19:** Identify the air quality impacts of development proposals to avoid significant adverse impacts and require appropriate mitigation measures or offset fees.

- **Policy AQ-20:** Submit development proposals to SMAQMD for review and comment in compliance with CEQA prior to consideration by the appropriate decision making body.

- **Policy AQ-21:** Provide for the location of ancillary employee services (including, but not limited to, child care, restaurants, banking facilities, convenience markets) at major employment centers for the purpose of reducing midday vehicle trips.
- **Policy AQ-22:** Provide for buffers between sensitive land uses and sources of air pollution or odor.
- **Policy AQ-23:** Promote mixed-use development to reduce the length and frequency of vehicle trips.
- **Policy AQ-24:** Provide for increased intensity of development along existing and proposed transit corridors.
- **Policy AQ-25:** Require that new development be designed to promote pedestrian and bicycle access and circulation.
- **Policy AQ-26:** Accommodate growth within existing urban areas (infill) as a priority over urban expansion.
- **Policy AQ-27:** Require that all employee parking areas for new development be designed with controllable access.
- **Policy AQ-28:** Require that large new developments dedicate land for use as park-and-ride lots if suitably located.
- **Policy AQ-29:** Require traffic counter loops and traffic management hardware at nonresidential garage entrances, driveways, new intersections, and other appropriate locations.
- **Policy AQ-30:** Require that new commercial and industrial projects adjacent to bus stops make provisions in their project design for park-and-ride spaces.
- **Policy AQ-31:** Preserve and ensure the dedication of rights-of-way and station sites along future light rail extensions.
- **Policy AQ-32:** Require that new and replacement fuel storage tanks at automobile and light duty truck refueling stations be clean-fuel compatible, if technically and economically feasible.
- **Policy AQ-33:** Require the recovery of chlorofluorocarbons (CFCs) when air conditioning and refrigeration units are serviced or disposed.
- **Policy AQ-34:** Support revisions to the AQAP to accelerate and strengthen market-based strategies consistent with the General Plan.
- **Policy AQ-35:** In conjunction with SMAQMD and SACOG, support and participate in a public education and outreach program dealing with air quality issues, with a goal of attaining a solid foundation of public support for needed air quality measures.
- **Policy AQ-36:** Coordinate air quality planning efforts with other local, regional, and state agencies.
- **Policy AQ-37:** Maximize air quality benefits through selective use of vegetation in landscaping and through revegetation of appropriate areas.
- **Policy AQ-38:** A conformity analysis shall be conducted to assure that transportation plans, programs, and projects will not impair efforts to meet air quality standards.

At the time of writing this EIR, the Sacramento County General Plan is undergoing its first comprehensive update since it was last adopted in 1993. This update is necessary to plan for growth in the next planning cycle (2005-

2030) as well as to address new emerging planning issues. The update is expected to be adopted in 2010 (Sacramento County Planning and Community Development Department 2009).

El Dorado County General Plan

The following goals, objectives, and policies from the El Dorado County General Plan (El Dorado County 2004) regarding air quality are applicable to the proposed off-site roadways that would extend from the Folsom Heights property east into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County General Plan policies related to air quality that would apply to the other four action alternatives or the No Project Alternative.

- **Policy TC-1q:** The County shall utilize road construction methods that seek to reduce air, water, and noise pollution associated with road and highway development.

- **Policy TC-3a:** The County shall support all standards and regulations adopted by the El Dorado County Air Quality Management District governing transportation control measures and applicable state and Federal standards.

- **Policy 6.3.1.1:** The County shall require that all discretionary projects and all projects requiring a grading permit, or a building permit that would result in earth disturbance, that are located in areas likely to contain naturally occurring asbestos (based on mapping developed by the California Department of Conservation [DOC]) have a California-registered geologist knowledgeable about asbestos-containing formations inspect the project area for the presence of asbestos using appropriate test methods. The County shall amend the Erosion and Sediment Control Ordinance to include a section that addresses the reduction of thresholds to an appropriate level for grading permits in areas likely to contain naturally occurring asbestos (based on mapping developed by the DOC). The Department of Transportation and the County Air Quality Management District shall consider the requirement of posting a warning sign at the work site in areas likely to contain naturally occurring asbestos based on the mapping developed by the DOC.

GOAL 6.7: Air Quality Maintenance

A. Strive to achieve and maintain ambient air quality standards established by the U.S. Environmental Protection Agency and the California Air Resources Board.

B. Minimize public exposure to toxic or hazardous air pollutants and air pollutants that create unpleasant odors.

Objective 6.7.1: El Dorado County Clean Air Plan – Adopt and enforce the El Dorado County Clean Air Act Plan in conjunction with the County Air Quality Management District.

Objective 6.7.2: Vehicular Emissions – Reduce motor vehicle air pollution by developing programs aimed at minimizing congestion and reducing the number of vehicle trips made in the County and encouraging the use of clean fuels.

- **Policy 6.7.2.5:** Upon reviewing projects, the County shall support and encourage the use of, and facilities for, alternative-fuel vehicles to the extent feasible. The County shall develop language to be included in County contract procedures to give preference to contractors that utilize low-emission heavy-duty vehicles.

Objective 6.7.7: Construction Related, Short-Term Emissions – Reduce construction related, short-term emissions by adopting regulations which minimize their adverse effects.

- **Policy 6.7.7.1:** The County shall consider air quality when planning the land uses and transportation systems to accommodate expected growth, and shall use the recommendations in the most recent version of the El Dorado County Air Quality Management (AQMD) Guide to Air Quality Assessment: Determining

Significance of Air Quality Impacts Under the California Environmental Quality Act, to analyze potential air quality impacts (e.g., short-term construction, long-term operations, toxic and odor-related emissions) and to require feasible mitigation requirements for such impacts. The County shall also consider any new information or technology that becomes available prior to periodic updates of the Guide. The County shall encourage actions (e.g., use of light-colored roofs and retention of trees) to help mitigate heat island effects on air quality.

Objective 6.7.8: The Effects of Air Pollution on Vegetation – Monitor ongoing scientific research regarding the adverse effects, if any, of air pollution on vegetation.

- **Policy 6.7.8.1:** The County shall monitor ongoing scientific research regarding the adverse effects, if any, of air pollution on vegetation, including commercially valuable timber, threatened or endangered plant species, and other plant species. If and when such research conclusively determines, or if and when the weight of scientific opinion concludes, that air pollution is causing significant harm to vegetation within El Dorado County or similarly situated areas, the County, through its periodic review of the General Plan pursuant to Policy 2.9.1.2, shall consider whether to add policies to the General Plan to try to mitigate such harm.

City of Folsom General Plan

The following goals, objectives, and policies from Air Quality Element of the City of Folsom General Plan (City of Folsom 1988) regarding air quality are applicable to the Proposed Project Alternative and the other four action alternatives. There are no City of Folsom General Plan policies related to air quality that would apply to the No Project Alternative.

Air Quality Element Goals and Policies

GOAL 31: To improve the air quality of the City of Folsom including:

1. Achievement and Maintenance of ambient air quality standards established by the U.S. Environmental Protect Agency and the California Air Resources Board.

2. Minimizing public exposure to toxic or hazardous air pollutants.

3. Limiting visibility reducing particulate matter in the atmosphere.

4. Minimizing public exposure to air pollutants which create a public nuisance through irritation to the senses or unpleasant odor.

- **Policy 31.4:** To minimize air quality impacts mitigation measures shall be required for transportation emissions associated with all development estimated to generate 2,000 or more trips per day. Measures include:

    1. Project proponent funding of roadway improvements.

    2. Commercial/industrial project proponent sponsorship of van pools or club buses.

    3. Project proponent funded transit subsidies sufficient to reduce emissions from transit through the substitution of diesel-fueled buses with buses powered by alternative fuels, such as methanol and electric.

    4. Commercial/industrial project sponsored daycare and employee services at the employment site.

    5. Park and ride lots.

- **Policy 31.6:** Non-retail industrial and non-retail commercial projects which directly emit air pollutants should be located in areas designated for industrial development, and separated from residential mixed use areas.

- **Policy 31.7:** All employers of 50 or more full time employees per shift shall develop and implement incentive-based trip reduction programs for their employees. Incentives may include:

    1. Provision of reserved and preferentially located parking spaces for the exclusive use of employees who actively participate in ride-sharing.

    2. Provision of secure bicycle storage facilities.

    3. Provision of shower and locker facilities for use by employees who commute by non-motorized means.

    4. Distribution by employers of current information regarding the availability, cost, and schedules of public transit.

    5. Employer provision of economic incentives to maximize the use of transit, ridesharing, van pooling, and non-motorized transportation.

- **Policy 31.9:** The city should encourage bicycle usage though the development and maintenance of a safe and comprehensive bikeway system which includes:

    1. The provision of securely anchored bicycle racks.

    2. Sidewalks in residential development with protective curbing and adequate lighting.

- **Policy 31.10:** The City of Folsom shall develop, as part of its transportation plan and Transportation and Circulation. Element of the General Plan, a transit development plan so that Folsom residents may safely and conveniently use transit for work, school, shopping, recreational, and other trips within the City and outside of the City.

Goal 32: To minimize public exposure to toxic or hazardous air pollutants.

TOXIC AIR CONTAMINANTS

It is important to understand that TACs are not considered criteria air pollutants and thus are not specifically addressed through the setting of ambient air quality standards. Instead, EPA and ARB regulate HAPs and TACs, respectively, through statutes and regulations that generally require the use of the maximum or best available control technology (MACT and BACT) to limit emissions. These in conjunction with additional rules set forth by SMAQMD establish the regulatory framework for TACs (see discussion under "State and Local Toxic Air Contaminant Programs" below).

Federal Hazardous Air Pollutant Program

EPA has programs for identifying and regulating HAPs. Title III of the CAAA directed EPA to promulgate national emissions standards for HAPs (NESHAP). The NESHAP for major sources of HAPs may differ from those for area sources. Major sources are defined as stationary sources with potential to emit more than 10 tons per year (tpy) of any HAP or more than 25 tpy of any combination of HAPs; all other sources are considered area sources.

The CAAA called on EPA to promulgate emissions standards in two phases. In the first phase (1992–2000), EPA developed technology-based emissions standards designed to reduce emissions as much as feasible. These standards are generally referred to as requiring maximum available control technology (MACT). For area sources, the standards may be different, based on generally available control technology. In the second phase, EPA

promulgated health risk–based emissions standards were deemed necessary to address risks remaining after implementation of the technology-based NESHAP standards.

The CAAA also required EPA to promulgate vehicle or fuel standards containing reasonable requirements that control toxic emissions of, at a minimum, benzene and formaldehyde. Performance criteria were established to limit mobile-source emissions of benzene, formaldehyde, and 1,3-butadiene. In addition, Section 219 of the CAAA required the use of reformulated gasoline in selected areas with the most severe ozone nonattainment conditions to further reduce mobile-source emissions.

State and Local Toxic Air Contaminant Programs

TACs in California are regulated primarily through the Tanner Air Toxics Act (Assembly Bill [AB] 1807 [Chapter 1047, Statutes of 1983]) and the Air Toxics Hot Spots Information and Assessment Act (AB 2588 [Chapter 1252, Statutes of 1987]). AB 1807 sets forth a formal procedure for ARB to designate substances as TACs. Research, public participation, and scientific peer review must occur before ARB can designate a substance as a TAC. To date, ARB has identified more than 21 TACs and adopted EPA's list of HAPs as TACs. Most recently, particulate matter emissions from diesel exhaust (diesel PM) was added to the ARB list of TACs.

After a TAC is identified, ARB then adopts an airborne toxics control measure (ATCM) for sources that emit that particular TAC. If there is a safe threshold for a substance at which there is no toxic effect, the control measure must reduce exposure below that threshold. If there is no safe threshold, the measure must incorporate BACT to minimize emissions; for example, the ATCM limits truck idling to 5 minutes (Title 13, Section 2485 of the California Code of Regulations).

The Air Toxics Hot Spots Information and Assessment Act requires that existing facilities that emit toxic substances above a specified level prepare an inventory of toxic emissions, prepare a risk assessment if emissions are significant, notify the public of significant risk levels, and prepare and implement risk reduction measures.

ARB has adopted control measures for diesel PM and more stringent emissions standards for various on-road mobile sources of emissions, including transit buses and off-road diesel equipment (e.g., tractors, generators). In February 2000, ARB adopted a new rule for public-transit bus fleets and emissions standards for new urban buses. These new rules and standards include all the following elements:

- more stringent emission standards for some new urban bus engines, beginning with 2002 model year engines;
- zero-emission bus demonstration and purchase requirements applicable to transit agencies; and
- reporting requirements, under which transit agencies must demonstrate compliance with the public-transit bus fleet rule.

Recent and future milestones include the low-sulfur diesel fuel requirement and tighter emissions standards for heavy-duty diesel trucks (2007) and off-road diesel equipment (2011) nationwide. Over time, replacing older vehicles will result in a vehicle fleet that produces substantially lower levels of TACs than under current conditions. Mobile-source emissions of TACs (e.g., benzene, 1,3-butadiene, diesel PM) have been reduced significantly over the last decade and will be reduced further in California through a progression of regulatory measures (e.g., Low Emission Vehicle/Clean Fuels and Phase II reformulated gasoline regulations) and control technologies. With implementation of ARB's Risk Reduction Plan, it is expected that diesel PM concentrations will be reduced by 75% in 2010 and 85% in 2020 from the estimated year-2000 level. Adopted regulations are also expected to continue to reduce formaldehyde emissions from cars and light-duty trucks. As emissions are reduced, it is expected that risks associated with exposure to the emissions will also be reduced.

In addition, the *Air Quality and Land Use Handbook: A Community Health Perspective*, published by ARB, provides guidance on land use compatibility with sources of TACs (ARB 2005). The handbook is not a law or

adopted policy but offers advisory recommendations for the siting of sensitive receptors near uses associated with TACs, such as freeways and high-traffic roads, commercial distribution centers, rail yards, ports, refineries, dry cleaners, gasoline stations, and industrial facilities, to help keep children and other sensitive populations out of harm's way.

Senate Bill (SB) 352 (California Education Code Section 17213, California Public Resources Code Section 21151.8) expands on previous requirements for the review of TAC sources near school sites. Accordingly, SB 352 requires that any school site located within 500 feet of the edge of the closest travel lane of a freeway or other busy traffic corridor be reviewed for potential health risks.

At the local level, air pollution control or management districts may adopt and enforce ARB control measures. Under SMAQMD Rule 202 (New Source Review), all sources that possess the potential to emit TACs must obtain permits from the district. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new-source review standards and air toxics control measures. SMAQMD limits emissions and public exposure to TACs through a number of programs. The district prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

Sources that require a permit are analyzed by SMAQMD (e.g., health risk assessment) based on their potential to emit toxics. If it is determined that the project will emit toxics in excess of SMAQMD's threshold of significance for TACs (identified below), sources have to implement the BACT for TACs (T-BACT) to reduce emissions. If a source cannot reduce the risk below the threshold of significance even after T-BACT has been implemented, the SMAQMD will deny the permit required by the source. This helps to prevent new problems and reduces emissions from existing older sources by requiring them to apply new technology for controlling TACs when retrofitting emissions sources. It is important to note that the air quality permitting process applies only to stationary sources; properties that may be exposed to elevated levels of TACs from nonstationary sources (e.g., high traffic-volume roadways, truck yards) and the nonstationary sources themselves are not subject to this process or to any requirements of T-BACT implementation. Rather, emissions controls on nonstationary sources are subject to regulations implemented on the state and Federal level. Local programs of EDCAQMD with respect to TACs in El Dorado County are similar to SMAQMD's programs described above.

State regulations on asbestos are related to demolition and renovations, and waste disposal of asbestos-containing materials. California also has a statewide regulation that addresses NOA. The Asbestos ATCM for Asbestos-Containing Serpentine, adopted in 1990, prohibited the use of serpentine aggregate for surfacing if the asbestos content was 5% or more asbestos (ARB 2009d). The limit on asbestos content was lowered to 0.25% in 2000 and modified to include ultramafic rock.

In July 2001, ARB adopted an ATCM for construction, grading, quarrying, and surface mining operations that regulates grading and excavation activities in areas of serpentine or ultramafic rocks. In addition, the Governor's Office of Planning and Research issued a memorandum providing guidance to lead agencies in analyzing the impacts of NOA through the CEQA review process (OPR 2008).

SMAQMD enforces ARB's Asbestos ATCM to control dust emissions and human exposure to the asbestos fibers found in serpentine and ultramafic rock (and soil derived from those substrates). The ATCM can be summarized as follows (ARB 2008e):

> Large construction projects are required to prepare a dust mitigation plan and receive approval from the district prior to start of the project. The plan must specify measures that will be taken to ensure that no visible dust crosses the property line and must address specific topics. The dust mitigation plan must address control of emissions from: track-out, disturbed surface areas, storage piles, on-site vehicle traffic, off-site transport of material, and earthmoving activities. The plan must also address post construction stabilization and air monitoring (if required by the local air

district [SMAQMD]). Table 1 (not shown here) shows control options for the topics to be addressed in the asbestos dust mitigation plan for large construction projects. Many of these requirements would already be carried out by such projects to minimize nuisance dust complaints and protect water quality.

ODORS

SMAQMD adopted a nuisance rule that addresses odor exposure. Rule 402 states that no person shall discharge from any source whatsoever such quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons, or to the public, or that endanger the comfort, repose, health, or safety of any such persons, or the public, or that cause to have a natural tendency to cause injury or damage to business or property. The provisions of Rule 402 do not apply to odors emanating from agricultural operations necessary for the growing of crops or raising of fowl or animals.

SMAQMD recommends that odor impacts be addressed in a qualitative manner. Such an analysis shall determine whether the project would result in excessive nuisance odors, as defined under the California Code of Regulations and Section 41700 of the California Health and Safety Code, and thus would constitute a public nuisance related to air quality.

Two situations increase the potential for odor problems. The first occurs when a new odor source is located near existing sensitive receptors. The second occurs when new sensitive receptors are developed near existing sources of odors. In the first situation, SMAQMD recommends operational changes, add-on controls, process changes, or buffer zones where feasible to address odor complaints. In the second situation, the potential conflict is considered significant if the plan area is at least as close as any other site that has already experienced significant odor problems related to the odor source. For projects being developed near a source of odors where there is no nearby development that may have filed complaints, and for odor sources being developed near existing sensitive receptors, SMAQMD recommends that the determination of potential conflict be based on the distance and frequency at which odor complaints from the public have occurred in the vicinity of a similar facility.

Odors in Sacramento and El Dorado Counties are regulated by SMAQMD and EDCAQMD, respectively. Neither district has specific rules or standards related to odor emissions. Any actions related to odors are based on citizen complaints to local governments and/or to SMAQMD and EDCAQMD.

3A.2.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines and guidance from SMAQMD and EDCAQMD. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project Alternative or alternatives under consideration were determined to result in a significant impact related to air quality if they would do any of the following:

- conflict with or obstruct implementation of the applicable air quality plan,
- violate any air quality standard or contribute substantially to an existing or projected air quality violation,
- result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable NAAQS or CAAQS (including releasing emissions that exceed quantitative thresholds for ozone precursors),

- expose sensitive receptors to substantial pollutant concentrations, or
- create objectionable odors affecting a substantial number or people.

As stated in Appendix G, the significance criteria established by the applicable air quality management district may be relied on to make the above determinations. Thus, in accordance with SMAQMD- and EDCAQMD recommended thresholds for evaluating project-related air quality impacts, implementation of the Proposed Project Alternative or alternatives under consideration would be considered significant if operation of the Proposed Project Alternative or alternatives under consideration would (SMAQMD 2009a; EDCAQMD 2002):

- for project-related construction activity that would occur in Sacramento County, generate construction-related criteria air pollutant or precursor emissions that exceed the SMAQMD-recommended threshold of 85 lb/day for NO_X, or result in or substantially contribute (at a level equal to or greater than 5%) to emissions concentrations (e.g., 50 $\mu g/m^3$ and 2.5 $\mu g/m^3$ for PM_{10}, respectively) that exceed the NAAQS or CAAQS; for project-related construction activity in El Dorado County, generate construction-related criteria air pollutant or precursor emissions that exceed the EDCAQMD-recommended threshold of 82 lb/day for NO_X or 82 lb/day for ROG, or result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS;
- generate long-term regional criteria air pollutant or precursor emissions that exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, or result in or substantially contribute (at a level equal to or greater than 5%) to emissions concentrations (e.g., 50 $\mu g/m^3$ and 2.5 $\mu g/m^3$ for PM_{10}, respectively) that exceed the NAAQS or CAAQS;
- contribute to localized concentrations of air pollutants at nearby receptors that would exceed applicable ambient air quality standards;
- expose sensitive receptors to TAC emissions that exceed an incremental increase of 10 in 1 million for the carcinogenic risk (i.e., the risk of contracting cancer) and/or a noncarcinogenic Hazard Index of 1.0 at the Maximally Exposed Individual (MEI). This threshold of significance applies to projects that would introduce new stationary or area sources of TAC emissions in close proximity to existing or future planned sensitive receptors. ARB and SMAQMD do not have a recommended threshold of significance for evaluating projects that would locate sensitive receptors near existing sources of TAC emissions such as a freeway, high-volume roadway, or rail yard. For the purposes of this analysis, the City will use applicable screening criteria recommended by ARB and SMAQMD as thresholds of significance to evaluate instances in which each action alternative would locate a sensitive receptor in close proximity to a freeway, high-volume roadway, or a TAC-emitting land use such as a gasoline station or a dry-cleaning operation that uses perchloroethylene. (ARB's and SMAQMD's screening criteria are discussed in greater detail under the analysis methodology and Impact 4.2-4 below.); and
- expose sensitive receptors to excessive nuisance odors, as defined under SMAQMD Rule 402 (see "Odors" under "Regional and Local Plans, Policies, Regulations, and Laws" above).

ANALYSIS METHODOLOGY

Short-term construction-generated emissions of criteria air pollutants and ozone precursors were assessed in accordance with methods recommended by SMAQMD and EDCAQMD. Where quantification is required, emissions were modeled using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008), as recommended by SMAQMD's *Guide to Air Quality Assessment in Sacramento County* (SMAQMD 2009a). URBEMIS was used to determine whether short-term construction-related emissions of criteria air pollutants associated with development of each alternative would exceed applicable thresholds and where mitigation would be required. Modeling was based on project-specific data, when available. However, when

project-specific information (e.g., amount of land to be disturbed/graded per day, types of equipment to be used, number of construction employees) was not available, reasonable assumptions and default settings were used to estimate criteria air pollutant emissions. A detailed list of modeling assumptions is provided in Appendix C1. For linear infrastructure improvements, including the sewer force main connection to the existing off-site pump station north of U.S. 50 and the two roadway connections from Folsom Height into El Dorado Hills (both of which are off-site elements), SMAQMD's Road Construction Emissions Model (SMAQMD 2009c) was used to estimate emissions associated with construction of these facilities. Predicted short-term construction-generated emissions were compared with applicable SMAQMD or EDCAQMD thresholds for determination of significance, depending on the location of the construction activity. Each off-site element was modeled and analyzed separately; however, in the event that construction of one off-site element in SMAQMD's jurisdiction would occur at the same time as construction of another off-site element and/or construction of on-site elements, their combined mass emissions levels are also compared to SMAQMDS's applicable mass emission threshold for NO_X (85 lb/day).

According to SMAQMD, short-term construction-generated ROG emissions should be estimated and disclosed; however, SMAQMD has not established a threshold to determine the significance of such emissions. Thus, in accordance with methodologies recommended by SMAQMD, short-term construction-generated ROG emissions are modeled and presented for informational purposes only. SMAQMD bases this approach on the fact that ROG emissions attributable to construction equipment exhaust are low and those from application of architectural coatings are regulated by Rule 442 (SMAQMD 2009a, page 3-2).

Long-term (i.e., operational) regional emissions of criteria air pollutants and precursors, including mobile- and area-source emissions, were also quantified using the URBEMIS 2007 Version 9.2.4 computer model (Rimpo and Associates 2008) and assume that full build out of the project would occur in the year 2030. The area-source emissions associated with the Proposed Project Alternative and the other four action alternatives were modeled in separate URBEMIS model runs from mobile-source emissions. Area-source emissions were modeled according to the size and type of land uses proposed under the Proposed Project Alternative and the other four action alternatives. Mass mobile-source emissions were modeled based on the net increase in daily vehicle trips and the net increase in regional VMT that would result from full build out of the Proposed Project Alternative and the four other action alternatives. VMT and trip parameters were available from the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land" Stankiewicz, pers. comm., 2009a). Predicted long-term operational emissions were compared with applicable SMAQMD thresholds for determination of significance.

An ARB publication, *Air Quality and Land Use Handbook: A Community Health Perspective (Handbook)* (ARB 2005), provides guidance concerning land use compatibility with sources of TAC emissions. The *Handbook* offers recommendations for the siting of sensitive receptors near uses associated with TACs, such as freeways and high-traffic roads, commercial distribution centers, rail yards, ports, refineries, dry cleaners, gasoline stations, and industrial facilities. The *Handbook* is advisory and not regulatory, but it offers the recommendations identified below that are pertinent to the project.

- Avoid siting new commercial trucking facilities that accommodate more than 100 trucks per day, or 40 trucks equipped with transportation refrigeration units (TRUs), within 1,000 feet of sensitive receptors (e.g., residences, schools, or parks).

- Avoid siting new sensitive land uses within 300 feet of a large gasoline station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gasoline-dispensing facilities.

- Avoid siting new sensitive land uses within 300 feet of any dry-cleaning operation using perchloroethylene (perc). For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult the local air district. Do not site new sensitive land uses in the same building with dry-cleaning operations that use perc.

- Obtain facility-specific information where there are questions about siting a sensitive land use close to an industrial facility, including the amount of pollutant emitted and its toxicity, distance to nearby receptors, and types of emissions controls in place.

- Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads carrying 100,000 vehicles per day, or rural roads carrying 50,000 vehicles per day.

The land use compatibility with TAC-generating traffic volumes on area freeways and high-traffic volume roadways is assessed according to guidance provided by ARB's *Handbook* and SMAQMD's *Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways (Protocol)* (SMAQMD 2010). SMAQMD's *Protocol* provides more detailed guidance for assessing risk levels at receptors located closer to a freeway or high-volume roadway than 500 feet. The guidance provided in SMAQMD's *Protocol* accounts for the orientation of the roadway (i.e., north-south or east-west), the orientation of the receptors relative to the roadway, the predominant wind direction, and the traffic volume during the peak traffic hour. The peak-hour traffic volumes used in this analysis are based on the average daily traffic volumes used in the traffic study prepared for this project (DKS Associates 2009). The *Protocol* has been designed to determine whether a receptor closer than 500 feet to a freeway would be subject to levels of cancer risk greater than 296 in a million. If the screening criteria determine that the level of cancer would be lower than 296 in a million, the *Protocol* advises that no further roadway-related air quality evaluation is recommended. If the level of cancer risk at a receptor is estimated to be greater than 296 in a million the *Protocol* recommends the completion of a site-specific health risk assessment.

It is important to note, however, that both ARB's *Handbook* and SMAQMD's *Protocol* are considered screening level guidance and do not contain recommended thresholds of significance. In particular, SMAQMD's *Protocol* clearly states that the evaluation criterion of 296 in a million does not necessarily represent an acceptable level of cancer risk. In the absence of a recommended threshold of significance from ARB or SMAQMD, however, the City and USACE have decided to use their respective screening levels as the threshold of significance for evaluating roadside TAC exposure in this program-level analysis. The City/USACE believe that the decision to use this screening criterion as a program-level threshold of significance is appropriate, in part, due to expected future changes in the inventory of mobile-source TAC emissions in the SVAB. In 2000, the total SVAB-wide average risk from inhalation of TACs of 520 chances in one million, as determined by ARB, accounts for emissions of 10 select TACs that pose the greatest risk in California based primarily on *ambient* air quality data from all sources (e.g., stationary, area, on-road mobile, other mobile, and natural). According to ARB's emissions inventory for 2000, approximately 23% of the total acetaldehyde emissions for that year, 43% of benzene, 39% of 1,3-butadiene, 31% of formaldehyde, and 28% of diesel PM emitted in the SVAB were associated with on-road mobile sources (ARB 2008c). Based on these percentages and the individual health risks as determined by ARB in 2000 for each TAC, approximately 27.5% (143 chances in one million) of the total SVAB estimated inhalation risk of 520 chances in one million was associated with on-road mobile sources, 70% of the risk being attributable to diesel PM alone. According to ARB, implementation of the risk reduction plan to reduce diesel PM is estimated to drop 2010 and 2020 concentrations and associated health risk by 75% and 85%, respectively, from the estimated 2000 level (ARB 2008c).

Nonetheless, the City/USACE do not intend for their use of ARB and SMAQMD's screening criteria as thresholds of significance to establish a precedent for the CEQA/NEPA analyses performed for other projects in the region, in part, because ARB and SMAQMD are expected to continue to develop guidance and rules regarding mobile-source TAC emissions as future studies of roadside concentrations of TACs become available.

All other air quality impacts (i.e., local mobile-source emissions, exposure of sensitive receptors to TAC and odorous emissions) were assessed in accordance with methodologies recommended by SMAQMD and EDCAQMD. The potential for exposure of people to airborne asbestos associated with the demolition of buildings that have asbestos-containing materials is discussed in Section 3A.8, "Hazards and Hazardous Materials – Land".

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the Proposed Project Alternative at the end of each impact conclusion (i.e., similar, greater, lesser).

Decisions concerning the project's conformity with the Federal Clean Air Act (i.e., the "conformity analysis") will be made in the USACE record of decision.

IMPACT 3A.2-1 Generation of Construction Emissions of NO_X and PM_{10}. *Construction activities associated with the project would generate intermittent emissions of NO_X and PM_{10}. Because of the large size of the project, construction-generated emissions of NO_X, an ozone precursor, and fugitive PM_{10} dust would exceed SMAQMD-recommended thresholds and would substantially contribute to emissions concentrations that exceed the NAAQS and CAAQS. Thus, project-generated, construction-related emissions of criteria air pollutants and precursors could violate or contribute substantially to an existing or projected air quality violation, expose sensitive receptors to substantial pollutant concentrations, and/or conflict with air quality planning efforts.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences would generate exhaust emissions of criteria air pollutants and precursors from the operation of off-road construction equipment and fugitive PM_{10} dust emissions from ground disturbance activities. Construction-generated emission levels, however, would not be anticipated to exceed SMAQMD thresholds because construction is not expected to require a high number of diesel-powered construction equipment, involve intense levels of earth movement, occur simultaneously, or occur in close proximity to sensitive receptors for an extended period of time. Also, the number of rural residences that could be developed would be less than the NO_X screening level of 180 single-family homes established by SMAQMD (SMAQMD 2009a) Therefore, construction-generated emissions of criteria air pollutants and precursors would not violate or contribute substantially to an existing or projected air quality violation. No off-site water facilities would be constructed under this alternative, so no construction emissions would be generated by off-site improvements. This **direct** impact would be **less than significant**. **No indirect** impact would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, RHD, CD

Construction emissions are considered short term and temporary in duration, but have the potential to represent a significant impact with respect to air quality. Respirable particulate matter (PM_{10}) and fine particulate matter ($PM_{2.5}$) are among the pollutants of greatest concern with respect to construction activities. Particulate emissions from construction activities can lead to adverse health effects and nuisance concerns, such as reduced visibility and soiling of exposed surfaces. Particulate emissions can result from a variety of construction activities, including excavation, grading, demolition, vehicle travel on paved and unpaved surfaces, and vehicle and equipment exhaust. Construction emissions of PM_{10} can vary greatly depending on the level of activity, the specific operations taking place, the number and types of equipment operated, local soil conditions, weather conditions, and the amount of earth disturbance (e.g., site grading, excavation, cut-and-fill).

Emissions of ozone precursors, ROG and NO_X, are primarily generated from mobile sources and vary as a function of vehicle trips per day associated with delivery of construction materials, the importing and exporting of soil, vendor trips, and worker commute trips; and the types and number of heavy-duty, off-road equipment used and the intensity and frequency of their operation. A large portion of construction-related ROG emissions also result from the application of asphalt and architectural coatings and vary depending on the amount of coatings and paving applied each day.

Development of the SPA would occur over a very large area (approximately 3,510 acres), large portions of the SPA would undergo construction at one time, and construction would require substantial amounts of earthwork and grading. However, a detailed schedule describing the timing and location of construction activities under the Proposed Project Alternative and the other four action alternatives is not available at the time of writing this EIR/EIS. Construction of the site is anticipated to commence in 2011 and last until approximately 2030. Given that exhaust emission rates of the construction equipment fleet in the state are expected to decrease over time due to state and SMAQMD-led efforts, maximum daily construction emissions were estimated using the earliest calendar when construction would begin (i.e., 2011) in order to generate conservative estimates. It is anticipated, however, that in later years, advancements in engine technology, retrofits, and turnover in the equipment fleet would result in lower levels of emissions. Accordingly, maximum daily construction emissions for the Proposed Project Alternative and the other four action alternatives were estimated using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008). URBEMIS is designed to model construction emissions for land use development projects based on building size, land use and type, and disturbed acreage; and allows for the input of project-specific information. Project-generated emissions of criteria air pollutants (e.g., PM_{10}) and precursors (i.e., ROG and NO) were modeled based on general information provided in the project description and default SMAQMD-recommended settings and parameters attributable to the proposed land use types and site location. URBEMIS also divides construction activity into distinct construction phases: site grading, asphalt paving, building construction, and the application of architectural coatings.

Without detailed information about the phasing of construction (see Section 2.3.1 in Chapter 2, "Alternatives," for a discussion of project phasing), it was assumed that the Proposed Project Alternative and the other four action alternatives would be constructed at a consistent, linear rate over a 19-year period (2011–2030). All construction activity phases were assumed to occur simultaneously over the course of a year. Because of the size of the project and the extended period until full build out, it is likely that all four construction phases could occur simultaneously at various locations on the SPA. In other words, site grading, asphalt paving, building construction, and the application of architectural coatings could take place at different areas of the SPA at the same time. Construction emissions levels associated with the Proposed Project Alternative and the other four action alternatives would differ according to the total number of residential units, commercial square footage, office square footage, and school square footage to be developed. Thus, for the Proposed Project Alternative and the other four action alternatives, the subtotal quantities of all land use types were divided by 19 years to calculate the annual average level of construction activity (e.g., residential units, commercial square footage).

Table 3A.2-3 summarizes the modeled worst-case daily emissions of ROG, NO_X, PM_{10} and $PM_{2.5}$ associated with construction of the Proposed Project Alternative and the other four action alternatives. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

As shown above in Table 3A.2-3, the maximum daily level of construction-generated NO_X emissions under the Proposed Project Alternative and the other four action alternatives would exceed the SMAQMD-recommended threshold of 85 lb/day. It should be noted that the maximum daily emissions level estimates displayed in Table 3A.2-3 assume that the intensity of construction activity would be the same during the 19 years of construction on the site. It is more likely, however, that some period of construction (and associated emissions) would be more intense than other periods due to changes in market conditions and according to preferences of the City and the project applicants. If, for instance, peak construction activity would be as much as three times as intense as the average level of construction activity during the 19-year build out period, then the maximum daily emission levels would be three times the levels presented in Table 3A.2-3.

Table 3A.2-3
Summary of Modeled Maximum Daily Criteria Air Pollutant and Precursor Emissions Associated with Construction of On-Site Elements

Source	Emissions (lb/day) [1,2]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Proposed Project Alternative				
Unmitigated	120.0	128.1	578.8	126.2
Mitigated [3]	119.2	105.4	147.6	—
Resource Impact Minimization Alternative				
Unmitigated	99.2	123.0	485.8	106.6
Mitigated [3]	98.5	100.7	124.1	—
Centralized Development Alternative				
Unmitigated	105.9	124.6	448.7	98.9
Mitigated [3]	105.1	102.3	114.9	—
Reduced Hillside Development Alternative				
Unmitigated	116.7	129.2	569.0	124.2
Mitigated [3]	115.9	106.5	145.2	—
No USACE Permit Alternative				
Unmitigated	89.7	121.6	478.3	105.0
Mitigated [3]	88.9	99.3	122.1	—
SMAQMD Significance Threshold [4]	—	85	—	—

Notes:

ROG = reactive organic gases

NO_X = oxides of nitrogen

PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less

$PM_{2.5}$ = respirable particulate matter with an aerodynamic diameter of 2.5 micrometers or less

SMAQMD = Sacramento Metropolitan Air Quality Management District

lb/day = pounds per day

[1] Maximum daily construction emissions are representative of a construction day in the earliest construction year (2011) assuming that all types of construction activities (i.e., grading, asphalt paving, building construction, and architectural coatings) would take place simultaneously at various locations of the SPA. The detailed breakdown of land use types and other input parameters used in the modeling, as well as detailed modeling output, are included in Appendix C1.

[2] Construction emission estimates do not account for the fact that the intense level of grading that would occur on the eastern side of the SPA (compared to the intensity of grading that would be performed in other areas of the site) under the Proposed Project, Resource Impact Minimization, Reduced Hillside, and No USACE Permit Alternatives, but not the Centralized Development Alternative. This distinction is pertinent because grading is the most emissions-intensive phase of construction activities. However, a more detailed analysis is not provided because grading plans were not available for all action alternatives at the time of the analysis.

[3] The mitigated total reflects a 75% reduction in fugitive PM_{10} dust emissions, a 45% reduction in PM_{10} exhaust emissions from off-road diesel equipment, and a 20% reduction in NO_X emissions from off-road diesel equipment, as required by Mitigation Measure 3A.2-1a, but not the purchase of off-sets for NO_X, as required by Mitigation Measure 3A.2-1b. Reduction levels that would result from other measures listed under Mitigation Measure 3A.2-1a cannot be quantified. A mitigated total is not reported for $PM_{2.5}$ because the reduction that would result from the measures of Mitigation Measure 3A.2-1a cannot be quantified. The purchase of off-sets for NO_X, as required by Mitigation Measure 3A.2-1b, however, would ensure that NO_X would be reduced to 85 lb/day.

[4] SMAQMD has not identified mass emissions thresholds for construction-related emissions of ROG, PM_{10} or $PM_{2.5}$.

Source: Modeling performed by AECOM in 2010

With respect to construction-generated emissions of PM_{10}, SMAQMD typically recommends that project-level analyses determine the maximum concentration of PM_{10} emissions by performing air dispersion modeling with the EPA's AERMOD model if the maximum daily acreage of ground disturbance would exceed 15 acres. Given the overall size of the SPA and the likelihood that substantial portions would undergo construction at one time, it is assumed that more than 15 acres of ground disturbance activity would occur in one day. This is particularly the case for the eastern hillside area of the SPA where extensive cut and fill operations would be performed. Thus, it is concluded that ground-disturbing activities associated with site construction would result in concentrations of PM_{10} that exceed the NAAQS or CAAQS. However, dispersion modeling has not been performed for this program-level analysis because detailed information about grading activities and the locations and occupancy timing of future planned on-site receptors is not known at the time of writing this EIR/EIS. A project-level analysis that incorporates specific details of each phase of the selected alternative would be necessary to perform accurate and meaningful dispersion modeling and properly disclose the air quality impacts associated with PM_{10} emission concentrations. SMAQMD has approved this approach for this analysis because the analysis is being performed at the program-level (Hurley, pers. comm., 2009)

Because mass emissions of NO_X would exceed SMAQMD's recommended threshold of significance and because grading activities are anticipated to be extensive, construction-generated emissions of criteria air pollutants and precursors could violate or contribute substantially to an existing or projected air quality violation. Also, construction emissions of criteria air pollutants and precursors could expose sensitive receptors to substantial pollutant concentrations, particularly when grading and other ground disturbance activities occurs near land uses that have already been developed (and where people are already living or working) on the SPA. In addition, because the SMAQMD's significance thresholds approximately correlate with reductions from heavy-duty vehicles and reduction requirements for land use project emissions in the SIP, construction-generated emissions could also conflict with air quality planning efforts. This would be a **direct significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure 3A.2-1a: Implement Measures to Control Air Pollutant Emissions Generated by Construction of On-Site Elements.

To reduce short-term construction emissions, the project applicant(s) for all project phases shall require their contractors to implement SMAQMD's list of Basic Construction Emission Control Practices, Enhanced Fugitive PM Dust Control Practices, and Enhanced Exhaust Control Practices (list below) or whatever mitigation measures are recommended by SMAQMD at the time individual portions of the site undergo construction. In addition to SMAQMD-recommended measures, construction operations shall comply with all applicable SMAQMD rules and regulations.

Basic Construction Emission Control Practices

- Water all exposed surfaces two times daily. Exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads.
- Cover or maintain at least two feet of free board space on haul trucks transporting soil, sand, or other loose material on the site. Any haul trucks that would be traveling along freeways or major roadways should be covered.
- Use wet power vacuum street sweepers to remove any visible trackout mud or dirt onto adjacent public roads at least once a day. Use of dry power sweeping is prohibited.
- Limit vehicle speeds on unpaved roads to 15 miles per hour (mph).
- All roadways, driveways, sidewalks, parking lots to be paved should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.

- Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes (as required by the state airborne toxics control measure [Title 13, Section 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.

- Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determine to be running in proper condition before it is operated.

Enhanced Fugitive PM Dust Control Practices – Soil Disturbance Areas

- Water exposed soil with adequate frequency for continued moist soil. However, do not overwater to the extent that sediment flows off the site.

- Suspend excavation, grading, and/or demolition activity when wind speeds exceed 20 mph.

- Install wind breaks (e.g., plant trees, solid fencing) on windward side(s) of construction areas.

- Plant vegetative ground cover (fast-germinating native grass seed) in disturbed areas as soon as possible. Water appropriately until vegetation is established.

Enhanced Fugitive PM Dust Control Practices – Unpaved Roads

- Install wheel washers for all exiting trucks, or wash off all trucks and equipment leaving the site.

- Treat site accesses to a distance of 100 feet from the paved road with a 6 to 12-inch layer of wood chips, mulch, or gravel to reduce generation of road dust and road dust carryout onto public roads.

- Post a publicly visible sign with the telephone number and person to contact at the construction site regarding dust complaints. This person shall respond and take corrective action within 48 hours. The phone number of SMAQMD and the City contact person shall also be posted to ensure compliance.

Enhanced Exhaust Control Practices

- The project shall provide a plan, for approval by the City of Folsom Community Development Department and SMAQMD, demonstrating that the heavy-duty (50 horsepower [hp] or more) off-road vehicles to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project wide fleet-average 20% NO_X reduction and 45% particulate reduction compared to the most current California Air Resources Board (ARB) fleet average that exists at the time of construction. Acceptable options for reducing emissions may include use of late-model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. The project applicant(s) of each project phase or its representative shall submit to the City of Folsom Community Development Department and SMAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 hp, that would be used an aggregate of 40 or more hours during any portion of the construction project. The inventory shall include the horsepower rating, engine production year, and projected hours of use for each piece of equipment. The inventory shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs. At least 48 hours prior to the use of heavy-duty off-road equipment, the project representative shall provide SMAQMD with the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman. SMAQMD's Construction Mitigation Calculator can be used to identify an equipment fleet that achieves this reduction (SMAQMD 2007a). The project shall ensure that

emissions from all off-road diesel powered equipment used on the SPA do not exceed 40% opacity for more than three minutes in any one hour. Any equipment found to exceed 40 percent opacity (or Ringelmann 2.0) shall be repaired immediately, and the City and SMAQMD shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least weekly, and a monthly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey. SMAQMD staff and/or other officials may conduct periodic site inspections to determine compliance. Nothing in this mitigation measure shall supersede other SMAQMD or state rules or regulations.

- If at the time of construction, SMAQMD has adopted a regulation or new guidance applicable to construction emissions, compliance with the regulation or new guidance may completely or partially replace this mitigation if it is equal to or more effective than the mitigation contained herein, and if SMAQMD so permits. Such a determination must be supported by a project-level analysis and be approved by SMAQMD.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department

Mitigation Measure 3A.2-1b: Pay Off-Site Mitigation Fee to SMAQMD to Off-Set NO_X Emissions Generated by Construction of On-Site Elements.

Implementation of the Proposed Project Alternative or the other four other action alternatives would result in construction-generated NO_X emissions that exceed the SMAQMD threshold of significance, even after implementation of the SMAQMD Enhanced Exhaust Control Practices (listed in Mitigation Measure 3A.2-1a). Therefore, the project applicant(s) shall pay SMAQMD an off-site mitigation fee for implementation of any of the five action alternatives for the purpose of reducing NO_X emissions to a less-than-significant level (i.e., less than 85 lb/day). The specific fee amounts shall be calculated when the daily construction emissions can be more accurately determined: that is, if the City/USACE select and certify the EIR/EIS and approves the Proposed Project Alternative or one of the other four other action alternatives, the City and the applicants must establish the phasing by which development would occur, and the applicants must develop a detailed construction schedule. Calculation of fees associated with each project development phase shall be conducted by the project applicant(s) in consultation with SMAQMD staff before the approval of grading plans by the City. The project applicant(s) for all project phases shall pay into SMAQMD's off-site construction mitigation fund to further mitigate construction-generated emissions of NO_X that exceed SMAQMD's daily emission threshold of 85 lb/day. The calculation of daily NO_X emissions shall be based on the cost rate established by SMAQMD at the time the calculation and payment are made. At the time of writing this EIR/EIS the cost rate is $16,000 to reduce 1 ton of NO_X plus a 5% administrative fee (SMAQMD 2008c). The determination of the final mitigation fee shall be conducted in coordination with SMAQMD before any ground disturbance occurs for any project phase. Based on information available at the time of writing this EIR/EIS, and assuming that construction would be performed at a consistent rate over a 19-year period (and averaging of 22 work days per month), it is estimated that the off-site construction mitigation fees would range from $517,410 to $824,149, depending on which alternative is selected. Because the fee is based on the mass quantity of emissions that exceed SMAQMD's *daily* threshold of significance of 85 lb/day, total fees would be substantially greater if construction activity is more intense during some phases and less intense during other phases of the 19-year build out period, and in any event, based on the actual cost rate applied by SMAQMD. (This

fee is used by SMAQMD to purchase off-site emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies.)

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction for all project phases.

Enforcement: The City of Folsom Community Development Department shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.

Mitigation Measure 3A.2-1c: Perform a Project-Level Analysis to Disclose Projected PM_{10} Emission Concentrations at Nearby Sensitive Receptors Resulting from Construction of On-Site Elements.

Prior to construction of each development phase of on-site land uses, the project applicant shall perform a project-level CEQA analysis that includes detailed dispersion modeling of construction-generated PM_{10} to disclose what PM_{10} concentrations would be at nearby sensitive receptors. The dispersion modeling shall be performed in accordance with applicable SMAQMD guidance that is in place at the time the analysis is performed. At the time of writing this EIR/EIS, SMAQMD's most current and most detailed guidance for addressing construction-generated PM_{10} emissions is found in its *Guide to Air Quality Assessment in Sacramento County* (SMAQMD 2009a). The project-level analysis shall incorporate detailed parameters of the construction equipment and activities, including the year during which construction would be performed, as well as the proximity of potentially affected receptors, including receptors proposed by the project that exist at the time the construction activity would occur.

Implementation: All detailed, project-level analysis shall be performed by the project applicant(s) and fully funded by the project applicant of each development phase. All feasible mitigation shall be also be funded by the project applicant(s).

Timing: Before the approval of all grading plans by the City.

Enforcement: City of Folsom Community Development Department

Off-Site Elements

Maximum daily construction emissions associated with the construction of the off-site elements were estimated using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008) and SMAQMD's Road Construction Emissions Model (SMAQMD 2009c). While URBEMIS is designed to model construction emissions for land use development projects, the Road Construction Emissions Model (SMAQMD 2009c) is designed to estimate emissions from heavy-duty construction equipment, haul trucks, and worker commute trips and fugitive PM dust associated with linear construction projects. For all the elements, it was assumed that the most emissions-intensive phase of construction would consist of grading, excavation, and other earth-moving activities (i.e., the grading phase in the construction module of the URBEMIS model). Because detailed information about the construction of the off-site elements was not available at the time of this analysis, the following assumptions were used in the modeling in order to be conservative:

- the entire off-site area could potentially be graded on a single day, regardless of project size;
- each off-site element could potentially be constructed as early as the year 2011. This is a conservative assumption because equipment exhaust emissions from subsequent years are anticipated to be lower as new regulations and emissions technologies for off-road equipment come into place; and

- Nearby land uses on the SPA could be developed and inhabited or operating at the time construction is taking place.

Emission levels associated with the construction of each of the proposed off-site elements were modeled separately. Model inputs include conservative estimates about size (i.e., dimensions and acreage) of the construction area associated with each off-site element based in Exhibit 2-9 (see Chapter 2, "Alternatives") and default parameters (i.e., equipment types and numbers) from the applicable model. Table 3A.2-4 summarizes the modeled worst-case daily emissions of ROG, NO_X, PM_{10} and $PM_{2.5}$ associated with construction of each off-site element. Refer to Appendix C1 for a detailed summary of the modeling assumptions, inputs, and outputs.

Table 3A.2-4
Summary of Modeled Maximum Daily Criteria Air Pollutant and Precursor Emissions Associated with Construction of Off-Site Elements

Off-Site Element	Area (acres)[2]	Emissions (lb/day) [1]			
		ROG	NO_X	PM_{10}	$PM_{2.5}$
In Sacramento County					
Detention Basin [3]	3.4	4.2	33.6	70.6	16.0
Prairie City Road Interchange [3]	19.3	5.3	40.9	388.0	82.7
Rowberry Drive Overcrossing [3]	18.7	5.3	40.9	377.0	80.4
Oak Avenue Interchange [3]	46.7	10.6	89.8	938.7	199.1
Sewer Force Main Connection [4]	2.4	9.8	75.8	27.4	8.0
SMAQMD Significance Threshold [5]	—	—	85	—	—
In El Dorado County					
Roadway Connections 4[4]	1.4	5.8	46.1	16.0	4.9
EDCAQMD Significance Threshold [6]	—	82	82	—	—

Notes:
ROG = reactive organic gases
NO_X = oxides of nitrogen
PM_{10} = respirable particulate matter with an aerodynamic diameter of 10 micrometers or less
$PM_{2.5}$ = respirable particulate matter with an aerodynamic diameter of 2.5 micrometers or less
SMAQMD = Sacramento Metropolitan Air Quality Management District
lb/day = pounds per day

[1] The construction area associated with each off-site element is based on Exhibit 2-9 in Chapter 2, "Alternatives."

[2] Maximum daily construction emissions are representative of a construction day in the earliest construction year (2011). Detailed input parameters and modeling output are included in Appendix C1. Maximum daily mass emissions of PM_{10} and PM2.5 are shown for disclosure purposes only.

[3] Maximum daily emissions were estimated using the construction module and grading phase in URBEMIS 2007 Version 9.2.4 (Rimpo and Associates 2008).

[4] Maximum daily emissions on projects linear in nature were estimated using the Roadway Construction Emissions Model SMAQMD 2009c)

[5] SMAQMD has not identified mass emissions thresholds for construction-related emissions of ROG, PM_{10} or $PM_{2.5}$.

[6] EDCAQMD has not identified mass emissions thresholds for construction-related emissions of PM_{10} or $PM_{2.5}$.

Source: Modeling performed by AECOM in 2009

The analysis of each off-site element is discussed separately below, followed by a discussion of potential impacts to air quality that may result if construction of multiple off-site elements would occur simultaneously.

Detention Basin

The off-site detention basin would be located in Sacramento County and, therefore, in SMAQMD's jurisdiction. Based on Exhibit 2-9 (see Chapter 2, "Alternatives"), construction of the detention basin would involve grading and excavation activity on approximately 3.4 acres of undeveloped land. As shown in Table 3A.2-4, maximum daily emissions of NO_X generated by this activity would be approximately 33.6 lb/day, which is less than SMAQMD's recommended threshold of significance of 85 lb/day. With regard to construction-generated PM_{10} emissions, SMAQMD does not recommend that dispersion modeling be performed to determine whether construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS because the maximum daily disturbed area would not exceed SMAQMD's screening level of 15 acres (SMAQMD 2009a, page 3-13, 3-14). Nonetheless, without implementation of SMAQMD's Basic Construction Emission Control Practices, there is a potential that construction-generated concentrations of PM_{10} would exceed or substantially contribute to the CAAQS and NAAQS at nearby sensitive receptors.

Prairie City Road Interchange and Rowberry Drive Crossing

The Prairie City Road Interchange and Rowberry Drive Overcrossing over U.S. Highway 50 (U.S. 50) would be located in Sacramento County and, therefore, in SMAQMD's jurisdiction. Based on Exhibit 2-9 (see Chapter 2, "Alternatives"), construction of these two off-site elements would involve grading and construction activity in areas of approximately 19.3 acres and 18.7 acres, respectively. As shown in Table 3A.2-4, maximum daily emissions of NO_X generated by the grading of each of these areas would be approximately 40.9 lb/day. The emissions level estimated for both elements is the same due to their similarities in size, type of improvement, and the types and number of equipment necessary to construct both elements. Thus, the respective maximum daily emissions of NO_X generated by construction of each of these off-site elements would be less than SMAQMD's recommended threshold of significance of 85 lb/day. With regard to construction-generated PM_{10} emissions, SMAQMD recommends that, if the maximum daily disturbed area exceeds 15 acres, dispersion modeling should be performed to determine whether construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS at nearby receptors (SMAQMD 2009a, pages 3-13, 3-14). However, this EIR/EIS contains a program-level analysis; dispersion modeling cannot be performed to support a thorough project-level analysis of these two off-site elements because critical information is not known at the time of writing this EIR/EIS, including detailed parameters about the construction of each off-site element (i.e., equipment types, intensity of earth movement activity, year of construction) and the proximity of future nearby sensitive receptors that may exist at the time the construction is performed, including on-site receptors proposed by the project. Therefore, until a detailed analysis is performed, it is presumed that concentrations of PM_{10} associated with the construction of both of these improvement projects could potentially exceed or contribute substantially to exceedances of the CAAQS and NAAQS at nearby receptors.

Oak Avenue Interchange

The Oak Avenue Interchange would be located in Sacramento County and, therefore, in SMAQMD's jurisdiction. Based on Exhibit 2-9 (see Chapter 2, "Alternatives"), construction of this interchange would involve grading and construction activity in an area that is approximately 46.7 acres in size. As shown in Table 3A.2-4, maximum daily emissions of NO_X generated by the grading of these areas would be approximately 89.8 lb/day, which exceeds SMAQMD's recommended threshold of significance of 85 lb/day.

With regard to construction-generated PM_{10} emissions, SMAQMD recommends that if the maximum daily disturbed area exceeds 15 acres, dispersion modeling should be performed to determine whether construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS at nearby receptors (SMAQMD 2009a, pages 3-13, 3-14). However, this EIR/EIS contains a program-level analysis; dispersion modeling cannot currently be performed to support a thorough project-level analysis of the Oak Avenue Interchange element because critical information is not known at the time of writing this EIR/EIS, including detailed parameters about the construction of each off-site element (i.e., equipment types, intensity of earth movement activity, year of

construction) and the proximity of future nearby sensitive receptors that may exist at the time the construction is performed, including on-site receptors proposed by the project. Thus, until such a project-level analysis is performed, it is presumed that concentrations of PM_{10} associated with the construction of the Oak Avenue Interchange could potentially exceed or contribute substantially to exceedances of the CAAQS and NAAQS at nearby receptors.

Therefore, construction-generated NO_X emissions could violate or contribute substantially to an existing or projected air quality violation in the SVAB. Also, construction emissions of criteria air pollutants and precursors could expose sensitive receptors to substantial pollutant concentrations, particularly when grading and other ground disturbance activities occurs near land uses that have already been developed (and where people are already living or working) on the SPA. In addition, because the SMAQMD's significance thresholds approximately correlate with reductions from heavy-duty vehicles and reduction requirements for land use project emissions in the SIP, construction-generated emissions could also conflict with air quality planning efforts.

Sewer Force Main Connection to Existing Off-Site Pump Station

The sewer force main connection to the existing off-site pump station north of U.S. 50 would be located in Sacramento County and, therefore, in SMAQMD's jurisdiction. Based on Exhibit 2-9 (see Chapter 2, "Alternatives"), the sewer force main connection would be approximately 2,100 feet long and, assuming a corridor width of up to 50 feet, as much as 2.4 acres could be subject to involve grading and excavation activity. It is also assumed that some soil would be removed from the site and consistent rock material would be imported to provide a foundation for the conduit. Because this off-site element would be linear in nature, SMAQMD's Road Construction Emissions Model (SMAQMD 2009c) was used to estimate emissions associated with construction of this sewer force main connection. As shown in Table 3A.2-4, maximum daily emissions of NO_X generated by this activity would be approximately 75.8 lb/day, which is less than SMAQMD's recommended threshold of significance of 85 lb/day. With regard to construction-generated PM_{10} emissions, SMAQMD does not recommend that dispersion modeling be performed to determine whether construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS because the maximum daily disturbed area would not exceed SMAQMD's screening level of 15 acres (SMAQMD 2009a, pages 3-13, 3-14). Nonetheless, without implementation of SMAQMD's Basic Construction Emission Control Practices, there is a potential that construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS at nearby receptors.

Roadway Connections into El Dorado County

Two roadway connections would be constructed from the east side of the SPA into El Dorado County. These roadway connections would be located in EDCAQMD's jurisdiction. Based on Exhibit 2-9 (see Chapter 2, "Alternatives"), the two roadway connections would have a combined length of 1,500 feet and, assuming a corridor width of up 40 feet, as much as 1.4 acres could be subject to grading and excavation activity. It is also assumed that some soil would be removed from the site and some consistent material would be imported to provide a foundation for the roadways. Because this off-site element would be linear in nature, the Road Construction Emissions Model (SMAQMD 2009c) was used to estimate emissions associated with construction of these roadway connections. As shown in Table 3A.2-4, maximum daily emissions of NO_X and ROG generated by this activity would be approximately 46.1 lb/day and 5.8 lb/day, respectively, which are less than EDCAQMD's recommended threshold of significance of 82 lb/day. With regard to construction-generated PM_{10} emissions, dispersion modeling was not performed because the maximum daily disturbed area would not exceed EDCAQMD's screening level of 12 acres. Nonetheless, without implementation of ECAQMD-approved fugitive dust control measures, there is a potential that construction-generated concentrations of PM_{10} would exceed the CAAQS and NAAQS at nearby receptors.

Summary

The timing of construction of each of the off-site elements is unknown at the time of writing this EIR/EIS. If the construction schedules of multiple off-site elements located in SMAQMD's jurisdiction (i.e., Sacramento County) would overlap with each other, and/or with construction of on-site elements, their combined emissions of NO_X would potentially exceed SMAQMD's mass emission threshold of 85 lb/day. The combined effect of NO_X emissions from multiple sources is additive because NO_X is a precursor to ozone, which is a pollutant of regional concern. Even though NO_X emissions associated with construction of the two roadway connections would occur in El Dorado County, their impact would also be additive because the western portion of El Dorado County is part of the SVAB and the SFNA. PM_{10}, however, is a pollutant of localized concern and PM_{10} generated by construction of the various off-site elements would not combine to form higher concentrations of PM_{10} than construction of any single off-site element because the various off-site elements are not located in close proximity to each other. Nonetheless, as discussed above, PM_{10} emissions generated by grading and ground disturbance activity during construction of all of the off-site elements could exceed or substantially contribute to local exceedances of the CAAQS and NAAQS for PM_{10}, especially if adequate dust control measures are not implemented. As a result, because both NO_X and PM_{10} emissions associated with the construction of the off-site elements could exceed applicable thresholds this would be considered a **direct, significant** impact. **No indirect** impacts would occur.

Mitigation Measure 3A.2-1d: Implement SMAQMD's Basic Construction Emission Control Practices during Construction of all Off-Site Elements located in Sacramento County.

The applicants responsible for the construction of each off-site element in Sacramento County shall require its contractors to implement SMAQMD's Basic Construction Emission Control Practices during construction. A list of SMAQMD's Basic Construction Emission Control Practices is provided under Mitigation Measure 3A.2-1a.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: The project applicant(s) responsible for construction of each off-site element in Sacramento County.

Timing: Before the approval of all grading plans from SMAQMD.

Enforcement:
1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.2-1e: Implement EDCAQMD-Recommended Measures for Controlling Fugitive PM_{10} dust During Construction of the Two Roadway Connections in El Dorado County.

Prior to construction of each roadway extension in El Dorado County, the applicants or its contractors shall develop a fugitive dust control plan that is approved by EDCAQMD and the applicants shall require their contractors to implement the dust control measures identified in the EDCAQMD-approved fugitive dust control plan. The fugitive dust control plan shall contain measures that are recommended by EDCAQMD at the time the plan is developed, which may include, but is not limited to, the current list of EDCAQMD-recommended dust control measures provided in Table 3A.2-5 below.

Table 3A.2-5 EDCAQMD-Recommend Fugitive Dust Control Measures	
Source	Mitigation Measure
Soil Piles	Enclose, cover, or water twice daily all soil piles
	Automatic sprinkler system installed on soil piles
Exposed Surface/Grading	Water all exposed soil twice daily
	Water exposed soil with adequate frequency to keep soil moist at all times
Truck Hauling Road	Water all haul roads twice daily
	Pave all haul roads
Truck Hauling Load	Maintain at least two feet of freeboard
	Cover load of all haul/dump trucks securely
Source: Table 4.12 of EDCAQMD's *Guide to Air Quality Assessment* (EDCAQMD 2002).	

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado County).

Implementation: The project applicant(s) responsible for constructing the roadway connections in El Dorado County.

Timing: Before the approval of grading plans by EDCAQMD.

Enforcement: El Dorado County Development Services Department.

Mitigation Measure 3A.2-1f: Implement SMAQMD's Enhanced Exhaust Control Practices during Construction of all Off-Site Elements.

Implement SMAQMD's Enhanced Exhaust Control Practices, which are listed in Mitigation Measure 3A.2-1a, in order to control NO_X emissions generated by construction of all off-site elements (in Sacramento and El Dorado Counties, or Caltrans right-of-way).

Implementation: The project applicant(s) responsible for construction of each off-site element in Sacramento and El Dorado counties.

Timing: Before the approval of all grading plans from the respective air district (i.e., SMAQMD or EDCAQMD).

Enforcement:

1. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
2. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.2-1g: Pay Off-Site Mitigation Fee to SMAQMD to Off-Set NO_X Emissions Generated by Construction of Off-Site Elements.

The off-site elements could result in construction-generated NO_X emissions that exceed the SMAQMD threshold of significance, even after implementation of the SMAQMD Enhanced Exhaust Control Practices (listed in Mitigation Measure 3A.2-1a). Therefore, the responsible project applicant(s) for each off-site element in Sacramento County shall pay SMAQMD an off-site mitigation fee for implementation of each off-site element in Sacramento County for the purpose of reducing NO_X emissions to a less-than-significant level (i.e., less than 85 lb/day). The specific fee amounts shall be calculated when the daily construction emissions can be more accurately determined. This calculation shall occur if the City/USACE certify the EIR/EIS and select and approves the Proposed Project Alternative or one of the other four other action alternatives, the City, Sacramento County, and the applicants establish the phasing by which construction of the off-site elements would occur, and the applicants develop a detailed construction schedule. Calculation of fees associated with each off-site element shall be conducted by the project applicant(s) in consultation with SMAQMD staff before 'the approval of respective grading plans by Sacramento County. The project applicant(s) responsible for each off-site element in Sacramento County shall pay into SMAQMD's off-site construction mitigation fund to further mitigate construction-generated emissions of NO_X that exceed SMAQMD's daily emission threshold of 85 lb/day. The calculation of daily NO_X emissions shall be based on the cost rate established by SMAQMD at the time the calculation and payment are made. At the time of writing this EIR/EIS the cost rate is $16,000 to reduce 1 ton of NO_X plus a 5% administrative fee (SMAQMD 2008c). The determination of the final mitigation fee shall be conducted in coordination with SMAQMD before any ground disturbance occurs for any project phase. Because the fee is based on the mass quantity of emissions that exceed SMAQMD's *daily* threshold of significance of 85 lb/day, total fees for construction of the off-site elements would vary according to the timing and potential overlap of construction schedules for off-site elements. This measure applies only to those off-site elements located in SMAQMD's jurisdiction (i.e., in Sacramento County) because EDCAQMD does not offer a similar off-set fee program for construction-generated NO_X emissions in its jurisdiction. (This fee is used by SMAQMD to purchase off-site emissions reductions. Such purchases are made through SMAQMD's Heavy Duty Incentive Program, through which select owners of heavy-duty equipment in Sacramento County can repower or retrofit their old engines with cleaner engines or technologies.)

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: The project applicant(s) of all off-site elements in Sacramento County.

Timing: Before the approval of each grading plan for the off-site elements in Sacramento County.

Enforcement:

1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.

2. For the U.S. 50 interchange improvements: Caltrans shall not grant any grading permits to the respective project applicant(s) until the respective project applicant(s) have paid the appropriate off-site mitigation fee to SMAQMD.

Mitigation Measure 3A.2-1h: Perform a Project-Level Analysis to Disclose Projected PM_{10} Emission Concentrations at Nearby Sensitive Receptors Resulting from Construction of Off-Site Elements.

Prior to construction of each off-site element located in Sacramento County that would involve site grading or earth disturbance activity that would exceed 15 acres in one day, the responsible agency or its selected consultant shall require that detailed dispersion modeling is conducted of construction-generated PM_{10} emissions pursuant to SMAQMD guidance that is in place at the time the analysis is performed. At the time of writing this EIR/EIS, SMAQMD's most current and most detailed guidance for addressing construction-generated PM_{10} emissions is found in its *Guide to Air Quality Assessment in Sacramento County* SMAQMD 2009a). SMAQMD emphasizes that PM_{10} emission concentrations at nearby sensitive receptors be disclosed in project-level CEQA analysis. Each project-level analysis shall incorporate detailed parameters of the construction equipment and activities, including the year during which construction would be performed, as well as the proximity of potentially affected receptors, including receptors proposed by the project that exist at the time the construction activity would occur. If the modeling analysis determines that construction activity would result in an exceedance or substantial contribution to the CAAQS and NAAQS at a nearby receptor, then the project applicant(s) shall require their respective contractors to implement additional measures for controlling construction-generated PM_{10} exhaust emission and fugitive PM_{10} dust emissions in accordance with SMAQMD guidance, requirements, and/or rules that apply at the time the project-level analysis is performed. It is likely that these measures would be the same or similar to those listed as Enhanced Fugitive PM Dust Control Practices for Soil Disturbance Areas and Unpaved Roads and Enhanced Exhaust Control Practices included in Mitigation Measure 3A.2-1a. Dispersion modeling is not required for the two El Dorado County roadway connections because the total amount of disturbed acreage is expected to be less than the EDCAQMD screening level of 12 acres.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County or Caltrans).

Implementation: All detailed, project-level analysis shall be performed by the responsible lead agency or its selected consultant and funded by the project applicant(s). Implementation of the project-level modeling analysis and any necessary additional mitigation shall be fully funded by the project applicant(s) responsible for each off-site improvement.

Timing:

1. For all off-site improvements within unincorporated Sacramento County: Before the approval of the respective grading plans from the Sacramento County Planning and Community Development Department
2. For the U.S. 50 interchange improvements: Before the approval of construction plans from Caltrans.

Enforcement:

1. For all off-site improvements within Sacramento County: Sacramento County Planning and Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

With regard to NO_X emissions associated with construction of on-site elements, implementation of SMAQMD's Basic Construction Emission Control Practices and Enhanced Exhaust Control Practices, as required by Mitigation Measure 3A.2-1a, and payment of an off-site mitigation fee to off-set construction-generated NO_X emissions, as required by Mitigation Measure 3A.2-1b, would reduce emissions of NO_X associated with construction of the on-site elements to levels that do not exceed SMAQMD's threshold of significance of 85 lb/day.

With regard to NO_X emissions associated with construction of off-site elements, implementation of SMAQMD's Basic Construction Emission Control Practices and Enhanced Exhaust Control Practices, as required by Mitigation Measure 3A.2-1d and Mitigation Measure 3A.2-1f, respectively, and payment of an off-site mitigation fee to off-set construction-generated NO_X emissions, as required by Mitigation Measure 3A.2-1g, would reduce emissions of NO_X associated with construction of the off-site elements in Sacramento County to levels that do not exceed SMAQMD's threshold of significance of 85 lb/day. Consequently, emissions of NO_X associated with the construction of both on-site and off-site elements would be reduced to a **less-than-significant** level.

With regard to PM_{10} emission concentrations resulting from construction of on-site elements implementation of SMAQMD's Basic Construction Emission Control Practices, Enhanced Fugitive PM Dust Control Practices for Soil Disturbance Areas, and Enhanced Fugitive PM Dust Control Practices for Unpaved Roads, as required by Mitigation Measure 3A.2-1a, would reduce PM_{10} concentrations generated during the construction of the on-site elements. Nonetheless, resultant PM_{10} concentrations could potentially exceed or substantially contribute to the CAAQS and NAAQS because the intensity of construction activity and the acreage of ground disturbance that could occur at any one point in time could be substantially high and/or take place in close proximity to existing or future planned sensitive receptors (e.g., residents, schools). Therefore, PM_{10} emissions associated with construction of the on-site elements would be **significant and unavoidable** unless the results of a detailed project-level analysis, as required by Mitigation Measure 3A.2-1c, support another impact conclusion. Mitigation Measure 3A.2-1c requires a detailed project-level analysis after project phasing has been determined and tentative maps and improvement plans have been prepared, because at the time this DEIR/DEIS was prepared, site-specific information that would allow detailed dispersion modeling of construction-generated PM_{10} from construction of the on-site elements in relation to nearby sensitive receptors was not available (please refer to Section 2.3.1 in Chapter 2, "Alternatives," for a discussion of project phasing).

With regard to PM_{10} emission concentrations resulting from construction of off-site elements, implementation of SMAQMD's Basic Construction Emission Control Practices, as required by Mitigation Measure 3A.2-1d, as well as implementation of EDCAQMD-recommended fugitive PM_{10} dust control measures, would reduce PM_{10} concentrations generated during the construction of the off-site elements. Nonetheless, resultant PM_{10} concentrations could potentially exceed or substantially contribute to the CAAQS and NAAQS because the intensity of construction activity and the acreage of ground disturbance that could occur at any one point in time could be substantially high and/or take place in close proximity to existing or future planned sensitive receptors (e.g., residents, schools). Therefore, PM_{10} emissions associated with construction of the off-site elements would be **significant and unavoidable** unless the results of a detailed project-level analysis, as required by Mitigation Measure 3A.2-1h, support another impact conclusion. Mitigation Measure 3A.2-1h requires a detailed project-level analysis after project phasing has been determined and tentative maps and improvement plans have been prepared, because at the time this DEIR/DEIS was prepared, site-specific information that would allow detailed dispersion modeling of construction-generated PM_{10} from construction of the off-site elements in relation to nearby sensitive receptors was not available.

Additionally, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties and/or Caltrans; therefore, the City would not have control over their timing or implementation. Therefore, the impacts related to those off-site facilities are considered potentially significant and unavoidable. These impacts would be reduced to a **less-than-significant** level if El Dorado County and/or Caltrans cooperate in their implementation.

IMPACT 3A.2-2 Generation of Long-Term Operational (Regional) Emissions of ROG, and NO_X. *Operational area- and mobile-source emissions from project implementation would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS for ozone. In addition, because of the large increase in emissions associated with project build out and the fact that the project is not within an already approved plan (which means that increased emissions would not already be accounted for in applicable air quality plans), project implementation could conflict with air quality planning efforts in the SVAB.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. This amount of development is less than SMAQMD's operational screening level of 375 single family dwelling units (SMAQMD 2009a). Thus, if developed, these residences would not be anticipated to generate operational emissions that exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X. Also, it is not anticipated that operation of these rural residents would generate concentrations of PM_{10} and $PM_{2.5}$ emissions that would exceed or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS for these pollutants. In addition, no stationary sources of CAPs would be developed on the site or as part of the off-site water facilities. Thus, the **direct** impact of long-term operational emissions of criteria air pollutants and precursors would be **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP

Operation of the No USACE Permit Alternative would also result in long-term regional emissions of ROG, NO_X, and PM_{10} associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. According to the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land," full build out of the No USACE Permit Alternative would result in approximately 196,000 additional vehicle trips per day and a regional net increase of 511,300 VMT per day (Stankiewicz, pers. comm., 2009a). Operational emissions were also modeled in URBEMIS and estimated operational emissions for the No USACE Permit Alternative are presented in Table 3A.2-6.

Table 3A.2-6
Summary of Modeled Long-Term Operational Emissions Under the No USACE Permit Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Operational Sources [1]				
Mobile-Source Emissions	418	264	882	171
Area-Source Emissions	974	257	859	826
Total Unmitigated Operational Emissions	1,393	521	1,741	997
SMAQMD Significance Threshold	65	65	— [2]	— [2]

Notes: CAAQS = California ambient air quality standards; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SMAQMD = Sacramento Metropolitan Air Quality Management District
See Appendix C1 for modeling assumptions and results.

Table 3A.2-6
Summary of Modeled Long-Term Operational Emissions Under the No USACE Permit Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$

[1] Operational emissions shown represent the maximum daily emissions during the summertime or wintertime in year 2030. Totals may not add exactly due to rounding.

[2] SMAQMD has not identified mass emissions thresholds for operational emissions of PM_{10} or $PM_{2.5}$. Emission levels are shown for informational purposes only.

Source: Modeling performed by AECOM in 2009

Based on the modeling conducted, and as summarized in Table 3A.2-6, operation of the No USACE Permit Alternative would result in a net increase in unmitigated long-term regional emissions of approximately 1,393 lb/day of ROG, 521 lb/day of NO_X, 1,741 lb/day of PM_{10}, and 997 lb/day of $PM_{2.5}$. Operational area- and mobile-source emissions of NO_X from implementation of the No USACE Permit Alternative would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS. In addition, because development of the SPA is not included in an already-approved general plan, and operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with land use development on the site would not already be accounted for in applicable air quality plans, implementation of the No USACE Permit Alternative could conflict with air quality planning efforts in the SVAB. As a result, this long-term **direct** impact is considered **significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure 3A.2-2: Implement All Measures Prescribed by the Air Quality Mitigation Plan to Reduce Operational Air Pollutant Emissions.

To reduce operational emissions, the project applicant(s) for all project phases shall implement all measures prescribed in the SMAQMD-approved *Folsom Plan Area Specific Plan Air Quality Mitigation Plan* (AQMP) (Torrence Planning 2008), a copy of which is included in Appendix C2. The AQMP is intended to improve mobility, reduce vehicle miles traveled, and improve air quality as required by AB 32 and SB 375. The AQMP includes, among others, measures designed to provide bicycle parking at commercial land uses, an integrated pedestrian/bicycle path network, transit stops with shelters, a prohibition against the use the wood-burning fireplaces, Energy Star roofing materials, electric lawnmowers provided to homeowners at no charge, and on-site transportation alternatives to passenger vehicles (including light rail) that provide connectivity with other local and regional alternative transportation networks.

Implementation: The project applicant(s) of all project phases.

Timing: Before issuance of subdivision maps or improvement plans.

Enforcement: City of Folsom Community Development Department.

PP

Operation of the Proposed Project Alternative would result in long-term regional emissions of ROG, NO_X, and PM_{10} associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. According to the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land," full build out of the Proposed Project Alternative would

result in approximately 247,000 additional vehicle trips per day and a regional net increase of 612,800 VMT per day (Stankiewicz, pers. comm., 2009a).

Operational emissions were modeled using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008), as recommended by SMAQMD. Model defaults were adjusted to reflect project-specific data where available including the sizes and types of proposed land uses. Modeled operational emissions for the Proposed Project Alternative are presented in Table 3A.2-7. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

Table 3A.2-7
Summary of Modeled Long-Term Operational Emissions Under the Proposed Project Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Operational Sources [1]				
Mobile-Source Emissions	522	323	1,058	205
Area-Source Emissions	1,539	386	1,375	1,324
Total Unmitigated Operational Emissions	2,061	709	2,433	1,529
SMAQMD Significance Threshold	65	65	— [2]	— [2]

Notes: CAAQS = California ambient air quality standards; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SMAQMD = Sacramento Metropolitan Air Quality Management District

See Appendix C1 for modeling assumptions and results.

[1] Operational emissions shown represent the maximum daily emissions during the summertime or wintertime in year 2030. Totals may not add exactly due to rounding.

[2] SMAQMD has not identified mass emissions thresholds for operational emissions of PM_{10} or $PM_{2.5}$. Emission levels are shown for informational purposes only.

Source: Modeling performed by AECOM in 2010

Based on the modeling conducted, and as summarized in Table 3A.2-7, operation of the Proposed Project Alternative would result in a net increase in unmitigated long-term regional emissions of approximately 2,061 lb/day of ROG, 709 lb/day of NO_X, 2,433 lb/day of PM_{10}, and 1,529 lb/day of $PM_{2.5}$. Operational area- and mobile-source emissions of NO_X from implementation of the Proposed Project Alternative would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS. In addition, because development of the SPA is not included in an existing approved general plan, and operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with land use development on the site would not already be accounted for in applicable air quality plans, implementation of the Proposed Project Alternative could conflict with air quality planning efforts in the SVAB. As a result, this long-term **direct** impact is considered **significant**. **No indirect** impacts would occur.

Mitigation Measure: Implement Mitigation Measure 3A.2-2.

RIM

Operation of the Resource Impact Minimization Alternative would also result in long-term regional emissions of ROG, NO_X, and PM_{10} associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. According to the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land," full build out of the Resource Impact Minimization Alternative would result in approximately 192,000 additional vehicle trips per day and a regional net increase of

474,800 VMT per day (Stankiewicz, pers. comm., 2009a). Operational emissions were also modeled in URBEMIS and estimated operational emissions for the Resource Impact Minimization Alternative are presented in Table 3A.2-8.

Table 3A.2-8
Summary of Modeled Long-Term Operational Emissions Under the Resource Impact Minimization Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Operational Sources [1]				
Mobile-Source Emissions	407	250	821	159
Area-Source Emissions	1,205	305	1,073	1,033
Total Unmitigated Operational Emissions	1,612	556	1,894	1,192
SMAQMD Significance Threshold	65	65	— [2]	— [2]

Notes: CAAQS = California ambient air quality standards; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SMAQMD = Sacramento Metropolitan Air Quality Management District

See Appendix C1 for modeling assumptions and results.

[1] Operational emissions shown represent the maximum daily emissions during the summertime or wintertime in year 2030. Totals may not add exactly due to rounding.

[2] SMAQMD has not identified mass emissions thresholds for operational emissions of PM_{10} or $PM_{2.5}$. Emission levels are shown for informational purposes only.

Source: Modeling performed by AECOM in 2009

Based on the modeling conducted, and as summarized in Table 3A.2-8, operation of the Resource Impact Minimization Alternative would result in a net increase in unmitigated long-term regional emissions of approximately 1,612 lb/day of ROG, 556 lb/day of NO_X, 1,894 lb/day of PM_{10}, and 1,192 lb/day of $PM_{2.5}$. Operational area- and mobile-source emissions of NO_X from implementation of the Resource Impact Minimization Alternative would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS. In addition, because development of the SPA is not included in an already-approved general plan, and operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with land use development on the site are not already accounted for in the applicable SMAQMD regional air quality plans, implementation of the Resource Impact Minimization Alternative could conflict with air quality planning efforts in the SVAB. As a result, this long-term **direct** impact is considered **significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.2-2.

RHD

Operation of the Reduced Hillside Development Alternative would also result in long-term regional emissions of ROG, NO_X, and PM_{10} associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. According to the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land," full build out of the Reduced Hillside Development Alternative would result in approximately 268,000 additional vehicle trips per day and a regional net increase of 634,300 VMT per day (Stankiewicz, pers. comm., 2009a). Operational emissions were also modeled in URBEMIS and estimated operational emissions for the Reduced Hillside Development Alternative are presented in Table 3A.2-9.

Table 3A.2-9
Summary of Modeled Long-Term Operational Emissions Under the Reduced Hillside Development Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Operational Sources [1]				
Mobile-Source Emissions	517	323	1,069	207
Area-Source Emissions	1,718	411	1,556	1,497
Total Unmitigated Operational Emissions	2,235	734	2,625	1,705
SMAQMD Significance Threshold	65	65	— [2]	— [2]

Notes: CAAQS = California ambient air quality standards; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SMAQMD = Sacramento Metropolitan Air Quality Management District

See Appendix C1 for modeling assumptions and results.

[1] Operational emissions shown represent the maximum daily emissions during the summertime or wintertime in year 2030. Totals may not add exactly due to rounding.

[2] SMAQMD has not identified mass emissions thresholds for operational emissions of PM_{10} or $PM_{2.5}$. Emission levels are shown for informational purposes only.

Source: Modeling performed by AECOM in 2010

Based on the modeling conducted, and as summarized in Table 3A.2-9, operation of the Reduced Hillside Development Alternative would result in a net increase in unmitigated long-term regional emissions of approximately 2,235 lb/day of ROG, 734 lb/day of NO_X, 2,625 lb/day of PM_{10}, and 1,705 lb/day of $PM_{2.5}$. Operational area- and mobile-source emissions of NO_X from implementation of the Reduced Hillside Development Alternative would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS. In addition, because development of the SPA is not included in an already-approved general plan, and operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with land use development on the site are not already accounted for in applicable SMAQMD regional air quality plans, implementation of the Reduced Hillside Development Alternative could conflict with air quality planning efforts in the SVAB. As a result, this long-term **direct** impact is considered **significant**. **No indirect** impacts would occur. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3A.2-2.

CD

Operation of the Centralized Development Alternative would also result in long-term regional emissions of ROG, NO_X, and PM_{10} associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. According to the traffic data used to prepare Section 3A.15, "Traffic and Transportation – Land," full build out of the Centralized Development Alternative would result in approximately 230,000 additional vehicle trips per day and a regional net increase of 601,700 VMT per day (Stankiewicz, pers. comm., 2009a). Operational emissions were also modeled in URBEMIS and estimated operational emissions for the Centralized Development Alternative are presented in Table 3A.2-10.

Table 3A.2-10
Summary of Modeled Long-Term Operational Emissions Under the Centralized Development Alternative

Source	Emissions (lb/day) [1]			
	ROG	NO_X	PM_{10}	$PM_{2.5}$
Operational Sources [1]				
Mobile-Source Emissions	497	312	1,040	201
Area-Source Emissions	1,358	340	1,215	1,170
Total Unmitigated Operational Emissions	1,855	652	2,255	1,371
SMAQMD Significance Threshold	65	65	— [2]	— [2]

Notes: CAAQS = California ambient air quality standards; lb/day = pounds per day; $\mu g/m^3$ = micrograms per cubic meter; ROG = reactive organic gases; NO_X = oxides of nitrogen; PM_{10} = respirable particulate matter; $PM_{2.5}$ = fine particulate matter; SMAQMD = Sacramento Metropolitan Air Quality Management District

See Appendix C1 for modeling assumptions and results.

[1] Operational emissions shown represent the maximum daily emissions during the summertime or wintertime in year 2030. Totals may not add exactly due to rounding.

[2] SMAQMD has not identified mass emissions thresholds for operational emissions of PM_{10} or $PM_{2.5}$. Emission levels are shown for informational purposes only.

Source: Modeling performed by AECOM in 2010

Based on the modeling conducted, and as summarized in Table 3A.2-10, operation of the Centralized Development Alternative would result in a net increase in unmitigated long-term regional emissions of approximately 1,855 lb/day of ROG, 652 lb/day of NO_X, 2,255 lb/day of PM_{10}, and 1,371 lb/day of $PM_{2.5}$. Operational area- and mobile-source emissions of NO_X from implementation of the Centralized Development Alternative would exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X, and would result in or substantially contribute to emissions concentrations that exceed the NAAQS or CAAQS. In addition, because development of the SPA is not included in an already-approved general plan, and operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with land use development on the site would not already be accounted for in applicable air quality plans, implementation of the Centralized Development Alternative could conflict with air quality planning efforts in the SVAB. As a result, this long-term **direct** impact is considered **significant**. **No indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3A.2-2.

Off-Site Elements

The off-site elements would not be anticipated to result in increased operational emissions of criteria air pollutants beyond those associated with the on-site project development. While the road improvement-related elements would accommodate local vehicle traffic, they would not be expected to result in a substantial increase in vehicle trips and associated mobile-source emissions. (A substantial portion of vehicle trips using the proposed roadway infrastructure elements would be generated by the land uses developed on the SPA and associated mobile-source emissions are discussed in the analysis of on-site elements above.) Some of the roadway infrastructure improvements may actually reduce VMT by enabling more direct travel routes between area destinations. Also, it is not anticipated that the detention basin would generate a substantial number of vehicle trips other than the nominal amount of trips associated with routine maintenance of the facility. As a result, this **direct** impact would be **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of all air pollutant reduction measures contained in the SMAQMD-approved *Folsom Plan Area Specific Plan Air Quality Mitigation Plan*, as required by Mitigation Measure 3A.2-2, would reduce ROG and NO_X emissions associated with operation of the project. However, for reasons described in more detail below, the exact reduction achieved by implementation of Mitigation Measure 3A.2-2 cannot be determined for the Proposed Project and the other four other action alternatives. While the AQMP was developed to achieve a 35% reduction in operational NO_X emissions from baseline levels, the baseline levels are not represented by the URBEMIS modeling output summarized in Tables 3A.2-6 through 3A.2-10 (above). For the purposes of developing an AQMP pursuant to SMAQMD's *Guidance for Land Use Emission Reductions* (SMAQMD 2007b) a baseline emissions level is presumed that is based on standard default trip generation rates established by the Institution of Transportation Engineers (ITE). The traffic modeling performed to support the analysis in Section 3A.15, "Traffic and Transportation – Land," and the associated modeling of operational emissions summarized in Tables 3A.2-6 through 3A.2-10 of this section, did not utilize standard ITE trip generation rates. Instead, the traffic analysis was based on a modified version of the 2008 SACMET regional travel demand forecasting model (Stankiewicz, pers. comm., 2009b). As explained in Section 3A.15, "Traffic and Transportation – Land," a traffic demand forecasting model is a tool that assigns trips generated by the various land uses to the surrounding roadway network based on the locations of trip attractions and productions. The traffic demand forecast model incorporates several types of data, including detailed land use; trip generation characteristics of specific land use types; mode choice propensity based upon user and trip characteristics; roadway, pedestrian, and transit networks; and census information. By incorporating more parameters that are unique to the region and the SPA, the model estimates more precise (and lower) estimates of VMT than using standard default ITE trip generation rates, which in turn results in more precise (and lower) estimates of operational air pollutant emissions. In other words, the traffic modeling already accounts for some of the unique attributes of the proposed land use plans (such as the proximity of residential and commercial land uses to activity centers and to transit service), for which an emissions reduction is also included in the AQMP. Therefore, one would overestimate the reduction achieved by the AQMP by reducing the levels of operational NO_X emissions reported in Tables 3A.2-6 through 3A.2-10 by 35%. The actual emission reduction benefit of the AQMP would be some amount less than 35%. Nonetheless, even if operational emissions of ROG and NO_X were 35% lower than the levels reported in Tables 3A.2-6 through 3A.2-10, they would still exceed SMAQMD's significance threshold of 65 lb/day. As a result, this impact would be **significant and unavoidable**.

IMPACT 3A.2-3 Generation of Local Mobile-Source CO Emissions. *Project-generated local mobile-source CO emissions would not result in or substantially contribute to concentrations that exceed the 1-hour ambient air quality standard of 20 ppm or the 8-hour standard of 9 ppm.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Vehicle trip generated by this amount of rural residences would not be expected to result in a substantial increase in congestion at any area intersections and thus would not result in high concentrations of localized CO. No off-site water facilities would be constructed under this alternative. Thus, this **direct** impact would be **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

The primary mobile-source pollutant of localized concern is CO. Local mobile-source CO emissions near roadway intersections are a direct function of traffic volume, speed, and delay. Transport of CO is extremely

limited because it disperses rapidly with distance from the source under normal meteorological conditions. However, under certain specific meteorological conditions, CO concentrations near roadways and/or intersections may reach unhealthy levels with respect to local sensitive land uses, such as residential units, hospitals, schools, and childcare facilities. Thus, high local CO concentrations are considered to have a direct influence on the receptors they affect. Modeling of CO concentrations is typically recommended for areas located near signalized roadway intersections that are projected to operate at an unacceptable level of service (LOS) (i.e., LOS E or F) during peak traffic hours (Garza, Graney, and Sperling 1997).

Intersections controlled by stop signs do not experience high enough traffic volumes and associated congestion to be the site of violations of the AAQS; therefore, CO modeling is not recommended for unsignalized intersections (Garza, Graney, and Sperling 1997). Because the intersections controlled by stop signs would accommodate fewer vehicles than signalized intersections, it is reasonable to conclude that congestion at the intersections controlled by stop signs would not result in CO concentrations that exceed the AAQS.

SMAQMD recently released new screening criteria in its *Guide to Air Quality Assessment in Sacramento County* that provide lead agencies with a conservative indication of whether project-generated vehicle trips would result in the generation of CO emissions that exceed or contribute to an exceedance of the CAAQS for CO (SMAQMD 2009a). The screening criteria have been developed to help lead agencies analyze potential CO impacts and identify when site-specific CO dispersion modeling is not necessary. SMADQMD's recommended screening criteria are divided into the following two tiers.

First Tier

The project would result in a less-than-significant impact to air quality for local CO if:

- Traffic generated by the project would not result in deterioration of intersection level of service (LOS) to LOS E or F; or
- The project would not contribute additional traffic to an intersection that already operates at LOS of E or F.

Second Tier

If all of the following criteria are met, the project would result in a less-than-significant impact to air quality for local CO.

- The project would not result in an affected intersection experiencing more than 31,600 vehicles per hour;
- The project would not contribute traffic to a tunnel, parking garage, bridge underpass, urban street canyon, or below-grade roadway; or other locations where horizontal or vertical mixing of air would be substantially limited; and
- The mix of vehicle types at the intersection is not anticipated to be substantially different from the County average (as identified by the EMFAC or URBEMIS models).

Based on the traffic analysis prepared for the Proposed Project and the other four action alternatives (Tables 3A.15-16 through 3A.15-24), some signalized intersections in the vicinity of the SPA are predicted to operate at an unacceptable LOS under build out conditions (DKS Associates 2009). However, because none of the intersections would be anticipated to accommodate volumes of traffic that would exceed 31,600 vehicles per hour (Stankiewicz, pers. comm., 2009b), all affected roadways would be at-grade, and the mix of vehicles traveling on these roadways is not anticipated to be substantially different from the County average, the project would not result in concentrations of CO that would exceed or contribute to an exceedance of the CAAQS. Furthermore, due to stricter vehicle emissions standards in newer cars, new technology, and increased fuel economy, future CO emission factors under future build out conditions (year 2030) would be substantially lower than those under

existing conditions. Thus, even though there would be more vehicle trips under the Proposed Project and the other four action alternatives at build out than under existing conditions, project-generated local mobile-source CO emissions would not result in or substantially contribute to concentrations that exceed the 1-hour ambient air quality standard of 20 ppm or the 8-hour standard of 9 ppm. As a result, this **direct** impact would be **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measures: No mitigation measures are required.

Off-Site Elements

The off-site elements would not involve construction of new housing or development of new businesses that would generate vehicle trips or associated emissions of CO. Therefore, the off-site elements would not result in CO emissions that would exceed or substantially contribute to concentrations that exceed the 1-hour ambient air quality standard of 20 ppm or the 8-hour standard of 9 ppm. This **direct** impact would be **less than significant**. **No indirect** impacts would occur.

Mitigation Measures: No mitigation measures are required.

IMPACT 3A.2-4 Exposure of Sensitive Receptors to Short- and Long-Term Emissions of Toxic Air Contaminants. *Project implementation would result in exposure of receptors to short- and long-term emissions of TACs from on-site stationary and mobile sources and from off-site mobile sources.*

On-Site Elements

NP

Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Construction of these residences would not be anticipated to require a high number of diesel-powered construction equipment or occur in close proximity to sensitive receptors for an extended period of time. In addition, no stationary sources of TACs would be developed on the site and no land uses would be developed that would harbor activity by area sources of TACs (e.g., loading dock activity by diesel trucks). There would be no off-site water facilities constructed under this alternative. Thus, **no direct** or **indirect** impacts would occur. ***[Lesser]***

NCP, RIM

Under the No USACE Permit and Resource Impact Minimization Alternatives, the TAC impacts associated with the temporary and short-term emissions from construction equipment, stationary-source emissions, emissions from on-site operational mobile sources, TAC exposure from remediation activity, exposure of on-site receptors to diesel PM generated at the off-site corporation yard, and land use compatibility with U.S. 50 would be the same as for the Proposed Project Alternative. However, the analysis of the project's land use compatibility with high-volume arterial roadways would be different, as described in detail in Section 4.1, "Cumulative Impacts".

No indirect impacts would occur. ***[Lesser for exposure of existing residents in El Dorado Hills to construction-generated emissions of TACs. Similar for all other TAC impacts.]***

Mitigation Measure 3A.2-4a: Develop and Implement a Plan to Reduce Exposure of Sensitive Receptors to Construction-Generated Toxic Air Contaminant Emissions.

The project applicant(s) for all project phases shall develop a plan to reduce the exposure of sensitive receptors to TACs generated by project construction activity associated with buildout of the selected

alternative. Each plan shall be developed by the project applicant(s) in consultation with SMAQMD. The plan shall be submitted to the City for review and approval before the approval of any grading plans.

The plan may include such measures as scheduling activities when the residences are the least likely to be occupied, requiring equipment to be shut off when not in use, and prohibiting heavy trucks from idling. Applicable measures shall be included in all project plans and specifications for all project phases.

The implementation and enforcement of all measures identified in each plan shall be funded by the project applicant(s) for the respective phase of development.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

Mitigation Measure 3A.2-4b: Implement Measures to Reduce Exposure of Sensitive Receptors to Operational Emissions of Toxic Air Contaminants.

The following measures shall be implemented to reduce exposure of sensitive receptors to Toxic Air Contaminants.

- Proposed commercial and industrial land uses that have the potential to emit TACs or host TAC-generating activity (e.g., loading docks) shall be located away from existing and proposed on-site sensitive receptors such that they do not expose sensitive receptors to TAC emissions that exceed an incremental increase of 10 in 1 million for the cancer risk and/or a noncarcinogenic Hazard Index of 1.0.

- The multi-family residences planned across from the off-site corporation yard near the southwest corner of the SPA shall be set back as far as possible from the boundary of the corporation yard and/or relocated to another area.

- Where necessary to reduce exposure of sensitive receptors to an incremental increase of 10 in 1 million for the cancer risk and/or a noncarcinogenic Hazard Index of 1.0, proposed commercial and industrial land uses that would host diesel trucks shall incorporate idle reduction strategies that reduce the main propulsion engine idling time through alternative technologies such as, IdleAire, electrification of truck parking, and alternative energy sources for TRUs, to allow diesel engines to be completely turned off.

- Signs shall be posted in at all loading docks and truck loading areas which indicate that diesel-powered delivery trucks must be shut off when not in use for longer than 5 minutes on the premises in order to reduce idling emissions. This measure is consistent with the ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling, which was approved by the California Office of Administrative Law in January 2005.

- Implement the following additional guidelines, which are recommended in *ARB's Land Use Handbook: A Community Health Perspective* (ARB 2005) and are considered to be advisory and not regulatory:

    - Sensitive receptors, such as residential units and daycare centers, shall not be located in the same building as dry-cleaning operations that use perchloroethylene. Dry-cleaning operations that use

perchloroethylene shall not be located within 300 feet of any sensitive receptor. A setback of 500 feet shall be provided for operations with two or more machines.

- Large gasoline stations (defined as facilities with a throughput of 3.6 million gallons per year or greater) and sensitive land uses shall not be sited within 300 feet of each other. Small gasoline-dispensing facilities (less than 3.6 million gallons of throughput per year) and sensitive land uses shall not be sited within 50 feet of each other.

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of all grading plans by the SMAQMD and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

PP

The exposure of sensitive receptors (e.g., proposed residential units, schools) to TAC emissions from construction activities and from existing and stationary, area, and mobile sources under the Proposed Project Alternative is discussed separately below.

Temporary, Short-Term Emissions from Construction Equipment

Construction of the Proposed Project Alternative would result in short-term emissions of diesel exhaust from on-site heavy-duty equipment. Emissions of particulate exhaust from diesel-fueled engines (diesel PM) were identified as a TAC by ARB in 1998. Construction of the project would result in the generation of diesel PM emissions from the use of off-road diesel equipment required for site grading and excavation, paving, and other construction activities. According to ARB, the potential cancer risk from the inhalation of diesel PM, which is discussed below, outweighs the potential noncancer health impacts (ARB 2003).

The dose to which the receptors are exposed (a function of concentration and duration of the exposure period) is the primary factor used to determine health risk (i.e., potential exposure to TAC emission levels that exceed applicable standards). According to the Office of Environmental Health Hazard Assessment (OEHHA), health risk assessments, which determine the exposure of sensitive receptors to TAC emissions, should be based on a 70-year exposure period; however, such assessments should be limited to the period/duration of activities associated with the project (Salinas, pers. comm., 2004). The use of mobilized equipment in each area of the SPA would be temporary. In addition, some new residents would occupy the site concurrently with on-site construction activities. Thus, diesel PM from construction activities could also expose on-site residents and schools to levels that exceed applicable standards as some phases of the development plan are built out while construction of other phases continues. Particularly, some residents may be exposed to diesel PM generated by construction activity in all directions (at varying times). Even with the dispersive properties of diesel PM (Zhu et al. 2002), construction activities could expose sensitive receptors to levels of health risk that exceed applicable standards. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur.

Stationary-Source Emissions

No stationary sources of TAC emissions are located on or immediately adjacent to the SPA.

Long-term operation of industrial and commercial uses developed under the Proposed Project Alternative would likely include the installation of stationary sources of TACs, such as dry cleaning establishments, gasoline-dispensing facilities, diesel-fueled backup generators, medical incinerators, and/or restaurants using charbroilers. These and other types of stationary sources may also be developed at off-site locations near the SPA in future years. All stationary sources that may emit TACs would be subject to SMAQMD permitting regulations and T-

BACT requirements. Pursuant to SMAQMD Regulation 2 (Permit Requirements) and Rule 904 (Air Toxic Control Measures) SMAQMD would analyze such sources (e.g., in a health risk assessment) based on their potential to emit TACs. If it is determined that the sources would emit TACs in excess of SMAQMD's applicable threshold of significance, T-BACT would be implemented to reduce emissions. If the implementation of T-BACT would not reduce the risk below the applicable threshold, then SMAQMD would deny the required permit. Furthermore, no commercial or industrial land uses would be located along the eastern edge of the SPA, just across from the existing residential neighborhood (Stonebrier) in El Dorado Hills. As a result, operation of any stationary sources would not result in the exposure of sensitive receptors to TACs at levels exceeding SMAQMD's significance threshold. Therefore, this **direct** impact is considered **less than significant. No indirect** impact would occur.

Emissions from On-Site Operational Mobile Sources

The Proposed Project Alternative would include proposed residences, schools, and parks. Because of the sensitivity of such uses, assessment of compatibility of surrounding land uses with respect to sources of TAC emissions is required.

On-site mobile sources of TACs would primarily be associated with the operation of school buses transporting students to and from the proposed schools, as well as diesel-powered delivery trucks associated with proposed on-site commercial and industrial activities.

Emissions from school buses can vary, depending on various factors, including bus type, age, maintenance, and amount of time spent idling. Health impacts from exhaust exposure include eye and respiratory irritation, enhanced respiratory allergic reactions, asthma exacerbation, increased cancer risk, and immune system degradation. Generally, children are more vulnerable to air pollutants because of higher inhalation rates, narrower airways, and less mature immune systems.

In response to the above issue, the ARB adopted an ATCM as part of the Particulate Matter Risk Reduction Plan to specifically deal with diesel emissions from school buses. This ATCM became effective July 16, 2003. The school bus idling ATCM includes the following requirements:

(a) The driver of a school bus or vehicle, transit bus, or heavy-duty vehicle (other than a bus) shall manually turn off the bus or vehicle upon arriving at a school and restart no more than 30 seconds before departing. A driver of a school bus or vehicle shall be subject to the same requirement when operating within 100 feet of a school and shall be prohibited from idling more than 5 minutes at each stop beyond schools, such as parking or maintenance facilities, school bus stops, or school activity destinations. A driver of a transit bus or heavy-duty vehicle (other than a bus) shall be prohibited from idling more than 5 minutes at each stop within 100 feet of a school. Idling necessary for health, safety, or operational concerns shall be exempt from these restrictions.

(b) The motor carrier of the affected bus or vehicle shall ensure that drivers are informed of the idling requirements, track complaints and enforcement actions, and keep track of driver education and tracking activities.

According to ARB, implementation of the above requirements would eliminate unnecessary idling for school buses and other heavy-duty vehicles, protecting children from unhealthful exhaust emissions and thus reducing localized exposure to TACs and other harmful air pollution emissions at and near schools.

On-site operational mobile sources of TAC emissions would also be associated with the operation of diesel-powered delivery trucks at the loading docks and delivery areas of commercial and industrial land uses. Some sensitive land uses within the SPA would be located within 100 feet of commercial or industrial uses (e.g., community commercial, general commercial, regional commercial, industrial/office park, and mixed-use land use types). Operational activities that require the use of diesel-fueled vehicles for extended periods, such as commercial trucking facilities, delivery/distribution areas, or loading docks, could expose nearby sensitive

receptors to diesel PM emissions. The diesel PM emissions generated by these uses would be produced primarily at discrete locations on a regular basis. Idling trucks at these locations, including TRUs, could result in the exposure of nearby residents to increased diesel PM levels on a reoccurring basis.

As referenced above, the ARB's *Handbook* recommends avoiding the siting of new commercial trucking facilities that accommodate more than 100 trucks per day, or 40 trucks equipped with transportation refrigeration units (TRUs), within 1,000 feet of sensitive receptors (e.g., residences or schools) (ARB 2005). The number of trucks that would visit the facilities on any given day is not known at this time; however, based on data from similar projects, the types of commercial uses proposed for the SPA would not involve large-scale trucking operations. For the purposes of the Proposed Project Alternative, it is not anticipated that the combination of industrial land uses proposed in the SPA would exceed these screening limits.

In addition to the school bus idling ATCM, ARB also adopted an idling restriction ATCM for large commercial diesel-powered vehicles, which became effective February 1, 2005. In accordance with this measure, affected vehicles are required to limit idling to no longer than 5 minutes under most circumstances. ARB is also evaluating additional ATCMs intended to further reduce TACs associated with commercial operations, including a similar requirement to limit idling of smaller diesel-powered commercial vehicles.

Nonetheless, given that proposed on-site commercial and industrial land uses have not yet been identified and could potentially involve substantial volumes of truck activity occurring in close proximity to nearby sensitive receptors, exposure of nearby on-site receptors to mobile-source TACs associated with commercial and industrial activities is considered a **direct** and **potentially significant** impact. **No indirect** impact would occur.

Further, as stated previously, the ARB guidance document is not regulatory, and the SMAQMD has not established any guidelines for the assessment of such impacts or any applicable thresholds for these types of emissions.

TAC Exposure from Remediation Activity

Remediation activity is currently underway on the Aerojet General Corporation parcel along the western property boundary, which has been classified as a Superfund site (see Section 3A.8 "Hazards and Hazardous Materials – Land," for additional information). Area 40 refers to a portion of the Superfund site that is located just west of the SPA and extends into an area on the SPA that would be designated as Open Space. A report prepared by ARCADIS (2007) entitled *Draft Ambient Air Evaluation of Aerojet Area 40* examines potential health risks to future adult and child recreators on this open space associated with VOCs potentially migrating from ground water into the ambient air. The report analyzes groundwater analytical data for the VOC plume located in the northern portion of Area 40. The primary chemicals of potential concern in the VOC plume include trichloroethene (TCE) and tetrachloroethene (PCE). Exposure and risk to adult and child recreators were estimated using standard EPA and California risk assessment practices. The analysis determined that the hazard indices (a.k.a., hazard quotients) used for determining levels of non-cancer risk would be 0.010 and 0.000025 from TCE and PCE exposure, respectively. It also determined that cancer risk levels would be 0.8 in one million from TCE exposure and 0.01 in one million from PCE exposure. Because all of the estimated risk levels would be below the SMAQMD's recommended thresholds of significance for health risk, airborne exposure of recreators on the SPA to off-gassing VOC emissions from the contaminated groundwater plume would be considered a **direct**, **less-than-significant** impact. **No indirect** impact would occur.

Land Use Compatibility with Off-Site Corporation Yard

The City plans to develop a new corporation yard south of White Rock Road near the southwestern corner of the SPA. The corporation yard would be used to stage, store, and maintain equipment used by the City, including diesel-powered trucks and heavy-duty equipment (e.g., mowers). The location of on-site receptors, particularly residences within the SPA that would be zoned for multi-family medium density development near the southwestern corner of the SPA could be exposed to diesel PM emissions generated at the corporation yard.

Moreover, because the predominant wind direction in the area and from the south-southwest at approximately 10 mph (ARB 1994), these receptors would located downwind of the corporation yard. The types of equipment that would be operated at the corporation yard and the frequency and intensity of their operation have not yet been identified. Given that activities at the corporation yard could potentially generate substantial levels of diesel PM exhaust, as well as the close proximity of nearby sensitive receptors, the potential for these on-site receptors to be exposed to high concentration of diesel PM emissions from the corporation yard is a **direct** and **potentially significant** impact. **No indirect** impact would occur.

Land Use Compatibility with U.S. 50

The Proposed Project Alternative would involve development of lands on the south side of U.S. 50, which accommodates high volumes of traffic and associated mobile-source TAC emissions. As explained in the regulatory setting above, ARB published a guidance document entitled *Air Quality and Land Use Handbook: A Community Health Perspective* that includes the recommendation to avoid siting new sensitive land uses (e.g., residences, schools) within 500 feet of freeways. In addition, SB 352 (Education Code Section 17213, Public Resources Code Section 21151.8) expands on previous requirements for the review of TAC sources near school sites. Accordingly, SB 352 requires that any school site located within 500 feet of the edge of the closest travel lane of a freeway or other busy traffic corridor be reviewed for potential health risks. No residential land uses, schools, or other sensitive land uses would be developed within 500 feet of U.S. 50. Therefore, the impact associated with off-site mobile-source TAC emissions at the SPA would be **direct** and **less than significant**. **No indirect** impact would occur. ***[Similar]***

See Section 4.1, "Cumulative Impacts" for a detailed discussion of impacts on Land Use Compatibility with High-Volume Arterial Roadways. This impact analysis is contained in the Cumulative Impacts chapter due to the fact that the condition under which analysis was performed is cumulative in nature (i.e., the result of past, present, and future projects).

Mitigation Measure: Implement Mitigation Measures 3A.24a-4b.

CD

Under the Centralized Development Alternative, the analysis of the TAC impacts associated with the stationary-source emissions, emissions from on-site operational mobile sources, TAC exposure from remediation activity, exposure of on-site receptors to diesel PM generated at the off-site corporation yard, the project's land use compatibility with U.S. 50 would be the same as for the Proposed Project Alternative.

The analysis of short-term TAC emissions from construction equipment would be different, however, in that the existing receptors in the Stonebrier development in El Dorado Hills east of the SPA would not likely be exposed to high levels of health risk because intense levels of grading and earth disturbance would not occur in the hills on the east side of the SPA, as indicated by the land use plan in Exhibit 2-15 (see Chapter 2, "Alternatives"). Nonetheless, as with the Proposed Project Alternative, diesel PM from construction activities could expose on-site residents and schools to levels that exceed applicable standards as some phases of the development plan are built out while construction of other phases continues. Particularly, some residents may be exposed to diesel PM generated by construction activity in all directions (at varying times). Even with the dispersive properties of diesel PM (Zhu et al. 2002), construction activities could expose sensitive receptors to levels of health risk that exceed applicable standards. Therefore, this **direct** impact is considered **potentially significant**. **No indirect impacts** would occur.

In addition, the analysis of the project's land use compatibility with high-volume arterial roadways would be different, as described in detail in Section 4.1 "Cumulative Impacts".

No indirect impacts would occur under the Resource Impact Minimization Alternative. ***[Lesser for exposure of existing residents in El Dorado Hills to construction-generated emissions of TACs. Similar for all other TAC impacts.]***

Mitigation Measure: Implement Mitigation Measures 3A.2-4a-4b.

RHD

Under the Reduced Hillside Development Alternative, the TAC impacts associated with the short-term emissions from construction equipment, stationary-source emissions, emissions from on-site operational mobile sources, TAC exposure from remediation activity, exposure of on-site receptors to diesel PM generated at the off-site corporation yard, and land use compatibility with U.S. 50 would be the same as for the Proposed Project Alternative. However, the analysis of the project's land use compatibility with high-volume arterial roadways would be different, as described in detail in Section 4.1 "Cumulative Impacts".

No indirect impacts would occur under the Reduced Hillside Development Alternative. ***[Lesser for exposure of residential receptors that would be located along the east side of Scott Road North between Easton Valley Parkway and Road "A." Similar for all other TAC impacts.]***

Mitigation Measure: Implement Mitigation Measures 3A.2-4a-4b.

Off-Site Elements

The exposure of sensitive receptors (e.g., residential units, schools) to TAC emissions associated with construction and operation of the proposed off-site elements are discussed separately below.

Temporary, Short-Term Emissions from Construction Equipment

Construction of the off-site elements would result in short-term emissions of diesel PM from on-site heavy-duty equipment. Most of the activity associated with construction of the freeway interchange at Prairie City Road would be on the south side of U.S. 50 and, therefore, more than 1,000 feet from the nearest sensitive receptor, Folsom High School, which is on the north side of U.S. 50. The sewer force main, the freeway interchange at Oak Avenue, and the Rowberry Drive Overcrossing would be constructed on the north side of U.S. 50 and this activity would occur relatively close to the residential neighborhoods north of Iron Point Road. Construction of the two roadway connections into El Dorado Hills would also occur in close proximity to existing neighborhoods in El Dorado County. Even with the dispersive properties of diesel PM (Zhu et al. 2002), short-term construction activities could expose sensitive receptors to levels that exceed applicable standards because of its close proximity to nearby Folsom High School and existing nearby residential land uses. Therefore, this **direct** impact is considered **potentially significant**. **No indirect** impacts would occur.

Mitigation Measure: Implement Mitigation Measures 3A.2-1a and 3A.2-1b for the off-site improvements in Sacramento County; and Mitigation Measure 3A.2-1f for the off-site improvements in El Dorado County.

Operational TAC Emissions

The off-site element would not host sources of TAC emissions (e.g., backup diesel generators) or attract sources of TAC emissions (e.g., diesel trucks). Therefore, operation of these off-site facilities would not result in elevated risk levels at nearby receptors. This **direct** impact would be **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measure 3A.2-4a would lessen health-related risks associated with the use of off-road diesel powered equipment during construction activity under all action alternatives. However, given that construction activity would occur on the SPA during the 19-year buildout of the project, exposure to construction-generated TAC emissions would not necessarily be reduced to less-than-significant levels. Therefore, the potential exposure of receptors to construction-generated TAC emissions is considered to be **significant and unavoidable**.

Implementation of Mitigation Measure 3A.2-4b would lessen health-related risks associated with mobile-source TACs under the Proposed Project Alternative and the other four action alternatives; however, TAC exposure levels at sensitive receptors located within 500 feet of a freeway or high-traffic volume roadway would not necessarily be reduced to less-than-significant levels. Exposure of receptors to mobile-source TAC emissions therefore is considered to be **significant and unavoidable**.

Implementation of Mitigation Measure 3A.2-1a, 3A.2-1b, and 3A.2-1f would lessen health-related risks associated with the use of off-road diesel powered equipment during construction activity in El Dorado County. However, given that construction activity would occur on the SPA during the 19-year buildout of the project, exposure to construction-generated TAC emissions would not necessarily be reduced to less-than-significant levels. Therefore, the potential exposure of receptors to construction-generated TAC emissions is considered to be **significant and unavoidable**.

Similarly, increasing the set back distance between on-site residents and the off-site, future planned corporation yard would not necessarily reduce the levels of TAC exposure at these residents to a less-than-significant level. Therefore, the potential exposure of on-site residents to TAC emissions from the corporation yard would be considered **significant and unavoidable**.

Additionally, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties and/or Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Therefore, the impacts related to those off-site facilities are considered potentially significant and unavoidable.

These conclusions have been reached due to the uncertainty about the potential TAC emissions sources associated with on-site commercial and industrial land use activities and the proximity of sensitive receptors to such uses. In addition, there is also uncertainty about the feasibility and effectiveness of extending the setback distances between roadways and receptors and the effectiveness and feasibility of tiered planting of fine-needle tree species. Therefore, this conclusion may change as more detailed information regarding proposed on-site commercial uses becomes available and analyses of individual phases are performed at the project level as part of future CEQA documents prior to approval of subdivision maps or improvement plans.

IMPACT 3A.2-5 Exposure of Sensitive Receptors to Construction-Generated Emissions of Naturally Occurring Asbestos. *Asbestos is a toxic air contaminant. Residents and other receptors located close to construction activity could be exposed to dust from asbestos rock and soils during earth disturbance activities.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, "normal agricultural activities" would continue on the SPA; based on the soil types at the SPA, those activities would consist of dryland farming (i.e., livestock grazing) and, therefore, would not involve substantial amounts of grading or other types of ground disturbance. There would be no off-site water facilities constructed under this alternative. Under the No Project Alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If

additional residences are built in areas that have the potential to contain NOA, however, it is not anticipated that construction of these residences would involve an extensive amount of earth disturbance or rock blasting and it is unlikely that construction activity would occur in close proximity to other sensitive receptors. Thus, it is not anticipated that sensitive receptors would be exposed to airborne asbestos generated during construction or operational activity. This **direct** impact would be **less than significant**. **No indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, RHD

Grading, blasting, and other forms of ground disturbance during construction would result in fugitive PM_{10} dust emissions. As stated in the setting above, some areas of the SPA may contain serpentine or ultramafic rock that is common to the Sierra Nevada foothills. These types of rock contain thin veins of asbestos that can become airborne when disturbed by grading or blasting. According to a report prepared by the California Geological Survey, more than half of the SPA is located in "areas moderately likely to contain NOA" (Higgins and Clinkenbeard 2006). Although geologic conditions are more likely for asbestos formation in particular areas identified by the map, the presence thereof is not certain.

Detailed construction plans for the project have not been developed. During site grading and rock blasting activities, the serpentine soils may be disturbed, potentially exposing residents of the nearby residential neighborhoods in El Dorado County to asbestos during project construction. Also, the site would be developed in phases, so construction activity would be spread out over many years. Construction activities for later phases could adversely affect residential land uses and other receptors that have already been developed in earlier phases of development. Without appropriate controls, sensitive receptors near construction sites could be exposed to localized high levels of re-entrained fugitive PM_{10} dust, potentially including NOA. As a result, this **direct** impact would be considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

> Mitigation Measure 3A.2-5: Implement a Site Investigation to Determine the Presence of NOA and, if necessary, Prepare and Implement an Asbestos Dust Control Plan.
>
> A site investigation shall be performed to determine whether and where NOA is present in the soil and rock on the SPA. The site investigation shall include the collection of soil and rock samples by a qualified geologist. If the site investigation determines that NOA is present on the SPA then the project applicant shall prepare an Asbestos Dust Control Plan for approval by SMAQMD as required in Section 93105 of the California Health and Safety Code, "Asbestos Airborne Toxic Control Measure for Construction, Grading, Quarrying, and Surface Mining Operations." The Asbestos Dust Control Plan shall specify measures, such as periodic watering to reduce airborne dust and ceasing construction during high winds, that shall be taken to ensure that no visible dust crosses the property line. Measures in the Asbestos Dust Control Plan may include but shall not be limited to dust control measures required by Mitigation Measure 3A.2-1a. The project applicant shall submit the plan to the Folsom Community Development Department for review and SMAQMD for review and approval before construction of the first project phase. SMAQMD approval of the plan must be received before any asbestos-containing rock (serpentinite) can be disturbed. Upon approval of the Asbestos Dust Control Plan by SMAQMD, the applicant shall ensure that construction contractors implement the terms of the plan throughout the construction period.
>
> **Implementation:** The project applicant(s) of all project phases.
>
> **Timing:** Before the approval of all grading plans by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

CD

Under the Centralized Development Alternative, the analysis of NOA impacts would be the same as under the Proposed Project Alternative except that existing receptors in the El Dorado Hills neighborhood east of the SPA would not likely be exposed to high levels of health risk because substantial grading, blasting, and other earth disturbance would not occur in the hills on the east side of the SPA, as indicated by the land use plan in Exhibit 2-15 (see Chapter 2, "Alternatives"). Nonetheless, as with the Proposed Project Alternative, NOA that becomes airborne during construction activities for later phases of development could adversely affect residential land uses and other receptors that have already been developed in earlier phases of development. Without appropriate controls, sensitive receptors near construction sites could be exposed to localized high levels of re-entrained fugitive PM_{10} dust, potentially including NOA. As a result, this **direct** impact would be considered **potentially significant**. **No indirect** impacts would occur. ***[Lesser for exposure of existing residents in El Dorado Hills to construction-generated emissions of NOA. Similar for all other TAC impacts.]***

Mitigation Measure: Implement Mitigation Measure 3A.2-5.

Off-Site Elements

Construction of some of the off-site elements would occur in "areas moderately likely to contain NOA" according to a report prepared by the California Geological Survey about NOA areas in eastern Sacramento County (Higgins and Clinkenbeard 2006), including the Oak Avenue interchange and the Rowberry Drive Overcrossing. The Prairie City road interchange, sewer force main, and off-site detention basin would not be located in "areas moderately likely to contain NOA." The proposed road extensions into El Dorado County would be located in "areas that probably do not contain asbestos," according to a report prepared by the California Geological Survey about NOA areas in western El Dorado County (Churchill, Higgins, and Hill 2000).

As with construction of the on-site elements, sensitive receptors near construction sites in "areas moderately likely to contain NOA" could be exposed to localized high levels of re-entrained fugitive PM_{10} dust, potentially including NOA, without appropriate controls. As a result, this **direct** impact would be considered **potentially significant**. **No indirect** impacts would occur.

Mitigation Measure: Implement Mitigation Measure 3A.2-5. (However, for construction of the two roadway extensions into El Dorado County that occurs in El Dorado County, approval of the grading plans must be received from EDCAQMD.)

Implementation of Mitigation Measure 3A.2-5 would reduce impacts associated with generation of fugitive dust that potentially contains NOA. If the site investigation determines that NOA is present on the SPA, then implementation of a dust control plan that is approved by the applicable air district (i.e., SMAQMD or EDCAQMD) would reduce impacts related to construction in serpentinite soils. Implementation of these measures would reduce the potentially significant impact associated with exposure to NOA during construction to a **less-than-significant** level.

IMPACT 3A.2-6 Possible Exposure of Sensitive Receptors to Odorous Emissions. *Temporary, short-term construction and long-term operation of the project could result in the frequent exposure of sensitive receptors to substantial objectionable odor emissions.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, existing land uses at the SPA would continue, including up to 44 rural residences permitted under the existing Sacramento County General Plan AG-80 designation and zoning. Residential land uses are not typically regarded as sources of objectionable odors. Occasional operation of off-road agricultural equipment could result in diesel exhaust with odorous emissions; however, such activities would be short-term and intermittent and would not involve a substantial number of equipment operating at one time. There would be no off-site water facilities constructed under this alternative. Because the SPA would continue with dryland farming activities under the No Project Alternative and no new sources of odor emissions would be encountered, **no direct** or **indirect** impacts would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

The exposure of sensitive receptors (e.g., existing and proposed residential units, schools, and parks) to odorous emissions from construction and operation of the project is discussed under separate headings below.

Short-Term Use of Construction Equipment for On-Site Land Uses and Off-Site Elements

Project construction activities associated with the development of on-site land uses could result in odorous emissions from diesel exhaust generated by construction equipment. During some periods of the 19-year buildout of the project intense levels of construction activity could potentially occur in close proximity to existing or future-planned sensitive receptors or construction activity could potentially occur near sensitive receptors for an extended period of time. In particular, a substantial number of people in the existing residential neighborhood that located just east of the SPA in El Dorado Hills could be exposed to odorous diesel exhaust emissions generated by on-site construction activity. The potential for this to occur would be particularly high under the No USACE Permit, Proposed Project, Resource Impact Minimization Alternative, Centralized Development, and Reduced Hillside Development Alternative because the level of grading in the hilly, eastern end of the SPA would involve a substantial number of construction equipment operating at heavy loads. Because this activity could result in objectionable odors that affect a substantial number of people, this would be considered a **direct, significant** impact.

Long-Term Operation of On-Site Land Uses

No common sources of nuisance odors, such as wastewater treatment facilities, waste-disposal facilities, or agricultural operations, are proposed as part of the project. While there would be approximately 3–4 wastewater pumping stations located on the SPA, these facilities would have controls that would prevent the release of objectionable odors. In addition, the detention basins that would be located throughout the site would not typically hold storm water long enough for odor-generating anaerobic activity to occur. With regular maintenance and proper design, residential land uses are typically not considered a major source of odors. However, truck deliveries to commercial uses and sewer lift stations could intermittently and temporarily emit diesel odors. Additionally, commercial uses could provide development of convenience uses that may include sources of odorous emissions (e.g., fast-food restaurants) that would be perceived as offensive to some individuals. The operation of such sources could expose a substantial number of proposed on-site receptors to objectionable odorous emissions. As a result, this **direct** impact would be considered **potentially significant**. **No indirect** impacts would occur. ***[Similar]***

Land Use Compatibility with Off-Site Corporation Yard

The City plans to develop a corporation yard south of White Rock Road near the southwestern corner of the SPA. The corporation yard would be used to stage, store, and maintain equipment used by the City, including diesel-powered trucks and heavy-duty equipment (e.g., mowers). The location of on-site receptors, in particular residences within the SPA that would be zoned for multi-family medium density development near the southwestern corner of the SPA could be exposed to odorous exhaust emissions generated by equipment at the corporation yard. Moreover, because the predominant wind direction in the area and from the south-southwest at approximately 10 mph (ARB 1994), these receptors would located downwind of the corporation yard. The types of equipment that would be operated at the corporation yard and the frequency and intensity of their operation have not yet been identified. Given that equipment at the corporation yard could potentially generate substantial levels of diesel exhaust, as well as the close proximity of nearby sensitive receptors, the potential for these on-site receptors to be frequently exposed high levels of odorous exhaust emissions from the corporation yard is a **direct** and **potentially significant** impact. **No indirect** impact would occur.

Land Use Compatibility with Off-Site Agricultural Land Uses

Land uses developed on the southern side of the SPA could be exposed to odors generated by neighboring agricultural land uses, which are used for livestock grazing. This could occur when some portions of the site are developed and occupied while others portions continue to be used for livestock grazing. Also, receptors developed along the southern portion of the SPA could be exposed to odors generated by agricultural activities that take place just south of White Rock Road. SMAQMD does not have a recommended screening distance for livestock grazing. SMAQMD recommends a screening distance of 1 mile for most odor-generating land uses, including feed lots and dairies (SMAQMD 2009a). Because the project could result in the development of receptors located in close proximity to land in the immediate vicinity that support livestock grazing, this would be a **direct** and **potentially significant** impact. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.2-1a and Mitigation Measure 3A.2-1f to Control Exposure of Sensitive Receptors to Construction-Related Odorous Emissions.

Mitigation Measure 3A.2-6: Implement Measures to Control Exposure of Sensitive Receptors to Operational Odorous Emissions.

The project applicant(s) for all project phases shall implement the following measures:

- The odor-producing potential of land uses shall be considered when the exact type of facility that would occupy areas zoned for commercial, industrial, or mixed-use land uses is determined. Facilities that have the potential to emit objectionable odors shall be located as far away as feasible from existing and proposed sensitive receptors.

- The multi-family residences planned across from the off-site corporation yard near the southwest corner of the SPA shall be set back as far as possible from the boundary of the corporation yard and/or relocated to another area. (This measure is also required by Mitigation Measure 3A.2-4b to limit exposure to TAC emissions.)

- Before the approval of building permits, odor control devices shall be identified to mitigate the exposure of receptors to objectionable odors if a potential odor-producing source is to occupy an area zoned for commercial, industrial, or mixed-use land uses. The identified odor control devices shall be installed before the issuance of certificates of occupancy for the potentially odor-producing use. The odor-producing potential of a source and control devices shall be determined in coordination with SMAQMD and based on the number of complaints associated with existing sources of the same nature.

- The deeds to all properties located within the SPA that are within one mile of an on- or off-site area zoned or used for agricultural use (including livestock grazing) shall be accompanied by a written disclosure from the transferor, in a form approved by the City of Folsom, advising any transferee of the potential adverse odor impacts from surrounding agricultural operations, which disclosure shall direct the transferee to contact the County of Sacramento concerning any such property within the County zoned for agricultural uses within one mile of the subject property being transferred.

- Truck loading docks and delivery areas shall be located as far away as feasible from existing and proposed sensitive receptors.

- Signs shall be posted at all loading docks and truck loading areas which indicate that diesel-powered delivery trucks must be shut off when not in use for longer than 5 minutes on the premises in order to reduce idling emissions. This measure is consistent with the ATCM to Limit Diesel-Fueled Commercial Motor Vehicle Idling, which was approved by California's Office of Administrative Law in January 2005. (This measure is also required by Mitigation Measure 3A.2-4b to limit TAC emissions.)

- Proposed commercial and industrial land uses that have the potential to host diesel trucks shall incorporate idle reduction strategies that reduce the main propulsion engine idling time through alternative technologies such as, IdleAire, electrification of truck parking, and alternative energy sources for TRUs, to allow diesel engines to be completely turned off. (This measure is also required by Mitigation Measure 3A.2-4b to limit TAC emissions.)

Implementation: The project applicant(s) of all project phases.

Timing: Before the approval of building permits by the City and throughout project construction, where applicable, for all project phases.

Enforcement: City of Folsom Community Development Department.

Off-Site Elements

Construction activities associated with the building of the off-site elements could result in odorous emissions from diesel exhaust generated by construction equipment. However, because of the temporary nature of these emissions and the highly diffusive properties of diesel exhaust, residents and other receptors on and off the SPA would not likely be affected by diesel exhaust odors associated with construction. Operation of the off-site elements would not be considered sources of odors. Motor vehicles using the improved freeway interchanges and overcrossing would not result in a noticeable increase in odorous emissions. Similar to the on-site storm water detention basins discussed above, the off-site detention basin that would be located just west of the SPA would not typically hold storm water long enough for odor-generating anaerobic activity to occur. Further, no odors would be associated with the wastewater force main that would connect to the existing sewer pump station because it would be enclosed. As a result, the **direct** impact associated with construction and operation of the off-site elements would be considered **less than significant**. **No indirect** impacts would occur.

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measure 3A.2-1a and Mitigation Measure 3A.2-1f would reduce the mass levels of odorous diesel exhaust during construction of the on-site elements. However, given that construction activity would occur on the SPA during the 19-year buildout of the project, generation of construction-generated diesel exhaust, particularly during periods of intense grading on the eastern, hilly side of the SPA, could expose a substantial number of people to odorous emissions and, therefore, this impact would not be reduced to a less-than-significant level. Therefore, the potential exposure of a substantial number of people to these objectionable odors is considered to be **significant and unavoidable**.

By requiring odor control devices on potential odor-producing sources and by requiring consideration of the odor-producing potential of on-site land uses and their proximity to receptors, implementation of Mitigation Measure 3A.2-6 would reduce the possible exposure of sensitive receptors to odorous emissions associated with operation of on-site land uses to a **less-than-significant** level.

Increasing the set back distance between on-site residents and the off-site, future planned corporation yard would not necessarily reduce the intensity or frequency of these residents' exposure to odorous exhaust emissions generated at the corporation yard to a less-than-significant level. Therefore, the potential exposure of on-site residents to odorous exhaust emissions from the corporation yard would be considered **significant and unavoidable**.

3A.2.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of mitigation measures contained in this section would reduce impacts associated with temporary, short-term construction-related emissions of criteria air pollutants and precursors; long-term operation-related (regional) emissions of criteria air pollutants and precursors; exposure to TACs; and exposure to odorous emissions from construction activity; and exposure to odorous emissions from operation of the proposed corporation yard, but not to a less-than-significant level, because emissions and exposure levels would (or could potentially) still exceed applicable thresholds and, therefore, residual significant impacts would occur. All other air quality impacts would be less than significant.

Additionally, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties and/or Caltrans; therefore, neither the City nor AECOM the project applicant(s) would have control over their timing or implementation. Therefore, the impacts related to those off-site facilities that are under the jurisdiction of El Dorado County, Sacramento County, or Caltrans, are considered potentially significant and unavoidable.

This page intentionally left blank.

This section was prepared by RMC Water and Environment.

3B.2 AIR QUALITY – WATER

3B.2.1 AFFECTED ENVIRONMENT

The "Water" Study Area lies within the Sacramento Valley Air Basin (SVAB). The climate of the SVAB is Mediterranean in character, with mild, rainy winter weather from November through March and warm to hot, dry weather from May through September. The topographic features giving shape to the Air Basin are the Coast Range to the west, the Sierra Nevada to the east, and the Cascade Range to the north. These mountain ranges channel winds through the Air Basin but also inhibit dispersion of pollutant emissions.

The Sacramento Valley is subject to eight unique wind patterns, which are described in more detail in Section 3A.2, "Air Quality – Land," and the Sacramento Metropolitan Air quality Management District's (SMAQMD) State CEQA Guidelines, 2004. The seasonal vertical and horizontal movement of air is an important atmospheric component involved in the dispersion and subsequent dilution of air pollutants. Without movement, air pollutants can collect and concentrate in a single area, increasing associated health hazards. For instance, in the winter months, the SVAB typically experiences calm atmospheric conditions that lead to the formation of fog. These calm conditions result in stagnation of basin air and increased air pollution. As a result, persistent inversions occur frequently in the SVAB, especially during late fall and early spring and act to restrict vertical dispersion of pollutants released near ground level.

CRITERIA AIR POLLUTANTS

From a regulatory standpoint, the air pollutants of most concern within the "Water" Study Area are ozone, nitrogen oxide (NO_X), carbon monoxide (CO), reactive organic gasses (ROG), and particulate matter (PM).

As described in more detail in Section 3A.2, "Air Quality – Land," the regulation of air pollutants is achieved through both national and state ambient air quality standards and emission limits for individual sources of air pollutants. As required by the Federal Clean Air Act (CAA), the EPA has identified criteria pollutants and established National Ambient Air Quality Standards (NAAQS or national standards) to protect public health and welfare. NAAQS have been established for ozone, CO, nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter equal to or less than 10 microns (PM_{10}), particulate matter less than 2.5 microns ($PM_{2.5}$), and lead (Pb). PM_{10} is also known as respirable particulate and $PM_{2.5}$ is also known as fine particulate. These pollutants are called "criteria" air pollutants because standards have been established for each of them to meet specific public health and welfare criteria.

The NAAQS are defined as the maximum acceptable concentration that may be reached, but not exceeded more than once per year. California has adopted more stringent ambient air quality standards for most of the criteria air pollutants with the California Ambient Air Quality Standards (CAAQS or state standards). Table 3.A2-1 provides a summary of the NAASQ and CAAQS standards.

TOXIC AIR CONTAMINANTS

Toxic Air Contaminants (TACs) are pollutants that are associated with acute, chronic, or carcinogenic effects but for which no ambient air quality standard has been established or, in the case of carcinogens, is appropriate. As provided in Section 3A.2, "Air Quality – Land," PM_{10} emissions from diesel fueled engines are some of the greatest TACs of concern.

ODORS AND NUISANCES

Though offensive odors from stationary sources rarely cause any physical harm, they still remain unpleasant and can lead to public distress generating citizen complaints to local governments. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors. The operation of water conveyance and treatment facilities are not known to be significant sources of objectionable odors.

NATURALLY OCCURRING ASBESTOS

Airborne asbestos presents an inhalation hazard because the fibers can enter the lungs and in some cases result in lung cancer, asbestosis and mesothelioma. Levels and types of asbestos minerals vary with the rock and with location: some serpentinite may not contain harmful asbestos while others may contain a high percentage. Asbestos fibers are potentially harmful when they are airborne, therefore, asbestos sources that are friable and pulverized are considered more of a health risk than solid, non-friable sources.

Naturally occurring asbestos has been identified in proximity to the Bear Mountain Fault Zone within eastern Sacramento County (Wagner et al. 1981; Churchill et al. 2000). Based on a review of maps produced by the California Geological Survey, the "Water" Study Area does not overlap with any geologic formations known to contain naturally occurring asbestos.

SENSITIVE RECEPTORS

Some receptors are considered more sensitive than others to air pollutants. The reasons for greater than average sensitivity include preexisting health problems, proximity to emissions source, or duration of exposure to air pollutants. Schools, hospitals and convalescent homes are considered to be relatively sensitive to poor air quality because children, elderly people and the infirm are more susceptible to respiratory distress and other air quality-related health problems than the general public. Residential areas are considered sensitive to poor air quality because people usually stay home for extended periods of time, with associated greater exposure to ambient air quality.

As provided in Chapter 2, "Alternatives," physical improvements are only proposed within Zone 4 of the "Water" Study Area; whereas no physical improvements are proposed within Zones 1, 2, and 3. In this context, emphasis in terms of the affected environment is placed on sensitive receptors located within Zone 4 of the "Water" Study Area. Sensitive receptors within Zone 4 are primarily located within urban areas along raw and/or treated water conveyance alignments and consist of agricultural residences, low- and-medium-density residences, and schools. No sensitive receptors are currently located within the immediate vicinity of the water treatment plants (WTP). However, medium and high-density residential uses are planned in close proximity, as close as 50 feet, to the western perimeter of the Folsom Boulevard WTP site. Likewise, the conveyance pumping facilities, if constructed at the North Douglas Tanks, would be operated in close proximity to planned residences within the Sunridge Specific Plan area and North Douglas communities, respectively.

Conveyance alignments under Off-site Water Facility Alternative 2, 2A, 3, 3A, 4, and 4A would cross through a poverty census block and is discussed further in Section 3B.6, "Environmental Justice – Water."

3B.2.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to air quality are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.2, "Air Quality – Land:"

- Federal Clean Air Act, administered by the U. S. Environmental Protection Agency (USEPA)
- Federal Hazardous Air Pollutant Program

No other Federal plans, policies, regulations, or laws are applicable to the Off-site Water Facility Alternatives under consideration.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following State plans, policies, regulations, and laws related to air quality are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.2, "Air Quality – Land:"

- California Clean Air Act (CCCA), administered by the California Air Resources Board (ARB)
- State Toxic Air Contaminant Programs

No other State plans, policies, regulations, or laws are applicable to the Off-site Water Facility Alternatives under consideration.

Regional and Local Plans, Policies, Regulations, and Laws

The following local and regional plans, policies, regulations, and laws related to air quality are relevant to the Off-site Water Facility Alternatives, and are described in detail in Section 3A.2, "Air Quality – Land:"

- Guide to Air Quality Assessment in Sacramento County, prepared by the Sacramento Metropolitan Air Quality Management District (SMAQMD)
- Sacramento Metropolitan Air Quality Management District Rule 201: General Permit Requirements; Rule 402: Odors; Rule 403: Fugitive Dust; and Rule 442: Architectural Coatings.
- Sacramento Regional 8-Hour Ozone Attainment and Reasonable Further Progress Plan
- Sacramento County General Plan
- City of Folsom General Plan

City of Rancho Cordova General Plan

The following policies contained in the Air Quality Element of the City of Rancho Cordova's General Plan would be applicable to Off-site Water Facilities:

- **Policy AQ.1.1** – Coordinate with responsible agencies and other jurisdictions to improve air quality within Rancho Cordova and the greater Sacramento region.
- **Policy AQ.1.2** – Evaluate projects for compliance with State and federal ambient air quality standards and the Sacramento Metropolitan Air Quality Management District's (SMAQMD) thresholds of significance. (Refer to Table AQ-3 in this Element for ambient air quality standards.)
- **Policy AQ.1.5** – Require odor impact analyses be conducted for evaluating new development requests that either could generate objectionable odors that may violate SMAQMD Rule 402 or any subsequent rules and regulations regarding objectionable odors near sensitive receptors or locate new sensitive receptors near existing sources of objectionable odors. Should objectionable odor impacts be identified, odor mitigation shall be required in the form of setbacks, facility improvements or other appropriate measures.

- **Policy AQ.2.4** – Maximize air quality benefits through selective use of landscaping vegetation that is low in emission of volatile organic compounds, and through re-vegetation of appropriate areas.

- **Policy AQ.2.5** – Utilize the guidelines in the California Air Resources Control Board Air Quality and Land Use Handbook: A Community Health Perspective when evaluating new development requests that either would generate toxic air contaminant emissions near sensitive receptors or locate new sensitive receptors near existing sources of air toxic emissions or order to minimize health hazards, and implement all feasible best available control technology, as required by SMAQMD.

- **Policy AQ.3.2** – Promote mass transit as an alternative to single-occupant motor vehicle travel.

- **Policy AQ.4.1** – Promote improved air quality benefits through energy conservation measures for new and existing development.

3B.2.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, air quality impacts would be considered significant if construction and operation of the Off-site Water Facilities would:

- conflict with or obstruct implementation of the applicable air quality plan;

- violate any air quality standard or contribute substantially to an existing or projected air quality violation;

- result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or state ambient air quality standard (including releasing emissions, which exceed quantitative thresholds for ozone precursors);

- expose sensitive receptors to substantial pollutant concentrations; or

- create objectionable odors affecting a substantial number of people;

Significance Criteria for Evaluating Toxic Air Contaminant Emissions

California Office of Environmental Health Hazard Assessment (OEHHA) defines a “no significant risk level” to have a potential cancer risk of no more than 10 in 1,000,000 when addressing risks under the Proposition 65 Regulation (OEHHA 1994). The California Air Toxics “Hot Spots” regulation (AB 2588) does not specify a significance threshold, but it requires public notification if the maximum incremental risk from a facility exceeds 10 in 1,000,000. No notification is required if the incremental risk is less than 10 in 1,000,000. This same risk level is also used by the SMAQMD for approval of facilities, with toxic Best Available Control Technology (BACT) being required for facilities with a cancer risk greater than 1 in 1,000,000. Based on these risk levels, the following thresholds are applied for the evaluation of TACs:

- probability of contracting cancer for the Maximally Exposed Individual (MEI) equals to 10 in one million or more, or

- ground-level concentrations of non-carcinogenic toxic air contaminants would result in a Hazard Index equal to or less than one for the MEI.

ANALYSIS METHODOLOGY

Off-site Water Facility-related air quality impacts generally fall into two categories, temporary, short-term impacts during construction, and long-term impacts during project operation. Construction activities would affect local particulate concentrations primarily because of fugitive dust emissions and fine particulates. The construction of the Off-site Water Facility Alternatives would also result in increased ROG and NO_X emissions from construction equipment. During the operations phase, Off-site Water Facility-related motor vehicle trips would also contribute to local and regional emissions. Modeling methodologies used in quantifying construction and operational emissions are described in the following discussion. Additional information and model results are presented in Appendix M-IV.

Construction emissions were estimated following the SMAQMD Guide to Air Quality Assessment in Sacramento County and using the Urban Emissions Model (URBEMIS) 2007 version 9.2.4. URBEMIS 2007 was used to quantify off-road equipment construction and vehicle trip emissions associated with pumping stations and the WTP. SMAQMD's roadway construction model was used to estimate emissions from construction of the Off-site Water Facility Alternative conveyance components. Construction fugitive dust emissions (PM_{10}) were calculated for disturbed soil. Consistent with the URBEMIS user's guide, it was assumed that 25% of the total acres disturbed for each construction phase would represent the maximum daily acres disturbed. Construction emissions associated with the Off-site Water Facility Alternatives were estimated under the assumption that up to three construction crews would be working simultaneously. A summary of the construction information used and URBEMIS outputs is included in Appendix M-IV.

It was assumed that the conveyance components under the Off-site Water Facility Alternatives would be constructed concurrently in 2011 to create a possible worst-case scenario to be used for evaluation purposes. Construction of the WTP was added in 2012. As provided in Chapter 2, "Alternatives," the City assumes that, on average, these scenarios could result in up to three construction crews being active at any one time. Based on the parameters set in Chapter 2, "Alternatives," the City estimates that the Off-site Water Facilities would generate up to 50 haul truck trips per day and 66 worker roundtrips per day. These trips would be dispersed on the roadway network to each of the facility construction sites. Trucks traveling to and from the construction sites would include dump trucks to transport excavated material, flatbed semi trucks, and trailers to transport pipes, concrete ready-mix trucks to transport controlled fill and concrete, and other miscellaneous trucks to support construction activities.

The calculated estimates were then compared to the 85-pounds-per-day construction threshold for NO_X, 65 pounds per day operational threshold for NO_X or ROG, 150 pounds per day threshold for PM_{10}, and 550 pounds per day for CO. As mentioned earlier, as the "Water" Study Area is either attainment or unclassified with respect to CO, SO_2, NO_2, sulfates, lead and H2S, and as the Off-site Water Facility Alternatives would not result in substantial emissions of these pollutants, these pollutants are not evaluated further.

In evaluating potential impacts to sensitive receptors within the "Water" Study Area, the City has also considered approved, future projects that are currently not constructed, but proposed in close-proximity to one or more of the Off-site Water Facility Alternatives. This approach allows for the evaluation of planned land uses that may not be captured in existing environmental conditions.

ISSUES NOT DISCUSSED FURTHER IN THIS EIR/EIS

Implementation of the applicable air quality plan—The Off-site Water Facility Alternatives are the result of a projected water supply demand for the Folsom SPA and, for this reason, the "Water" sections of the EIR/EIS do not discuss the consistency of the Folsom Specific Plan with local air quality plans and policies. Rather, "Water" sections of Chapter 3 address potential off-site changes in land use as a result of facilities proposed in Chapter 2, "Alternatives." Further discussion of the Folsom Specific Plan's consistency with applicable land use plans is provided in Section 3A.2, "Air Quality – Land." Based on those actions described in Chapter 2, "Alternatives,"

the Off-site Water Facility Alternatives do not in themselves propose any substantial change in land use that could otherwise conflict with or obstruct implementation of the applicable air quality plan. In this context, **no direct** or **indirect impact** would occur.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.2-1 Generation of Construction Emissions of NO_X and PM_{10}. *Construction of the Off-site Water Facility Alternatives would produce construction-generated emissions of NO_X, an ozone precursor, and fugitive PM_{10} dust would exceed SMAQMD-recommended thresholds and would substantially contribute to emissions concentrations that exceed the NAAQS and CAAQS. Thus, project-generated, construction-related emissions of criteria air pollutants and precursors could violate or contribute substantially to an existing or projected air quality violation and/or expose sensitive receptors to substantial pollutant concentrations.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

Construction activities associated with the Off-site Water Facilities would occur in two distinct phases: Phase I involves site preparation and earthmoving activities, while Phase II involves installing equipment, concrete, and structural improvements. Site preparation includes activities such as general land clearing and vegetation removal. Earthmoving activities include cut and fill operations, trenching, soil compaction, and grading. General construction includes adding improvements such as roadway surfaces, well and pump structures, and storage and treatment facilities. The emissions generated from these common construction activities include:

- dust (including PM_{10} and $PM_{2.5}$) primarily from fugitive sources such as soil disturbance and vehicle travel over unpaved surfaces;

- combustion emissions of criteria air pollutants (including ROG, NO_X, PM_{10}) primarily from operation of heavy equipment construction machinery (primarily diesel operated), portable auxiliary equipment and construction worker automobile trips (primarily gasoline operated); and,

- evaporative emissions (ROG) from asphalt paving and architectural coating applications.

Construction-related fugitive dust emissions would vary from day to day, depending on the level and type of activity, silt content of the soil, and the weather. In the absence of mitigation, construction activities may result in generating significant quantities of dust, and as a result, local visibility and PM_{10} concentrations may be adversely affected. In addition, the fugitive dust generated by construction would include not only PM_{10}, but also larger particles, which would fall out of the atmosphere within several hundred feet of the construction area and could result in nuisance-type impacts.

Construction activities would also result in the emission of pollutants of concern (ROG, NO_X, and PM_{10} and $PM_{2.5}$) from construction equipment exhaust and construction worker automobile trips. Emission levels for construction activities would vary depending on the number and type of equipment, duration of use, operating schedules, and the number of construction workers. Criteria pollutant emissions of ROG and NO_X from these emission sources would incrementally add to the regional atmospheric loading of ozone precursors during project construction.

For the worst-case day construction scenario, it was assumed that construction of multiple components of the Off-site Water Facilities (e.g., conveyance improvements) could occur simultaneously. The emission estimates for each of the above alternatives is primarily differentiated based on the length of conveyance pipeline construction with all other factors being equal (i.e., worst-case day site preparation for Off-site Water Facility Alternative 1 would be equivalent to the worst-case day site preparation for Off-site Water Facility Alternative 4). Estimated construction-related fugitive dust emissions, as well as exhaust emissions from construction equipment and worker trips are shown in Table 3B.2-1. As shown in Table 3B.2-1, unmitigated emissions of NO_X would exceed the 85 pounds per day significance threshold specified by the SMAQMD in 2011 or 2012 and, therefore, the associated **direct** impact would be **potentially significant**. **No indirect** impact would result. ***[Similar]***

Mitigation Measure 3B.2-1a: Develop and Implement a Construction NO_X Reduction Plan.

Consistent with SMAQMD requirements, the City of Folsom shall provide a plan for demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average 20% NO_X reduction. Prior to construction, the City's contractor shall submit to the SMAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used an aggregate of 40 or more hours during any portion of the construction of the Off-site Water Facilities. The inventory shall include the horsepower rating, engine production year, and projected hours of use or fuel throughput for each piece of equipment. The inventory shall be updated and submitted monthly throughout the duration of the project, except that an inventory shall not be required for any 30-day period in which no construction activity occurs. At least 48 hours prior to the use of subject heavy-duty off-road equipment, the Off-site Water Facilities representative shall provide SMAQMD with the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman.

Table 3B.2-1 Off-site Water Facilities Construction and Operational Emissions				
Off-site Water Facility Alternative	ROG (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)
Off-site **Water Facilities Construction**				
No USACE Permit and Proposed Off-site Water Facility Alternative – 2011	25.06	**107.18**	77.38	21.32
No USACE Permit and Proposed Off-site Water Facility Alternative – 2012	234.3	**110.81**	27.55	11.29
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 1 – 2011	23.46	**103.38**	76.98	21.02
Off-site Water Facility Alternative 1 – 2012	232.73	**107.01**	27.55	10.99
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 1A – 2011	23.26	**102.88**	76.98	21.02
Off-site Water Facility Alternative 1A – 2012	232.53	**106.51**	27.55	10.99
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 2 – 2011	14.4	64.6	24.3	8.1
Off-site Water Facility Alternative 2 – 2012	14.4	64.6	24.3	8.1
Significant Emissions	No	No	No	No
Off-site Water Facility Alternative 2A – 2011	20.3	79	25.7	9.4
Off-site Water Facility Alternative 2A – 2012	20.3	79	25.7	9.4
Significant Emissions	No	No	No	No
Off-site Water Facility Alternative 2B – 2011	11	56.1	23.5	7.3
Off-site Water Facility Alternative 2B– 2012	11	56.1	23.5	7.3
Significant Emissions	No	No	No	No
Off-site Water Facility Alternative 3 – 2011	25.86	**109.28**	77.58	21.52
Off-site Water Facility Alternative 3 – 2012	235.13	**112.91**	28.15	11.49
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 3A – 2011	24.36	**105.68**	77.18	21.22
Off-site Water Facility Alternative 3A – 2012	233.63	**109.31**	27.75	11.19
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 4 – 2011	26.16	**109.98**	77.68	21.62
Off-site Water Facility Alternative 4 – 2012	235.43	**113.61**	25.05	11.59
Significant Emissions	No	**Yes**	No	No
Off-site Water Facility Alternative 4A – 2011	25.56	**108.38**	77.48	21.52
Off-site Water Facility Alternative 4A – 2012	234.83	**112.01**	28.05	11.49
Significant Emissions	No	**Yes**	No	No
Thresholds for Construction Emission	*None*	*85(1)*	*150(2)*	*None*

Note: Calculations were completed using URBEMIS 2007 and SMAQMD, 2007 and are included in Appendix M-VI. The emissions listed above are for a worse-case day, where it was assumed that construction of the conveyance components of the Off-site Water Facilities would overlap with construction of the WTP.

Implementation: City of Folsom Utilities Department

Timing: Prior to construction of the Off-site Water Facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-1b: Conduct Visible Emissions Testing and if Non-Compliance, Repair Equipment Immediately.

Controlling visible emissions from off-road diesel powered equipment. The City shall ensure that emissions from all off-road diesel powered equipment used on the project site do not exceed 40% opacity for more than three minutes in any one hour. Any equipment found to exceed 40% opacity (or Ringelmann 2.0) shall be repaired immediately, and the City and SMAQMD shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least monthly, and a quarterly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-1c: Implement Fugitive Dust Control Measures and a Particulate Matter Monitoring Program during Construction.

The City shall implement fugitive dust control measures and a particulate matter monitoring program during construction. The City shall ensure implementation of dust control measures and a particulate matter monitoring program during each phase of construction. Dust control measures may include, but are not limited to, the following:

- minimize on-site construction vehicle speeds on unpaved surfaces;
- post speed limits;

- suspend grading operations when wind is sufficient to generate visible dust clouds;
- pave, water, use gravel, cover, or spray a dust-control agent on all haul roads;
- Prohibit no open burning of vegetation during project construction;
- Chip or deliver vegetative material to waste-to-energy facilities;
- reestablish vegetation as soon as possible after construction and maintain vegetation consistent with the parameters established in Mitigation Measure 3B.2.1a;
- clean earthmoving construction equipment with water once daily and clean all haul trucks leaving the site; and
- water and keep moist all exposed earth surfaces, graded areas, storage piles, and haul roads at all times.

Implementation: City of Folsom Utilities Department

Timing: During construction of all Off-site Water Facilities.

Enforcement:
1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.
2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.
3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

2, 2A, and 2B

The types and sources of construction emissions associated with Off-site Water Facility Alternatives 2, 2A, and 2B would be similar to those identified for the above alternatives; however, no WTP would be constructed under these alternatives. As shown in Table 3B.2-1, construction-related emissions for Off-site Water Facility Alternatives 2, 2A, and 2B is substantially reduced as a result of the reduced length of the conveyance alignment(s) and absence of a new WTP. Based on these differences, Off-site Water Facility Alternatives 2, 2A, and 2B would not generate significant emissions of NO_X or PM_{10} in 2011 or 2012 and, therefore, construction emissions would not exceed SMAQMD thresholds and, therefore, **direct** and **indirect** air quality impacts would be **less than significant**. ***[Lesser]***

Following the application of the prescribed mitigation measures, the City would still be unable to achieve a 20% reduction in NO_X in 2011 or 2012 for the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A. For this reason, temporary and short-term construction-related impacts to local and regional ozone concentrations would remain **significant and unavoidable** under the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A because no feasible mitigation is available to fully reduce the impacts to a less-than-significant level.

IMPACT 3B.2-2 Generation of Long-Term Operational (Regional) Emissions of ROG, and NO_X. *Operational area- and mobile-source emissions from implementation of the Off-site Water Facility Alternatives would not exceed the SMAQMD-recommended threshold of 65 lb/day for ROG and NO_X.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

Operational emissions for the Off-site Water Facility Alternatives would be generated primarily from on-road vehicular traffic and, to a lesser extent, areas source. Regardless of which siting option is chosen for the WTP, the maximum amount of Off-site Water Facilities-generated traffic on any single day would be up to 40 trips (35 trips related to operation/maintenance of the WTP, 2 trips for chemical/supply deliveries, 2 trips from visitors, and 1 trip related to solids removal). For the pump station facilities, a minor number of employee trips would be required periodically for routine inspection and maintenance. These trips would likely be made by employees at the WTP and, therefore, are assumed to be included within the total 40 daily vehicle trips. As provided in Table 3B.2-2, operational emissions associated with the Off-site Water Facility Alternatives would not exceed the significance thresholds for NO_X or ROG.

Further, since the Off-site Water Facilities lie in an attainment area for CO (concentrations are within the state and Federal ambient standards) and the "Water" Study Area contains relatively low background levels of CO compared to other parts of the Central Valley, it is expected that the indirect impact on CO concentrations would be minimal. For these reasons, implementation of the Off-site Water Facilities would generate only minor quantities of criteria air pollutants over its long-term operation and, therefore, the **direct** and **indirect** impacts would be **less than significant**. ***[Similar]***

Table 3B.2-2
Off-site Water Facilities Construction and Operational Emissions

Off-site Water Facility Alternative	ROG (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)
Off-site Water Facilities Operations (WTP) – 2012	4.51	4.25	6.13	1.19
Significant Emissions	No	No	No	No
Thresholds for Operational Emissions	*65*	*65*	*150*	*None*

Note: Calculations were completed using URBEMIS 2007 and are included in Appendix M-VI.
Source: URBEMIS 2007

The water treatment processes at the proposed WTP facility would involve chemical coagulation, flocculation, filtration, disinfection, and the option for ozonation. Chemicals used in these processes would be stored on-site and would include aluminum sulfate, polymers, filter aid polymer, sodium hydroxide, sodium hypochlorite, powdered activated carbon, citric acid, and sodium bisulfite. These chemicals would be stored in tanks, drums, etc. within a designated chemical building, consistent with state and Federal standards. The chemical tank vents would be subject to SMAQMD permitting. Such permits may require scrubbing of air vented from these tanks to remove acid and caustic vapors. If determined necessary, the ozonation process would be subject to SMAQMD review and permitting.

The operation of emergency generators would burn diesel fuel and would generate combustion emissions during operation. However, back-up generators would not be operated under normal conditions and, more limited, up to one hour per week for testing. Because the emergency generators are stationary point sources, they would be subject to review and permitting by SMAQMD. The increased emissions from diesel or gasoline back-up generators are expected to result in **less-than-significant direct** and **indirect** impacts to local and regional air quality. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2, 2A, and 2B

With the integration into the Vineyard SWTP, either directly or through the Douglas Tanks, no new major sources of operational emissions would be expected. Existing personal at the Vineyard SWTP would likely be sufficient to cover most operational duties and, therefore, only a few new employee vehicle trips, less than 10 total daily trips, would be anticipated over the long-term. Based on this circumstance, long-term emissions of criteria air pollutants would be less than those estimated for the Proposed Off-site Water Facility Alternative and this **direct** and **indirect** impact would be **less than significant**. ***[Lesser]***

Mitigation Measures: No mitigation measures are required.

IMPACT 3B.2-3 Exposure of Sensitive Receptors to Short- and Long-Term Emissions of Toxic Air Contaminants. *Implementation of the Off-site Water Facility Alternatives could expose sensitive receptors to short- and long-term emissions of TACs from on-site stationary sources.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Construction of the Off-site Water Facility Alternatives would not emit any hazardous air pollutants (HAPs) in any significant quantity other than from large, heavy-duty, diesel-powered equipment exhaust. The OEHHA currently describes the health risk from diesel exhaust entirely in terms of the amount of particulate, or PM_{10}, that is emitted. Currently, the health risk associated with diesel exhaust PM_{10} or diesel particular matter (DPM) only has a carcinogenic and chronic effect; no short-term acute effect is recognized. Off-site Water Facilities construction would be limited in duration, lasting less than three years total, and therefore, no long term, chronic impact would be expected. Further, over the 3-year construction schedule, constructed-generated diesel PM would not be emitted at any single location along the selected pipeline route for an extended period of time. In recognition of these circumstances combined with dust control mitigation prescribed in Mitigation Measure 3B.4-1c, construction of the Off-site Water Facilities would not expose sensitive receptors to substantial pollutant concentration and the **direct** and **indirect** impact is considered **less than significant**. ***[Similar]***

Over the longer term, operational emissions associated with the proposed booster pump station(s) would be generated from the use of pumps and emergency generators. This equipment would operated via electricity under normal operating conditions year around and, under certain situations, under diesel power during emergencies. The operation of diesel engines to pump raw/treated water supplies would contribute to increased air emissions in the areas where these facilities are proposed. As indicated in Section 3B.10, "Land Use and Agricultural Resources – Water," residential uses are planned in areas in close proximity to the White Rock WTP and the Folsom Boulevard WTPs. Similarly, based on the ultimate connection point to the Freeport Project, the booster pump under any of the Off-site Water Facility alternatives could be located in close proximity to existing agricultural residences.

The typical significance threshold for health risk exposure to TACs, including diesel emissions, is 10 cases of cancer per 1,000,000 population over a 70-year exposure period. The diesel PM cancer risk is the probability of an individual developing cancer as a result of exposure to diesel PM. The new booster pump and WTP would be developed and operated in areas within the Central Valley where residential uses are planned or rural residences currently exist. The precise locations of these facilities has not yet been determined, but the anticipated general locations are shown in Exhibits 2-25, 2-26, 2-28, 2-29, 2-30, and 2-31.

The Off-site Water Facilities are expected to cause minimal diesel emissions with fewer than 5 diesel truck trips per day and testing of the emergency generator limited to one-hour intervals on a weekly basis. For these reasons, the WTP and pumping facilities are not expected to substantially increase toxic risks to adjacent receptors.

Further, a recently completed health risk assessment of comparable sources, but at a higher rated treated/pumping capacity, assessed the potential impact of diesel sources operating within 200 feet of nearby residences on a year-round basis (Environmental Science Associates 2007). The study concluded that the impact of the diesel PM emissions would be less than significant because they resulted in a cancer risk of less than 10 cases in a million population. This finding is largely attributed to the highly dispersive nature of diesel PM once emitted. However, without a precise facility location for the booster pump and WTP, the City is unable to confirm that these facilities would be located outside a 200-foot-wide buffer and whether DPM emissions would pose conditions that exceed the previously studied impacts. For this reason, the implementation of Mitigation Measures 3B.2-2a and 2b would be required to reduce the **direct** and **indirect** impacts to a **less-than-significant** level. ***[Similar]***

Mitigation Measure 3B.2-3a: Cite Pump Siting Buffers Away from Sensitive Receptors.

New pumping stations including back-up diesel generators shall be located more than 200 feet away from sensitive receptors. Electrically-powered pumps shall be used to power new pumps, to the extent practicable.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water pumping facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

Mitigation Measure 3B.2-3b: Conduct Project-Level DPM Screening and Implement Measures to Reduce Annual DPM to Acceptable Concentrations.

Screening-level DPM assessments shall be conducted for diesel-powered pump operations proposed within 200 feet of residences or other sensitive receptors. These analyses should include exact distances between the receptors and operations, and include the actual DPM emissions for the engines proposed. If the analysis shows an annual average DPM concentration from project operations at residences within 200 feet of the DPM source to be greater than 0.024 $\mu g/m^3$, the engine location shall be moved to a location where the annual average DPM concentration from project emissions at the residences is less than 0.024 $\mu g/m^3$. The acceptable concentration of 0.024 $\mu g/m^3$ was determined using the current OEHHA cancer potency factor and methodology for diesel exhaust (OEHHA 2003). If diesel exhaust concentrations at the affected receptor would be below 0.024 $\mu g/m^3$, then the cancer health risk would be less than 9.9 cancers in a million population.

Implementation: City of Folsom Utilities Department

Timing: Prior to the approval of grading plans and building permits for all off-site water pumping facilities.

Enforcement:

1. For improvements that would be located within the City of Folsom: City of Folsom Community Development Department and SMAQMD.

2. For improvements that would be located within unincorporated Sacramento County: Sacramento County Planning and Community Development Department and SMAQMD.

3. For improvements that would be located within the City of Rancho Cordova: City of Rancho Cordova Planning Department and SMAQMD.

With implementation of Mitigation Measures 3B.2-3a and 3B.2-3b, air quality impacts to sensitive receptors would be reduce to a **less-than-significant** level because diesel powered pumps and back-up generators would be placed a sufficient distance from sensitive receptors.

IMPACT 3B.2-4 Creation of Objectionable Odors. *The Off-site Water Facilities could create objectionable odors affecting a substantial number of people.*

NCP, PA, 1, 1A, 3, 3A, 4, and 4A

As outlined under SMAQMD's Qualitative Long-Term Emission Thresholds, the types of land use development that pose potential odor problems include agriculture, wastewater treatment plants, food processing and rendering facilities, chemical plants, composting facilities, landfills, transfer stations, and dairies. The implementation of the Off-site Water Facilities does not involve the operation of any of these uses nor would it involve the placement of sensitive receptors in close proximity to one of the above-identified odor-generating uses.

During construction of the Off-site Water Facilities, the various diesel-powered vehicles and equipment in use could create minor odors. These odors are not likely to be noticeable beyond the immediate construction area and, in addition, would be temporary and short-lived in nature as construction progresses. Based on these considerations, **direct** and **indirect** impacts from construction-related odors would be **less than significant**. ***[Similar]***

Operation of the WTP, conveyance, and pumping facilities would involve use of vehicles and/or maintenance equipment when necessary; however, these activities are not expected to generate objectionable odors. Further, pumping operations would be within fully enclosed structures and due to their nature would not result in odor generation. Treatment chemicals used in the water treatment processes would be stored in an enclosed building and would not generate odors off-site. Although water treatment residuals would be generated during the treatment process, these residuals would be mostly inert, containing the particles removed from the raw water (primarily silt and clay) and aluminum hydroxide produced during coagulation. The residuals would be dried on-site in solids drying beds and hauled off-site for disposal. This process would not create objectionable odors that could otherwise affect a substantial number of people and the **direct** and **indirect** impacts are considered **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2, 2A, and 2B

The discussion provided for the above alternatives would generally apply to Off-site Water Facility Alternatives 2, 2A, and 2B. The main differentiating characteristic between the previously discussed alternatives and Off-site Water Facility Alternatives 2, 2A, and 2B is that these alternatives would not include a new WTP. In this context, **no direct** or **indirect** impacts in relation to odors would be expected under Off-site Water Facility Alternatives 2, 2A, and 2B. ***[Lesser]***

Mitigation Measures: No mitigation measures are required.

3B.2.4 RESIDUAL SIGNIFICANT IMPACTS

Construction of the Off-site Water Facility Alternatives could result in temporary, but significant and unavoidable impacts to air quality through the generation of criteria ozone precursors (e.g., NO_X). Even after the application of mitigation, residual construction-related direct and indirect NO_X impacts would be significant for the No USACE Permit Alternative, Proposed Off-site Water Facility Alternative, and Off-site Water Facility Alternatives 1, 1A, 3, 3A, 4, and 4A. Due to the substantially smaller footprint of the Off-site Water Facilities under Alternatives 2, 2A, and 2B, residual construction-related ozone impacts would be less than significant without mitigation. Only minor quantities of criteria air pollutants would be generated during the operation of all the Off-site Water Facility Alternatives and, therefore, the residual impact would be less than significant with no mitigation required.

3A.3 BIOLOGICAL RESOURCES – LAND

3A.3.1 AFFECTED ENVIRONMENT

The SPA is located in the eastern portion of Sacramento County, and there are two local roadway connections into western El Dorado County. The SPA is characterized by rolling foothill topography. Elevations within the SPA range from approximately 240 feet to 800 feet above mean sea level. Historic land uses in the area include cattle ranching, farming, and mining activities, primarily gold mining. The SPA is predominantly characterized by annual grassland on gently sloping topography. Also present in the SPA are blue oak woodland, seasonal wetland, freshwater seeps, swales, riparian woodland and scrub, and intermittent and perennial drainages (Alder Creek).

The following documents were used as information sources during preparation of this biological resources section. These documents are provided in Appendix D1 through Appendix D25 of this EIR/EIS.

PLANT COMMUNITIES

The SPA is characterized primarily by annual grassland, which covers the eastern two-thirds of the site as well as the southwest corner, and by blue oak woodland, which is prevalent in the northwestern portion of the site. Some areas of the SPA, mostly in the western half, have a subsurface hardpan layer that supports a mosaic of vernal pools and swales, and seasonal wetlands interspersed within a matrix of annual grassland vegetation. Plant communities found in the SPA are described in the following paragraphs. The location and extent of these communities is shown in Exhibit 3A.3-1.

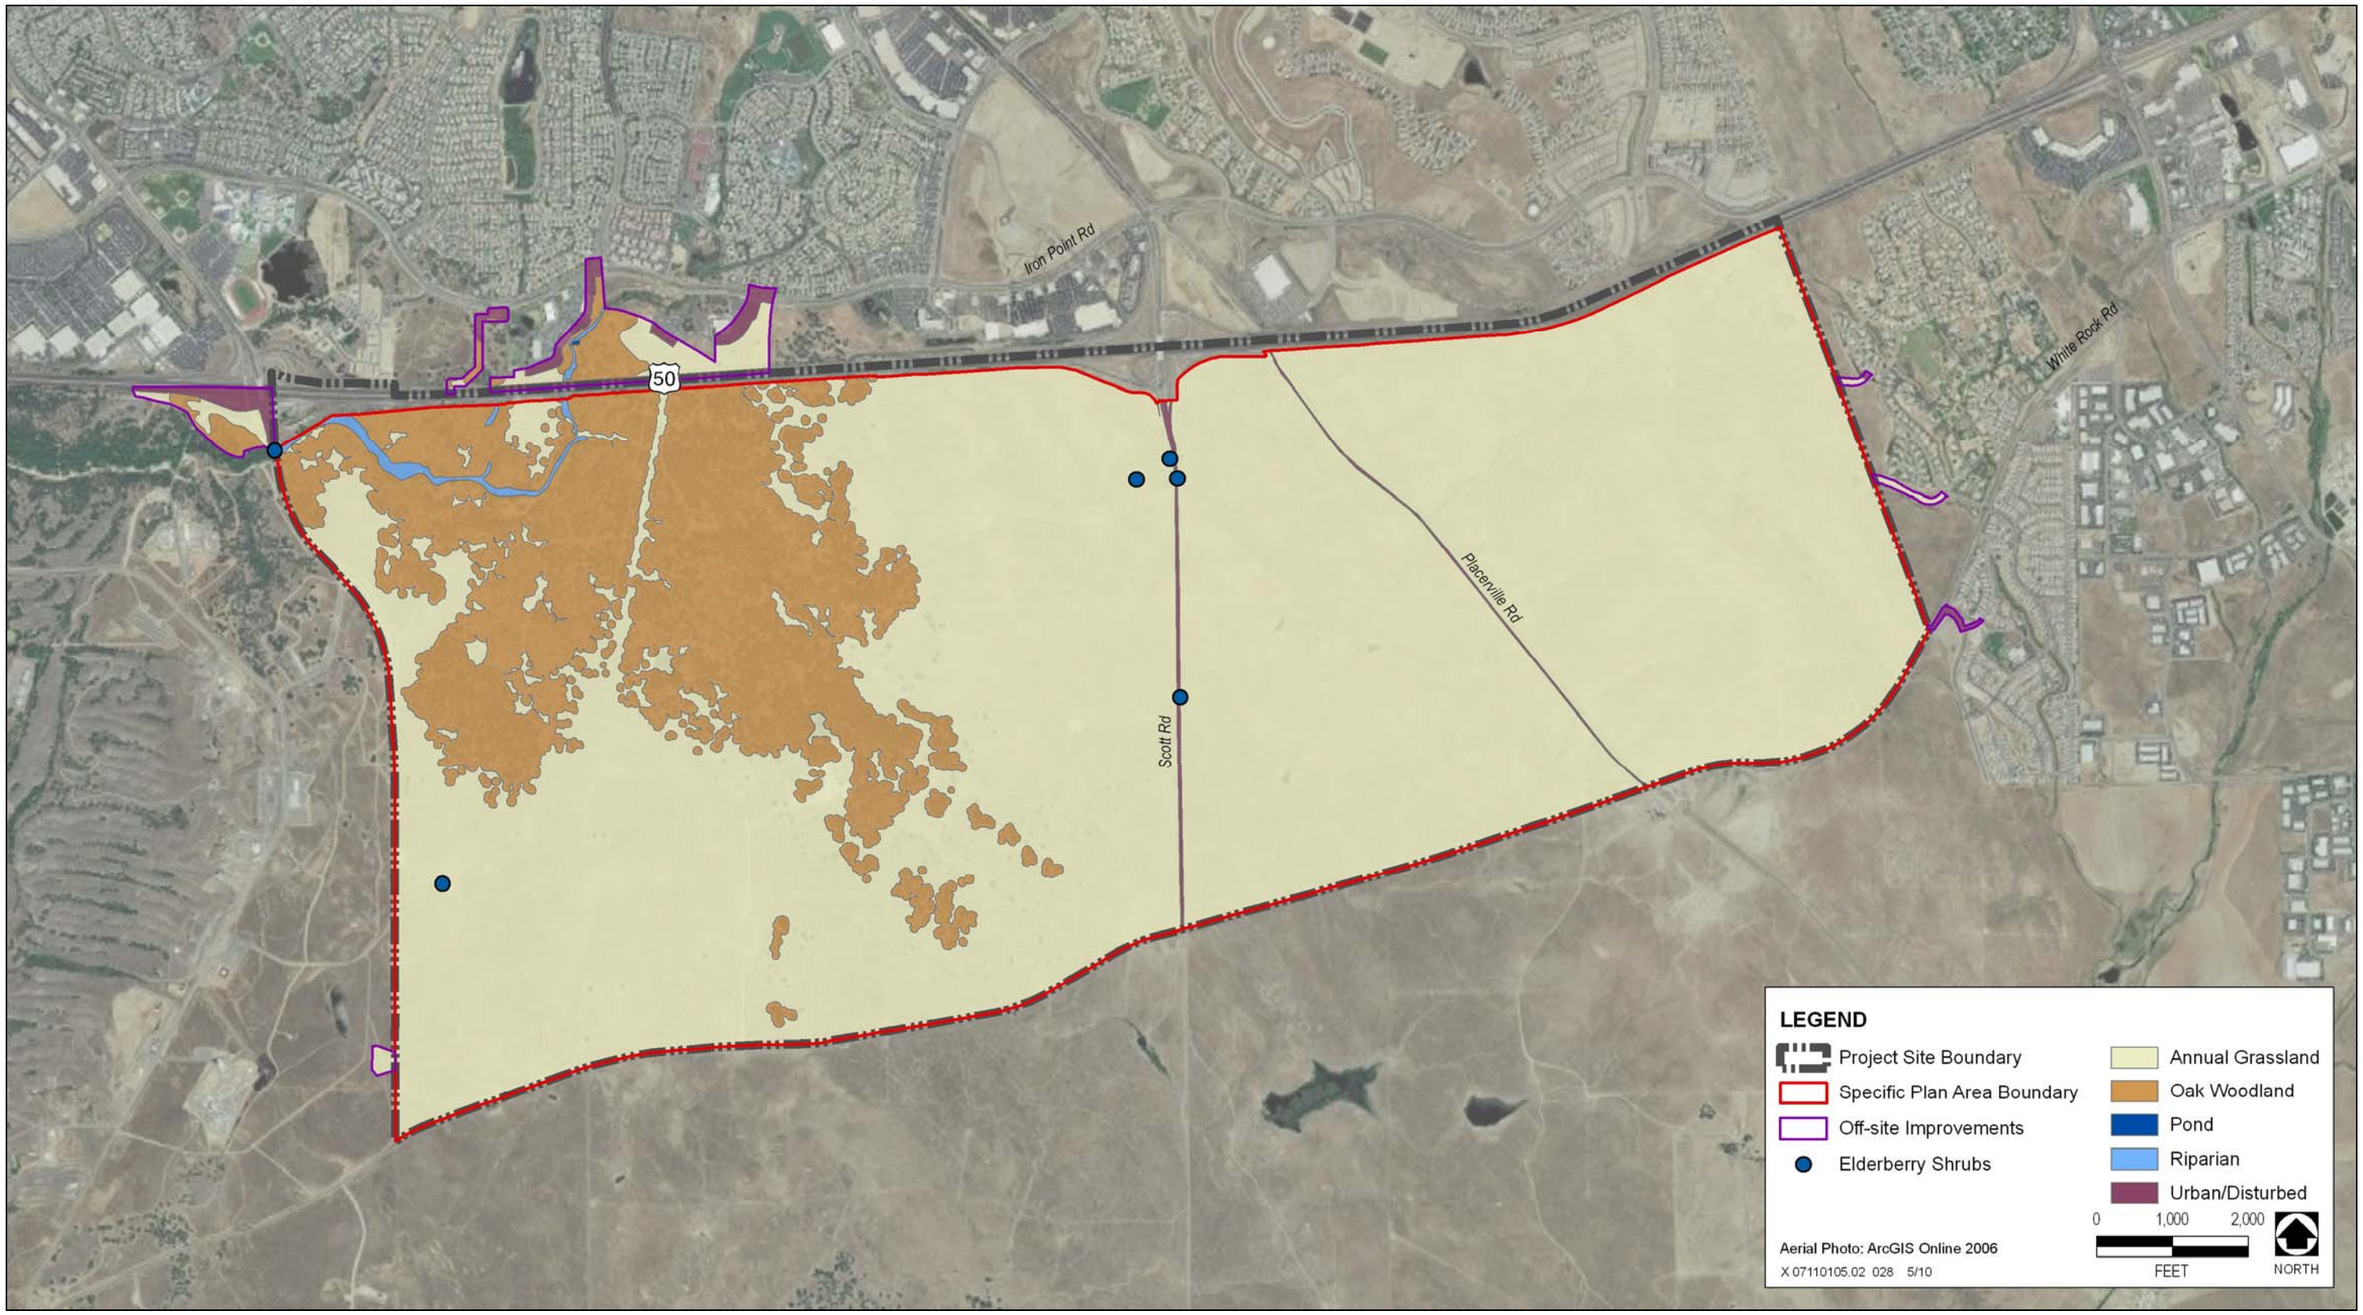
Upland Communities

Annual Grassland

This community type covers over two-thirds (approximately 2,594 acres) of the SPA and is characterized by a dense cover of nonnative annual grasses interspersed with numerous species of nonnative annual forbs and native wildflowers. Characteristic grass species include ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), Italian ryegrass (*Lolium multiflorum*), and medusahead (*Taeniatherum caput-medusae*). Common nonnative forbs include cut-leaved geranium (*Geranium dissectum*), Klamath weed (*Hypericum perforatum*), prickly sow thistle (*Sonchus asper*), yellow starthistle (*Centaurea solstitialis*), and Italian thistle (*Carduus pycnocephalus*). Native wildflowers observed in the annual grassland within the SPA include wild hyacinth (*Triteleia hyacinthina*), Ithuriel's spear (*Triteleia laxa*), purple owl's-clover (*Castilleja exserta*), valley tassels (*Castilleja attenuata*), harvest brodiaea (*Brodiaea elegans*), and Fremont's tidy-tips (*Layia fremontii*). The off-site project elements contain another 43.3 acres of annual grassland.

Valley Needlegrass Grassland

Small inclusions of valley needlegrass grassland may be present in the SPA, interspersed within the annual grassland community described above. Valley needlegrass grassland is characterized by purple needlegrass (*Nassella pulchra*), a native perennial bunchgrass. Associate species are primarily native and nonnative annual



Source: ECORP Consulting 2008, RRM Design Group 2008

Existing Plant Communities **Exhibit 3A.3-1**

forbs including blowwives (*Achyrachaena mollis*), purple clarkia (*Clarkia purpurea* ssp. *quadrivulnera*), California poppy (*Eschscholzia californica*), hayfield tarweed (*Hemizonia congesta* ssp. *luzulifolia*), valley tassels (*Castilleja attenuata*), and species characteristic of the annual grassland community. This community type has not been mapped and quantified in the SPA or in the proposed off-site sewer force main alignment, but was observed on the Folsom Heights property during the wetland delineation conducted on the property and may be present elsewhere. ECORP Consulting (ECORP) biologists surveyed the remaining off-site elements for valley needlegrass grassland in fall and winter 2008 and did not find this community present.

Blue Oak Woodland

As defined by the California Oak Woodlands Conservation Act of 2001, oak woodlands are stands of oak trees with greater than 10% canopy cover. Approximately 642 acres of blue oak woodland containing 249.8 acres of tree canopy (39% canopy cover) is present in the SPA, primarily in the northwestern third of the site, and approximately 38 additional acres are present within the location of the off-site interchange elements at Prairie City Road, Oak Avenue, and Rowberry Drive Overcrossing. Blue oak woodland is a broadleaved deciduous woodland plant community with a grassy understory. The tree layer is dominated by blue oak (*Quercus douglasii*) while the understory is dominated by dogtail grass (*Cynosurus echinatus*), soft chess, and other herbaceous species similar to those found in the annual grassland community.

Wetland Communities and Other Waters

Freshwater Seeps

A seep is a wetland plant community characterized by dense cover of perennial herb species usually dominated by rushes, sedges, and grasses. Freshwater seep communities occur on sites with permanently moist or wet soils resulting from daylighting groundwater. Characteristic plant species found in seeps in the SPA include Baltic rush (*Juncus balticus*), iris-leaved rush (*Juncus xiphioides*), common spikerush (*Eleocharis macrostachya*), white hedge-nettle (*Stachys albens*), rice cutgrass (*Leersia oryzoides*), and dense-flowered willowherb (*Epilobium densiflorum*). There are approximately 10.80 acres of seeps present, primarily in the eastern portion of the SPA interspersed within the annual grassland matrix. All acreage of the seep habitat in the SPA has been determined to fall under USACE jurisdiction. There are no seeps present in the off-site elements of the project.

Vernal Pools

Vernal pools are natural ephemeral wetlands that form in shallow depressions underlain by an impervious or restrictive soil layer near the surface that restricts the percolation of water. Vernal pools are supported by direct precipitation and surface runoff. They pond during the wet season and typically become dry by late spring. Vernal pools are typically characterized by a high percentage of native plant species, many of which may be endemic (restricted) to vernal pools. Many of the vernal pools located on the northeastern portion of the Folsom 560 site appear to have been created by human activities, probably from mining test holes.

Characteristic vernal pool species in the SPA include annual hairgrass (*Deschampsia danthonioides*), Fremont's goldfields (*Lasthenia fremontii*), common spikerush, coyote thistle, stipitate popcorn flower (*Plagiobothrys stipitatus*), white-headed navarretia (*Navarretia leucocephala*), and horned downingia (*Downingia bicornuta*). There are approximately 4.67 acres of vernal pools in the SPA, consisting of 4.64 acres subject to USACE jurisdiction and 0.03 acre that has been determined to be non-jurisdictional by USACE, but is considered a water of the state subject to regulation under the Porter Cologne Act. They are concentrated primarily within the blue oak woodland in the western third of the site, but there are a few scattered elsewhere. There is an estimated 0.59 acre of vernal pool habitat in the off-site elements of the project that is likely subject to USACE jurisdiction, but a formal wetland delineation has not been completed and verified by USACE for the off-site elements.

Seasonal Wetlands

Seasonal wetlands are present in the SPA in both topographic depressions and swales. Hydrologically, seasonal wetlands are similar to vernal pools because they remain inundated or saturated for extended periods during winter and spring. Seasonal wetland swales do not pond water appreciably, but are inundated by flowing water during rainfall and support a saturated upper soil horizon for an extended period of time during the growing season. Characteristic plant species in seasonal wetlands and seasonal wetland swales in the SPA include coyote thistle (*Eryngium vaseyi*), toad rush (*Juncus bufonius*), hyssop loosestrife (*Lythrum hyssopifolium*), foothill meadowfoam (*Limnanthes striata*), dallis grass (*Paspalum dilatatum*), rabbitsfoot grass (*Polypogon monspeliensis*), common spikerush, and Italian ryegrass (*Lolium multiflorum*). There are approximately 4.66 acres of depressional seasonal wetlands and 25.48 acres of seasonal wetland swales scattered throughout the SPA. It has been determined by USACE that 4.657 acres of the depressional seasonal wetlands and all of the 25.48 acres of seasonal wetland swales are Federally jurisdictional. There is 0.004 acre of depressional seasonal wetland that has been disclaimed by USACE, but that is considered a water of the state subject to regulation under the Porter Cologne Act. Off-site project elements support an additional 0.25 acre of depressional seasonal wetlands and 0.55 acre of seasonal wetland swales. Jurisdiction over the off-site seasonal wetlands has not been determined.

Drainage Channels

Drainage channels occur throughout the SPA. These include intermittent to nearly permanent stream channels. Alder Creek is an intermittent to perennial stream that transects the SPA from the south-central portion at White Rock Road to the northwest corner at Prairie City Road, flowing generally in a northwesterly direction. Portions of Alder Creek support surface flow all year because flows are supplemented by runoff from adjacent developed areas, but upstream segments of the creek within the SPA are intermittent. Intermittent stream channels support flowing water through winter and spring, but dry up by summer. Many of the other intermittent channels present in the SPA are tributary to Alder Creek. There are 17.19 acres of perennial stream channel and 11.72 acres of intermittent drainage channel scattered throughout the SPA and all of this acreage has been determined to be Federally jurisdictional by USACE. The proposed off-site elements of the project (i.e., Prairie City Road and Oak Avenue Interchanges and improvements to Prairie City and White Rock Roads) contain an additional 0.04 acre of intermittent drainage channels and 2.47 acres of perennial stream channel and 0.04 acre of intermittent drainage channel. Jurisdiction over the off-site drainage channels has not yet been determined, but it is likely that they are all subject to Federal jurisdiction.

Hydrophytic plant species (i.e., plants adapted to grow in water), such as cattail (*Typha* sp.), dense sedge (*Carex densa*), slender rush (*Juncus tenuis*), American tule (*Scirpus americanus*), and dallisgrass, occur within the Ordinary High Water Mark (OHWM) of the drainage channels on-site. Vegetation cover becomes denser in flatter portions of the drainages where the channels are wide and relatively shallow. Riparian vegetation occurs within the OHWM and along the banks of Alder Creek. Much of the riparian habitat is characterized by dense monocultures of Himalayan blackberry (*Rubus discolor*) and would best be described as blackberry scrub. There are scattered patches of riparian woodland that include typical riparian species such as black willow (*Salix goodingii*), arroyo willow (*Salix lasiolepis*), purpletop vervain (*Verbena bonariensis*), and tall flatsedge (*Cyperus eragrostis*). Approximately 11 acres of riparian habitat are present in the SPA. The Oak Avenue interchange supports an additional 2.4 acres of riparian woodland and blackberry scrub along the banks of a perennial tributary to Alder Creek and the Prairie City Road interchange supports another 0.9 acre of riparian woodland along Alder Creek. These are the only off-site elements that support riparian habitat. Approximately 0.11 acre of riparian habitat present qualifies as a wetland under the CWA. This habitat consists of a stand of willow shrubs located within an intermittent drainage channel at the northern boundary of the Folsom Heights site and is best described as willow scrub.

Artificial ditches are also present throughout the SPA. Ditches are excavated channels surrounded by levees. Many of these features follow topographic contours and may represent relics from historic hydraulic gold mining activities, while others may have been excavated to transport irrigation water. Some ditches in the SPA support

hydrophytic vegetation such as rabbitsfoot grass, curly dock (*Rumex crispus*), and common yellow monkeyflower (*Mimulus guttatus*). Approximately 2.36 acres of ditches, 1.96 of which have been determined to be Federally jurisdictional, are present throughout the SPA and 0.01 acre of ditch is present in the off-site Oak Avenue interchange element.

Freshwater Marsh

Freshwater marsh is an emergent wetland plant community occurring in areas that are permanently or nearly permanently inundated. In the SPA, this community type was found in association with a few of the drainage channels described above. Dominant plant species identified in the freshwater marsh include cattail and common tule (*Scirpus acutus*). Approximately 0.21 acre of freshwater marsh are present in the SPA and approximately 1.94 acres present in the off-site elements of the project. All of the freshwater acreage present in the SPA has been determined to be Federally jurisdictional.

Ponds

Nine ponds, comprising approximately 7.72 acres, are present throughout the SPA. These include ponds created through impoundment of stream channels and excavated basins. Approximately 6.87 acres of pond were determined to be Federally jurisdictional while 0.85 were determined by USACE to be non-jurisdictional, although these waters are still considered waters of the state. The on-site ponds are typically inundated year round and some support sparse cover of emergent vegetation along the shallow margins, and black willow and Fremont cottonwood (*Populus fremontii*) on their banks. In contrast to seasonal wetlands, seeps, and marshes, ponds are characterized predominantly by open water or bare ground and are not vegetated wetlands. No ponds are present in off-site elements of the project.

WILDLIFE

The SPA supports an abundant and diverse fauna. This large and mostly contiguous block of open space, dominated by natural plant communities, is particularly important to native wildlife species associated with grassland, oak woodland, and riparian habitats. The SPA provides habitat for both resident breeding and migratory raptors that prefer large tracks of open grassland for foraging. The oak woodland and riparian communities are attractive to many of the common wildlife species in Sacramento County, as well as a few special-status wildlife species, which are discussed separately below under “Sensitive Biological Resources.”

A few of the many common wildlife species expected to occur in the SPA include red-tailed hawk (*Buteo jamaicensis*), western kingbird (*Tyrannus verticalis*), oak titmouse (*Baeolophus inornatus*), savannah sparrow (*Passerculus sandwichensis*), western meadowlark (*Sturnella neglecta*), gopher snake (*Pituophis catenifer*), western fence lizard (*Sceloporus occidentalis*), coyote (*Canis latrans*), and black-tailed hare (*Lepus californicus*).

SENSITIVE BIOLOGICAL RESOURCES

Sensitive biological resources addressed in this section include those that are afforded consideration or protection under the California Environmental Quality Act (CEQA), California Fish and Game Code, California Endangered Species Act (CESA), Federal Endangered Species Act (ESA), Clean Water Act (CWA), and the Porter-Cologne Water Quality Control Act (Porter-Cologne Act).

Special-Status Species

Special-status species include plants and animals in the following categories:

- species officially listed by the State of California or the Federal government as endangered, threatened, or rare;

- candidates for state or Federal listing as endangered, threatened, or rare;
- taxa (i.e., taxonomic categories or groups) that meet the criteria for listing, even if not currently included on any list, as described in California Code of Regulations (CCR) Section 15380 of the State CEQA Guidelines;
- species identified by the California Department of Fish and Game (DFG) as species of special concern;
- species listed as Fully Protected under the California Fish and Game Code;
- species afforded protection under local or regional planning documents; and
- taxa considered by the California Native Plant Society (CNPS) to be "rare, threatened, or endangered in California." The CNPS includes five lists for categorizing plant species of concern, which are summarized as follows:

    - List 1A—Plants presumed to be extinct in California;
    - List 1B—Plants that are rare, threatened, or endangered in California and elsewhere;
    - List 2—Plants that are rare, threatened, or endangered in California but more common elsewhere;
    - List 3—Plants about which more information is needed (a review list); and
    - List 4—Plants of limited distribution (a watch list).

Plant inventories prepared by CNPS provide one source of substantial evidence that is used by lead agencies to determine what plants meet the definition of endangered, rare, or threatened species, as described in CCR Section 15380 of the State CEQA Guidelines. For purposes of this EIR/EIS, the relevant inventories are List 1B (plants that are rare, threatened, or endangered in California and elsewhere) and List 2 (plants that are rare, threatened, or endangered in California but more common elsewhere). All plants listed in the CNPS Inventory (CNPS 2008) are considered "special plants" by DFG. The term "special plants" is a broad term used by DFG to refer to all of the plant taxa inventoried by the California Natural Diversity Database (CNDDB), regardless of their legal or protection status. Notation as a List 1B or 2 plant species does not automatically qualify the species as endangered, rare, or threatened within the definition of State CEQA Guidelines CCR Section 15380. Rather, CNPS designations are considered along with other available information about the status, threats, and population condition of plant species to determine whether a species warrants evaluation as an endangered, rare, or threatened species under CEQA. Plants on Lists 1A, 1B, and 2 of the CNPS Inventory may qualify for listing, and DFG recommends—and local governments may require—that these species be addressed during CEQA review of proposed projects. However, a plant species need not be in the CNPS Inventory to be considered a rare, threatened, or endangered species under CEQA.

The term California species of special concern is applied by DFG to animals not listed under the Federal ESA or the CESA, but that are nonetheless declining at a rate that could result in listing, or historically occurred in low numbers and known threats to their persistence currently exist. DFG's fully protected status was California's first attempt to identify and protect animals that were rare or facing extinction. Most species listed as fully protected were eventually listed as threatened or endangered under CESA, however some species remain listed as fully protected but do not have simultaneous listing under CESA. Fully protected species may not be taken or possessed at any time and no take permits can be issued for these species except for scientific research purposes or for relocation to protect livestock.

Tables 3A.3-1 and 3A.3-2 below provide lists of special-status species known to occur or with potential to occur in the SPA. These lists were developed through review of biological studies previously conducted in the SPA and in the vicinity, as listed previously in this section. The CNDDB (CNDDB 2008) and CNPS Inventory of Rare and Endangered Plants (CNPS 2008) were also reviewed for specific information on previously documented occurrences of special-status species in the Folsom and eight surrounding U.S. Geological Survey (USGS) quadrangles. Exhibit 3A.3-2 shows all of the CNDDB occurrences within a five-mile radius of the SPA.

Table 3A.3-1
Special-Status Plant Species Known to Occur or with Potential to Occur in the SPA

Species	Status [1]			Habitat and Blooming Period	Potential for Occurrence [2]
	USFWS	DFG	CNPS Other		
Big scale balsamroot *Balsamorhiza macrolepis* var. *macrolepis*	–	–	1B.2	Chaparral, cismontane woodland, and valley and foothill grassland, often on serpentinite soils; 295 to 4,600 foot elevation; blooms March–June.	Could occur in grassland and oak woodland in the SPA. However, the probability of occurrence is low because, although not restricted to serpentinite soils, this species is usually (65 to 74% of the time) found on serpentinite soils, which are not present in the SPA.
Brandegee's clarkia *Clarkia biloba* ssp. *brandegeae*	–	–	1B.2	Chaparral and cismontane woodland, often in roadcuts; 240 to 3,000 foot elevation; blooms May–July.	Could occur in the blue oak woodland community.
Hispid bird's beak *Cordylanthus mollis* ssp. *hispidus*	–	–	1B.1	Alkaline meadows, seeps, and playas; below 500 foot elevation; blooms June–September.	Unlikely to occur; no suitable habitat is present.
Dwarf downingia *Downingia pusilla*	–	–	2.2	Vernal pools or other seasonal wetlands in annual grasslands; below 1,500 foot elevation; blooms March–May.	Could occur in seasonal wetlands, vernal pools, and swales in the SPA.
Tuolumne button-celery *Eryngium pinnatisectum*	–	–	1B.2	Vernal pools or other seasonal wetlands in cismontane woodland and lower montane coniferous forest; 200 to 3,000 foot elevation; blooms June–August.	Could occur in on-site vernal pools and seasonal wetlands in the SPA.
Bogg's Lake hedge hyssop *Gratiola heterosepala*	–	E	1B.2	Lake margin marshes and swamps, vernal pools, and other seasonal wetlands, primarily in clay soils; 30 to 8,000 foot elevation; blooms April–August.	Likely to occur in vernal pools or other seasonal wetlands in the SPA. Known occurrences immediately adjacent to the SPA on west side of Prairie City Road very near the proposed off-site detention basin location.
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	–	–	1B.2	Vernal pools and swales in areas of low cover of competing vegetation; most often on gopher turnings along margins of pools (Witham 2006:38); 95 to 750 foot elevation; blooms March–May.	Could occur in vernal pools and swales in the SPA.
Red Bluff dwarf rush *Juncus leiospermus* var. *leiospermus*	–	–	1B.1	Vernal pools, meadows and seeps, and other seasonally wet habitats; 115 to 3,500 foot elevation; blooms March–May.	Unlikely to occur; the nearest record of this species is from Roseville and is probably erroneous (CNDDB 2008). Sacramento and El Dorado Counties are outside the known range of this species.

Table 3A.3-1
Special-Status Plant Species Known to Occur or with Potential to Occur in the SPA

Species	Status [1]			Habitat and Blooming Period	Potential for Occurrence [2]
	USFWS	DFG	CNPS Other		
Greene's legenere *Legenere limosa*	–	–	1B.1	Relatively deep and wet vernal pools (Witham 2006:39); below 3,000 foot elevation. Blooms April–June.	Could occur in vernal pools in the SPA.
Pincushion navarretia *Navarretia meyersii* ssp. *Meyersii*	–	–	1B.1	Vernal pools; 65 to 750 foot elevation; blooms in May.	Could occur in vernal pools in the SPA.
Slender Orcutt grass *Orcuttia tenuis*	T	E	1B.1	Vernal pools; 100 to 5,800 foot elevation; blooms May–October.	Could occur in vernal pools in the SPA.
Sacramento Orcutt grass *Orcuttia viscida*	E	E	1B.1	Vernal pools; 95 to 325 foot elevation; blooms April–July.	Could occur in vernal pools in the SPA.
Sanford's arrowhead *Sagittaria sanfordii*	–	–	1B.2	Shallow freshwater marshes and swamps; below 2,200 foot elevation; blooms May–October.	Likely to occur in ponds, drainages, or other wetlands in the SPA that support freshwater marsh vegetation. Documented CNDDB occurrence boundary overlaps SPA boundary along Grant Line Road.

Notes: USFWS = U.S. Fish and Wildlife Service; DFG = California Department of Fish and Game; CNPS = California Native Plant Society; CNDDB = California Natural Diversity Database; ESA = Federal Endangered Species Act; CESA = California Endangered Species Act

[1] Legal Status Definitions

U.S. Fish and Wildlife Service:
E Endangered (legally protected)
T Threatened (legally protected)

California Department of Fish and Game:
E Endangered (legally protected)

California Native Plant Society Categories:
1B Plant species considered rare or endangered in California and elsewhere (protected under CEQA, but not legally protected under ESA or CESA)
2 Plant species considered rare or endangered in California but more common elsewhere (protected under CEQA, but not legally protected under ESA or CESA)

CNPS Extensions:
.1 Seriously endangered in California (>80% of occurrences are threatened and/or high degree and immediacy of threat)
.2 Fairly endangered in California (20 to 80% of occurrences are threatened)

[2] Potential for Occurrence Definitions

Unlikely to occur: Species is unlikely to be present in the SPA due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

Could occur: Suitable habitat is available at the SPA; however, there are little to no other indicators that the species might be present.

Likely to occur: Habitat conditions, known occurrences in the project vicinity, or other factors indicate a relatively high likelihood that the species would occur at the SPA.

Sources: CNDDB 2008; CNPS 2008; data compiled by AECOM/AECOM (now AECOM) in 2008

Table 3A.3-2
Special-Status Wildlife with Potential to Occur in the SPA and Off-Site Elements

Species	Listing Status[1]		Habitat	Potential for Occurrence[2]
	Federal	State		
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	T/PD	–	Elderberry shrubs below 3,000 feet in elevation, typically in riparian habitats.	Could occur; elderberry shrubs are present in the SPA. Documented CNDDB occurrences within 2 miles of the SPA.
Vernal pool fairy shrimp *Branchinecta lynchi*	T	–	Vernal pools and other seasonal wetlands in valley and foothill grasslands.	Likely to occur in vernal pools on site. Documented CNDDB occurrences in immediate project vicinity (i.e., within 1 mile).
Vernal pool tadpole shrimp *Lepidurus packardi*	E	–	Vernal pools and other seasonal wetlands in valley and foothill grasslands.	Likely to occur in vernal pools on site. Documented CNDDB locations abutting western SPA boundary.
Conservancy fairy shrimp *Branchinecta conservatio*	E	–	Vernal pools and other seasonal wetlands in valley and foothill grasslands.	Could occur; suitable habitat is present in vernal pools on site.
Amphibians and Reptiles				
Western pond turtle *Actinemys marmorata*	–	SC	Forage in ponds, marshes, slow-moving streams, sloughs, and irrigation/drainage ditches; nest in nearby uplands with low, sparse vegetation.	Known to occur. Documented in an on-site pond by ECORP (The Hodgson Company 2007a) and less than 1 mile downstream of the SPA (GenCorp 2007c), within Alder Creek.
California red-legged frog *Rana aurora draytonii*	T	SC	Foothill streams with dense shrubby or emergent riparian vegetation, minimum 11–20 weeks of water for larval development, and upland refugia for aestivation.	Unlikely to occur. Presumed extirpated from the valley floor. Nearest reproducing population is 30 miles east near Pollock Pines.
Western spadefoot *Spea hammondii*	–	SC	Vernal pools and other seasonal ponds with a minimum 3-week inundation period in valley and foothill grasslands.	Could occur; suitable habitat present on site. Nearest documented occurrences are more than 5 miles away in Roseville, Phoenix Park, and Mather Park areas.
Giant garter snake *Thamnophis gigas*	T	T	Slow-moving streams, sloughs, ponds, marshes, inundated floodplains, rice fields, and irrigation/drainage ditches on the Central Valley floor with mud bottoms, earthen banks, emergent vegetation, abundant small aquatic prey and absence or low numbers of large predatory fish. Also require upland refugia not subject to flooding during the snake's inactive season.	Unlikely to occur; suitable habitat absent on SPA and associated off-site areas evaluated in this EIR/EIS.

Table 3A.3-2
Special-Status Wildlife with Potential to Occur in the SPA and Off-Site Elements

Species	Listing Status[1]		Habitat	Potential for Occurrence[2]
	Federal	State		
California tiger salamander *Ambystoma californiense*	T	C	Vernal pools and seasonal wetlands with a minimum 10-week inundation period and surrounding uplands, primarily grasslands, with burrows and other belowground refugia (e.g., rock or soil crevices).	Unlikely to occur. Nearest known occurrence is 15 miles to the south and extensive surveys in the project vicinity have not detected the species north of the Cosumnes River (USFWS 2004).
Birds				
Tricolored blackbird *Agelaius tricolor* (nesting colony)	–	SC	Forages in agricultural lands and grasslands; nests in marshes, riparian scrub, and other areas that support cattails or dense thickets of shrubs or herbs.	Could nest on site; suitable marsh and blackberry bramble habitats for nesting and grassland foraging habitat is present and species has been documented at 4 locations within 5 miles of the SPA.
Grasshopper sparrow *Ammodramus savannarum* (nesting)	–	SC	Nests and forages in dense grasslands; favors a mix of native grasses, forbs, and scattered shrubs.	Could nest in grassland communities in the SPA, especially within valley needlegrass grassland if present.
Golden eagle *Aquila chrysaetos*	–	FP	Forages in large open areas of foothill shrub and grassland habitats and occasionally croplands. Does not nest in the Central Valley.	Unlikely to nest on site; migrating and nonbreeding individuals could forage in the grasslands on site.
Burrowing owl *Athene cunicularia* (burrow sites)	–	SC	Nests and forages in grasslands, agricultural lands, open shrublands, and open woodlands with existing ground squirrel burrows or friable soils.	Known to occur in grasslands on site; winter foraging documented by Foothill Associates (MJM Properties 2006b). Likely to nest on site; suitable nesting and foraging habitat present.
Swainson's hawk *Buteo swainsoni* (nesting)	–	T	Forages in grasslands and agricultural lands; nests in riparian and isolated trees.	Likely to nest on site; suitable nesting and foraging habitat present.
Northern harrier *Circus cyaneus* (nesting)	–	SC	Nests and forages in grasslands, agricultural fields, and marshes.	Known to occur; winter foraging documented by Foothill Associates (MJM Properties 2006b). Likely to nest on site; suitable nesting and foraging habitat present.
White-tailed kite *Elanus leucurus* (nesting)	–	FP	Forages in grasslands and agricultural fields; nests in riparian zones, oak woodlands, and isolated trees.	Likely to nest on site; suitable grassland foraging habitat and suitable nest trees present in blue oak woodland and riparian areas. Several CNDDB-documented nest sites in project vicinity.
Southern bald eagle *Haliaeetus leucocephalus leucocephalus* (nesting and wintering)	D	E	Forage primarily in large inland fish-bearing waters with adjacent large trees or snags; occasionally in uplands with abundant rabbits, other small mammals, or carrion. Often roosts communally in winter.	Unlikely to occur: foraging habitat is marginal, and the species does not nest on the Central Valley floor. However, could be a rare and irregular foraging visitor.

Table 3A.3-2
Special-Status Wildlife with Potential to Occur in the SPA and Off-Site Elements

Species	Listing Status[1]		Habitat	Potential for Occurrence[2]
	Federal	State		
Loggerhead shrike *Lanius ludovicianus* (nesting)	–	SC	Forages and nests in grasslands, shrublands, and open woodlands.	Likely to nest on site; suitable foraging and nesting habitat present on the site. Foraging documented adjacent to SPA along Alder Creek by Matus 1981.
California black rail *Laterallis jamaicensis coturniculus* (year round)	–	T	Freshwater marshes, wet meadows, and shallow margins of saltwater marshes. Requires consistent water depth of 1 inch and dense vegetation to nest.	Unlikely to occur; nearest known occurrence was documented in Clover Valley, Placer County in 2006 and was a southern range extension. Specific microhabitat conditions for nesting not present on site.
Modesto song sparrow (*Melospiza melodia*) (year round)		SC	Nests and forages primarily in emergent marsh, riparian scrub, and early successional riparian forest habitats in the north-central portion of the Central Valley; infrequently in mature riparian forest and sparsely vegetated ditches and levees.	Could occur; potentially suitable nesting habitat present along Alder Creek and a few other on-site wetlands. However, the SPA is on the fringes of the geographic range, and there is scientific uncertainty as to whether song sparrows in eastern Sacramento County above 200 feet in elevation are of the Modesto form (Grinnell and Miller 1944, Shuford and Gardali 2008:400-402).
Purple martin *Progne subis* (nesting)	–	SC	Nests in tree cavities, bridges, utility poles, lava tubes, and buildings. Forages in foothill and low montane oak and riparian woodlands; less frequently in coniferous forests and open or developed habitats.	Unlikely to nest on site. Only known breeding colonies in the region are in the City of Sacramento where they nest in hollow-box bridges (Shuford and Gardali 2008:332-334) and in a highway overpass in the City of Rocklin.
Bank swallow *Riparia riparia* (nesting)	–	T	Nests in colonies in unvegetated vertical banks with fine-textured, sandy soils, typically next to streams, rivers, or lakes, occasionally in gravel quarries or other eroding bluffs. Forages in a variety of habitats near nests.	Unlikely to occur due to lack of suitable habitat. On-site creek banks are sloping and vegetated.
Mammals				
Pallid bat *Anthrozous pallidus*	–	SC	Deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats. Roosts in rock crevices, oak hollows, bridges, or buildings.	Could occur on site; potentially suitable roosting habitat in oak trees and mine shaft.
Ringtail *Bassariscus astutus*	–	FP	Large acreages of oak woodland, riparian and other dense brush habitats with rock recesses or hollow snags for cover.	Unlikely to occur on site due to marginal habitat quality, open understory, proximity to urban Folsom, and lack of connectivity to other riparian forest or oak woodland habitats.

Table 3A.3-2
Special-Status Wildlife with Potential to Occur in the SPA and Off-Site Elements

Species	Listing Status[1]		Habitat	Potential for Occurrence[2]
	Federal	State		
Townsend's big-eared bat *Corynorhinus townsendii*	–	SC	Typically roosts in caves; however, colonies of <100 individuals occasionally nest in buildings or bridges. Forages in all habitats except alpine and subalpine, though most commonly in mesic forests and woodlands.	Could occur on site; potentially suitable roosting habitat in oak trees and mine shaft.
Western mastiff bat *Eumops perotis californicus*	–	SC	Typically roosts in high cliffs and rock crevices in small colonies of <100 individuals. Forages in a variety of grassland, shrub and wooded habitats including riparian and urban areas, though most commonly in open, arid lands.	Could forage on site; site unlikely to provide suitable roosting habitat.
Western red bat *Lasiurus blossevilli*	–	SC	Roosts primarily in tree foliage, especially in cottonwood, sycamore, and other riparian trees or orchards (Pierson et al. 2004). Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging, including grasslands, shrublands, and open woodlands.	Could forage on site; unlikely roost on site due to lack of riparian woodland.
American badger *Taxidea taxus*	–	SC	Drier open shrub, forest, and herbaceous habitats with friable soils.	Could occur; suitable habitat present. Documented adjacent to the SPA by Matus 1981. Nearest CNNDB occurrence (1990) is 10 miles to the southwest in Rancho Cordova.

Note: CNDDB = California Natural Diversity Database; USFWS = U.S. Fish and Wildlife Service

E Endangered (legally protected)	SC Species of special concern (no formal protection other than CEQA consideration)
T Threatened (legally protected)	T Threatened (legally protected)

[2] Potential for Occurrence Definitions

Unlikely to occur: Species is unlikely to be present in the SPA due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

Could occur: Suitable habitat is available at the SPA; however, there are little to no other indicators that the species might be present.

Likely to occur: Habitat conditions, behavior of the species, known occurrences in the project vicinity, or other factors indicate a relatively high likelihood that the species would occur at the SPA.

Known to occur: The species, or evidence of its presence, was observed at the SPA during reconnaissance surveys, or was reported by others.

CNNDB Occurrences within a Five-Mile Radius of the SPA **Exhibit 3A.3-2**

Special-Status Plants

The CNDDB and CNPS contain records for 22 special-status plant species in the nine quadrangles containing and surrounding the SPA. Based on the habitat and elevation range of the SPA, it was determined that 13 of these species have at least some potential to be present in the SPA (Table 3A.3-1). Two of these 13 species, Bogg's Lake hedge hyssop and Sanford's arrowhead, have a high likelihood of occurring in the SPA because they have been documented immediately adjacent to the site in similar habitats. Bogg's Lake hedge hyssop, a species that is state listed as endangered, has been documented in very close proximity to the proposed off-site detention basin location outside the southwest corner of the SPA. Potentially suitable habitat for Bogg's Lake hedge hyssop is present on the proposed detention basin site and there is high potential for this species to be present. Nine species listed in the CNDDB or CNPS Inventory as occurring in the vicinity of the SPA are not included in Table 3A.3-1 or addressed further in this EIR/EIS because they are restricted to higher elevations or restricted to habitats (e.g., chaparral) or particular soil types (e.g., serpentinite and gabbroic soils) that are not present in the SPA or off-site elements. These species are Stebbins' morning glory (*Calystegia stebbinsii*), Pine Hill Ceanothus (*Ceanothus roderickii*), Red Hills soaproot (*Chlorogalum grandiflorum*), Pine Hill flannelbush (*Fremontodendron decumbens*), El Dorado bedstraw (*Galium californicum* ssp. *sierrae*), Bisbee Peak rush-rose (*Helianthemum suffrutescens*), Layne's ragwort (*Packera layneae*), and El Dorado County mule ears (*Wyethia reticulata*). One other species, Hartweg's golden sunburst (*Pseudobahia bahiifolia*), was documented in the nine quadrangle search area, but the species is not expected to occur in the SPA because there is just one historic record of this species in the area from 1939 in El Dorado County. All other records of this species are from Fresno, Madera, Merced, Stanislaus, and Yuba Counties (Yuba occurrence thought to be extirpated) and so the SPA is outside of the currently known range of this species.

Focused surveys for special-status plant species have been conducted on the Folsom South, Prairie City Business Park, Hillsborough, and Sacramento Country Day School sites and no special-status plant species were found. However, surveys at the Folsom South and Sacramento Country Day School sites did not include big scale balsamroot, Brandegee's clarkia, or Sanford's arrowhead as target species. Big-scale balsamroot has very low potential to occur in grassland and oak woodland habitat in the SPA because serpentine soils are not present and the nearest documented occurrences are more than 10 miles away. The potential for this species cannot be completely ruled out, however, because although big scale balsamroot is most often associated with serpentinite soils, it is not restricted to serpentine and there is potentially suitable habitat present. Species that are weak indicators of serpentine such as narrow leaf soaproot (*Chlorogalum angustifolium*) have been identified in the SPA. Suitable habitat for Brandegee's clarkia is present throughout the SPA and there are documented occurrences in the immediate vicinity. Sanford's arrowhead has been documented immediately adjacent to the SPA and has high potential to be present in on-site ponds or sluggish portions of Alder Creek and its tributaries. Surveys conducted on the Hillsborough and Prairie City Road Business Park sites targeted all of the appropriate species, except big-scale balsamroot, which again has very low potential to grow in the SPA. The remainder of the SPA and off-site elements have not been surveyed for special-status plant species.

Special-Status Wildlife

Special-Status Fish

No special-status fish species are known or have potential to occur within the Alder Creek watershed. Anadromous Chinook salmon (*Oncorhynchus tshawytscha*) and steelhead (*Oncorhynchus mykiss*) use the lower American River below Nimbus Dam for spawning and rearing. Both of these species may have historically used Alder Creek prior to the construction of Nimbus Dam; however, the natural pre-development flow patterns that were more ephemeral and intermittent likely limited habitat values for these species. Potential adverse effects on special-status fish species and fisheries resources off-site are analyzed in Section 3.18, "Water Supply" of this EIR/EIS.

Sensitive Natural Communities

Sensitive natural Communities include those that are of special concern to DFG, or that are afforded specific consideration through CEQA, Section 1602 of the California Fish and Game Code, the Porter-Cologne Water Quality Act, and/or Section 404 of the CWA. Sensitive natural communities may be of special concern to these agencies and to conservation organizations for a variety of reasons, including their locally or regionally declining status, or because they provide important habitat to common and special-status species. Many of these communities are tracked in the CNDDB.

Natural communities present in the SPA that would be considered sensitive by regulatory agencies include vernal pools, seasonal wetland swales, seasonal wetlands, freshwater marsh, seeps, riparian habitats, valley needlegrass grassland, and blue oak woodland.

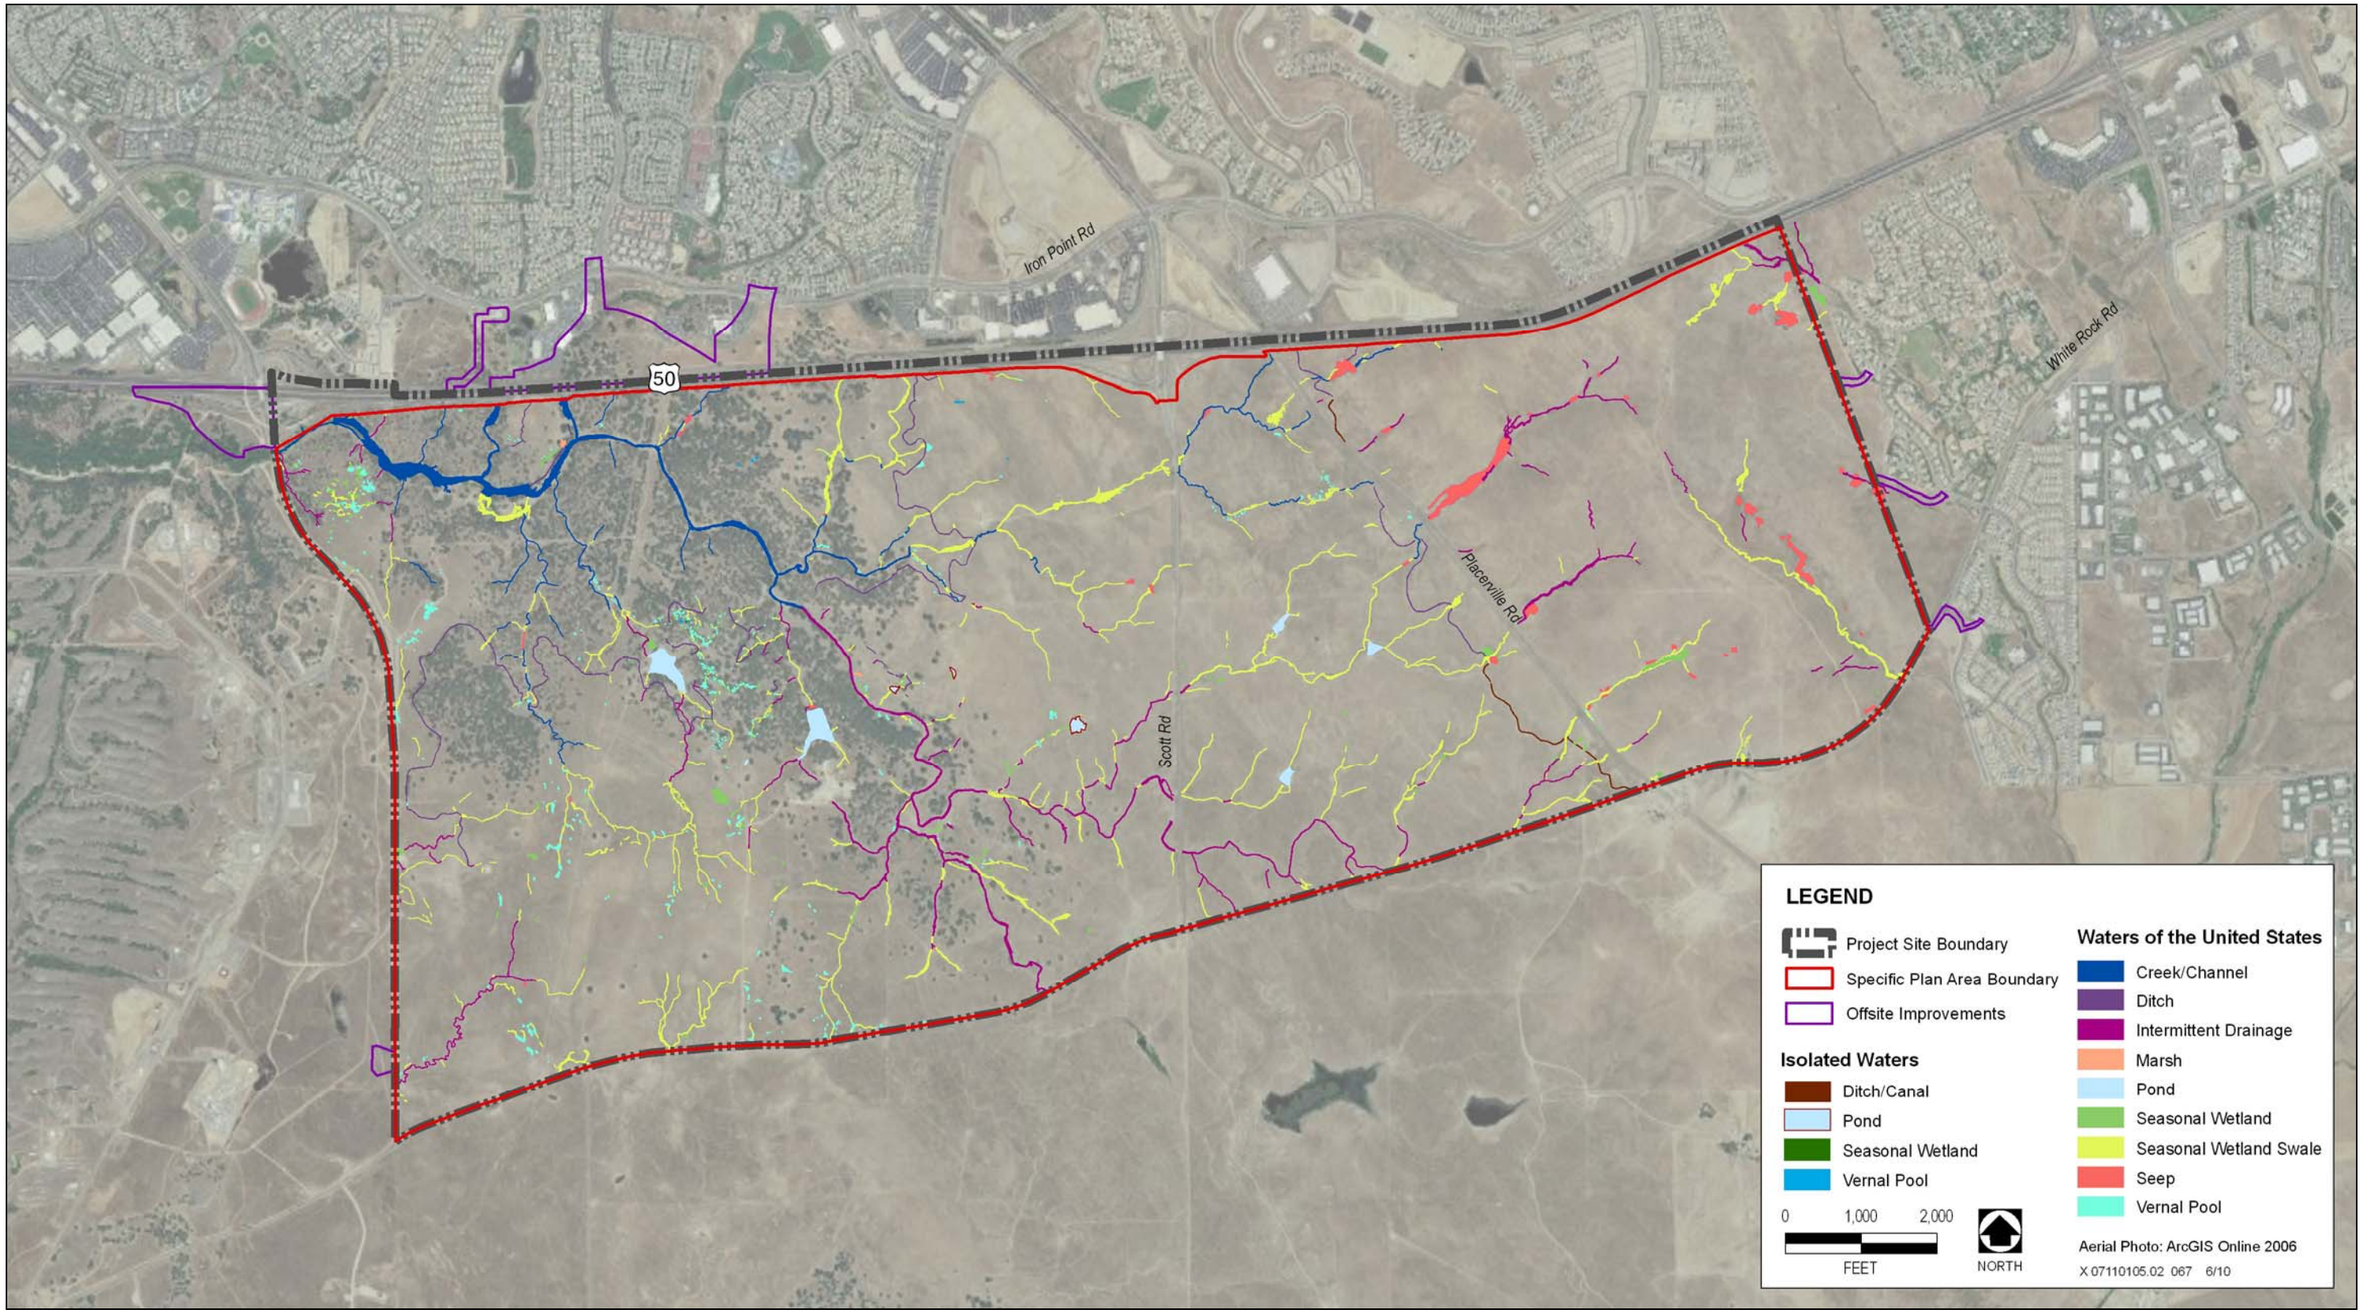
Wetlands and Other Waters of the U.S.

Wetland delineations for the various parcels contained within the SPA have been conducted by ECORP, EDAW/AECOM (now AECOM), Foothill Associates, and Gibson and Skordal between June 2005 and May 2007. The delineations covered the SPA in its entirety and all of them were conducted according to the methods identified in the U.S. Army Corps of Engineers (USACE) 1987 wetlands delineation manual (Environmental Laboratory 1987). The Javanifard and Zhargami parcel and the Folsom 138 property were delineated using the 1987 delineation manual plus the Interim Arid West Regional Supplement (Environmental Laboratory 2006). All of the wetland delineations have been verified by the USACE. The delineations identified a total of 83.64 acres of waters of the U.S., including wetlands, in the SPA. Waters of the U.S. delineated in the SPA consist of 10.80 acres of seeps, 4.64 acres of vernal pools, 4.66 acres of seasonal wetlands, 25.48 acres of seasonal wetland swales, 17.19 acres of perennial stream channels (including Alder Creek), 11.72 acres of intermittent stream channels, 0.11 acre of willow scrub, 1.96 acres of ditches, 0.21 acre of freshwater marsh, and 6.87 acres of ponds.

The SPA also contains 0.03 acre of isolated vernal pool, 0.004 acre of isolated seasonal wetland, 0.40 acre of ditch, and 0.85 acre of pond, which USACE determined to be nonnavigable, isolated, and intrastate waters with no apparent interstate commerce connection and therefore not at this time considered jurisdictional waters of the U.S. (non-jurisdictional). Although these aquatic features are not subject to USACE jurisdiction under Section 404 of the CWA, they may be considered waters of the state under California's Porter-Cologne Act, and therefore subject to regulation by the Central Valley Regional Water Quality Control Board (RWQCB). The locations and extent of wetlands and other waters of the U.S., as mapped by the biological consultants, are shown in Exhibit 3A.3-3.

Wetlands and other waters of the U.S. in the SPA, as well as waters of the state, provide important ecological functions within the watershed. Wetland functions are processes or services that take place in a wetland and they fall into the broad categories of habitat, hydrologic, and water quality functions. Habitat functions are those services that benefit wildlife and include providing food, shelter, water, and breeding grounds. Hydrologic functions of the wetlands and other waters in the SPA include groundwater recharge and moderation of discharge, water storage, and reduction of flow velocity. Water quality functions include nutrient cycling, removal of nutrients and compounds, and trapping sediment. Many wetland functions are interdependent and if one function becomes impaired, it can adversely affect other wetland functions.

In addition to waters of the U.S. in the SPA, it is estimated that the Off-site Elements (i.e., Prairie City Road, Oak Avenue, and Empire Ranch Interchanges, improvements to Prairie City and White Rock Roads, and an off-site detention basin) support approximately 5.85 acres of waters of the U.S. consisting of 0.59 acre of vernal pools, 0.25 acre of seasonal wetlands, 0.55 acre of seasonal wetland swales, 1.94 acres of freshwater marsh, 0.04 acre of intermittent drainage channels, 0.01 acre of ditch, and 2.47 acres of perennial stream channel. The wetlands and other waters within these off-site elements have not yet been delineated according to USACE methodology, so these numbers are approximate and have not been verified by USACE. An estimated 0.47 acre



Source: ECORP 2008, RRM Design Group 2008

Wetlands and Other Waters of the United States **Exhibit 3A.3-3**

of waters of the U.S. consisting of 0.003 acre vernal pool, 0.24 acre seasonal wetland, 0.14 acre intermittent drainage, and 0.09 acre freshwater marsh are present adjacent to a proposed off-site road extending from the eastern SPA boundary and connecting to Stonebriar Drive in El Dorado County (Road Connection No. 2). These features range from 10 to 70 feet in distance from the proposed road footprint. Waters of the U.S. within the location of road connections to El Dorado County were delineated according to USACE methodology, but these delineations have not been verified by USACE. Waters of the U.S. were not identified within the remaining Off-site Element locations (i.e., Rowberry Drive Overcrossing, sewer force main, and Road Connection No. 1 to El Dorado County).

3A.3.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

Federal Endangered Species Act

USFWS and the National Marine Fisheries Service have authority over projects that may result in take of a species listed as threatened or endangered under ESA (i.e., a Federally listed species). In general, persons subject to ESA (including private parties) are prohibited from "taking" endangered or threatened fish and wildlife species on private property, and from "taking" endangered or threatened plants in areas under Federal jurisdiction or in violation of state law. Under ESA, the definition of "take" is to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." USFWS has also interpreted the definition of "harm" to include significant habitat modification that could result in take. If a proposed project would result in take of a Federally listed species, the project applicant must acquire either an incidental-take permit, under Section 10(a) of ESA, or a Federal interagency consultation, under Section 7 of ESA before the take occurs. Such a permit typically requires various types of mitigation to compensate for or minimize the take.

Section 404 of the Clean Water Act

Section 404 of the Federal CWA requires a project applicant to obtain a permit before engaging in any activity that involves any discharge of dredged or fill material into waters of the U.S., including wetlands. Fill material is material placed in waters of the U.S. where the material has the effect of replacing any portion of a water of the United States with dry land, or changing the bottom elevation of any portion of a water of the United States. Waters of the U.S. include navigable waters of the U.S.; interstate waters; all other waters where the use, degradation, or destruction of the waters could affect interstate or foreign commerce; tributaries to any of these waters, and wetlands adjacent to these waters. Wetlands are defined as those areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Potentially jurisdictional wetlands must meet three wetland delineation criteria: hydrophytic vegetation, hydric soil types, and wetland hydrology. Wetlands that meet the delineation criteria may be jurisdictional under Section 404 of CWA pending USACE and U.S. Environmental Protection Agency (EPA) review.

As part of the review of a project, USACE must ensure compliance with applicable Federal laws, including EPA's Section 404(b)(1) Guidelines, which are described in Chapter 2, "Alternatives," Section 2.2.2. USACE regulations require that impacts to waters of the U.S. are avoided and minimized to the maximum extent practicable, and that unavoidable impacts are compensated (33 CFR 320.4[r]).

In 2008, USACE and EPA issued regulations governing compensatory mitigation for activities authorized by permits issued by USACE (33 CFR 332). The rule establishes a preference for the use of mitigation banks because they provide established wetland habitats that have already met success criteria thereby reducing some of the risks and uncertainties associated with compensatory mitigation involving creation of new wetlands that cannot yet demonstrate functionality at the time of project implementation. The rule also establishes a preference for providing compensatory mitigation within the affected watershed. Ideally, compensatory mitigation would

take place at a mitigation bank within the same watershed as the waters to be replaced. If mitigation banks are not available within the affected watershed, then compensatory mitigation involving creation or restoration within the affected watershed may be preferable to using a mitigation bank outside the affected watershed.

Section 401 Water Quality Certification

Under Section 401 of the CWA, an applicant for a Section 404 permit must obtain a certificate from the appropriate state agency stating that the intended dredging or filling activity is consistent with the state's water quality standards and criteria. In California, the authority to grant water quality certification is delegated by the State Water Resources Control Board to the nine RWQCBs.

Wetland Conservation Provision (Swampbuster) of the Food Securities Act

The Wetland Conservation provision of the 1985 and 1990 farm bills requires all agricultural producers to protect wetlands on the farms they own or operate to be eligible for U.S. Department of Agriculture (USDA) farm program benefits. Producers will not be eligible if they plant an agricultural commodity on a wetland converted by drainage, leveling, or any other means after December 23, 1985, or convert a wetland for the purpose of or to make agricultural production possible after November 28, 1990. The Natural Resources Conservation Service (NRCS) is the lead Federal agency responsible for wetland delineations on agricultural land for both Swampbuster and Section 404. Generally, areas subject to regulation under Swampbuster and Section 404 are the same, but some activities that are exempt under Swampbuster may require permitting under Section 404. Many ongoing, normal farming activities, such as plowing, harvesting, seeding, and construction and maintenance of irrigation ditches, stock ponds, and farm roads are exempt from Section 404 of the CWA under the condition they would not result in bringing a wetland into agricultural production or converting an agricultural wetland to a non wetland area. Farmers are required to contact either NRCS or USACE before conducting any activities that could affect wetlands to verify applicability of exemptions and determine if permits are needed.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA), first enacted in 1918, provides for protection of international migratory birds and authorizes the Secretary of the Interior to regulate the taking of migratory birds. The MBTA provides that it shall be unlawful, except as permitted by regulations, to pursue, take, or kill any migratory bird, or any part, nest, or egg of any such bird. The current list of species protected by the MBTA can be found in Title 50 of the Code of Federal Regulations (CFR), Section 10.13 (50 CFR 10.13). The list includes nearly all birds native to the United States.

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

California Endangered Species Act

The California Endangered Species Act (CESA) directs state agencies not to approve projects that would jeopardize the continued existence of an endangered or threatened species or result in the destruction or adverse modification of habitat essential to the continued existence of a species. Furthermore, CESA states that reasonable and prudent alternatives shall be developed by DFG, together with the project proponent and any state lead agency, consistent with conserving the species, while at the same time maintaining the project purpose to the greatest extent possible. A "take" of a species, under CESA, is defined as an activity that would directly or indirectly kill an individual of a species. The CESA definition of take does not include "harm" or "harass" as is included in the Federal act. As a result, the threshold for a take under CESA may be higher than under ESA because habitat modification is not necessarily considered take under CESA.

California Public Resources Code Section 21083.4 (Oak Woodlands)

Section 21083.4 of the California Public Resources Code requires counties to determine if a project within their jurisdiction may result in conversion of oak woodlands that would have a significant adverse effect on the environment. If the lead agency determines that a project would result in a significant adverse effect on oak woodlands, mitigation measures to reduce the significant adverse effect of converting oak woodlands to other land uses are required.

Section 1602 of the California Fish and Game Code

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California that supports wildlife resources are subject to regulation by DFG under Section 1602 of the California Fish and Game Code. Under Section 1602, it is unlawful for any person to substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by DFG, or use any material from the streambeds, without first notifying DFG of such activity and obtaining a final agreement authorizing such activity. "Stream" is defined as a body of water that flows at least periodically or intermittently through a bed or channel having banks and that supports fish or other aquatic life. DFG's jurisdiction within altered or artificial waterways is based on the value of those waterways to fish and wildlife. A DFG streambed alteration agreement must be obtained for any project that would result in an impact on a river, stream, or lake.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act requires that each of the nine RWQCBs prepare and periodically update basin plans for water quality control. Each basin plan sets forth water quality standards for surface water and groundwater and actions to control nonpoint and point sources of pollution to achieve and maintain these standards. Basin plans offer an opportunity to protect wetlands through the establishment of water quality objectives. The RWQCB's jurisdiction includes Federally protected waters as well as areas that meet the definition of "waters of the state." Waters of the state is defined as any surface water or groundwater, including saline waters, within the boundaries of the state. The RWQCB has the discretion to take jurisdiction over areas not Federally protected under Section 401 provided they meet the definition of waters of the state. Mitigation requiring no net loss of wetlands functions and values of waters of the state is typically required by the RWQCB.

California Fish and Game Code Section 3503.5 (Protection of Raptors)

Section 3503.5 of the California Fish and Game Code states that it is unlawful to take, possess, or destroy any raptors (i.e., species in the orders Falconiformes and Strigiformes), including their nests or eggs. Typical violations include destruction of active raptor nests as a result of tree removal and failure of nesting attempts, resulting in loss of eggs and/or young, because of disturbance of nesting pairs by nearby human activity.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

Sacramento County Policies and Ordinances

The following goals and policies of the Sacramento County General Plan (1993) are applicable only to the off-site detention basin east of Prairie City Road under all five action alternatives because the SPA would be annexed into the City of Folsom and would no longer be under Sacramento County jurisdiction if any of the action alternatives were implemented. There are no Sacramento County goals and policies that are applicable to the No Project Alternative because the SPA would continue to be used for cattle grazing and no development requiring County permits would take place.

Conservation Element

- **Policy CO-62.** Ensure no net loss of marsh and riparian woodland acreage, functions, and values.

- **Policy CO-83.** Ensure no net loss of vernal pool acreage, functions, and values and mitigate any loss in relation to the values of quality of habitat.

- **Policy CO-84.** Evaluate feasible on-site alternatives in the environmental review process that reduce impacts on vernal pools and provide effective on-site preservation in terms of minimum management requirements, effective size, and evaluation criteria identified in the report "Sacramento County Vernal Pools" (Sacramento County1990).

- **Policy CO-85.** Require in-kind compensation for the type and functional values of vernal pools eliminated by development.

- **Policy CO-86.** When on-site preservation or mitigation is infeasible or undesirable, require off-site mitigation at County-approved mitigation banks within Sacramento County.

- **Policy CO-112.** Channel modifications shall retain marsh and riparian vegetation whenever possible or otherwise recreate the natural stream channel consistent with the ecological integrity of the preexisting stream. Modifications resulting in wetland or riparian loss shall be mitigated.

- **Policy CO-117.** Provide a transition zone adjacent to stream corridors which incorporates:

  1) A buffer zone on each side of the stream, between the outer edge of any existing or planned riparian or wetland vegetation and more intensive uses.

  2) The transition zone for stream corridors shall provide sufficient width to allow a minimum 50 to 150 foot natural buffer, a 20 foot mowed fire break at the outer edge, sufficient additional width to provide for access for channel maintenance and flood control and for planned passive recreation uses.

  3) The width of the natural buffers shall be based on:
     a. quality and quantity of existing and planned habitat,
     b. presence of species as well as species sensitivity to human disturbance,
     c. areas for regeneration of vegetation,
     d. corridor for wildlife habitat linkage,
     e. nature of planned urban uses adjacent to the corridor,
     f. need for community greenways, and
     g. the effective use of active barriers.

  4) The transition zone shall not include containment ponds for other features implementing pollutant discharge requirements.

- **Policy CO-147.** Identify suitable habitat for threatened and endangered species through the Community and Specific Plan process.

- **Policy CO-149.** Acquisition programs for acquiring open space located within natural areas shall, wherever possible, review the significance of obtaining areas known to contain threatened, endangered, and special status species.

- **Policy CO-150.** To the extent feasible, plans for urban development and flood control projects shall incorporate habitat corridors connecting on-site or adjoining areas (if any) not designated for alteration.

Sacramento County Swainson's Hawk Ordinance

Chapter 16.130 of Title 16 of the Sacramento County Code addresses the reduction in Swainson's hawk foraging habitat within unincorporated Sacramento County. Under the County's Swainson's Hawk Mitigation Program, mitigation for impacts over 40 acres can be achieved only by providing replacement habitat. This policy would apply only to the off-site detention basin east of Prairie City Road under all five action alternatives because the SPA would be annexed into the City of Folsom and would no longer be under Sacramento County jurisdiction if any of the action alternatives were implemented. This policy would not be applicable under the No Project Alternative because the SPA would continue to be used for cattle grazing and no development requiring County permits would take place.

Sacramento County Tree Preservation Ordinance

The Sacramento County Tree Preservation Ordinance provides protection for trees meeting the following specifications:

- native oak trees with a diameter at breast height (DBH) of 6 inches or greater;
- heritage oak trees, which are defined as California oak trees with a DBH of 60 inches or greater; and
- street or public trees, which are defined as any tree that is rooted on public property or with one-half of its crown diameter (drip line) overlapping public property; and landmark trees, which are defined as especially prominent or stately trees.

This ordinance would apply only to the off-site detention basin east of Prairie City Road under all five action alternatives because the SPA would be annexed into the City of Folsom and would no longer be under Sacramento County jurisdiction if any of the action alternatives were implemented. This policy would not be applicable under the No Project Alternative because the SPA would continue to be used for cattle grazing and no development requiring County permits would take place.

El Dorado County Policies and Ordinances

The following goals and policies of the El Dorado County General Plan (2004) are applicable only to the two local roadway connections from the Folsom Heights property off-site into El Dorado Hills under the Proposed Project Alternative. There are no El Dorado County goals and policies that are applicable to the No Project Alternative or other four action alternatives because the SPA is not within El Dorado County and the Proposed Project Alternative is the only one that has off-site elements within El Dorado County.

Conservation and Open Space Element

- **Policy 7.3.3.1:** For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual.
- **Policy 7.3.3.5:** Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.
- **Policy 7.4.1.5:** Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.

- **Policy 7.4.1.6:** All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP).

Folsom Municipal Code Chapter 12.16 – Tree Preservation

Folsom Municipal Code Chapter 12.16 protects native oak trees (i.e., *Quercus lobata*, *Q. douglasii*, *Q. wislizenii*, and hybrids thereof) with a DBH of 6 inches or greater for single trunk trees or an aggregate DBH of 20 inches or greater for multiple trunk trees; landmark trees, heritage trees, and street trees. Landmark trees are trees determined by the city council to be a significant community benefit. Heritage trees are native oak trees with a DBH of 19 inches or greater for single trunk trees or an aggregate DBH of 38 inches or greater for multiple trunk trees. Street tree means any tree growing within the City's tree maintenance strip and contained on the master tree list available from the planning director. Removal of protected trees, as well as disturbances that could result in eventual death, such as trenching, grading, soil compaction, placement of fill, impervious surfaces, irrigation, and landscaping within the drip lines of protected trees requires a tree permit be obtained from the City Planning Director.

City of Folsom General Plan

The following goals and policies of the City of Folsom General Plan (1993) are applicable to the Proposed Project and the other four action alternatives. There are no City of Folsom goals or policies that would apply to the No Project Alternative.

Open Space and Conservation Element

GOAL 25: preserve, acquire, enhance, and maintain the biological resources identified below, wherever feasible, for the use and enjoyment of present and future generations:

- Sensitive habitats including riparian vegetation, vernal pools, remnant valley bunch grasslands (e.g., valley needlegrass grassland), oak savanna and woodlands, freshwater marshlands, and permanent and seasonal wetlands.

- Sensitive wildlife species including tricolored blackbird, Swainson's hawk, tiger salamander, and valley elderberry longhorn beetle.

Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon

The Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS 2005) was released by USFWS on December 15, 2005. This plan focuses on 33 species of plants and animals that occur exclusively or primarily within vernal pool ecosystems, including the Federally listed vernal pool fairy shrimp and tadpole shrimp. The plan outlines recovery priorities and provides goals, objectives, strategies, and criteria for recovery. One of the overall objectives of the recovery plan is to promote natural ecosystem processes and functions by protecting and conserving intact vernal pools and vernal pool complexes. Habitat protection under the recovery plan includes the protection of the topographic, geographic, and edaphic features that support hydrologically interconnected systems of vernal pools, swales, and other seasonal wetlands within an upland matrix that together form hydrologically and ecologically functional vernal pool complexes. While not regulatory in nature, the Recovery Plan needs to be taken into consideration when analyzing potential impacts on vernal pools and associated biota to ensure that projects do not prevent or impair the plan's future long term implementation success. It is also used by the USFWS to determine recommendations and requirements during endangered species consultation for vernal pool dependent species.

3A.3.3 ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. The Proposed Project or alternatives under consideration were determined to result in a significant impact related to biological resources if they would do any of the following:

- have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by DFG or USFWS;
- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by DFG or USFWS;
- have a substantial adverse effect on Federally protected waters of the U.S., including wetlands, as defined by Section 404 of the CWA through direct removal, filling, hydrological interruption, or other means;
- interfere substantially with the movement of any native resident or migratory wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance;
- conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan;
- substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; or substantially reduce the number or restrict the range of an endangered, rare, or threatened species; or
- result in a conversion of oak woodland that would have a significant effect on the environment.

ANALYSIS METHODOLOGY

This analysis of impacts on biological resources resulting from implementation of the project is based on review of existing biological resources documented on or near the SPA, as listed previously in this section, information obtained from the CNDDB and CNPS databases, and a reconnaissance site visit conducted by EDAW/AECOM (now AECOM) staff on September 26, 2007. All biological resources impacts are analyzed at a program level of detail.

Analysis of impacts for the No Project Alternative is based on proposed land use development under the current Sacramento County General Plan zoning as General Agriculture - 80 acres (AG-80). This land use designation allows farming operations of no less than 80 acres with no more than one residence per 80 acres (for a total of up to 44 residences in the SPA). Compatible uses include dry land grain farming and dry or irrigated pastures, but intensive agriculture such as row crops, tree crops, and dairies are not consistent with this land use designation. Analysis of biological resources impacts for the No Project Alternative are based on the assumption that the SPA would continue to be used primarily as range land, and a Section 404 permit would not be required from USACE. Constraints to other agricultural development in the SPA include shallow soils, unreliable water supply, moderately steep topography, and fair to poor crop yield (Sacramento County 1993).

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project), NCP (No USACE Permit), PP (Proposed Project), RIM (Resource Impact Minimization), CD (Centralized Development), and RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the PP at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.3-1 Loss and Degradation of Waters of the U.S., including Wetlands, and Waters of the State. *Project implementation would result in the placement of fill material into jurisdictional waters of the U.S., including wetlands subject to USACE jurisdiction under the Federal CWA. Wetlands and other waters of the U.S. that would be affected by project implementation include seeps, vernal pools, seasonal wetlands and seasonal wetland swales, drainage channels, ditches, and ponds. Waters of the state would also be filled with project implementation.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the SPA would continue to be used for cattle grazing under the existing Sacramento County General Plan designations and zoning, and no off-site water improvements would be constructed. This activity is not expected to result in discharge of fill or dredged materials into waters of the U.S. or the loss of wetlands including vernal pools. No changes in the zoned land use would be expected under the No Project Alternative and site topography would not be altered. Therefore **direct** and **indirect** impacts on waters of the U.S. and waters of the state would be **less than significant**. ***[Lesser]***

On-Site Elements

NCP

The No USACE Permit Alternative would not result in fill of wetlands or other waters subject to USACE jurisdiction under the CWA. No development would occur within 50 feet of wetland features and free spanning bridges would be constructed wherever roadways cross waters to avoid impacts on these waters. This alternative would designate an additional 456 acres of open space compared to the Proposed Project Alternative. However, mixed use development would still be constructed adjacent to aquatic resources resulting in topographic modifications, creation of impervious surfaces, urban runoff, erosion, and siltation; intrusion of humans and domestic animals; and introduction of invasive plant species that could result in habitat degradation.

Relative to the other project alternatives, excluding the No Project Alternative, the No USACE Permit Alternative would preserve a larger proportion of the wetland and drainage complexes within the SPA, provide a larger buffer to minimize impacts of adjacent land uses, and preserve a greater proportion of upland habitat to support species that use both wetland and upland habitats and provide ecological services to vernal pool species. This alternative would also preserve all of the existing acreage of isolated waters considered waters of the state. Exhibit 3A.3-4 depicts aquatic resources in the SPA relative to the open space areas and impact areas for the No USACE Permit Alternative.

Because this alternative would not result in fill of waters of the U.S., **no direct** impacts would occur. ***[Lesser]*** However, this alternative would still result in substantial changes to site topography and increased impervious surfaces and urban development would still occur. Therefore, **indirect significant** impacts would result, but to a much lesser extent than the Proposed Project Alternative. ***[Lesser]***

Aquatic Resources and Open Space Areas Under the No USACE Permit Alternative **Exhibit 3A.3-4**

Mitigation Measure 3A.3-1a: Design Stormwater Drainage Plans and Erosion and Sediment Control Plans to Avoid and Minimize Erosion and Runoff to All Wetlands and Other Waters That Are to Remain in the SPA and Use Low Impact Development Features.

To minimize indirect effects on water quality and wetland hydrology, the project applicant(s) of all project phases shall include stormwater drainage plans and erosion and sediment control plans in their improvement plans and shall submit these plans to the City Public Works Department for review and approval. For off-site elements within Sacramento County or El Dorado County jurisdiction (e.g., off-site detention basin and off-site roadway connections to El Dorado Hills), plans shall be submitted to the appropriate county planning department. Before approval of these improvement plans, the project applicant(s) of all project phases shall obtain a NPDES MS4 Municipal Stormwater Permit and Grading Permit, comply with the City's Grading Ordinance and County drainage and stormwater quality standards, and commit to implementing all measures in their drainage plans and erosion and sediment control plans to avoid and minimize erosion and runoff into Alder Creek and all wetlands and other waters that would remain on-site. Detailed information about stormwater runoff standards and relevant City and County regulation is provided in Chapter 3A.9, "Hydrology and Water Quality."

The project applicant(s) of all project phases shall implement stormwater quality treatment controls consistent with the *Stormwater Quality Design Manual for Sacramento and South Placer Regions* (Sacramento Stormwater Quality Control Partnership 2007). Appropriate runoff controls such as berms, storm gates, off-stream detention basins, overflow collection areas, filtration systems, and sediment traps shall be implemented to control siltation and the potential discharge of pollutants. Development plans shall incorporate Low Impact Development (LID) features, such as pervious strips, permeable pavements, bioretention ponds, vegetated swales, disconnected rain gutter downspouts, and rain gardens, where appropriate. Use of LID features is recommended by the EPA to minimize impacts on water quality, hydrology, and stream geomorphology and is specified as a method for protecting water quality in the proposed specific plan. In addition, free spanning bridge systems shall be used for all roadway crossings over wetlands and other waters that are retained in the on-site open space. These bridge systems would maintain the natural and restored channels of creeks, including the associated wetlands, and would be designed with sufficient span width and depth to provide for wildlife movement along the creek corridors even during high-flow or flood events.

In addition to compliance with City ordinances, the project applicant(s) of all project phases shall obtain a General Construction Stormwater Permit from the Central Valley RWQCB, prepare a Stormwater Pollution Prevention Plan (SWPPP), and implement Best Management Practices (BMPs) to reduce water quality effects during construction. Detailed information about the SWPPP and BMPs are provided in Chapter 3A.9, "Hydrology and Water Quality."

Each project phase shall result in no net change to peak flows into Alder Creek and associated tributaries, or to Buffalo Creek, Carson Creek, and Coyote Creek. The project applicant(s) shall establish a baseline of conditions for drainage on-site. The baseline-flow conditions shall be established for 2-, 5-, 10-, and 20-year storm events. These baseline conditions shall be used to develop monitoring standards for the stormwater system in the SPA. The baseline conditions, monitoring standards, and a monitoring program shall be submitted to USACE and the City for their approval. Water quality and detention basins shall be designed and constructed to ensure that the performance standards, which are described in Chapter 3A.9, "Hydrology and Water Quality," are met and shall be designed as off-stream detention basins. Discharge sites into Alder Creek and associated tributaries, as well as tributaries to Carson Creek, Coyote Creek, and Buffalo Creek, shall be monitored to ensure that preproject conditions are being met. Corrective measures shall be implemented as necessary. The mitigation measures will be satisfied when the monitoring standards are met for 5 consecutive years without undertaking corrective measures to meet the performance standard.

The project applicant(s) shall design a land use plan that moves the proposed on-stream detention basin in the northeast corner of the SPA to a location that is off stream. All water quality and detention basins constructed as part of the project shall be designed and built off stream.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado County for the roadway connections, Sacramento County for the detention basin west of Prairie City Road, and Caltrans for the U.S. 50 interchange improvements).

Implementation: Project applicant(s) of all project phases and on-site and off-site elements.

Timing: Before approval of improvement and drainage plans, and on an ongoing basis throughout and after project construction, as required for all project phases.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Public Works Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. U.S. Army Corps of Engineers, Sacramento District.
6. Central Valley Regional Water Quality Control Board.

PP

Implementation of the Proposed Project Alternative would result in direct impacts from the loss of waters of the U.S. resulting from the placement of fill material into approximately 39.50 acres of Federally jurisdictional waters of the U.S. on-site, including wetlands. This constitutes 47% of the existing waters of the U.S. present in the SPA. Waters of the U.S. that would be filled consist of 2.92 acres of vernal pools, 3.87 acres of seasonal wetland, 17.63 acres of seasonal wetland swale, 0.07 acre of freshwater marsh, 4.48 acres of freshwater seep, 1.17 acres of pond, 3.38 acres of stream channel, 4.47 acres of intermittent drainage channel, 1.43 acres of ditches, and 0.11 acre of willow scrub. In addition, 1.25 out of 1.30 acres of waters that USACE determined to be non-jurisdictional would also be filled by the Proposed Project Alternative. The non-jurisdictional waters in the SPA consist of 0.03 acre of vernal pool, 0.004 acre of seasonal wetland, 0.42 acre of ditch, and 0.85 acre of pond. Though the placement of fill material into these waters does not require a permit from USACE under Section 404 of the CWA, they are considered waters of the state subject to the jurisdiction of the Central Valley RWQCB under the Porter-Cologne Act. The conversion of these waters of the U.S. to uplands from the placement of fill material would result in a complete loss of the functions of the waters of the U.S. In addition to direct impacts resulting from the placement of fill material into Federally jurisdictional waters of the U.S., the Proposed Project Alternative would also result in indirect impacts to 0.29 acres of waters of the U.S. from fragmentation. This would occur as a result of placing fill material into the upstream and downstream portions of the waters of the U.S. proposed to be placed into the open space preserve, as described below. Because the upstream and downstream portions of these preserved waters of the U.S. would be filled, indirect impacts would occur to 0.17 acre of seasonal wetland swale, 0.016 acre of perennial stream channel, 0.09 acre of intermittent drainage, and 0.012 acre of ditch resulting in a loss of/adverse indirect impacts to the functions of these waters. While fragmented stream channels could function to store surface water, recharge groundwater, and provide some habitat values, they would no longer function to

convey stormwater through the system, transport sediment, reduce flow velocity, and their nutrient cycling and other water quality functions would be diminished. Many of the features that currently convey seasonal flows could become inundated year round when cut off from other drainage channels.

The Proposed Project Alternative includes 1,050 acres of open space designed to preserve approximately 52% of the wetlands and other waters of the U.S. present in the SPA, including most of Alder Creek. Approximately 6.33 acres of freshwater seep, 1.72 acres of vernal pools, 0.78 acre of seasonal wetland, 7.85 acres of seasonal wetland swale, 13.81 acres of perennial stream channel, 7.25 acres of intermittent drainage channel, 0.55 acre of ditches, 0.14 acre of freshwater marsh, and 5.71 acres of ponds would be preserved within the open space areas. Preserved wetlands and other waters within the designated open space areas would be provided a 25-foot buffer where no project-related ground disturbance would occur. Outside of the 25-foot buffer, an additional 50 feet of no development buffer would be established; however, disturbance associated with contour grading, mitigation planting, trails, benches, and other passive recreational amenities may occur in the outer 50 feet of buffer. Exhibit 3A.3-5 depicts aquatic resources in the SPA relative to the open space areas and impact areas for the Proposed Project Alternative. Table 3A.3-3 provides a summary of impacts on wetlands and other waters of the U.S. and preservation under the Proposed Project Alternative development scenario. Table 3A.3-4 provides a side by side comparison of preserved versus affected acreage of wetlands and other waters of the U.S. for each project alternative. The open space design provides a large habitat patch that maintains stream networks and wetland complexes, provides corridors for habitat connectivity both on and off the SPA, and minimizes the perimeter-to-area ratio (i.e., edge effects).

In addition to direct impacts, the Proposed Project Alternative would result in indirect effects on wetlands from increased urbanization and population, including reduction in water quality caused by urban runoff, erosion, and siltation; intrusion of humans and domestic animals; and introduction of invasive plant species that could result in habitat degradation. On-site wetlands and other waters would be indirectly affected by substantial grading and creation of impervious surfaces proposed for adjacent uplands. All portions of the SPA, with the exception of 25-foot buffers around preserved wetlands, would be subject to contour grading, which could affect wetland hydrology and water quality. Overall site topography would be substantially altered to achieve level ground for development. These earthmoving activities and resulting gradient changes across the SPA could alter hydrologic patterns and adversely affect wetlands and drainage channels retained in the SPA, as well as off-site wetlands, by altering hydration periods, peak flows, runoff volumes, and runoff durations. Construction of a 1.4-acre on-site detention basin on an intermittent tributary to Carson Creek on the Folsom Heights site could substantially alter water quality and hydrology of Carson Creek and associated wetlands and other waters of the U.S. Construction of new roadways and roadway improvements associated with development of the backbone infrastructure and the on-stream detention basin could disrupt or eliminate hydrologic connectivity that is important to support wetlands and the plant and wildlife species that inhabit them. Although the main channel of Alder Creek would be retained, many intermittent tributaries and seasonal swales directly connected to Alder Creek would be filled. This could adversely affect the hydrology and water quality of the preserved portions of the creek.

The loss and degradation of USACE jurisdictional vernal pools and other wetland habitats and other waters of the U.S. (e.g., ponds and drainage channels) that would occur with project implementation constitutes a substantial adverse effect on Federally jurisdictional waters of the U.S., including wetlands, as defined by Section 404 of the CWA. Construction of the on-stream detention basin is a significant direct and indirect impact. Removal of 1.25 acres non USACE jurisdictional wetlands in the SPA constitutes an adverse effect on waters of the state subject to Central Valley RWQCB jurisdiction. Therefore, both **direct** and **indirect significant** impacts would occur.

Mitigation Measure: Implement Mitigation Measure 3A.3-1a.

Table 3A.3-3
Summary of Wetland Impacts and Preservation for the Proposed Project Alternative

Aquatic Resources and Open Space Areas under the Proposed Project Alternative **Exhibit 3A.3-5**

Mitigation Measure 3A.3-1b: Secure Clean Water Act Section 404 Permit and Implement All Permit Conditions; Ensure No Net Loss of Functions of Wetlands, Other Waters of the U.S., and Waters of the State.

Before the approval of grading and improvement plans and before any groundbreaking activity associated with each distinct project phase, the project applicant(s) of all project phases requiring fill of wetlands or other waters of the U.S. or waters of the state shall obtain all necessary permits under Sections 401 and 404 of the CWA or the state's Porter-Cologne Act for the respective phase. For each respective phase, all permits, regulatory approvals, and permit conditions for effects on wetland habitats shall be secured before implementation of any grading activities within 250 feet of waters of the U.S. or wetland habitats, including waters of the state, that potentially support Federally listed species, or within 100 feet of any other waters of the U.S. or wetland habitats, including waters of the state. The project applicant(s) shall commit to replace, restore, or enhance on a "no net loss" basis (in accordance with USACE and the Central Valley RWQCB) the acreage of all wetlands and other waters of the U.S. that would be removed, lost, and/or degraded with implementation of project plans for that phase. Wetland habitat shall be restored, enhanced, and/or replaced at an acreage and location and by methods agreeable to USACE, the Central Valley RWQCB, and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes.

As part of the Section 404 permitting process, a draft wetland mitigation and monitoring plan (MMP) shall be developed for the project on behalf of the project applicant(s). Before any ground-disturbing activities that would adversely affect wetlands and before engaging in mitigation activities associated with each phase of development, the project applicant(s) shall submit the draft wetland MMP to USACE, the Central Valley RWQCB, Sacramento County, El Dorado County, and the City for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be finalized prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of mitigation, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer.

As part of the MMP, the project applicant(s) shall prepare and submit plans for the creation of aquatic habitat in order to adequately offset and replace the aquatic functions and services that would be lost at the SPA, account for the temporal loss of habitat, and contain an adequate margin of safety to reflect anticipated success. Restoration of previously altered and degraded wetlands shall be a priority of the MMP for offsetting losses of aquatic functions in the SPA because it is typically easier to achieve functional success in restored wetlands than in those created from uplands. The MMP must demonstrate how the aquatic functions that would be lost through project implementation will be replaced.

The habitat MMP for jurisdictional wetland features shall be consistent with USACE's and EPA's April 10, 2008 *Final Rule for Compensatory Mitigation for Losses of Aquatic Resources* (33 CFR Parts 325 and 332 and 40 CFR Part 230). According to the *Final Rule*, mitigation banks should be given preference over other types of mitigation because a lot of the risk and uncertainty regarding mitigation success is alleviated by the fact that mitigation bank wetlands must be established and demonstrating functionality before credits can be sold. This also alleviates temporal losses of wetland function while compensatory wetlands are being established. Mitigation banks also tend to be on larger, more ecologically valuable parcels and are subjected to more rigorous scientific study and planning and implementation procedures than typical permittee-responsible mitigation sites (USACE and EPA, 2008). However, the *Final Rule* also establishes a preference for compensating losses of aquatic resources within the same watershed as the impact site. The SPA includes portions of the Alder Creek, Buffalo Creek, Coyote Creek, and Carson Creek Watersheds. The majority of the SPA is within the Alder Creek Watershed. Alder Creek and Buffalo Creek are part of the Lower American River Watershed. Carson Creek and Coyote Creek are part of the Cosumnes River Watershed. Mitigation credits may be available within the Cosumnes River Watershed, but not within the American River Watershed and not within the sub-watersheds of the SPA.

Therefore aquatic habitats may need to be restored or created in the SPA and adjacent off-site lands, within the affected watersheds, in order to successfully replace lost functions at the appropriate watershed scale where loss of function would occur. It is not likely feasible to provide compensatory mitigation for all aquatic resource impacts on site. Therefore, a combination of on-site and off-site permittee-responsible mitigation and mitigation banking may be necessary to achieve the no-net-loss standard.

The SPA is located within the service areas of several approved mitigation banks (e.g., Bryte Ranch, Clay Station, Fitzgerald Ranch, and Twin City). The majority of compensatory mitigation for wetland impacts is proposed to be accomplished at an agency-approved mitigation bank authorized to sell credits to offset impacts in the SPA. The applicants' biological consultant, ECORP, has identified availability of approximately 31 vernal pool credits and 228 seasonal wetland credits at mitigation banks whose service area appears to include the SPA. However, the availability of these credits has not been confirmed and availability is subject to change and, as noted above, a combination of mitigation bank credits and permittee-responsible on and off-site mitigation may be necessary to fully offset project impacts on wetlands and other waters of the U.S.

Compensatory mitigation for losses of stream and intermittent drainage channels shall be achieved through in-kind preservation, restoration, or enhancement, as specified in the *Final Rule* guidelines. The wetland MMP shall address how to mitigate impacts on vernal pool, seasonal swale, seasonal wetland, seep, marsh, pond, and intermittent and perennial stream habitat, and shall describe specific method(s) to be implemented to avoid and/or mitigate any off-site project-related impacts. The wetland compensation section of the habitat MMP shall include the following:

- Compensatory mitigation sites and criteria for selecting these mitigation sites. In General, compensatory mitigation sites should meet the following criteria, based on the *Final Rule*;
    - located within the same watershed as the wetland or other waters that would be lost;
    - located in the most likely position to successfully replace wetland functions lost on the impact site considering watershed-scale features such as aquatic habitat diversity, habitat connectivity, available water sources and hydrologic relationships, land use trends, ecological benefits, and compatibility with adjacent land uses
- A complete assessment of the existing biological resources in both the on-site preservation areas and off-site compensatory mitigation areas, including wetland functional assessment using the California Rapid Assessment Method (CRAM) (Collins et al. 2008), to establish baseline conditions;
- Specific creation and restoration plans for each mitigation site;
- In kind reference wetland habitats for comparison with compensatory wetland habitats (using performance and success criteria) to document success;
- Description of methodology used to select reference wetlands for comparison;
- Monitoring protocol, including schedule and annual report requirements, and the following elements:
    - ecological performance standards, based on the best available science, that can be assessed in a practicable manner (e.g., performance standards proposed by Barbour et al. 2007). Performance standards must be based on attributes that are objective and verifiable;
    - CRAM conducted annually for 5 years after construction or restoration of compensatory wetlands to determine whether these areas are acquiring wetland functions and to plot the performance

trajectory of preserved, restored, or created wetlands over time. CRAM scores for compensatory wetlands shall also be compared against scores for reference wetlands assessed in the same year;

- CRAM analysis conducted annually for 5 years after any construction adjacent to wetlands preserved in the SPA to determine whether these areas are retaining wetland functions. CRAM scores for wetlands preserved on site shall also be compared against scores for reference wetlands assessed in the same year;

- analysis of CRAM data, including assessment of potential stressors, to determine whether any remedial activities may be necessary;

- corrective measures if performance standards are not met;

- monitoring of plant communities as performance criteria (annual measure of success, during monitoring period) and success criteria (indicative of achievement of mitigation habitat requirement at end of monitoring period) for hydrologic function have become established and the creation site "matures" over time (the project applicants' biological consultant has developed a draft monitoring methodology and success criteria that are provided in Appendix D);

- GIS analysis of compensatory wetlands to demonstrate actual acreage of functioning wetland habitat;

- adaptive management measures to be applied if performance standards and acreage requirements are not being met;

- responsible parties for monitoring and preparing reports; and

- responsible parties for receiving and reviewing reports and for verifying success or prescribing implementation or corrective actions.

An operations and management plan (OMP) for all on- and off-site wetland preservation and mitigation areas shall be prepared and submitted to USACE and USFWS for review and approval prior to the issuance of any permits under Section 404 of the CWA. The plan shall include detailed information on the habitats present within the preservation and mitigation areas, the long-term management and monitoring of these habitats, legal protection for the preservation and mitigation areas (e.g., conservation easement, declaration of restrictions), and funding mechanism information (e.g., endowment).

USACE has determined that the project will require an individual permit. In its final stage and once approved by USACE, the MMP for the project is expected to detail proposed wetland restoration, enhancement, and/or replacement activities that would ensure no net loss of aquatic functions in the project vicinity. Approval and implementation of the wetland MMP shall aim to fully mitigate all unavoidable impacts on jurisdictional waters of the U.S., including jurisdictional wetlands. In addition to USACE approval, approval by the City, Sacramento County, El Dorado County, and the Central Valley RWQCB, as appropriate depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes, will also be required. Approvals from Sacramento County and El Dorado County shall be required for impacts resulting from off-site project elements occurring in these counties, such as the off-site detention basin in Sacramento County and the roadway connections into El Dorado County. To satisfy the requirements of the City and the Central Valley RWQCB, mitigation of impacts on the nonjurisdictional wetlands beyond the jurisdiction of USACE shall be included in the same MMP. All mitigation requirements determined through this process shall be implemented before grading plans are approved. The MMP shall be submitted to USACE and approved prior to the issuance of any permits under Section 404 of the CWA.

Water quality certification pursuant to Section 401 of the CWA will be required before issuance of the record of decision and before issuance of a Section 404 permit. Before construction in any areas containing wetland features, the project applicant(s) shall obtain water quality certification for the project. Any measures required as part of the issuance of water quality certification shall be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans, El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases requiring fill of wetlands or other waters of the U.S. or waters of the state.

Timing: Before the approval of grading or improvement plans or any ground-disturbing activities for any project development phase containing wetland features or other waters of the U.S. The MMP must be approved before any impact on wetlands can occur. Mitigation shall be implemented on an ongoing basis throughout and after construction, as required.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
3. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. U.S. Army Corps of Engineers, Sacramento District; Central Valley Regional Water Quality Control Board as appropriate depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes and in compliance with the City's Grading Ordinance (Folsom Municipal Code 14.29), or appropriate county grading ordinance for off-site detention basin and roadway connections from Folsom Heights to El Dorado Hills.

RIM

The Resource Impact Minimization Alternative would preserve 57.17 acres (68%) of wetlands and other waters of the U.S., 13.33 acres more than would be preserved under the Proposed Project Alternative. Approximately 26.47 acres (32%) of on-site wetlands and other waters of the U.S. would be filled under this alternative compared with 39.50 acres under the Proposed Project Alternative. The Resource Impact Minimization Alternative would designate an additional 379 acres of open space, thereby preserving a greater proportion of adjacent upland habitats to provide larger wetland habitat buffers (generally at least 250 feet), preserve more of the micro watershed areas, support species that use both wetland and upland habitats, and provide ecological services to wetland species. This alternative would maintain greater hydrological functionality and wetland connectivity because more of the intermittent drainage channels and swales would be preserved and free spanning bridges would be constructed wherever roadways cross waters to avoid impacts on these waters. This alternative would also include control measures and performance standards that address stormwater flow, volume, and water quality for developed areas to minimize hydrologic and geomorphic modifications that could adversely affect wetlands and other waters that are preserved in the SPA. The Resource Impact Minimization Alternative would also result in fill of 0.53 acre of waters of the state, 0.72 acre less than would be filled under the Proposed Project Alternative. In addition to direct impacts

resulting from the placement of fill material into Federally jurisdictional waters of the U.S., the Resource Impact Minimization Alternative would also result in indirect impacts to 0.35 acre of waters of the U.S. from fragmentation. Fragmented waters under this alternative consist of 0.20 acre of seasonal wetland swale, 0.03 acre of stream channel, 0.11 acre of seasonal drainage channel, and 0.01 acre of ditch. The total acreage of fragmented waters under this alternative is 0.06 acre greater than the acreage of fragmented waters under the Proposed Project Alternative. Exhibit 3A.3-6 depicts aquatic resources in the SPA relative to the open space areas and impact areas for the Resource Impact Minimization Alternative.

Because the Resource Impact Minimization Alternative would still result in the fill of substantial acreage of waters of the U.S., including wetlands, as defined by Section 404 of the CWA, a **direct significant** impact would result, but would be substantially less compared to the Proposed Project Alternative. ***[Lesser]***

The larger, more contiguous preserve design, stormwater control measures, and preservation of a greater percentage of tributary channels and swales, would substantially reduce, but not entirely eliminate indirect effects on wetlands and other waters because major urban development and topographical modifications would still occur throughout the SPA. Therefore, the Resource Impact Minimization Alternative would result in **indirect significant** impacts, but to a much lesser extent than the Proposed Project Alternative. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b.

CD

The Centralized Development Alternative would preserve an additional 2.45 acres of wetlands and other waters of the U.S., relative to the Proposed Project Alternative. Approximately 37.05 acres (44%) of wetlands and other waters of the U.S. would be filled under this alternative compared with 39.50 acres under the Proposed Project Alternative. The Centralized Development Alternative would designate an additional 414 acres of open space thereby preserving a greater proportion of adjacent upland habitats to provide larger wetland habitat buffers, preserve more of the micro watershed areas, support species that use both wetland and upland habitats, and provide ecological services to wetland species. The Centralized Development Alternative would result in fill of 1.28 acre of waters of the state, compared to 1.25 acres under the Proposed Project Alternative. In addition to direct impacts resulting from the placement of fill material into Federally jurisdictional waters of the U.S., the Centralized Development Alternative would also result in indirect impacts to 0.28 acre of waters of the U.S. from fragmentation. Fragmented waters under this alternative consist of 0.21 acre of seasonal wetland swale, 0.01 acre of stream channel, 0.05 acre of seasonal drainage channel, and 0.01 acre of ditch. The total acreage of fragmented waters under this alternative is 0.01 acre less than the acreage of fragmented waters under the Proposed Project Alternative. Exhibit 3A.3-7 depicts aquatic resources in the SPA relative to the open space areas and impact areas for the Centralized Development Alternative. See Table 3A.3-4 for a side by side comparison of preserved versus affected acreage of wetlands and other waters of the U.S. for each project alternative.

The Centralized Development Alternative would create two large open space areas that would reduce potential indirect effects from habitat fragmentation and edge effects, and hydrological modification from grading and impervious surfaces adjacent to wetlands. This alternative also includes control measures and performance standards that address stormwater flow, volume, and water quality for developed areas to minimize hydrologic and geomorphic modifications that could adversely affect wetlands and other waters that are preserved in the SPA. The open space design and stormwater control measures would substantially reduce, but not entirely eliminate potential indirect effects on wetlands and other waters.

Because the Centralized Development Alternative would still result in the fill of substantial acreage of waters of the U.S., including wetlands, as defined by Section 404 of the CWA, a **direct significant** impact would result. ***[Similar]***

Because a number of intermittent tributaries and seasonal swales directly connected to Alder Creek would still be filled and major urban development and topographical modifications would still occur throughout the SPA, the Centralized Development Alternative would result in **indirect significant** impacts, but to a lesser extent than the Proposed Project Alternative. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b.

RHD

The Reduced Hillside Development Alternative would result in fill of 42.69 acres (51%) of Federally protected waters of the U.S., including wetlands. This is 3.19 acres more than would be filled under the Proposed Project Alternative. In addition, 1.28 of the existing 1.30 acres of waters of the state would be filled under this alternative; 0.02 acre more than would be filled under the Proposed Project Alternative. In addition to direct impacts resulting from the placement of fill material into Federally jurisdictional waters of the U.S., the Reduced Hillside Development Alternative would also result in indirect impacts to 0.25 acre of waters of the U.S. from fragmentation. Fragmented waters under this alternative consist of 0.17 acre of seasonal wetland swale, 0.01 acre of stream channel, 0.06 acre of seasonal drainage channel, and 0.01 acre of ditch. The total acreage of fragmented waters under this alternative is 0.04 acre less than the acreage of fragmented waters under the Proposed Project Alternative. Exhibit 3A.3-8 depicts aquatic resources in the SPA relative to the open space areas and impact areas for the Proposed Project Alternative. See Table 3A.3-4 above for a comparison of preserved versus affected acreage of wetlands and other waters of the U.S. for each project alternative.

Grading and creation of impervious surfaces in adjacent upland habitats would be the same under this alternative as under the Proposed Project Alternative. However, this alternative includes control measures and performance standards that address stormwater flow, volume, and water quality for developed areas to minimize hydrologic and geomorphic modifications that could adversely affect wetlands and other waters that are preserved in the SPA. Therefore, potential adverse effects on wetlands and other waters from altered hydrologic patterns would be lessened relative to the Proposed Project Alternative, but not substantially because major grading and topographic modifications would still occur throughout the SPA and no greater wetland buffers would be provided. More intermittent tributaries and seasonal swales directly connected to Alder Creek would be filled by implementation of this alternative, thereby eliminating natural hydrologic connectivity.

The loss and degradation of USACE jurisdictional vernal pools and other wetland habitats and other waters of the U.S. (e.g., ponds and drainage channels) that would occur with development of the Reduced Hillside Development Alternative constitutes a substantial adverse effect on Federally protected waters of the U.S., including wetlands, as defined by Section 404 of the CWA. Removal of 1.43 acres non-USACE jurisdictional wetlands in the SPA constitutes an adverse effect on waters of the state subject to Central Valley RWQCB jurisdiction. Therefore, **direct** and **indirect significant** impacts would occur. ***[Similar]***

Aquatic Resources and Open Space Areas under the Reduced Hillside Development Alternative

Exhibit 3A.3-8

Off-Site Elements

Approximately 5.85 acres of waters of the U.S., including wetlands, would be permanently filled by construction of off-site infrastructure outside the project boundary. The off-site project elements that would directly affect potential waters of the U.S. are the detention basin west of Prairie City Road and the interchange improvements to U.S. 50. Affected wetlands and other waters of the U.S. consist of 0.59 acre of vernal pools, 0.25 acre of seasonal wetlands, 0.55 acre of seasonal wetland swales, 1.94 acres of freshwater marsh, 0.04 acre of intermittent drainage channels, 0.01 acre of ditch, and 2.47 acres of perennial stream channel. Indirect impacts on another 0.47 acre of waters of the U.S. could result from construction of the two roadway connections into El Dorado Hills.

The loss and degradation of USACE jurisdictional vernal pools and other wetland habitats and other waters of the U.S. (e.g., drainage channels) that would occur with project implementation constitutes a substantial adverse effect on Federally protected waters of the U.S., including wetlands, as defined by Section 404 of the CWA. Therefore, construction of off-site elements that support project development would result in **direct** and **indirect significant** impacts on waters of the U.S.

Implementation of Mitigation Measures 3A.3-1a and 3A.3-1b would reduce significant impacts on jurisdictional wetlands and other waters of the U.S. and waters of the state under the No USACE Permit, Proposed Project Alternative, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives, but not necessarily to a less-than-significant level. After a mitigation plan has been accepted by USACE and is implemented as required (including on-site preservation and purchase of credits at a mitigation bank and/or in-lieu fee mitigation), the direct impacts resulting from project implementation could be mitigated by providing “no net loss” of overall wetland acreage resulting from the project, as required in USACE permit conditions. However, USACE requires mitigation resulting in no net loss of wetland functions. Removal of 45.35 acres (39.5 acres on site and 5.85 acres off-site) of waters of the U.S., including stream channels, vernal pools, and other similar wetland habitats is a substantial loss, especially when considered in the context of the regional rate and acreage of habitat losses. Creating compensatory wetlands cannot be guaranteed to fully replace the functions of wetlands lost and temporal losses would occur unless all impacts could be mitigated through purchase of fully functioning, established, in-kind wetlands from an approved mitigation bank. It is unknown at this time if mitigation credits are available to fully cover the loss of wetland functions resulting from project implementation. Creation and preservation of wetlands within smaller and more fragmented areas surrounded by urban development cannot fully compensate for the whole suite of ecological services provided by larger expanses of interconnected wetland complexes surrounded by open space. Also, if compensatory wetland mitigation could not be provided in the same watershed an overall loss of function up to the subbasin level could result.

Considering the rate of development in Sacramento County and the limited amount of undeveloped, unspoken for land that supports existing wetlands that could be preserved, or that is suitable for creation of compensatory aquatic habitats similar to those that would be removed by project implementation, it may not be possible to fully mitigate the loss of habitat functions provided by the nearly 45 acres of aquatic habitats that would be lost as a result of the Proposed Project. Furthermore, indirect impacts would remain significant and unavoidable for the Proposed Project Alternative because:

- the amount of habitat loss and degradation is extensive and contributes significantly to the loss of this habitat type in the region,
- micro watersheds of aquatic resources retained on the site would not be preserved,
- wetland buffers from construction impacts would only be 25 feet in some cases and not more than 75 feet in many others,
- nearly 50% of the aquatic resources in the SPA would be filled, and

- the magnitude of topographic modification that would occur across the site with project implementation is severe.

All of these factors are likely to substantially diminish the water quality, hydrologic, and habitat functions of all wetlands remaining on site and downstream in the project vicinity. Therefore, direct and indirect impacts would remain **significant and unavoidable** for the Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives. Under the No USACE Permit Alternative, there would be no direct impacts, but indirect impacts would remain **significant and unavoidable**. In addition, some of the off-site elements fall under the jurisdiction of El Dorado and Sacramento Counties, and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation.

IMPACT 3A.3-2 Loss and Degradation of Habitat for Special-Status Wildlife Species and Potential Direct Take of Individuals. *Project implementation would result in the loss and degradation of habitat for several special-status wildlife species. Take of several listed species, including vernal pool invertebrates, valley elderberry longhorn beetle, and Swainson's hawk, could also occur.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the SPA would remain as open space used for livestock grazing consistent with the current AG-80 zoning designation, and no off-site water facilities would be constructed. Continuation of existing land uses is not expected to result in changes to the types and quality of wildlife habitat available in the SPA. The AG-80 zoning designation is considered to provide 100% foraging habitat value for Swainson's hawk (Sacramento County 2006). Under the No Project Alternative, site topography would not be altered, existing vegetation would not be removed, and no loss of vernal pools or other aquatic habitats would be expected. Therefore, **direct** and **indirect** impacts would be **less than significant**. ***[Lesser]***

On-Site Elements

NCP

Wildlife Associated with Vernal Pools

The No USACE Permit Alternative would result in no permanent fill of vernal pool, seasonal wetlands, or seasonal wetland swales, which are potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad. No development would occur within 50 feet of wetland features and free spanning bridges would be constructed over waterways to avoid impacts from roadways. This alternative would designate an additional 456 acres of open space compared to the Proposed Project Alternative. Compared to the other Project Alternatives, the No USACE Permit Alternative would preserve a larger portion of wetlands within the SPA, provide a larger buffer to minimize impacts of adjacent land uses, and preserve a greater proportion of upland habitat to support species that use both wetland and upland habitats. However, mixed use development would still be constructed in adjacent uplands. Although they would be lessened, indirect effects on wetlands from topographic modifications, creation of impervious surfaces, urban runoff, erosion, siltation, intrusion of humans and domestic animals, and introduction of invasive plant species could result in habitat degradation. Implementation of the No USACE Permit Alternative would result in **no direct** impacts to wildlife species associated with vernal pools; however **indirect significant** impacts would still occur because of the substantial changes to the site topography, increased impervious surfaces, and urban development adjacent to wetland habitats. ***[Lesser]***

Swainson's Hawk and Other Raptors

The No USACE Permit Alternative would result in removal of approximately 362 acres of oak woodland, which provides potential nesting habitat for Swainson's hawk and other raptors. Tree removal during the raptor breeding season (February–August) could result in mortality of eggs and chicks if an active nest were present. Other construction activities could disturb active nests near the construction area or in trees not yet removed from the SPA, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Implementation of the No USACE Permit Alternative would result in the direct loss of approximately 1,902 acres of grassland, which provides foraging habitat for Swainson's hawk and other raptors. Some of the remaining 692 acres of grassland habitat would be directly affected by contour grading, recreational amenities, and other activities within the open space area. In addition, this alternative would result in indirect effects to the nesting and foraging habitat remaining in the SPA due to disturbance from use of adjacent development, which could reduce nest success and foraging habitat quality. Therefore, **direct** and **indirect** impacts to Swainson's hawk and other raptors would be **significant.** ***[Similar]***

Valley Elderberry Longhorn Beetle

Implementation of the No USACE Permit Alternative could result in removal of elderberry shrubs containing valley elderberry longhorn beetle larvae. Indirect impacts from ground-disturbing activities or use of herbicides could also result if the health of elderberry shrubs containing valley elderberry longhorn beetle larvae is adversely affected. Therefore, **direct** and **indirect** impacts to valley elderberry longhorn beetle would be **significant**. ***[Similar]***

Tricolored Blackbird

Construction activities during implementation of the No USACE Permit Alternative could result in disturbance to tricolored blackbird colonies, which may result in nest abandonment and loss of eggs or young. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. Because project activities adjacent to potential nesting habitat are not expected to result in the mortality of individuals, chicks, or eggs, **indirect** impacts would be considered **less than significant**. ***[Similar]***

Special-Status Bats

Implementation of the No USACE Permit Alternative would likely require an abandoned mine shaft to be filled or capped. If the mine shaft is used by bats as a day roost, hibernation roost, or maternity colony roost, implementation of this alternative could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Project activities could result in **significant direct** or **indirect** impacts on special-status bat species. ***[Similar]***

Other Special-Status Species

The No USACE Permit Alternative would have a **less-than-significant direct** and **indirect** impact on western pond turtle, loggerhead shrike, grasshopper sparrow, Modesto song sparrow, and American badger because implementation of this alternative would not substantially reduce their populations. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b.

Mitigation Measure 3A.3-2a: Avoid Direct Loss of Swainson's Hawk and Other Raptor Nests.

To mitigate impacts on Swainson's hawk and other raptors (including burrowing owl), the project applicant(s) of all project phases shall retain a qualified biologist to conduct preconstruction surveys and to identify active nests on and within 0.5 mile of the SPA and active burrows in the SPA. The surveys

shall be conducted before the approval of grading and/or improvement plans (as applicable) and no less than 14 days and no more than 30 days before the beginning of construction for all project phases. To the extent feasible, guidelines provided in *Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in the Central Valley* (Swainson's Hawk Technical Advisory Committee 2000) shall be followed for surveys for Swainson's hawk. If no nests are found, no further mitigation is required.

If active nests are found, impacts on nesting Swainson's hawks and other raptors shall be avoided by establishing appropriate buffers around the nests. No project activity shall commence within the buffer area until the young have fledged, the nest is no longer active, or until a qualified biologist has determined in coordination with DFG that reducing the buffer would not result in nest abandonment. DFG guidelines recommend implementation of 0.25- or 0.5-mile-wide buffers, but the size of the buffer may be adjusted if a qualified biologist and the City, in consultation with DFG, determine that such an adjustment would not be likely to adversely affect the nest. Monitoring of the nest by a qualified biologist during and after construction activities will be required if the activity has potential to adversely affect the nest.

If active burrows are found, a mitigation plan shall be submitted to the City for review and approval before any ground-disturbing activities. The City shall consult with DFG. The mitigation plan may consist of installation of one-way doors on all burrows to allow owls to exit, but not reenter, and construction of artificial burrows within the project vicinity, as needed; however, burrow owl exclusions may only be used if a qualified biologist verifies that the burrow does not contain eggs or dependent young. If active burrows contain eggs and/or young, no construction shall occur within 50 feet of the burrow until young have fledged. Once it is confirmed that there are no owls inside burrows, these burrows may be collapsed.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of grading and improvement plans, before any ground-disturbing activities, and during project construction as applicable for all project phases.

Enforcement:

1. California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the U.S. 50 interchange improvements: Caltrans.
5. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.3-2b: Prepare and Implement a Swainson's Hawk Mitigation Plan.

To mitigate for the loss of Swainson's hawk foraging habitat, the project applicant(s) of all project phases shall prepare and implement a Swainson's hawk mitigation plan including, but not limited to the requirements described below.

Before the approval of grading and improvement plans or before any ground-disturbing activities, whichever occurs first, the project applicant(s) shall preserve, to the satisfaction of the City or Sacramento County, as appropriate depending on agency jurisdiction, suitable Swainson's hawk foraging habitat to ensure 1:1 mitigation of habitat value for Swainson's hawk foraging habitat lost as a result of the project, as determined by the City, or Sacramento County, after consultation with DFG and a qualified biologist.

The 1:1 habitat value shall be based on Swainson's hawk nesting distribution and an assessment of habitat quality, availability, and use within the City's planning area, or Sacramento County jurisdiction. The mitigation ratio shall be consistent with the 1994 DFG Swainson's Hawk Guidelines included in the *Staff Report Regarding Mitigation for Impacts to Swainson's Hawks (*Buteo swainsoni*) in the Central Valley of California*. Such mitigation shall be accomplished through either the transfer of fee title or perpetual conservation easement. The mitigation land shall be located within the known foraging area and within Sacramento County. The City, or Sacramento County if outside City jurisdiction, after consultation with DFG, will determine the appropriateness of the mitigation land.

Before approval of such proposed mitigation, the City, or Sacramento County for the off-site detention basin, shall consult with DFG regarding the appropriateness of the mitigation. If mitigation is accomplished through conservation easement, then such an easement shall ensure the continued management of the land to maintain Swainson's hawk foraging values, including but not limited to ongoing agricultural uses and the maintenance of all existing water rights associated with the land. The conservation easement shall be recordable and shall prohibit any activity that substantially impairs or diminishes the land's capacity as suitable Swainson's hawk habitat.

The project applicant(s) shall transfer said Swainson's hawk mitigation land, through either conservation easement or fee title, to a third-party, nonprofit conservation organization (Conservation Operator), with the City and DFG named as third-party beneficiaries. The Conservation Operator shall be a qualified conservation easement land manager that manages land as its primary function. Additionally, the Conservation Operator shall be a tax-exempt nonprofit conservation organization that meets the criteria of Civil Code Section 815.3(a) and shall be selected or approved by the City or County, after consultation with DFG. The City, or County, after consultation with DFG and the Conservation Operator, shall approve the content and form of the conservation easement. The City, or County, DFG, and the Conservation Operator shall each have the power to enforce the terms of the conservation easement. The Conservation Operator shall monitor the easement in perpetuity to assure compliance with the terms of the easement.

The project applicant(s), after consultation with the City, or County of jurisdiction, DFG, and the Conservation Operator, shall establish an endowment or some other financial mechanism that is sufficient to fund in perpetuity the operation, maintenance, management, and enforcement of the conservation easement. If an endowment is used, either the endowment funds shall be submitted to the City for impacts on lands within the City's jurisdiction or Sacramento County for the off-site detention basin to be distributed to an appropriate third-party nonprofit conservation agency, or they shall be submitted directly to the third-party nonprofit conservation agency in exchange for an agreement to manage and maintain the lands in perpetuity. The Conservation Operator shall not sell, lease, or transfer any interest of any conservation easement or mitigation land it acquires without prior written approval of the City and DFG. Mitigation lands established or acquired for impacts incurred at the off-site detention basin shall require approval from Sacramento County prior to sale or transfer of mitigation lands or conservation easement.

If the Conservation Operator ceases to exist, the duty to hold, administer, manage, maintain, and enforce the interest shall be transferred to another entity acceptable to the City and DFG, or Sacramento County and DFG depending on jurisdiction of the affected habitat. The City Planning Department shall ensure that mitigation habitat established for impacts on habitat within the City's planning area is properly established and is functioning as habitat by conducting regular monitoring of the mitigation site(s) for the

first 10 years after establishment of the easement. Sacramento County shall monitor habitat and ensure success for impacts on habitat at the off-site detention basin.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Sacramento County and Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of grading, improvement, or construction plans and before any ground-disturbing activity in any project development phase that would affect Swainson's hawk foraging habitat.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2c: Avoid and Minimize Impacts to Tricolored Blackbird Nesting Colonies.

To avoid and minimize impacts to tricolored blackbird, the project applicant(s) of all project phases shall conduct a preconstruction survey for any project activity that would occur during the tricolored blackbird's nesting season (March 1–August 31). The preconstruction survey shall be conducted by a qualified biologist before any activity occurring within 500 feet of suitable nesting habitat, including freshwater marsh and areas of riparian scrub vegetation. The survey shall be conducted within 14 days before project activity begins.

If no tricolored blackbird colony is present, no further mitigation is required. If a colony is found, the qualified biologist shall establish a buffer around the nesting colony. No project activity shall commence within the buffer area until a qualified biologist confirms that the colony is no longer active. The size of the buffer shall be determined in consultation with DFG. Buffer size is anticipated to range from 100 to 500 feet, depending on the nature of the project activity, the extent of existing disturbance in the area, and other relevant circumstances.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any ground-disturbing activity within 500 feet of suitable nesting habitat as applicable for all project phases.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
2. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2d: Avoid and Minimize Impacts to Special-Status Bat Roosts.

The project applicant of all project phases containing potential bat roosting habitat shall retain a qualified biologist to conduct surveys for roosting bats. Surveys shall be conducted in the fall to determine if the mine shaft is used as a hibernaculum and in spring and/or summer to determine if it is used as a maternity or day roost. Surveys shall consist of evening emergence surveys to note the presence or absence of bats and could consist of visual surveys at the time of emergence. If evidence of bat use is observed, the number and species of bats using the roost shall be determined. Bat detectors may be used to supplement survey efforts. If no bat roosts are found, then no further study shall be required.

If roosts of pallid bat or Townsend's big-eared bats are determined to be present and must be removed, the bats shall be excluded from the roosting site before the mine shaft is removed. A mitigation program addressing compensation, exclusion methods, and roost removal procedures shall be developed in consultation with DFG before implementation. Exclusion methods may include use of one-way doors at roost entrances (bats may leave but not reenter), or sealing roost entrances when the site can be confirmed to contain no bats. Exclusion efforts may be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young). The loss of each roost (if any) will be replaced in consultation with DFG and may include construction and installation of bat boxes suitable to the bat species and colony size excluded from the original roosting site. Roost replacement will be implemented before bats are excluded from the original roost sites. Once the replacement roosts are constructed and it is confirmed that bats are not present in the original roost site, the mine shaft may be removed.

Implementation: Project applicant(s) of all project phases containing potential bat roosting habitat.

Timing: Before the approval of removal or fill of the mine shaft in the SPA.

Enforcement: City of Folsom Community Development Department.

Mitigation Measure 3A.3-2e: Obtain an Incidental Take Permit under Section 10(a) of ESA; Develop and Implement a Habitat Conservation Plan to Compensate for the Loss of Vernal Pool Habitat.

The project applicant(s) for all project phases shall obtain an incidental take permit under Section 10(a) of ESA. No project construction shall proceed in areas supporting potential habitat for Federally listed vernal pool invertebrates, or within adequate buffer areas (250 feet or lesser distance deemed sufficiently protective by a qualified biologist with approval from USFWS), until a BO has been issued by USFWS and the project applicant(s) have abided by conditions in the BO (including all conservation and minimization measures). Conservation and minimization measures are likely to include preparation of supporting documentation describing methods to protect existing vernal pools during and after project construction.

Under the No USACE Permit Alternative, interagency consultation under Section 7 of ESA would not occur; therefore, the project applicant(s) would be required to develop a habitat conservation plan to mitigate impacts on Federally listed vernal pool invertebrates. The project applicant(s) shall complete and implement, or participate in, a habitat conservation plan that shall compensate for the loss of acreage, function, and value of affected vernal pool habitat. The habitat conservation plan shall be consistent with the goals of the *Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon* (USFWS 2005) and must be approved by USFWS.

The project applicant(s) for all project phases shall ensure that there is sufficient upland habitat within the target areas for creation and restoration of vernal pools and vernal pool complexes to provide ecosystem health. The land used to satisfy this mitigation measure shall be protected through a fee title or conservation easement acceptable to the City and USFWS.

The project applicant(s) for all project phases shall identify the extent of indirectly affected vernal pool and seasonal wetland habitat, either by identifying all such habitat within 250 feet of project construction activities or by providing an alternative technical evaluation in support of a lesser indirect impact distance. If a lesser distance is pursued, this distance shall be approved by USFWS. The project applicant(s) shall preserve 2 wetted acres of vernal pool habitat for each wetted acre of any indirectly affected vernal pool habitat. This mitigation shall occur before the approval of any grading or improvement plans for any project phase that would allow work within 250 feet of such habitat, and before any ground-disturbing activity within 250 feet of the habitat. The project applicant(s) will not be required to complete this mitigation measure for direct or indirect impacts that have already been mitigated to the satisfaction of USFWS through another BO or mitigation plan.

A standard set of BMPs shall be applied to construction occurring in areas within 250 feet of off-site vernal pool habitat, or within any lesser distance deemed adequate by a qualified biologist (with approval from USFWS) to constitute a sufficient buffer from such habitat. Refer to Section 3A.9, "Hydrology and Water Quality - Land" for the details of BMPs to be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties or Caltrans).

Implementation: Project applicant(s) of all project phases and on-site and off-site elements.

Timing: Before the approval of any grading or improvement plans, before any ground-disturbing activities within 250 feet of said habitat, and on an ongoing basis throughout construction as applicable for all project phases as required by the habitat conservation plan and/or BO.

Enforcement:

1. U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.
5. For the U.S. 50 interchange improvements: Caltrans.

Mitigation Measure 3A.3-2f: Obtain an Incidental Take Permit under Section 10(a) of ESA; Develop and Implement a Habitat Conservation Plan to Compensate for the Loss of VELB Habitat.

As long as valley elderberry longhorn beetle remains a species protected under ESA, the project applicant(s) of all project phases containing elderberry shrubs shall obtain an incidental take permit under Section 10(a) of ESA for valley elderberry longhorn beetle. No project construction shall proceed in areas potentially containing valley elderberry longhorn beetle until a BO has been issued by USFWS, and the project applicant(s) for all project phases have abided by all pertinent conditions in the BO relating to the proposed construction, including all conservation and minimization measures. Conservation and minimization measures are likely to include preparation of supporting documentation that describes methods for relocation of existing shrubs and maintaining existing shrubs and other vegetation in a conservation area.

Under the No USACE Permit Alternative, interagency consultation under Section 7 of ESA would not occur; therefore, the project applicant(s) would be required to develop a habitat conservation plan to mitigate impacts on valley elderberry longhorn beetle. The project applicant(s) shall complete and implement a habitat conservation plan that will compensate for the loss of valley elderberry longhorn beetle. Relocation of existing elderberry shrubs and planting of new elderberry seedlings shall be implemented on a no-net-loss basis. Detailed information on monitoring success of relocated and planted shrubs and measures to compensate (should success criteria not be met) would also likely be required in the BO. Ratios for mitigation of valley elderberry longhorn beetle habitat will ultimately be determined through the ESA Section 10(a) consultation process with USFWS, but shall be a minimum of "no net loss."

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases potentially containing elderberry shrubs.

Timing: Before the approval of any grading or improvement plans or any ground-disturbing activity within 100 feet of valley elderberry longhorn beetle habitat as applicable for all project phases, and on an ongoing basis as required by the habitat conservation plan and/or BO.

Enforcement:
1. U.S. Fish and Wildlife Service
2. City of Folsom Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

PP

Development under the Proposed Project Alternative would result in an increase in development and human population that would result in adverse effects on a number of special-status wildlife species. Special-status wildlife listed under ESA that could be substantially affected by the Proposed Project Alternative include vernal pool fairy shrimp, vernal pool tadpole shrimp, conservancy fairy shrimp, and valley elderberry longhorn beetle. Swainson's hawk, which is listed under CESA as threatened, could also be adversely affected by the Proposed Project Alternative. Impacts on these five listed species would be considered significant and are discussed in detail below. Special-status raptors, western spadefoot, tricolored blackbird, and special-status bats could also be adversely affected, and are discussed further below. Impacts on all other special-status wildlife species are considered less than significant because potential loss of a few individuals is not likely to result in a substantial adverse affect on the population.

Wildlife Associated with Vernal Pools

The SPA contains approximately 5 acres of vernal pools, 5 acres of seasonal wetlands, and 26 acres of seasonal wetland swales that are considered potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad. Vernal pool tadpole shrimp and conservancy fairy shrimp are Federally listed as endangered. Vernal pool fairy shrimp is Federally listed as threatened. Western spadefoot is a California species of special concern. Vernal pool tadpole shrimp have been documented directly adjacent to the southwest corner of the SPA, and vernal pool fairy shrimp have been documented less than one mile to the south of the SPA (CNDDB 2008). Western spadefoot are known to occur in Mather Regional Park, more than 5 miles from the SPA.

California tiger salamander is not expected to occur in the SPA. Although there is potentially suitable breeding habitat in some vernal pools, seasonal wetlands, and ponds and suitable uplands in the grasslands on site, California tiger salamander have not been detected in Sacramento County north of the Cosumnes River (USFWS 2004). In a survey transect that extended along the west side of the Sacramento Valley from Shasta County to Solano County, California tiger salamanders were recorded only at the Jepson Prairie in Solano County (Watts 2008). Surveys of vernal pool habitats on and near the SPA have not incidentally detected California tiger salamander. Given that the closest known population is 15 miles to the south of the SPA and the lack of known populations in the project region, it is unlikely for California tiger salamander to occur in the SPA.

Protocol surveys (two wet-seasons or consecutive wet- and dry-season surveys) for Federally listed vernal pool crustaceans have been conducted on over 70% of the SPA and no listed adults or cysts were detected (MJM Properties 2007a, MJM Properties 2007b, Colliers International 2007a, Gibson and Skordal 2009). However, vernal pool fairy shrimp have been detected in two locations within the Prairie City Business Park property at the northwest corner of the SPA during wet-season surveys in 2008-2009 (ECORP 2009b). At least one wet-season survey has been conducted in other areas along the western portion of the site, but no listed vernal pool crustaceans have been detected (ECORP 2009b). Federally listed vernal pool crustaceans could occur elsewhere in the SPA where suitable habitat is present (Holloway Rassmusson Molondanof 2005 and The Hodgson Company 2007a). Although surveys over the majority of the SPA in suitable habitat indicate that listed vernal pool crustaceans may be absent from most of the site, vernal pool fairy shrimp is known to occur in at least one watershed, which is connected to other suitable habitats on the site. In addition, many of the wetlands surveyed contained linderiella, which is not a listed species, but is often found in association with listed crustaceans. Therefore, there remains potential for listed vernal pool crustaceans to occur in suitable habitats in the SPA.

Focused surveys for western spadefoot were conducted in April 2006 on approximately 40% of the SPA and were not detected (MJM Properties 2006d). The aquatic habitats surveyed were determined to be unsuitable for western spadefoot due to the abundance of predatory bullfrogs. Although habitat conditions may not be suitable for successful reproduction of western spadefoot, the species may be present in vernal pools or other seasonal wetlands in the SPA.

Implementation of the Proposed Project Alternative would permanently remove approximately 25 acres of potential habitat for special-status vernal pool crustaceans and western spadefoot, which includes approximately 3 acres of vernal pools, 4 acres of seasonal wetland, and 18 acres of seasonal wetland swale, as discussed under Impact 3A.3-1 “Loss and Degradation of Jurisdictional Wetlands and Other Waters of the U.S., and Waters of the State.” Approximately 2 acres of vernal pools, 1 acre of seasonal wetland, and 8 acres of seasonal wetland swale would be preserved in open space areas. Preserved wetlands within the designated open space areas would be provided with a 25-foot-wide buffer where no project-related ground disturbance would occur. Outside of the 25-foot-wide buffer, an additional 50 feet of “no-development” buffer would be established; however disturbance associated with contour grading, mitigation planting, trails, benches, and other passive recreational amenities may occur in this 50-foot “no development” buffer.

In addition to the direct effect of habitat loss or injury to individuals by filling suitable habitat, vernal pool species could be indirectly affected by project activities that occur adjacent to wetland habitats. Indirect effects include habitat degradation that could result from reduction in water quality caused by urban runoff, erosion, and siltation; intrusion of humans and domestic animals; and introduction of invasive plant species. In addition, the hydrology of the wetland habitats for vernal pool crustaceans and western spadefoot could be altered by substantial grading of the site, including within the open space areas, and creation of impervious surfaces proposed for adjacent uplands. All portions of the SPA, with the exception of 25-foot-wide buffers around preserved wetlands, would be subject to contour grading, which could affect wetland hydrology and water quality. Overall site topography would be substantially altered to achieve level ground for development. These earthmoving activities and resulting gradient changes across the SPA could alter hydrologic patterns and adversely affect wetlands and drainage channels retained in the SPA, as well as off-site wetlands, by altering hydration periods, peak flows, runoff volumes, and runoff durations. Construction of new roadways and roadway improvements associated with

development of the backbone infrastructure could disrupt or eliminate hydrologic and biological connectivity that is important to support wetlands and associated wildlife species. In addition, western spadefoot, if they occur in the SPA, could be indirectly affected by an increase in vehicular traffic on the site, which could result in mortality during dispersal or seasonal movements between aquatic and upland habitats.

Therefore, **direct** and **indirect** impacts to vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad would be **significant.**

Swainson's Hawk and Other Raptors

Swainson's hawk, a species state-listed as threatened, is one of several raptors that are likely to nest and/or forage in the SPA. Two California species of special concern (western burrowing owl and northern harrier) have been documented foraging on the site (MJM Properties 2006b), and are expected to nest on site. White-tailed kite, which is fully protected under the California Fish and Game Code, is also expected to nest and forage on site. One additional California species of special concern, golden eagle, may forage on site outside of the breeding season. All raptors and their nests are protected under Section 3503.5 of the California Fish and Game Code. Common raptors that could nest in the SPA include Cooper's hawk, American kestrel, red-tailed hawk, red-shouldered hawk, western screech-owl, great horned owl, and barn owl.

Implementation of the Proposed Project Alternative would have a substantial adverse effect on nesting and foraging habitat for raptors. Of the approximately 642 acres of existing oak woodland that is considered potential nesting habitat for Swainson's hawk and other tree-nesting raptors, approximately 243 acres (37%) would be removed. If trees are to be removed during the raptor breeding season (February–August), mortality of eggs and chicks could result if an active nest were present. In addition, project construction could disturb active nests near the construction area or in trees not yet removed from the SPA, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Indirect effects to nesting raptors include increased nest failure due to disruption of essential breeding and foraging behavior resulting from human disturbances in adjacent developed areas and increased nest predation by wildlife species associated with human development, such as crows and raccoons, as well as domestic cats (and dogs for ground-nesting raptors such as burrowing owl and northern harrier). The 2,594 acres of grassland habitat present in the SPA is considered foraging habitat for raptors and could be used for nesting by burrowing owl and northern harrier. The grading, paving, and other ground disturbances in the project footprint could indirectly affect nesting and foraging raptors by reducing the population of the small mammal prey base of many raptors over the entire SPA through conversion of natural vegetation cover. Large raptors generally require large areas of suitable foraging habitat. The remaining grassland in the open space areas would be fragmented by the development, which may cause the habitat to be unsuitable for raptor foraging.

As a consequence of direct loss of nesting and foraging habitat and indirect effects to nest success and foraging habitat quality, implementation of the Proposed Project Alternative could eventually lead to the permanent displacement of some raptors from the SPA. Therefore, the Proposed Project Alternative would result in **significant direct** and **indirect** impacts on Swainson's hawk and other raptors.

Valley Elderberry Longhorn Beetle

The valley elderberry longhorn beetle is Federally listed as threatened, but has been proposed for delisting. Several elderberry shrubs with stems greater than 1.0 inch in diameter at ground level, which provide potential habitat for valley elderberry longhorn beetle (USFWS 1999), have been documented throughout the SPA (GenCorp 2007d,e; MJM Properties 2006b; Colliers International 2006). Valley elderberry longhorn beetles have been documented within two miles of the site (CNDDB 2008), and beetle exit holes potentially created by valley elderberry longhorn beetles have been observed in elderberry shrubs adjacent to the SPA (ECORP 2007d).

Implementation of the Proposed Project Alternative could result in the direct or indirect loss of valley elderberry longhorn beetles or their habitat. Six elderberry shrubs have been mapped in the SPA (Exhibit 3A.3-1), but at

least one unmapped shrub is known to occur on site (GenCorp 2007d), and additional shrubs may also be present because thorough, focused surveys have not been conducted. Although a portion of the SPA including one mapped elderberry shrub has been set aside for preservation, at least four elderberry shrubs are known to be located within areas proposed for development, and additional shrubs may also be located within development and/or grading areas. If elderberry shrubs containing valley elderberry longhorn beetle larvae are removed while listed, direct take of this Federally-threatened species would result, which would constitute a significant impact. It is conceivable that over the 20-year buildout period, the species could become delisted. Indirect impacts could also result if the health of elderberry shrubs containing valley elderberry longhorn beetle larvae is adversely affected. Indirect impacts could occur if herbicides or insecticides are used in habitats adjacent to elderberry shrubs, if earthmoving activities disturb elderberry shrub roots, or if the topography and/or hydrology of the surrounding area are altered to the extent that it reduces the soil moisture surrounding the elderberry shrub. Therefore, direct and indirect impacts to valley elderberry longhorn beetle are considered to be significant. If delisting occurs, this **direct** and **indirect** impact would be less than significant, however for purposes of this EIR/EIS, this direct and indirect impact is considered **significant**.

Tricolored Blackbird

Nesting habitat for tricolored blackbird is found in riparian habitat and blackberry brambles along Alder Creek and adjacent to several ponds in the SPA. Tricolored blackbirds nest in colonies of 100s to 10,000s of individuals. Nesting colonies will often occur in the same location over many years, but colonies may also shift locations if nest failure occurs. An abundant insect source near the nesting colony is an important habitat component and nesting colonies are often associated with dairies, feedlots, or wastewater treatment ponds. Although tricolored blackbirds are not known to nest on the site and suitable nesting and foraging habitat is limited, several tricolored blackbird colonies are known from within 5 miles of the SPA (CNDDB 2008). Disturbance during construction could result in nest abandonment and loss of eggs or young if an active tricolored blackbird nesting colony were to be present during ground-disturbing activities. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. Because project activities adjacent to potential nesting habitat are not expected to result in the mortality of individuals, chicks, or eggs, **indirect impacts** would be considered **less than significant**.

Special-Status Bats

Several special-status bat species have potential to occur in the SPA, including pallid bat, Townsend's big-eared bat, western mastiff bat, and western red bat. These species may forage over open grassland and woodland areas, as well as riparian areas. Roosting habitat is typically a limiting factor to bat distribution. Western mastiff bat is unlikely to roost on site due to habitat preference to use tall cliffs and rocks, which are absent from the site. Western red bat roosts in tree foliage, especially in cottonwoods, sycamore, and other broad-leaved deciduous riparian trees (Pierson et al. 2004); suitable roosting habitat for western red bat is lacking from the site, as the riparian habitat along Alder Creek mostly consists of willow and blackberry scrub. An abandoned mine shaft is present in the south central portion of the site and would likely be filled or capped due to public safety issues. It is unknown if this mine shaft provides suitable thermal or structural conditions for roosting bats. However, if the mine shaft is used as a day roost, hibernation roost, or maternity colony roost, implementation of the Proposed Project Alternative could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Day roosts are used throughout the spring and summer and maternity colony roosts can be active from approximately early April until mid-October. Hibernation roosts may be used from approximately November to early March. Loss of individual bats would be considered a **potentially significant, direct** impact. There would be **no indirect** impact on special-status bat species.

Other Special-Status Species

Several other special-status species have potential to occur in the SPA: western pond turtle, loggerhead shrike, grasshopper sparrow, Modesto song sparrow, and American badger, as discussed below.

Suitable habitat for western pond turtle occurs in two large ponds within the oak woodland community in the west-central portion of the site and in perennial portions of Alder Creek and tributaries. Western pond turtles are known to occur in at least one pond in the SPA and have been documented in Alder Creek immediately downstream of the SPA (GenCorp 2007e). No turtles were observed during focused surveys in the eastern central portion of the SPA (MJM Properties 2006b) and suitable habitat was determined to be absent in the southern and eastern portions of the site (MJM Properties 2006b, Centex Homes 2006a, Holloway Rassmusson Molondanof 2005). Implementation of the Proposed Project Alternative would not directly fill the occupied or suitable ponds in the western-central portion of the site or the perennial portions of Alder Creek and its tributaries, and upland habitats suitable for nesting would be retained in proximity to aquatic habitat. **Direct** and **indirect** impacts to western pond turtle are considered **less than significant**.

The SPA provides potential nesting habitat for loggerhead shrike, grasshopper sparrow, and Modesto song sparrow. Individuals of these species may nest in open woodland, grassland, or riparian habitats, respectively, on site. Portions of these habitats would be removed by project implementation, but large areas of oak woodland, grassland, and riparian habitat would be preserved in the open space areas, especially along Alder Creek. **Direct** and **indirect** impacts of project implementation on these species are considered **less than significant** because potential loss of a few individuals is not likely to result in a substantial effect on their populations.

American badger is a wide-ranging species that uses grassland and oak woodland habitats. American badger has been documented adjacent to the SPA by Matus (1981, cited in GenCorp 2007e), and nearly the entire SPA provides suitable habitat. It is unknown if the species currently occurs in the SPA. Although implementation of the Proposed Project Alternative would result in loss of habitat for American badger, oak woodland and grassland habitat would be preserved in the open space areas and abundant grassland habitat is present to the south of the SPA. The loss of habitat from the SPA would not be likely to cause loss of individuals because there would still be adequate suitable foraging and denning habitat in the area to support the local population. Therefore, **direct** and **indirect** impacts to American badger are considered **less than significant**.

Mitigation Measure: Implement Mitigation Measures 3A.3-1a, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, and 3A.3-2d.

Mitigation Measure 3A.3-2g: Secure Take Authorization for Federally Listed Vernal Pool Invertebrates and Implement All Permit Conditions.

No project construction shall proceed in areas supporting potential habitat for Federally listed vernal pool invertebrates, or within adequate buffer areas (250 feet or lesser distance deemed sufficiently protective by a qualified biologist with approval from USFWS), until a biological opinion (BO) has been issued by USFWS and the project applicant(s) of all project phases have abided by conditions in the BO (including conservation and minimization measures) intended to be completed before on-site construction. Conservation and minimization measures shall include preparation of supporting documentation describing methods to protect existing vernal pools during and after project construction, a detailed monitoring plan, and reporting requirements.

As described under Mitigation Measure 3A.3-1a, an MMP shall be developed that describes details how loss of vernal pool and other wetland habitats shall be offset, including details on creation of habitat, account for the temporal loss of habitat, contain performance standards to ensure success, and outline remedial actions if performance standards are not met.

The project applicant(s) of all project phases shall complete and implement a habitat MMP that will result in no net loss of acreage, function, and value of affected vernal pool habitat. The final habitat MMP shall be consistent with guidance provided in *Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans within the Jurisdiction of the Sacramento Field Office, California* (USFWS 1996) or shall provide an

alternative approach that is acceptable to the City, USACE, and USFWS and accomplishes no net loss of habitat acreage, function, and value.

The project applicant(s) of all project phases shall ensure that there is sufficient upland habitat within the target areas for creation and restoration of vernal pools and vernal pool complexes to provide ecosystem health. The project applicant(s) of all project phases shall identify the extent of indirectly affected vernal pool and seasonal wetland habitat, either by identifying all such habitat within 250 feet of project construction activities or by providing an alternative technical evaluation. If a lesser distance is pursued, this distance shall be approved by USFWS. The project applicant(s) shall preserve acreage of vernal pool habitat for each wetted acre of any indirectly affected vernal pool habitat at a ratio approved by USFWS at the conclusion of the Section 7 consultation. This mitigation shall occur before the approval of any grading or improvement plans for any project phase that would allow work within 250 feet of such habitat, and before any ground-disturbing activity within 250 feet of the habitat. The project applicant(s) will not be required to complete this mitigation measure for direct or indirect impacts that have already been mitigated to the satisfaction of USFWS through another BO or mitigation plan (i.e., if impacts on specific habitat acreage are mitigated by one project phase or element, the project applicant(s) will not be required to mitigate for it again in another phase of the project).

A standard set of BMPs shall be applied to construction occurring in areas within 250 feet of off-site vernal pool habitat, or within any lesser distance deemed adequate by a qualified biologist (with approval from USFWS) to constitute a sufficient buffer from such habitat. Refer to Section 3A.9, "Hydrology and Water Quality - Land" for the details of BMPs to be implemented.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., El Dorado and/or Sacramento Counties, or Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any grading or improvement plans, before any ground-disturbing activities within 250 feet of said habitat, and on an ongoing basis throughout construction as applicable for all project phases as required by the mitigation plan, BO, and/or BMPs.

Enforcement:

1. U.S. Army Corps of Engineers, Sacramento District; U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the U.S. 50 interchange improvements: Caltrans.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

Mitigation Measure 3A.3-2h: Obtain Incidental Take Permit for Impacts on Valley Elderberry Longhorn Beetle and Implement All Permit Conditions.

Before each phase of the project, the project applicant(s) shall have a qualified biologist identify any elderberry shrubs within 100 feet of the project footprint and conduct a survey for valley elderberry

longhorn beetle exit holes in stems greater than 1 inch in diameter. If no project activity, including grading or use of herbicides, would occur within 100 feet of an elderberry shrub, then no further mitigation shall be required for valley elderberry longhorn beetle in those areas.

If project activities would occur within 100 feet of any elderberry shrubs, consultation with USFWS under Section 7 will be required. No project construction shall proceed in areas potentially containing valley elderberry longhorn beetle until a BO has been issued by USFWS, and the project applicant(s) of all project phases have abided by all pertinent conditions in the BO relating to the proposed construction, including conservation and minimization measures, intended to be completed before on-site construction. Conservation and minimization measures are likely to include preparation of supporting documentation that describes methods for relocation of existing shrubs and maintaining existing shrubs and other vegetation in a conservation area.

Relocation of existing elderberry shrubs and planting of new elderberry seedlings shall be implemented on a no-net-loss basis. Compensatory mitigation for elderberry shrubs that would be removed from their current locations would be developed in consultation with USFWS during the Section 7 consultation process. Compensatory mitigation may include planting replacement elderberry seedlings or cuttings and associated native plants within the open space areas of the SPA, planting replacement elderberry seedlings or cuttings and associated native plants at a suitable off-site location, purchasing credits at an approved mitigation bank, or a combination thereof. Relocated and replacement shrubs and associated native plantings shall be placed in conservation areas providing a minimum of 1,800 square feet per transplanted shrub. These conservation areas shall be preserved in perpetuity as habitat for valley elderberry longhorn beetle. The number of elderberry shrubs that would be affected by implementing the project is expected to be low because there are currently a total of less than 10 shrubs known to be present in the SPA. Ratios for mitigation of valley elderberry longhorn beetle habitat will ultimately be determined through the ESA Section 7 consultation process with USFWS, but shall be a minimum of "no net loss." USFWS uses stem count data, presence or absence of exit holes, and whether the affected elderberry shrubs are located in riparian habitat to determine the number of elderberry seedlings or cuttings and associated riparian vegetation that would need to be planted as compensatory mitigation for affected elderberry longhorn beetle habitat. The final VELB mitigation plan, including transplanting procedures, long-term protection, management of the mitigation areas, and monitoring procedures shall be consistent with the *Conservation Guidelines for the Valley Elderberry Longhorn Beetle* (USFWS 1999).

The population of valley elderberry longhorn beetles, the general condition of the conservation area, and the condition of the elderberry and associated native plantings in the conservation area must be monitored over a period of either ten consecutive years or for seven years over a 15-year period. A minimum survival rate of at least 60% of the elderberry plants and 60% of the associated native plants must be maintained throughout the monitoring period. Within one year of discovering that survival has dropped below 60%, the project applicant(s) shall replace failed plantings to bring survival above this level. Detailed information on monitoring success of relocated and planted shrubs and measures to compensate (should success criteria not be met) would be required in the BO.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries (i.e., U.S. 50 interchange improvements) must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans).

Implementation: Project applicant(s) of all project phases.

Timing: Before the approval of any grading or improvement plans or any ground-disturbing activity within 100 feet of valley elderberry longhorn beetle habitat as applicable for all project phases, and on an ongoing basis as required by BO.

Enforcement:

1. U.S. Army Corps of Engineers, Sacramento District; U.S. Fish and Wildlife Service.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the U.S. 50 interchange improvements: Caltrans.

RIM

Wildlife Associated with Vernal Pools

The Resource Impact Minimization Alternative would result in permanent fill of approximately 1 acre of vernal pool, 3 acres of seasonal wetlands, and 13 acres of seasonal wetland swales, which is 6 acres less of potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad directly affected than the Proposed Project Alternative. Indirect effects on vernal pool species would also be less because the Resource Impact Minimization Alternative generally includes at least a 250-foot buffer around wetland habitats, resulting in an additional 379 acres of open space, which would preserve more of the micro watersheds and maintain greater hydrologic function of wetland habitats. However, permanent loss of habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot would still occur, and direct take of individuals could occur, as a result of implementation of the Resource Impact Minimization Alternative. Indirect effects to these species would still occur as a result of development in uplands adjacent to wetland habitats, including alteration of the topography and hydrologic function, increased run-off from adjacent impervious surfaces, and degraded water quality from containments. Therefore **direct** and **indirect** impacts to vernal pool-associated wildlife species would be **significant.** ***[Lesser]***

Swainson's Hawk and Other Raptors

The Resource Impact Minimization Alternative would result in removal of approximately 312 acres of oak woodland, which provides potential nesting habitat for Swainson's hawk and other raptors. Tree removal during the raptor breeding season (February–August) could result in mortality of eggs and chicks if an active nest were present. Other construction activities could disturb active nests near the construction area or in trees not yet removed from the SPA, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Implementation of the Resource Impact Minimization Alternative would result in the direct loss of almost 2,000 acres of grassland, which provides foraging habitat for Swainson's hawk and other raptors. Some of the remaining 597 acres of grassland habitat would be directly affected by contour grading, recreational amenities, and other activities within the open space area. In addition, this alternative would result in indirect effects to the nesting and foraging habitat remaining in the SPA due to disturbance from use of adjacent development, which could reduce nest success and foraging habitat quality. Therefore, **direct** and **indirect** impacts to Swainson's hawk and other raptors would be **significant.** ***[Similar]***

Valley Elderberry Longhorn Beetle

Implementation of the Resource Impact Minimization Alternative could result in removal of elderberry shrubs containing valley elderberry longhorn beetle larvae. Indirect impacts from ground-disturbing activities or use of herbicides could also result if the health of elderberry shrubs containing valley elderberry longhorn beetle larvae is adversely affected. Therefore, **direct** and **indirect** impacts to valley elderberry longhorn beetle are considered to be **significant**. ***[Similar]***

Tricolored Blackbird

Construction activities during implementation of the Resource Impact Minimization Alternative could result in disturbance to tricolored blackbird colonies, which may result in nest abandonment and loss of eggs or young. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. Because project activities adjacent to potential nesting habitat are not expected to result in the mortality of individuals, chicks, or eggs, **indirect impacts** would be considered **less than significant**. ***[Similar]***

Special-Status Bats

Implementation of the Resource Impact Minimization Alternative would likely require an abandoned mine shaft to be filled or capped. If the mine shaft is used by bats as a day roost, hibernation roost, or maternity colony roost, implementation of this alternative could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Project activities could result in **significant direct** or **indirect** impacts on special-status bat species. ***[Similar]***

Other Special-Status Species

The Resource Impact Minimization Alternative would have a **less-than-significant direct** and **indirect** impact on western pond turtle, loggerhead shrike, grasshopper sparrow, Modesto song sparrow, and American badger because implementation of this alternative would not substantially reduce their populations. ***[Similar]***

> Mitigation Measure: Implement Mitigation Measures 3A.3-1a, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2g, and 3A.3-2h.

CD

Wildlife Associated with Vernal Pools

The Centralized Development Alternative would result in permanent fill of approximately 3 acres of vernal pool, 3 acres of seasonal wetlands, and 18 acres of seasonal wetland swales, which is about 1 acre less of potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad directly affected than the Proposed Project Alternative. Indirect effects on vernal pool species would also be less slightly less than the Proposed Project Alternative because the Centralized Development Alternative would designated an additional 414 acres of open space, which would preserve more of the uplands surrounding the wetlands, providing lager buffers and maintaining more of the micro watersheds and greater hydrologic function. However, permanent loss of habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot would still occur as a result of implementation of the Centralized Development Alternative. Indirect effects to these species would still occur as a result of development in uplands adjacent to wetland habitats, including alteration of the topography and hydrologic function, increased runoff from adjacent impervious surfaces, and degraded water quality from containments. Therefore **direct** and **indirect** impacts to wildlife species associated with vernal pools would be **significant.** ***[Lesser]***

Swainson's Hawk and Other Raptors

The Centralized Development Alternative would result in removal of approximately 395 acres of oak woodland, which provides potential nesting habitat for Swainson's hawk and other raptors. Tree removal during the raptor breeding season (February–August) could result in mortality of eggs and chicks if an active nest were present. Other construction activities could disturb active nests near the construction area or in trees not yet removed from the SPA, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Implementation of the Centralized Development Alternative would result in the direct loss of approximately 1,860

acres of grassland, which provides foraging habitat for Swainson's hawk and other raptors. Some of the remaining 734 acres of grassland habitat would be directly affected by contour grading, recreational amenities, and other activities within the open space area. In addition, this alternative would result in indirect effects to the nesting and foraging habitat remaining in the SPA due to disturbance from use of adjacent development, which could reduce nest success and foraging habitat quality. Therefore, **direct** and **indirect** impacts to Swainson's hawk and other raptors would be **significant.** ***[Similar]***

Valley Elderberry Longhorn Beetle

Implementation of the Centralized Development Alternative could result in removal of elderberry shrubs containing valley elderberry longhorn beetle larvae. Indirect impacts from ground-disturbing activities or use of herbicides could also result if the health of elderberry shrubs containing valley elderberry longhorn beetle larvae is adversely affected. Therefore, **direct** and **indirect** impacts to valley elderberry longhorn beetle would be **significant**. ***[Similar]***

Tricolored Blackbird

Construction activities during implementation of the Centralized Development Alternative could result in disturbance to tricolored blackbird colonies, which may result in nest abandonment and loss of eggs or young. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. Because project activities adjacent to potential nesting habitat are not expected to result in the mortality of individuals, chicks, or eggs, **indirect** impacts would be considered **less than significant**. ***[Similar]***

Special-Status Bats

Implementation of the Centralized Development Alternative would likely require an abandoned mine shaft to be filled or capped. If the mine shaft is used by bats as a day roost, hibernation roost, or maternity colony roost, implementation of this alternative could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Project activities could result in **significant direct** or **indirect** impacts on special-status bat species. ***[Similar]***

Other Special-Status Species

The Centralized Development Alternative would have a **less-than-significant direct** and **indirect** impact on western pond turtle, loggerhead shrike, grasshopper sparrow, Modesto song sparrow, and American badger because implementation of this alternative would not substantially reduce their populations. ***[Similar]***

> Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2g, and 3A.3-2h.

RHD

Wildlife Associated with Vernal Pools

The Reduced Hillside Development Alternative would result in permanent fill of approximately 3.5 acre of vernal pool, 4 acres of seasonal wetlands, and 20 acres of seasonal wetland swales, which is about 3 acres more of potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad directly affected than the Proposed Project Alternative. Indirect effects on vernal pool species would also be similar to the Proposed Project Alternative. Major grading and topographic modifications would occur throughout the SPA and similar wetland buffers would be provided as described in the Proposed Project Alternative. However, permanent loss of habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal

pool tadpole shrimp, and western spadefoot would still occur as a result of implementation of the Reduced Hillside Development Alternative. Although this alternative includes control measures and performance standards that address stormwater flow, volume, and water quality for development areas to minimize hydrologic and geomorphic modifications, indirect effects to vernal pool associated species would still occur as a result of development in uplands adjacent to wetland habitats, due to alteration of the topography and hydrologic function, increased run-off from adjacent impervious surfaces, and degraded water quality from containments. Therefore **direct** and **indirect** impacts to wildlife species associated with vernal pools would be **significant.** ***[Greater]***

Swainson's Hawk and Other Raptors

The Reduced Hillside Development Alternative would result in removal of approximately 444 acres of oak woodland, which provides potential nesting habitat for Swainson's hawk and other raptors. Tree removal during the raptor breeding season (February–August) could result in mortality of eggs and chicks if an active nest were present. Other construction activities could disturb active nests near the construction area or in trees not yet removed from the SPA, potentially resulting in nest abandonment by the adults and mortality of chicks and eggs. Implementation of the Reduced Hillside Development Alternative would result in the direct loss of approximately 2,181 acres of grassland, which provides foraging habitat for Swainson's hawk and other raptors. Some of the remaining 413 acres of grassland habitat would be directly affected by contour grading, recreational amenities, and other activities within the open space area. In addition, this alternative would result in indirect effects to the nesting and foraging habitat remaining in the SPA due to disturbance from use of adjacent development, which could reduce nest success and foraging habitat quality. Therefore, **direct** and **indirect** impacts to Swainson's hawk and other raptors would be **significant.** ***[Similar]***

Valley Elderberry Longhorn Beetle

Implementation of the Reduced Hillside Development Alternative could result in removal of elderberry shrubs containing valley elderberry longhorn beetle larvae. Indirect impacts from ground-disturbing activities or use of herbicides could also result if the health of elderberry shrubs containing valley elderberry longhorn beetle larvae is adversely affected. Therefore, **direct** and **indirect** impacts to valley elderberry longhorn beetle would be **significant**. ***[Similar]***

Tricolored Blackbird

Construction activities during implementation of the Reduced Hillside Development Alternative could result in disturbance to tricolored blackbird colonies, which may result in nest abandonment and loss of eggs or young. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. Because project activities adjacent to potential nesting habitat are not expected to result in the mortality of individuals, chicks, or eggs, **indirect** impacts would be considered **less than significant**. ***[Similar]***

Special-Status Bats

Implementation of the Reduced Hillside Development Alternative would likely require an abandoned mine shaft to be filled or capped. If the mine shaft is used by bats as a day roost, hibernation roost, or maternity colony roost, implementation of this alternative could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Project activities could result in **significant direct** or **indirect** impacts on special-status bat species. ***[Similar]***

Other Special-Status Species

The Reduced Hillside Development Alternative would have a **less-than-significant direct** and **indirect** impact on western pond turtle, loggerhead shrike, grasshopper sparrow, Modesto song sparrow, and American badger because implementation of this alternative would not substantially reduce their populations. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2g, and 3A.3-2h.

Off-Site Elements

Wildlife Associated with Vernal Pools

The off-site elements would result in fill of approximately 0.59 acres of vernal pool, 0.25 acres of seasonal wetlands, or 0.55 acres seasonal wetland swales, which are potential habitat for vernal pool fairy shrimp, conservancy fairy shrimp, vernal pool tadpole shrimp, and western spadefoot toad. Construction of the off-site elements that support project development could result in loss of individuals or potential habitat for special-status wildlife associated with vernal pools. Indirect effects could include habitat degradation from runoff, erosion, siltation, or alteration of the hydrologic function of the wetlands. Therefore, **significant direct** and **indirect** impacts would occur.

Swainson's Hawk and Other Raptors

Construction of the off-site elements could result in disturbance to nesting Swainson's hawk or other raptors or direct removal of nest trees. Ground-disturbing activities near active nest trees could result in nest abandonment by the adults and mortality of chicks and eggs. Although the interchange improvements would result in loss of approximately 43 acres of annual grassland, these area are not likely important raptor foraging areas, as they are adjacent to existing roadways and U.S. 50 and located in hilly terrain. Loss of an active Swainson's hawk or other raptor nest would be considered a **potentially significant direct** and **indirect** impact.

Valley Elderberry Longhorn Beetle

It is unknown if suitable habitat for valley elderberry longhorn beetle would be affected by the off-site elements. However, if elderberry shrubs with stems greater than 1 inch are present in or adjacent to project construction, **significant direct** or **indirect** impacts to valley elderberry longhorn beetle larvae could occur. There are no elderberry shrubs present at the off-site detention basin site or the off-site roadway connections into El Dorado County. Elderberry shrubs are present in the U.S. 50 Prairie City Road interchange improvement footprint.

Tricolored Blackbird

Construction activities for the off-site elements could result in disturbance to tricolored blackbird colonies, which may result in nest abandonment and loss of eggs or young. Due to the potential for large numbers of nesting tricolored blackbirds to be lost, this **direct** impact would be considered **potentially significant**. **Indirect** impacts on tricolored blackbirds from off-site construction would be **less than significant** because they are not expected to result in the mortality of individuals, chicks, or eggs.

Special-Status Bats

Construction of the off-site elements would not involve modification of any existing bridge or overpass structures or other habitat that could be used by roosting bats. Therefore, **no direct** or **indirect impacts** to special-status bats would occur.

Other Special-Status Species

Construction of the off-site elements would not remove or disturb important nesting habitat for loggerhead shrike, grasshopper sparrow, or Modesto song sparrow, and would not remove or disturb a substantial amount of suitable habitat for American badger or substantially reduce their populations. In addition, no aquatic habitat for western pond turtle would be affected by the off-site elements. Therefore, **direct** and **indirect** impacts from construction of the off-site elements to these special status species would be considered **less than significant**.

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2g, and 3A.3-2h.

Implementation of Mitigation Measures 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, 3A.3-2f, 3A.3-2g, and 3A.3-2h would lessen significant direct and indirect impacts on special-status wildlife resulting from the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives; however, this impact would remain **significant and unavoidable** because the direct removal of approximately 2,700 acres and indirect effect to approximately 800 acres of potential habitat for special-status wildlife cannot be fully mitigated. In addition, some of the off-site elements (two roadway connections in El Dorado County, detention basin in Sacramento County, and U.S. 50 interchange improvements) fall under the jurisdiction of El Dorado and Sacramento Counties and Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. The amount of habitat lost could potentially contribute to the decline of Swainson's hawk populations in the region. This decline would constitute a substantial adverse effect under CEQA.

Impacts on special-status wildlife species could be fully mitigated only through a combination of habitat preservation and restoration in the vicinity of the SPA. Parcels of similar habitat quality are currently present in the project vicinity, but these parcels would be of lesser value following development of the project because of the effects of habitat fragmentation and secondary and indirect impacts related to the project. Moreover, there would be a net loss of approximately 3,500 acres of potential habitat for special-status species regardless of the acreage preserved. Therefore, fully compensating for the impact by preserving existing habitat in the project vicinity is infeasible. The mitigation does include elements of habitat creation and enhancement that would increase the habitat value of preserved lands so that mitigation habitat could be of greater value than habitat lost and degraded, but there is not sufficient undeveloped land in the project vicinity to offset the effects of habitat fragmentation on special-status species, and thus, fully mitigate the impact, or reduce it to a less-than-significant level.

IMPACT 3A.3-3 Potential Loss or Degradation of Special-Status Plant Populations and Habitat. *Project implementation could result in direct removal of special-status plants, if they are present, through loss of suitable habitat or degradation of suitable habitat due to site alteration.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the SPA would remain as open space used for livestock grazing consistent with the current AG-80 zoning designation, and no off-site water facilities would be constructed. Continuation of the existing land use would not result in substantial changes to the vegetation in the SPA or Water Facilities Study Area and habitat that could support special-status plants would not be removed. Therefore, potential **direct** and **indirect** impacts on special-status plants would be **less than significant**. ***[Lesser]***

NCP, PP, RIM, CD, RHD,

Eleven special-status plant species have the potential to occur in the SPA and off-site improvement areas in vernal pool, seasonal wetland, freshwater marsh, pond, oak woodland, and grassland habitats. Protocol-level surveys for eight of these species—Ahart's dwarf rush, Bogg's Lake hedge-hyssop, dwarf downingia, legenere, pincushion navarretia, Sacramento Orcutt grass, slender Orcutt grass, and Tuolumne button-celery—were conducted on the Folsom South property by ECORP in spring 2006 (MJM Properties LLC 2006) and no special-status plants were found. Protocol-level surveys were conducted on the Sacramento Country Day School property by Virginia Daines and Susan Saunders in spring 2005. Species targeted during the Country Day School surveys included the species targeted during the Folsom South surveys plus hoary navarretia (*Navarretia eriocephala*), a CNPS watch list species. No special-status plant species were found on the Sacramento Country Day School site. Neither of the

surveys included big scale balsamroot, Brandegee's clarkia, or Sanford's arrowhead as target species; therefore, these species could have been overlooked, if present during these surveys. Big scale balsamroot and Brandegee's clarkia grow in upland habitats that were not focused on during the Folsom South surveys because the target species of those surveys are associated with vernal pools or other wetland habitats. Sanford's arrowhead is an emergent species that grows in shallowly inundated areas such as pond edges or slow-moving stream channels. This species has been documented immediately adjacent to the SPA. It is unlikely that ponds were included in the Folsom South surveys, since species targeted during those surveys do not typically grow in ponds. Suitable habitat for Sanford's arrowhead is not likely present on the Sacramento Country Day School site.

In 2009, ECORP conducted protocol-level surveys at the Hillsborough and Prairie City Business Park properties for all of the target species listed previously, except for big-scale balsamroot. No special-status plant species were found during these surveys.

Protocol-level special-status plant surveys were conducted on the Carpenter Ranch property by Gibson and Skordal during April, May, and June 2009. All of the target species were included in these surveys. No special-status plant species were found during the surveys conducted on Carpenter Ranch.

Special-status plant surveys have not been conducted on any of the other properties comprising the SPA or in any of the off-site improvement areas. Bogg's Lake hedge-hyssop, a species that is state-listed as endangered, has been documented in close proximity to the proposed off-site detention basin near the southwest boundary of the SPA. Potentially suitable habitat for this species is present on the proposed off-site detention basin site and there is high potential for it to be present there. Potentially suitable habitat for special-status plants is also present in the interchange improvement areas and the roadway connections into El Dorado County. In addition, because the project would be constructed in phases over a period of approximately 15 to 20 years, special-status plants could colonize previously surveyed areas before construction begins. Therefore, the possibility that special-status plants are present, or would be present at the beginning of construction, in the SPA or off-site improvement areas cannot be eliminated at this time.

Loss of suitable habitat as a result of project development could result in direct removal or mortality of special-status plants, if they are present. Project development could also result in indirect impacts on special-status plants including impacts caused by pollutants transported by urban runoff and other means, changes in vegetation as a result of changes in land use and management practices, altered hydrology from the construction of adjacent residential development and roadways, habitat fragmentation, and the introduction of invasive species or noxious weeds from surrounding development.

Because project development would result in loss and degradation of habitat that could support special-status plant species, **direct** and **indirect** impacts on special-status plant species are considered **potentially significant**. ***[Similar]***

> Mitigation Measure 3A.3-3: Conduct Special-Status Plant Surveys; Implement Avoidance and Mitigation Measures or Compensatory Mitigation.
>
> To mitigate for the potential loss or degradation of special-status plant species and habitat, the project applicant(s) of all project phases shall adhere to the requirements described below.
>
> - The project applicant(s) of all proposed project phases, including the proposed off-site elements, shall retain a qualified botanist to conduct protocol level preconstruction special-status plant surveys for all potentially occurring species. If no special-status plants are found during focused surveys, the botanist shall document the findings in a letter report to USFWS, DFG, the City of Folsom, Caltrans (for interchange improvements to U.S. 50), El Dorado County (for roadway connections in El Dorado County), and Sacramento County (for the off-site detention basin) and no further mitigation shall be required.

- If special-status plant populations are found, the project applicant(s) of affected project phases shall consult with DFG and USFWS, as appropriate depending on species status, to determine the appropriate mitigation measures for direct and indirect impacts on any special-status plant population that could occur as a result of project implementation. Mitigation measures may include preserving and enhancing existing populations, creation of off-site populations on project mitigation sites through seed collection or transplantation, and/or restoring or creating suitable habitat in sufficient quantities to achieve no net loss of occupied habitat or individuals.

- If potential impacts on special-status plant species are likely, a mitigation and monitoring plan shall be developed before the approval of grading plans or any ground-breaking activity within 250 feet of a special-status plant population. The mitigation plan shall be submitted to Caltrans (for interchange improvements to U.S. 50), El Dorado County (for impacts in roadway connections in El Dorado County), Sacramento County (for impacts in the off-site detention basin footprint), or the City of Folsom (for on-site impacts and all other off-site elements), for review and approval. It shall be submitted concurrently to DFG or USFWS, as appropriate depending on species status, for review and comment. The plan shall require maintaining viable plant populations on-site and shall identify avoidance measures for any existing population(s) to be retained and compensatory measures for any populations directly affected. Possible avoidance measures include fencing populations before construction and exclusion of project activities from the fenced-off areas, and construction monitoring by a qualified botanist to keep construction crews away from the population. The mitigation plan shall also include monitoring and reporting requirements for populations to be preserved on site or protected or enhanced off-site.

- If relocation efforts are part of the mitigation plan, the plan shall include details on the methods to be used, including collection, storage, propagation, receptor site preparation, installation, long-term protection and management, monitoring and reporting requirements, and remedial action responsibilities should the initial effort fail to meet long-term monitoring requirements.

- If off-site mitigation includes dedication of conservation easements, purchase of mitigation credits or other off-site conservation measures, the details of these measures shall be included in the mitigation plan, including information on responsible parties for long-term management, conservation easement holders, long-term management requirements, and other details, as appropriate to target the preservation on long term viable populations.

Mitigation for the off-site elements outside of the City of Folsom's jurisdictional boundaries must be coordinated by the project applicant(s) of each applicable project phase with the affected oversight agency(ies) (i.e., Caltrans, El Dorado and/or Sacramento Counties).

Implementation: Project applicant(s) of all project phases and on- and off-site elements.

Timing: Before approval of grading or improvement plans or any ground disturbing activities, including grubbing or clearing, for any project phase, including off-site elements.

Enforcement:

1. U.S. Fish and Wildlife Service, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For the two roadway connections in El Dorado Hills: El Dorado County Development Services Department.
4. For the detention basin west of Prairie City Road: Sacramento County Planning and Community Development Department.

5. For the U.S. 50 interchange improvements: Caltrans.

Implementation of Mitigation Measure 3A.3-3 would reduce the potentially significant impacts on special-status plant species under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives to a **less-than-significant** level because each phase of development would be required to identify and avoid special-status plant populations or provide compensation for the loss of special-status plants through creation of off-site populations, conservation easements, or other appropriate measures. However, some of the off-site elements (U.S. 50 interchange improvements, two roadway connections in El Dorado County, and detention basin in Sacramento County) fall under the jurisdiction of Caltrans, El Dorado County, and Sacramento County, respectively. Therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of Caltrans, Sacramento County, or El Dorado County, this impact is considered **potentially significant and unavoidable** for off-site improvements that would be located in those jurisdictions.

IMPACT 3A.3-4 Loss of Sensitive Natural Communities (Not Already Covered under Other Impacts). *Project implementation would result in loss of riparian habitat, and valley needlegrass grassland that may be present in the SPA and could be removed by project development. These are natural communities considered sensitive by state and local resource agencies and require consideration under CEQA.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the SPA would remain as open space used for livestock grazing consistent with the current AG-80 zoning designation, and no off-site water facilities would be constructed. Under the No Project Alternative, topography would not be altered, existing vegetation would not be removed, and no loss or alteration of vernal pools or other aquatic habitats would be expected. Therefore, potential **direct** and **indirect** impacts on sensitive natural communities would be **less than significant**. ***[Lesser]***

NCP, PP, RIM, CD, RHD

The SPA supports approximately 11 acres of riparian habitat. Implementation of the No USACE Permit and Resource Minimization Alternatives would each result in removal 0.50 acre of riparian habitat, while the Proposed Project Alternative would result in removal of approximately 0.70 acre of riparian habitat associated with Alder Creek and its tributaries. Implementation of the Centralized Development and Reduced Hillside Development Alternatives would each result in loss of 0.69 acres of riparian habitat. Construction of the Prairie City Road and Oak Avenue interchanges would result in removal of an additional 3.3 acres of riparian habitat associated with Alder Creek and tributaries. These off-site impacts would be the same under each action alternative and would not occur under the No Project Alternative because the interchanges would not be constructed or improved without project implementation. Construction of the off-site detention basin, the Rowberry Drive Overcrossing, the underground sewer force main, and two off-site roadway connections into El Dorado County would have no impact on riparian habitat. The interchange improvements to U.S. 50 at Prairie City Road would affect riparian habitat.

Potential indirect impacts on riparian habitat include degradation caused by pollutants transported by urban runoff, changes in vegetation as a result of changes in land use and management practices, altered site hydrology from the construction of adjacent residential development and roadways, and the introduction of invasive species or noxious weeds from the surrounding development, and intrusion by humans and domestic animals that could disturb riparian vegetation and reduce habitat values.

The SPA may also support valley needlegrass grassland, a community identified as sensitive by DFG and tracked in the CNDDB. Although plant communities in the SPA were mapped by ECORP, valley needlegrass grassland blends in with annual grassland and often occurs as small patches in large expanses of annual grassland. For this reason it is easily overlooked unless someone is specifically searching for it and may be present in patches too small to have been identified at the coarse scale that upland habitats were mapped. Valley needlegrass grassland has been identified adjacent to the SPA and could be present in the SPA. If present, valley needlegrass grassland could be removed as a result of project implementation. This community was not found in any of the off-site improvement areas.

The loss and degradation of riparian habitat that would occur with project implementation constitutes an adverse effect on a sensitive natural community regulated by DFG under Section 1602 of the California Fish and Game Code. Therefore, a **direct** and **indirect significant** impact would result. ***[Similar]***

The loss of valley needlegrass grassland would be an adverse affect on a sensitive natural community. Because it is unknown if this community is present in the SPA, this is considered a **potentially significant direct** impact. ***[Similar]***

Mitigation Measure: Implement Mitigation Measures 3A.3-1a and 1b.

Mitigation Measure 3A.3-4a: Secure and Implement Section 1602 Streambed Alteration Agreement.

The project applicant(s) of all project phases shall obtain a Section 1602 streambed alteration agreement from DFG for all construction activities that would occur in the bed and bank of Alder Creek and other drainage channels and ponds in the SPA. As a condition of issuance of the streambed alteration agreement, the project applicant(s) for all project phases affecting riparian habitat shall hire a qualified restoration ecologist to prepare a riparian habitat MMP. The draft MMP shall describe specific method(s) to be implemented to avoid and/or compensate for impacts on the stream channel of Alder Creek and other drainage channels within DFG jurisdiction, and the bed and banks of the on-site ponds. Mitigation measures may include establishment or restoration of riparian habitat within the project's open space areas along preserved stream corridors, riparian habitat restoration off-site, or preservation and enhancement of existing riparian habitat either on or off the SPA. The compensation habitat shall be similar in composition and structure to the habitat to be removed and shall be at ratios adequate to offset the loss of riparian habitat functions and services at the SPA. The riparian habitat compensation section of the habitat MMP shall include the following:

- compensatory mitigation sites and criteria for selecting these mitigation sites;
- complete assessment of the existing biological resources in both the on-site and off-site preservation and restoration areas;
- site-specific management procedures to benefit establishment and maintenance of native riparian plant species, including black willow, arroyo willow, white alder, and Fremont cottonwood;
- a planting and irrigation program if needed for establishment of native riparian trees and shrubs at strategic locations within each mitigation site (planting and irrigation may not be necessary if preservation of functioning riparian habitat is chosen as mitigation or if restoration can be accomplished without irrigation or planting);
- in kind reference habitats for comparison with compensatory riparian habitats (using performance and success criteria) to document success;
- monitoring protocol, including schedule and annual report requirements (compensatory riparian habitats shall be monitored for a minimum period of five years);

- ecological performance standards, based on the best available science and including specifications for native riparian plant densities, species composition, amount of dead woody vegetation gaps and bare ground, and survivorship; at a minimum, compensatory mitigation planting sites must achieve 80% survival of planted riparian trees and shrubs by the end of the five-year maintenance and monitoring period or dead and dying trees shall be replaced and monitoring continued until 80% survivorship is achieved;

- corrective measures if performance standards are not met;

- responsible parties for monitoring and preparing reports; and

- responsible parties for receiving and reviewing reports and for verifying success or prescribing implementation or corrective actions.

Any conditions of issuance of the Streambed Alteration Agreement shall be implemented as part of project construction activities that adversely affect the bed and bank and riparian habitat associated with Alder Creek and other drainage channels and ponds that are within the project area that is subject to DFG jurisdiction. The agreement shall be executed by the project applicant(s) and DFG before the approval of any grading or improvement plans or any construction activities in any project phase that could potentially affect the bed and bank of Alder Creek and other on-site or off-site drainage channels under DFG jurisdiction and their associated freshwater marsh and riparian habitat.

Mitigation for the U.S. 50 interchange improvements must be coordinated by the project applicant(s) of each applicable project phase with the Caltrans.

Implementation: Project applicant(s) of all project phases and the off-site Prairie City Road and Oak Avenue interchange improvements.

Timing: Before the approval of grading or improvement plans or any construction activities (including clearing and grubbing) that affect the bed and bank or riparian and freshwater marsh habitat associated with Alder Creek and other on-site or off-site drainage channels and ponds.

Enforcement:

1. California Department of Fish and Game,

2. City of Folsom Community Development Department.

3. Caltrans for interchange improvements to U.S. 50.

Mitigation Measure 3A.3-4b: Conduct Surveys to Identify and Map Valley Needlegrass Grassland; Implement Avoidance and Minimization Measures or Compensatory Mitigation.

The project applicant(s) of all project phases shall retain a qualified botanist to conduct preconstruction surveys to determine if valley needlegrass grassland is present in the SPA. This could be done concurrently with any special-status plant surveys conducted on site as special-status plant surveys are floristic in nature, i.e. require that all species encountered be identified, and require preparation of a plant community map. If valley needlegrass grassland is not found in the SPA, the botanist shall document the findings in a letter report to the City of Folsom, and no further mitigation shall be required. Valley needlegrass grassland was not found in any of the off-site project elements.

If valley needlegrass grassland is found in the SPA, the location and extent of the community shall be mapped and the acreage of this community type, if any, that would be removed by project implementation shall be calculated. The project applicant(s) for all project phases affecting valley needlegrass grassland

shall consult with DFG and the City of Folsom to determine appropriate mitigation for removal of valley needlegrass grassland resulting from project implementation. Mitigation measures may include establishment of valley needlegrass grassland within project's open space areas currently characterized by annual grassland, establishment of valley needlgrass grassland off-site, or preservation and enhancement of existing valley needlegrass grassland either on or off the SPA.

Implementation: Project applicant(s) of all project phases.

Timing: Before approval of grading or improvement plans or any ground-disturbing activities, including grubbing or clearing, for any project phase.

Enforcement: 1. California Department of Fish and Game,

2. City of Folsom Community Development Department.

Implementation of Mitigation Measures 3A.3-4a and 3A.3-4b would reduce significant impacts on sensitive natural communities under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives, and the off-site Prairie City Road and Oak Avenue interchange elements to a **less-than-significant** level because a mitigation and monitoring plan ensuring adequate compensation for the loss of riparian habitat would have to be developed and implemented as a condition of the streambed alteration permit and because valley needlegrass grassland would be identified and mapped in the SPA and the removed acreage of this community would be compensated through establishment elsewhere or preservation and enhancement of existing acreage of valley needlegrass grassland. However, some of the off-site elements (U.S. 50 interchange improvements) fall under the jurisdiction of Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of Caltrans, this impact is considered **potentially significant and unavoidable** for off-site improvements which would be located in Caltrans jurisdiction.

IMPACT 3A.3-5 Loss of Blue Oak Woodland and Individual Oak Trees. *Project implementation would result in the removal of blue oak woodland. In addition, individual oak trees meeting the criteria for protection under Folsom Municipal Code and the Sacramento County Tree Ordinance, but not included within the oak woodland, would also be removed.*

On-Site and Off-Site Elements

NP

Under the No Project Alternative, the SPA would remain as open space used for livestock grazing consistent with the current AG-80 zoning designation, and no off-site water facilities would be constructed. Under this alternative, site topography would not be altered and existing woodland vegetation would not be removed. Therefore, potential **direct** and **indirect** impacts on blue oak woodland and individual oak trees would be **less than significant**. ***[Lesser]***

On-Site Elements

NCP, RIM, CD

The Resource Impact Minimization, Centralized Development, and No USACE Permit Alternatives preserve a greater proportion of the on-site oak resources than the Proposed Project and Reduced Hillside Development Alternatives, but each would still result in removal of substantial acreage of blue oak woodland and protected trees.

Table 3A.3-5 provides a side-by-side comparison of the acreage of oak woodland impacts and percent preserved for each alternative. The No USACE Permit Alternative would remove the least acreage of blue oak woodland, and would preserve 79% of the existing blue oak woodland in the SPA. See Exhibits 3A.3-9, 3A.3-10, and 3A.3-11 for the habitat locations and acreages under each of the alternatives.

Table 3A.3-5
Summary of Blue Oak Woodland Impacts and Preservation for Each Project Alternative

Alternative	Acres of Existing Habitat	Acres of Impact	Acres Preserved	Percent Preserved
No Project	642.1	Unknown	Unknown	Unknown
No USACE Permit	642.1	130.1	512.1	79
Proposed Project	642.1	243.1	399.1	62
Resource Impact Minimization	642.1	154.7	487.5	75
Centralized Development	642.1	213.5	428.6	66
Reduced Hillside Development	642.1	245.8	396.4	61

Note: The acres of impact and acres and percent preserved cannot be determined under the No Project Alternative. Making such estimates would be considered too speculative for meaningful consideration because it cannot be predicted if such development under the Sacramento County General Plan would occur and the location in which it would occur. Development applications would be submitted and processed individually through the County.
Source: ECORP 2009a

Development of the No USACE Permit, Resource Impact Minimization, and Centralized Development Alternatives would involve similar contour grading, mitigation planting, road and trail development, and creation of impervious surfaces within and immediately adjacent to open space areas as the Proposed Project Alternative. These activities could result in indirect impacts affecting oak tree root systems. Trenching, grading, soil compaction, placement of fill, impervious surfaces, irrigation, and landscaping within the drip lines of oak trees could lead to root damage ultimately resulting in death of the tree. Additional indirect impacts could result from habitat fragmentation, introduction of invasive species or noxious weeds, vegetation management practices (e.g., clearing for fire control), and intrusion by humans and domestic animals that could disturb oak woodland vegetation and reduce habitat values.

Because the No USACE Permit, Resource Impact Minimization, and Centralized Development Alternatives would result in the removal of substantial acreage of blue oak woodland and individual oak trees meeting minimum dbh criteria, a **direct significant** impact would result, but to a lesser degree than the Proposed Project Alternative. ***[Lesser]***

Because the No USACE Permit, Resource Impact Minimization, and Centralized Development Alternatives would result in urbanization adjacent to blue oak woodland and would include development activities that could mortally damage oak trees, including grading, trenching, and impervious surfaces, an **indirect significant** impact would result. ***[Similar]***

Mitigation Measure 3A.3-5: Conduct Tree Survey, Prepare and Implement an Oak Woodland Mitigation Plan, Replace Native Oak Trees Removed, and Implement Measures to Avoid and Minimize Indirect Impacts on Oak Trees and Oak Woodland Habitat Retained On Site.

The project applicant(s) shall prepare an oak woodland mitigation and monitoring plan. The project applicant(s) of all on- and off-site project phases containing oak woodland habitat shall adhere to the requirements described below, which are consistent with those outlined in California Public Resources Code 21083.4.

Oak Woodland Resources under the Centralized Development Alternative **Exhibit 3A.3-11**

Pursuant to Sacramento County General Plan policy, the acreage of oak woodland habitat for determining impacts and mitigation requirements was calculated as the oak tree canopy area within stands of oak trees having greater than 10% cover plus a 30-foot-radius buffer measured from the outer edge of the tree canopy. Oak trees located in areas greater than 30 feet from stands meeting the greater than 10% tree canopy cover criterion were considered isolated trees and not part of the blue oak woodland community. Mitigation for impacts on isolated oak trees is discussed separately below.

- Preserve approximately 399 acres of existing oak woodland habitat in the SPA (this acreage is based on the extent of oak woodland habitat as determined from aerial photograph interpretation; however, following completion of ground verification by a qualified arborist, the actual amount of oak woodland present within impact areas could be slightly greater or lesser than the amount calculated from aerial photograph and, therefore, the amount preserved could also be slightly greater or lesser than 399 acres).

- Create 243 acres of oak woodland habitat in the SPA by planting a combination of blue oak acorns, seedlings, and trees in the following SPA locations:

  - Non-wooded areas that are adjacent to or contiguous with the existing oak woodland habitat.

  - Preserve and passive open space zones throughout the SPA.

  - Open space areas that are adjacent to existing oak woodlands that will be impacted by project grading (i.e. catch slopes).

  - Other practical locations within the SPA in or adjacent to open space.

  The following oak woodland mitigation planting criteria shall be used to create oak woodland habitat:

  - A minimum of 55 planting sites per acre (with a total of 70 units, as defined below) will mitigate for one acre of oak woodland impacts. A combination of acorns, seedlings, and various sizes of container trees (#1 container, #5 container, #15 container) or transplanted trees shall be incorporated into the planting design. Mitigation acreage that is planted solely with larger oak trees (no acorns) shall have a minimum of 35 planting sites per acre. The units are defined as follows:

    – One established acorn equals one unit (acorns will be over planted to maximize potential germination).

    – One oak seedling equals one unit.

    – One #1 container oak tree equals two units.

    – One #5 container oak tree equals three units.

    – One #15 container oak tree equals four units.

    – One transplanted oak tree equals four units per trunk diameter inch (dbh).

- Preserve and protect existing off-site oak woodland habitat. Existing, unprotected oak woodland habitat within Sacramento and El Dorado Counties may be secured and placed under conservation easement in lieu of onsite mitigation measures if necessary. The off-site locations would be managed as oak woodland habitat in perpetuity.

- Create oak woodlands off site. Plant a combination of blue oak acorns, seedlings, and trees at off-site location(s), if needed to achieve the creation goal of 243 acres of new blue oak woodland habitat. This measure would only be needed if 243 acres of blue oak woodland could not be created in the SPA. Off-site creation shall follow the same guidelines as outlined in the Mitigation Planting Criteria for on-site creation. Off-site tree planting shall occur at sites within Sacramento County that should naturally support blue oak woodland and shall be used to restore former blue oak woodland habitat that has been degraded or removed through human activities. Restoration shall be designed to result in species composition and densities similar to those in the SPA prior to project development. Planted areas shall be placed under conservation easement and managed as oak woodland habitat in perpetuity.

- The oak woodland mitigation plan prepared by the project applicant(s) shall include a maintenance and monitoring program for any replacement trees. The program shall include monitoring and reporting requirements, schedule, and success criteria. Replacement oak trees shall be maintained and monitored for a minimum of eight years from the date of planting and irrigation shall be provided to planted trees for the first five years after planting. Any replacement trees that die during the monitoring period shall be replaced. The mitigation planting site must achieve 80% survival of planted trees by the end of the eight-year maintenance and monitoring period or dead and dying trees shall be replaced and monitoring continued until 80% survivorship is achieved. Security acceptable to the City and sufficient to cover maintenance and monitoring costs for eight years shall be provided to the City Planning Department. The security will be forfeited if the project applicant or designated responsible party fails to provide maintenance and monitoring and meet the success criteria.

The project applicant(s) of all on-site project phases containing individual trees and the off-site Prairie City Road and Oak Avenue interchange improvements to U.S. 50; Rowberry Drive Overcrossing; and the underground sewer force main shall develop a map depicting the tree canopy of all oak trees in the survey area and identifying the acreage of tree canopy that would be preserved and the acreage that would be removed. A tree permit for removal of isolated oak trees (those not located within the delineated boundary of oak woodland habitat) shall be obtained from the City Planning Director. As a condition of the tree removal permit, project applicant(s) shall be required to develop a Planting and Maintenance Agreement. The City's Tree Preservation Code requires compensatory mitigation and the City and the project applicants have developed a plan, as set forth Section 10 of the *Folsom Plan Area Specific Plan* (attached to this EIR/EIS as Appendix N) specifically to avoid and minimize adverse effects on individual oak trees from project development and to provide compensatory mitigation for removal of protected trees in the SPA. In addition to the language contained in the *Folsom Plan Area Specific Plan*, the following elements shall be included in a protected tree mitigation plan to be developed by the project applicants and agreed upon by the City:

- Project applicant(s) of projects containing isolated oak trees shall retain a certified arborist or registered professional forester to perform a determinate survey of tree species, size (dbh), condition, and location for all areas of the project site proposed for tree removal and encroachment of development. The condition of individual trees shall be assessed according to the American Society of Consulting Arborists rating system with the following added explanations:

    - 5 = Excellent; No problems – tree has no structural problems, branches are properly spaced and tree characteristics are nearly perfect for the species.

    - 4 = Good; No apparent problems – tree is in good condition and no apparent problems from visual inspection. If potential structural or health problems are tended at this stage, future hazard can be reduced and more serious health problems can be averted.

- 3 = Fair; Minor problems – There are some minor structural or health problems that pose no immediate danger. When the recommended actions in an arborist report are completed correctly the defect(s) can be minimized or eliminated.

- 2 = Poor; Major problems – the tree is in poor condition, but the condition could be improved with correct arboricultural work including, but not limited to: pruning, cabling, bracing, bolting, guying, spraying, mistletoe removal, vertical mulching, and fertilization. If the recommended actions are completed correctly, hazard can be reduced and the rating can be elevated to a 3. If no action is taken the tree is considered a liability and should be removed.

- 1 = Hazardous or non correctable condition – the tree is in extremely poor condition and in non-reversible decline. This rating is assigned to a tree that has structural and/or health problems that no amount of tree care work or effort can change. The issues may or may not be considered a dangerous situation. The tree may also be infested with a disease or pest(s) that is non-controllable at this time and is causing an unacceptable risk of spreading the disease or pests(s) to other trees.

- 0 = Dead – the tree has no significant signs of life (dead or very close to being dead).

► The determination for whether an individual tree shall be preserved, removed without compensation, or removed with compensatory mitigation shall be based on the condition and size of the tree as follows:

- Trees rated 0 or 1 may be removed with no mitigation.

- Trees rated 2 may be removed at 50% of the normal Folsom Municipal Code mitigation.

- Trees rated 3, 4, and/or 5 may be removed at the normal Folsom Municipal Code mitigation.

- Native oaks measuring 24 inches or greater dbh for a single trunk or 40 inches or more for a multi-trunked tree and rated a 4 or 5 shall be retained. Trees of this size but having a rating of 2 or 3 shall not be removed or mitigated, unless retaining wall(s) higher than 4 feet tall (from bottom of footing to the top of the wall) would be required to protect the tree(s) from mass grading of the SPA properties.

- Native oaks measuring between 12 and 24 inches dbh and rated a 4 or 5 shall not be removed or mitigated unless wall(s) would need to be built that are higher than 4 feet tall (from bottom of footing to the top of the wall) would be required to protect the tree(s) from mass grading of the SPA properties. Trees in this size class but rated 2 or 3 shall not be removed unless unreasonable costs to save the tree(s) (greater than the normal Folsom Municipal Code mitigation) would result.

- Native oaks measuring 5 inches or greater dbh but less than 12 inches dbh shall not be removed unless unreasonable costs to save the tree(s) (greater than the normal Folsom Municipal Code mitigation) would result.

- Native oak trees measuring 1 inch or greater dbh but less than 5 inches dbh may be preserved to receive a Small Tree Preservation Credit (STPC). Any tree that is to be considered for preservation credit shall be evaluated, included in the arborist report, and shall have been found to be rated a 3, 4, or a 5. Credits shall only be accepted if the tree protection zone (TPZ) (i.e., the outer edge of the tree canopy drip line) is protected with fencing in the exact manner that 5 inches dbh and greater trees are protected on a construction site, and the spacing is equal to the proper tree spacing dictated by the Folsom Master Tree List. STPC shall not count if they the tree is in a

poor growing space due to its position within the TPZ of another protected tree to be preserved. The City shall accept the preservation of native oak trees in this size class as credit towards the total removed inches based on the following STPC criteria:

Caliper of Tree Preserved	Mitigation Tree Credit Equivalent
1 inch or greater, but less than 2 inches	One #15 container tree or two #5 container trees
2 inches or greater, but less than 3 inches	Two #15 container trees
3 inches or greater, but less than 4 inches	Three #15 container trees
4 inches or greater, but less than 5 inches	Four #15 container trees

- Folsom Municipal Code requires one of the following be planted as compensation for each diameter inch of protected tree removed:

  - half of a 24-inch box tree;
  - one #15 container tree;
  - two #5 container trees; or
  - $150 in-lieu payment or other fee set by City Council Resolution.

- The Planting and Maintenance Agreement shall include a planting plan, planting and irrigation design details, and a weaning schedule for the establishment period. The plan shall include a 5-year establishment period for trees and 8 years for planted acorns with an annual monitoring report that includes corrections needed with proposed work plan, and notice of compliance within 90-days of annual monitoring report. Security in an form acceptable to the City and sufficient to cover maintenance and monitoring costs for eight years shall be provided to the City Planning Department. The security will be forfeited if the project applicant or designated responsible party fails to fulfill the Planting and Maintenance Agreement.

- To avoid and minimize indirect impacts on protected trees to remain in the SPA, the project applicant(s) of all affected project phases shall install high visibility fencing outside the outer edge of the drip lines of all trees to be retained in the SPA during project construction. The fencing may be installed around groups or stands of trees or whole wooded areas, but must be installed so that the drip lines of all trees are protected. Grading, trenching, equipment or materials storage, parking, paving, irrigation, and landscaping shall be prohibited within the fenced areas (i.e. drip lines of protected trees). If the activities listed cannot be avoided within the drip line of a particular tree, that tree shall be counted as an affected tree and compensatory mitigation shall be provided, or the tree in question shall be monitored for a period of five years and replaced only if the tree appears to be dead or dying within five years of project implementation.

Through a combination of the mitigation options presented above along with the proposed on-site preservation of blue oak woodland habitat in the open space areas, the project applicant(s) can satisfy the mitigation requirements for removal of trees protected under the Folsom Municipal Code while also mitigating the impacts on oak woodland habitat, as determined through consultation with the Sacramento County Planning Department and the City of Folsom.

Mitigation for the U.S. 50 interchange improvements must be coordinated by the project applicant(s) of each applicable project phase with Caltrans.

Implementation: Project applicant(s) of all project phases and off-site elements affecting blue oak woodland and protected trees.

Timing: Before approval of grading or improvement plans or any ground disturbing activities, including grubbing or clearing, for any project phase containing protected trees or oak woodland.

Enforcement: 1. City of Folsom Community Development Department.

2. Caltrans for interchange improvements to U.S. 50.

PP, RHD

The Proposed Project Alternative has been designed to retain a substantial portion of the on-site blue oak woodland habitat within designated open space. However, as shown above in Table 3A.3-5, implementation of the Proposed Project Alternative would still result in the removal or disturbance of 243 acres of blue oak woodland habitat containing 81.6 acres of oak tree canopy, and another 8.4 acres of isolated native oak tree canopy not contiguous with the blue oak woodland habitat (see also Exhibit 3A.3-12). The and Reduced Hillside Development Alternative would result in removal of approximately 246 acres of blue oak woodland habitat containing 83 acres of oak tree canopy and approximately 8.7 acres of isolated oak tree canopy (Exhibit 3A.3-13). Tree surveys conducted on the Folsom 138, Folsom South, Carpenter Ranch, and Sacramento Country Day School properties identified a total of 16,605 blue oak trees, 285 interior live oak trees, 114 valley oak trees, and 1 walnut tree meeting criteria for protection under Folsom Municipal Code. Tree surveys were not conducted on all parcels containing trees, but this information provides a general idea of the woodland composition in the SPA.

Development of the Proposed Project and Reduced Hillside Development Alternatives would also involve contour grading, mitigation planting, road and trail development, and creation of impervious surfaces within and immediately adjacent to open space areas containing protected oak trees. These activities could result in indirect impacts affecting oak tree root systems such as trenching, grading, soil compaction, placement of fill, impervious surfaces, irrigation, and landscaping within the drip lines of oak trees, which can lead to root damage ultimately resulting in death of the tree. Additional indirect impacts could result from habitat fragmentation, introduction of invasive species or noxious weeds, vegetation management practices (e.g., clearing for fire control), and intrusion by humans and domestic animals that could disturb oak woodland vegetation and reduce habitat values.

Removal of blue oak woodland and individual oak trees and other trees meeting minimum DBH criteria would conflict with local ordinances, specifically Folsom Municipal Code, as would damage to the root zones of protected trees that leads to eventual death of the trees. Furthermore, blue oak woodland is considered a sensitive natural community by DFG and California Public Resources Code 21083.4 requires counties to consider the environmental effects of oak woodland conversion. Therefore, a **direct** and **indirect significant** impact would result. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

Off-Site Elements

The off-site detention basin west of Prairie City Road and the two-roadway connections from Folsom Heights off-site into El Dorado Hills would have **no direct** or **indirect** impacts on blue oak woodland or individual oak trees, because none are present at those locations.

Development of the interchange improvements to U.S. 50 would result in removal of an additional 598 blue oak trees, 43 valley oak trees, and 61 interior live oak trees meeting criteria for protection under Folsom Municipal Code. Protected trees that would be removed for off-site improvements are as follows: 173 oak trees and 2 street trees at the Prairie City Road Interchange, 527 oak trees at the Oak Avenue interchange, and 3 oak trees at the Rowberry Drive Overcrossing. An additional 32 native oak trees could be removed or damaged during construction of the underground sewer force main.

A total of 39.9 acres of oak woodland habitat would be removed as a result of implementation of the off-site project elements. This acreage consists of 6.5 acres at the Prairie City Road interchange, 31.4 acres at the Oak Avenue interchange, 0.3 acre at the Rowberry Drive Overcrossing, and 1.7 acres at the underground sewer force main.

Construction of the U.S. 50 interchange improvements and the underground sewer alignment would result in removal of blue oak woodland and individual oak trees and other trees meeting minimum dbh criteria, which would conflict with Folsom Municipal Code, as would damage to the root zones of protected trees that leads to eventual death of the trees. Furthermore, blue oak woodland is considered a sensitive natural community by DFG and California Public Resources Code 21083.4 requires counties to consider the environmental effects of oak woodland conversion. Therefore, a **direct** and **indirect significant** impact would occur from construction of the Prairie City Road and Oak Avenue interchanges, Rowberry Drive Overcrossing, and the underground sewer force main.

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

Implementation of Mitigation Measure 3A.3-5 would reduce significant impacts from loss of blue oak woodland and protected trees under the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives and the off-site elements, but not to a less-than-significant level because the loss of individual oak trees and blue oak woodland acreage and function would be extensive and would contribute substantially to the regional loss of this resource. It is unknown at this time if blue oak woodland habitat acreage having similar tree sizes and densities, species composition, site condition, and landscape context to the blue oak woodland to be removed would be available for purchase and preservation in perpetuity. While preserving oak woodland habitat in the SPA to the maximum extent possible is desirable and valuable, the quality of oak woodland habitat remaining on the site after project development would be diminished because it would be converted from a large, contiguous patch of oak woodland habitat surrounded by undeveloped grasslands to a smaller habitat patch dissected by paved roads and surrounded by urban development. Furthermore, planting replacement trees would result in temporal losses of oak tree resources until the replacement trees reached comparable sizes as the trees to be removed; a process that would take many decades. In addition, the U.S. 50 interchange improvements fall under the jurisdiction of Caltrans; therefore, neither the City nor the project applicant(s) would have control over their timing or implementation. Therefore, impacts on blue oak woodland and protected trees would remain **significant and unavoidable**.

IMPACT 3A.3-6 Potential Interference with Wildlife Movement. *Project implementation could interfere with the movement of native resident or migratory wildlife species or with established native resident or migratory wildlife corridors.*

On-Site and Off-Site Elements

NP

Development of the site under the existing AG-80 land use designation would not prevent movement of native wildlife and no movement corridors would be eliminated. There would be no off-site water facilities constructed. Therefore, **no direct** or **indirect** impacts to wildlife movement would occur. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

Wildlife corridors are features that provide connections between two or more areas of habitat that would otherwise be isolated and unusable. Often drainages, creeks, or riparian areas are used by wildlife as movement corridors as these features can provide cover and access across a landscape. Alder Creek flows northwesterly from White Rock Road to Prairie City Road. It is unknown the extent to which this creek corridor is used by wildlife in

Oak Woodland Resources under the Reduced Hillside Development Alternative

Exhibit 3A.3-13

the area for movement. However, the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives include preservation of most of the Alder Creek corridor as open space. Other drainage features in the SPA do not support riparian vegetation cover and therefore do not provide valuable movement corridors. Annual grassland habitat present to the south is currently used as rangeland and would remain in open space into the foreseeable future based on zoning under the Sacramento County General Plan. This adjacent open space provides opportunities for wildlife to move around developed areas to preserved open spaces on site and to use the Alder Creek corridor to move across the SPA. Areas to the north and east of the SPA are already developed and do not provide natural habitat areas for wildlife.

Regionally common wildlife species, such as coyote, fox, raccoon, skunk, and possum, are expected to continue to use the Alder Creek corridor after project implementation. There are no established migratory routes through the SPA that are vital for the movement of any resident or migratory fish or wildlife species or population. Therefore, **direct** and **indirect** impacts on wildlife movement from the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives are considered **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Off-Site Elements

The off-site elements include several freeway interchange improvements and an overcrossing, two local roadway connections from Folsom Heights into El Dorado County, a new underground sewer force main, and a detention basin. These elements would not interfere with wildlife movement because the existing U.S. 50 limits wildlife movement in this area. The improvements to the existing Prairie City interchange would not substantially interfere with wildlife movement east and west along the Alder Creek corridor because the project activities would not extend into the creek corridor. The proposed detention basin to the west of the site also would not interfere with wildlife movement because it would not be located in areas providing important linkages between areas of wildlife habitat.

Because the off-site elements would not result in disruption of important linkages between wildlife habitats, this **direct** impact is considered **less than significant**. **No indirect** impacts would occur. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3A.3-7 Conflict with an Adopted Habitat Conservation Plan. *Project implementation would not result in conflicts with the goals of an adopted Habitat Conservation Plan.*

On-Site and Off-Site Elements

NP, NCP, PP, RIM, CD, RHD

The South Sacramento Habitat Conservation Plan (SSHCP) is being prepared by the County of Sacramento. Project consistency with the SSHCP is not required under CEQA because the SSHCP has not been adopted and is not scheduled for completion and implementation until late 2010 or early 2011. Furthermore, while the exact scope and content of the SSHCP are not known at this time, the proposed planning area for the SSHCP does not include the SPA according to the notice of preparation issued on June 11, 2008 for the SSHCP EIR.

Implementation of the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives, as well as the off-site elements, would not reduce the effectiveness of the proposed SSHCP's conservation strategy or adversely affect attainment of the goals and objectives of the SSHCP because the SPA and off-site elements are not included in the planning area and

the SSHCP is not adopted. Therefore, there is no conflict with any adopted HCPs and **no direct** or **indirect** impacts would occur. ***[Similar]***

Mitigation Measures: No mitigation measures are required.

3A.3.4 RESIDUAL SIGNIFICANT IMPACTS

Although impacts on some biological resources would be reduced to less-than significant levels through implementation of the mitigation measures described in this section, impacts on jurisdictional waters of the United States, including wetlands, and blue oak woodlands would remain significant and unavoidable even with implementation of the mitigation measures listed herein because the project would contribute substantially to the regional loss of these habitats and temporal losses of aquatic resources and blue oak woodland would occur during implementation of mitigation until performance standards and success criteria are met and it is unknown whether the acreage and functions of these habitats can be replaced through preservation and creation since mitigation sites have not been identified and a mitigation plan has not been developed. Even after a mitigation plan is developed and implemented, there would be a substantial regional loss of this resource for many decades and the full range of habitat functions may never be successfully replaced. Impacts on trees protected under Folsom Municipal Code and County Tree Preservation Ordinance would also remain significant and unavoidable because temporal losses of oak tree resources would persist until replacement trees reached comparable sizes to the trees to be removed; a process that would take many decades, and it is unknown if suitable mitigation sites are available in the region to establish replacement trees at appropriate ratios to compensate for the loss of oak tree resources in the SPA. Cumulative impacts on aquatic resources, oak woodlands, nesting and foraging habitat for raptors, including Swainson's hawk, and potential habitat for special-status plant species would remain significant and unavoidable even with implementation of the mitigation measures because the project would contribute substantially to the regional loss and degradation of these habitats.

In addition, some of the off-site elements fall under the jurisdiction of El Dorado County, Sacramento County, or Caltrans; therefore, neither the City nor the project applicant(s) would have control over the timing or implementation of mitigation measures for these interchange improvements. Because the City does not control implementation of mitigation measures for off-site improvements constructed in areas under the jurisdiction of these other agencies, Impacts 3A.3-1 through 3A.3-5 are considered potentially significant and unavoidable for off-site improvements which would be located in the jurisdiction of El Dorado County, Sacramento County, or Caltrans.

This section was prepared by RMC Water and Environment.

3B.3 BIOLOGICAL RESOURCES – WATER

3B.3.1 AFFECTED ENVIRONMENT

As provided in Chapter 2, Alternatives, physical improvements proposed as part of the Off-site Water Facility Alternatives would be limited to Zone 4 of the "Water" Study Area. In this context, emphasis for the description of the affected environment for the "Water" Study Area is placed on Zone 4. No new facilities are proposed within Zones 1, 2, and 3 and, therefore, the description of the affected environment for biological resources for these areas is limited to those details necessary to support the discussion of potential operational-related effects of the Off-site Water Facility Alternatives. More specifically, the description of the affected environment for Zones 1 and 2 is focused on fishery resources within the Sacramento River and wetland resources within the NCMWC serviced area. The Freeport Regional Water Project EIR/EIS provides extensive detail regarding the terrestrial biological and fishery resources present within Zone 3, including portions of Zone 2 within the immediate vicinity of the Freeport Project intake, and is incorporated by reference into this EIR/EIS.

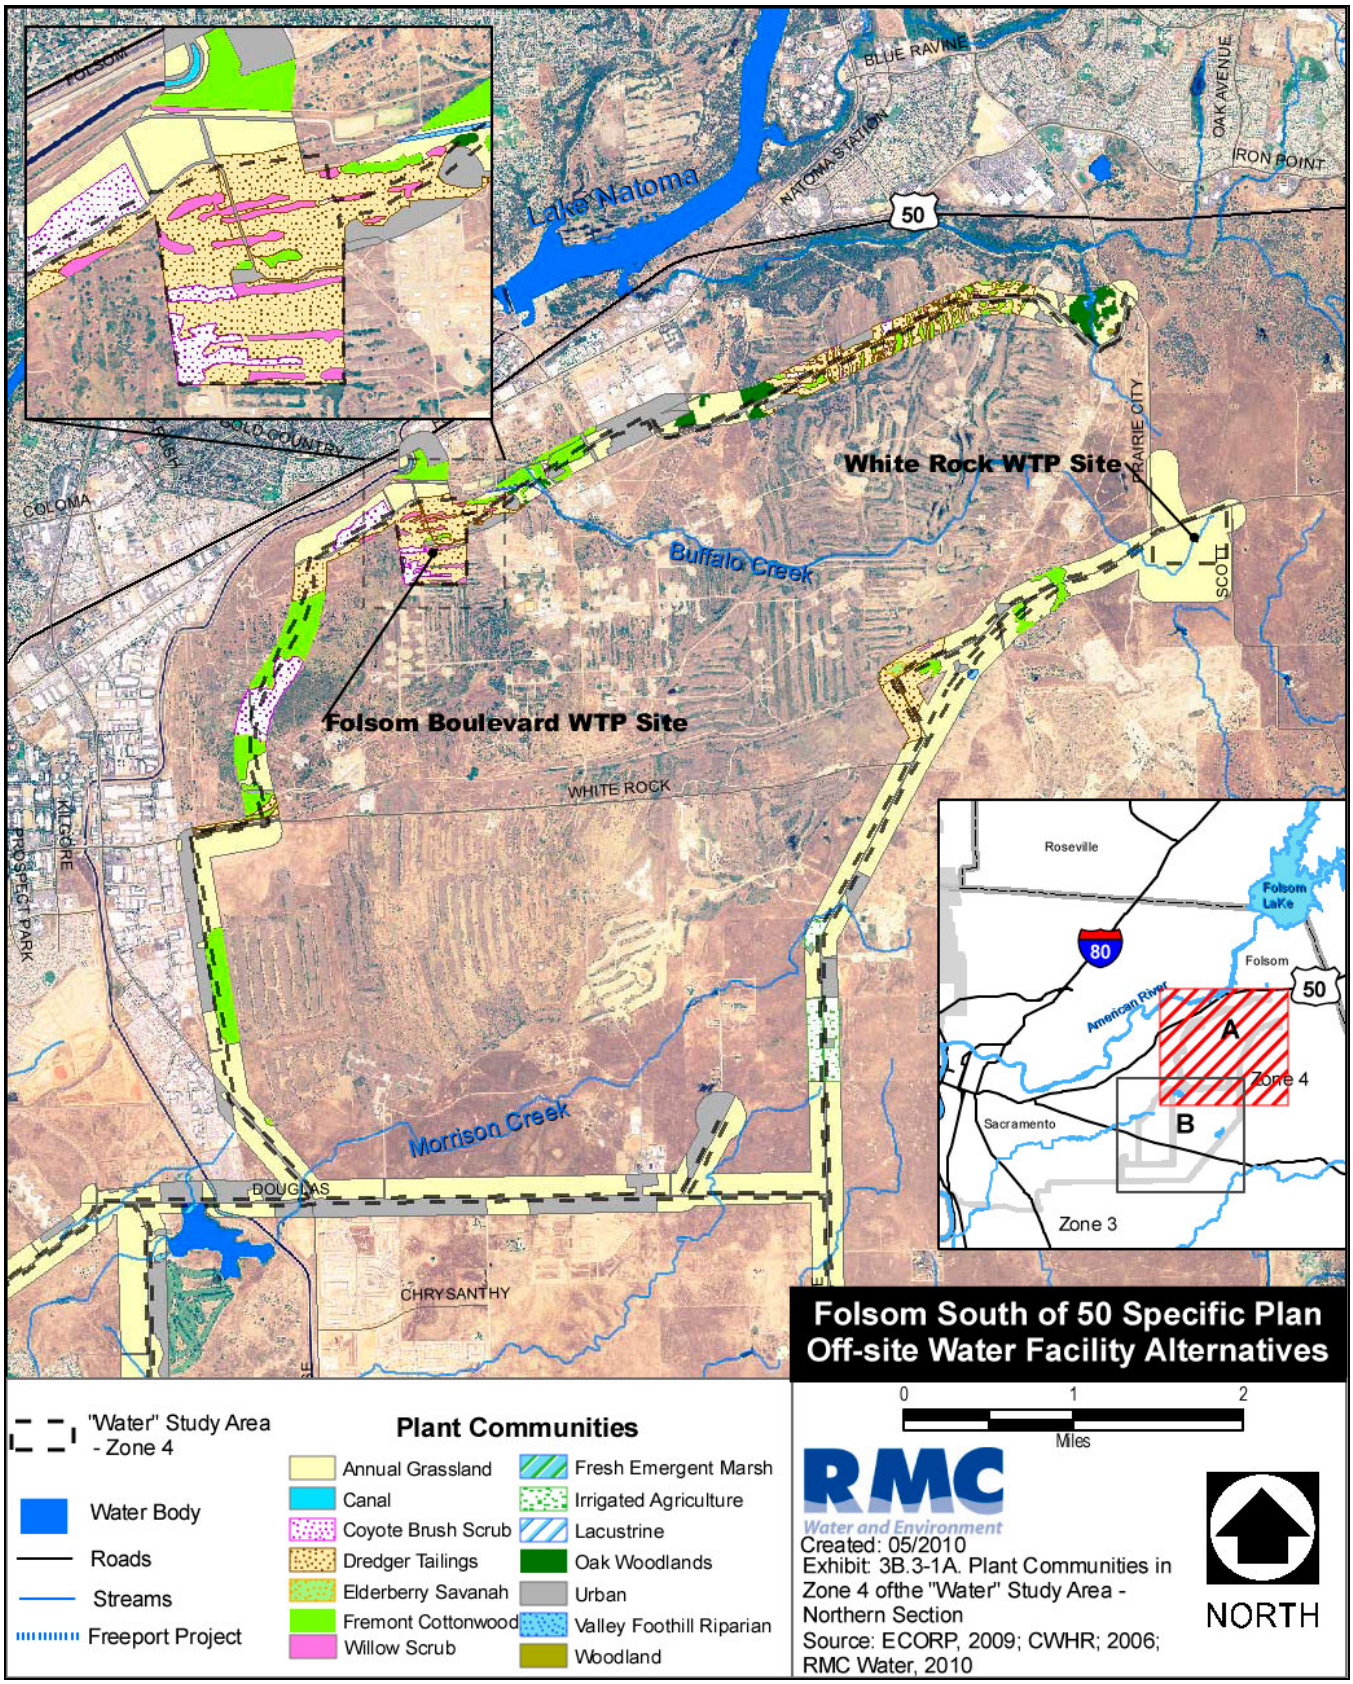
PLANT COMMUNITIES IN ZONE 4 OF THE "WATER" STUDY AREA

The established vegetative communities within the "Water" Study Area and their associated habitat values are identified and described in this section using the California Department of Fish and Game's (DFG) *A Guide to Wildlife Habitats* (Mayer and Laudenslayer 1988). As shown in Exhibits 3B.3-1A and 3B.3-1B, a majority of Zone 4 of the "Water" Study Area is comprised of urban or developed habitat, coyote scrub brush, annual grassland, dredge tailings, and, to a lesser extent, woodlands and savannah. Exhibit 3B.3-1A illustrates plant communities within the northern portion of the Zone 4 "Water" Study Area, including the two off-site WTP locations, while Exhibit 3B.3-1B depicts the plant communities within the southern portions of Zone 4. As shown in these two exhibits, sensitive plant communities documented within Zone 4 include Valley oak woodland, fresh emergent marsh, elderberry savannah, Valley foothill riparian, vernal pools, and seasonal and perennial wetlands.

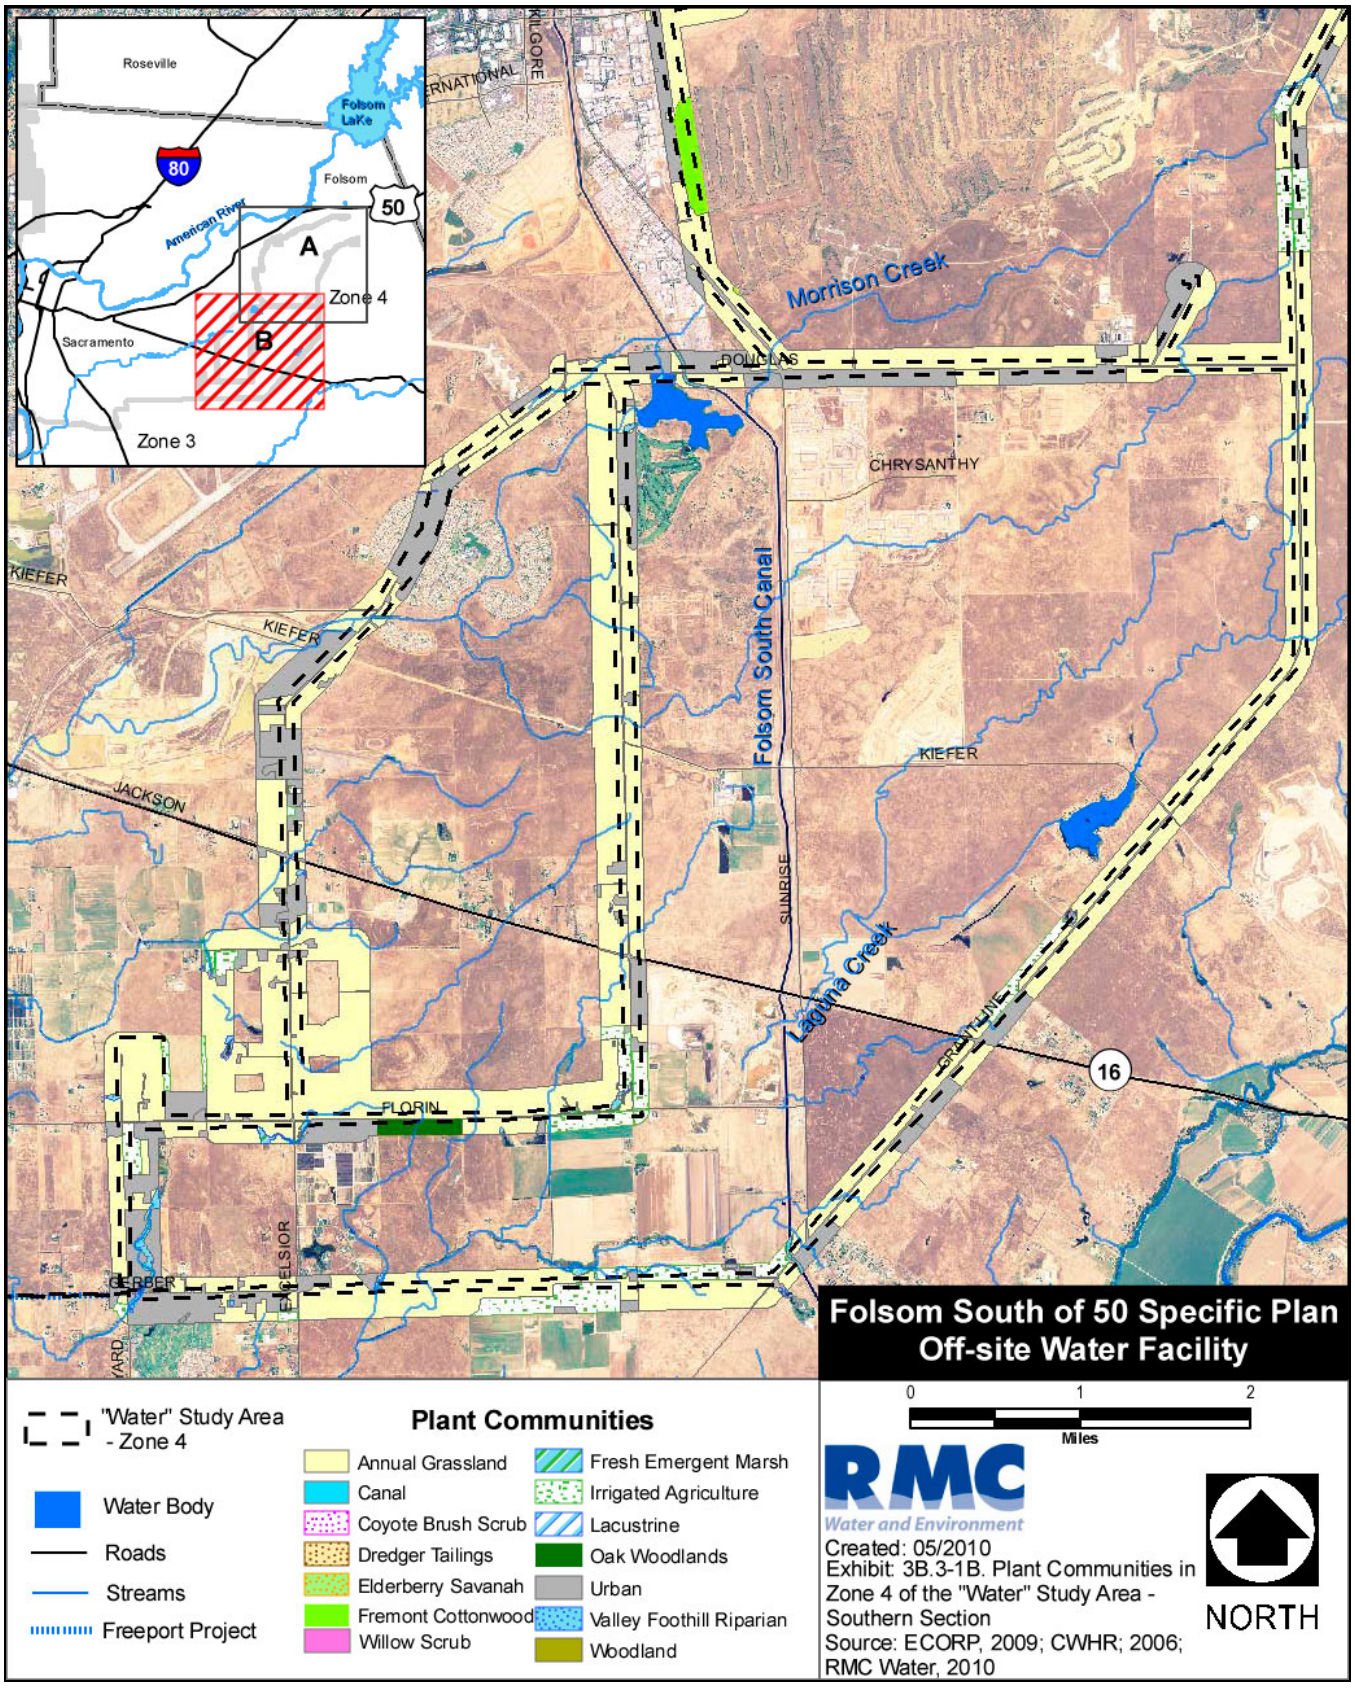
The Off-site Water Facility Alternatives conveyance alignment(s) are mostly located within existing and/or planned roadway rights-of-way for Kiefer Boulevard and Grant Line, White Rock, Douglas, Florin, Excelsior, and Eagles Nest Roads. These roadways cross through open annual grassland, mixed oak savanna, vernal pools, and riparian communities in close proximity to local waterways, including Morrison, Elder, Buffalo, and Laguna Creeks. As shown in Exhibits 3B.3-1A and 3B.3-1B riparian and wetland plant communities are extensive along the numerous drainages that traverse the "Water" Study Area.

The White Rock Water Treatment Plant (WTP) site is located within an undeveloped area, immediately south of White Rock Road and characterized by rolling annual grassland near the headwaters of Buffalo Creek (see Exhibit 3B.3-1A). This site is bordered by the Prairie City Off-Highway Vehicle (OHV) Area to the south. A perimeter reconnaissance-level survey of the subject property indicates the site is currently used for livestock grazing and consists primarily of annual grasslands with a small, seasonal drainage bisecting it diagonally from the northeast and numerous seasonal wetlands situated within the associated floodplain.

The Folsom Boulevard WTP site is located within an urbanized area, just south of Folsom Boulevard and is characterized by ruderal and urban habitats, dredge tailings containing sparse vegetation, a small patch of Fremont cottonwood, several narrow strips of willow scrub, and patches of coyote brush scrub along the western and southern perimeters (see Exhibit 3B.3-1A). Buffalo Creek meanders along the northern perimeter of the subject property. Areas adjacent and to the north are developed with various commercial and light industrial uses. Areas to the west of the Folsom Boulevard WTP site are planned for development in conjunction with the City of Rancho Cordova's planned Westborough Specific Plan area.



Plant Communities within Northern Sections of Zone 4 of the "Water" Study Area **Exhibit 3B.3-1A**



Plant Communities within Southern Sections of Zone 4 of the "Water" Study Area **Exhibit 3B.3-1B**

Plant communities found in Zone 4 of the "Water" Study Area are described in the following paragraphs. Acreage estimates in the following sections represent the total amount of each community type located within areas that could be affected by any of the Off-site Water Facility Alternatives. Acreage was calculated conservatively, assuming a 200-foot corridor for pipeline alignments.

Upland Communities

Urban or Developed Environments

Urban or developed environments comprise approximately 325.3 acres of Zone 4 of the "Water" Study Area and generally provide limited habitat for common wildlife species such as rock pigeon (*Columba livia*), house sparrow (*Passer domesticus*), and American crow (*Corvus brachyrhynchos*). Species occurring within this habitat type are typically common and well-adapted to an urban environment. Paved roadways are included as developed areas and provide minimal habitat for most wildlife species. Within the Off-site Water Facilities Study Area, urban or developed areas include paved surfaces and development within the City of Rancho Cordova and within unincorporated portions of Sacramento County along existing roadways, highways, and railroad easements (see Exhibit 3B.3-1).

Annual Grassland

California annual grasslands are extensive throughout the "Water" Study Area covering approximately 671.1 acres and consist of open grasslands composed primarily of nonnative annual plant species which include wild oats (*Avena fatua*), soft chess (*Bromus hordeaceus*), Italian ryegrass (*Lolium multiflorum*), and ripgut brome (*Bromus diandrus*). Annual grassland communities may provide habitat for common species such as rock pigeon, house sparrow, mourning dove (*Zenaida macroura*), and western meadowlark (*Sturnella neglecta*). Raptor species forage in annual grassland as well. Many of the annual grasslands support vernal pools, seasonal wetlands, and seasonal wetland swales (ECORP 2009).

Numerous elderberry shrubs (*Sambucus mexicana*) are also documented within this habitat type along White Rock Road and the planned Easton Valley Parkway.

Canal

The Folsom South Canal (FSC) runs north-south through Zone 4 of the "Water" Study Area and is mapped as canal in Exhibit 3B.3-1. The FSC comprises 0.6 acres of Zone 4 and is characterized as a broad, trapezoidal, concrete-lined channel that is bordered by chain-link fence on both sites and supports no vegetation (ECORP 2009).

Coyote Brush Scrub

The coyote brush scrub community is primarily found within the low-lying areas between mine tailings, encompassing approximately 18.5 acres within Zone 4; mainly within the Off-site Water Facility Alternative 4 corridor (see Exhibit 3B.3-1). This community is dominated by coyote brush (*Baccharis pilularis*) and other shrubs, such as blue elderberry, poison oak (*Toxicodendron diversilobum*), willow (*Salix* sp.), and hoary coffeeberry (*Rhamnus tomentella*). Invasive plant species that occur in this community include yellow star-thistle (*Centaurea solstitialis*) and milk thistle (*Silybum marianum*).

Common wildlife associated with this community in the project area includes Pacific gopher snake (*Pituophis catenifer*), California quail (*Callipepla californica*), deer mouse (*Peromyscus maniculatus*), black-tailed jackrabbit (*Lepus californicus*), and gray fox (*Urocyon cinereoargenteus*).

Several seasonal wetlands and a few seasonal ponds also occur within the coyote brush scrub community (ECORP 2009).

Fremont-Cottonwood Woodland

The Fremont cottonwood woodland and Fremont cottonwood-oak woodland communities occur scattered throughout the northern sections of Zone 4. They encompass a combined total of approximately 46.6 acres. Fremont cottonwood (*Populus fremontii*) dominates the former community, whereas Fremont cottonwood and various oak species (*Quercus* sp.) are co-dominants in the latter community. The understory of both communities consists of willows, coyote brush, poison oak, and annual grasses. In some areas, willows and elderberry shrubs also form part of the overstory.

Common wildlife species occurring in these communities include Pacific treefrog (*Hyla regilla*), racer (*Coluber constrictor*), Cooper's hawk (*Accipiter cooperii*), coyote (*Canis latrans*), and California vole (*Microtus californicus*). A few seasonal wetlands and seasonal ponds also occur within the cottonwood woodlands (ECORP 2009).

Willow Scrub

The willow scrub community occurs only in a few low-lying areas between mine dredge tailings, encompassing approximately 5.5 acres in the north-central portion of Zone 4. It also mixes with Fremont cottonwood and oaks in other low-lying areas between mine tailings (see Exhibit 3B.3-1) (ECORP 2009). This community is dominated by dense shrub-type willows. Other shrubs and herbaceous vegetation associated with the community include coyote brush, blue elderberry, poison oak, rush (*Juncus* spp.), and non-native grasses.

Some common wildlife species that occur in willow scrub include mountain garter snake (*Thamnophis elegans*), mourning dove, dusky-footed woodrat (*Neotoma fuscipes*), and desert cottontail (*Sylvilagus audubonii*).

Dredge Tailings

Dredge tailings occur throughout portions of Zone 4, north of Douglas Road, comprising approximately 83.2 acres, and are associated with historic mining activities. Vegetation within these areas varies both in terms of species composition and cover. This community includes those areas that remain almost entirely unvegetated; annual grasslands overlap with this mapping unit and include areas where a more uniform grassland has become established. A variety of plant communities have been documented in the lower-lying areas in-between the dredge tailings. These communities can range from rural vegetation to riparian woodlands.

Irrigated Agriculture

Major agricultural uses in the study area are orchards, vineyards, and other row crops. This cover type includes approximately 39.0 acres within Zone 4 of the "Water" Study Area.

Elderberry Savanna

Two small areas occupying approximately 0.3 acres in the southwest quadrant of the project site are dominated by elderberry savanna. This plant community is characterized by open stands of elderberry with an understory of annual grassland (ECORP 2009).

Oak and Foothill Woodlands

Mixed oak woodlands occur within Zone 4 of the "Water" Study Area and include mostly interior live oak (*Quercus wislizenii*) and blue oak (*Quercus douglasii*), with pockets of foothill pine (*Pinus sabiniana*). Valley foothill woodlands are composed primarily of Fremont cottonwood, willow, coyote brush, and poison oak. Patches of shrubs, annual grasses, and forbs make up the understory of both the oak and pine woodlands. The foothill pine-oak woodland communities are a common natural community, encompassing approximately

8.6 acres in northern portions of Zone 4. Trees dominate these communities, and a variety of shrubs, annual grasses, and other herbaceous species form the understory.

Common wildlife species that use this habitat include California slender salamander (*Batrachoseps attenuatus*), western fence lizard (*Sceloporus occidentalis*), red-tailed hawk (*Buteo jamaicensis*), deer mouse, raccoon (*Procyon lotor*), and black-tailed deer (*Odocoileus hemionus*). Bird species in particular, and mammals such as striped skunk (*Mephitis mephitis*), woodrat (*Neotoma* sp.), and black-tailed deer (*Odocoileus* sp.), use woodlands for foraging, breeding, and cover. Species observed within this habitat include black phoebe (*Sayornis nigricans*), red-tailed hawk (*Buteo jamaicensis*), and turkey vulture (*Cathartes aura*).

Seasonal wetlands and seasonal ponds occur within the foothill pine-oak woodland habitat as well as two ephemeral drainages (ECORP 2009).

Wetland Communities and Other Waters

Seasonal Wetlands and Seasonal Wetland Swales

Seasonal wetland and seasonal wetland swale ecosystems can occur in basins or depressions at all elevations, aspects, and exposures, but they are most common on level to gently rolling topography (Mayer and Laudenslayer 1988). Pond turtles and amphibians such as frogs and salamanders may inhabit seasonal wetland habitat. Waterfowl, wading birds, and aerial insectivores such as flycatchers, swallows, swifts, and bats may forage in or over larger wetland habitats. Seasonal wetlands and seasonal wetland swales occur throughout Zone 4 of the "Water" Study Area, comprising approximately 7.8 acres and 4.9 acres, respectively, and are concentrated along streams or drainages and within depressions.

Seasonal wetlands are similar to vernal pools in that they are seasonally inundated or saturated during the winter and spring and become dry in the summer and fall. Seasonal wetlands occur in low-lying areas and are generally wet only during or following rainfall. They are distinguished from vernal pools in that they support a different flora generally composed of species not particularly unique or restricted in distribution. Common plant species in seasonal marshes in the project area include Mediterranean barley (*Hordeum marinum*), and annual rabbit-foot grass (*Polypogon monspeliensis*), knotgrass (*Paspalum distichum*), pale spikerush (*Eleocharis macrostachya*), Baltic rush (*Juncus balticus*), cattail (*Typha* sp.), umbrella nut-sedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), watercress (*Rorippa* sp.), and cocklebur (*Xanthium strumarium*).

Seasonal wetlands and seasonal wetland swales are known to support a variety of wildlife species, including Western pond turtle (*Clemmys marmorata*), branchiopods such as fairy (*Branchinecta lynchi*) and tadpole *(Lepidurus packardi*) shrimp, amphibians such as Pacific tree frogs and western toads, and birds including a variety of wading birds, shorebirds and waterfowl.

Vernal Pools

Vernal pools are composed of seasonally flooded depressions underlain by a clay, rock, or mineral layer beneath the soil through which water cannot easily pass. These areas support plant species such as white meadowfoam (*Limnanthes alba*), Fremont's tidy-tips (*Layia fremontii*), and woolly marbles (*Psilocarphus brevissimus*). As previously indicated, vernal pool grasslands are extensive throughout the southern portions of Zone 4 of the "Water" Study Area; comprising approximately 10.8 acres of vernal pools.

Vernal pools often provide suitable habitat conditions for many rare plants and animals such as vernal pool tadpole and fairy shrimp, Conservancy fairy shrimp (*Branchinecta conservvatio*), and legenere (*Legenere limosa*).

Drainage Channels and Riverine Habitat

Drainage channels occur throughout Zone 4 of the "Water" Study Area. These include intermittent to nearly permanent stream channels, all of which have an ordinary high water mark. Morrison, Elder, Buffalo, and Laguna Creeks are intermittent to perennial streams that transect Zone 4 as shown in Exhibit 3B.3-1. Portions of Morrison, Elder, Buffalo, and Laguna Creeks support surface flow all year because flows are supplemented by runoff from adjacent developed areas, but upstream segments of these creeks are intermittent. Intermittent stream channels support flowing water through winter and spring, but dry up by summer. Many of the other intermittent channels present on the project site are tributary to Alder Creek. There are 6.7 acres of perennial stream channel (or riverine habitat) scattered throughout Zone 4. Jurisdiction over drainage channels outside the Folsom SPA has not been formally determined, but it is likely that the majority, if not all of these features are subject to Federal jurisdiction.

Wildlife such as great egret (*Ardea alba*), great blue heron (*Ardea herodias*), and other shorebirds may forage in these streams. The streams may provide habitat for Pacific chorus frog, western pond turtle, and other amphibians and reptiles.

Freshwater Forested/Willow Scrub

Approximately 2.2 acres of this community is present within Zone 4 of the "Water" Study Area and includes California box elder (*Acer negundo* var. *californicum*), Fremont cottonwood *(Populus fremontii* ssp. *fremontii*), valley oak (*Quercus lobata*), Oregon ash (*Fraxinus latifolia*), Himalayan blackberry (*Rubus discolor*), California blackberry (*Rubus ursinus*), and willows (*Salix* spp.). The willow scrub community is dominated by narrow-leaved willow (*Salix exigua*) and arroyo willow (*Salix lasiolepis*). Scattered white alder (*Alnus rhombifolia*) present and patches of poison hemlock (*Conium maculatum*). The canopy is fairly open, with dense thickets of shrub. The herbaceous layer is dominated by poison hemlock (*Conium maculatum*), annual grasses, and mugwort (*Artemesia* sp.). Wildlife species potentially occurring would be similar to the riverine habitat.

Freshwater Emergent Wetland or Marsh

Freshwater marsh is an emergent wetland plant community occurring in areas that are permanently or nearly permanently inundated. Within Zone 4 of the "Water" Study Area, this community type is found in association with the drainage channels described above. Approximately 13.2 acres of freshwater marsh are present throughout Zone 4 of the "Water" Study Area. Vegetation within the community consists primarily of wetland species, including cattails, hard-stem bulrush (*Scirpus acutus*), tall flatsedge (*Cyperus eragrostis*), soft rush (*Juncus effusus*), and willow. The permanently flooded marsh habitats along Morrison, Elder, Buffalo, and Laguna Creeks can be described as Valley Freshwater Marsh, a community considered sensitive by the CDFG due to activities throughout the state that have reduced the extent of the community.

Wildlife associated with this community include those commonly found in wetland environments, such as Pacific treefrog, bullfrog (*Rana catesbeiana*), western pond turtle, shorebirds, waterfowl, and other common wildlife found in riparian and wetland habitats.

Ponds

These include ponds created through impoundment of stream channels and excavated basins. Approximately 5.1 acres of pond habitat occur within Zone 4 of the "Water" Study Area. The on-site ponds are typically inundated year round and some support sparse cover of emergent vegetation along the shallow margins, and black willow and Fremont cottonwood on their banks. In contrast to seasonal wetlands, seeps, and marshes, ponds are characterized predominantly by open water or bare ground and are not vegetated wetlands. No ponds are present in off-site elements of the project. Wildlife species found within pond habitats would be similar to those found in perennial wetland and riverine habitats and could include bull frogs, western pond turtle, and shorebirds.

PLANT COMMUNITIES IN ZONES 1 AND 2 OF THE "WATER" STUDY AREA

Zone 1 comprises the Natomas Central Mutual Water Company's (NCMWC's) service area in the southern Natomas Basin, north of the City of Sacramento and Sacramento International Airport. Habitats found within Zone 1 include riverine/open water habitat along the Sacramento River, cropland, and urban land, mainly in the southern portion of NCMWC's service area. Open water habitats include ponds, flooded oxbows, rivers, streams, and canals and are present within the Sacramento River, Cache Creek, Willow Slough, Tule Canal, and other unnamed waterways. The depths and/or flow velocities of these features restrict the establishment of terrestrial vegetation, but submerged and floating aquatic vegetation may occur (Environmental Science Associates 2007). Several of these open water features are drainages that may support freshwater marsh or riparian communities. Based on National Wetland Inventory data produced by USFWS, Zone 1 of the "Water" Study Area contains a total of 143.13 acres of wetland habitat within NCMWC's service area, with freshwater emergent wetland comprising 85 acres and the remainder consisting of freshwater forested/shrub wetland, freshwater pond, and riverine. Urban and cropland habitats are present within the remainder of Zone 1 and comprise the majority of the land area.

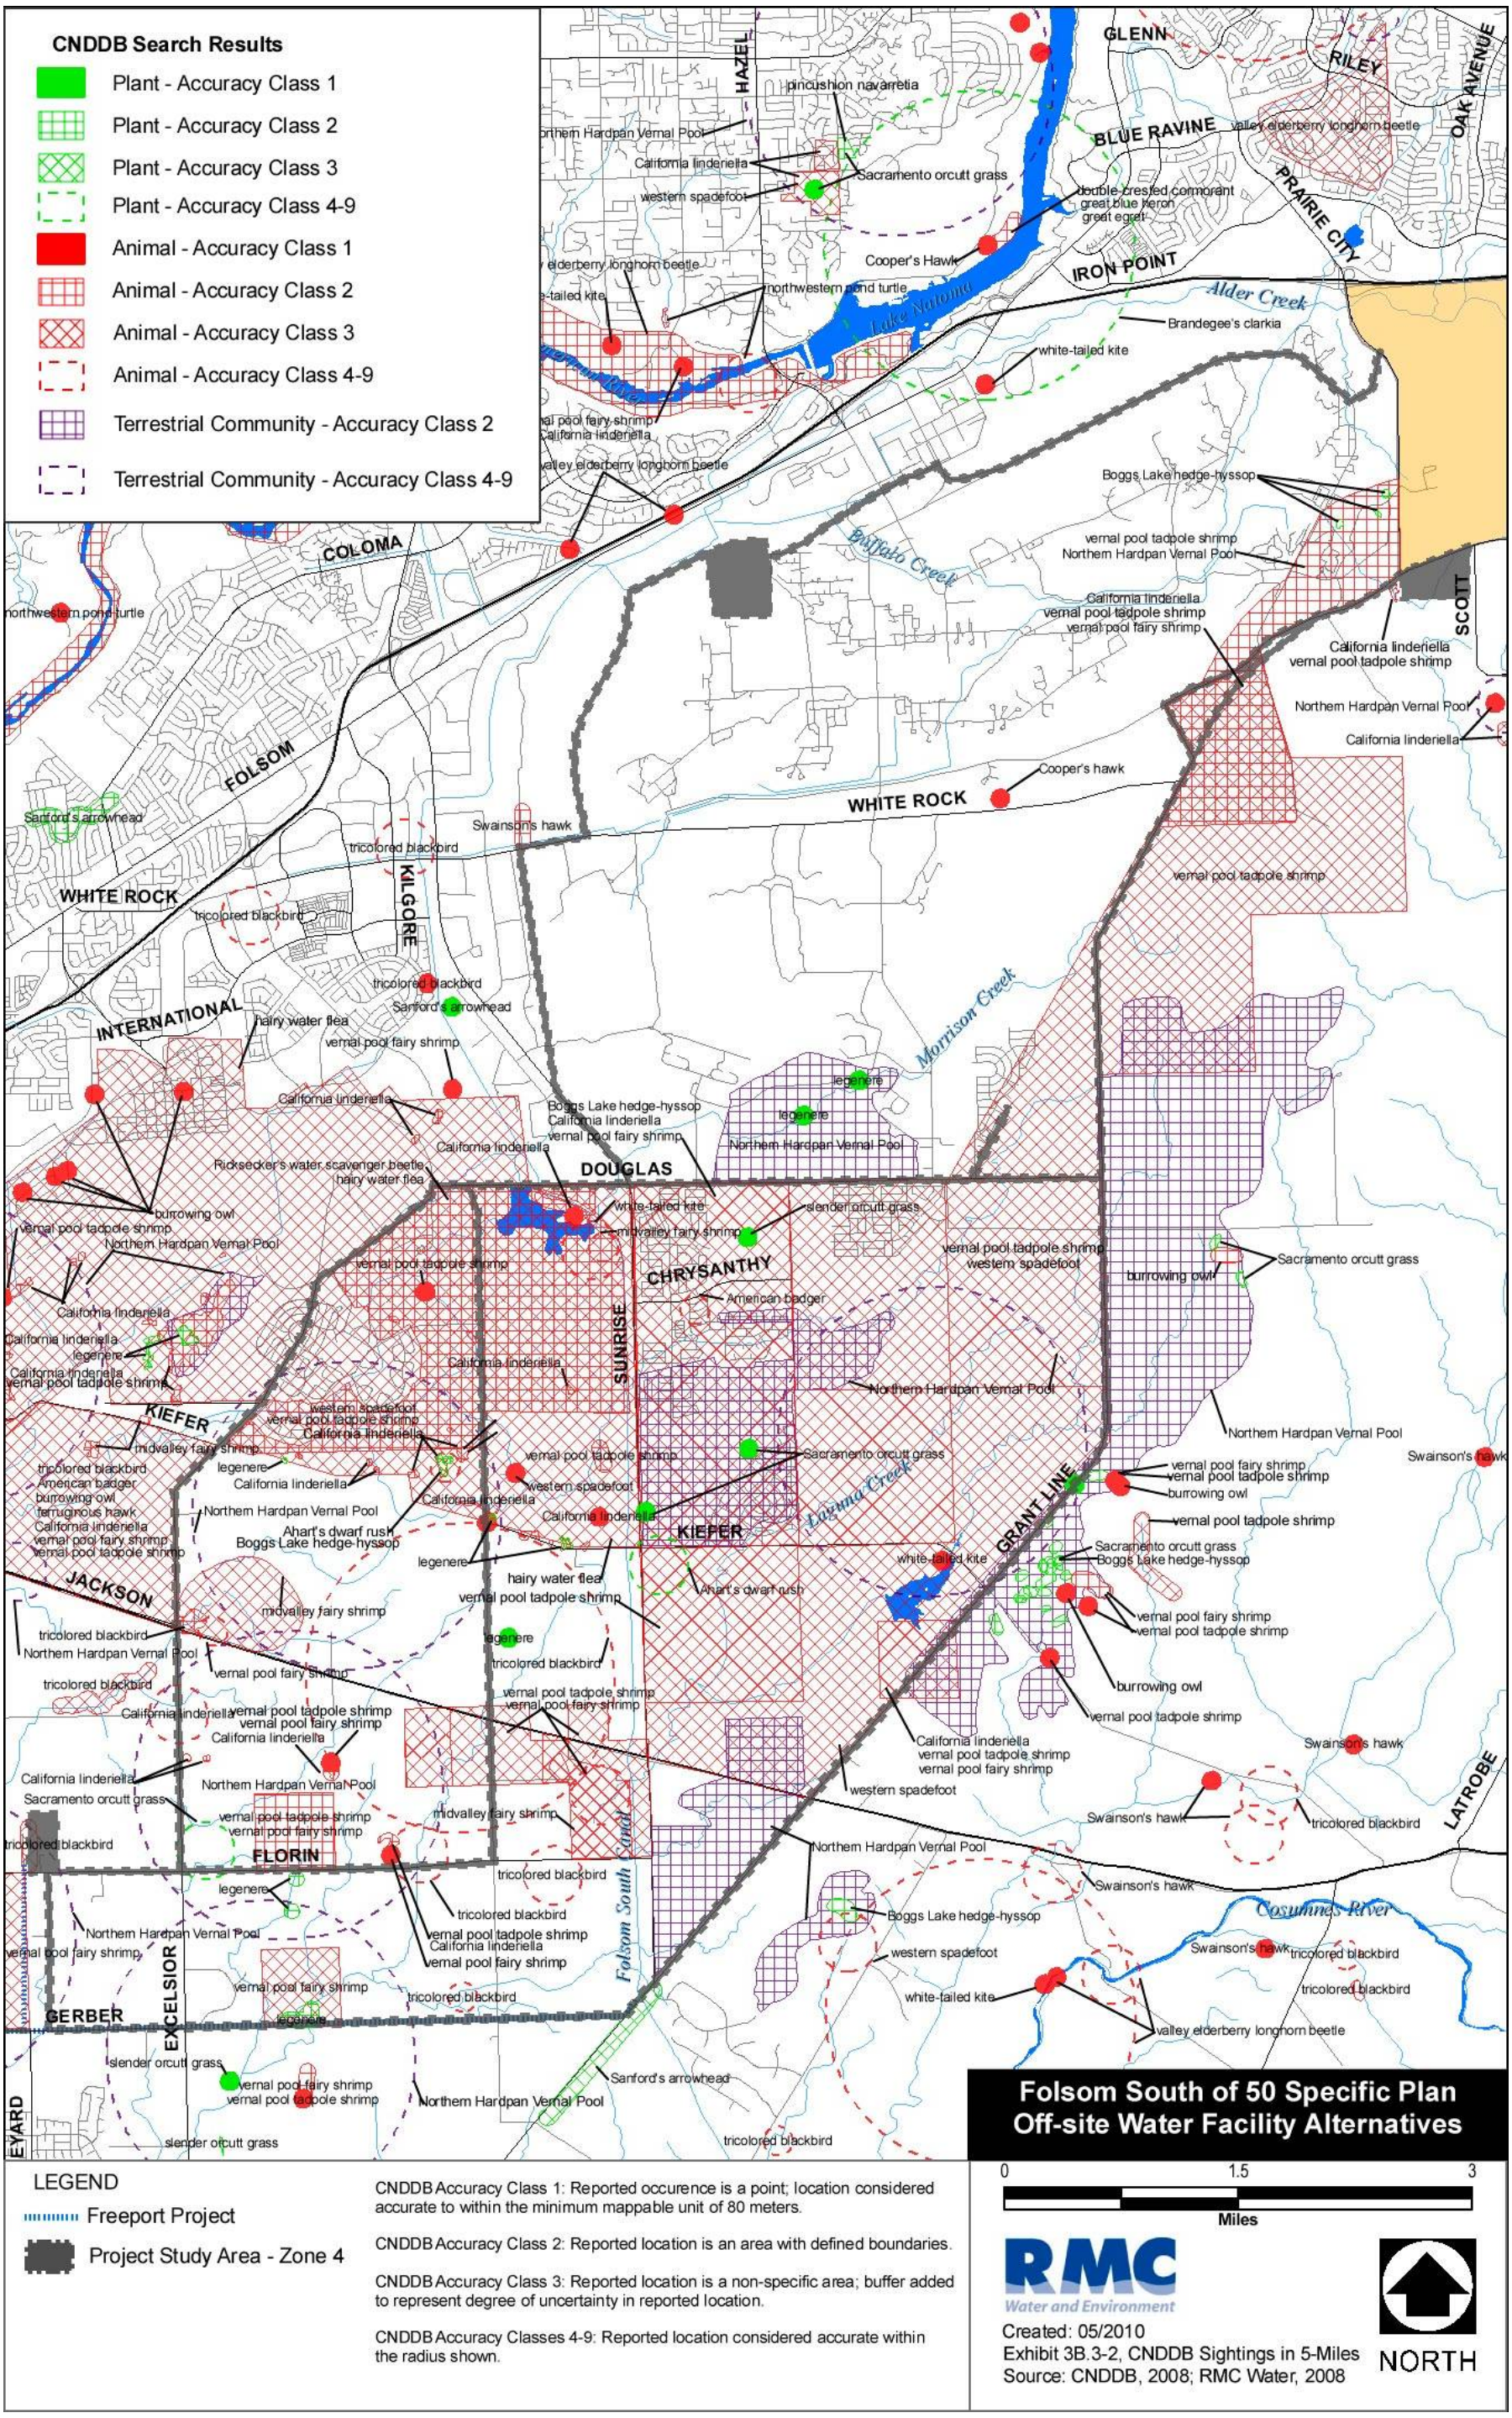
Zone 2 of the "Water" Study Area is comprised of the Sacramento River between Freeport and the NCMWC's service area. Zone 2 mainly consists of open water habitat with riparian habitats situated along the levees and banks. According to data produced by the National Wetland Inventory, Zone 2 is comprised of 1205 acres of riverine habitat and 12.2 acres of freshwater Forested/Shrub Wetland. Details regarding the quantity of flow within the river during dry, average, and wet year conditions are provided in Section 3.9B.1.

SPECIAL-STATUS SPECIES IN ZONE 4 OF THE "WATER" STUDY AREA

Sensitive biological resources addressed in this section include those that are afforded consideration or protection under the California Environmental Quality Act (CEQA), California Fish and Game Code, California Endangered Species Act (CESA), Federal Endangered Species Act (ESA), Clean Water Act (CWA), and the Porter-Cologne Water Quality Control Act (Porter-Cologne Act). For purposes of this analysis, the term "special-status" includes those species categories identified and described in Section 3A.3 (Biological Resources, "Land"), on page 3A.3-8. A list of special-status species with potential to occur within the vicinity of Zone 4 of the "Water" Study Area was compiled based on data from the above sources. Conclusions regarding habitat suitability and species occurrence are based on a reconnaissance-level assessment of the area, as well as existing literature, and other environmental documents prepared for other projects within Zone 4 of the "Water" Study Area. Exhibit 3B.3-2 illustrates the location of documented special-status species within a 5-mile radius of Zone 4 of the "Water" Study Area.

Surveys were conducted to determine habitat suitability for biological resources that could potentially occur within Zone 4 of the "Water" Study Area. Road alignment surveys included both sides of the roadway through a combination of foot surveys, where accessible, and by automobile, in instances where access was limited. The reconnaissance survey did not include areas that were inaccessible due to private property fencing, construction activities, or the planned Rancho Cordova and Easton Valley Parkway alignments. For planned roadways and areas where access was limited, the previously prepared environmental documents were used and are incorporated by reference. These documents include:

- White Rock Road Widening Project, Phases A, B, and C, EIR;
- Freeport Regional Water Project EIR/EIS;
- Easton Project EIR for the Easton Valley Parkway; and
- Rio del Oro Specific Plan EIR/EIS.



Special-Status Plant and Wildlife Species with Potential to Occur in Zone 4 of the "Water" Study Area **Exhibit 3B.3-2**

Special-status Plants

Based on information obtained from a literature review and from regulatory agencies, 17 special-status plant species were identified as having the potential to occur within Zone 4 of the "Water" Study Area (Appendix M-V, Tables 1 and 2). Appendix M-V provides additional information on the status, life history, distribution, and potential for occurrence in the project area for each of these species. Table 3B.3-1 identifies the plant and wildlife species that could occur, are likely to occur, and known to occur within Zone 4 the "Water" Study Area. Exhibit 3B.3-2 illustrates the relative locations of these special-status plant species occurrences.

Table 3B.3-1
Special-Status Plant Species with Potential to Occur in Zone 4 of the "Water" Study Area

Species	Federal/State/ CNPS Status	General Habitat	Potential for Species to Occur
PLANTS			
Arctostphaylos myrtifolia Ione manzanita	FT/--/1B.2	Chaparral and cismontane woodland on acidic, Ione soils, clay or sandy substrates. From 200 to 1,900 feet in elevation.	**Unlikely to Occur.** Unlikely to occur due to lack of suitable habitat in Zone 4 of Off-site Water Facilities Study Area.
Castilleja campestris ssp. *succulenta* succulent owl's–clover	FT/CE/1B.2	Vernal pools, often acidic. From 200 to 2,460 feet in elevation.	**Likely to Occur.** Potentially occurring in the project area. The project area is not within designated critical habitat.
Chlorogalum grandiflorun Red Hill's soaproot	--/--/1B.2	Cismontane woodland, chaparral, and lower montane coniferous forests on serpentine or gabbro soils. From 850 to 3,500 feet in elevation.	**Unlikely to Occur.** Zone 4 is outside of the species' known elevation range and no suitable habitat was observed.
Clarkia biloba ssp. *brandegeeae*	--/--/1B.2	Chaparral and cismontane woodland in openings and rocky slopes; often road cuts, from 0 to 3,000 feet in elevation.	**Unlikely to Occur.** No suitable habitat was observed in Zone 4.
Downingia pusilla Dwarf downingia	--/--/2.2	Mesic areas in valley and foothill grassland and vernal pools. From 3 to 1,450 feet in elevation.	**Likely to Occur.** Suitable habitat observed within Zone 4.
Eriogonum apricum var. *apricum* Ione buckwheat	FE/SE/1B.1	Chaparral in openings and Ione soil. From 200 to 475 feet in elevation.	**Unlikely to Occur.** Unlikely to occur due to lack of suitable habitat and soils in project area.
Eriogonum apricum var. *prostratum* Irish Hill buckwheat	FE/SE/1B.1	Chaparral in openings and Ione soil. From 200 to 400 feet in elevation.	**Unlikely to Occur.** Unlikely to occur due to lack of suitable habitat and soils in project area.
Eryngium pinnatisectum Tuolumne button-celery	--/--/1B.2	Cismontane woodlands, lower montane coniferous forests, and vernal pools in mesic areas. From 230 to 300 feet in elevation.	**Could Occur.** Potentially suitable habitat exists within Zone 4.
Gratiola heterosepala Bogg's Lake hedge-hyssop	--/CE/1B.2	Marshes and swamps and vernal pools, clay. From 30 to 7,800 feet in elevation.	**Likely to Occur.** Potentially occurring in the project area.
Horkelia parryi Parry's horkelia	--/--/1B.2	Chaparral and cismontane woodland, especially Ione formation. From 260 to 3,400 feet in elevation.	**Unlikely to Occur.** Lack of suitable habitat in zone 4 of project area.

Table 3B.3-1
Special-Status Plant Species with Potential to Occur in Zone 4 of the "Water" Study Area

Species	Federal/State/ CNPS Status	General Habitat	Potential for Species to Occur
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	--/--/1B.2	Mesic areas in valley and foothill grassland. From 100 to 325 feet in elevation.	**Likely to Occur.** Potentially occurring in the project area.
Legenere limosa legenere	--/--/1B.1	Vernal pools. From 3 to 2,900 feet in elevation	**Likely to Occur.** Potentially occurring in the project area.
Navarretia myersii ssp. *Myersii* Pincushion navarretia	--/--1B.1	Vernal pools. From 65 to 1,100 feet in elevation.	**Likely to Occur.** Potentially occurring in the project area.
Orcuttis tenuis slender Orcutt grass	FT/CE/1B.1	Vernal pools. From 115 to 5,775 feet in elevation.	**Known to Occur.** Potentially occurring in the project area. The project area is located within Critical Habitat Unit 6 (Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A).
Orcuttia viscida Sacramento Orcutt grass	FE/CE/1B.1	Vernal pools. From 115 to 325 feet in elevation.	**Known to Occur.** Potentially occurring in the project area. The project area is located within Critical Habitat Unit 2 (Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A).
Pseudobahia bahifolia Hartweg's golden sunburst	FE/CE/1B.1	Cismontane woodland and Valley and foothill grassland clay, often acidic soils. From 100 to 1,000 feet in elevation	**Likely to Occur.** Potentially occurring in the project area.
Sagittaria sanfordi Sanford's arrowhead	--/--/1B.2	Marshes and swamps. From 0 to 2,000 feet in elevation.	**Could Occur.** Potentially occurring in the project area.

STATUS CODES

Federal

FE = Endangered
FT = Threatened
FC = Candidate

State

CE = Endangered
CT = Threatened
CFP = Fully Protected
CSC = California Department of Fish and Game Special Concern species

California Native Plant Society

List 1B = Plants rare, threatened, or endangered in California and elsewhere
List 2 = Plants rare, threatened, or endangered in California, but more common elsewhere
List 3 = Plants about which we need more information--a review list
List 4 = Plants of limited distribution--a watch list

0.1 = Seriously endangered in California
0.2 = Fairly endangered in California
0.3 = Not very endangered in California

Potential for Occurrence Definitions

Unlikely to occur: Species is unlikely to be present on the project site due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

Could occur: Suitable habitat is available at the project site; however, there are little to no other indicators that the species might be present.

Likely to occur: Habitat conditions, behavior of the species, known occurrences in the project vicinity, or other factors indicate a relatively high likelihood that the species would occur at the project site.

Known to occur: The species, or evidence of its presence, was observed at the project site during reconnaissance surveys, or was reported by others.

Special-Status Wildlife

Based on information obtained from a literature review and from regulatory agencies, 25 special-status terrestrial wildlife species were identified as having the potential to occur within Zone 4 of the "Water" Study Area (Appendix M-V, Tables 1 and 2). Appendix M-V provides additional information on the status, life history, distribution, and potential for occurrence in the project area for each of these species. Table 3B.3-2 identifies the wildlife species that could occur, are likely to occur, and known to occur within Zone 4 the "Water" Study Area. Exhibit 3B.3-2 illustrates the relative locations of these special-status wildlife species occurrences.

Table 3B.3-2
Special-Status Wildlife Species with Potential to Occur in Zone 4 of the "Water" Study Area

Species	Federal/State	General Habitat	Potential for Species to Occur
INVERTEBRATES			
Branchinecta conservvatio Conservancy fairy shrimp	FE/--	Large vernal pools with cool, moderately turbid water	**Could Occur.** Potentially suitable habitat occurs in Zone 4, but Zone 4 is not within designated critical habitat.
Branchinecta lynchi vernal pool fairy shrimp	FT/--	Vernal pools throughout California west of the Sierra Nevada.	**Known to Occur**. Potentially occurring in the project area. The project area is within Critical Habitat Unit 13 (Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A).
Desmocerus californicus dimorphus = valley elderberry longhorn beetle	FT/--	Elderberry shrubs throughout the Central Valley and foothills below 3,000 feet elevation.	**Known to Occur.** Potentially occurring in the project area. Several elderberry shrubs were detected in the project area during surveys along White Rock Road and the Off-site Water Facility Alternative 1A alignment and the planned Easton Valley Parkway.
Lepidurus packardi vernal pool tadpole shrimp	FE/--	Vernal pools in the Central Valley containing clear to highly turbid water.	**Known to Occur.** The project area is within Critical Habitat Unit 8 (Off-site Water Facility Alternatives 2, 2A, 3, 3A, 4, and 4A).
AMPHIBIANS AND REPTILES			
Actinemys (=Emys) marmorata marmorata northwestern pond turtle	--/CSC	Ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Requires basking sites and suitable upland habitat for egg-laying. Nest sites most often characterized as having gentle slopes (<15%) with little vegetation or sandy banks.	**Likely to Occur**. Suitable habitat is found along local drainages within the Off-site Water Facilities Study Area. Nearest known occurrence is at Mather Lake (DFG 2008).
Ambystoma californiense California tiger salamander	FT (central population)/--	Requires underground refuges, such as ground squirrel burrows, for shelter; typically found in more friable soils. Water sources, such as vernal pools, are required for breeding.	**Unlikely to Occur**. Nearest recorded sighting is south of the Cosumnes River. No contributing drainages intersect the off-site water facility study area.
Rana aurora draytonii California red-legged frog	FT/CSC	Breeds in slow moving streams, ponds, and marshes with emergent vegetation; forages in nearby uplands within about 200 feet.	**Unlikely to Occur.** There are no known occurrences of California red-legged frog in Sacramento County. Sacramento County is not within the current range of the species.

Table 3B.3-2
Special-Status Wildlife Species with Potential to Occur in Zone 4 of the "Water" Study Area

Species	Federal/State	General Habitat	Potential for Species to Occur
Spea hammondii western spadefoot toad	--/CSC	Requires vernal pools and seasonal wetlands below 4,500 feet that lack predators for breeding. Also occurs in grassland habitat and occasionally in valley foothill oak woodlands and orchards.	**Known to Occur.** Documented within Off-site Water Facilities Study Area; sightings along Grant Line Road, south of Douglas Road.
Spea hammondii western spadefoot toad	--/CSC	Requires vernal pools and seasonal wetlands below 4,500 feet that lack predators for breeding. Also occurs in grassland habitat and occasionally in valley foothill oak woodlands and orchards.	**Known to Occur.** Documented within Off-site Water Facilities Study Area; sightings along Grant Line Road, south of Douglas Road.
Thamnophis gigas Giant garter snake	FT/ST	Marshes, sloughs, low-gradient streams, small lakes, and rice fields.	**Unlikely to Occur (Zone 4).** No documented sightings or suitable habitats were observed in Zone 4. Giant garter snake is known to occur in Zone 1 within NCMWC's service area.
BIRDS			
Ammodramus savannarum grasshopper sparrow	--/CSC(nesting)	Dry, dense grasslands and prairies, especially those with a variety of grasses and tall forbs and scattered shrubs for singing perches. Nests are built of grasses and forbs in a slight depression in ground, hidden at base of an overhanging clump of grasses or forbs.	**Could Occur.** Potentially occurring in the project area. May nest and forage in dense grassland areas along Grant Line, Douglas, and White Rock Roads.
Athene cunicularia hypugaea western burrowing owl	--/CSC	Year-long resident of open, dry grassland and desert habitats and in grass, forb, and open shrub stages of pinyon-juniper and ponderosa pine habitats up to 5,300 feet.	**Known to Occur.** Potentially occurring in the project area. May nest and forage in the Off-site Water Facilities Study Area.
Agelaius tricolor tricolored blackbird	--/CSC	Breeds near freshwater, preferably in emergent wetland with tall dense cattails or tules, but also in willow, blackberry, wild rose, and tall herbs. Forages in grassland and cropland in the Central Valley and on the coast.	**Known to Occur.** Potentially occurring in the project area. May forage in project area. This species is identified as occurring along Eagles Nest Road.
Aquila chrysaetos Golden eagle	CFP/--	Grasslands and early successional stages of forest and shrub habitats for foraging up to 11,500 feet. Secluded cliffs with overhanging ledges or large trees in open areas with unobstructed views for nesting.	**Could Occur.** May forage in portions of Zone 4.
Buteo swainsoni Swainson's hawk	--/ST	Uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert. Riparian woodlands, juniper-sage flats, and oak woodlands for nesting. Grasslands and agricultural areas for foraging.	**Known to Occur**. Potentially occurring in the project area. May nest and forage in grassland portions of project area along White Rock, Grant Line, and Douglas Roads.
Circus cyaneus northern harrier	-- /CSC(breeding)	Grasslands, marshes, and agricultural areas for foraging and nesting.	**Likely to Occur.** Potentially occurring in the project area. May nest and forage in the Off-site Water Facilities Study Area.

Table 3B.3-2
Special-Status Wildlife Species with Potential to Occur in Zone 4 of the "Water" Study Area

Species	Federal/State	General Habitat	Potential for Species to Occur
Elanus leucurus white-tailed kite	--/CFP	Open woodland, marshes, partially cleared lands and cultivated fields, mostly in lowland situations. Nests in trees, often near a marsh, usually 20 to 50 feet above the ground in branches near the top of a tree.	**Known to Occur.** Observed southwest of the intersection of Sunrise Boulevard/ Douglas Road. May nest and forage in the Off-site Water Facilities Study Area.
Haliaeetus leucocephalus Bald eagle	FT/SE	Year-round resident in ice-free regions of California. Foraging areas include regulated and unregulated rivers, reservoirs, lakes, estuaries, and coastal marine ecosystems. Majority of bald eagles in California breed near reservoirs and nests are usually located within one mile of foraging habitat.	**Unlikely to Occur.** No appropriate nesting or foraging habitat present in Zone 4 of the off-site water study area.
Lanius ludovicianus Loggerhead shrike	--/CSC (nesting)	Open habitats with sparse shrubs and trees (or other suitable perch sites) and bare ground and/or low, sparse herbaceous cover; oak woodlands for nesting. Found in lowlands and foothills throughout California.	**Likely to Occur.** Suitable habitat observed during field reconnaissance. May nest and forage in the Off-site Water Facilities Study Area.
Ripaeria riparia Bank swallow	--/CSC	Sporadic colonial breeder, frequently near flowing water. Nests in steep sand, dirt, or gravel banks, in a burrow dug near the top of the bank, along the edge of inland water or in gravel pits, and road embankments.	**Unlikely to Occur.** No appropriate nesting or foraging habitat present in Zone 4 of the project area.
MAMMALS			
Antrozous pallidus pallid bat	--/CSC	Inhabits grasslands, shrublands, woodlands, and forests from sea level up through mixed conifer forests. Typically roosts in caves, crevices, or mines. Requires open habitat for foraging.	**Likely to Occur.** Potentially occurring in the project area. May forage in project area and use bridge structures.
Taxidea taxus American badger	--/CSC	Dry, open stages of most shrub, forest, and herbaceous habitats, with friable soils. Cultivated lands have been reported to provide little usable habitat.	**Likely to Occur.** Suitable habitat occurs along waterways traversing the Off-site Water Facilities Study Area. Not observed during field surveys.

Potential for Occurrence Definitions

Unlikely to occur: Species is unlikely to be present on the project site due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

Could occur: Suitable habitat is available at the project site; however, there are little to no other indicators that the species might be present.

Likely to occur: Habitat conditions, behavior of the species, known occurrences in the project vicinity, or other factors indicate a relatively high likelihood that the species would occur at the project site.

Known to occur: The species, or evidence of its presence, was observed at the project site during reconnaissance surveys, or was reported by others.

FISHERY RESOURCES IN ZONE 2 OF THE "WATER" STUDY AREA

Numerous fish monitoring studies have documented that a variety of resident and migratory fish and microinvertebrates are present in the Sacramento River in the vicinity of Zone 2 of the "Water" Study Area. Relevant studies include: (1) investigations of fish eggs and larvae near Hood, (2) fisheries surveys characterizing species composition, abundance, and seasonal distribution of downstream migrating juvenile Chinook salmon and steelhead near Knights Landing, and (3) seasonal and geographic distribution of various State and Federally listed threatened or endangered fish species including Winter-run and Central Valley fall/late fall-run Chinook salmon (*Onocorhynchus tshawytscha*), Green sturgeon (*Acipenseridae* sp.), Delta smelt (*Hypomesus transpacificus*), Sacramento splittail (*Pogonichthys macrolepidotus*), Longfin smelt (*Spirinchus thaleichthys*), and Central Valley steelhead (*Onocorhynchus mykiss*). These studies help define the existing conditions for Zone 2 of the Off-site Water Facilities Study Area.

Other fish species common in the Sacramento River near the Freeport Project intake location include river and Pacific lamprey (*Lampetra* sp.), California roach (*Hesperoleucus symmetricus*), large-mouth bass (*Micropterus salmoides*), hardhead, threadfin shad, catfish (*Ictalurus punctatus*), Sacramento pike (*Ptychocheilus grandis*), minnow, tule perch, sculpin, bullhead, and a variety of other resident fish species (FRWA 2003). The Sacramento River also provides habitat for a variety of invertebrates, including planktonic species such as copepods, and epibenthic species such as crawfish and amphipods.

Additional surveys beyond those available for the study area were not conducted. Historical survey information was deemed sufficient to establish information about composition and abundance of fishery species in Zone 2 of the "Water" Study Area.

Special-status Fish Species

Fish species listed for protection under CESA and known to occur within Zone 2 of the "Water" Study Area include Central Valley steelhead, winter-run and fall-run Chinook salmon, Delta smelt and green sturgeon. Other special-status fish species include longfin smelt, lamprey, hardhead, Sacramento splittail, and California roach. Based on currently available information regarding these species' habitat distributions and known or presumed occurrences, these species could potentially occur within Zone 2 of the "Water" Study Area. The Freeport Project EIR/EIS, incorporated by reference into this EIR/EIS, provides detailed descriptions for each of these fish species along with an assessment of the potential impacts associated with operation of the Freeport Project intake, which includes a positive barrier fish screen.

The species composition and relative abundance of both fish and macroinvertebrates within the Sacramento River vary within and among years in response to environmental factors such as changes in hydrologic conditions, seasonal migration patterns, and microhabitat conditions. Several of the fish species inhabiting Zone 2, most notably striped bass, white sturgeon, American shad, and catfish, support recreational fisheries, but are not listed under the state or Federal ESA. Many other fish and macroinvertebrates are considered to be important prey and forage species.

Several endangered or threatened fish species have been collected in the vicinity of the Sacramento River within the "Water" Study Area. These include: (1) winter-run Chinook salmon (listed as an endangered species under the CESA and Federal ESA, (2) spring-run Chinook salmon and steelhead (listed as threatened species under the CESA and Federal ESA), (3) green sturgeon juveniles and adults, (recently listed as a threatened species under the Federal ESA), and (4) Delta smelt (listed as a threatened species under the CESA and Federal ESA). Although Delta smelt have been occasionally collected in the Sacramento River near the Freeport Project diversion, they primarily occur downstream; that is, within the lower Sacramento River downstream of Sacramento and within the lower portions of the Delta and Suisun Bay.

Table 3B.3-3 identifies the wildlife species that could occur, are likely to occur, and known to occur within Zone 2 the "Water" Study Area.

Table 3B.3-3
Special-Status Fish Species with Potential to Occur in Zone 2 of the "Water" Study Area

Species	Federal/State	General Habitat	Potential for Species to Occur
Acipenser medirostris Green sturgeon	FT/CSC	Habitat requirements of green sturgeon are poorly known, but spawning and larval ecologies probably are similar to those of white sturgeon. Adult green sturgeon are more marine than white sturgeon, spending limited time in estuaries or freshwater (SWRCB 1999). Indirect evidence indicates that green sturgeon spawn mainly in the Sacramento River; spawning has been reported in the mainstem as far north as Red Bluff. Preferred spawning habitat is the lower reaches of large rivers with swift currents and large cobble.	**Likely to Occur.** Green sturgeon may spawn both upstream and downstream of Zone 2. It is probable that green sturgeon larvae or juveniles will be in the water column throughout the year.
Hypomesus transpacificus Delta smelt	FT/ST	Delta smelt are endemic to the upper Sacramento-San Joaquin Delta. Juvenile and adult Delta smelt typically inhabit open waters of the lower Delta and Suisun Bay including Suisun Marsh. Delta smelt inhabit shallow-water areas (typically less than nine feet deep at the lower low water); however, juvenile and adult Delta smelt are also known to occur within the deeper channel areas (Hanson, unpublished data). Juvenile and adult Delta smelt are generally found in the lower reaches of the Sacramento River downstream of Rio Vista, the San Joaquin River downstream of Mossdale, and within Suisun Bay (SWRCB 1999).	**Known to Occur.** Based on the Smelt's geographic distribution, the Freeport Project diversion and Zone 2 of the "Water" Study Area are located near the northern extent of the Delta smelt's geographic range and with the designated critical habitat for Delta smelt.
Lampetra tridentate River lamprey	FSC/CSC	The river lamprey has been captured mostly in the upper portion of the Sacramento-San Joaquin estuary and its tributaries in California.	**Known to Occur.** River lamprey have been found throughout the mainstem Sacramento River and the downstream Delta. They migrate through the mainstem river and tributaries to spawn in small streams in April and May.
Oncorhynchus mykiss Central Valley steelhead	FT/--	Steelhead typically return to their natal streams to spawn. Considerable variation occurs in steelhead-run timing. Stocks in the Central Valley are all winter steelhead. Adults migrate upstream through the Delta and into the Sacramento River and tributaries primarily during the late fall, winter, and spring. Steelhead begin moving through the mainstem in July, and continue migrating through February or March.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within an area of the Sacramento River designated as critical habitat for steelhead.

Table 3B.3-3
Special-Status Fish Species with Potential to Occur in Zone 2 of the "Water" Study Area

Species	Federal/State	General Habitat	Potential for Species to Occur
Oncorhynchus tshawytscha Central Valley spring-run Chinook salmon	FT/ST	Spring-Run salmon migrate upstream from March through October. Adults hold in deep cold pools within the rivers and tributaries over the summer months prior to spawning from August to October.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within an area of the Sacramento River designated as critical habitat for spring-run Chinook salmon.
Oncorhynchus tshawytscha Winter-run Chinook salmon	FE/SE	Adult winter-run Chinook salmon migrate through the Delta from late November through June and into the Sacramento River from December through July. Winter-run Chinook salmon remain in the river up to several months before spawning.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within an area of the Sacramento River designated as critical habitat for winter-run Chinook salmon.
Oncorhynchus tshawytscha Central Valley fall/late fall-run Chinook salmon	FP/CSC	Adult late-fall-run Chinook salmon migrate through the Delta and into the Sacramento River from October through March, or possibly April, and spawn from January through April. Peak spawning activity occurs in February and March.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within an area of the Sacramento River designated as critical habitat for fall/late fall-run Chinook salmon.
Pogonichthys macrolepidotus Sacramento splittail	FSC/SSC	The Sacramento splittail is a large minnow endemic to the Bay/Delta Estuary. Once found throughout low-elevation lakes and rivers of the Central Valley from Redding to Fresno, this native species now occurs in the lower reaches of the Sacramento and San Joaquin Rivers and tributaries, the Delta, Suisun and Napa marshes, the Sutter and Yolo Bypasses, and the tributaries of north San Pablo Bay.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within the range of Sacramento sptiltail.
Spirinchus thaleichthys Longfin smelt	FSC/SSC	The longfin smelt is a small, planktivorous fish that is found in several Pacific coast estuaries from San Francisco Bay to Prince William Sound, Alaska. Longfin smelt can tolerate a broad range of salinity concentrations, ranging from freshwater to seawater.	**Known to Occur.** The Freeport Project diversion and Zone 2 of the "Water" Study Area are located within an area of the Sacramento River likely on the edge of this species range.

Potential for Occurrence Definitions

Unlikely to occur: Species is unlikely to be present on the project site due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

Could occur: Suitable habitat is available at the project site; however, there are little to no other indicators that the species might be present.

Likely to occur: Habitat conditions, behavior of the species, known occurrences in the project vicinity, or other factors indicate a relatively high likelihood that the species would occur at the project site.

Known to occur: The species, or evidence of its presence, was observed at the project site during reconnaissance surveys, or was reported by others.

Critical Habitat Designations for Fish

Central Valley Spring-run and Fall, Late Fall-run Chinook Salmon

NMFS recently designated critical habitat for the Central Valley spring-run Chinook salmon; effective January 2, 2006. Critical habitat consists of the waters, substrates, and adjacent riparian zones of accessible estuarine and riverine reaches. Critical habitat is designated to include all reaches accessible to Chinook salmon in the Sacramento River and its tributaries in California, all river reaches and estuarine areas of the Sacramento-San Joaquin Delta, all waters from Chipps Island westward to the Carquinez Bridge, including Honker Bay, Grizzly Bay, Suisun Bay, and Carquinez Straits, all waters of San Pablo Bay west of the Carquinez Bridge, and all waters of San Francisco Bay (north of San Francisco/Oakland Bay Bridge) from San Pablo Bay to the Golden Gate Bridge. Excluded are areas above specific dams or above long standing naturally impassable barriers.

Table 5-3 of the Freeport Project EIR, Life Stage Timing and Distribution of Selected Species Potentially Affected by the Proposed Alternatives, which is incorporated by reference into this EIR/EIS, provides the known timing and distribution of these species within the vicinity of the Freeport Project intake/fish screen. This table is included in Appendix M-V.

Existing Factors Affecting Chinook Salmon Populations

The following environmental and biological factors affect the abundance, mortality, and population dynamics of Chinook salmon:

- loss of access to historic spawning and juvenile rearing habitat within the upper reaches of the Sacramento River and its tributaries as a result of the migration barriers caused by major dams and reservoirs;
- river and creek water temperatures affect incubating eggs, holding adults, and growth and survival of juvenile salmon;
- changes in habitat quality including availability for spawning and juvenile rearing;
- exposure to contaminants;
- predation mortality by Sacramento pikeminnow, striped bass, and other predators;
- competition and interactions with hatchery-produced Chinook salmon; and
- recreational and commercial fishing of subadult and adult Chinook salmon.

In recent years, however, a number of changes have been made to improve the survival and habitat conditions for Chinook salmon. Several large, previously unscreened water diversions have been equipped with positive barrier fish screens. These screens include perforated metal plates, meshes, or other physical devices that are designed to prevent fish from passing into intake facilities (entrainment) while minimizing the stress and injury that may occur when fish impact the screen or are subjected to changes in water velocity caused by the diversion.

Changes to ocean salmon fishing regulations, and modifications to California State Water Project (SWP) and Central Valley Project (CVP) Delta export operations, have also been made to improve the survival of both adult and juvenile Chinook salmon. Improvements in fish passage facilities have been made to improve migration and upstream access. These and other changes in management actions, in combination with favorable hydrologic and oceanographic conditions in recent years, are thought to have contributed to the increasing abundance of adults returning to the upper Sacramento River in the mid-1990s. However, since 2006, hydrological conditions have been such that both spring and fall run populations have been low, necessitating commercial fishing bans in 2008 and 2009.

Central Valley Steelhead

NMFS recently designated critical habitat for Central Valley steelhead; effective January 2, 2006. Critical habitat is designated to include all river reaches accessible to listed steelhead in the Sacramento and San Joaquin Rivers and their tributaries. Also included are river reaches and estuarine areas of the Sacramento-San Joaquin Delta, all waters from Chipps Island westward to the Carquinez Bridge, including Honker Bay, Grizzly Bay, Suisun Bay, and Carquinez Straits, all waters of San Pablo Bay west of the Carquinez Bridge, and all waters of San Francisco Bay (north of the San Francisco/Oakland Bay Bridge) from San Pablo Bay to the Golden Gate Bridge. Excluded are areas of the San Joaquin River upstream of the Merced River confluence and areas above specific dams or above longstanding naturally impassable barriers.

Central Valley Winter-run Chinook Salmon

NMFS designated critical habitat for Central Valley winter-run Chinook salmon on June 16, 1993. Critical habitat is designated to include the Sacramento River from Shasta Dam to Chipps Island. Also included are all waters from Chipps Island westward to Carquinez Bridge, including Honker Bay, Grizzly Bay, Suisun Bay, and Carquinez Straits, all waters of San Pablo Bay west of the Carquinez Bridge, and all waters of San Francisco Bay (north of the San Francisco/Oakland Bay Bridge) from San Pablo Bay to the Golden Gate Bridge.

Delta Smelt

USFWS designated critical habitat for Delta smelt within the Sacramento-San Joaquin system on December 19, 1994. Specific areas identified as critical habitat for Delta smelt spawning include Barker, Lindsay, Cash, Prospect, Georgiana, Beaver, Hog, Sycamore Sloughs and the Sacramento River in the Delta, and the tributaries of northern Suisun Bay. Areas identified as critical habitat for Delta smelt rearing extend eastward from the Carquinez Straits, including Suisun, Grizzly, and Honker Bays, Montezuma Slough and its tributary sloughs, up the Sacramento River to its confluence with Three-Mile Slough, and south along the San Joaquin River including Big Break. The Sacramento River upstream of Sacramento (I Street Bridge) is not within the area designated as critical habitat by USFWS for Delta smelt.

Green Sturgeon

Green sturgeon is listed by NMFS as a threatened species under the Federal ESA. Critical habitat for the species was designated by NMFS on October 9, 2009.

Longfin Smelt

The longfin smelt is listed as a threatened species under the CESA. At this time, no critical habitat designations are currently in place for this species.

Wetlands and Other Waters of the United States

An inventory of wetland areas within Zone 4 of the "Water" Study Area was conducted using a combination of information produced by USFWS as part of the National Wetlands Inventory (2009) and wetland inventories conducted by ECORP, January 2009. These data sources provide complete coverage for the conveyance pipeline corridors evaluated for the Off-site Water Facility Alternatives and the Folsom Boulevard and White Rock WTP sites. Total acreage of jurisdictional wetlands within areas that could be affected by any of the Off-site Water Facility Alternatives was estimated, and has not been verified by USACE. Acreage was calculated conservatively, assuming a 200-foot corridor for pipeline alignments. The inventory revealed a total of 50.7 acres of potential waters of the U.S., including wetlands, within Zone 4 of the "Water" Study Area. Potential jurisdictional wetlands and waters of the U.S. inventoried within Zone 4 consist of 7.8 acres of seasonal wetlands, 4.9 acres of seasonal wetland swales, 10.8 acres of vernal pools, 6.7 acres of drainage channel, including intermittent and perennial stream channels (or riverine habitat), 2.2 acres of freshwater forested/shrub wetland, 13.2 acres of freshwater emergent wetland (or marsh), and 5.1 acres of freshwater pond. The locations and extent of wetlands and other

waters of the U.S., as mapped by the National Wetlands Inventory and ECORP (2009), are shown in Exhibits 3B.3-3a, Exhibits 3B.3-3b, Exhibits 3B.3-3c, and Exhibits 3B.3-3d.

As described in more detail in Section 3A.3, Biological Resources – "Land," wetlands and other waters of the U.S. on the project site, as well as waters of the state, provide important ecological functions within the watershed.

3B.3.2 REGULATORY FRAMEWORK

FEDERAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following Federal plans, policies, regulations, and laws related to biological resources are relevant to the Off-site Water Facilities, and are described in detail in Section 3A.3, "Biological Resources – Land:"

- Federal Endangered Species Act
- Section 404 of the Clean Water Act
- Section 401 Water Quality Certification
- Migratory Bird Treaty Act
- Wetland Conservation Provision (Swampbuster) of the Food Securities Act

Operations Criteria and Plan for Long-Term Operation of CVP/SWP

Reclamation, as a Federal agency, obtains incidental take authorization through consultation with the U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) under Section 7 of the ESA to facilitate operation of the CVP. Similar take authorizations apply to DWR as part of its operation of the SWP. As part of combined operation of the CVP/SWP, the USFWS and NMFS have issued biological opinions that apply to the coordinated operation and are described in more detail below.

FWS Biological Opinion on Coordinated Operations of the CVP and SWP. The December 15, 2008, biological opinion by the USFWS on the coordinated operations of the CVP/SWP concluded that continued long term operations of the CVP and SWP, as proposed, were "likely to jeopardize" the continued existence of delta smelt without further flow conditions in the Delta for their protection and the protection of designated delta smelt critical habitat. The FWS developed a Reasonable and Prudent Alternative (RPA), which consists of five components aimed at protecting delta smelt, improving and restoring habitat, and monitoring and reporting results. Two RPA components establish flow conditions on Old and Middle River (OMR) flows to reduce the effects that reverse flows have on the entrainment of adults, larvae and juvenile life stages into the CVP and SWP pumping facilities in the south Delta:

- RPA Component 1 – addresses high and low entrainment risk periods and actions to protect adult delta smelt under specific conditions during the winter adult migration period. The measures reduce entrainment risk by limiting OMR reverse flows.

- RPA Component 2 – implemented upon the completion of RPA Component 1 or when Delta water temperatures reach 12ºC, a level that is associated with the start of delta smelt spawning, or biological evidence is collected in trawl programs or at the fish facilities that adult smelt have started spawning. OMR flows are also limited under RPA Component 2 depending on the location of the population relative to the proximity of the conveyance channels leading to the pumping facilities in the south Delta.

NMFS Biological Opinion on Coordinated Operations of the CVP and SWP. The NMFS published a biological opinion on June 4, 2009 describing the anadromous fish protections for the continued long term coordinated operations of the CVP and SWP[1] (NMFS 2009). This BO concluded that continued long term

[1] Judge Wanger issued a preliminary injunction against portions of the 2009 BO that address conditions downstream of Zone 2 of the "Water" Study Area with focus on the relationship between San Joaquin River flows at Vernalis and CVP/SWP exports from the Delta and the maximum reverse flows within the Delta that CVP/SWP pumping can cause.

operations of the CVP and SWP, as proposed, were "likely to jeopardize" the continued existence of Sacramento River winter run Chinook salmon, Central Valley spring run Chinook salmon, Central Valley steelhead, and the southern Distinct Population Segment (DPS) of North American green sturgeon. They also concluded that continued CVP/SWP operations were "likely to destroy or adversely modify" designated or proposed critical habitat of these species.

The NMFS concluded that Reclamation and DWR (the "water projects") both "directly altered the hydrodynamics of the Sacramento-San Joaquin River basins and have interacted with other activities affecting the Delta to create an altered environment that adversely influences salmonid and green sturgeon population dynamics." Within the Delta, the NMFS opinion identified adverse effects which include: water diversion from the north Delta into the Delta interior; enhance vulnerability of juvenile salmonids to entrainment at the export pumping facilities; enhanced vulnerability of San Joaquin River steelhead to direct entrainment and export-related changes in Delta hydrodynamics; and direct mortality of salmonids due to entrainment at the export pumps. To address these issues, the NMFS described six actions within RPA IV to be taken in the Delta:

- Action IV.1 – Modify Delta Cross Channel gate operations and evaluate methods to control access to Georgiana Slough and the Interior Delta to reduce diversion of listed fish from the Sacramento River into the southern or central Delta.
- Action IV.2 – Control the net negative flows toward the export pumps in OMR to reduce the likelihood that fish will be diverted from the San Joaquin or Sacramento River into the southern or central Delta.
- Action IV.3 – Curtail exports when protected fish are observed near the export facilities to reduce mortality from entrainment and salvage.
- Action IV.4 – Improve fish screening and salvage operations to reduce mortality from entrainment and salvage.
- Action IV.5 – Establish a technical group to assist in determining real-time operational measures, evaluating the effectiveness of the actions, and modifying them if necessary.
- Action IV.6 – Do not implement the South Delta Barriers Improvement Program.

Essential Fish Habitat for Pacific Salmon

The Magnuson-Stevens Fishery Conservation and Management Act, as amended by the Sustainable Fisheries Act of 1996, established procedures designed to identify, conserve, and enhance Essential Fish Habitat (EFH). The EFH designation applies to all species managed under a Federal Fishery Management Plan (FMP). In California, the FMP for salmon designates the mainstem Sacramento River as EFH (Pacific Fisheries Council 1999).

STATE PLANS, POLICIES, REGULATIONS, AND LAWS

The following state plans, policies, regulations, and laws related to biological resources are relevant to the Off-site Water Facilities Alternatives, and are described in detail in Section 3A.3, "Biological Resources – Land:"

- California Endangered Species Act
- California Public Resources Code Section 21083.4 (Oak Woodlands)
- Section 1602 of the California Fish and Game Code
- Porter-Cologne Water Quality Control Act
- California Fish and Game Code Section 3503.5 (Protection of Raptors)

DFG 2081 Incidental Take Permit (ITP) for Longfin Smelt

The DFG issued an ITP pursuant to Fish and Game Code section 2081 to the DWR on February 23, 2009 for the on-going and long-term operation of SWP facilities in the Delta for the protection of longfin smelt. For the most part the 2081 ITP conditions of approval prescribe OMR flow requirements that are also included in the FWS OCAP BO. These requirements are designed to protect adult longfin smelt migration and spawning during the December through February period and larval and juvenile longfin smelt during the January through June period. For the adults (December through February) DFG identified OMR flows no more negative than -5,000 cfs. For the larval/juvenile longfin smelt period, they identified OMR flows no more negative than -1,250 to -5,000 cfs, January through March, no more negative than -2,000 to -5,000, April and May, and no more negative than -5,000 cfs during June.

REGIONAL AND LOCAL PLANS, POLICIES, REGULATIONS, AND LAWS

The following regional and local plans, policies, regulations, and laws related to biological resources are relevant to the Off-site Water Facilities Alternatives, and are described in detail in Section 3A.3, "Biological Resources – Land:"

- Sacramento County General Plan, Conservation and Open Space Elements
- Sacramento County Swainson's Hawk Ordinance
- Sacramento County Tree Preservation Ordinance
- Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon

Sacramento County General Plan

The Open Space Element of the County General Plan provides policies and strategies to conserve biological resources. Open space areas, including wetlands, waterways, oak woodlands, and grasslands, have been designated as part of the land use element. No portions of the Off-site Water Facilities Study Area have been designated as open space areas in the General Plan; however, wetlands, riparian habitat, and oak woodlands are present and may require compliance with the Conservation and Open Space Elements.

As indicated in Chapter 1B, Sacramento County currently released a draft of its 2025 General Plan; however, this update to the General Plan is not expected to be adopted until sometime in late 2010.

South Sacramento Habitat Conservation Plan

The proposed South Sacramento Habitat Conservation Plan (SSHCP) is a regional approach to conserving species and addressing issues related to urban development, habitat conservation, open space protection, and agricultural protection. The SSHCP would consolidate environmental efforts to protect and enhance vernal pool habitat and other aquatic and upland habitats to provide ecologically viable conservation areas in south Sacramento County for numerous species. Adoption of the SSHCP would authorize Sacramento County and its partners to issue permits that allow landowners to engage in specific development activities (covered activities) that could result in the incidental take of listed species. Sacramento County and its partners would adopt a developer-paid fee based on loss of habitat acreage, habitat type and long-term management costs. Fees would fund the habitat preservation, restoration and management elements of the proposed SSHCP.

The SSHCP will cover 40 species, 10 of which are either state or Federally listed. Sacramento County and its partners intend to apply for permits from the USFWS and the DFG for the incidental take of covered species resulting from otherwise lawful activities. Many of these species are documented within Zone 4 of the "Water" Study Area. The anticipated duration of the permit would be 30 years. Pursuant to the Federal ESA, Sacramento County and cooperating agencies, organizations, and stakeholders must prepare a regional habitat conservation plan (HCP) as part of their application for the Federal incidental take permit.

Sacramento County and USFWS issued a notice of preparation for the preparation of an EIR/EIS in June 2008. A draft of the SSHCP was released for public review in October of 2009. Zone 4 of the "Water" Study Area overlaps with portions of the SSHCP plan area. Due to uncertainties regarding the timing of the SSHCP process along with the expected approval date, the City has assumed a potential adoption date of early 2011.

Natomas Basin Habitat Conservation Plan

The adoption of the (1994) North Natomas Community Plan required the development and implementation of a HCP as mitigation for development in North Natomas. The purpose of the Natomas Basin Habitat Conservation Plan (NBHCP) is to promote biological conservation along with economic development and continuation of agriculture within the Natomas Basin. The Final NBHCP was released in April 2003, and approved by USFWS in June, 2003. The NBHCP covers 7 plant and 15 animal species, including giant garter snake.

Under the NBHCP, development projects must pay mitigation fees related to the acreage that will be disturbed by the project, conduct a biological survey for covered species, consult with USFWS and DFG regarding the results of the survey, and implement measures required by the agencies to avoid and minimize impacts to covered species. No physical disturbance to the site is permitted until the above conditions have been met.

City of Rancho Cordova

The following goals and policies of the City of Rancho Cordova's General Plan related to the protection of biological resources and applicable to one or more components of the Off-site Water Facilities Alternatives are as follows.

Goal NR1: Protect and preserve diverse wildlife and plant habitats, including habitat for special status species.

Goal NR.2: Preserve the City's rich and diverse natural wetlands.

Goal NR.3: Preserve and maintain creek corridors and wetland preserves with useable buffer zones throughout the new development areas as feasible.)

Goal NR.4: Encourage the planting and preservation of high-quality trees throughout the City.

Goal NR.5: Protect the quantity and quality of the City's water resources.

- **Policy NR.1.1:** Protect rare, threatened, and endangered species and their habitats in accordance with State and federal law.
- **Policy NR.1.2:** Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Game guidelines.
- **Policy NR.1.4:** Discourage the planting of invasive species.
- **Policy NR.1.5:**Ensure the protection of wildlife through the establishment of programs to control feral pet populations.
- **Policy NR.1.6:** Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.
- **Policy NR.1.7:** Prior to project approval, the City shall require a biological resources evaluation for private and public development projects in areas identified to contain or possibly contain listed plant and/or wildlife species based upon the City's biological resource mapping provided in the General Plan EIR or other technical materials.

- **Policy NR.1.9:** The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.

- **Policy NR.2.2:** Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.

- **Policy NR.2.5:** The City shall require that drainage improvements that discharge into areas of wetlands to be preserved are, to the maximum extent feasible, designed to mimic the undeveloped surface water flow conditions of the area in terms of seasonality, volume, and flow velocity.

- **Policy NR.3.2:** In general, the City will encourage the preservation of existing location, topography, and meandering alignment of creeks. Where necessary, and if consistent with other City policies, the creation and realignment of creek corridors shall be constructed to recreate the character of the natural creek corridor. Channelization and the use of concrete within creek corridors shall not be supported.

- **Policy NR.4.1:** Conserve native oak and landmark tree resources for their historic, economic, aesthetic, educational, and environmental value.

3B.3.3 Environmental Consequences and Mitigation Measures

Thresholds of Significance

The thresholds for determining the significance of impacts for this analysis are based on the environmental checklist in Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. For the purposes of this analysis, an impact to biological resources would be considered significant if the construction or operation of the Off-site Water Faculty Alternatives would:

- have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game, National Marine Fisheries Service, or U.S. Fish and Wildlife Service;

- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Game, National Marine Fisheries Service, or U.S. Fish and Wildlife Service;

- have a substantial adverse effect on Federally protected (or jurisdictional) wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal wetlands) through direct removal, filling, hydrological interruption, or other means;

- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of wildlife nursery sites;

- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or

- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

ANALYSIS METHODOLOGY

This section provides a program-level analysis of potential impacts to local biological resources based on the description of the various Off-site Water Facility Alternative components and their respective footprints as identified and described in Chapter 2, "Alternatives." The impact analysis focuses on foreseeable changes to the baseline condition in the context of the significance criteria presented above. In conducting the following impact analysis for biological resources, three principal factors were taken into consideration when determining the significance of the Off-site Water Facilities:

- magnitude of the impact (e.g., substantial/not substantial);
- uniqueness of the affected resource (i.e., rarity of the resource); and
- susceptibility of the affected resource to disturbance (i.e., sensitivity of the resource).

The significance evaluation considers the interrelationship of these three components. For example, a relatively small magnitude impact to a state or Federally listed species or associated habitat would be considered significant if the species is very rare and is believed to be very susceptible to disturbance (e.g., vernal pool fairy shrimp). Conversely, common wildlife species found in urban areas are not rare or sensitive to disturbance. Therefore, a much larger magnitude of impact would be required to result in a significant impact.

As provided in Section 3B.9, "Hydrology and Water Quality – Water," the hydrological changes within the Natomas Basin, Sacramento River, and Freeport Project – or Zones 1, 2, and 3 of the Off-site Water Facilities Study Area – as a result of Off-site Water Facilities operations are expected to be minor with minimal changes to existing hydrologic conditions. This analysis acknowledges these findings and, therefore, places emphasis on potential impacts to special status species, wetlands, and sensitive habitats that occur within the 200-foot corridor under consideration for each of the Off-site Water Facility Alternatives. These improvements would be exclusively constructed within Zone 4 of the "Water" Study Area and, therefore, this analysis emphasizes those Zone 4 areas. Potential impacts to biological resources within the Folsom SPA, including issues related to the On-site WTP and sections of the pipeline for the Proposed Alternative along Oak Avenue are covered programmatically in Section 3A.3.3. Impacts to biological resources and fisheries within Zones 1, 2, and 3 as a result of operational effects to hydrology within the Sacramento River and drainage return flows within the NCMWC are also considered in this analysis and evaluated under separate subheadings, where appropriate, to provide the appropriate geographic context for the discussion.

The analysis of impacts to biological resources resulting from implementation of the Off-site Water Facility alternatives is based on review of existing biological resources, including wetlands and fisheries, documented on or within 5-miles of Zone 4 of the "Water" Study Area. Sources of information contributing to this analysis were obtained from the California Natural Diversity Database (CNDDB) and California Native Plant Society (CNPS) databases, National Wetlands Inventory, and reconnaissance-level surveys of accessible areas by RBI on October 6–7, 2008 (RBI 2008) and ECORP, Inc. during the months of October and November in 2008 (ECROP 2009). These background reports and databases included identification of vegetation communities, wildlife habitats, and animal species occurring in Zone 4 of the "Water" Study Area. The reconnaissance survey did not include areas that were inaccessible due to private property fencing, construction activities, or the area from the intersection of Sunrise Boulevard and Douglas Boulevard to the intersection of Prairie City Road and Easton Valley Parkway. Both sides of roads in the project area were surveyed by foot and by automobile, as appropriate. The following sources were reviewed to augment field reconnaissance, reports, and databases noted above in instances where access was restricted:

- Rio del Oro Specific Plan EIR/EIS;
- Freeport Regional Water Project EIR/EIS;
- Easton Project EIR; and

- White Rock Road Widening Project, Phases A, B, and C, EIR.

The Freeport Regional Water Project EIR/EIS provides extensive detail regarding the terrestrial biological and fishery resources present within Zones 2 and 3 and is incorporated by reference into this EIR/EIS. Discussions of the potential impacts to fisheries and aquatic species within Zones 1, 2, 3, and 4 incorporate and, where appropriate, summarize the findings of Freeport Project EIR analysis.

IMPACT ANALYSIS

Impacts that would occur under each of the Off-site Water Facility Alternatives are identified as follows:

NCP (No USACE Permit Alternative)

PA (Proposed Off-site Water Facility Alternative)

1 (Off-site Water Facility Alternative 1 – Raw Water Conveyance – Gerber/Grant Line Road Alignment and White Rock WTP)

1A (Off-site Water Facility Alternative 1A Raw Water Conveyance – Gerber/Grant Line Road Alignment Variation and White Rock WTP)

2 (Off-site Water Facility Alternative 2 Treated Water Conveyance – Douglas Road Alignment and Vineyard SWTP)

2A (Off-site Water Facility Alternative 2A Treated Water Conveyance – Excelsior Road Alignment Variation and Vineyard SWTP)

2B (Off-site Water Facility Alternative 2B Treated Water Conveyance – North Douglas Tanks Variation and Vineyard SWTP)

3 (Off-site Water Facility Alternative 3 Raw Water Conveyance – Excelsior Road Alignment and White Rock WTP)

3A (Off-site Water Facility Alternative 3A Raw Water Conveyance – Excelsior Road Alignment Variation and White Rock WTP)

4 (Off-site Water Facility Alternative 4 Raw Water Conveyance – Easton Valley Parkway Alignment and Folsom Boulevard WTP)

4A (Off-site Water Facility Alternative 4A Raw Water Conveyance – Easton Valley Parkway Alignment Variation and Folsom Boulevard WTP).

The impacts for each alternative are compared relative to the PA at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3B.3-1 **Loss and Degradation of Waters of the U.S., including Wetlands, and Waters of the State.** *Construction of the Off-site Water Facility Alternatives has the potential to result in substantial adverse effects to Federally and state-protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to vernal pools and seasonal wetlands) through direct fill or excavation, hydrological interruption, or other indirect impacts. Wetlands, waters of the state, and other waters of the U.S. that would be affected by implementation of the Off-site Water Facility Alternatives include seeps, vernal pools, seasonal wetlands and seasonal wetland swales, drainage channels, ditches, and ponds.*

NCP

The No USACE Permit Alternative would be specifically designed so that the off-site water supply facilities would not result in any direct impacts (i.e., fill) to water of the United States, including wetlands. Under this

alternative, where the water conveyance facilities intersect waters of the U.S., the City would employ the use of trenchless construction methods, including but not limited to, horizontal directional drilling, microtunneling, or jack-and-bore. Furthermore, the new water treatment plant, whether on-site or off-site, would not be constructed within 50 feet of any waters of the U.S. Therefore, there would be **no direct** impacts from fill of jurisdictional waters of the U.S. ***[Lesser].***

However, there is a potential that indirect impacts, such as transport of sedimentation from construction activities, could still occur. Therefore, **indirect** impacts are considered **potentially significant.** ***[Lesser]***

Mitigation Measure: Implement Mitigation Measure 3B.3-1b and 3A.3-1a.

PA

Construction and operations of the Proposed Off-site Water Facility Alternative could involve construction-related, direct and indirect impacts to wetlands and waters of the U.S. within Zone 4 of the "Water" Study Area. A total of approximately 50.7 acres of waters of the U.S., including wetlands and vernal pools, occurs within the 200-foot pipeline corridor under consideration for these alternatives. Based on the hydrological changes anticipated within Zones 1 and 2 as a result of the Proposed Off-site Water Facility Alternative as described in more detail in Section 3B.9, Hydrology and Water Quality – "Water," these operational changes could affect existing riparian vegetation along the Sacramento River. These separate, interconnected impacts are discussed in more detail under the following subheadings. The analysis of potential wetland impacts for On-site WTP is covered under Section 3A.3, Biological Resources – "Land."

Construction Effects within Zone 4 of the "Water" Study Area

Implementation of the Proposed Off-site Water Facility Alternative could result in direct and indirect impacts to waters of the U.S. as result of the placement of fill materials or excavation within jurisdictional waters of the U.S., including wetlands within the pipeline corridor for the Proposed Off-site Facility Alternative. In reality, construction of the Off-site Water Facility Alternatives would be expected to affect a corridor of less than 100 feet in width and, to the extent feasible, the City would route the pipeline alignment to avoid waters of the U.S.; especially within the permanent easement. For this reason and to enable preliminary evaluation, the City has evaluated both sides of the corridor under consideration to determine where reductions in direct and indirect wetland impacts could be achieved. The left and right sides of the alignment corridor are defined as the sides of the roadway when facing in the direction of flow (i.e., facing toward the SPA, with the source of water or Freeport Project at the observer's back).

The 200-foot corridor for the Proposed Off-site Water Facility Alternative contains a total of $\pm$12.9 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of the conveyance pipeline and WTP under this alternative. As shown in the table, along the left half of the two-hundred-foot corridor up to 0.53 acres of seasonal wetland, 0.96 acres of seasonal wetland swale, 2.01 acres of vernal pools, 0.5 acres of riverine habitat, 1.28 acres of freshwater emergent wetland, and 0.44 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the two-hundred-foot corridor, up to 1.09 acres of seasonal wetland, 1.18 acres of seasonal wetland swale, 3.12 acres of vernal pools, up to 1.09 acres of freshwater emergent wetland, 0.16 acres of riverine habitat, and 0.12 acres of freshwater forested/willow scrub could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction.

The potential for direct and indirect impacts to wetlands and waters of the U.S. exists. A majority of the direct effects would occur in areas where the conveyance alignment deviates outside the actual roadway or right-of-way and intersects with wetlands or other waters of the U.S. Although the City would to the maximum extent practical, route the conveyance pipeline along roadways or within portions of the roadway shoulder not containing wetlands, the possibility for the construction and permanent easement to impact wetlands directly or indirectly is

high given the number and frequency of potentially jurisdictional features. Additionally, this alternative travels cross-country, east of the end of Gerber Road and through an area containing vernal pools and riverine channels associated with Laguna Creek. This area contains a wetland preserve area immediately to the south of East Bay Municipal Utility District's (EBMUD's) easement for Segment 3 of the Freeport Project.

Table 3B.3-4
Summary of Wetland Impacts for the Off-site Water Facility Alternatives[a]

Wetland Type	PA		1 [(1)]		1A[(1)]		2		2A		2B		3[(1)]		3A[(1)]		4[(2)]		4A[(2)]

Notes:

[a] The No USACE Permit Alternative would be sited to avoid all direct wetland impacts.

[1] Includes wetland areas on White Rock WTP site.

[2] Includes wetland areas on Folsom Boulevard WTP Site.

[3] L=left side of 200-foot corridor; R=right side of 200-foot corridor. Left and right sides of the alignment corridor are defined as the sides of the roadway when facing in the direction of flow (i.e., facing toward the SPA, with the Freeport Project at the observer's back).

[4] rounded to the nearest tenth.

Source: National Wetlands Inventory 2009; ECORP 2009; and RMC 2010

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative could be up to 6.8 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. Based on these considerations, impacts to wetlands and waters of the U.S. could be **potentially significant**.

Operational Effects within Zones 1, 2, 3, and 4 of the "Water" Study Area

Section 3B.9.3 provides an analysis of the Off-site Water Facility's operation under a range of hydrologic conditions. Following construction of the Off-site Water Facilities, operational effects to waters of the U.S., including wetlands, would be expected to be limited to portions of Zone 1 and 2 (Sacramento River) where minor changes in surface water levels would occur. Minor changes in river conditions that would occur as part of the Off-site Water Facility operations (see Table 3B.9-3) would be expected to result in negligible changes in water levels within Sacramento River or drainage channels that expect irrigation return flow within the NCMWC service area. Based on these considerations, operation of the Proposed Off-site Water Facility Alternative would result in **less-than-significant direct** and **indirect** impacts to wetland and riparian areas within the hydrologic

influence of the Sacramento River within Zones 1 and 2 of the "Water" Study Area and drainage channels and irrigation canals with NCMWC's service area.

Mitigation Measure 3B.3-1a: Secure Clean Water Act Section 404 Permit and Implement All Permit Conditions; Ensure No Net Loss of Functions of Wetlands, Other Waters of the U.S., and Waters of the State.

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the Off-site Water Facilities requiring fill of wetlands or other waters of the U.S. or waters of the state, the City shall obtain all necessary permits under Sections 401 and 404 of the CWA or the state's Porter-Cologne Water Quality Control Act for the respective phase. For each respective Off-site Water Facility component, all permits, regulatory approvals, and permit conditions for effects on wetland habitats shall be secured before implementation of any grading activities within 250 feet of waters of the U.S. or wetland habitats, including waters of the state, that potentially support Federally listed species. The City shall commit to replace, restore, or enhance on a "no net loss" basis (in accordance with USACE and the Central Valley RWQCB) the acreage of all wetlands and other waters of the U.S. that would be removed, lost, and/or degraded with implementation of project plans for that phase. Wetland habitat shall be restored, enhanced, and/or replaced at an acreage and location and by methods agreeable to USACE, the Central Valley RWQCB, and the City, as appropriate, depending on agency jurisdiction, and as determined during the Section 401 and Section 404 permitting processes.

As part of the Section 404 permitting process, a draft wetland mitigation and monitoring plan (MMP) shall be developed for the selected Off-site Water Facility Alternative on behalf of the City. Before any ground-disturbing activities that would adversely affect wetlands and before engaging in mitigation activities associated with each phase of development, the City shall submit the draft wetland MMP to USACE and the Central Valley RWQCB for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be approved prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of mitigation, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer.

As part of the MMP, the City shall prepare and submit plans for the creation of aquatic habitat in order to adequately offset and replace the aquatic functions and services that would be lost, account for the temporal loss of habitat, and contain an adequate margin of safety to reflect anticipated success. Restoration of previously altered and degraded wetlands shall be a priority of the MMP for offsetting losses of aquatic functions on the project site because it is typically easier to achieve functional success in restored wetlands than in those created from uplands. The MMP must demonstrate how the aquatic functions and values that would be lost through project implementation will be replaced.

The habitat MMP for jurisdictional wetland features shall be consistent with USACE's and EPA's April 10, 2008 *Final Rule for Compensatory Mitigation for Losses of Aquatic Resources* (33 CFR Parts 325 and 332 and 40 CFR Part 230). According to the *Final Rule*, mitigation banks should be given preference over other types of mitigation because a lot of the risk and uncertainty regarding mitigation success is alleviated by the fact that mitigation bank wetlands must be established and demonstrating functionality before credits can be sold. This also alleviates temporal losses of wetland function while compensatory wetlands are being established. Mitigation banks also tend to be on larger, more ecologically valuable parcels and are subjected to more rigorous scientific study and planning and implementation procedures than typical permittee-responsible mitigation sites (USACE and EPA 2008). It is not likely feasible to provide compensatory mitigation for all aquatic resource impacts on site. Therefore, a combination of on-site and off-site permittee-responsible mitigation and mitigation banking would likely be necessary to achieve the no-net-loss standard.

Compensatory mitigation for losses of stream and intermittent drainage channels shall be achieved through in-kind preservation, restoration, or enhancement, as specified in the *Final Rule* guidelines. The wetland MMP shall address how to mitigate impacts on all aquatic resource types and shall describe specific method(s) to be implemented to avoid and/or mitigate any Off-site Water Facility-related impacts. The wetland compensation section of the habitat MMP shall include all the contents identified in Mitigation Measure 3A.3-1A.

USACE has determined that the Off-site Water Facilities may require an individual permit. In its final stage and once approved by USACE, the MMP for the Off-site Water Facilities is expected to detail proposed wetland restoration, enhancement, and/or replacement activities that would ensure no net loss of aquatic functions in the project vicinity. Approval and implementation of the wetland MMP shall aim to fully mitigate all unavoidable impacts on jurisdictional waters of the U.S., including jurisdictional wetlands. To satisfy the requirements of the City and the Central Valley RWQCB, mitigation of impacts on the non-jurisdictional wetlands beyond the jurisdiction of USACE shall be included in the same MMP. All mitigation requirements determined through this process shall be implemented before grading plans are approved. The MMP shall be submitted to USACE and approved prior to the issuance of any permits under Section 404 of the CWA.

Water quality certification pursuant to Section 401 of the CWA will be required before issuance of the Section 404 permit. Before construction in any areas containing wetland features, the City shall obtain water quality certification for the Off-site Water Facilities. Any measures required as part of the issuance of water quality certification shall be implemented.

Implementation: City of Folsom Utilities Department

Timing: Before the approval of grading or improvement plans or any ground-disturbing activities for all the Off-site Water Facilities containing wetland features or other waters of the U.S. The MMP must be approved before any impact on wetlands can occur. Mitigation shall be implemented on an ongoing basis throughout and after construction, as required.

Enforcement: 1. U.S. Army Corps of Engineers, Regional Water Quality Control Board, California Department of Fish and Game.

Mitigation Measure 3B.3-1b: Maximize Use of Trenchless Technology for Conveyance Pipeline Design.

Following the selection of a Off-site Water Facility Alternative, the City shall design and route the water conveyance pipeline to avoid waters of the U.S. and State, including wetlands and vernal pools, to the maximize extent practical. Where avoidance is not practical, the City shall maximize the use of trenchless technologies (micro-tunneling or jack-and-bore), where feasible.

All trenchless construction crossings will include the preparation of a Frac-Out (or inadvertent return of drilling lubricants) Contingency Plan for tunneling activities that use drilling lubricants (e.g., construction of pipelines using jack-and-bore methods). The purpose of the plan will be to minimize the potential for a frac-out associated with tunneling activities, provide for the timely detection of frac-outs, and ensure an organized, timely, and "minimum-impact" response in the event of a frac-out and release of drilling lubricant (i.e., bentonite). Preparation and implementation of a Frac-Out Contingency Plan will be reflected in contract documents.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement: 1. U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, Regional Water Quality Control Board, California Department of Fish and Game.

Mitigation Measure 3B.3-1c: Restore all Waters Impacted by Trenching and Temporary Construction Staging Areas to Pre-Project Contours and Conditions.

For all water line crossings of waters of the U.S. or waters of the state in which the use of trenchless technologies are not feasible, the City shall ensure that all waters impacted by trenching activities are restored to pre-project contours and conditions. In addition, within 30 days following project construction, the City shall ensure that all temporary construction staging areas within waters of the U.S. or waters of the state are restored to pre-project contours and conditions.

At minimum, the City shall ensure that the following measures are implemented during construction:

- Conduct trenching and construction activities across drainages during low-flow (e.g., <1 to 2 cfs) or dry periods as feasible;
- If working in active channels, install cofferdam upstream and downstream of stream crossing to separate construction area from flowing waterway;
- Place sediment curtains upstream and downstream of the construction zone to prevent sediment disturbed during trenching activities from being transported and deposited outside of the construction zone;
- Locate spoil sites such that they do not drain directly into the drainages or seasonal wetlands;
- Store equipment and materials away from the drainages and wetland areas. No debris will be deposited within 250 feet of the drainages and wetland areas;
- Prepare and implement a revegetation plan to restore vegetation in all temporarily disturbed wetlands and other waters using native species seed mixes and container plant material that are appropriate for existing hydrological conditions.

Before the approval of grading and improvement plans and before any groundbreaking activity associated with the Off-site Water Facilities requiring fill of wetlands or other waters of the U.S. or waters of the state, the City shall submit a wetland mitigation and monitoring plan (MMP) for the restoration of these waters within the selected water alignment to the USACE and Central Valley RWQCB for review and approval of those portions of the plan over which they have jurisdiction. The MMP would have to be approved prior to issuance of a Section 404 permit. Once the final MMP is approved and implemented, mitigation monitoring shall continue for a minimum of 5 years from completion of restoration activities, or human intervention (including recontouring and grading), or until the performance standards identified in the approved MMP have been met, whichever is longer.

At minimum, the MMP shall provide the following information:

- A description and drawings showing the existing contours (elevation) and existing vegetation of the waters of the U.S. and waters of the state that would be impacted through trenching activities. This information shall include site photographs taken at each impacted water.
- Methods used to ensure that trenching within waters of the U.S. and waters of the state do not adversely alter existing hydrology, including the draining of the waters (e.g., use of cut-off walls).

- The methods used to restore the site to the original contour and condition, as well as a plan for the revegetation of the site following installation of the water line.
- Proposed schedule for restoration activities.

Implementation: City of Folsom Utilities Department

Timing: Before the approval of grading or improvement plans or any ground-disturbing activities for all the Off-site Water Facilities containing wetland features or other waters of the U.S.

Enforcement:
1. U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, Regional Water Quality Control Board, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure: Implement Mitigation Measure 3A.3-1a.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:
1. U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, Regional Water Quality Control Board, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

1

Off-site Water Facility Alternative 1 would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility. Unlike the previous alternative, this alternative would involve the construction of the off-site White Rock WTP. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative.

The 200-foot corridor and WTP site for Off-site Water Facility Alternative 1 contain a total of ±11.1 acres of waters of the U.S., including wetlands and vernal pools. The left half of the 200-hundred-foot corridor contains up to 0.76 acres of seasonal wetland, 1.3 acres of seasonal wetland swale, 2.34 acres of vernal pools, 0.67 acres of riverine habitat, 1.08 acres freshwater emergent wetland, and 0.43 acres of freshwater pond that could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the two-hundred-foot corridor, up to 1.29 acres of seasonal wetland, 1.55 acres of seasonal wetland swale, 3.36 acres of vernal pools, 0.76 acres of riverine habitat, 0.93 acres freshwater emergent wetland, and 0.13 acres of freshwater forested/ willow scrub could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction.

Of these wetland acreages, up to 0.21 acres of seasonal wetland, 0.36 acres of seasonal wetland swale, 0.34 acres of vernal pools, and 0.17 acres of riverine habitat, and 0.1 acres of freshwater emergent wetland, are included on the White Rock WTP site (ECORP, 2009). These wetland features are primarily associated with a seasonal drainage feature that traverse the White Rock WTP site diagonally from northeast to southwest.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 8.0 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. For these reasons, this impact is considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

1A

Off-site Water Facility Alternative 1A would involve similar construction and operational activities as previously described for Off-site Water Facility Alternative 1. The 200-foot corridor for Alternative 1A contains a total of ±12.8 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left half of the two-hundred-foot corridor, up to 0.88 acres of seasonal wetland, 1.31 acres of seasonal wetland swale, 2.36 acres of vernal pools, 0.68 acres of riverine habitat, 1.05 acres freshwater emergent wetland, and 0.62 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the two-hundred-foot corridor, up to 1.45 acres of seasonal wetland, 1.55 acres of seasonal wetland swale, 3.35 acres of vernal pools, 0.76 acres of riverine habitat, 0.93 acres freshwater emergent wetland, and 0.26 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Of these wetland acreages, up to 0.21 acres of seasonal wetland, 0.36 acres of seasonal wetland swale, 0.34 acres of vernal pools, and 0.17 acres of riverine habitat, and 0.1 acres of freshwater emergent wetland are included on the White Rock WTP site.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 8.3 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. Based on these considerations, impacts to wetlands and waters of the U.S. could be **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

2

Off-site Water Facility Alternative 2 would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility; however, this alternative would not involve the construction of a WTP. The 200-foot corridor for Off-site Water Facility Alternative 2 contains a total of ±22.7 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. Along the left half of the 200-foot corridor, up to 1.1 acres of seasonal wetland, 1.28 acres of seasonal wetland swale, 2.73 acres of vernal pools, 3.22 acres of riverine habitat, 3.26 acres freshwater emergent wetland, and 0.35 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the 200-foot corridor, up to 1.7 acres of seasonal wetland, 0.7 acres of seasonal wetland swale, 2.08 acres of vernal pools, 1.86 acres of riverine habitat, 3.93 acres freshwater emergent wetland, 3.07 acres of freshwater pond, and 0.13 acres of freshwater forested/willow scrub could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. In addition, the Vineyard SWTP sites contains just under 3.6 acres of wetlands, mainly in the form of freshwater emergent marsh; however, as provided in Chapter 2, "Alternatives," improvements associated

with this alternative would be limited to the developed footprint of the SWTP and, therefore, these wetland areas are not included in the acreage estates for this alternative.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 25.4 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Eagles Nest Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternatives, and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

2A

Off-site Water Facility Alternative 2A would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility; however, this alternative would not involve the construction of a WTP. The 200-foot corridor for Off-site Water Facility Alternative 2A contains a total of ±22.7 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left half of the 200-foot corridor, up to 2.08 acres of seasonal wetland, 0.79 acres of seasonal wetland swale, 2.36 acres of vernal pools, 3.20 acres of riverine habitat, 1.24 acres freshwater emergent wetland, and 0.39 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the two-hundred-foot corridor, up to 1.66 acres of seasonal wetland, 0.58 acres of seasonal wetland swale, 1.99 acres of vernal pools, 1.81 acres of riverine habitat, 3.24 acres freshwater emergent wetland, and 3.29 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. In addition, the Vineyard SWTP sites contains just under 3.6 acres of wetlands, mainly in the form of freshwater emergent marsh; however, as provided in Chapter 2, "Alternatives," improvements associated with this alternative would be limited to the developed footprint of the SWTP and, therefore, these wetland areas are not included in the acreage estates for this alternative.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 12.6 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Excelsior Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternative, and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

2B

Off-site Water Facility Alternative 2B would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility; however, this alternative would not involve the construction of a WTP. Additionally, the conveyance pipeline alignment under this alternative has a substantially reduced length. The 200-foot corridor for Off-site Water Facility Alternative 2B contains a total of ±4.5 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left half of the 200-foot corridor, up to 0.61 acres of seasonal wetland, 0.23 acres of seasonal wetland swale, 1.06 acres of vernal pools, 0.14 acres of riverine habitat, 0.53 acres freshwater emergent wetland, and 0.13 acres of freshwater forested/ willow scrub could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right

half of the 200-hundred-foot corridor, up to 0.14 acres of seasonal wetland, 0.26 acres of seasonal wetland swale, 1.11 acres of vernal pools, 0.09 acres of riverine habitat, and 0.21 acres freshwater emergent wetland, could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 2.7 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With the substantially reduced distance of the conveyance alignment, the magnitude of wetland impacts would be less under this alternative as compared to the Proposed Off-site Water Facility Alternative,and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

3

Off-site Water Facility Alternative 3 would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility and Off-site Water Facility Alternative 1. The 200-foot corridor for Off-site Water Facility Alternative 3 contains a total of ±25.4 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left half of the 200-foot corridor, up to 1.31 acres of seasonal wetland, 1.64 acres of seasonal wetland swale, 3.07 acres of vernal pools, 3.39 acres of riverine habitat, 3.36 acres freshwater emergent wetland, and 0.35 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the two-hundred-foot corridor, up to 1.91 acres of seasonal wetland, 1.06 acres of seasonal wetland swale, 2.42 acres of vernal pools, 2.03 acres of riverine habitat, 4.03 acres freshwater emergent wetland, 3.07 acres of freshwater pond, and 0.13 acres of freshwater forested/willow scrub could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Of these wetland acreages, up to 0.21 acres of seasonal wetland, 0.36 acres of seasonal wetland swale, 0.34 acres of vernal pools, 0.17 acres of riverine habitat, and 0.1 acres of freshwater emergent wetland, are included on the White Rock WTP site.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 14.7 acres Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Excelsior Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternative, and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

3A

Off-site Water Facility Alternative 3A would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility and Off-site Water Facility Alternative 1. The 200-foot corridor for Off-site Water Facility Alternative 3A contains a total of ±22.7 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left half of the 200-foot corridor, up to 2.29 acres of seasonal wetland, 1.15 acres of seasonal wetland swale, 2.7 acres of vernal pools, 3.37 acres of riverine habitat, 1.34 acres freshwater emergent wetland, and 0.39 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right half of the 200-foot corridor, 1.87 acres of seasonal wetland, 0.94 acres of seasonal wetland swale, 2.33 acres of vernal pools, 1.98 acres of riverine habitat,

up to 3.34 acres freshwater emergent wetland, and 3.29 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Of these wetland acreages, up to 0.21 acres of seasonal wetland, 0.36 acres of seasonal wetland swale, 0.34 acres of vernal pools, 0.17 acres of riverine habitat, and 0.1 acres of freshwater emergent wetland, are included on the White Rock WTP site.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 13.75 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Excelsior Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternative, and the **direct** and **indirect** impacts are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

4

Off-site Water Facility Alternative 4 would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility; however, the WTP under this alternative would be constructed within a more urbanized environment and no wetland features delineated on the Folsom Boulevard WTP site. Instead, a series of linear willow scrub habitats totaling approximately 18.4 acres has formed in between some of the dredge tailings. The 200-foot corridor for Off-site Water Facility Alternative 4 contains a total of $\pm$21.9 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left, 100 feet of the corridor, up to 1.48 acres of seasonal wetland, 1.04 acres of seasonal wetland swale, 1.51 acres of vernal pools, 3.18 acres of riverine habitat, 2.57 acres freshwater emergent wetland, and 0.40 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right, 100 feet of the corridor, up to 1.94 acres of seasonal wetland, 0.46 acres of seasonal wetland swale, 1.81 acres of vernal pools, 1.76 acres of riverine habitat, 2.68 acres freshwater emergent wetland, and 3.01 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 11.7 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Eagles Nest Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternative. Both **direct** and **indirect** impacts to wetlands under this alternative are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

4A

Off-site Water Facility Alternative 4A would involve similar construction and operational activities as previously described for the Proposed Off-site Water Facility; however, the WTP under this alternative would be constructed within a more urbanized environment with no delineated wetland features. The 200-foot corridor for Off-site Water Facility Alternative 4A contains a total of $\pm$18.4 acres of waters of the U.S., including wetlands and vernal pools. Table 3B.3-4 provides a breakdown of the different wetland types potentially impacted by construction of this alternative. As shown along the left, 100 feet of the corridor, up to 2.34 acres of seasonal wetland, 0.56 acres of seasonal wetland swale, 2.01 acres of vernal pools, 3.15 acres of riverine habitat, 0.58 acres freshwater emergent wetland, and 0.25 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction. Along the right, 100 feet of the corridor, up to 1.72 acres of seasonal

wetland, 0.34 acres of seasonal wetland swale, 1.72 acres of vernal pools, 1.71 acres of riverine habitat, 1.98 acres freshwater emergent wetland, and 2.98 acres of freshwater pond could be subject to fill, excavation, or indirect impacts (e.g., sedimentation) during construction.

Based on the preliminary estimates provided in Table 3B.3-4, the potential **direct** and **indirect** impacts to waters of the U.S., including wetlands, under this alternative during construction could be up to 10.4 acres. Because the City has not yet completed project specific engineering details for this alternative, the actual impacts to waters of the U.S., including wetlands, cannot be determined. With additional wetland areas potentially affected along Excelsior Road, the magnitude of wetland impacts would be greater under this alternative as compared to the Proposed Off-site Water Facility Alternative. Both **direct** and **indirect** impacts to wetlands under this alternative are considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a.

Implementation of Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1a would reduce significant impacts on jurisdictional wetlands and waters of the U.S. and waters of the state under the Off-site Water Facility Alternatives. Presuming the City completes additional routing analysis and prepares a mitigation plan that is acceptable to USACE and implemented as required, the direct and indirect impacts resulting from the Off-site Water Facility Alternatives could be mitigated to a **less-than-significant** level by providing "no net loss" of overall wetland acreage, as required in USACE permit conditions.

IMPACT 3B.3-2 Loss and Degradation of Habitat for Special-Status Wildlife Species and Potential Direct Take of Individuals. *The Off-site Water Facility Alternatives have the potential to result in a substantial adverse effect, either directly or through habitat modifications, on species identified as a candidate, sensitive, or special-status by DFG, NMFS, and USFWS. Impacts could include loss and degradation of habitat for several special-status wildlife species or take of listed species, including vernal pool invertebrates, valley elderberry longhorn beetle, and Swainson's hawk.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

As provided in Chapter 2, Alternatives, the "Water" Study Area includes four separate zones, however, construction activities would be limited to Zone 4 where physical improvements are proposed. In this context, this analysis provides discussions for the construction and operational impacts to special status wildlife species as a result of the Off-site Water Facility Alternatives.

Construction Impacts

Twenty-five special-status terrestrial wildlife species were identified as having the potential to occur within 5 miles of Zone 4 of the "Water" Study Area with 16 of these species having a moderate to high potential for occurrence, including vernal pool and conservancy fairy shrimp, Swainson's hawk, valley elderberry longhorn beetle, and vernal pool tadpole shrimp. Zone 4 of the "Water" Study Area also provides habitat for several species of concern, which include western spadefoot toad, burrowing owl, and pallid bat. Construction of the pipeline alignments, pump stations, and WTPs under these Off-site Water Facility Alternatives may result in direct or indirect impacts to animal species listed in Table 3B.3-5. Table 3B.3-2 presents a detailed accounting of those wildlife species potentially affected by each alternative conveyance alignment and WTP site. Specific impacts to special-status species are addressed below.

Vernal Pool Fairy Shrimp and Vernal Pool Tadpole

Vernal pools, seasonal wetlands, and seasonal wetland swale are documented throughout Zone 4 of the "Water" Study Area, comprising approximately 10.8 acres, 7.8 acres, and 4.9 acres, respectively, and support special-status invertebrates such as vernal pool fairy shrimp and vernal pool tadpole shrimp. Other species may include

California linderiella fairy shrimp (*Linderiella occidentalis*) or conservancy fairy shrimp (*Branchinecta conservatio*). As shown in Table 3B.3-5, vernal pool fairy shrimp and vernal pool tadpole shrimp are known to occur in the vicinity of all the Off-site Water Facility Alternatives that cross through Zone 4 of the "Water" Study Area. Depending on the location of the construction (i.e., roadway centerline verses shoulder) construction activities associated with the pipelines and WTPs could result in **significant direct** and **indirect** impacts to vernal pool habitat and, hence, vernal pool crustaceans. ***[Similar]***

Excavation and trenching activities could directly impact vernal pools, which could result in habitat loss or injury to individuals by filling or excavation within suitable habitat. Direct impacts could be minimized or avoided by constructing the conveyance alignments primarily along and within existing roadways or by using trenchless construction techniques to cross larger vernal pool or wetland features. However, without a more detailed alignment for each of the Off-site Water Facility Alternatives, such a determination is not possible. Temporary dewatering activities during construction could cause mortality of individual wetland species, especially vernal pool crustaceans. (See also discussion of dewatering in Section 3B.17, "Groundwater – Water"). Generally, the USFWS considers disturbance within 250 feet of vernal pool crustacean habitat to be an indirect impact to the species (USFWS 1996). Construction activities associated with pipeline and WTP facilities could result in **significant direct** impacts to vernal pool crustaceans, and may also lead to a cumulative decline of the species over time. **Indirect** impacts may include the temporary degradation of water quality or dewatering of pools during construction and could also be **significant**. ***[Similar]***

Western Spadefoot Toad and Northwestern Pond Turtle

Vernal pools, wetland, and wetland swale habitat occur throughout portions of Zone 4 of the "Water" Study Area and provide suitable habitat for special-status amphibians such as western spadefoot toad. Western pond turtle may occur in drainage ditches, sloughs, and other aquatic features within Zone 4 of the "Water" Study Area where suitable habitat is present. As shown in Table 3B.3-5, the nearest known occurrences of western spadefoot and northwestern pond turtle are within less than 1/4 mile. Construction activities associated with the conveyance pipeline and pump station facilities could result in direct and indirect impacts to vernal pools, wetlands, and creeks, and hence, potential habitat for western spadefoot toad and northwestern pond turtle. This **direct** impact is considered **potentially significant**. **Indirect** impacts may include the temporary degradation of water quality or dewatering of pools during construction and could also be **potentially significant**. ***[Similar]***

Valley Elderberry Longhorn Beetle

Table 3B.3-5 indicates that occurrences of elderberry shrubs – the exclusive habitat for valley elderberry longhorn beetle – are documented in the northeastern sections of Zone 4 of the "Water" Study Area. The nearest occurrence of these species is less than 50 feet from the centerline of White Rock Road and the planned Easton Valley Parkway (Sacramento County 2008a and 2008b, and ECORP 2009). As a result, construction of the conveyance pipelines within portions of these roadways could result in direct impacts to valley elderberry longhorn beetle.

Direct impacts to elderberry shrubs include damage, pruning, and/or removal of shrubs, potentially resulting from excavation and trenching that would be used to install pipeline across smaller ditches (less than 10 feet in width). Some direct impacts would be minimized by constructing primarily along and within existing roadways and within agricultural lands, and by using trenchless construction techniques to cross larger water bodies. Temporary dewatering activities during construction may cause mortality of individual shrubs, especially if long dewatering periods are required to construct the pipeline facilities. (See also discussion of dewatering in Section 3B.17, "Groundwater – Water").

(Note: Source information compiled in Appendix M.)

Indirect impacts could occur if herbicides or insecticides are used in habitats adjacent to elderberry shrubs, if earthmoving activities disturb elderberry shrub roots, or if the topography and/or hydrology of the surrounding area are altered to the extent that it reduces the soil moisture surrounding the elderberry shrub. USFWS considers disturbance within 100 feet of an elderberry shrub to be a potential direct impact to valley elderberry longhorn beetle (USFWS, 1999). As a result, construction activities associated with the pipelines could result in **significant direct** and **indirect** impacts to valley elderberry longhorn beetle. ***[Similar]***

Swainson's Hawk and Other Raptors

As provided in Table 3B.3-5 and shown in Exhibit 3B.3-2, there are numerous documented sightings of Swainson's hawk within Zone 4 of the "Water" Study Area. Occurrences of nesting Swainson's hawks are documented within one mile of all the Off-site Water Facility Alternatives and 1/4 mile of the White Rock WTP. Swainson's hawk nests in trees, often within riparian habitats, and forage within cropland, fields, and open lands; hawks may occur within the alignment of each conveyance alignment alternative. Construction of the Off-site Water Facilities may temporarily and/or permanently disturb the nesting of state-threatened Swainson's hawk due to construction noise and disturbance, as well as potential nest site removal or abandonment during the breeding season.

DFG generally considers all disturbance within 1/2-mile of an active nest to be a potential impact to Swainson's hawk. Construction may also affect foraging habitat for Swainson's hawk in the Off-site Water Facilities Study Area (Swainson's Hawk Technical Advisory Committee [SHTAC] 2000). DFG generally considers impacts to suitable foraging habitat within 10 miles of an active nest to be a potential indirect impact to Swainson's hawk (SHTAC 2000). Based on this criterion, all facility siting options have a high likelihood of impacting Swainson's hawk foraging habitat. In addition, the White Rock WTP and conveyance alignment could adversely affect nesting habitat and result in a **potentially significant direct** and **indirect** impacts. ***[Similar]***

As shown in Table 3B.3-5, there are also several occurrences of burrowing owl within Zone 4 of the "Water" Study Area. Burrowing owls often occur along the edges of croplands and along drainage ditches and levees where suitable habitat containing burrows occurs. Construction of the Off-site Water Facility Alternatives may temporarily and permanently disturb the nesting of burrowing owl due to construction noise and disturbance, as well as permanent and temporary disturbance of foraging habitat. DFG generally considers all disturbance within 50 meters (160 feet) of an active nest to be a potential impact to burrowing owl (California Burrowing Owl Consortium [CBOC] 1993). Construction may also affect foraging habitat for burrowing owl in Zone 4 of the "Water" Study Area. As a result, each of the Off-site Water Facility Alternatives has a high likelihood to result in a **potentially significant direct** or **indirect** impacts on burrowing owl. ***[Similar]***

Construction of the Off-site Water Facility Alternatives could also temporarily and permanently disturb the nesting of White-tailed kite, Loggerhead shrike, and Tricolored blackbird, due to construction noise and disturbance, as well as potential nest site removal during the breeding season. Construction may also permanently and temporarily affect foraging habitat for these species within portions of the Zone 4 "Water" Study Area. Although direct impacts could be minimized or avoided by constructing primarily along and within existing roadways and by using trenchless construction techniques to cross larger water bodies, without a detailed alignment, the City is unable to confirm avoidance of impacts to these species. Additionally, DFG generally considers disturbance within 500 feet of a nesting raptor to be an impact and, therefore, construction activities associated with the conveyance pipeline, pump station, and WTP could result in **potentially significant direct** and **indirect** impacts to these species, and may also lead to a cumulative decline of the species over time. ***[Similar]***

Special-status Bats

Several special-status bat species have potential to occur within zone 4 of the "Water" Study Area, including pallid bat and Townsend's big-eared bat. These species may forage over open grassland and woodland areas, as

well as riparian areas. In addition, several small bridge crossings are present within Zone 4, which could provide suitable roosting habitat. At this time, it is unknown if these bridge structures provide suitable thermal or structural conditions for roosting bats. However, if one or more of these structures is used as a day roost, hibernation roost, or maternity colony roost, implementation of the Off-site Water Facility Alternatives could result in injury and mortality of pallid bat, Townsend's big-eared bat, or other common bat species. Day roosts are used throughout the spring and summer and maternity colony roosts can be active from approximately early April until mid-October. Hibernation roosts may be used from approximately November to early March. Loss of individual bats would be considered a **potentially significant, direct** impact. **Indirect** impact on special-status bat species could also be **potentially significant**. ***[Similar]***

Other Special-status Species

Several other special-status species have potential to occur on the project site: grasshopper sparrow, Modesto song sparrow, and American badger, as discussed below.

Zone 4 of the "Water" Study Area provides potential nesting habitat for grasshopper sparrow and Modesto song sparrow. Individuals of these species may nest in open woodland, grassland, or riparian habitats, respectively, on site. Portions of these habitats would be impacted during the implementation of the Off-site Water Facility Alternatives, however, no large habitat conversions are anticipated under the Off-site Water Facility Alternatives. As a result, direct and indirect impacts on these species as a result of the Off-site Water Facility Alternatives are considered less than significant because minor reduction in habitat is not likely to result in a substantial effect on their populations.

As provided in Table 3B.3-5, there are a few occurrences of American badger in Zone 4 of the "Water" Study Area. Due to the high mobility of this species, the relatively narrow and linear construction footprints, and the relative abundance of available habitat in Zone 4 of the "Water" Study Area, construction activities associated with the Off-site Water Facility Alternatives would not likely result in significant impacts to this species. Therefore, **direct** and **indirect** impacts to American badger would be **less than significant**. ***[Similar]***

Operational Impacts

Fish species listed for protection under CESA and known to occur within Zone 2 of the "Water" Study Area include Central Valley steelhead, winter-run and fall-run Chinook salmon, Delta smelt and green sturgeon. Other special-status fish species include longfin smelt, lamprey, hardhead, Sacramento splittail, and California roach. Each of these species are known to occur within the vicinity of Zone 2 of the "Water" Study Area at some point during the year and as a result could be impacted by the change in the agricultural delivery schedule of up to 8,000 acre-feet per year (AFY) of CVP water to a municipal and industrial (M&I) delivery schedule.

As described in more detail in Section 3B.9.3, hydrologic modeling results for the operations of the Off-site Water Facility Alternatives show no significant changes in any of the hydrologic indicators measured. The proposed change in the point of diversion and change in CVP delivery schedule are relatively minor when compared to overall flows in the Sacramento River system, including total Delta inflow and outflow, and Delta CVP and SWP exports (see Section 3B.9, "Hydrology and Water Quality – Water," for additional discussion). The minor changes in hydrologic conditions would have only very minimal impacts on overall aquatic habitat quantity and quality and would contribute additional flows to a section of the Sacramento River (e.g., Zone 2 of the "Water" Study Area). In this context, the operation of the Off-site Water Facility Alternatives would not result in any substantial changes in flows that could contribute to a reduction in fish populations or the quality or quantity of aquatic habitat within the Sacramento River system, including the Delta, for any special-status wildlife and fishery species and the **direct** and **indirect** impacts are considered **less than significant**. ***[Similar]***

As provided in Impact 3B.9-2, the major water quality changes associated with the operation of the Off-site Water Facility Alternatives are associated with the changes in the type of the return flows anticipated between agricultural and M&1 uses. Although currently a topic debate in relation to potential impacts to fishery resources,

the City acknowledges that the operation of the Off-site Water Facility Alternatives would indirectly contribute to additional ammonia loadings to the Sacramento River through discharges from SRCSD's WWTP. The extent of potential impact from increased discharges of ammonia and other priority pollutants on special status fish species would be contingent on the fate and transport of the pollutants in question in relation to the specific movement of fish under existing conditions and with the operation of the Off-site Water Facility Alternatives. Given all the various existing stressors that characterize existing river conditions combined with the fact that the Off-site Water Facility Alternatives would involve only minor hydrologic changes and essentially a trading in the type of nitrogen-based inputs to the system, potential impacts to fisheries in relation to cumulative sources of existing loadings are considered **less than significant**. ***[similar]*** Impact 3A.13.3 specially addresses the potential impacts of the corresponding increases in wastewater discharges to the SRCSD's WWTP from the SPA and SRCSD's ability to meet its waste discharge requirements.

As provided in Chapter 2, "Alternatives," implementation of the Off-site Water Facility Alternatives would not result in changes to existing irrigation patterns within NCMWC's service area or limit the availability of surface water for continued irrigated agriculture. Similarly and based on this circumstance, operation of the Off-site Water Facility Alternatives would result in no adverse effects to giant garter snake within the Natomas Basin. For this reason, a **less-than-significant** impact would occur. ***[Similar]***

Mitigation Measure 3B.3-2: Conduct Preconstruction Survey for Western Spadefoot Toad and Northwestern Pond Turtle and if Found, Implement Avoidance and Compensation Measures.

Prior to construction, a qualified biologist retained by the City shall conduct protocol-level surveys for the western spadefoot toad and northwestern pond turtle to determine if these species are currently using water features crossed by the selected alignment. If either of these species is detected, then the City shall consult with the DFG (and USFWS if appropriate) to develop additional minimization measures prior to project construction (if necessary). These additional measures may include timing restrictions for groundwater dewatering activities, construction monitoring, and long-term monitoring.

If temporary fencing is used, it shall take the form of silt fencing and temporary plastic construction fencing placed no closer than 25 feet from the edge of the protected habitat. Protective fencing around vernal pools identified as potential habitat for special-status species shall be constructed in a way that allows western spadefoot toad to access these wetlands.

Impacted western spadefoot toad habitat shall be mitigated and compensated in accordance with USFWS and DFG requirements.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:

1. U.S. Fish and Wildlife Service, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, 3A.3-2f, 3A.3-2g, and 3A.3-2h.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:
1. U.S. Fish and Wildlife Service, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Mitigation Measures 3B.3-1a, 3B.3-1b, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, 3A.3-2f, 3A.3-2g, and 3B.3-2h, would lessen significant direct and indirect impacts on special-status wildlife resulting from Off-site Water Facility Alternatives NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4B. Given the linear nature of the Off-site Water Facility Alternatives and their orientation towards existing built-environments, fully compensating for direct and indirect impacts within the overall Zone 4 portion of the "Water" Study Area is considered feasible for most species potentially impacted by the alternatives under consideration. Based on the combination of preconstruction surveys, habitat preservation, and restoration measures proposed by the City, impacts to special-status wildlife species, with the exception of vernal pool crustaceans, would be avoided or minimized to a **less-than-significant** level.

In the absence of complete avoidance, impacts to vernal pool crustaceans species could only be mitigated through a combination of habitat preservation and restoration in the vicinity of the selected Off-site Water Facilities. Given that even following the restoration of the impacted area(s), the take of these species could have already occurred, the City is unable to demonstrate complete avoidance. Therefore, demonstrating full compensation for these impacts by preserving and restoring existing habitats for vernal pool crustaceans in the vicinity of the selected Off-site Water Facility Alternative is infeasible. For this reason, the direct and indirect impacts would remain **significant** and **unavoidable** for those Off-site Water Facility Alternatives unable to demonstrate complete avoidance of "take" of vernal pool species. Avoidance measures employed under the No USACE Permit Alternative to avoid direct impacts to vernal pools combined with mitigation to reduce potential indirect impacts, would reduce the overall magnitude of impact to vernal pools to a **less-than-significant** level.

IMPACT 3B.3-3 Potential Loss or Degradation of Special-Status Plant Populations and Habitat. *Implementation of the Off-site Water Facility Alternatives could result in direct removal of special-status plants, if they are present, through loss of suitable habitat or degradation of suitable habitat due to site alteration.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

Seventeen special-status plant species have the potential to occur within Zone 4 of the "Water" Study Area in vernal pool, seasonal wetland, freshwater marsh, pond, oak woodland, and grassland habitats. Seven of these species—Ahart's dwarf rush, Bogg's Lake hedge-hyssop, dwarf downingia, legenere, Sacramento Orcutt grass, slender Orcutt grass, and Tuolumne button-celery—were determined to have a moderate to high potential to occur within Zone 4. Construction of the Off-site Water Facility Alternatives could adversely affect these species and their habitats by incidentally taking a species, potentially jeopardizing the viability of a population, disturbing habitat, or disruption of reproductive activities.

As provided in Table 3B.3-6, construction of the conveyance pipeline and WTPs may result in direct or indirect impacts to several special-status plant species. Certain grasslands and seasonal wetlands within and in the vicinity of Zone 4 of the "Water" Study Area are known to or may potentially provide habitat for numerous special-status plant species, including Boggs Lake hedge-hyssop, Ahart's dwarf rush, slender Orcutt grass, Sacramento Orcutt grass, and Sanford's arrowhead. As shown in Table 3B.3-6, the Off-site Water Facility Alternative alignments each contain suitable habitats for special-status plants. Therefore, each of the Off-site Water Facilities alignments and WTPs could directly or indirectly impact the habitat of one or more of these special status species, or individual plants that may inhabit areas.

Loss of suitable habitat as a result of the Off-site Water Facility Alternatives could result in direct removal or mortality of special-status plants, if they are present. Construction activities could also result in indirect impacts on special-status plants including impacts caused by sedimentation, changes in vegetation as a result of changes in land use and management practices, altered hydrology, habitat fragmentation, and the introduction of invasive species or noxious weeds from surrounding development. Because implementation of all Off-site Water Facility Alternatives could result in loss and degradation of habitat that could support special-status plant species, **direct** and **indirect** impacts on special-status plant species are considered **potentially significant**. ***[Similar]***

Mitigation Measure: Implement Mitigation Measure 3A.3-3.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:

1. U.S. Fish and Wildlife Service and California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

Implementation of Mitigation Measure 3A.3-3 would reduce the potentially significant impacts on special-status plant species under the Off-site Water Facility Alternatives to a **less-than-significant** level because each facility component would be required to identify and avoid special-status plant populations or provide compensation for the loss of special-status plants through creation of off-site populations, conservation easements, or other appropriate measures.

Table 3B.3-6
Special-Status Plant Species Potentially Affected by Off-site Water Facility Alternatives/Facilities

IMPACT 3B.3-4 Loss of Sensitive Natural Communities (Not Already Covered under Other Impacts). *Construction and operation of the Off-site Water Facility Alternatives has the potential to have a substantial adverse effect on local riparian and woodland habitats. These are natural communities considered sensitive by state and local resource agencies and require consideration under CEQA.*

NCP, PA, 1, 1A

Table 3B.3-7 provides a breakdown of the different plant communities included within the 200-foot construction corridor for these alternatives along with an additional breakdown of the acreages within the 100-feet to the right and left of the alignment. The left and right sides of the alignment corridor are defined as the sides of the roadway when facing in the direction of flow (i.e., facing toward the SPA, with the source of water or Freeport Project at the observer's back). As provided in Table 3B.3-7, these Off-site Water Facility Alternatives contain up to 0.7 acres of marsh, 0.5 acres of oak-dominated woodland, and 0.3 acres of elderberry savanna total within each alignment corridor. In addition, it is important to note that although Table 3B.3-7 does not reflect any riparian habitat for these alternatives, these estimates conflict with the riparian acreages provided in Table 3B.3-4 for these alternatives. This is due to the fact that data from the National Wetlands Inventory (2009) was used in deriving the habitat estimates for Table 3B.3-4, but not for the estimates in Table 3B.3-7. For this reason, a worst-case estimate is being used for potential riparian impacts under these alternatives using the estimates provided in Table 3B.3-4 of approximately 0.6 acres total. Implementation of these Off-site Water Facility Alternatives could result in disturbance and/or removal of these natural communities at several locations along the conveyance alignments and WTP sites. Riparian areas potentially affected by these alternatives include Buffalo Creek, Morrison Creek, and Laguna Creek.

Given uncertainties regarding the timing of construction, precise location of the conveyance alignment, and other roadway improvement projects proposed within eastern Sacramento County, it is possible that construction could extend into areas adjacent to the roadways thereby requiring the crossing of these water features and their associated riparian corridors. Trenchless or in-channel construction techniques may be used to cross smaller drainages with trenchless construction potentially occurring at larger waterway crossings such as Morrison, Buffalo, and Laguna Creeks. As engineering design progresses, the City anticipates completing additional routing analysis before finalizing the method for each crossing in consultation with DFG, the Central Valley RWQCB, and USFWS, as appropriate. Similarly, the placement of the WTP under these alternatives has not been determined for the approximately 68-acre White Rock WTP and, therefore, the exact acreage of affected riparian habitat cannot be quantified at this time. For these reasons and based on the program-level of this analysis, the City concludes that up to 0.5 acres of riparian habitat (see Table 3B.3-4), 0.6 acres of marsh, 0.5 acres of oak-dominated woodland, and 0.3 acres of elderberry savanna could be directly impacted under these alternatives if impacts are limited to one side of the alignment corridor.

Dewatering of trenches or smaller ditches could temporarily affect riparian vegetation, depending on the length of time necessary to install the pipeline and the season of construction. Indirect impacts to riparian vegetation, such as fuel spills and/or disturbance of roots, may also occur under unanticipated circumstances thereby resulting in adverse impacts to riparian resources. The potential impacts of constructing these alternatives could include the direct loss of these acreages from facility footprints, construction-related disturbance, and indirect water quality impacts. For this reason, **direct** and **indirect** impacts resulting from construction would be **potentially significant**. ***[Similar]***

As provided in Table 3B.9-3, of Section 3B.9, Hydrology and Water Quality "Water," the operation of the Off-site Water Facility Alternatives would involve negligible changes to existing flows within Zone 2 of the "Water" Study Area and downstream locations within the Delta. Based on these findings, neither the operations of the Off-site Water Facilities nor the assignment of water supplies from NCMWC in the Sacramento River basin would have substantial adverse effects on riparian habitat or other sensitive natural communities along the Sacramento River as a result of substantial changes in water levels or diversion of flow. No new groundwater pumping would

be required within NCMWC's service area and, therefore, no changes to surface water hydrology within wetlands and other sensitive wetland features within the NCMWC's service area is anticipated. For these reasons, **direct** and **indirect** impacts to sensitive communities from long-term operation of the Off-site Water Facilities would be **less than significant**. ***[Similar]***

Note: acreage rounded to the nearest tenth

[1] Acreages include White Rock WTP site

[2] Acreages includes Folsom Boulevard WTTP site.

[3] L=left side of 200-foot corridor; R=right side of 200-foot corridor. Left and right sides of the alignment corridor are defined as the sides of the roadway when facing in the direction of flow (i.e., facing toward the SPA, with the Freeport Project at the observer's back).

Source: ECORP 2009; and RMC 2010

Mitigation Measure: Implement Mitigation Measures 3B.3-1a, 3B.3-1b, 3A.3-1b, and 3A.3-4a.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement: 1. California Department of Fish and Game and Regional Water Quality Control Board.

2 and 2A

Off-site Water Facility Alternative 2 and 2A would not involve the construction of any new WTP facilities; however, as shown in Table 3B.3-7, the alternative alignment considered under these alternatives could entail substantially higher impacts on up to a total of 5.9 and 6.3 acres of riparian habitat, respectively. As provided in Table 3B.3-7, these Off-site Water Facility Alternatives also contain up to 2.2 acres of marsh (only Alternative 2), 5.2 and 3.1 acres of oak-dominated woodland, and 0.3 acres of elderberry savanna (only Alternative 2). Based on these estimates, these alternatives have the potential to impact up to 3.3 and 3.5 acres of riparian habitat, respectively, if impacts are limited to one side of the roadway along with potential disturbance and/or removal of other natural communities. Riparian areas potentially affected by these alternatives include Buffalo Creek, Morrison Creek, Elder Creek, and Mather Lake. The potential impacts of constructing these alternatives could include the direct loss of these acreages from facility footprints, construction-related disturbance, and indirect water quality impacts. For this reason, potential **direct** and **indirect** impacts resulting from construction would be **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-4, 3B.3-1a, 3B.3-1b and 3A.3-1b.

Similar to the Proposed Off-site Water Facility Alternative, direct and indirect impacts to sensitive communities from long-term operation of the Off-site Water Facilities under these alternatives would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

2B

Off-site Water Facility Alternative 2B would not involve the construction of any new WTP facilities and would have a substantially reduced impact on riparian habitat. As provided in Table 3B.3-7, this Off-site Water Facility Alternative only contains up to 0.3 acres of elderberry savanna. Based on these estimates, this alternative would not impact any riparian habitat and disturbance and/or removal would be limited to elderberry savanna. Based on the substantially reduced potential for impacts to sensitive habitat under this alternative, potential **direct** and **indirect** impacts resulting from construction would be **less than significant**. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

Similar to the Proposed Off-site Water Facility Alternative, **direct** and **indirect** impacts to sensitive communities from long-term operation of the Off-site Water Facilities under these alternatives would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3 and 3A

Off-site Water Facility Alternative 3 and 3A would involve the construction of the White Rock WTP facilities and, therefore, the estimates provided in Table 3B.3-4 of approximately 0.6 acres of riparian (riverine) habitat for the White Rock WTP site would also apply to this alternative. In addition, as shown in Table 3B.3-7, these alternative alignments considered under these alternatives could entail substantially higher impacts on up to 5.9 and 6.3 acres of riparian habitat, respectively. As shown in Table 3B.3-7, these Off-site Water Facility Alternatives also contain up to 2.2 acres of marsh (only Alternative 3), 5.4, and 2.8 acres of oak-dominated woodland, and 0.3 acres of elderberry savanna (only Alternative 3). Based on these estimates, these alternatives have the potential to impact up to 3.3 and 3.5 acres of riparian habitat, respectively, if impacts are limited to one side of the roadway along disturb and/or remove other natural communities. Riparian areas potentially affected by these alternatives include Buffalo Creek, Morrison Creek, Elder Creek, and Mather Lake. The potential impacts of

constructing these alternatives could include the direct loss of these acreages from facility footprints, construction-related disturbance, and indirect water quality impacts. For this reason, potential **direct** and **indirect** impacts resulting from construction would be **potentially significant.** ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-4, 3B.3-1a, 3B.3-1b and 3A.3-1b.

Similar to the Proposed Off-site Water Facility Alternative, direct and indirect impacts to sensitive communities from long-term operation of the Off-site Water Facilities under these alternatives would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

4 and 4A

Off-site Water Facility Alternative 4and 4A would involve the construction of the 120-acre Folsom Boulevard WTP and an alternative conveyance alignment. As provided in Table 3B.3-7, these Off-site Water Facility Alternatives also contain up to 2.2 acres of marsh (only Alternative 4), 7.9, and 3.2 acres of oak-dominated woodland, 6.3 and 6.7 acres of valley foothill riparian, and 2.2 acres of willow scrub. Based on these estimates, these alternatives have the potential to impact up to 3.6 and 3.8 acres of riparian habitat, respectively, is impacts are contained to one side of the alignment corridor along with disturbance and/or removal of other natural communities. Riparian areas potentially affected by these alternatives include Buffalo Creek, Elder Creek, and Mather Lake. The potential impacts of constructing these alternatives could include the direct loss of these acreages from facility footprints, construction-related disturbance, and indirect water quality impacts. For this reason, potential **direct** and **indirect** impacts resulting from construction would be **potentially significant.** ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3B.3-4, 3B.3-1a, 3B.3-1b and 3A.3-1b.

Similar to the Proposed Off-site Water Facility Alternative, direct and indirect impacts to sensitive communities from long-term operation of the Off-site Water Facilities under these alternatives would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

Implementation of Mitigation Measures 3A.3-1a, 3B.3-1a, 3B.3-1b, and 3A.3-1b would reduce significant impacts on sensitive natural communities under the Off-site Water Facility Alternatives to a **less-than-significant** level because a mitigation and monitoring plan ensuring adequate compensation for the loss of riparian habitat would have to be developed and implemented as a condition of the streambed alteration permit.

IMPACT 3B.3-5 Loss of Individual Oak Trees. *Implementation of the Off-site Water Facility Alternatives could result in the removal of oak woodland and individual oak trees meeting the criteria for protection under Folsom Municipal Code and the Sacramento County Tree Ordinance.*

NCP, PA, 1, and 1A

These alternatives could involve the removal or disturbance of several oak trees that occur within the 200-foot corridor under consideration. Similar to other natural features evaluated in this section, the City further analyzed the right and left one hundred feet within the corridor to determine if any substantial reductions in habitat impacts could be achieved by constructing facilities on the side of the corridor with fewer trees. As shown in Table 3B.3-8, the implementation of these alternatives could result in the removal or disturbance of approximately 5 interior live oaks and 2 valley oaks measuring 6 inches or greater in diameter at breast height.

Because construction of Off-site Water Facilities components could require the removal of trees, including oak species, the County of Sacramento may require a permit for the pruning or removal of protected trees within its jurisdiction. Therefore, this **direct** and **indirect** impact is considered **potentially significant**. ***[Similar]***

Table 3B.3-8
Trees Potentially Affected by Each Off-site Water Facility Alternative Corridor[a]

Source: ECORP 2009 and RMC 2010

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

Implementation: City of Folsom Utilities Department

Timing: Prior to and during construction of all Off-site Water Facilities

Enforcement:
1. U.S. Fish and Wildlife Service, California Department of Fish and Game.
2. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.
3. For improvements within Sacramento County or City of Rancho Cordova: Sacramento County Planning and Community Development Department or City of Rancho Cordova Planning Department.

2 and 2A

These alternatives could involve the removal or disturbance of several oak trees that occur within the 200-foot corridor under consideration. As provided in Table 3B.3-8, the implementation of these alternatives could result in the removal or disturbance of approximately 10 interior live oaks under Alternative 2 and 88 interior live oaks under Alternative 2A measuring 6 inches or greater in diameter at breast height. It is important to note that the

vast majority of these trees occur along one side of the alignment, so it is likely that the alignment can be adjusted to minimize tree removal.

Because construction of Off-site Water Facilities components could require the removal of trees, including oak species, the County of Sacramento may require a permit for the pruning or removal of protected trees within its jurisdiction. The City of Rancho Cordova also has an adopted City's Tree Preservation and Protection Ordinance that would be applicable to portions of the respective Off-site Water Facility Alternatives that cross the City of Rancho Cordova's jurisdiction. Therefore, this **direct** and **indirect** impact is considered **potentially significant.** ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

2B

No oak trees are located within 200-foot corridor under consideration for this alternative and, therefore, no removal or disturbance of several oak species that occur. For this reason, **no direct** and **indirect** impacts would occur. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

3 and 3A

These alternatives could involve the removal or disturbance of several oak trees that occur within the 200-foot corridor under consideration. As provided in Table 3B.3-8, the implementation of these alternatives could result in the removal or disturbance of approximately 10 interior live oaks under Alternative 2 and 88 interior live oaks under Alternative 2A measuring 6 inches or greater in diameter at breast height. It is important to note that the vast majority of these trees occur along one side of the alignment.

Because construction of Off-site Water Facilities components could require the removal of trees, including oak species, the County of Sacramento may require a permit for the pruning or removal of protected trees within its jurisdiction. The City of Rancho Cordova also has an adopted City's Tree Preservation and Protection Ordinance that would be applicable to portions of the respective Off-site Water Facility Alternatives that cross the City of Rancho Cordova's jurisdiction. Therefore, this **direct** and **indirect** impact is considered **potentially significant**. ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

4 and 4A

These alternatives could involve the removal or disturbance of several oak trees that occur within the 200-foot corridor under consideration. As provided in Table 3B.3-8, the implementation of these alternatives could result in the removal or disturbance of approximately 63 blue oaks, 228 interior live oaks, and 79 valley live oaks under Alternative 4. Up to 152 blue oaks, 254 interior live oaks, and 61 valley live oaks under Alternative 4A measuring 6 inches or greater in diameter at breast height.

Because construction of Off-site Water Facilities components could require the removal of trees, including oak species, the County of Sacramento may require a permit for the pruning or removal of protected trees within its jurisdiction. The City of Rancho Cordova also has an adopted City's Tree Preservation and Protection Ordinance that would be applicable to portions of the respective Off-site Water Facility Alternatives that cross the City of Rancho Cordova's jurisdiction. Therefore, this **direct** and **indirect** impact is considered **potentially significant.** ***[Greater]***

Mitigation Measure: Implement Mitigation Measure 3A.3-5.

With the implementation of Mitigation Measure 3A.3-5, appropriate compensation measures would be implemented through the preparation and implementation of an oak tree replacement plan to reduce potential impacts to riparian habitats and other sensitive natural communities. Compliance with the prescribed mitigation would ensure that these impacts are reduced to a **less-than-significant** level with no corresponding net reduction in the numbers of protected trees.

IMPACT 3B.3-6 Potential Interference with Wildlife or Fisheries Movement. *Construction and operation of the Off-site Water Facility Alternatives has the potential to interfere substantially with the movement of native resident or migratory fish or within established native resident or migratory wildlife corridors.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

The Off-site Water Facilities would generally be constructed within existing road right-of-way and disturbed easements. Construction of the Off-site Water Facilities may have a temporary impact to the movements of some terrestrial wildlife during construction. However, construction of the Off-site Water Facilities conveyance facilities would not result in any permanent barriers to the movement of terrestrial species. During construction of the Off-site Water Facilities, direct impacts to local drainage ways within Zone 4 could occur. However, once constructed, these facilities would be submerged and would not adversely affect migratory corridors for wildlife. Operation of the Off-site Water Facilities is expected to result in **less-than-significant direct** and **indirect** impacts to existing wildlife corridors. ***[Similar]***

Except in flood conditions, there is no direct hydrologic connection between the streams within Zone 4 of the Off-site Water Facilities Study Area and the Sacramento River. Water from Morrison Creek is pumped into the Sacramento River by the City of Sacramento. Therefore, the pump is an impassable barrier to fish species in the Sacramento River. Similar barriers separate Buffalo and Alder Creeks from the American River. Therefore, construction-related direct impacts to fish species within Zone 4 are considered **less than significant**. Similarly, the operation of these facilities within Zone 4 is not expected to interfere substantially with the movement of any native resident or migratory fish and **no indirect** or **direct** impact is expected. ***[Similar]***

Operations of the Off-site Water Facilities would produce only minor levels of noise from pumps, and would not lead to on-going disturbance that would interfere with the movement of any native wildlife species or wildlife corridors and nursery sites. Assignment of water from NCMWC to the City would result in slight, permanent increases in river flows (see Chapter 3B.9.3) within a section of the Sacramento River, north of Freeport. In considering the combination of a change in delivery schedule, addition of a new point of diversion, and quantity of water diverted, the Off-site Water Facilities could realize benefits in terms of increased flows within the Sacramento River when compared to existing conditions, and therefore, could realize added minor benefits to fisheries. The direct and indirect impacts would be **less than significant**. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

IMPACT 3B.3-7 Potential Conflict with Habitat Conservation Plans. *Construction of the Off-site Water Facilities has the potential to conflict with the provisions of an adopted Habitat Conservation Plan or Natural Community Conservation Plan.*

NCP, PA, 1, 1A, 2, 2A, 2B, 3, 3A, 4, and 4A

No Habitat Conservation Plan (HCP) or Natural Communities Conservation Plan (NCCP) has been adopted for the portions of the Off-site Water Facilities Study Area where physical improvements are proposed. Operational

changes within NCMWC's service area as a result of the Off-site Water Facilities would not result in substantial changes to existing irrigation patterns, which changes could otherwise result in adverse effects to giant garter snake within the Natomas Basin. Issues related to changes in hydrology and flow, as a result of the Off-site Water Facilities, are discussed in further in Section 3B.9, "Hydrology and Water Quality – Water." Based on these findings, the Off-site Water Facilities would not conflict with objectives and policies of the NBHCP.

Likewise, the SSHCP is not scheduled for completion and implementation until late 2010 or early 2011, and the exact scope and content of that SSHCP is not known at this time. Therefore, a consistency determination for the Off-site Water Facilities is not appropriate at this time. If the SSHCP is finalized and approved before commencement of mitigation developed for the Off-site Water Facilities, USACE and the City have the option of participating in the mitigation program that would be implemented in conjunction with the SSHCP.

Based on this discussion, the Off-site Water Facilities would not conflict with any adopted HCP or NCCP and **no direct** or **indirect impact** is expected. ***[Similar]***

Mitigation Measure: No mitigation measures are required.

3B.3.4 RESIDUAL SIGNIFICANT IMPACTS

Implementation of the proposed Off-site Water Facility Alternatives could result in potentially impacts to biological resources including plant, wildlife, and fishery resources. Implementation of Mitigation Measures 3B.3-1a, 3B.3-1b, 3B.3-1c, and 3A.3-1b would minimize potential effects to waters of the U.S. and waters of the state, including wetlands, to less-than-significant levels by requiring that all disturbed waters be restored to pre-construction contours and permit conditions. These measures would also ensure that all ephemeral, intermittent or perennial streams are crossed using "trenchless" techniques. Additionally, the City will be required to submit, for review and approval, a mitigation and monitoring plan for the restoration of areas temporarily impacted by construction. Combined and fully implemented, compliance with these measures would ensure that performance standards and success criteria for restored or newly created habitats are satisfied thereby ensuring no net loss of habitat acreage, function, and value. Based on these considerations, no significant, residual impact to wetlands.

Although it is the City's preference to install new conveyance improvements within Zone 4 of the "Water" Study Area within existing roadway right-of-way, it is possible that one or more sections of the conveyance pipeline or associated structural facilities could be located outside the roadway. The extent of any impact to special status plant and wildlife species that does occur during construction to areas outside the roadway would be generally mitigated to less-than-significant levels according to the measures identified in this section 3B.3-1a, 3B.3-1b, 3A.3-1b, 3A.3-2a, 3A.3-2b, 3A.3-2c, 3A.3-2d, 3A.3-2e, 3A.3-2f, 3A.3-2g, 3A.3-2h, and 3A.3-3. However, since the City is unable to ensure that the actual placement of the conveyance alignment and structural facilities, there is no way of completely demonstrating avoidance of the numerous vernal pool features located the corridor under consideration for all the Off-site Water Facility Alternatives. Even if the vernal pool or seasonal wetland areas are restored following construction, there could still be direct impacts or take of vernal pool crustaceans during construction. This impact represents would be potentially significant and unavoidable, residual impact of the Off-site Water Facility Alternatives.

Implementation of Mitigation Measures 3A.3-4a and 3A.3-5 would minimize impacts to oak woodlands and sensitive riparian habitats to less-than-significant levels through restoration of the construction area and/or compensation of the impacted habitats. As a result, no residual significant impacts would remain.

3A.4 CLIMATE CHANGE – LAND

Emissions of greenhouse gases (GHGs) have the potential to adversely affect the environment because such emissions contribute, on a cumulative basis, to global climate change. The proper context for addressing this issue in an EIR/EIS is as a discussion of cumulative impacts, because although the emissions of one single project will not cause global climate change, GHG emissions from multiple projects throughout the world could result in a cumulative impact with respect to global climate change. In turn, global climate change has the potential to result in rising sea levels, which can inundate low-lying areas; to affect rainfall and snowfall, leading to changes in water supply; to affect habitat, leading to adverse effects on biological resources; and to result in other effects.

Therefore, the cumulative global climate change analysis presented in this section of the EIR/EIS includes two subsections: 3A.4.1 and 3A.4.2. In Subsection 3A.4.1, the projected GHG emissions generated by the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives are analyzed with respect to their potential to contribute to global climate change. In Subsection 3A.4.2, the potential effects of global climate change are identified based on available scientific data, and their potential effects on the project are evaluated to the extent possible based on the quality of the data. Consequently, the format of this subsection is altered in comparison to other sections in Chapter 3.

3A.4.1 GREENHOUSE GAS EMISSIONS AND CONTRIBUTION TO GLOBAL CLIMATE CHANGE

INTRODUCTION

Cumulative impacts are the collective impacts of one or more past, present, and future projects that, when combined, result in adverse changes to the environment. In determining the significance of a proposed project's contribution to anticipated adverse future conditions, a lead agency should generally undertake a two-step analysis. The first question is whether the *combined* effects from *both* the proposed project *and* other projects would be cumulatively significant. If the agency answers this inquiry in the affirmative, the second question is whether "the proposed project's *incremental* effects are cumulatively considerable" and thus significant in and of themselves. The cumulative project list for this issue (climate change) comprises anthropogenic (i.e., human-made) GHG emissions sources across the globe, and no project alone would reasonably be expected to contribute to a noticeable incremental change to the global climate. However, legislation and executive orders on the subject of climate change in California have established a statewide context for and a process for developing an enforceable statewide cap on GHG emissions. Given the nature of environmental consequences from GHGs and global climate change, CEQA requires that lead agencies consider evaluating the cumulative impacts of GHGs, even relatively small (on a global basis) additions. Small contributions to this cumulative impact (from which significant effects are occurring and are expected to worsen over time) may be potentially considerable and therefore significant.

This section presents a discussion of existing climate conditions, the current state of climate change science, and GHG emissions sources in California; a summary of applicable regulations; and a description of project-generated GHG emissions and their contribution to global climate change.

AFFECTED ENVIRONMENT

Existing Climate

Climate is the accumulation of daily and seasonal weather events over a long period of time, whereas weather is defined as the condition of the atmosphere at any particular time and place (Ahrens 2003). The SPA is located in a climatic zone characterized as dry-summer subtropical or Mediterranean (abbreviated Cs) on the Köppen climate classification system. The Köppen system's classifications are primarily based on annual and monthly averages of temperature and precipitation.

The Sacramento Valley Air Basin (SVAB) is relatively flat, bordered by mountains to the east, west, and north. The climate is characterized by hot, dry summers and cool, rainy winters. Periods of dense and persistent low-level fog that are most prevalent between storms are characteristic of SVAB winter weather. The extreme summer aridity of the Mediterranean climate is caused by sinking air of subtropical high pressure regions. In the case of the SVAB, the ocean has less influence than in the coastal areas, giving the interior Mediterranean climate (abbreviated CSA on the Köppen climate system) more seasonal temperature variation (Ahrens 2003).

Most precipitation in the area results from air masses that move in from the Pacific Ocean during the winter months. These storms usually move from the west or northwest. More than half the total annual precipitation falls during the winter rainy season (November–February); the average winter temperature is a moderate 49 degrees °F. During the summer, daily temperatures range from 50°F to more than 100°F. The inland location and surrounding mountains shelter the area from much of the ocean breezes that keep the coastal regions moderate in temperature.

The local meteorology of the SPA and vicinity is represented by measurements recorded at the Folsom Dam station. The normal annual precipitation, which occurs primarily from November through March, is approximately 24 inches (Western Regional Climate Center 2009). January temperatures range from an average minimum of 37.9°F to an average maximum of 53.7°F. July temperatures range from an average minimum of 60.3°F to an average maximum of 94.5°F (Western Regional Climate Center 2009). The predominant wind direction and speed is from the south-southwest at approximately 10 miles per hour (mph) (California Air Resources Board [ARB] 1994).

Attributing Climate Change—The Physical Scientific Basis

Certain gases in the earth's atmosphere, classified as GHGs, play a critical role in determining the earth's surface temperature. Solar radiation enters the earth's atmosphere from space. A portion of the radiation is absorbed by the earth's surface, and a smaller portion of this radiation is reflected back toward space. This absorbed radiation is then emitted from the earth as low-frequency infrared radiation. The frequencies at which bodies emit radiation are proportional to temperature. The earth has a much lower temperature than the sun; therefore, the earth emits lower frequency radiation. Most solar radiation passes through GHGs; however, infrared radiation is absorbed by these gases. As a result, radiation that otherwise would have escaped back into space is instead "trapped," resulting in a warming of the atmosphere. This phenomenon, known as the greenhouse effect, is responsible for maintaining a habitable climate on Earth. Without the greenhouse effect, Earth would not be able to support life as we know it.

Prominent GHGs contributing to the greenhouse effect are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). Human-caused emissions of these GHGs in excess of natural ambient concentrations are responsible for intensifying the greenhouse effect and have led to a trend of unnatural warming of the earth's climate, known as global climate change or global warming. It is *extremely unlikely* that global climate change of the past 50 years can be explained without the contribution from human activities (Intergovernmental Panel on Climate Change [IPCC] 2007).

Climate change is a global problem. GHGs are global pollutants, unlike criteria air pollutants and toxic air contaminants , which are pollutants of regional and local concern. Whereas pollutants with localized air quality effects have relatively short atmospheric lifetimes (about 1 day), GHGs have long atmospheric lifetimes (1 year to several thousand years). GHGs persist in the atmosphere for long enough time periods to be dispersed around the globe. Although the exact lifetime of any particular GHG molecule is dependent on multiple variables and cannot be pinpointed, it is understood that more CO_2 is emitted into the atmosphere than is sequestered by ocean uptake, vegetation, and other forms of sequestration. Of the total annual human-caused CO_2 emissions, approximately 54% is sequestered through ocean uptake, uptake by northern hemisphere forest regrowth, and other terrestrial sinks within a year, whereas the remaining 46% of human-caused CO_2 emissions remains stored in the atmosphere (Seinfeld and Pandis 1998).

Similarly, impacts of GHGs are borne globally, as opposed to localized air quality effects of criteria air pollutants and toxic air contaminants. The quantity of GHGs that it takes to ultimately result in climate change is not precisely known; suffice it to say, the quantity is enormous, and no single project alone would measurably contribute to a noticeable incremental change in the global average temperature, or to global, local, or micro climate. From the standpoint of CEQA, GHG impacts to global climate change are inherently cumulative.

Attributing Climate Change—Greenhouse Gas Emission Sources

Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the transportation, industrial/manufacturing, utility, residential, commercial and agricultural emissions sectors (ARB 2009a). In California, the transportation sector is the largest emitter of GHGs, followed by electricity generation (ARB 2009a). Emissions of CO_2 are byproducts of fossil fuel combustion. CH_4, a highly potent GHG, results from off-gassing (the release of chemicals from nonmetallic substances under ambient or greater pressure conditions) is largely associated with agricultural practices and landfills. N_2O is also largely attributable to agricultural practices and soil management. CO_2 sinks, or reservoirs, include vegetation and the ocean, which absorb CO_2 through sequestration and dissolution, respectively, two of the most common processes of CO_2 sequestration.

State Greenhouse Gas Emissions Inventory

According to different ranking systems, California is the 12th to 16th largest emitter of CO_2 in the world (California Energy Commission [CEC] 2006). California produced 484 million gross metric tons of CO_2 equivalent (CO_2e) in 2004 (ARB 2009a). CO_2e is a measurement used to account for the fact that different GHGs have different potential to retain infrared radiation in the atmosphere and contribute to the greenhouse effect. This potential, known as the global warming potential (GWP) of a GHG, is dependent on the lifetime, or persistence, of the gas molecule in the atmosphere. For example, as described in Appendix C, "Calculation References," of the General Reporting Protocol of the California Climate Action Registry (CCAR) (CCAR 2009), 1 ton of CH_4 has the same contribution to the greenhouse effect as approximately 21 tons of CO_2. Therefore, CH_4 is a much more potent GHG than CO_2. Expressing emissions in CO_2e takes the contributions of all GHG emissions to the greenhouse effect and converts them to a single unit equivalent to the effect that would occur if only CO_2 were being emitted.

Combustion of fossil fuel in the transportation sector was the single largest source of California's GHG emissions in 2004, accounting for 38% of total GHG emissions in the state (ARB 2009a). This sector was followed by the electric power sector (including both in-state and out-of-state sources) (19%) and the industrial sector (23%) (ARB 2008). See Exhibit 3A.4-1 below.

Local Inventory

A GHG emissions inventory was conducted for each incorporated city in Sacramento County, including the City of Folsom (City), and the unincorporated area of Sacramento County (County) for the year 2005. The City of Folsom estimated that communitywide GHG Emissions totaled approximately 609,009 metric tons of CO_2e in 2005. The City of Folsom contributed approximately 4.4% of the GHG emissions generated in Sacramento County. On-road transportation emissions composed 41.1% of Folsom's GHG emissions, followed by 24.0% from commercial/industrial land uses, and 21.6% from residential uses (Sacramento County 2009).

California's Greenhouse Gas Emissions by Economic Sector (2002-2004 Average) Exhibit 3A.4-1

REGULATORY FRAMEWORK

Numerous Federal, state, regional, and local laws, rules, regulations, plans, and policies define the framework that regulates and will potentially regulate climate change. The following discussion focuses on climate change requirements applicable to the project.

Federal Plans, Policies, Regulations, and Laws

Supreme Court Ruling

The U.S. Environmental Protection Agency (EPA) is the Federal agency responsible for implementing the Federal Clean Air Act (CAA). The Supreme Court of the United States ruled on April 2, 2007 that CO_2 is an air pollutant as defined under the CAA, and that EPA has the authority to regulate emissions of GHGs. However, there are no Federal regulations or policies regarding GHG emissions applicable to the Proposed Project, or alternatives under consideration.

EPA Proposed Regulations

In response to the mounting issue of climate change, EPA has taken actions to regulate, monitor, and potentially reduce GHG emissions. Although both actions discussed below are still in the proposal stage, they would have implications on the regulation, monitoring, and reduction of GHG emissions from stationary and mobile sources.

Proposed Mandatory Greenhouse Gas Reporting Rule

On April 10, 2009, EPA published its Proposed Mandatory Greenhouse Gas Reporting Rule (proposed reporting rule) in the Federal Register. The proposed reporting rule is a response to the fiscal year (FY) 2008 Consolidate Appropriations Act (House Resolution 2764; Public Law 110-161), which required EPA to develop "… mandatory reporting of greenhouse gases above appropriate thresholds in all sectors of the economy…" The proposed reporting rule would apply to fossil fuel and industrial GHG suppliers, vehicle and engine manufacturers, and all facilities that would emit 25,000 metric tons of CO_2e or more per year. Facility owners would be required to submit an annual GHG emissions report with detailed calculations of facility GHG emissions. The proposed reporting rule would also mandate record keeping and administrative requirements for EPA to verify annual GHG emissions reports. Owners of existing facilities that commenced operation prior to January 1, 2010 would be required to submit an annual report for calendar year 2010. Owners of new facilities commencing operation after January 1, 2010 would be required to submit an annual report from the facility's commencement date to December 31, 2010. For all subsequent operating years, facility owners would be required to report GHG emissions for the whole calendar year (January 1 to December 31). The comment period on the proposed reporting rule ended on June 6, 2009.

Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under the Federal Clean Air Act

On April 23, 2009, EPA published their Proposed Endangerment and Cause or Contribute Findings for Greenhouse Gases under the CCA (Endangerment Finding) in the Federal Register. The Endangerment Finding is based on Section 202(a) of the CAA, which states that the Administrator (of EPA) should regulate and develop standards for "emission[s] of air pollution from any class or classes of new motor vehicles or new motor vehicle engines, which in [its] judgment cause, or contribute to, air pollution which may reasonably be anticipated to endanger public health or welfare." The proposed rule addresses Section 202(a) in two distinct findings. The first addresses whether or not the concentrations of the six key GHGs (i.e., CO_2, CH_4, N_2O, HFCs, perflurorocarbons [PFCs], and SF_6) in the atmosphere threaten the public health and welfare of current and future generations. The second addresses whether or not the combined emissions of GHGs from new motor vehicles and motor vehicle engines contribute to atmospheric concentrations of GHGs and therefore the threat of climate change.

The Administrator proposed the finding that atmospheric concentrations of GHGs endanger the public health and welfare within the meaning of Section 202(a) of the CCA. The evidence supporting this finding consists of human activity resulting in "high atmospheric levels" of GHG emissions, which are very likely responsible for increases in average temperatures and other climatic changes. Furthermore, the observed and projected results of climate change (e.g., higher likelihood of heat waves, wildfires, droughts, sea level rise, higher intensity storms) are a threat to the public health and welfare. Therefore, GHGs were found to endanger the public health and welfare of current and future generations.

The Administrator also proposed the finding that GHG emissions from new motor vehicles and motor vehicle engines are contributing to air pollution, which is endangering public health and welfare. The proposed finding cites that in 2006, motor vehicles were the second largest contributor to domestic GHG emissions (24% of total) behind electricity generation. Furthermore, in 2005, the United States was responsible for 18% of global GHG emissions. Therefore, GHG emissions from motor vehicles and motor vehicle engines were found to contribute to air pollution that endangers public health and welfare.

State Plans, Policies, Regulations, and Laws

ARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California and for implementing the California Clean Air Act (CCAA), which was adopted in 1988.

Various statewide and local initiatives to reduce the state's contribution to GHG emissions have raised awareness that, even though the various contributors to and consequences of global climate change are not yet fully

understood, global climate change is under way, and there is a real potential for severe adverse environmental, social, and economic effects in the long term. Because every nation emits GHGs and therefore makes an incremental cumulative contribution to global climate change, cooperation on a global scale will be required to reduce the rate of GHG emissions to a level that can help to slow or stop the human-caused increase in average global temperatures and associated changes in climatic conditions.

Assembly Bill 1493

In 2002, then-Governor Gray Davis signed Assembly Bill (AB) 1493. AB 1493 requires that ARB develop and adopt, by January 1, 2005, regulations that achieve "the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks and other vehicles determined by ARB to be vehicles whose primary use is noncommercial personal transportation in the state."

To meet the requirements of AB 1493, in 2004 ARB approved amendments to the California Code of Regulations (CCR) adding GHG emissions standards to California's existing standards for motor vehicle emissions. Amendments to CCR Title 13, Sections 1900 and 1961 (13 CCR 1900, 1961), and adoption of Section 1961.1 (13 CCR 1961.1) require automobile manufacturers to meet fleet-average GHG emissions limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes (i.e., any medium-duty vehicle with a gross vehicle weight rating less than 10,000 pounds that is designed primarily for the transportation of persons), beginning with the 2009 model year. For passenger cars and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 pounds or less, the GHG emission limits for the 2016 model year are approximately 37% lower than the limits for the first year of the regulations, the 2009 model year. For light-duty trucks with LVW of 3,751 pounds to gross vehicle weight (GVW) of 8,500 pounds, as well as medium-duty passenger vehicles, GHG emissions would be reduced approximately 24% between 2009 and 2016.

In December 2004, a group of car dealerships, automobile manufacturers, and trade groups representing automobile manufacturers filed suit against ARB to prevent enforcement of 13 CCR Sections 1900 and 1961 as amended by AB 1493 and 13 CCR 1961.1 (*Central Valley Chrysler-Jeep et al. v. Catherine E. Witherspoon, in Her Official Capacity as Executive Director of the California Air Resources Board, et al.*). The automobile-makers' suit in the United States District Court for the Eastern District of California, contended California's implementation of regulations that, in effect, regulate vehicle fuel economy violates various Federal laws, regulations, and policies.

On December 12, 2007, the Court found that if California receives appropriate authorization from EPA (the last remaining factor in enforcing the standard), then these regulations would be consistent with and have the force of Federal law, thus, rejecting the automobile-makers' claim. This authorization to implement more stringent standards in California was requested in the form of a CAA Section 209(b), waiver in 2005. Since that time, EPA failed to act on granting California authorization to implement the standards. Governor Schwarzenegger and Attorney General Edmund G. Brown filed suit against EPA for the delay. In December 2007, EPA Administrator Stephen Johnson denied California's request for the waiver to implement AB 1493. Johnson cited the need for a national approach to reducing GHG emissions, the lack of a "need to meet compelling and extraordinary conditions", and the emissions reductions that would be achieved through the Energy Independence and Security Act of 2007 as the reasoning for the denial (Office of the White House 2009).

The State of California filed suit against EPA for its decision to deny the CAA waiver. The recent change in presidential administration directed EPA to reexamine its position for denial of California's CAA waiver and for its past opposition to GHG emissions regulation. California received the waiver on June 30, 2009.

Executive Order S-3-05

Executive Order S-3-05, which was signed by Governor Schwarzenegger in 2005, proclaims that California is vulnerable to the impacts of climate change. It declares that increased temperatures could reduce the Sierra Nevada snowpack, further exacerbate California's air quality problems, and potentially cause a rise in sea level.

To combat those concerns, the Executive Order established total GHG emission targets. Specifically, emissions are to be reduced to the 2000 level by 2010, the 1990 level by 2020, and to 80% below the 1990 level by 2050.

The Executive Order directed the Secretary of the California Environmental Protection Agency (CalEPA) to coordinate a multiagency effort to reduce GHG emissions to the target levels. The Secretary will also submit biannual reports to the Governor and State Legislature describing: progress made toward reaching the emission targets; impacts of global warming on California's resources; and mitigation and adaptation plans to combat these impacts. To comply with the Executive Order, the Secretary of the CalEPA created the California Climate Action Team (CCAT) made up of members from various state agencies and commission. CCAT released its first report in March 2006. The report proposed to achieve the targets by building on voluntary actions of California businesses, local government and community actions, as well as through state incentive and regulatory programs.

Assembly Bill 32, the California Global Warming Solutions Act of 2006

In September 2006, Governor Arnold Schwarzenegger signed AB 32, the California Global Warming Solutions Act of 2006. AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and a cap on statewide GHG emissions. AB 32 requires that statewide GHG emissions be reduced to 1990 levels by 2020. This reduction will be accomplished through an enforceable statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs ARB to develop and implement regulations to reduce statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then ARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires that ARB adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrives at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the state achieves the reductions in GHG emissions necessary to meet the cap. AB 32 also includes guidance to institute emissions reductions in an economically efficient manner and conditions to ensure that businesses and consumers are not unfairly affected by the reductions.

Assembly Bill 32, Climate Change Scoping Plan

On December 11, 2008 ARB adopted its *Climate Change Scoping Plan* (Scoping Plan), which functions as a roadmap of ARB's plans to achieve GHG reductions in California required by AB 32 through subsequently enacted regulations (ARB 2008). The Scoping Plan contains the main strategies California will implement to reduce CO_2e emissions by 169 MMT, or approximately 30%, from the state's projected 2020 emissions level of 596 MMT of CO_2e under a business-as-usual scenario. (This is a reduction of 42 MMT CO_2e, or almost 10%, from 2002–2004 average emissions, but requires the reductions in the face of population and economic growth through 2020.) The Scoping Plan also breaks down the amount of GHG emissions reductions ARB recommends for each emissions sector of the state's GHG inventory. The Scoping Plan calls for the largest reductions in GHG emissions to be achieved by implementing the following measures and standards:

- improved emissions standards for light-duty vehicles (estimated reductions of 31.7 MMT CO_2e),
- the Low-Carbon Fuel Standard (15.0 MMT CO_2e),
- energy efficiency measures in buildings and appliances and the widespread development of combined heat and power systems (26.3 MMT CO_2e), and
- a renewable portfolio standard for electricity production (21.3 MMT CO_2e).

ARB has not yet determined what amount of GHG emissions reductions it recommends from local government land use decisions; however, the Scoping Plan does state that successful implementation of the plan relies on local

governments' land use planning and urban growth decisions because local governments have primary authority to plan, zone, approve, and permit land development to accommodate population growth and the changing needs of their jurisdictions. ARB further acknowledges that decisions on how land is used will have large effects on the GHG emissions that will result from the transportation, housing, industry, forestry, water, agriculture, electricity, and natural gas emission sectors. The Scoping Plan states that the ultimate assignment to local government operations is to be determined (ARB 2008).

With regard to local land use planning, the Scoping Plan expects a reduction of approximately 5.0 MMT CO_2e from local land use changes associated with implementation of SB 375, discussed above. Also noteworthy is the fact that the Scoping Plan does not include any direct discussion about GHG emissions generated by construction activity.

Executive Order S-1-07

Executive Order S-1-07, which was signed by Governor Schwarzenegger in 2007, proclaims that the transportation sector is the main source of GHG emissions in California, at over 40% of statewide emissions. It establishes a goal that the carbon intensity of transportation fuels sold in California should be reduced by a minimum of 10% by 2020. This order also directed ARB to determine if this Low Carbon Fuel Standard could be adopted as a discrete early action measure after meeting the mandates in AB 32. ARB adopted the Low Carbon Fuel Standard on April 23, 2009.

Senate Bill 1368

SB 1368 is the companion bill of AB 32 and was signed by Governor Schwarzenegger in September 2006. SB 1368 requires the California Public Utilities Commission (CPUC) to establish a GHG performance standard for baseload generation from investor-owned utilities by February 1, 2007. The CEC must establish a similar standard for local publicly owned utilities by June 30, 2007. These standards cannot exceed the GHG emission rate from a baseload combined-cycle natural gas fired plant. The legislation further requires that all electricity provided to California, including imported electricity, must be generated from plants that meet the standards set by the CPUC and CEC.

Senate Bills 1078 and 107 and Executive Order S-14-08

SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20% of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010. In November 2008, Governor Schwarzenegger signed Executive Order S-14-08, which expands the state's Renewable Energy Standard to 33% renewable power by 2020. Governor Schwarzenegger plans to propose legislative language that will codify the new higher standard (California Office of the Governor 2008).

Senate Bill 97

SB 97, signed August 2007, acknowledges that climate change is a prominent environmental issue that requires analysis under CEQA. This bill directs the California Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Natural Resources Agency guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA by July 1, 2009. The California Natural Resources Agency adopted those guidelines on December 30, 2009, and the guidelines became effective March 18, 2010.

This bill also removes inadequate CEQA analysis of effects of GHG emissions from projects (retroactive and future) funded by the Highway Safety, Traffic Reduction, Air Quality and Port Security Bond Act of 2006, or the Disaster Preparedness and Flood Protection Bond Act of 2006 (Proposition 1B or 1E) as a legitimate cause of action. This provision will be repealed on January 1, 2010, wherein inadequate CEQA analysis for those projects

could then become a legitimate cause of action. This bill would only protect a handful of public agencies from CEQA challenges on certain types of projects for a few years.

Senate Bill 375

SB 375, signed in September 2008, aligns regional transportation planning efforts, regional GHG emission reduction targets, and land use and housing allocation. SB 375 requires Metropolitan Planning Organizations (MPOs) to adopt a Sustainable Communities Strategy (SCS) or Alternative Planning Strategy (APS), which will prescribe land use allocation in that MPO's Regional Transportation Plan (RTP). ARB, in consultation with MPOs, will provide each affected region with reduction targets for GHGs emitted by passenger cars and light trucks in the region for the years 2020 and 2035. These reduction targets will be updated every 8 years, but can be updated every 4 years if advancements in emissions technologies affect the reduction strategies to achieve the targets. ARB is also charged with reviewing each MPO's SCS or APS for consistency with its assigned targets. If MPOs do not meet the GHG emission reduction targets, transportation projects would not be eligible for funding programmed after January 1, 2012.

This bill also extends the minimum time period for the Regional Housing Needs Allocation (RNHA) cycle from 5 years to 8 years for local governments located within an MPO that meets certain requirements. City or County land use policies (including general plans) are not required to be consistent with the RTP (and associated SCS or APS). However, new provisions of CEQA would incentivize qualified projects that are consistent with an approved SCS or APS, categorized as "transit priority projects."

Regional and Local Plans, Policies, Regulations, and Laws

Sacramento County

Sacramento County's Board of Supervisors has approved the first phase of a climate action plan that will provide a framework for reducing GHG emissions. The first phase focuses on the County's overall strategy and goals for addressing climate change (Sacramento County 2009). Key goals in the first phase include a reduction in vehicle miles traveled (VMT) per capita in the region; improving energy efficiency of all existing and new buildings; emphasizing water use efficiency as a way to reduce energy consumption; maximizing waste diversion, composting, and recycling through residential and commercial programs; and protecting important farmlands and open space from conversion and encroachment and maintaining connectivity of protected areas.

El Dorado County

El Dorado County has not developed a climate action plan or similar GHG emissions reduction plan for GHG emission-generating activity in its jurisdiction, nor has El Dorado County began efforts to develop such a plan at the time of writing this EIR/EIS.

City of Folsom

The City of Folsom has not developed a climate action plan or similar GHG emissions reduction plan for GHG emission-generating activity in its jurisdiction. The City of Folsom General Plan does not contain any goals or policies that relate directly to climate change or GHGs City of Folsom 1988). The City is in the early stages of updating its General Plan, which will include multiple policies that directly address climate change and GHG emissions.

ENVIRONMENTAL CONSEQUENCES AND MITIGATION MEASURES

Thresholds of Significance

ARB, the Sacramento Metropolitan Air Quality Management District (SMAQMD), and El Dorado County Air Quality Management District (EDCAQMD) have not identified a significance threshold for analyzing GHG emissions associated with a land use development projects. SMAQMD has updated its CEQA guidance, and it released its *Guide to Air Quality Assessment in Sacramento County* in December 2009 (SMAQMD 2009a). However, SMAQMD does not include any particular GHG significance threshold in its guide. Instead, it suggests that lead agencies identify thresholds of significance applicable to a proposed project that is supported by substantial evidence (SMAQMD 2009a, page 6-5). Nevertheless, the primary focus of SMAQMD's guidance for addressing GHG emissions is "to provide guidance about evaluating whether the GHG emissions associated with a proposed project would be a cumulatively considerable contribution to global climate change" (SMAQMD 2009a, page 6-3).

The City and USACE acknowledge that, by adoption of AB 32 and SB 97, the State of California has identified GHG emission reduction goals and that the effect of GHG emissions as they relate to global climate change is inherently an adverse environmental impact. While the emissions of one single project will not cause global climate change, GHG emissions from multiple projects throughout the world could result in a cumulative impact with respect to global climate change.

To meet AB 32 goals, California would need to generate less GHG emissions than current levels. It is recognized, however, that for most projects there is no simple metric available to determine if a single project would substantially increase or decrease overall GHG emission levels.

Although the text of AB 32 applies to stationary sources of GHG emissions, this mandate demonstrates California's commitment to reducing the rate of GHG emissions and the state's associated contribution to climate change, without intent to limit population or economic growth within the state. Thus, to achieve the goals of AB 32, which are tied to GHG emission rates of a specific benchmark year (i.e., 1990), California would have to achieve a lower rate of emissions per unit of population than its current rate. Further, to accommodate *future* population and economic growth, the state would have to achieve an even lower rate of emissions per unit than was achieved in 1990. (The goal to achieve 1990 quantities of GHG emissions by 2020 means that this will need to be accomplished in the face of 30 years of population and economic growth beyond 1990.) Thus, future planning efforts that would not encourage reductions in GHG emissions or not enable land uses to operate in a GHG-efficient manner would conflict with the policy decisions contained in the spirit of AB 32, thus impeding California's ability to comply with the mandate.

Thus, if a statewide context for addressing GHG emissions is applied, any net increase in GHG emissions within state boundaries would be considered "new" emissions. For example, a land development project, such as the Folsom South of 50 Project, does not create "new" emitters of GHGs, but would theoretically accommodate a greater number of residents in the state. Some of the residents that move to the project could already be residents in California, while others may be from out-of-state (or would "take the place" of in-state residents who "vacate" their current residences to move to the new project). The out-of-state residents would be contributing new emissions in a statewide context, but would not necessarily be generating new emissions in a global context. Given the statewide context established by AB 32, the project would need to accommodate an increase in population in a manner that would not inhibit the state's ability to achieve the goals of lower emissions overall.

However, the State of California has established GHG emission reduction targets and has determined that GHG emissions as they relate to global climate change are a source of adverse environmental impacts in California that should be addressed under CEQA. Although AB 32 did not amend CEQA, it identifies the myriad of environmental problems in California caused by global warming (California Health and Safety Code, Section 38501[a]). SB 97, however, did amend CEQA by directing OPR to prepare revisions to the State CEQA

Guidelines addressing the mitigation of GHGs or their consequences. As an interim step toward development of required guidelines, in June 2008, OPR published a technical advisory, entitled *CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review* (OPR 2008). In this technical advisory, OPR recommends that the lead agencies under CEQA make a good-faith effort, based on available information, to estimate the quantity of GHG emissions that would be generated by a proposed project, including the emissions associated with vehicular traffic, energy consumption, water usage, and construction activities, to determine whether the impacts have the potential to result in a project or cumulative impact and to mitigate the impacts where feasible mitigation is available.

OPR's technical advisory also acknowledges that "perhaps the most difficult part of the climate change analysis will be the determination of significance," and noted that "OPR has asked ARB technical staff to recommend a method for setting thresholds which will encourage consistency and uniformity in the CEQA analysis of GHG emissions throughout the state." ARB has not yet completed this task at the time of writing this EIR/EIS.

OPR has provided proposed amendments to the State CEQA Guidelines, including Appendix G, to address impacts of GHG emissions, as directed by SB 97 (2007). These proposed amendments were approved by the California Natural Resources Agency (CRNA) on December 30, 2009 and the adopted amendments will not become effective until after the Office of Administrative Law completes its review of the adopted amendments and rulemaking file, and transmits the adopted amendments to the Secretary of State for inclusion in the California Code of Regulations (CNRA 2010). The thresholds for determining the significance of the impact of projected GHG emissions generated by the project for this analysis are based on OPR's proposed additions to Appendix G of the State CEQA Guidelines. These thresholds also encompass the factors taken into account under NEPA to determine the significance of an action in terms of its context and the intensity of its impacts. An impact related to global climate change (i.e., the projected GHG emissions generated by the project) is considered significant if the Proposed Project or alternatives under consideration would do any of the following (OPR's proposed additions to Appendix G):

- generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or,

- conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

SMAQMD also recommends that the above two criteria be addressed in the GHG analysis of an EIR (SMAQMD 2009a, page 6-6).

For the purposes of this EIR/EIS, the City and USACE have decided to quantify total GHG emissions from the Proposed Project and alternatives under consideration, and determine whether the associated emissions would substantially help or hinder the state's ability to attain the goals identified in AB 32 (i.e., reduction of statewide GHG emissions to 1990 levels by 2020). The analysis of GHG emissions in this EIR/EIS recognizes that the impact that GHG emissions have on global climate change does not depend on whether they are generated by stationary, mobile, or area sources, or whether they are generated in one region or another. As stated above, the mandate of AB 32 demonstrates California's commitment to reducing GHG emissions and the state's associated contribution to climate change, without intending to limit population or economic growth within the state. Thus, to achieve the goals of AB 32, which are tied to mass GHG emission levels of a specific benchmark year (i.e., 1990), California would have to achieve a lower rate of emissions per unit of population (per person) and/or per level of economic activity (e.g., per job) than its current rate. Furthermore, to accommodate future population and economic growth, the state would have to achieve an even lower rate of emissions per unit than it achieved in 1990. (The goal—to achieve 1990 quantities of GHG emissions by 2020—will need to be accomplished despite 30 years of population and economic growth beyond 1990.) For this reason, land uses need to be GHG "efficient" to attain AB 32 goals while accommodating population and job growth. Thus, the program-level analysis of GHGs for this EIR/EIS focuses on the annual operational GHG emissions per service population (SP), or annual

GHG/SP, where SP is the number of residents accommodated by each alternative plus the number of jobs supported by each alternative. The benchmark for this metric is estimated to be approximately 4.36 metric tons CO_2e/SP/year for the year 2020 and 3.68 metric tons CO_2e/SP/year for the year 2030. These benchmarks were developed and estimated based on future expected growth in the state's population and economy and the mass emissions reduction target mandated by AB 32 for the year 2020 and an interpolated mass emissions reduction target mandated target for the year 2030 that is based on Executive Order S-3-05; assumptions were also made about which emissions sectors of the statewide GHG emissions inventory are affected by land use planning and development design decisions. For instance, GHG emissions produced by the forestry sector are not accounted for in this metric because the Proposed Project and alternatives under consideration would not result in the removal or addition of forests or state forestland. These and other detailed projections and calculations used to estimate this benchmark are presented in Appendix C1.

Additionally, the application of an efficiency-based metric in this analysis is consistent with the discussion in ARB's Scoping Plan of the importance of GHG efficiency in land use planning that must be achieved to attain the mandated reductions in mass annual GHG emission levels (ARB 2008, page ES-12). However, although the Scoping Plan discusses efficiency in terms of (imperial) tons per person, it does not explicitly discuss ways to account for projected growth in the state's population or projected growth in the state's economy. Moreover, the metric of mass GHG emissions per capita would not be useful for understanding the efficiency of nonresidential land uses (e.g., commercial, industrial, educational).

Because the CO_2e/SP/year metric accounts for future population growth, future economic growth, and mass emission targets, future land use development projects that would not be more GHG efficient than "business as usual" would conflict with the spirit of AB 32 policy.

Nonetheless, one of the primary challenges to establishing a reasonable threshold and determining impacts (and mitigation) relates to enactment of AB 32 and other GHG emission-reduction legislations. As previously described, much of this legislation requires ARB and others to establish standards that relate to energy efficiency, carbon levels in fuels, smokestack emissions, and regional transportation planning (i.e., SB 375). These standards are in the development process but may be a few to several years away from implementation. The project, however, would also be in development for multiple decades (±20 years), and during its lifetime would be subject to these as-yet undeveloped thresholds. There is a lag time between enactment of these legislative fixes and the regulations that will implement them. As a consequence, local governmental agencies are left to struggle with trying to discern the extent to which their decisions can and will influence GHG emissions, versus what still-to-be-developed regulations will achieve. For instance, a local lead agency can base a threshold on generation of emissions below some business-as-usual target, but it is difficult to ascertain whether these regulations will largely result in substantial reductions that hit the target, or whether local agencies will need to impose additional measures. This challenge is discussed in more detail in the "Impact Analysis" section below.

Analysis Methodology

At the time of writing this EIR/EIS, neither ARB nor any air district in California (including SMAQMD and EDCAQMD) has formally adopted a recommended methodology for evaluating GHG emissions associated with new development. Though SMAQMD has not developed a threshold of significance for determining whether project-related GHG emissions are considered to be significant, its *Guide to Air Quality Assessment in Sacramento County* does recommend that lead agencies estimate GHG emissions associated with temporary and short-term, project-related construction activities, as well as the long-term, operational emissions associated with a project, including mobile- and area-source GHG emissions and direct, off-site emissions associated with the project's consumption of electricity and water (SMAQMD 2009a, page 6-6).

In the case of the Folsom South of 50 Project, CO_2 emissions associated with project construction and operation were modeled using URBEMIS 2007 version 9.2.4 (Rimpo and Associates 2008); a model widely-used in

regional air quality analysis. Indirect emissions associated with energy consumption were estimated using methodology recommended in the current CCAR General Reporting Protocol version 3.1 (CCAR 2009).

It is important to note that all CO_2 emissions from project operation may not necessarily be considered "new" emissions, given that a project itself does not create "new" emitters (people) of GHGs, at least not in the traditional sense. In other words, the GHG emissions for a residential project are not necessarily all new GHG emissions in the local area, state, or world; to a large degree, a new residential development, accommodates household relocations. In this sense, residential development projects can be seen as reacting to increased demand from the growing population and economy, and are not in themselves creators of economic or population growth. Emissions of GHGs are, however, influenced by the location and design of projects, to the extent that they can influence travel to and from the projects, and to the degree the projects are designed to maximize energy efficiency and GHG efficiency.

The methodology used in this EIR/EIS to analyze the project's contribution to global climate change includes a calculation of GHG emissions and a discussion about the context in which they can be evaluated. The lead agencies' purpose of calculating the project's GHG emissions is for informational and comparison purposes, as neither SMAQMD or EDCAQMD have not adopted a quantifiable threshold for evaluating whether project-generated GHG's would be considered a significant impact.

IMPACT ANALYSIS

Impacts that would occur under each alternative development scenario are identified as follows: NP (No Project/Action), NCP (No USACE Permit), PP (Proposed Project/Action), RIM (Resource Impact Minimization), CD (Centralized Development), RHD (Reduced Hillside Development). The impacts for each alternative are compared relative to the Proposed Project Alternative at the end of each impact conclusion (i.e., similar, greater, lesser).

IMPACT 3A.4-1 Generation of Temporary, Short-Term Construction-Related GHG Emissions. *Project-related construction activities associated with development of the project and off-site elements would result in increased generation of GHG emissions. These emissions would be temporary and short-term and would decline over time as new regulations are developed that address medium- and heavy-duty on-road vehicles and off-road equipment under the mandate of AB 32.*

On-Site and Off-Site Elements

NP

Under the No Project alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. If developed, construction of these residences would not be anticipated to require a high number of diesel-powered construction equipment or involve intense levels of earth movement for an extended period of time. Thus, these activities would not conflict with the policy decisions contained in AB 32, and thereby would not impede California's ability to comply with the mandate of AB 32. No off-site water facilities would be constructed in this alternative. As a result, GHG emissions associated with project-related construction under the No Project Alternative would not result in a cumulatively considerable incremental contribution to climate change. This would be a **less-than-significant** impact. ***[Lesser]***

Mitigation Measure: No mitigation measures are required.

On-Site Elements

NCP

The types of emissions-generating construction activities that would occur under the No USACE Permit Alternative would be similar to those that would take place under the Proposed Project Alternative. Construction-generated GHG emissions associated with buildout of the No USACE Permit Alternative were modeled in URBEMIS and are presented in Table 3A.4-1. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

As shown in Table 3A.4-1, estimated GHG emissions from construction during the 19-year buildout of the No USACE Permit Alternative would be approximately 42,664 metric tons of CO_2, which is less than estimated for the Proposed Project Alternative. Similar to the Proposed Project Alternative, GHG emissions generated by construction under the No USACE Permit Alternative would be temporary and short term. Although a new regime of regulations is expected to come into place under AB 32 and existing regulatory efforts will help reduce GHG emissions generated by construction activity throughout the state, given the information available today, GHG emissions associated with construction of the No USACE Permit Alternative would result in a cumulatively considerable incremental contribution to this **significant** cumulative impact. ***[Lesser]***

Mitigation Measure 3A.4-1: Implement Additional Measures to Control Construction-Generated GHG Emissions.

To further reduce construction-generated GHG emissions, the project applicant(s) of all project phases shall implement all feasible measures for reducing GHG emissions associated with construction that are recommended by SMAQMD at the time individual portions of the site undergo construction. Such measures may reduce GHG exhaust emissions from the use of on-site equipment, worker commute trips, and truck trips carrying materials and equipment to and from the SPA, as well as GHG emissions embodied in the materials selected for construction (e.g., concrete). Other measures may pertain to the materials used in construction. Prior to releasing each request for bid to contractors for the construction of each development phase, the project applicant(s) shall obtain the most current list of GHG reduction measures that are recommended by SMAQMD and stipulate that these measures be implemented in the respective request for bid as well as the subsequent construction contract with the selected primary contractor. The project applicant(s) for any particular development phase may submit to SMAQMD a report that substantiates why specific measures are considered infeasible for construction of that particular development phase and/or at that point in time. The report, including the substantiation for not implementing particular GHG reduction measures, shall be approved by SMAQMD prior to the release of a request for bid by the project applicant(s) for seeking a primary contractor to manage the construction of each development phase. By requiring that the list of feasible measures be established prior to the selection of a primary contractor, this measure requires that the ability of a contractor to effectively implement the selected GHG reduction measures be inherent to the selection process.

SMAQMD's recommended measures for reducing construction-related GHG emissions at the time of writing this EIR/EIS are listed below and the project applicant(s) shall, at a minimum, be required to implement the following:

- Improve fuel efficiency from construction equipment:
    - reduce unnecessary idling (modify work practices, install auxiliary power for driver comfort);
    - perform equipment maintenance (inspections, detect failures early, corrections);
    - train equipment operators in proper use of equipment;
    - use the proper size of equipment for the job; and
    - use equipment with new technologies (repowered engines, electric drive trains).

- Use alternative fuels for electricity generators and welders at construction sites such as propane or solar, or use electrical power.

- Use an ARB-approved low-carbon fuel, such as biodiesel or renewable diesel for construction equipment. (Emissions of oxides of nitrogen [NO_X] emissions from the use of low carbon fuel must be reviewed and increases mitigated.) Additional information about low-carbon fuels is available from ARB's Low Carbon Fuel Standard Program (ARB 2009b).

- Encourage and provide carpools, shuttle vans, transit passes and/or secure bicycle parking for construction worker commutes.

- Reduce electricity use in the construction office by using compact fluorescent bulbs, powering off computers every day, and replacing heating and cooling units with more efficient ones.

- Recycle or salvage non-hazardous construction and demolition debris (goal of at least 75% by weight).

- Use locally sourced or recycled materials for construction materials (goal of at least 20% based on costs for building materials, and based on volume for roadway, parking lot, sidewalk and curb materials).

- Minimize the amount of concrete used for paved surfaces or use a low carbon concrete option.

- Produce concrete on-site if determined to be less emissive than transporting ready mix.

- Use EPA-certified SmartWay trucks for deliveries and equipment transport. Additional information about the SmartWay Transport Partnership Program is available from ARB's Heavy-Duty Vehicle Greenhouse Gas Measure (ARB 2009c) and EPA (EPA 2009).

- Develop a SMAQMD-approved plan to efficiently use water for adequate dust control. This may consist of the use of non-potable water from a local source.

In addition to SMAQMD-recommended measures, construction activity shall comply with all applicable rules and regulations established by SMAQMD and ARB.

Implementation: Project applicant(s) during all project phases and on-site and off-site elements.

Timing: Before approval of final maps and building permits for all project phases, including all on- and off-site elements and implementation throughout project construction.

Enforcement:

1. For all project-related improvements that would be located within the City of Folsom: City of Folsom Community Development Department.

2. For all on- and off-site project-related activities within the City of Folsom and Sacramento County.

3. For the two roadway extensions into El Dorado Hills: El Dorado County Development Services Department.

Mitigation Measure: Implement Mitigation Measures 3A.2-1a and 3A.2-1b.

PP

Heavy-duty off-road equipment, materials transport, and worker commutes during construction of the Proposed Project Alternative would result in exhaust emissions of GHGs. Exact project-specific data (e.g., construction equipment types and number requirements) were not available at the time of this analysis.

GHG emissions generated by construction would be primarily in the form of CO_2. Although emissions of other GHGs, such as CH_4 and N_2O, are important with respect to global climate change, the emission levels of these other GHGs from on- and off-road vehicles used during construction are relatively small compared with CO_2 emissions, even when factoring in the relatively larger global warming potential of CH_4 and N_2O.

Accordingly, total construction emissions for the 19-year buildout period associated with implementation of the Proposed Project Alternative and action alternatives were estimated using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008). URBEMIS is designed to model construction emissions for land use development projects based on building size, land use and type, and disturbed acreage and allows for the input of project-specific information. Construction-generated GHG emissions were modeled based on general information provided in the project description described in Chapter 2, "Alternatives," and default SMAQMD-recommended settings and parameters attributable to the proposed land use types and site location. In short, modeling was conducted using the same assumptions for estimating construction-generated emissions of criteria air pollutants and precursors, which are listed in the discussion under Impact 3A.2-1 of Section 3A.2, "Air Quality – Land."

Development of the SPA would occur over a very large area (approximately 3,510 acres) and construction would require substantial amounts of earthwork and grading. However, a detailed schedule describing the timing and location of construction activities under the Proposed Project and four other action alternatives (Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit) is not available at the time of writing this EIR/EIS. Construction of the site is anticipated to commence in 2011 and last until approximately 2030. Given that exhaust emission rates of the construction equipment fleet in the state are expected to decrease over time due to ARB- and SMAQMD-lead efforts, annual construction emissions were estimated using the earliest calendar when construction would begin (i.e., 2011) in order to generate conservative estimates. It is anticipated, however, that in later years, advancements in engine technology, retrofits, and turnover in the equipment fleet would result in increased fuel efficiency, potentially more alternatively fueled equipment, and lower levels of GHG emissions. Also, the URBEMIS model does not account for reductions in CO_2 emission rates that would affect future construction activity due to the regulatory environment that is expected to evolve under AB 32. For instance, ARB's Scoping Plan identifies the need to expand efficiency strategies and low carbon fuels for heavy-duty and off-road vehicles (ARB 2008).

Construction emissions levels associated with the Proposed Project and four other action alternatives would differ in the total number of residential units, commercial square footage, office square footage, and school square footage to be developed. A summary of the GHG emissions generated during buildout of the Proposed Project and four other action alternatives is presented in Table 3A.4-1. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

Table 3A.4-1
Summary of Modeled Greenhouse Gas Emissions (CO_2e) from On-Site Elements for the Proposed Project and Action Alternatives

Source	CO_2e Emissions by Alternative [1]				
	PP	RIM	RHD	CD	NCP
Construction Emissions over Buildout Period (2011-2030) (metric tons) [2, 3]	50,456	44,979	50,684	47,105	42,664
Operational Emissions at Full Buildout (Year 2030) (metric tons/year)					
Area-Source Emissions [4]	45,478	36,027	46,995	40,062	31,435
Mobile-Source Emissions [4]	111,037	86,171	111,848	108,560	92,043
Indirect Operational Emissions Associated with Electricity Consumption [5]	111,049	96,503	145,454	126,154	99,860
Indirect Operational Emissions Associated with Water Consumption [6]	23,485	18,193	26,399	21,433	16,877
Total Operational Emissions [7]	**291,049**	**236,895**	**330,696**	**296,208**	**240,215**
Operational GHG Efficiency Metrics					
Residential Population Accommodated by Alternative	24,335	19,584	28,084	20,689	15,808
Employment (jobs) Accommodated by On-Site Development	13,209	9,500	14,119	13,574	11,173
Service Population (SP) Supported by Alternative	37,544	29,084	42,203	34,263	26,981
Annual CO_2e/SP (metric tons/year)	7.8	8.2	7.8	8.7	8.9
GHG Efficiency Benchmarks					
Annual CO_2e/SP benchmark that reflects statewide target for Year 2020 (metric tons/year) [8]	4.4				
Annual CO_2e/SP benchmark that reflects statewide target for Year 2030 (metric tons/year) [8]	3.7				

Notes: CO_2e = carbon dioxide equivalent; PP = Proposed Project/Action; RIM = Resource impact Minimization; CD = Centralized Development; RHD = Reduced Hillside Development; NCP = No USACE Permit; GHG = greenhouse gas; SP = Service Population; AB = Assembly Bill; ARB = Air Resources Board; CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; VMT = vehicle miles traveled; CCAR = California Climate Action Registry; CEC = California Energy Commission

[1] The values presented do not include the full life cycle of GHG emissions that would occur over the production/transport of materials used during the construction of the on-site elements under each build alternative or used during the operational life of the project, solid waste that would be generated over the life of the project, and the end of life for the materials and processes that would occur as an indirect result of the project. Estimating the GHG emissions associated with these processes would be too speculative for meaningful consideration and would require analysis beyond the current state of the art in impact assessment, and may lead to a false or misleading level of precision in reporting operational GHG emissions. Furthermore, indirect emissions associated with in-state energy production and generation of solid waste would be regulated under AB 32 directly at the source or facility that would handle these processes. The emissions associated with off-site facilities in California would be closely controlled, reported, capped, and traded under AB 32 and California ARB programs, as recommended by ARB's Scoping Plan (ARB 2008). Therefore, it is assumed that GHG emissions associated with these life-cycle stages would be consistent with AB 32 requirements. Note that this table does not include the No Project Alternative, because if developed, construction of residences that could be developed under the adopted Sacramento County General Plan and zoning ordinance would not be anticipated to require a high number of diesel-powered construction equipment or involve intense levels of earth movement for an extended period of time.

[2] Construction emissions were modeled with the URBEMIS 2007 computer model using the same assumptions and input parameters to estimate criteria air pollutant emissions in Section 3A.2, "Air Quality – Land." The URBEMIS 2007 model does not account for CO_2 emissions associated with the production of concrete or other building materials used in project construction. It also does not estimate GHG emissions other than CO_2, though the levels of these pollutants (i.e., CH_4 and N_2O) are expected to be nominal in comparison to the estimated CO_2 levels, even considering their respective global warming potentials. Estimated values represent the levels of construction-generated GHG emissions that would be generated during the entire 19-year construction period. Construction emission estimates do not account for the fact that the intense level of grading that would occur on the eastern side of the SPA (compared to the intensity of grading that would be performed in other areas of the site) under the Proposed Project, Resource Impact Minimization, Reduced Hillside Development, and No USACE Permit Alternatives, but not the Centralized Development Alternative. This distinction is pertinent because grading is one of the most GHG emission-intensive phases of construction. However, a more detailed analysis is not provided because grading plans were not available for the Proposed Action or the four other action alternatives at the time of the analysis.

[3] Construction emission estimates do not account for the fact that the intense level of grading that would occur on the eastern side of the SPA (compared to the intensity of grading that would be performed in other areas of the site) under the Proposed Project, Resource Impact Minimization, Reduced Hillside Development, and No USACE Permit Alternatives, but not the Centralized Development Alternative. This distinction is pertinent because grading is one of the most GHG emission-intensive phases of construction. However, a more detailed analysis is not provided because grading plans were not available for the Proposed Action or the four other action alternatives at the time of the analysis.

[4] Direct operational area- and mobile-source emissions were modeled using the URBEMIS 2007 computer model, based on VMT and the number of trips obtained from the traffic analysis, as well as the same assumptions and input parameters used to estimate criteria air pollutant emissions in Section 3A.2, "Air Quality – Land." URBEMIS also does not estimate GHG emissions other than CO_2 emissions, although the levels of these pollutants (i.e., CH_4 and N_2O) are expected to be nominal in comparison to the estimated CO_2 levels, even considering their respective global warming potential.

[5] Indirect operational CO2e emissions associated with electricity consumption were estimated using the methodologies and emission factors from the California Climate Action Registry's General Reporting Protocol, Version 3.1 (CCAR 2009).

[6] Electricity consumption and direct sources (e.g., mobile sources) associated with the consumption of water, including the conveyance, distribution, and treatment of that water, was estimated by RMC as part the Water Supply and Demand Analysis. See Appendix M for detailed assumptions and calculations of water-related GHG emissions.

[7] Totals may not add exactly due to rounding. Actual values for these parameters are expected to be lower for multiple reasons, which are discussed in detail in the impact analysis. This estimate total does not account for the depletion of carbon sequestration associated with the loss of blue oak woodland and individual oak trees that currently exist in the SPA. This impact is discussed in greater detail in Section 3A.3, "Biological Resources – Land".

[8] These benchmarks are based on projected increases in the state's population and employment levels and reductions targets established by AB 32.

Source: Modeling performed by AECOM in 2010

As shown in Table 3A.4-1, estimated GHG emissions from construction during the 19-year buildout of the Proposed Project Alternative would be approximately 50,456 metric tons of CO_2. This value accounts only for exhaust emissions of GHGs that would be generated by heavy-duty equipment, haul trucks, and vehicle trips, however. Additional GHG emissions would also be "embodied" in the materials selected for construction and the level of embodied GHG emission can vary substantially according to which materials are selected. This is particularly the case for construction of buildings and infrastructure that involve high quantities of cement, which is a key ingredient of concrete, given that ARB has identified cement production as an energy-intensive, GHG-intensive industry (ARB 2008, page 31). In fact, ARB has included cement plants as separate emissions sector in its demand-based GHG inventory for the state (ARB 2008, pg. 13). Construction-generated exhaust emissions would be temporary and short-term in that they would only occur during the buildout period; they would not continue on an ongoing basis year after year throughout the operational life of the development, as is the case with large stationary-source facilities or the operation of most land use developments. In addition, the regulatory environment that continues to evolve under the mandate of AB 32 is expected to reduce some of the GHG emissions from construction activity. ARB's Scoping Plan does not directly discuss GHG emissions generated by construction activity; however, it does recommend measures for improving the efficiency of medium- and heavy-duty on-road vehicles (1.4 MMT CO_2e) and expended efficiency strategies for off-road vehicles (e.g., forklifts, bulldozers). In addition, existing programs for air quality improvement in California, including the *Diesel Risk Reduction Plan* and the *2007 State Implementation Plan*, will result in the accelerated phase-in of cleaner technology for virtually all of California's diesel engine fleets, including construction equipment (ARB 2008). Measures implemented under these plans are likely to result in future fleets of construction equipment that are more GHG-efficient than existing fleets. For these reasons, levels of GHG emissions associated with construction activity are expected to decrease over time as new regulations are developed under the mandate of AB 32.

Nonetheless, due to the intensity and duration of construction activities under the Proposed Project Alternative, construction-generated GHG emission levels would make an incremental contribution to GHGs that cause climate change. It is presumed that this level of construction-generated GHG emissions would be substantial compared to other construction projects in the region and in the state, particularly given the large size of the project (approximately 3,510 acres) and the intense level of grading that would occur on the hilly, eastern side of the SPA.

Although the construction-generated emissions would be temporary and short-term, and although a new regime of regulations is expected to come into place under AB 32 and existing regulatory efforts will help reduce GHG emissions generated by construction activity throughout the state, given the information available today, GHG emissions associated with construction of the Proposed Project Alternative would result in a cumulatively considerable incremental contribution to this **significant** cumulative impact.

Mitigation Measure: Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1.

RIM

The types of emissions-generating construction activities that would occur under the Resource Impact Minimization Alternative would be similar to those that would take place under the Proposed Project Alternative. Construction-generated GHG emissions associated with buildout of the Resource Impact Minimization Alternative were modeled in URBEMIS and are presented in Table 3A.4-1. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

As shown in Table 3A.4-1, estimated GHG emissions from construction during the 19-year buildout of the Resource Minimization Alternative would be approximately 44,979 metric tons of CO_2, which is less than estimated for the Proposed Project Alternative. Similar to the Proposed Project Alternative, GHG emissions generated by construction under the Resource Impact Minimization Alternative would be temporary and short term. Although a new regime of regulations is expected to come into place under AB 32 and existing regulatory efforts will help reduce GHG emissions generated by construction activity throughout the state, given the

information available today, GHG emissions associated with construction of the Resource Impact Minimization Alternative would result in a cumulatively considerable incremental contribution to this **significant** cumulative impact. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1.

CD

The types of emissions-generating construction activities that would occur under the Centralized Development Alternative would be similar to those that would take place under the Proposed Project Alternative. Construction-generated GHG emissions associated with buildout of the Centralized Development Alternative were modeled in URBEMIS and are presented in Table 3A.4-1. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

As shown in Table 3A.4-1, estimated GHG emissions from construction during the 19-year buildout of the Centralized Development Alternative would be approximately 47,105 metric tons of CO_2. This mass emissions level is less than the level estimated for the Proposed Project Alternative (i.e., 50,456 metric tons), in part, because intense grading would not occur on the eastern side of the SPA. Similar to the Proposed Project Alternative, GHG emissions generated by construction under the Centralized Development Alternative would be temporary and short term. Although a new regime of regulations is expected to come into place under AB 32 and existing regulatory efforts will help reduce GHG emissions generated by construction activity throughout the state, given the information available today, GHG emissions associated with construction of the Centralized Development Alternative would result in a cumulatively considerable incremental contribution to this **significant** cumulative impact. ***[Lesser]***

Mitigation Measure: Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1.

RHD

The types of emissions-generating construction activities that would occur under the Reduced Hillside Development Alternative would be similar to those that would take place under the Proposed Project Alternative. Construction-generated GHG emissions associated with buildout of the Reduced Hillside Development Alternative were modeled in URBEMIS and presented in Table 3A.4-1. Refer to Appendix C1 for a detailed summary of the URBEMIS modeling assumptions, inputs, and outputs.

As shown in Table 3A.4-1, estimated GHG emissions from construction during the 19-year buildout of the Reduced Hillside Alternative would be approximately 50,684 metric tons of CO_2, which is greater than estimated for the Proposed Project Alternative. Similar to the Proposed Project Alternative, GHG emissions generated by construction under the Reduced Hillside Development Alternative would be temporary and short -term. Although a new regime of regulations is expected to come into place under AB 32 and existing regulatory efforts will help reduce GHG emissions generated by construction activity throughout the state, given the information available today, GHG emissions associated with construction of the Reduced Hillside Development Alternative would result in a cumulatively considerable incremental contribution to this **significant** cumulative impact. ***[Greater]***

Mitigation Measure: Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1.

Off-Site Elements

GHG emissions associated with the construction of the off-site elements were estimated using the URBEMIS 2007 Version 9.2.4 computer program (Rimpo and Associates 2008) and SMAQMD's Road Construction Emissions Model (SMAQMD 2009b). Although the model was developed by SMAQMD, it is also recommended by EDCAQMD and other air districts in the state for estimating emissions generated by construction projects that

are linear in nature. While construction-generated emissions of criteria air pollutants are evaluated according to maximum daily emission levels (as discussed under Impact 3A.2-1 in Section 3A.2, "Air Quality – Land"), GHG emission levels from construction activity are typically evaluated according to their annual level or the total level that would be emitted during project construction. However, annual or total levels of GHG emissions associated with construction of the off-site elements could not be accurately estimated due to the lack of information concerning the construction schedule, types and quantities of equipment involved, and types and quantities of construction materials used. Nonetheless, maximum daily GHG emission levels were estimated for each off-site element using these two models. While URBEMIS is designed to model construction emissions for land use development projects, the Road Construction Emissions Model (SMAQMD 2009b) is designed to estimate emissions from heavy-duty construction equipment, haul trucks, and worker commute trips and fugitive PM (particulate matter) dust associated with linear construction projects. For all the elements, it was estimated that the most emission-intensive phase of construction would consist of grading, excavation, and other earth-movement activities, as is typically the case for most construction projects. Because detailed information about the construction of the off-site elements was not available at the time of this analysis, the following conservative projections were used in the modeling:

- the entire site could potentially be graded on a single day, regardless of project size; and
- each off-site element could potentially be constructed as early as the year 2011. This is a conservative assumption because equipment exhaust emissions from subsequent years are anticipated to be lower as new regulations and emissions technologies for off-road equipment come into place.

Emission levels associated with the construction of each of the proposed off-site elements were modeled separately. Model inputs include conservative estimates about size (i.e., dimensions and acreage) of the construction area associated with each off-site element based on the map in Exhibit 2-9 in Chapter 2, "Alternatives," and default parameters (i.e., equipment types and numbers) from the applicable model. Table 3A.4-2 summarizes the modeled worst-case daily GHG emission levels associated with construction of each off-site element. Refer to Appendix C1 for a detailed summary of the modeling assumptions, inputs, and outputs.

Table 3A.4-2
Summary of Maximum Daily Exhaust Emissions of Greenhouse Gases from Construction of Off-Site Elements

Off-Site Element	Area (acres)[1]	Exhaust Emissions of CO_2 (lb/day)[2]
Detention Basin [3]	3.4	4,159
Prairie City Road Interchange [3]	19.3	4,159
Rowberry Drive Overcrossing [3]	18.7	4,159
Oak Avenue Interchange [3]	46.7	9,122
Sewer Force Main Connection to Existing Pump Station [4]	2.4	9,004
Roadway Extensions into El Dorado County [4]	1.4	4,916

Notes: CO_2 = carbon dioxide; lb/day = pounds per day; GHG = greenhouse gases; SMAQMD = Sacramento Metropolitan Air Quality Management District

[1] The area of each off-site element was estimated based on Exhibit 2-9 in Chapter 2, "Alternatives."

[2] Maximum daily construction emissions are representative of a construction day in the earliest construction year (2011). Detailed input parameters and modeling output are included in Appendix C1. Emission level estimated do not include embodied GHG emissions associated with materials used in construction (e.g., concrete).

[3] Maximum daily emissions were estimated using the construction module and grading phase in URBEMIS 2007 Version 9.2.4 (Rimpo and Associates 2008).

[4] Maximum daily emissions on projects linear in nature were estimated using the Roadway Construction Emissions Model SMAQMD 2009b)

Source: Modeling performed by AECOM in 2009

The estimated GHG emission levels presented in Table 3A.4-2 do not include embodied GHG emissions, which are associated with the types and quantities of materials (e.g., concrete) used to construct each off-site element. Thus, in the discussion of each off-site element below, embodied emissions are addressed qualitatively.

Detention Basin and Sewer Force Main Connection

Based on the map in Exhibit 2-9 in Chapter 2, "Alternatives," grading and excavation activity associated with construction of the detention basin and sewer force main connection to an existing pump station would occur on approximately 3.4 acres and 2.4 acres of undeveloped land, respectively. As shown in Table 3A.2-4, maximum daily exhaust emissions of CO_2 generated by this activity would be approximately 4,159 pounds per day (lb/day) for the detention basin and 9,004 lb/day for the sewer force main connection. However, these estimates of maximum daily emission levels do not necessarily serve as strong indicators of the total level of GHG emissions that would result from construction of these two facilities. Nonetheless, because these two construction projects would be relatively small in acreage, total emissions associated with these activities are not anticipated to be substantial. In addition, levels of embodied GHG emissions are not anticipated to be high because construction of the detention basin and the sewer force main connection are not expected to involve extensive quantities of concrete or other energy-intensive construction materials. As a result, GHG emissions associated with construction of the detention basin and force main connection would not result in a cumulatively considerable incremental contribution to climate change. This would be a **less-than-significant** impact.

Mitigation Measure: No mitigation measures are required.

Prairie City Road Interchange, Rowberry Drive Overcrossing, Oak Avenue Interchange, and Roadway Extensions

Estimated maximum daily exhaust GHG emission levels associated with the construction of the Prairie City Road Interchange, Rowberry Drive overcrossing, Oak Avenue Interchange, and two roadway extensions into El Dorado County are also shown in Table 3A.4-2. The emission levels shown in Table 3A.4-2 for these off-site elements generally correlate with the size (i.e., acreage) of each element because it is estimated that the entire area of each off-site element would be graded in a single day. It is important to note that these estimates of maximum daily emission levels do not necessarily serve as strong indicators of the total level of GHG emissions that would result from construction of these off-site elements. There is the potential, however, that the total level of GHG-emitting equipment, the number of workers, and/or the length of time to build these off-site elements could be substantial. In addition, levels of embodied GHG emissions associated with construction of these off-site elements could be high because they could involve high quantities of concrete, asphalt, and/or other energy-intensive construction materials. Given that detailed parameters about the construction of these infrastructure improvements are not known at the time of writing this EIR/EIS, it is assumed that GHG emissions associated with construction of these elements could result in cumulatively considerable incremental contributions to climate change. This would be a **significant** cumulative impact.

Mitigation Measure: Implement Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1.

Implementation of Mitigation Measure 3A.2-1a and Mitigation Measure 3A.2-1b (see Section 3A.2, "Air Quality – Land") would reduce construction vehicle emissions to the degree feasible, by requiring all SMAQMD-recommended measures that are applicable to the project such as the use of certain engines, following specific criteria, and other requirements. By reducing emissions of criteria air pollutants, GHG emissions also would be reduced. Implementation of Mitigation Measure 3A.4-1 would result in additional reductions in GHG emissions associated with construction activity. Mitigation Measures 3A.2-1a, 3A.2-1b, and 3A.4-1 are programmatic in that they recognize that emission control technologies will continue to evolve and the feasibility of more GHG reductions will likely increase over the 19-year buildout period of the project. They also recognize that a framework for understanding GHG emissions embodied in construction materials (e.g., concrete) may continue to evolve such that embodied emissions can be reduced through project-level mitigation. However, the extent to

which feasible technologies and GHG reduction measures will continue to be developed is not known at the time of writing this EIR/EIS. Therefore, this analysis concludes that these reductions would not be sufficient to fully reduce the construction-generated GHGs to the extent that they would not be cumulatively considerable. The regulatory changes that are likely under AB 32 and other legislation may result in additional, more substantial reductions in emissions through the use of low carbon fuels or off-road engine standards. Because of the uncertainty with respect to GHG reductions from regulations that have not yet been developed, and because the GHGs generated by construction of the Prairie City Road Interchange, Rowberry Drive overcrossing, Oak Avenue Interchange, and Roadway Connections to El Dorado County could be considerable, the incremental contribution of GHG emissions from project-related construction would be cumulatively considerable and **significant and unavoidable**.

This significance determination is based according to the program-level analysis presented above. However, an alternate impact conclusion for each of these four off-site elements may be supported by a project-level analysis that is based on detailed project-specific parameters (i.e., schedule, equipment, materials) used to estimate the total GHG emissions level associated with construction of the element and/or conducted in accordance with new guidance provided by ARB or the respective air district (i.e., SMAQMD or EDCAQMD). However, for purposes of this analysis and because additional detail is currently unavailable, a project-level significance determination cannot be made with reasonable accuracy.

IMPACT 3A.4-2 Generation of Long-Term Operational GHG Emissions. *Operation of the project over the long term would result in increased generation of GHGs, which would contribute considerably to cumulative GHG emissions.*

On-Site and Off-Site Elements

NP

Under the No Project alternative, development of up to 44 rural residences could occur under the existing Sacramento County agricultural zoning classification AG-80. Direct area- and mobile-source emissions of GHGs associated with operation of these residences and indirect emissions associated with electricity and water consumption by these residences would not be expected to be substantial. Also, development of these 44 rural residences on the 3,500-acre site would not involve the removal of a substantial number of trees, which are a form of carbon storage and sequester carbon from the atmosphere. In addition, no stationary sources of GHGs would be developed on the site. While the remainder of the undeveloped site would likely continue to be used for livestock grazing, generating substantial quantities of CH_4, this would not be considered a change relative to existing conditions. No off-site water facilities would be constructed under this alternative. Therefore, operational GHG emissions under the No Project Alternative would not result in a cumulatively considerable incremental contribution to climate change. This would be a **less-than-significant** impact. ***[Lesser]***

On-Site Elements

NCP, PP, RIM, CD, RHD

GHG emissions would be generated throughout the operational life of the Proposed Project and the four action alternatives. Operational emissions would be generated by area-, mobile-, and stationary-sources. Area-source emissions would be associated with activities such as combustion of natural gas for space and water heating, maintenance of landscaping and grounds, waste disposal, and other sources. Mobile-source emissions of GHGs would include project-generated vehicle trips for residents, employees, and visitors. In addition, increases in stationary-source emissions could occur at off-site utility providers from electricity generation that would supply power to the proposed land uses. Thus, the GHG's associated with the consumption of electricity in the SPA is considered an indirect source. On-site consumption of water would also result in indirect GHG emissions because of the electricity consumption associated with the off-site conveyance, distribution, and treatment of that water. In

addition, mobile and area source GHG emissions would be generated as a result of the operation and maintenance of on-site water treatment and conveyance facilities.

GHG emissions generated by operation of the proposed land uses under the Proposed Project and four action alternatives would be primarily in the form of CO_2. Although emissions of other GHGs, such as CH_4 and N_2O, are important with respect to global climate change, the emissions levels of these other GHGs from the sources considered for this project are relatively small compared with CO_2 emissions, even when factoring in the relatively larger global warming potential of CH_4 and N_2O.

At the time of writing this EIR/EIS emission factors and calculation methods for GHGs from development projects have not been formally adopted for use by the state, SMAQMD, or EDCAQMD. However, SMAQMD's *Guide to Air Quality Assessment in Sacramento County* does recommend that direct and indirect emissions of GHGs from a project be quantified and disclosed in the respective CEQA document, including area- and mobile-source emissions, and indirect emissions from in-state energy production and water consumption (SMAQMD 2009a, page 6-6). Direct operational CO_2 emissions were calculated using URBEMIS 2007, Version 9.2.4 (Rimpo and Associates 2008). Indirect operational emissions associated with electricity consumption were estimated according to methodologies of the CCAR's *General Reporting Protocol* (CCAR 2009). Indirect operational emissions associated with water consumption were estimated using information provided by the CEC (CEC 2007) as well as CCAR's *General Reporting Protocol* (CCAR 2009). The Proposed Project and four action alternatives would also result in the loss blue oak woodland and individual oak trees, which are a form of carbon storage and sequester carbon from the atmosphere; however, the loss in trees is not quantified for this analysis. The loss blue oak woodland and individual oak trees is discussed further in Section 3A.3, "Biological Resources – Land."

A summary of the operational GHG emissions were estimated for full buildout of the Proposed Project and four action alternatives, in the Year 2030 and are presented in Table 3A.4-1. The annual operational emissions level under the Proposed Project and four action alternatives was estimated using the best available methodologies and emission factors available at the time of writing this EIR/EIS. However, for many operational GHG emission sources GHG emission rates for future years are not yet developed, in part, because regulations continue to evolve under the mandate of AB 32. The URBEMIS model, as well as other GHG estimation protocols, do not yet account for the impact reductions of the future regulatory environment and future technological improvements that will result in GHG efficiencies. Thus, this analysis uses the emissions estimates modeled for full buildout as a proxy for evaluating GHG emissions associated with operation of the Proposed Project and four action alternatives.

As shown in Table 3A.4-1, estimated GHG emissions associated with operation of the land uses proposed under the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives would total approximately 291,049; 236,895; 296,208; 330,696; and 240,215 annual metric tons, respectively. At full buildout the size of the residential population accommodated by these action alternatives would be approximately 24,335; 19,584; 20,689; 28,084; and 15,808 residents, respectively; and the number of jobs supported by these action alternatives would be approximately 13,209; 9,500, 13,574; 14,119; and 11,173, respectively. When estimated CO_2e emissions are normalized with respect to service population, the average annual efficiency rate of operations under full buildout of the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives would be 7.8; 8.2; 8.7; 7.8; and 8.9 metric tons CO_2e/SP/year, respectively.

However, in many respects the annual CO_2e/SP values in Table 3A.4-1 for the Proposed Project and four action alternatives are representative of each action alternative's GHG efficiency under a business-as-usual scenario and are higher than what would likely occur. First, the level of mobile-source emissions, which was estimated to be 34-38% of the total operational emissions (depending on which action alternative is selected), is overstated because it is based on the VMT estimated by the traffic study, which is conservative. The total VMT estimated by the traffic study includes all trips associated with the proposed project Alternative, including trips that originate or terminate outside the project area. Many of these are trips would occur with or without the project, but in order to

be conservative, the traffic study attributes all of them to the project's land uses. Moreover, the estimated level of mobile-source emissions also includes some emissions associated with trips that would merely replace trips that already take place elsewhere in the Sacramento region. For instance, the VMT estimate includes mobile-source emissions associated with workers who would commute to the SPA from outside the area, even though these trips may be replacing the workers' existing commutes to other locations. This point is particularly pertinent to the proposed mix of land use types, because the project includes a large regional employment center (i.e., the regional shopping mall) that is out of proportion with the amount of housing proposed and thus would draw in worker commute trips from outside areas.

The location of a large regional employment center in this location is consistent with the Sacramento Area Council of Governments (SACOG) Sacramento Region Blueprint, which is intended to reduce overall VMT and GHG emissions in the region.

Furthermore, the VMT estimate accounts for only some (not all) of the trip reduction features that would be part of the project design under the Proposed Project and four action alternatives. The Proposed Project and each of the other four action alternatives include some "smart growth" concepts, such as a mix of uses configured for convenient bike and pedestrian access, an extensive network of bike and pedestrian connections and integration of transit infrastructure. The transportation model used in the traffic analysis functions at a regional scale, so all the nuances of the land use planning under the Proposed Project and each of the other four action alternatives are not necessarily reflected in their respective estimates of net VMT. By the same token, the No USACE Permit, Proposed Project, Centralized Development, and Reduced Hillside Development Alternatives, which are consistent with the SACOG Sacramento Region Blueprint, can only go so far in balancing land uses while remaining consistent with the direction from the SACOG Sacramento Region Blueprint to create a large regional employment center in this location – which results in a disproportionately high number of jobs in the SPA. This increases VMT compared to a fully integrated land use plan that has a balanced jobs/housing ratio. In addition, the emissions rates used to estimate mobile-source GHG emissions do not account for GHG reductions that would result from the Low Carbon Fuel Standard, which was adopted as a discrete early-action measure of AB 32, or the CAA waiver that California received from EPA allowing the state to adopt more stringent fuel efficiency standards for passenger vehicles and light trucks (AB 1493, which is discussed in the "Regulatory Framework" section above).

With regard to the other largest category of operational GHG emissions shown in Table 3A.4-1, indirect GHG emissions related to the consumption of fossil fuel-based electricity, these estimated emissions do not account for reductions that will result from future regulatory changes under AB 32. The estimate of these emissions is not discounted to reflect the alternative-energy mandate of SB 107, which requires the Sacramento Municipal Utility District (SMUD) and other electric utilities to provide at least 20% of its electricity supply from renewable sources by 2010 and 30% by 2020; this mandate would be fully implemented before full buildout of the Proposed Project and other four action alternatives. Because SMUD is still procuring enough renewable energy to meet this goal, the estimated rate of GHG emissions from electricity is expected to decrease between now and 2010. In addition, SB 1368 requires more stringent emissions performance standards for new power plants, both in-state and out-of-state, that will supply electricity to California consumers. Thus, implementation of SB 1368 will also reduce GHG emissions associated with electricity consumption. Rates of energy consumption will be further reduced with implementation of the 2010 Green Building Regulations, which will replace Title 24 building standards with more stringent, energy-efficiency requirements.

Further reductions are also expected from other regulatory measures that will be developed under the mandate of AB 32, as identified and recommended in ARB's Scoping Plan (ARB 2008). In general, the Scoping Plan focuses on achieving the state's GHG reduction goals with regulations that improve the efficiency of motor vehicles and the production (and consumption) of electricity. Thus, even with the implementation of no project-specific mitigation, the rate of GHG emissions from development under the Proposed Project and other four action alternatives are projected to decrease in subsequent years as the regulatory environment progresses under AB 32. Additionally, new technology improvements may become available or the feasibility of existing technologies may

improve. Nonetheless, a complete picture of the future regulatory environment is unknown at this time. GHG reduction measures promulgated under the AB 32 mandate may not be sufficient to cause future development to achieve ARB's recommended 30% reduction from business-as-usual emissions levels projected for 2020 (as discussed in the Scoping Plan) or the CO_2e/SP/year goals for the years 2020 or 2030 discussed above.

Also worth consideration is that, for the moment, the total annual GHG emissions level associated with operation of the Proposed Project and the other four action alternatives would exceed 25,000 metric tons of CO_2 per year throughout their operational life, which is the mandatory reporting level for stationary sources as part of implementation of AB 32. In comparison to this reporting level, the amount of operational GHG emissions of the Proposed Project and the other four action alternatives would be considered substantial.

Because the total GHG emissions associated with project operations under the Proposed Project and other four action alternatives would be considered substantial, and due to the uncertainty about whether the future regulations developed through implementation of AB 32 would cause operational emissions to be 30% lower than business-as-usual emission levels or achieve the CO_2e/SP/year goals for the years 2020 or 2030, the Proposed Project, Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives would result in a cumulatively considerable contribution to a **significant** cumulative impact related to long-term operational generation of GHGs. ***[According to the annual CO_2e/SP metric for the year 2030 presented in Table 3A.4-1, the extent of this impact for the Resource Impact Minimization, Centralized Development, Reduced Hillside Development, and No USACE Permit Alternatives would be greater than that for the Proposed Project Alternative. The Reduced Hillside Development Alternative's annual CO_2e/SP would be equal to that of the Proposed Project Alternative.]***

Mitigation Measure: Implement Mitigation Measure 3A.2-2.

Mitigation Measure 3A.4-2a: Implement Additional Measures to Reduce Operational GHG Emissions.

Each increment of new development within the project site requiring a discretionary approval (e.g., proposed tentative subdivision map, conditional use permit), shall be subject to a project-specific environmental review and will require that GHG emissions from construction and operation of each phase of development be reduced by 30% from business-as-usual 2006 emissions and as required by the California Global Warming Solutions Act of 2006 (AB 32).

The City shall require feasible reduction measures that, in combination with existing and future regulatory measures developed under AB 32, will reduce GHG emissions associated with the operation of future project development phases and supporting roadway and infrastructure improvements that are part of the selected action alternative by an amount sufficient to achieve the 2020-based goal of 4.36 CO_2e/SP/year for development that would become operational on or before the year 2020 and the 2020-based goal of 3.68 CO_2e/SP/year for development that would become operational on or before the year 2030, if it is feasible to do so. The feasibility of potential GHG reduction measures shall be evaluated by the City at the time each phase of development is proposed in order to allow for ongoing innovations in GHG reduction technologies, as well as incentives created in the regulatory environment.

For each increment of new development, the project applicant(s) shall submit to the City a list of feasible energy efficient design standards to be considered in the project-specific environmental review. These energy conservation measures which will be incorporated into the design, construction, and operational aspects of each increment of development, would result in a reduction in overall project energy consumption and GHGs. The project-specific environmental review shall further identify potentially feasible GHG reduction measures to reflect the current state of the regulatory environment, and which will continuously evolve under the mandate of AB 32 and the resulting CO_2e/SP/year metric. The City will review and ensure inclusion of the design features in the proposed project before the applicant(s) can receive the City's discretionary approval for the applicable increment of development. In determining

what measures should appropriately be imposed by the City under the circumstances, the City shall consider the following factors:

- the extent to which rates of GHG emissions generated by motor vehicles traveling to, from, and within the project site are projected to decrease over time as a result of regulations, policies, and/or plans that have already been adopted or may be adopted in the future by ARB or other public agency pursuant to AB 32, or by EPA;

- the extent to which mobile-source GHG emissions, which at the time of writing this EIR/EIS comprise a substantial portion of the state's GHG inventory, can also be reduced through design measures that result in trip reductions and reductions in trip length;

- the extent to which GHG emissions emitted by the mix of power generation operated by SMUD, the electrical utility that will serve the project site, are projected to decrease pursuant to the Renewables Portfolio Standard required by SB 1078 and SB 107, as well as any future regulations, policies, and/or plans adopted by the federal and state governments that reduce GHG emissions from power generation;

- the extent to which replacement of CCR Title 24 with the California Green Building Standards Code or other similar requirements will result in new buildings being more energy efficient and consequently more GHG efficient;

- the extent to which any stationary sources of GHG emissions that would be operated on a proposed land use (e.g., industrial) are already subject to regulations, policies, and/or plans that reduce GHG emissions, particularly any future regulations that will be developed as part of ARB's implementation of AB 32, or other pertinent regulations on stationary sources that have the indirect effect of reducing GHG emissions;

- the extent to which the feasibility of existing GHG reduction technologies may change in the future, and to which innovation in GHG reduction technologies will continue, effecting cost-benefit analyses that determine economic feasibility; and

- whether the total costs of proposed mitigation for GHG emissions, together with other mitigation measures required for the proposed development, are so great that a reasonably prudent property owner would not proceed with the project in the face of such costs.

In considering how much, and what kind of, measures are necessary in light of these factors, the City shall consider and implement as appropriate, the following non-exclusive and non-exhaustive list of measures. GHG emission reduction strategies and their respective feasibility are likely to evolve over time. These measures are derived from multiple sources including the Mitigation Measure Summary in Appendix B of the California Air Pollution Control Officer's Association (CAPCOA) white paper, *CEQA & Climate Change* (CAPCOA 2009a); CAPCOA's *Model Policies for Greenhouse Gases in General Plans* (CAPCOA 2009b); and the California Attorney General's Office publication, The California Environmental Quality Act: Addressing Global Warming Impacts at the Local Agency Level (California Attorney General's Office 2008).

Energy Efficiency

- Include clean alternative energy features to promote energy self-sufficiency (e.g., photovoltaic cells, solar thermal electricity systems, small wind turbines).

- Design buildings to meet CEC Tier II requirements (e.g., exceeding the requirements of the Title 24 [as of 2007] by 35%).

- Site buildings to take advantage of shade and prevailing winds and design landscaping and sun screens to reduce energy use.

- Install efficient lighting in all buildings (including residential). Also install lighting control systems, where practical. Use daylight as an integral part of lighting systems in all buildings.

- Install light-colored "cool" pavements, and strategically located shade trees along all bicycle and pedestrian routes.

Water Conservation and Efficiency

- With the exception of ornamental shade trees, use water-efficient landscapes with native, drought-resistant species in all public area and commercial landscaping. Use water-efficient turf in parks and other turf-dependant spaces.

- Install the infrastructure to use reclaimed water for landscape irrigation and/or washing cars.

- Install water-efficient irrigation systems and devices, such as soil moisture-based irrigation controls.

- Design buildings and lots to be water-efficient. Only install water-efficient fixtures and appliances.

- Restrict watering methods (e.g., prohibit systems that apply water to nonvegetated surfaces) and control runoff. Prohibit businesses from using pressure washers for cleaning driveways, parking lots, sidewalks, and street surfaces. These restrictions should be included in the Covenants, Conditions, and Restrictions of the community.

- Provide education about water conservation and available programs and incentives.

- To reduce stormwater runoff, which typically bogs down wastewater treatment systems and increases their energy consumption, construct driveways to single family detached residences and parking lots and driveways of multifamily residential uses with pervious surfaces. Possible designs include Hollywood drives (two concrete strips with vegetation or aggregate in between) and/or the use of porous concrete, porous asphalt, turf blocks, or pervious pavers.

- Comply with any applicable water conservation ordinances.

Solid Waste Measures

- Reuse and recycle construction and demolition waste (including, but not limited to, soil, vegetation, concrete, lumber, metal, and cardboard).

- Provide interior and exterior storage areas for recyclables and green waste at all buildings.

- Provide adequate recycling containers in public areas, including parks, school grounds, golf courses, and pedestrian zones in areas of mixed-use development.

- Provide education and publicity about reducing waste and available recycling services.

Transportation and Motor Vehicles

- Promote ride-sharing programs and employment centers (e.g., by designating a certain percentage of parking spaces for ride-sharing vehicles, designating adequate passenger loading and unloading zones

and waiting areas for ride-share vehicles, and providing a Web site or message board for coordinating ride-sharing).

- Provide the necessary facilities and infrastructure in all land use types to encourage the use of low- or zero-emission vehicles (e.g., electric vehicle charging facilities and conveniently located alternative fueling stations).

- At industrial and commercial land uses, all forklifts, "yard trucks," or vehicles that are predominately used on-site at non-residential land uses shall be electric-powered or powered by biofuels (such as biodiesel [B100]) that are produced from waste products, or shall use other technologies that do not rely on direct fossil fuel consumption.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and/or building permits for all project phases requiring discretionary approval, including all on- and off-site elements.

Enforcement: City of Folsom Community Development Department.

Mitigation Measure 3A.4-2b: Participate in and Implement an Urban and Community Forestry Program and/or Off-Site Tree Program to Off-Set Loss of On-Site Trees.

The trees on the project site contain sequestered carbon and would continue to provide future carbon sequestration during their growing life. For all trees that are subject to removal, the project applicant(s) of all project phases shall participate in and provide necessary funding for urban and community forestry program (such as the UrbanWood program managed by the Urban Forest Ecosystems Institute [Urban Forest Ecosystems Institute 2009]) in which wood from any removed trees is harvested for an end-use that would retain its carbon sequestration (e.g., furniture building, cabinet making). For all nonharvestable trees that are subject to removal, the project applicant(s) shall develop and fund an off-site tree program that includes a level of tree planting that, at a minimum, increases carbon sequestration by an amount equivalent to what would have been sequestered by the blue oak woodland during its lifetime. This program shall be funded by the project applicant(s) of each development phase and reviewed for comment by an independent Certified Arborist unaffiliated with the project applicant(s) and shall be coordinated with the requirements of Mitigation Measure 3.3-5, as stated in Section 3A.3, "Biological Resources - Land." Final approval of the program shall be provided by the City. Components of the program may include, but not be limited to, providing urban tree canopy in the City of Folsom, or reforestation in suitable areas outside the City. The California Urban Forestry Greenhouse Gas Reporting Protocol shall be used to assess this mitigation program (CCAR 2008). All unused vegetation and tree material shall be mulched for use in landscaping on the project site, shipped to the nearest composting facility, or shipped to a landfill that is equipped with a methane collection system, or combusted in a biomass power plant. Tree and vegetative material should not be burned on- or off-site unless used as fuel in a biomass power plant.

Implementation: The project applicant(s) of all project phases.

Timing: Before approval of final maps and/or building permits for all project phases requiring discretionary approval, including all on- and off-site elements.

Enforcement: The City of Folsom Community Development Department.

Off-Site Elements

This analysis is similar to the analysis of criteria air pollutant emissions associated with the operation of the off-site elements discussed under Impact 3A.2-2 in Section 3A.2, "Air Quality – Land."

The proposed off-site detention basin, Prairie City Road Interchange, Rowberry Drive overcrossing, Oak Avenue Interchange, sewer force main connection, and the two roadway extensions would not be anticipated to result in a considerable increase in operational GHG emissions beyond those associated with the project. While the road improvement-related elements would accommodate local vehicle traffic, they would not be expected to result in a substantial increase in vehicle trips and associated mobile-source emissions. (A substantial portion of vehicle trips using the proposed roadway infrastructure elements would be generated by the land uses developed in the SPA and associated mobile-source emissions are discussed in the analysis of on-site elements above.) Some of the roadway infrastructure improvements may actually reduce VMT by enabling more direct travel routes between area destinations. Also, it is not anticipated that the detention basin would generate a substantial number of vehicle trips other than the nominal amount of trips associated with routine maintenance of the facility. As a result, GHG emissions associated with operation of the off-site elements would not be cumulatively considerable and this would be a **less-than-significant** cumulative impact.

Mitigation Measure: No mitigation measures are required.

By acknowledging that the regulatory environment will continue to progress and that new GHG reduction technologies will continue to be innovated over time, Mitigation Measure 3A.4-2 requires the implementation of project-specific mitigation measures that are appropriate and feasible during each phase or increment of project development. Although Mitigation Measure 3A.4-2 would require the implementation of all feasible GHG reduction measures known at this time, it is unknown at the time of writing this EIR/EIS whether the selected project-specific measures during each project phase, in combination with the GHG reductions realized from the regulatory environment that exists at that time, would result in attainment of the applicable CO_2e/SP goal.

As the preceding discussion suggests, much of the difficulty in achieving the applicable CO_2e/SP goal through measures imposed by the City reflects the reality that the vast majority of GHG emissions associated with the Proposed Project and the other four action alternatives would be attributable to the combustion of fossil fuels, either in motor vehicles or in electricity-generating power plants. The state, it is clear, must make significant strides in changing the make-up of transportation fuels and power plant fuels if it is to achieve compliance with AB 32. Based on the Scoping Plan adopted by ARB on December 11, 2008, however, it is reasonable to expect that the state should be able to make such strides through regulations and policies adopted pursuant to AB 32. Given the long period of time needed for build-out of the project, these regulations and policies should be effective in reducing GHG emissions from vehicles and power plants during the period of time in which the City approves the vast majority of project-level development entitlements needed for development pursuant to, and consistent with, the Proposed Action or selected alternative. As these regulations and policies gradually become effective, the task of achieving the applicable CO_2e/SP goal should become comparatively easier. However, the precise level of reductions is difficult to calculate for all phases of development, and therefore would be speculative at this time. As a precaution, this EIR/EIS concludes that the No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives' incremental contribution to long-term operational GHG emissions is **cumulatively considerable** and **significant and unavoidable**.

3A.4.2 Impacts on the Project Related to Global Climate Change

Introduction

This section analyzes the potential impact of global climate change on the project (e.g., effects of increased sea levels, reduced snow pack). Because the potential impacts of global warming have only recently been realized,

firm data, commonly accepted thresholds for significance, and firm conclusions are not available. This section therefore draws from a range of studies that analyze global and regional patterns and trends. Given the uncertainties in climate change modeling and prediction there are few or no viable models or studies devoted specifically to the project vicinity. Therefore, in order to increase the data set of information about potential regional changes, some of the studies relied on analyze climate for the entire Central Valley, including both the Sacramento and San Joaquin Valleys.

Since there are no formally accepted methodologies, a lead agency must use its best efforts to find out and disclose all that it reasonably can about the potential adverse environmental effects of a proposed project or on a proposed project. However, the analysis cannot rely on speculation. Speculation that is based on unspecified and uncertain future effects that cannot reasonably be evaluated cannot result in verifiable analyses. Furthermore, such analysis could mislead the decision makers and the public. As indicated in the State CEQA Guidelines, "If after a thorough investigation, an agency finds that a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact." (State CEQA Guidelines CCR Section 15145.)

The following analysis is based on available information and projections applicable to estimating the types of effects that may occur. While some effects of global climate change are reasonably foreseeable, the extent to which many of these effects would manifest themselves and the potential of other effects to occur, remain speculative. In the interests of fully informing the decision makers, many of the potential effects that are subject to a high degree of speculation are discussed in the following evaluation, despite the fact that it would be too speculative to draw a conclusion as to their significance. The discussion herein focuses on the potential effects of climate change on the project, rather than the potential of the project to contribute to global climate change.

Although there is a strong scientific consensus that global warming/global climate change is occurring and is greatly influenced by human activity, there is less certainty as to the timing, severity, and potential consequences of global climate change. Scientists have identified several ways in which global climate change could alter the physical environment in California (Kiparsky and Gleick 2005, Roos 2005, California Department of Water Resources [DWR] 2006). These include:

- increased average temperatures;
- modifications to the timing, amount, and form (rain versus snow) of precipitation;
- changes in the timing and amount of runoff;
- reduced water supply;
- deterioration of water quality; and
- elevated sea level.

The changes listed above may translate into a variety of other issues and concerns, such as:

- reduced agricultural production as a result of changing temperatures and precipitation patterns;
- changes in the composition, health, and distribution of terrestrial and aquatic ecosystems;
- reduced hydroelectric energy production caused by changes in the timing and volume of runoff; and
- reduced availability of energy because of greater demands associated with increased temperatures.

However, this evaluation of the effects of global climate change on the project does not address climate change associated with energy supply for the following reasons:

- There are many potentially wide-ranging direct and indirect effects of global climate change, such as potential reductions in hydroelectric energy production. These reductions could result from changes in the timing and volume of runoff that would cause reductions in the generation of electricity. However it is too speculative to determine that these potential changes would affect the project because they are both geographically remote and the impact on overall energy supply and markets is unknown. Also, potential changes may be addressed or corrected by other entities (e.g., energy providers increasing generation capacity to meet the increased

demand that is not specifically associated with the project; greater development and use of alternative energy sources such as solar to offset capacity losses); and

- The specific measures that would be implemented to address more wide-ranging direct and indirect effects of global climate change cannot be reasonably projected at this time.

This analysis does not suggest that the project would see no effect related to energy supply. Rather, any effects would be the same at the project vicinity, as elsewhere in the county, region, state, nation, and world, and would not result in specific unique impacts in the project vicinity.

This analysis focuses on the effects of global climate change that might have a direct, reasonably foreseeable effect on physical conditions in the project vicinity. Therefore, this analysis gives greatest consideration to climate-change data with more consistency in projections of future conditions, and thus a probability for a greater likelihood of occurring within a reasonable time frame (i.e., approximately 100 years).

Because the impacts of global change would be similar within a regional or local area, this analysis assumes that regardless of whether the No Project, No USACE Permit, Proposed Project, Resource Impact Minimization, Centralized Development, and Reduced Hillside Development Alternatives were implemented, the impact on the project would be substantially similar.

INFORMATION SOURCES

Information on the current state of the science surrounding climate change was derived from research papers, technical memoranda, literature summaries, and studies, including the following:

- United Nations Intergovernmental Panel on Climate Change documents *Climate Change 2001: The Scientific Basis* (IPCC 2001a); *Climate Change 2001: Synthesis Report* (IPCC 2001b); and *Climate Change 2007: The Physical Basis. Summary for Policymakers* (IPCC 2007);

- *California Water Plan Update 2005* (Bulletin 160-05) (DWR 2005a) and accompanying papers *Climate Change and California Water Resources: A Survey and Summary of the Literature* (Kiparsky and Gleick 2005) and "Accounting for Climate Change" (Roos 2005);

- *Progress on Incorporating Climate Change into Planning and Management of California's Water Resources, Technical Memorandum Report* (DWR 2006); and

- Published reports on aspects of climate change and associated effects (see Chapter 5, "References," of this EIR/EIS for a listing of all information sources cited in this section).

CHARACTERIZATION OF CLIMATE CHANGE IMPACTS

This section summarizes the current scientific perspective of climate change and associated effects, particularly those that could affect the project. Information is provided for each effect of climate change considered in this document, consisting of:

- increased temperature;
- precipitation volume, type, and intensity;
- runoff volume and timing;
- water supply;
- sea level rise;
- water quality changes; and
- agricultural changes.

For each climate change effect there is a discussion of:

- status of current scientific information and data about past trends;
- projected future changes and the accuracy and variability of modeling results, including identification of results presumed too speculative for conclusive analysis; and
- potential for the environmental effects of climate change to affect the Proposed Project Alternative, based both on the certainty or uncertainty of modeling results and on the physical nature of the effect.

This information is used in this section to consider and evaluate potential environmental impacts of future climate change on the project.

Background

Theories about climate change and global warming existed as early as the late 1800s. It was not until the later 1900s that understanding of the Earth's atmosphere had advanced to the point where many atmospheric and climate scientists began to accept that the Earth's climate is changing (IPCC 2001a, 2001b; DWR 2006).

In recent years, the scientific consensus has broadened to consider increasing concentrations of GHGs, attributable to anthropogenic (human) activities, as a primary cause of global climate change. The United Nations IPCC predicts that changes in the Earth's climate will continue through the 21st century and that the rate of change may increase significantly in the future because of the growing population and associated increase in human activity (IPCC 2001b, 2007). Recent studies confirm the existence of climate change, and emphasize the occurrence of impacts in the next 20–50 years (Backlund, Janetos, and Schimel 2008), but the scope and rate of change remains uncertain.

In recent years, the issue of global climate change has had an increasing role in scientific and policy debates over multiple environmental topics such as land use planning, transportation planning, energy production, habitat and species conservation, use of ocean resources, and agricultural production. Of particular concern are the existing and potential future effects of global climate change on hydrologic systems and water management (e.g., domestic water supply, agricultural water supplies, flood control, water quality). There is evidence that global climate change has already had an effect on California's hydrologic system. For example, historical data indicate a trend toward declining volumes of spring and summer runoff from the Sierra Nevada.

California water planners and managers have been among the first groups in the nation to realize the potential implications of statewide and regional climate change (rather than global-scale changes) on the reliability and safety of their systems. Research and analysis on climate risks facing California water resources began in the early 1980s, and by the end of that decade, state agencies such as the CEC had prepared the first assessments of state GHG emissions and possible impacts on a wide range of sectors. The California Water Plan (Bulletin 160) first addressed climate change in 1993 (DWR 1993). More recently, DWR and the Public Interest Energy Research program of CEC expanded and refined the analysis of climate change effects in California in the 2005 update of the California Water Plan, which explores a wide range of climate impacts and risks, including risks to water resources (Kiparsky and Gleick 2005, Roos 2005). The 2005 update also describes efforts that should be taken to quantitatively evaluate climate change effects for the next Water Plan update (DWR 2005a). DWR has also followed up on these issues with a technical memorandum report that specifically discusses progress on modeling climate change in the state, characterizes the effects of climate change, and incorporates climate change into planning and management of California's water resources (DWR 2006).

Variability in Regional Modeling of Climate Change

Much of the available trend data, modeling, and projections related to climate change are on a global scale. Climate change projections often rely on general circulation models (GCMs). These models develop large-scale

scenarios of changing climate parameters, usually comparing scenarios with different concentrations of greenhouse gases in the atmosphere. This information is typically not specific enough to make accurate regional assessments. As a result, more effort has recently been put into reducing the scale and increasing the resolution of climate models through various techniques such as "downscaling" or integrating regional models into the global models (Kiparsky and Gleick 2005, Roos 2005, DWR 2006). However, the level of uncertainty related to regional climate change is generally higher than that related to global projections because these current methodologies add uncertainty.

Variability in the results of climate change modeling is largely based on which global climate model is used, what inputs are selected for the model (world population increases and greenhouse gas emissions), and how the model is downscaled to provide region-specific data. For example, in DWR's report *Progress on Incorporating Climate Change into Management of California's Water Resources, Technical Memorandum Report* (DWR 2006), four scenarios projecting regional climate change were selected, consisting of combinations of two different global climate models and two different emissions scenarios. These four scenarios provide temperature results ranging from weak warming to relatively strong warming, and precipitation results ranging from modest reductions to weak increases (DWR 2006).

It should be remembered that results of climate change modeling, particularly for regional models, are not specific, quantified predictions. There is a lot of uncertainty about the magnitude of climate change that will occur during this century. It is unlikely that this level of uncertainty will be resolved in the foreseeable future (Dettinger 2005a). Therefore, effects on the environment anticipated under various climate change models should be considered as general projections of potential future conditions, with actual environmental effects likely falling within the range of results provided by a variety of model outputs.

Temperature

Status and Trends

The Earth's climate has had periods of cooling and warming in the past. Significant periods of cooling have been marked by massive accumulations of sea- and land-based ice extending from the Earth's poles to as far as the middle latitudes. Periods of cooling have also been marked by lower sea levels because of the accumulation of water as ice and the cooling and contraction of the Earth's oceans. Periods of warming caused recession of the ice toward the poles, warming and thermal expansion of the Earth's oceans, and rise in sea levels (DWR 2006, IPCC 2007).

The potential for human-induced changes in the Earth's temperature has been tied to increased concentrations of GHGs in the atmosphere, caused primarily by the production and burning of fossil fuels. The primary gases of concern are carbon dioxide, methane, and nitrous oxide (IPCC 2001a, 2001b, 2007). Average temperatures in the Northern Hemisphere appear to have been relatively stable from about the year 1000 to the mid-1800s, based on temperature proxy records from tree rings, corals, ice cores, and historical observations (IPCC 2001a). However, there is a level of uncertainty related to proxy temperature records, especially those extending far back into the past.

The IPCC stated that the Earth's climate has warmed since the preindustrial era and that it is very likely that at least some of this change is attributable to the activities of humans (IPCC 2007). Global average near-surface air temperatures and ocean surface temperatures increased by 0.74 °C ± 0.18°C (1.33°F ± 0.32°F) during the 20th century (IPCC 2007).

Temperature measurements, apparent trends in reduced snowpack and earlier runoff, and other evidence such as changes in the timing of blooming plants indicate that temperatures in California and elsewhere in the western United States have increased during the past century (National Oceanic and Atmospheric Administration [NOAA] 2005, Mote et al. 2005, Cayan et al. 2001).

Projections

Modeling results from GCMs are consistent in predicting increases in temperatures globally with increasing concentrations of atmospheric GHGs resulting from human activity. As discussed above, climate change projections can be developed on a regional basis using techniques to downscale from the results of global models (although increased uncertainty results from the downscaling). One relatively large group of model projections for California that was recently examined provides a temperature rise of about 2.5 to 9°C (4.5 to 16.2°F) for Northern California by 2100. An analysis of the distribution of the projections generally showed a central tendency at about 3°C (5.4°F) of rise for 2050, and about 5°C (9°F) for 2100 (Dettinger 2005b).

Snyder et al. (2002) produced one of the most refined scale temperature and precipitation estimates to date. Resulting temperature increases for a scenario of doubled carbon dioxide concentrations are 1.4 to 3.8°C (2.5 to 6.8°F) throughout California. This is consistent with the global increases predicted by the IPCC (2001b, 2007). In a regional model of the western United States, Kim et al. (2002) projected a climate warming of around 3 to 4°C (5.4 to 7.2°F). Of note in both studies is the projection of uneven distribution of temperature increases. For example, regional climate models show that the warming effects are greatest in the Sierra Nevada, with implications for snowpack and snowmelt (Kim et al. 2002, Snyder et al. 2002).

Effect on the Project

Based on the results of a variety of regional climate models, it is reasonably foreseeable that some increase in annual average temperatures will occur in California, and in the project vicinity, during the next 100 years. Although a temperature increase is expected, the amount and timing of the increase is uncertain. In general, predictions put an increase in the range of 3 to 5°C (5.4 to 9°F) over the next 50–100 years (Kim et al. 2002, Snyder et al. 2002, Dettinger 2005b).

An increase in average annual temperatures, by itself, would have little effect on the proposed land uses other than adjustments in project operations in response to warmer temperatures, such as increased evapotranspiration rates affecting both detention basin areas and landscaped areas, resulting in an increased irrigation demand, and potentially greater overall energy consumption to meet air conditioning needs.

Effects related to water supply is discussed below. Potential outcomes of increased temperature on a global and regional scale, such as changes in precipitation and runoff, also have a potential to substantially affect physical conditions in the project vicinity. These topic areas are also discussed below.

Therefore, although an increase in annual average temperature is a reasonably foreseeable effect of future climate change, this environmental change alone would have little effect on the project.

Precipitation

Climate change can affect precipitation in a variety of ways, such as by changing the following:

- overall amount of precipitation,
- type of precipitation (rain versus snow), and
- timing and intensity of precipitation events.

Each of these issue areas is discussed below.

Amount of Precipitation

Status and Trends

Worldwide precipitation is reported to have increased about 2% since 1900. While global average precipitation has been observed to increase, changes in precipitation over the past century vary in different parts of the world. Some areas have experienced increased precipitation while other areas have experienced a decline (Exhibit 3A.4-2) (IPCC 2001b, 2007; NOAA 2005). An analysis of trends in total annual precipitation in the western United States by the National Weather Service's Climate Prediction Center provides evidence that annual precipitation has increased in much of California, the Colorado River Basin, and elsewhere in the West since the mid-1960s (DWR 2006). In another study evaluating trends in annual November through March precipitation for the western United States and southwest Canada, the data indicate that for most of California and the Southwest there was increasing precipitation during the periods of 1930–1997 and 1950–1997 (Mote et al. 2005).
